PREFACE

Engineering offers the most exciting and fulfilling of careers. As a Engineer you can find satisfaction by serving the society through your knowledge of technology. Although the number of Engineering colleges imparting quality education and training has significantly increased after independence in the country, but simultaneous increase in the number of serious aspirants has made the competition difficult, it is no longer easy to get a seat in a prestigious Engineering college today.

For success, you require an objective approach of the study. This does not mean you 'prepare' yourself for just 'objective questions'. Objective Approach means more than that. It could be defined as that approach through which a student is able to master the concepts of the subject and also the skills required to tackle the questions asked in different entrances such as JEE Main & Advanced, as well other regional Engineering entrances. These two-volume books on Mathematics 'Objective Mathematics (Vol.1 & 2)' fill the needs of such books in the market in Mathematics and are borne out of my experience of teaching Mathematics to Engineering aspirants.

The plan of the presentation of the subject matter in the books is as follows

- The whole chapter has been divided under logical topic heads to cover the syllabi of JEE Main & Advanced and various Engineering entrances in India.
- The Text develops the concepts in an easy going manner, taking the help of the examples from the day-to-day life.
- Important points of the topics have been highlighted in the text. Under Notes, some extra points regarding the topics have been given to enrich the students.
- The Solved Examples make the students learn the basic problem solving skills in Mathematics. Very detailed explanations have been provided to make the students skilled in systematically tackling the problems.
- The answers / solutions to all the questions have been provided.
- The Objective Questions have been divided according to their types Single correct option, More than One, Assertion-Reason, Matching Type, Integer Type, Passage Based, etc. which can take the students to a level required for various Engineering entrances in the present scenario.
- Entrance Corner includes the Previous Years' Questions asked in JEE Main & Advanced and other various Engineering entrances. At the end of the book, JEE Main & Advanced & Other Regional Entrances Solved Papers have been given.

I would open-heartedly welcome the suggestions for the further improvements of this book (Vol.1) from the students and teachers.

Sets

Introduction

In our mathematical language, everything in this universe whether living or non-living is called an object. If we consider a collection of objects given in such a way that it is possible to tell beyond doubt, whether a given object is in the collection under consideration or not, then such a collection of objects is called a well-defined collection of objects.

Set

A set is a well-defined collection of objects. By 'well-defined collection of objects', it means that we can definitely decide whether a given particular object belongs to a given collection or not. The objects, elements and members of a set are synonymous terms.

Example 1. *The set of intelligent students in a class is*

(a) a null set *(b) a well-defined collection*
(c) a finite set *(d) not a well-defined collection*

Sol. (d) Since, the criterion for determining the intelligence of a student may vary from person to person, so this is not a well-defined collection of objects.

Example 2. *Which of the following is the collection of first five prime numbers?*

(a) {1, 2, 3, 5, 7} *(b)* {2, 3, 5, 7, 11}
(c) {3, 5, 7, 11, 13} *(d)* {1, 2, 3, 4, 5}

Sol. (b) It is clear that first five prime numbers are {2, 3, 5, 7, 11}.

Notations

Sets are usually denoted by capital letters A, B, C etc., and their elements by small letters a, b, c, etc.

Let A be any set of objects and let a be a member of A, then we write $a \in A$ and read it as 'a belongs to A' or 'a is an element of A' or 'a is member of A'. If a is not an object of A, then we write $a \notin A$ and read as 'a does not belong to A' or 'a is not an element of A' or 'a is not a member of A'.

Representation of Sets

A set is often represented in one of the following two forms :

(i) Roster form or Tabular form (ii) Set builder form

Chapter Snapshot

- Introduction
- Set
- Notations
- Representation of Sets
- Types of Sets
- Venn Diagram
- Operations on Sets
- Laws of Algebra of Sets
- Formulae to Solve Practical Problems on Union and Intersection of Sets

Roster Form or Tabular Form

In this form, a set is described by listing its elements, separated by commas, within braces { }.

e.g. The set of months of a year which have thirty days, in roster form can be described as

{April, June, September, November}

Example 3. *The roster form of set $A = \{x : x$ is a positive integer and divisor of $9\}$*

(a) $\{3, 6, 9\}$ (b) $\{1, 5, 9\}$ (c) $\{1, 3, 9\}$ (d) $\{2, 3, 9\}$

Sol. (c) Since, x is a positive integer and a divisor of 9. So, x can take values 1, 3, 9.

$\therefore$ Roster form of the set A is $\{1, 3, 9\}$.

Set Builder Form

In this form, instead of listing all the elements of a set we describe the set by some special property (properties) satisfied by all of its elements and write it as

$A = \{x : P(x) \text{ holds}\} = \{x \mid x$ has the property $P(x)\}$ and read it as 'A is the set of all elements of x such that x has the property P'. The symbol ':' or '|' stands for 'such that'.

Example 4. *If set $A = \{1, 2, 3, 4\}$, then it can be written in set builder form as*

(a) $A = \{x : x \in N$ and $x \le 5\}$
(b) $A = \{x : x \in N$ and $x < 5\}$
(c) $A = \{x : x \in N$ and $1 < x < 5\}$
(d) $A = \{x : x \in N$ and $x < 4\}$

Sol. (b) Clearly, $A = \{x : x \in N$ and $x < 5\}$ describes the set $A = \{1, 2, 3, 4\}$

Types of Sets

Empty Set

A set which does not contain any element is called an empty set or null set or void set and is denoted by the symbol ϕ or $\{\}$.

Example 5. *The set $\{x : x \in N, 3 < x < 4\}$ is equal to*

(a) $\{3, 4\}$ (b) $\{4\}$ (c) ϕ (d) $\{3\}$

Sol. (c) Since, $x \in N$ and $3 < x < 4$, so the given set has no element.

Example 6. *The set $\{x : x^2 + 1 = 0$ and $x \in R\}$ is equal to*

(a) $\{-1, 1\}$ (b) $\{1\}$
(c) $\{-1\}$ (d) ϕ

Sol. (d) We know that there is no real number x such that $x^2 + 1 = 0$.

- *The set $\{0\}$ is not an empty set as it contains the element 0 (zero).*
- *The set $\{\phi\}$ is not a null set. It is a set containing one element ϕ.*
- *A set which has atleast one element is called a non-empty set.*

Singleton Set

A set consisting of only one element is called a singleton set.

Example 7. *A set $A = \{x : x \in N$ and $2 < x < 4\}$ is called*

(a) null set
(b) infinite set
(c) singleton set
(d) None of the above

Sol. (c) $\{3\}$; Since, $x \in N$ and $2 < x < 4 \Rightarrow x = 3$

Finite Set

A set which is empty or having a definite number of elements is called a finite set.

Example 8. *A set $\{x \mid x \in N$ and $1 \le x \le 10\}$ is called*

(a) infinite set (b) finite set
(c) singleton set (d) null set

Sol. (b) Since, elements of the given set is

$\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$

Cardinal Number of a Finite Set

The number of distinct elements contained in a finite set A is called its cardinal number and is denoted by $n(A)$.

e.g. If $A = \{1, 3, 5, 7\}$, then $n(A) = 4$.

Example 9. *The number of elements in a set $\{x : x \in$ all vowels$\}$ is*

(a) 6 (b) 26
(c) 5 (d) 2

Sol. (c) $A = \{a, e, i, o, u\}$

So, $n(A) = 5$

Infinite Set

A set which is not finite is called an infinite set. In other words, a set in which the process of counting of elements does not come to an end is called an infinite set.

Example 10. *A set of all points in a plane is called*

(a) empty set (b) finite set
(c) infinite set (d) None of these

Sol. (c) Points in a plane cannot be counted.

Equal Sets

Two sets A and B are said to be equal, if every element of A is also an element of B and every element of B is also an element of A. Thus, if $x \in A \Rightarrow x \in B$ and $y \in B \Rightarrow y \in A$, then A and B are equal sets and we can write $A = B$.

Example 11. *The set* $A = \{x : x \in N$ *and* $1 < x < 7\}$ *is equal to*

(a) $\{2, 3, 4, 5, 6\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{2, 3, 4, 5, 6, 7\}$ (d) $\{1, 2, 3, 4, 5, 6, 7\}$

Sol. (a) Whenever, we have to show that two sets A and B are equal, show that $A \subseteq B$ and $B \subseteq A$, then $A = B$.

Equivalent Sets

Two finite sets A and B are said to be equivalent, if $n(A) = n(B)$.

Clearly, equal sets are equivalent, but equivalent sets need not to be equal.

Equivalence of two sets is denoted by the symbol '~'. Thus, if A and B are equivalent sets, we write $A \sim B$ which is read as 'A is equivalent to B'.

Example 12. *The set* $\{1, 2, 3, 4, 5\}$ *is equivalent to*

(a) $\{x : x \in$ *all vowels*$\}$ (b) $\{2, 3, 4\}$
(c) $\{1, 2, 4, 5\}$ (d) $\{1, 2, 3\}$

Sol. (a)

Subset and Superset

The set B is said to be subset of set A, if every element of set B is also an element of set A. Symbolically, we write it as, $B \subseteq A$ or $A \supseteq B$, where A is superset of B.

(i) $B \subseteq A$ is read as B is contained in A or B is subset of A or A is superset of B.

(ii) $A \supseteq B$ is read as A contains B or B is a subset of A.

Evidently, if A and B are two sets such that $A \in B \Rightarrow x \in A$, then B is subset of A. The symbol '$\Rightarrow$' stands for 'implies'. We read it as 'x belongs to B' implies that 'x belongs to A'.

Example 13. *The set* $A = \{1, 2, 3\}$ *is the subset of*

(a) $\{1, 2, 4, 5\}$ (b) $\{1, \{2, 3\}, 4, 5\}$
(c) $\{1, 2, 3, 7, 8\}$ (d) $\{\{1, 2\}, 3, 4\}$

Sol. (c)

Proper Subset

The set B is said to be a proper subset of set A, if every element of set B is an element of A, whereas every element of A is not an element of B.

We write it as $B \subset A$ and read it as B is a proper subset of A. Thus, B is a proper subset of A, if every element of B is an element of A and there is atleast one element in A which is not in B.

Observe that $A \subseteq A$ i.e. every set is a subset of itself, but not a proper subset.

Example 14. *The set* $\{1, 2\}$ *is the proper subset of*

(a) $\{1, 2\}$ (b) $\{1, 3, 4\}$
(c) $\{1, 2, 3\}$ (d) $\{\{1, 2\}, 3, 4\}$

Sol. (c)

Intervals as Subsets of *R*

Let $a, b \in R$ and $a < b$, then

(i) An open interval denoted by (a, b) is the set of all real numbers such that $(a, b) = \{x \in R : a < x < b\}$

(ii) A closed interval denoted by $[a, b]$ is the set of all real numbers such that $[a, b] = \{x \in R : a \le x \le b\}$

(iii) Interval closed at one end and open at the other are given by $[a, b) = \{x \in R \ a \le x < b\}$ and $(a, b] = \{x \in R : a < x \le b\}$

Example 15. *The subset of R as intervals* $\{x : x \in R, -12 < x < -10\}$ *is*

(a) $(-12, -10]$ (b) $[-12, -10]$
(c) $(-12, -10)$ (d) $[-12, -10)$

Sol. (c) The given subset is belong to open interval.

$\therefore$ $\{x : x \in R, -12 < x < -10\}$ is $(-12, -10)$.

Example 16. *Let R be set of points inside a rectangle of sides a and b* $(a, b > 1)$ *wth two sides along the positive direction of X-axis and Y-axis, then*

(a) $R = \{(x, y) : 0 \le x \le a, 0 \le y < b\}$
(b) $R = \{(x, y) : 0 \le x < a, 0 \le y \le b\}$
(c) $R = \{(x, y) : 0 \le x \le a, 0 < y < b\}$
(d) $R = \{(x, y) : 0 < x < a, 0 < y < b\}$

Sol. (d) Since, (x, y) both lies in first quadrant.

$\therefore$ $x, y > 0$ and less than side a and b because R lies inside the rectangle.

$\therefore$ $R = \{(x, y) : 0 < x < a, 0 < y < b\}$

Power Set

The set formed by all the subsets of a given set A is called the power set of A. It is usually denoted by $P(A)$.

Example 17. *If set* $A = \{1, 2, 3\}$, *then* $P(A)$ *is equal to*

(a) $\{\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{1, 3\}\}$
(b) $\{\{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{3, 1\}\}$
(c) $\{\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{3, 1\}, \{1, 2, 3\}\}$
(d) $\{\{1\}, \{2\}, \{3\}, \{1, 2, 3\}\}$

Sol. (c)

Some Results on Subsets

(i) Every set is a subset of itself.
(ii) The empty set is a subset of every set.
(iii) The total number of subset of finite set containing n elements is 2^n.

Comparable Sets

Two sets A and B are said to be comparable, if one of them is a subset of the other i.e. either $A \subseteq B$ or $B \subseteq A$.

Example 18. *The set* $\{1, 2, 3\}$ *is comparable with*

(a) $\{1, 2, 4, 5\}$ *(b)* $\{\{1, 2\}, 4, 3\}$
(c) $\{\{1, 3\}, 2, 4\}$ *(d)* $\{1, 2, 3, 4\}$

Sol. (d) Since, $\{1, 2, 3\}$ is the subset of $\{1, 2, 3, 4\}$.

Universal Set

In any discussion of set theory, there is always a set that contains all the sets under consideration i.e. it is a superset of each of the given sets. Such a set is called the universal set and is denoted by U.

Example 19. *Which of the following set is the universal set of sets* $A = \{2, 4, 5\}$, $B = \{1, 3, 5\}$? $C = \{3, 5, 7, 11\}$, $D = \{2, 4, 8, 10\}$

(a) $\{1, 2, 3, 5, 6, 7, 8, 9, 10\}$
(b) $\{1, 2, 3, 4, 5, 6, 7, 8, 10\}$
(c) $\{1, 2, 3, 4, 5, 7, 8, 10, 11\}$
(d) $\{1, 2, 3, 4, 6, 7, 8, 10, 11\}$

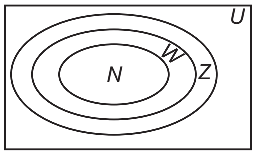
Sol. (c)

Venn Diagram

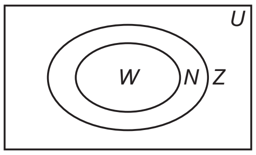
Venn diagrams are the diagrams which represent the relationship between sets.

Example 20. *The set of natural numbers is a subset of whole numbers which is a subset of integers. Then, correct representation of it through Venn diagram is*

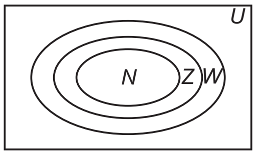
(a)



(b)

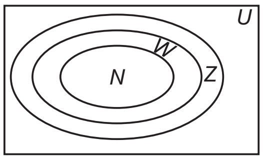


(c)



(d) *None of these*

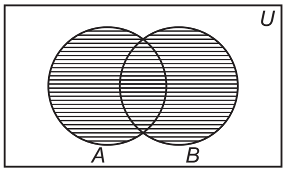
Sol. (a)



Operations on Sets

Now, we introduce some operations on sets to construct new sets from the given ones.

i. **Union of sets** The union of two sets A and B, denoted by $A \cup B$ is the set of all those elements, each one of which is either in A or in B or in both A and B.



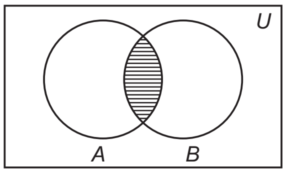
Thus, $A \cup B = \{x : x \in A \text{ or } x \in B\}$
Clearly $x \in A \cup B$
$\Rightarrow$ $x \in A$
or $x \in B$
and $x \notin A \cup B$
$\Rightarrow$ $x \notin A$ and $x \notin B$
In the figure, the shaded part represents, $A \cup B$.
It is evident that $A \subseteq A \cup B$, $B \subseteq A \cup B$.

Example 21. *If two sets* $A = \{1, 2, 3\}$ *and* $B = \{1, 3, 5, 7\}$, *then* $A \cup B$ *is equal to*

(a) $\{1, 2, 3, 7\}$ *(b)* $\{1, 2, 3, 5, 7, 8\}$
(c) $\{1, 2, 3, 5, 7\}$ *(d)* $\{1, 2, 3, 4, 5, 6, 7\}$

Sol. (c)

ii. **Intersection of sets** The intersection of two sets A and B, denoted by $A \cap B$ is the set of all elements, common to both A and B.



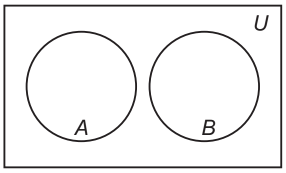
Thus, $A \cap B = \{x : x \in A \text{ and } x \in B\}$
Clearly, $x \in A \cap B$
$\Rightarrow$ $x \in A$ and $x \in B$
and $x \notin A \cap B$ $\Rightarrow$ $x \in A$ or $x \in B$
In the figure, the shaded part represents $A \cap B$.
It is evident that $A \cap B \subseteq A$, $A \cap B \subseteq B$.

Example 22. *If two sets* $A = \{1, 2, 3, 4\}$ *and* $B = \{2, 4, 5\}$, *then* $A \cap B$ *is equal to*

(a) $\{1, 3\}$ *(b)* $\{2, 4\}$
(c) $\{3, 4\}$ *(d)* $\{1, 6\}$

Sol. (b) Since, 2 and 4 are the common elements in sets A and B.

iii. **Disjoint sets** Two sets A and B are said to be disjoint, if $A \cap B = \phi$. If $A \cap B \neq \phi$, then A and B are said to be intersecting or overlapping sets.



Example 23. *Given that,*

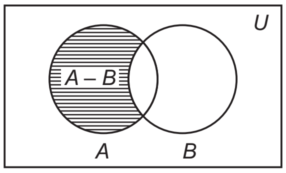
$$A = \{1, 2, 3, 4, 5, 6\}$$
$$B = \{7, 8, 9, 10, 11\}$$
$$C = \{6, 8, 10, 12, 14\}.$$

Which of the following pair of sets are disjoint sets?

(a) A and B
(b) B and C
(c) C and A
(d) None of the above

Sol. (a)

iv. **Difference of sets** If A and B are two sets, then their difference $A - B$ is the set of all those elements of A which do not belong to B.



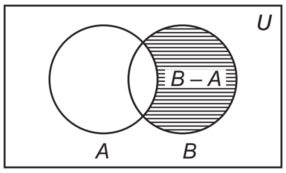
Thus, $A - B = \{x : x \in A \text{ and } x \notin B\}$

Clearly, $x \in A - B$

$\Rightarrow$ $x \in A$ and $x \notin B$

In the figure, the shaded part represents $A - B$.

Similarly, the difference $B - A$ is the set of all those elements of B that do not belong to A i.e.



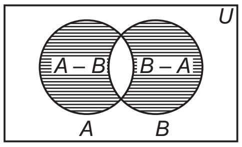
$$B - A = \{x : x \in B \text{ and } x \notin A\}$$

Example 24. *Given that two sets $A = \{1, 3, 5, 7, 9\}$ and $B = \{2, 3, 5, 7, 11\}$, then $A - B$ is*

(a) $\{1, 9\}$
(b) $\{2, 11\}$
(c) $\{3, 5, 7\}$
(d) $\{1, 2, 3, 5, 7, 9, 11\}$

Sol. (a) $\{1, 9\}$, since $1, 9 \notin B$

v. **Symmetric difference of two sets** The symmetric difference of two sets A and B is the set $(A - B) \cup (B - A)$ and is denoted by $A \Delta B$.



Thus, $A \Delta B = (A - B) \cup (B - A)$
$= \{x : x \notin A \cap B\}$

The shaded part represents $A \Delta B$.

Example 25. *If set $A = \{1, 3, 5, 7, 9\}$ and set $B = \{2, 3, 5, 7, 11\}$, then $A \Delta B$ is equal to*

(a) $\{3, 5, 7\}$ *(b)* $\{1, 2\}$
(c) $\{9, 11\}$ *(d)* $\{1, 2, 9, 11\}$

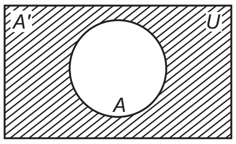
Sol. (d) $A \Delta B = (A - B) \cup (B - A)$
$= \{1, 9\} \cup \{2, 11\} = \{1, 2, 9, 11\}$

vi. **Complement of a set** Let U be the universal set and $A \subset U$, then the complement of A, denoted by A' or $U - A$ is defined as

$$A' = \{x : x \in U \text{ and } x \notin A\}$$

Clearly, $x \in A' \Leftrightarrow x \notin A$

The shaded part represents A'.



Example 26. *Given that $U = \{x : x$ is a letter in English alphabet$\}$ and $A = \{x : x$ is a vowel$\}$, then A' is equal to*

(a) ϕ *(b)* U
(c) $\{x : x \in$ *all consonants*$\}$ *(d) None of these*

Sol. (c)

vii. **Some results on complement** The following results are the direct consequences of the definition of the complement of the set.

(a) $U' = \phi$
(b) $\phi' = \{x \in U : x \notin \phi\} = U$
(c) $(A')' = \{x \in U : x \notin A'\} = \{x \in U : x \in A\} = A$
(d) $A \cap A' = \{x \in U : x \in A\} \cap \{x \in U : x \notin A\} = \phi$
(e) $A \cup A' = \{x \in U : x \in A\} \cup \{x \in U : x \notin A\} = U$

Laws of Algebra of Sets

In this article, we shall state and prove some fundamental laws of algebra of sets.

1. **Idempotent laws** For any set A, we have

(i) $A \cup A = A$ (ii) $A \cap A = A$

2. **Identity laws** For any set A, we have ϕ and U as identity elements for union and intersection, respectively.

Proof

(i) $A \cup \phi = \{x : x \in A \text{ or } x \in \phi\} = \{x : x \in A\} = A$

(ii) $A \cap U = \{x : x \in A \text{ and } x \in U\} = \{x : x \in A\} = A$

3. **Commutative laws** For any two sets A and B, we have

(i) $A \cup B = B \cup A$ (ii) $A \cap B = B \cap A$

i.e. union and intersection are commutative.

Proof

Recall that two sets X and Y are equal iff $X \subseteq Y$ if every element of X belongs to Y.

(i) Let x be an arbitrary element of $A \cup B$. Then,

$$\begin{aligned} & x \in A \cup B \\ \Rightarrow\quad & x \in A \text{ or } x \in B \\ \Rightarrow\quad & x \in B \text{ or } x \in A \\ \Rightarrow\quad & x \in B \cup A \\ \therefore\quad & A \cup B \subseteq B \cup A \end{aligned}$$

Similarly, $B \cup A \subseteq A \cup B$

Hence, $A \cup B = B \cup A$

(ii) Let x be an arbitrary element of $A \cap B$. Then,

$$\begin{aligned} & x \in A \cap B \\ \Rightarrow\quad & x \in A \text{ and } x \in B \\ \Rightarrow\quad & x \in B \text{ and } x \in A \\ \Rightarrow\quad & x \in B \cap A \\ & A \cap B \subseteq B \cap A \end{aligned}$$

Similarly, $B \cap A \subseteq A \cap B$

Hence, $A \cap B = B \cap A$

4. **Associative laws** If A, B and C are any three sets, then

(i) $(A \cup B) \cup C = A \cup (B \cup C)$

(ii) $A \cap (B \cap C) = (A \cap B) \cap C$

i.e. union and intersection are associative.

Proof

(i) Let x be an arbitrary element of $(A \cup B) \cup C$.

Then, $x \in (A \cup B) \cup C$

$$\begin{aligned} \Rightarrow\quad & x \in (A \cup B) \text{ or } x \in C \\ \Rightarrow\quad & (x \in A \text{ or } x \in B) \text{ or } x \in C \\ \Rightarrow\quad & x \in A \text{ or } (x \in B \text{ or } x \in C) \\ \Rightarrow\quad & x \in A \text{ or } x \in (B \cup C) \\ \Rightarrow\quad & x \in A \cup (B \cup C) \\ \therefore\quad & (A \cup B) \cup C \subseteq A \cup (B \cup C) \end{aligned}$$

Similarly, $A \cup (B \cup C) \subseteq (A \cup B) \cup C$

Hence, $(A \cup B) \cup C = A \cup (B \cup C)$

(ii) Let x be an arbitrary element of $A \cap (B \cap C)$.

Then, $x \in A \cap (B \cap C)$

$$\begin{aligned} \Rightarrow\quad & x \in A \text{ and } x \in (B \cap C) \\ \Rightarrow\quad & x \in A \text{ and } (x \in B \text{ and } x \in C) \\ \Rightarrow\quad & (x \in A \text{ and } x \in B) \text{ and } x \in C \\ \Rightarrow\quad & x \in (A \cap B) \text{ and } x \in C \\ \Rightarrow\quad & x \in (A \cap B) \cap C \\ \therefore\quad & A \cap (B \cap C) \subseteq (A \cap B) \cap C \end{aligned}$$

Similarly, $(A \cap B) \cap C \subseteq A \cap (B \cap C)$

Hence, $A \cap (B \cap C) = (A \cap B) \cap C$

5. **Distributive laws** If A, B and C are any three sets, then

(i) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

(ii) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

i.e. union and intersection are distributive over intersection and union, respectively.

Proof

(i) Let x be an arbitrary element of $A \cup (B \cap C)$.

Then, $x \in A \cup (B \cap C)$

$$\begin{aligned} \Rightarrow\quad & x \in A \text{ or } x \in (B \cap C) \\ \Rightarrow\quad & x \in A \\ \text{or}\quad & (x \in B \text{ and } x \in C) \\ \Rightarrow\quad & (x \in A \text{ or } x \in B) \\ \text{and}\quad & (x \in A \text{ or } x \in C) \\ \Rightarrow\quad & x \in (A \cup B) \\ \text{and}\quad & x \in (A \cup C) \\ \Rightarrow\quad & x \in ((A \cup B) \cap (A \cup C)) \\ \therefore\quad & A \cup (B \cap C) \subseteq (A \cup B) \cap (A \cup C) \end{aligned}$$

Similarly, $(A \cup B) \cap (A \cup C) \subseteq A \cup (B \cap C)$

Hence, $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

(ii) Let x be an arbitrary element of $A \cap (B \cup C)$.

Then, $x \in A \cap (B \cup C)$

$$\begin{aligned} \Rightarrow\quad & x \in A \\ \text{and}\quad & x \in (B \cup C) \\ \Rightarrow\quad & x \in A \\ \text{and}\quad & (x \in B \text{ or } x \in C) \\ \Rightarrow\quad & (x \in A \text{ and } x \in B) \\ \text{or}\quad & (x \in A \text{ and } x \in C) \\ \Rightarrow\quad & x \in (A \cap B) \\ \text{or}\quad & x \in (A \cap C) \\ \Rightarrow\quad & x \in (A \cap B) \cup (A \cap C) \\ \therefore\quad & A \cap (B \cup C) \subseteq (A \cap B) \cup (A \cap C) \end{aligned}$$

Similarly, $(A \cap B) \cup (A \cap C) \subseteq A \cap (B \cup C)$

Hence, $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

6. **De-Morgan's laws** If A and B are any two sets, then
   (i) $(A \cup B)' = A' \cap B'$
   (ii) $(A \cap B)' = A' \cup B'$

Proof

(i) Let x be an arbitrary element of $(A \cup B)'$.

Then, $x \in (A \cup B)'$
$\Rightarrow$ $x \notin (A \cup B)$
$\Rightarrow$ $x \notin A$
and $x \notin B$
$\Rightarrow$ $x \in A'$
and $x \in B'$
$\Rightarrow$ $x \in A' \cap B'$
$\therefore$ $(A \cup B)' \subseteq A' \cap B'$

Again, let y be an arbitrary element of $A' \cap B'$. Then, $y \in A' \cap B'$
$\Rightarrow$ $y \in A'$
and $y \in B'$
$\Rightarrow$ $y \notin A$
and $y \notin B$
$\Rightarrow$ $y \notin A \cap B$
$\Rightarrow$ $y \in (A \cup B)'$
$\therefore$ $A' \cap B' \subseteq (A \cup B)'$
Hence, $(A \cup B)' = A' \cap B'$

(ii) Let x be an arbitrary element of $(A \cap B)'$.

Then, $x \in (A \cap B)'$
$\Rightarrow$ $x \notin (A \cap B)$
$\Rightarrow$ $x \notin A$
and $x \notin B$
$\Rightarrow$ $x \in A'$
or $x \in B'$
$\Rightarrow$ $x \in A' \cup B'$
$\Rightarrow$ $(A \cap B)' \subseteq A' \cup B'$

Again, let y be an arbitrary element of $A' \cup B'$. Then,
$\Rightarrow$ $y \in (A' \cup B')$
$\Rightarrow$ $y \in A'$
or $y \in B'$
$\Rightarrow$ $y \notin A$ or $y \notin B$
$\Rightarrow$ $y \notin (A \cap B)$
$\Rightarrow$ $y \in (A \cap B)'$
$\therefore$ $A' \cup B' \subseteq (A \cap B)'$
Hence, $(A \cap B)' = A' \cup B'$

Formulae to Solve Practical Problems on Union and Intersection of Sets

Let A, B, C be any finite sets and U be the finite universal sets, then

(i) $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

(ii) If $(A \cap B) = \phi$, then $n(A \cup B) = n(A) + n(B)$

(iii) $n(A - B) =$ Number of elements which belong to only A of sets A and B
$= n(A) - n(A \cap B) = n(A \cup B) - n(B)$

(iv) $n(A \Delta B) =$ Number of elements which belong to exactly one of A or B
$= n(A) + n(B) - 2n(A \cap B)$

(v) $n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$

(vi) Number of elements in exactly two of the sets A, B, C
$= n(A \cap B) + n(B \cap C) + n(C \cap A) - 3n(A \cap B \cap C)$

(vii) Number of elements in exactly one of the sets A, B, C
$= n(A) + n(B) + n(C) - 2n(A \cap B) - 2n(B \cap C) - 2n(A \cap C) + 3n(A \cap B \cap C)$

(viii) $n(A' \cup B') = n\{(A \cap B)'\} = n(U) - n(A \cap B)$

(ix) $n(A' \cap B') = n\{(A \cup B)'\} = n(U) - n(A \cup B)$

Example 27. *In a group of 50 people, 35 speak Hindi, 25 speak both English and Hindi and all the people speak atleast one of two languages. The number of people who speak 'English', 'English but not Hindi' are respectively*

(a) 40, 15
(b) 15, 40
(c) 35, 15
(d) 25, 15

Sol. (a) Let H denotes the set of people speaking Hindi and E denotes the set of people speaking English.

We have, $n(H \cup E) = 50$, $n(H) = 35$, $n(H \cap E) = 25$

Also, we have
$n(H \cup E) = n(H) + n(E) - n(H \cap E)$
$\Rightarrow$ $50 = 35 + n(E) - 25$
$\Rightarrow$ $n(E) = 75 - 35 = 40$

which is the number of people who speak English.

We have to find the people speak only English

i.e. $n(E - H) = n(H \cup E) - n(H)$
$= 50 - 35 = 15$

1 Work Book Exercise

1 Let $A = \{1, 2, 3\}$, $B = \{3, 4\}$ $C = \{4, 5, 6\}$. Then, $A \cup (B \cap C)$ is

a $\{3\}$ **b** $\{1, 2, 3, 4\}$
c $\{1, 2, 5, 6\}$ **d** $\{1, 2, 3, 4, 5, 6\}$

2 If $A = \{a, b, d, e\}$, $B = \{c, d, f, l, m\}$ and $C = \{a, l, m, o\}$, then $C \cap (A \cup B)$ will be given by

a $\{a, d, l, m\}$
b $\{b, c, l, m, o\}$
c $\{a, l, m\}$
d $\{a, b, c, d, f, l, m, o\}$

3 If a set contains n elements, then power set will contain

a n elements **b** 2^n elements
c n^2 elements **d** None of these

4 If A and B are two sets, then $A \cap (A \cup B)$ equals

a A **b** B
c ϕ **d** None of these

5 If $A = \{\phi, \{\phi\}\}$, then the power set of A is

a A **b** $\{\phi, \{\phi\}, A\}$
c $\{\phi, \{\phi\}, \{\{\phi\}\}, A\}$ **d** None of these

6 Subtraction of integers is an operation that is

a commutative and associative
b not commutative but associative
c neither commutative nor associative
d commutative but not associative

7 Consider the set A of all determinants of order 3 with entries 0 or 1 only. Let B be the subset of A consisting of all determinants with value 1. Let C be the subset of the set of all determinants with value -1. Then,

a C is empty
b B has as many elements as C
c $A = B \cup C$
d B has twice as many elements as C

8 In a town of 840 persons, 450 persons read Hindi, 300 read English and 200 read both, then the number of persons who read neither is

a 210 **b** 290 **c** 180 **d** 260

9 Let $S = \{x : x$ is a positive multiple of 3 less than 100$\}$, $P = \{x : x$ is a prime number less than 20$\}$. Then, $n(S) + n(P)$ is

a 34
b 41
c 33
d 30

10 If A and B are two disjoint sets, then $n(A \cup B)$ is equal to

a $n(A) + n(B)$
b $n(A) + n(B) - n(A \cap B)$
c $n(A) - n(B)$
d $n(A) \cdot n(B)$

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. If $A = \{1, 3, 5, 7, 9, 11, 13, 15, 17\}$, $B = \{2, 4, \ldots\ldots, 18\}$ and N is the universal set, then $A' \cup \{(A \cup B) \cap B'\}$ is

(a) A (b) N
(c) B (d) None of these

Sol. We have, $(A \cup B) \cap B' = A - (A \cap B)$

Since, A and B are disjoint sets.

$\therefore \quad A \cap B = \phi$

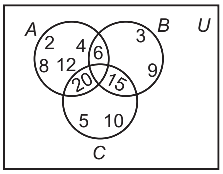
$\Rightarrow \quad (A \cup B) \cap B' = A$

$\therefore \quad \{(A \cup B) \cap B'\} \cup A' = A \cup A' = N$

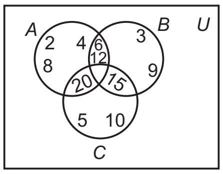
Hence, (b) is the correct answer.

Ex 2. Let A, B and C are subsets of universal set U. If $A = \{2, 4, 6, 8, 12, 20\}$, $B = \{3, 6, 9, 12, 15\}$, $C = \{5, 10, 15, 20\}$ and U is the set of all whole numbers. Then, the correct Venn diagram is

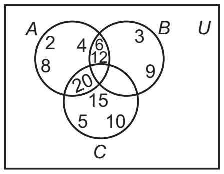
(a)



(b)



(c)



(d) None of these

Sol. Given, $A = \{2, 4, 6, 8, 12, 20\}$

$B = \{3, 6, 9, 12, 15\}$

$C = \{5, 10, 15, 20\}$

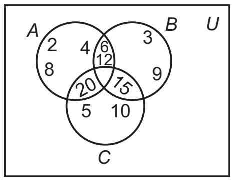
Now,

$A \cap B = \{2, 4, 6, 8, 12, 20\} \cap \{3, 6, 9, 12, 15\} = \{6, 12\}$

$B \cap C = \{3, 6, 9, 12, 15\} \cap \{5, 10, 15, 20\} = \{15\}$

$C \cap A = \{5, 10, 15, 20\} \cap \{2, 4, 6, 8, 12, 20\} = \{20\}$

and $\quad A \cap B \cap C = \phi$



Hence, (b) is the correct answer.

Ex 3. Let A and B have 3 and 6 elements, respectively. What can be minimum number of elements in $A \cup B$?

(a) 3 (b) 6
(c) 9 (d) 18

Sol. Note that $A \cup B$ will contain minimum number of elements, if $A \subset B$

So that, $\quad n(A \cup B) = n(B) = 6$

Hence, (b) is the correct answer.

Ex 4. Two finite sets have m and n elements. The total number of subsets of the first set is 56 more than total number of subsets of second set. The values of m and n are

(a) 7 and 6 (b) 6 and 3
(c) 5 and 1 (d) 8 and 7

Sol. Given, $2^m - 2^n = 56$

By hit and trial method, we get $m = 6$ and $n = 3$

Hence, (b) is the correct answer.

Type 2. More than One Correct Option

Ex 5. Let A and B be any two sets. Which of the following are correct?

(a) $(A - B) \cap B = \phi$
(b) $(A - B) \cup B = \phi$
(c) $(A - B) \cap A = A \cap B'$
(d) $(A - B) \cup B = A \cup B$

Sol. We have,

(a) $(A - B) \cap B = (A \cap B') \cap B \quad [\because A - B = A \cap B']$
$= A \cap (B' \cap B)$
$= A \cap \phi \quad [\because B' \cap B = \phi]$
$= \phi$

(b) $(A - B) \cup B = (A \cap B') \cup B$
$= (A \cup B) \cap (B' \cup B)$
$= (A \cup B) \cap U \quad [\because B' \cup B = U]$
$= A \cup B$

(c) $(A - B) \cap A = (A \cap B') \cap A = A \cap B'$

(d) $(A - B) \cup B = A \cup B$

Hence, (a), (c) and (d) are the correct answers.

Ex 6. If A and B are two sets such that $n(A) = 70$, $n(B) = 60$, $n(A \cup B) = 110$, then

(a) $n(A - B) = 40$
(b) $n(B - A) = 40$
(c) $n(A \cap B) = 20$
(d) $n(A - B) = n(A \cap B')$

Sol. We have, $n(A) = 70, n(B) = 60, n(A \cup B) = 110$

$\therefore \quad n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$\Rightarrow \quad n(A \cap B) = n(A) + n(B) - n(A \cup B)$
$= 70 + 60 - 110$
$= 20$

(a) $n(A - B) = n(A \cap B') = n(A) - n(A \cap B)$
$= 70 - 20 = 50$

(b) $n(B - A) = n(B \cap A')$
$= n(B) - n(A \cap B)$
$= 60 - 20 = 40$

Hence, (b), (c) and (d) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 7-9) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d), out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

Ex 7. Statement I If A and B are disjoint sets, then $(A' \cup B')' = \phi$.

Statement II $(A \cup B)' = A' \cap B'$ [De-Morgan's law]

Sol. $(A' \cup B')' = (A')' \cap (B')' = A \cap B = \phi$, as A and B are disjoint.

$\therefore$ Statement I is true, Statement II is true.

Also, Statement II is a correct explanation of Statement I.

Hence, (a) is the correct answer.

Ex 8. Statement I If A and B are any two non-empty sets, then

$(A - B) \cup (B - A) = (A \cup B) - (A \cap B)$

Statement II $(A - B) = A \cap B'$

and $(A \cap B) \cup C = (A \cup C) \cap (B \cup C)$

Sol. $(A - B) \cup (B - A) = (A \cap B') \cup (B \cap A')$ $[\because (A - B) = A \cap B']$

$= \{(A \cap B') \cup B\} \cap \{(A \cap B') \cup A'\}$ [distributive law]

$= \{(A \cup B) \cap (B' \cup B)\} \cap \{(A \cup A') \cap (B' \cup A')\}$

$= \{(A \cup B) \cap U\} \cap \{U \cap B' \cup A')\}$ [U = Universal set]

$= (A \cup B) \cap (B' \cup A') = (A \cup B) \cap (A \cap B)'$

$= (A \cup B) - (A \cap B)$

So, both statements are true and Statement II is correct explanation of Statement I.

Hence, (a) is the correct answer.

Ex 9. Statement I If $A' \cup B = U$, then $A \subseteq B$.

Statement II $A \subset B \leftrightarrow B^C \subset A^C$

Sol. $A' \cup B = U$, iff $B = A$ $[\because A \cup A' = U]$

$\Rightarrow \quad A = B \quad \Rightarrow \quad A \subseteq B$

Also, $\quad A \subseteq B \quad \Rightarrow \quad B^C \subset A^C$

So, both statements are true but Statement II is not the correct explanation of Statement I.

Hence, (b) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage (Ex. Nos. 10-12) *In a town of* 10000 *families, it was found that* 40% *families buy newspaper* A, 20% *families buy newspaper* B *and* 10% *families buy newspaper* C. 5% *families buy* A *and* B, 3% *buy* B *and* C *and* 4% *buy* A *and* C. *If* 2% *families buy all the three news papers, then*

Ex 10. The number of families which buy newspaper A only, is

(a) 3300 (b) 4000 (c) 1400 (d) 2000

Ex 11. The number of families which buy newspaper none of A, B and C, is

(a) 4400 (b) 4000 (c) 1000 (d) 3300

Ex 12. The number of families which buy newspaper B only, is

(a) 1400 (b) 2500
(c) 3000 (d) 2000

Sol. (Ex. Nos. 10-12) Let P, Q and R be the sets of families buying newspapers A, B and C respectively. Let U be the universal set. Then,

$$n(U) = 10000,\ n(P) = 40\% \text{ of } 10000 = 4000$$
$$n(Q) = 20\% \text{ of } 10000 = 2000,$$
$$n(R) = 10\% \text{ of } 10000 = 1000$$
$$n(P \cap Q) = 5\% \text{ of } 10000 = 500$$
$$n(Q \cap R) = 3\% \text{ of } 10000 = 300$$
$$n(R \cap P) = 4\% \text{ of } 10000 = 400$$
$$n(P \cap Q \cap R) = 2\% \text{ of } 10000 = 200$$

10. The number of families which buy newspaper A only

$= n(P \cap Q' \cap R') = n(P \cap (Q \cup R)')$

$= n(P) - n[P \cap (Q \cup R)]$

$[\because n(A \cap B') = n(A) - n(A \cap B)]$

$= n(P) - n[P \cap Q] \cup (P \cap R)$

$= n(P) - [n(P \cap Q) + n(P \cap R) - n(P \cap Q \cap R)]$

$= 4000 - [500 + 400 - 200] = 3300$

Hence, (a) is the correct answer.

11. The number of families which buy newspaper none of A, B and C

$= n(P \cup Q \cup R)'$

$= n(U) - n(P \cup Q \cup R)$

$= n(U) - [n(P) + n(Q) + n(R) - n(P \cap Q)$
$- n(Q \cap R) - n(P \cap R) + n(P \cap Q \cap R)]$

$= 10000 - [4000 + 2000 + 1000 - 500$
$- 300 - 400 + 200]$

$= 10000 - 6000$

$= 4000$

Hence, (b) is the correct answer.

12. The number of families which buy newspaper B only

$= n(P' \cap Q \cap R') = n(Q \cap P' \cap R')$

$= n[Q \cap (P \cup R)']$

$= n(Q) - n[Q \cap (P \cup R)]$

$n(Q) - n[(Q \cap P) \cup (Q \cap R)]$

$= n(Q) - [n(P \cap Q) + n(Q \cap R) - n(P \cap Q \cap R)]$

$= 2000 - [500 + 300 - 200] = 2000 - 600 = 1400$

Hence, (a) is the correct answer.

Type 5. **Match the Column**

Ex 13. Match the following sets for all sets A and B.

	Column I		Column II
A.	If $A \subset B$, then $A \cap B'$	p.	$A \cup B$
B.	If $A \subset B$, then $A' \cup B$	q.	ϕ
C.	$(A - B) \cup A$	r.	U
D.	$(A - B) \cup B$	s.	A

Sol. A. Since, $A \subset B$, so there is no element in A, which does not belong to B.

$\therefore \quad A - B = \phi \quad \Rightarrow \quad A \cap B' = \phi$

B. Since, $A \subset B$

$\therefore \quad A \cap B' = \phi$

$\Rightarrow \quad (A \cap B')' = \phi'$

$\Rightarrow \quad A' \cup B = U$

C. $(A - B) \cup A = A \quad [\because (A - B) \subset A]$

D. $(A - B) \cup B = (A \cap B') \cup B$

$= (A \cup B) \cap (B' \cup B)$

$= (A \cup B) \cap U$

$= A \cup B$

$A \to q$; $B \to r$, $C \to s$; $D \to p$

Type 6. **Single Integer Answer Type Questions**

Ex 14. If $U = \{x : x^5 - 6x^4 + 11x^3 - 6x^2 = 0\}$, $A = \{x : x^2 - 5x + 6 = 0\}$ and $B = \{x : x^2 - 3x + 2 = 0\}$, then $n(A \cap B)'$ is equal to ________ .

Sol. (3) We have, $U = \{x : x^5 - 6x^4 + 11x^3 - 6x^2 = 0\}$

$= \{0, 1, 2, 3\}$

$A = \{x : x^2 - 5x + 6 = 0\} = \{2, 3\}$

and $B = \{x : x^2 - 3x + 2 = 0\} = \{1, 2\}$

$\therefore \quad A \cap B = \{2\}$

Hence, $(A \cap B)' = U - (A \cap B)$

$= \{0, 1, 2, 3\} - \{2\} = \{0, 1, 3\}$

$\therefore \quad n(A \cap B)' = 3$

Ex 15. If $A = \{x : x$ is an even natural number$\}$ and $B = \{x : x$ is a prime number$\}$, then $n(A \cap B)$ is equal to ________ .

Sol. (1) We have,

$A = \{x : x$ is an even natural number$\}$

$= \{2, 4, 6, 8, \ldots\}$

and $B = \{x : x$ is a prime number$\}$

$= \{2, 3, 5, 7, 11, \ldots\}$

$A \cap B = \{2\}$

$n(A \cap B) = 1$

Target Exercises

Type 1. **Only One Correct Option**

1. The set $\{x : x$ is a positive integer less than 6 and $3^x - 1$ is an even number$\}$ in roster form is

(a) $\{1, 2, 3, 4, 5\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{2, 4, 6\}$ (d) $\{1, 3, 5\}$

2. The set $A = \{x : x^4 - x^3 - x^2 = 0$ and $x \in N\}$ represents

(a) a null set (b) a singleton set
(c) an infinite set (d) None of these

3. If $A = \{1, 2, 3\}, B = \{x \in R : x^2 - 2x + 1 = 0\}, C = \{1, 2, 3\}$ and $D = \{x \in R : x^3 - 6x^2 + 11x - 6 = 0\}$, then the equal sets are

(a) A and B (b) A and C
(c) A, B and C (d) A, C and D

4. Which of the following is true?

(a) $a \in \{\{a\}, b\}$ (b) $\{b, c\} \subset \{a, \{b, c\}\}$
(c) $\{a, b\} \subset \{a, \{b, c\}\}$ (d) None of these

5. Let P be the set of prime numbers and $S = \{t : 2^t - 1$ is a prime$\}$. Then,

(a) $S \subset P$ (b) $P \subset S$
(c) $S = P$ (d) None of these

6. If $U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$, $A = \{2, 4, 6, 8\}$ and $B = \{2, 3, 5, 7\}$, then $(A \cup B)'$, $(A' \cap B')$, $(A \Delta B)$ is equal to

(a) $\{1, 9\}$, $\{2, 8\}$, $\{3, 4, 5, 6, 7, 8\}$
(b) $\{1, 9\}$, $\{1, 9\}$, $\{3, 4, 5, 6, 7, 8\}$
(c) $\{1, 9\}$, $\{1, 9\}$, $\{5, 6, 7, 8\}$
(d) None of the above

7. If $A = \{x : x$ is a multiple of 3$\}$ and $B = \{x : x$ is a multiple of 5$\}$, then $A - B$ is equal to

(a) $\overline{A} \cap B$ (b) $A \cap \overline{B}$ (c) $\overline{A} \cap \overline{B}$ (d) $\overline{A \cap B}$

8. Which of the following is not correct?

(a) $A \subseteq A'$ if and only if $A = \phi$
(b) $A' \subseteq A$ if and only if $A = X$, where X is the universal set
(c) If $A \cup B = A \cup C$, then $B = C$
(d) $B = C$ if and only if $A \cup B = A \cup C$ and $A \cap B = A \cap C$

9. The set $(A \cup B \cup C) \cap (A \cap B' \cap C')' \cap C'$ is equal to

(a) $B \cap C'$ (b) $A \cap C$
(c) $B' \cap C'$ (d) None of these

10. If $A \cup B = A \cup C$ and $A \cap B = A \cap C$, then

(a) $B = C$ only when $A \subseteq B$
(b) $B = C$ only when $A \subseteq C$
(c) $B = C$
(d) None of the above

11. If $aN = \{an : n \in N\}$, $bN = \{nb : n \in N\}$, $cN = \{cN : n \in N\}$ and $bN \cap cN = dN$, where $a, b, c \in N$ and b, c are coprime, then

(a) $b = cd$ (b) $c = bd$
(c) $d = bc$ (d) None of these

12. If $A = \{\theta : 2\cos^2\theta + \sin\theta \le 2\}$ and
$$B = \left\{\theta : \frac{\pi}{2} \le \theta \le \frac{3\pi}{2}\right\}$$, then $A \cap B$ is equal to

(a) $\left\{\theta : \frac{\pi}{2} \le \theta \le \frac{5\pi}{6}\right\}$
(b) $\left\{\theta : \pi \le \theta \le \frac{3\pi}{2}\right\}$
(c) $\left\{\theta : \frac{\pi}{2} \le \theta \le \frac{5\pi}{6} \text{ or } \pi \le \theta \le \frac{3\pi}{2}\right\}$
(d) None of the above

13. Let $A = \{x : x$ is a digit in the number 3591$\}$,
$B = \{x : x \in N,\ x < 10\}$.
Which of the following is false?

(a) $A \cap B = \{1, 3, 5, 9\}$ (b) $A - B = \phi$
(c) $B - A = \{2, 4, 6, 7, 8\}$ (d) $A \cup B = \{1, 2, 3, 5, 9\}$

14. Let A and B be two sets, such that $A \cup B = A$. Then, $A \cap B$ is equal to

(a) ϕ (b) B
(c) A (d) None of these

15. Let A and B be two sets, then $(A \cup B)' \cup (A' \cap B)$ is equal to

(a) A' (b) A
(c) B' (d) None of these

16. Let U be the universal set and $A \cup B \cup C = U$. Then, $\{(A - B) \cup (B - C) \cup (C - A)\}'$ is equal to

(a) $A \cup B \cup C$
(b) $A \cup (B \cap C)$
(c) $A \cap B \cap C$
(d) $A \cap (B \cup C)$

17. If A and B are two sets, then $(A - B) \cup (B - A) \cup (A \cap B)$ is equal to

(a) $A \cup B$ (b) $A \cap B$
(c) A (d) B'

18. If $A = \{y : y = 2x, x \in N\}$, $B = \{y : y = 2x - 1, x \in N\}$, then $(A \cap B)'$ is

(a) A (b) B (c) ϕ (d) U

19. If $n(A) = 4$ and $n(B) = 7$, then the minimum and maximum value of $n(A \cup B)$ are, respectively

(a) 4 and 11 (b) 4 and 7
(c) 7 and 11 (d) None of these

20. Let X be the universal set for sets A and B. If $n(A) = 200$, $n(B) = 300$ and $n(A \cap B) = 100$, then $n(A' \cap B')$ is equal to 300, provided (X) is equal to
(a) 600 (b) 700
(c) 800 (d) 900

21. Suppose $A_1, A_2, \ldots, A_{30}$ are thirty sets each with five elements and $B_1, B_2, \ldots, B_n$ are n sets each with three elements. Let $\bigcup_{i=1}^{30} A_i = \bigcup_{j=1}^{n} B_j = S$. Assume that each elements of S belongs to exactly 10 of the A_i's and exactly 9 of B_j's. The value of n must be
(a) 30 (b) 40
(c) 45 (d) 50

22. If there are three atheletic teams in a school, 21 are in the basketball team, 26 in hockey team and 29 in the football team. 14 play hockey and basketball, 15 play hockey and football, 12 play football and basketball and 8 play all the games. The total number of members is
(a) 42 (b) 43
(c) 45 (d) None of these

23. In a certain town, 25% families own a phone and 15% own a car, 65% families own neither a phone nor a car. 2000 families own both a car and a phone.
Consider the following statements in this regard :
I. 10% families own both a car and a phone.
II. 35% families own either a car or a phone.
III. 40000 families live in the town.
Which of the above statements are correct?
(a) I and II (b) I and III
(c) II and III (d) I, II and III

24. 20 teachers of a school either teach Mathematics or Physics. 12 of them teach Mathematics, while 4 teach both the subject. Then, the number of teachers teaching Physics only is
(a) 12 (b) 8
(c) 16 (d) None of these

25. A survey shows that 63% of the Americans like cheese whereas 76% like apples. If x% of the Americans like both cheese and apples, then we have
(a) $x \geq 39$ (b) $x \leq 63$
(c) $39 \leq x \leq 63$ (d) None of these

Type 2. **More than One Correct Option**

26. If $A = \{1, 5, 7, 9\}$, $B = \{2, 5\}$, then $A - B$ is equal to
(a) $\{1, 7, 9\}$
(b) $\{1, 7, 9, 2\}$
(c) $\overline{A} \cap B$
(d) $A \cap \overline{B}$

27. If $X \cup \{1, 2\} = \{1, 2, 3, 5, 9\}$, then
(a) the smallest set of X is $\{3, 5, 9\}$
(b) the smallest set of X is $\{2, 3, 5, 9\}$
(c) the largest set of X is $\{1, 2, 3, 5, 9\}$
(d) the largest set of X is $\{2, 3, 4, 9\}$

28. In a group of 50 students, the number of students studying French, English, Sanskrit were found to be as follows
French = 17; English = 13; Sanskrit = 15;
French and English = 09; English and Sanskrit = 4;
French and Sanskrit = 5; English, French and Sanskrit = 3. The number of students who study
(a) French only is 6
(b) Sanskrit only is 8
(c) French and Sanskrit but not English is 2
(d) atleast one of the three language is 30

Type 3. **Assertion and Reason**

Directions (Q. Nos. 29-31) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

29. **Statement I** If $A = \{1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21\}$, $B = \{2, 4, 6, 8, 10, 12, 14, 16, 18, 20\}$ and N is the universal set, then $A' \cup ((A \cup B) \cap B') = A$
Statement II $(A \cup B) \cap B'$ is always A.

30. **Statement I** If A, B and C are any three non-empty sets, then $A - (B \cup C) = (A - B) \cap (A - C)$
Statement II $A \cap (B \Delta C) = (A \cap B) \Delta (A \cap C)$

31. **Statement I** If A, B and C any three sets and U is universal set, such that $n(U) = 700$, $n(A) = 200$, $n(B) = 300$ and $n(A \cap B) = 100$, then $n(A' \cap B') = 300$.
Statement II $n(A' \cap B') = n(U) - n(A \cap B)$

Type 4. **Linked Comprehension Based Questions**

Passage (Q. Nos. 32-34) *Out of 100 students; 15 passed in English, 12 passed in Mathematics, 8 in Science, 6 in English and Mathematics, 7 in Mathematics and Science, 4 in English and Science, 4 in all the three passed.*

32. The number of students passed in English and Mathematics but not in Science is
(a) 3 (b) 2 (c) 4 (d) 5

33. The number of students only passed in Mathematics is
(a) 5 (b) 4
(c) 3 (d) 2

34. The number of students only passed in more than one subject is
(a) 9 (b) 3
(c) 2 (d) 1

Type 5. **Match the Column**

35. Match the following sets for all sets A, B and C :

Column I		Column II	
A.	$[(A' \cup B') - A]'$	p.	$A - B$
B.	$[B' \cup (B' - A)]'$	q.	A
C.	$A - (A \cap B)$	r.	B
D.	$(A - B) \cap (C - B)$	s.	$(A \cap C) - B$

Type 6. **Single Integer Answer Type Questions**

36. If $A = \{a, b, c\}$, then the number of proper subsets of A is equal to________ .

37. If $A = \{x \in C : x^2 = 1\}$ and $B = \{x \in C : x^4 = 1\}$, then number of elements in $(A - B)$ is ________ .

38. If A and B are two sets containing 3 and 6 elements, respectively. The maximum number of elements in $A \cup B$ is equal to ________ .

39. A college awarded 38 medals in football, 15 in basketball and 20 in cricket. If these medals went to a total of 58 men and only three men got medals in all the three sports, how many received medals in exactly two of three sports?

Explanations

Target Exercises

1. Since, $3^x - 1$ is an even number for all $x \in Z^+$. So, the given set in roster form is $\{1, 2, 3, 4, 5\}$.

2. Given equation can be written as
$$x^2(x^2 - x - 1) = 0 \quad \Rightarrow \quad x = 0, \frac{1 \pm \sqrt{5}}{2}$$
$\therefore$ There is no natural value of x, which satisfies
$$x^4 - x^3 - x^2 = 0$$

3. $A = \{1, 2, 3\}$
$B = \{x \in R : x^2 - 2x + 1 = 0\} = \{1\}$
$C = \{1, 2, 3\}$
$D = \{x \in R : x^3 - 6x^2 + 11x - 6 = 0\} = \{1, 2, 3\}$
$\therefore A, C$ and D are equal.

4. a is not an element of $\{\{a\}, b\}$
$\therefore \quad a \notin \{\{a\}, b\}$
$\{b, c\}$ is the element of $\{a, \{b, c\}\}$
$\therefore \quad \{b, c\} \in \{a, \{b, c\}\}$
$b \in \{a, b\}$ but $b \notin \{a, \{b, c\}\}$
$\therefore \quad \{a, b\} \not\subset \{a, \{b, c\}\}$

5. Let $x \notin P$
$\Rightarrow x$ is a composite number.
Let us now assume that $x \in S$
$\Rightarrow \quad 2^x - 1 = m$ [where, m is a prime number]
$\Rightarrow \quad 2^x = m + 1$
which is not true for all composite numbers, say for $x = 4$ because $2^4 = 16$ which cannot be equal to the sum of any prime number m and 1.
Thus, we arrive at a contradiction
$\Rightarrow \quad x \notin S$
So, $\quad S \subset P$

6. Given, $\quad U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$,
$A = \{2, 4, 6, 8\}$
and $\quad B = \{2, 3, 5, 7\}$
Now, $\quad A' = U - A$
$= \{1, 2, 3, 4, 5, 6, 7, 8, 9\} - \{2, 4, 6, 8\}$
$= \{1, 3, 5, 7, 9\}$
and $\quad B' = U - B$
$= \{1, 2, 3, 4, 5, 6, 7, 8, 9\} - \{2, 3, 5, 7\}$
$= \{1, 4, 6, 8, 9\}$
(i) $A \cup B = \{2, 4, 6, 8\} \cup \{2, 3, 5, 7\}$
$= \{2, 3, 4, 5, 6, 7, 8\}$
$\therefore \quad (A \cup B)' = U - A \cup B$
$= \{1, 2, 3, 4, 5, 6, 7, 8, 9\} - \{2, 3, 4, 5, 6, 7, 8\}$
$= \{1, 9\}$
(ii) $(A' \cap B') = \{1, 3, 5, 7, 9\} \cap \{1, 4, 6, 8, 9\}$
$= \{1, 9\}$
(iii) Now, $\quad A - B = \{2, 4, 6, 8\} - \{2, 3, 5, 7\}$
$= \{4, 6, 8\}$
and $\quad B - A = \{2, 3, 5, 7\} - \{2, 4, 6, 8\}$
$= \{3, 5, 7\}$
$\therefore \quad A \Delta B = (A - B) \cup (B - A)$
$= \{4, 6, 8\} \cup \{3, 5, 7\} = \{3, 4, 5, 6, 7, 8\}$

7. $A - B = A \cap \overline{B}$ is a general result.

8. Options (a) and (b) are trivially true. Option (c) is incorrect because if $A = \{2, 3, 4\}$, $B = \{3\}$, $C = \{4\}$, then $A \cup B = A \cup C$ but $B \neq C$. Option (d) is also correct.

9. $(A \cup B \cup C) \cap (A \cap B' \cap C')' \cap C'$
$= (A \cup B \cup C) \cap (A' \cup B \cup C) \cap C'$
$= [(A \cap A') \cup (B \cup C)] \cap C'$
$= (\phi \cup B \cup C) \cap C'$
$= (B \cap C') \cup (C \cap C')$
$= (B \cap C') \cup \phi = B \cap C'$

10. Let $x \in B \Rightarrow x \in A \cup B \Rightarrow x \in A \cup C$
***Case* I** $\quad x \in A$
$\therefore \quad x \in A \cap B$ or $x \in A \cap C$ or $x \in C$
$\therefore \quad B \subseteq C$
***Case* II** $\quad x \in C$
$\therefore \quad x \in B \Rightarrow x \in C$ or $B \subseteq C$
Similarly, $\quad C \subseteq B$
$\therefore \quad B = C$

11. We have, $bN = \{nb : n \in N\}$, $cN = \{cn : n \in N\}$
and $\quad dN = \{dn : n \in N\}$
Also, $\quad bN \cap cN = dN$
$\therefore \quad bc \in bN \cap cN$ or $bc \in dN$
$\therefore \quad bc = d$ [as b and c are coprime]

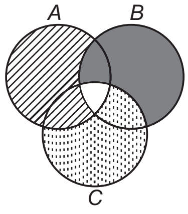
12. Let $2\cos^2\theta + \sin\theta \le 2$ and $\dfrac{\pi}{2} \le \theta \le \dfrac{3\pi}{2}$
$\Rightarrow \quad 2 - 2\sin^2\theta + \sin\theta \le 2$
$\Rightarrow \quad 2\sin^2\theta - \sin\theta \ge 0 \Rightarrow \sin\theta(2\sin\theta - 1) \ge 0$
$\Rightarrow \quad \dfrac{\pi}{2} \le \theta \le \dfrac{5\pi}{6}$ or $\pi \le \theta \le \dfrac{3\pi}{2}$
$\therefore \quad A \cap B = \left\{\theta : \dfrac{\pi}{2} \le \theta \le \dfrac{5\pi}{6} \text{ or } \pi \le \theta \le \dfrac{3\pi}{2}\right\}$

13. We have, $A = \{1, 3, 5, 9\}$
and $\quad B = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$
Now, find $A \cup B$, $A \cap B$, $A - B$, $B - A$
$\therefore$ Option (d) is false.

14. $A \cup B = A \Rightarrow B \subseteq A \Rightarrow A \cap B = B$

15. $(A \cup B)' \cup (A' \cap B) = (A' \cap B') \cup (A' \cap B)$
$= (A' \cup A') \cap (A' \cup B) \cap (B' \cup A') \cap (B' \cup B)$
$= A' \cap \{A' \cup (B \cap B')\} \cap U = A' \cap (A' \cup \phi) \cap U$
$= A' \cap A' \cap U = A' \cap U = A'$

16. $(A - B) \cup (B - C) \cup (C - A)$ is represented by the shaded portion in the figure. The unshaded portion is $A \cap B \cap C$.



$\therefore \quad \{(A - B) \cup (B - C) \cup (C - A)\}' = A \cap B \cap C$

17. Draw the Venn diagram. From the Venn diagram,
$$(A-B)\cup(B-A)\cup(A\cap B)=A\cup B$$

18. $A=\{2,4,6,8,\dots\}$, $B=\{1,3,5,7,\dots\}$
$$A\cap B=\phi$$
$$(A\cap B)'=U$$

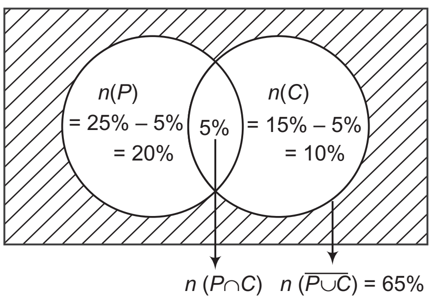
19. $n(A\cup B)$ is minimum when $A\subseteq B$.
In this case, $A\cup B=B$
and we have $n(A\cup B)=n(B)=7$
$n(A\cup B)$ is maximum when $A\cap B=\phi$.
In this case, $n(A\cup B)=n(A)+n(B)$
$$=4+7=11$$

20. We have, $n(A\cup B)=n(A)+n(B)-n(A\cap B)$
$\therefore\quad n(A\cup B)=200+300-100=400$
Also, $n(A'\cap B')=n((A\cup B)')=n(X)-n(A\cup B)$
$\Rightarrow\quad 300=n(X)-400 \Rightarrow n(X)=700$

21. Since, $S=\bigcup_{i=1}^{30}A_i$ and each element of S is in $10\,A_i$'s.
We have, $n(S)=\dfrac{1}{10}\sum_{i=1}^{30}n(A_i)=\dfrac{1}{10}(30\times5)=15$
Also, $S=\bigcup_{j=1}^{30}B_j$ and each element of S is in 9 B_j's.
We have, $n(S)=\dfrac{1}{9}\sum_{j=1}^{n}n(B_j)$
$\Rightarrow\quad 15=\dfrac{1}{9}(n\times3)\Rightarrow n=45$

22. Let B, H, F be the sets of members in the basketball team, hockey team, football team, respectively.
$\therefore\quad n(B)=21,\ n(H)=26,\ n(F)=29$
$n(H\cap B)=14,\ n(H\cap F)=15$
$n(F\cap B)=12,\ n(B\cap H\cap F)=8$
$\therefore\quad n(B\cup H\cup F)=n(B)+n(H)+n(F)$
$$-n(B\cap H)-n(H\cap F)-n(B\cap F)$$
$$+n(B\cap H\cap F)$$
$$=21+26+29-14-15-12+8=43$$

23. Let X, P, C denote the sets of all families, families owning phone, families owning car, respectively.
Let total number of families be k.
Since, $n(P\cap C)=\dfrac{k\times5}{100}=\dfrac{k}{20}\Rightarrow 2000=\dfrac{k}{20}$
$\Rightarrow\quad k=40000$
$\therefore$ Statement III is correct.
Now, $n(C\cap P)=2000=\dfrac{2000}{40000}\times100\%=5\%$
$\therefore$ Statement I is incorrect.



$\therefore$ It is clear from the Venn diagram that Statement II is correct.
$\therefore$ The correct answer is (c).

24. $n(M\cup P)=20,\ n(M)=12,\ n(M\cap P)=4$
$\because\quad n(M\cup P)=n(M)+n(P)-n(M\cap P)$
$\Rightarrow\quad 20=12+n(P)-4$
$\therefore\quad n(P)=12$
So, the required number
$$=n(P)-n(M\cap P)=12-4=8$$

25. $n(X)=100,\ n(C)=63,\ n(A)=76,\ n(C\cap A)=x$
Now, $n(C\cup A)=n(C)+n(A)-n(C\cap A)$
$\therefore\quad n(C\cup A)=63+76-x=139-x$
$\therefore\quad 139-x\le100$ or $x\ge39$
Also, $C\cap A\subseteq C$ and $C\cap A\subseteq A$
$\therefore\quad n(C\cap A)\subseteq n(C)$
and $n(C\cap A)\subseteq n(A)$
$\Rightarrow\quad n(C\cap A)\le63$
and $n(C\cap A)\le76$
$\Rightarrow\quad n(C\cap A)\le63$ i.e. $x\le63$
$\therefore\quad 39\le x\le63$

26. Given, $A=\{1,5,7,9\}$, $B=\{2,5\}$
$A-B=$ Set of all those elements of A, which do not belong to B
$=\{1,7,9\}$
Also, $A-B=A\cap\overline{B}$ is a general result.
Hence, options (a) and (d) are correct.

27. Given, $X\cup\{1,2\}=\{1,2,3,5,9\}$
The smallest set of $X=\{1,2,3,5,9\}-\{1,2\}=\{3,5,9\}$
The largest set of $X=$ The set which contains atleast elements 3, 5, 9
$=\{1,2,3,5,9\}$

28. Given, $n(F)=17,\ n(E)=13,\ n(S)=15,\ n(F\cap E)=9,$
$n(E\cap S)=4,\ n(F\cap S)=5,\ n(E\cap F\cap S)=3$
(a) Number of students study only French
$=n(F)-n(F\cap E)-n(F\cap S)+n(F\cap E\cap S)$
$=17-9-5+3=6$
(b) Number of students study only Sanskrit
$=n(S)-n(S\cap F)-n(S\cap E)+n(F\cap E\cap S)$
$=15-5-4+3=9$
(c) $n(F\cap S\cap\overline{E})=n(F\cap S)-n(F\cap E\cap S)$
$=5-3=2$
(d) $\therefore\ n(F\cup E\cup S)=n(F)+n(E)+n(S)$
$$-n(F\cap E)-n(E\cap S)-n(S\cap F)$$
$$+n(F\cap E\cap S)$$
$$=17+13+15-9-4-5+3=30$$

29. In Statement I, $A\cap B=\phi$
$\Rightarrow\quad (A\cup B)\cap B'=A$
$A'\cup((A\cup B)\cap B')=A'\cup A=N$
Statement I is true and Statement II is false.
Option (c) is true.

30. $A-(B\cup C)=A\cap(B\cup C)'=A\cap(B'\cap C')$
$=(A\cap B')\cap(A\cap C')$
$=(A-B)\cap(A-C)$
Statement I is true.
$A\cap(B\,\Delta\,C)=A\cap\{(B-C)\cup(C-B)\}$
$=\{A\cap(B-C)\}\cup\{A\cap(C-B)\}$
$=\{(A\cap B)-(A\cap C)\}\cup\{(A\cap C)-(A\cap B)\}$
$=(A\cap B)\,\Delta\,(A\cap C)$
Statement II is true.
Option (b) is true.

31. Since, $n(A' \cap B') = n(U) - n(A \cup B)$
$= n(U) - \{n(A) + n(B) - n(A \cap B)\}$
$= 700 - \{200 + 300 - 100\}$
$= 300$
$\therefore$ Statement I is true and Statement II is false.
Option (c) is true.

Solutions (Q. Nos. 32-34)
Let U, E, M and S be denote the total number of students passed in English, passed in Mathematics and passed in Science, respectively.
Here, $n(U) = 100, n(E) = 15, n(M) = 12,$
$n(S) = 8, n(E \cap M) = 6, n(M \cap S) = 7,$
$n(E \cap S) = 4$ and $n(E \cap M \cap S) = 4$

32. The number of students passed in English and Mathematics but not in Science
$= n(E \cap M \cap \bar{S})$
$= n(E \cap M) - n(E \cap M \cap S) = 6 - 4 = 2$

33. The number of students only passed in Mathematics
$= n(M \cap \bar{E} \cap \bar{S})$
$= n(M) - n(M \cap E) - n(M \cap S) + n(M \cap E \cap S)$
$= 12 - 6 - 7 + 4 = 16 - 13 = 3$

34. The number of students only passed in more than one subject
$= n(M \cap E) + n(M \cap S) + n(S \cap E) - 2n(M \cap E \cap S)$
$= 6 + 7 + 4 - 2(4) = 17 - 8 = 9$

35. A. $[(A' \cup B') - A]' = [(A \cap B)' \cap A']'$
$= (A \cap B) \cup A = A$
B. $[B' \cup (B' - A)]' = B' \cup (B' \cap A')]'$
$= [B' \cup (B \cup A)']'$
$= [B \cap (B \cup A)] = B$
C. $A - (A \cap B) = A \cap (A \cap B)'$
$= A \cap (A' \cup B')$
$= (A \cap A') \cup (A \cap B')$
$= \phi \cup (A \cap B')$
$= A \cap B' = A - B$
D. $(A - B) \cap (C - B)$
$= (A \cap B') \cap (C \cap B')$
$= (A \cap C) \cap B' = (A \cap C) - B$

36. We know that the total number of proper subsets of a finite set containing n elements is $2^n - 1$.
$\therefore$ Number of proper subsets of A
$= 2^3 - 1 = 7$

37. $A = \{-1, 1\}, B = \{-i, i, -1, 1\}$
$A - B = \phi$
$\therefore \quad n(A - B) = 0$

38. The maximum number of elements in $A \cup B$ iff
$n(A \cap B) = 0$
$\therefore \quad n(A \cup B) = n(A) + n(B) - n(A \cap B)$
$= 3 + 6 = 9$

39. We have, $n(F) = 38, n(B) = 15, n(C) = 20,$
$n(F \cup B \cup C) = 58, n(F \cap B \cap C) = 3$
Now, $n(F \cup B \cup C) = n(F) + n(B) + n(C)$
$- n(F \cap B) - n(F \cap C) - n(B \cap C)$
$+ n(F \cap B \cap C)$
$\Rightarrow \quad n(F \cap B) + n(B \cap C) + n(F \cap C)$
$= 38 + 15 + 20 + 3 - 58 = 18$
Now, number of men who received medals in exactly two of the three sports
$= n(F \cap B) + n(B \cap C) + n(F \cap C) - 3n(F \cap B \cap C)$
$= 18 - 3 \times 3 = 18 - 9 = 9$

Entrances Gallery

1. Since, $\cos\theta(\sqrt{2} + 1) = \sin\theta$
$\Rightarrow \quad \tan\theta = \sqrt{2} + 1$
and $\quad \sin\theta(\sqrt{2} - 1) = \cos\theta$
$$\Rightarrow \quad \tan\theta = \frac{1}{\sqrt{2} - 1} \times \frac{\sqrt{2} + 1}{\sqrt{2} + 1} = (\sqrt{2} + 1)$$
$\therefore \quad P = Q$

2. Let $A \cap B = \phi, A, B \subset S$
$\therefore$ Total number of unordered pairs of disjoint subsets of
$$S = \frac{3^4 + 1}{2} = 41$$

3. Given, $n(A) = 4, n(B) = 2$
$\Rightarrow \quad n(A \times B) = 8$
Total number of subsets of set $(A \times B) = 2^8$
Number of subsets of set $(A \times B)$ having no element (i.e. ϕ) $= 1$
Number of subsets of set $(A \times B)$ having one element $= {}^8C_1$
Number of subsets of set $(A \times B)$ having two elements $= {}^8C_2$
$\therefore$ Number of subsets having atleast three elements
$= 2^8 - (1 + {}^8C_1 + {}^8C_2)$
$= 2^8 - 1 - 8 - 28 = 2^8 - 37$
$= 256 - 37 = 219$

4. We have, $X = \{4^n - 3n - 1 : n \in N\}$
$X = \{0, 9, 54, 243, \ldots\}$ [put $n = 1, 2, 3, \ldots$]
$Y = \{9(n - 1) : n \in N\}$
$Y = \{0, 9, 18, 27, \ldots\}$ [put $n = 1, 2, 3, \ldots$]
It is clear that $X \subset Y$
$\therefore \quad X \cup Y = Y$

5. Since, $A \cap B = A \cap C$
and $\quad A \cup B = A \cup C \Rightarrow B = C$

6. Let the number of students play cricket $= C$
Number of students play tennis $= T$
and total number of students $= S$
$\therefore \ n(S) = 60, n(C) = 25, n(T) = 20$ and $n(C \cap T) = 10$
Now, $\quad n(C \cup T) = n(C) + n(T) - n(C \cap T)$
$= 25 + 20 - 10 = 35$
$\therefore$ The number of students who play neither game
$= n(C \cup T)' = n(S) - n(C \cup T)$
$= 60 - 35 = 25$

7. Given, set $A = \{x : |2x + 3| < 7\}$
Now, $\quad |2x + 3| < 7$
$\Rightarrow \quad -7 < 2x + 3 < 7$
$\Rightarrow \quad -7 - 3 < 2x < 7 - 3$
$\Rightarrow \quad -10 < 2x < 4$
$\Rightarrow \quad -5 < x < 2$
$\Rightarrow \quad 0 < (x + 5) < 7$

8. Let D, P, S denote dancing, painting and singing respectively.

$\therefore \quad n(D \cup P \cup S) = 265,$

$n(S) = 200, n(D) = 110, n(P) = 55,$

$n(S \cap D) = 60, n(S \cap P) = 30$

and $n(D \cap P \cap S) = 10$

$\because \quad n(D \cup P \cup S) = n(D) + n(P) + n(S) - n(D \cap P) - n(P \cap S) - n(S \cap D) + n(D \cap P \cap S)$

$\therefore \quad 265 = 110 + 55 + 200 - n(D \cap P) - 30 - 60 + 10$

$\Rightarrow \quad 265 = 285 - n(D \cap P)$

$\Rightarrow \quad n(D \cap P) = 20$

$\therefore$ Number of persons who like dancing and painting

$= n(D \cap P) - n(D \cap P \cap S)$

$= 20 - 10$

$= 10$

9. Given, $X_n = \left\{z = x + iy : |z|^2 \le \frac{1}{n}\right\} = \left\{x^2 + y^2 \le \frac{1}{n}\right\}$

$\therefore \quad X_1 = \{x^2 + y^2 \le 1\}, X_2 = \left\{x^2 + y^2 \le \frac{1}{2}\right\}$

$X_3 = \left\{x^2 + y^2 \le \frac{1}{3}\right\}, \dots X_\infty = \{x^2 + y^2 \le 0\}$

$\therefore \quad \bigcap_{n=1}^{\infty} X_n = X_1 \cap X_2 \cap \dots \cap X_\infty = \{x^2 + y^2 = 0\}$

Hence, $\bigcap_{n=1}^{\infty} X_n$ is a singleton set.

10. Given, figure clearly represents

$(A - B) \cup (B - A)$

11. Given, $n(A) = 1000, n(B) = 500, n(A \cap B) \ge 1, n(A \cup B) = p$

$\because \quad n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$\Rightarrow \quad 1 \le n(A \cap B) \le 500$

Hence, $\quad p \le 1000 + 500 - 1 = 1499$

and $\quad p \ge 1000 + 500 - 500 = 1000$

$\therefore \quad 1000 \le p \le 1499$

12. $n(M) = 45, n(M \cap B) = 10, n(M \cup B) = 64$

$\Rightarrow \quad n(B) = n(M \cup B) - n(M) + n(M \cap B)$

$= 64 - 45 + 10 = 29$

$\Rightarrow \quad n(\text{only } B) = n(B) - n(M \cap B) = 29 - 10 = 19$

13. $n(M) = 50 =$ Number of students failed in Mathematics

$n(P) = 45, n(B) = 40$

$\therefore n(M \cap P) + n(M \cap B) + n(P \cap B) - 3n(M \cap P \cap B) = 32 \quad \dots\text{(i)}$

We have, to find $n(M \cap P \cap B)$.

Total number of students $= 100$ [given]

Clearly, $\quad n(M \cup P \cup B) = 99$

$\Rightarrow \quad n(M) + n(P) + n(B) - \{n(M \cap P) + n(M \cap B) + n(P \cap B)\} + n(M \cap P \cap B) = 99$

$\Rightarrow \quad 50 + 45 + 40 - \{32 + 3n(M \cap P \cap B)\} + n(M \cap P \cap B) = 99$ [from Eq. (i)]

$\Rightarrow \quad 135 - 32 - 2n(M \cap P \cap B) = 99$

$\Rightarrow \quad 2n(M \cap P \cap B) = 4$

$\Rightarrow \quad n(M \cap P \cap B) = 2$

14. Since, $x^2 = 16$

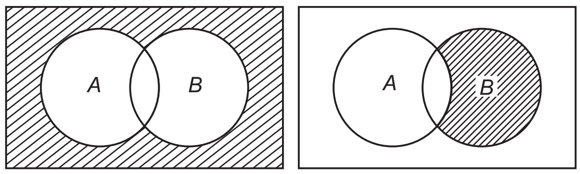
$\Rightarrow \quad x = \pm 4 \quad$ and $\quad 2x = 6$

$\Rightarrow \quad x = 3$

Hence, no value of x is satisfied.

$\therefore \quad A = \phi$

15.



$(A \cup B)'$ $\qquad$ $(A' \cap B)$

$\therefore \quad (A \cup B)' \cap (A' \cap B) = \phi$

16. $A = \{1, 2\} \in \{\{1, 2\}\} = C$

$\therefore \quad A \in C$

17. $n(A - B) = n(A) - n(A \cap B)$

$= 25 - 10 = 15$

2

Fundamentals of Relation and Function

Chapter Snapshot

Ordered Pair

Two elements a and b listed in a specific order form an ordered pair, denoted by (a, b). In an ordered pair (a, b); a is regarded as the first element and b is the second element. It is evident from the definition that

$$(a, b) \neq (b, a)$$

Equality of Ordered Pairs

Two ordered pairs (a_1, b_1) and (a_2, b_2) are equal iff

$$a_1 = a_2 \quad \text{and} \quad b_1 = b_2$$

i.e. $$(a_1, b_1) = (a_2, b_2)$$

$\Rightarrow$ $$a_1 = a_2 \quad \text{and} \quad b_1 = b_2$$

Thus, it is evident from the definition that, $(1, 2) \neq (2, 1)$ and $(1, 1) \neq (2, 2)$.

Example 1. *If* $\left(\frac{x}{3}+1, y-\frac{2}{3}\right)=\left(\frac{5}{3}, \frac{1}{3}\right)$, *find the values of x and y.*

(a) 2 and 1 (b) 2 and 2 (c) −2 and 1 (d) 1 and 1

Sol. (a) Given, $\left(\frac{x}{3}+1, y-\frac{2}{3}\right)=\left(\frac{5}{3}, \frac{1}{3}\right)$

$\Rightarrow$ $$\frac{x}{3}+1=\frac{5}{3} \quad \text{and} \quad y-\frac{2}{3}=\frac{1}{3}$$

$\Rightarrow$ $$\frac{x}{3}=\frac{5}{3}-\frac{1}{1} \quad \text{and} \quad y=\frac{1}{3}+\frac{2}{3}$$

$$x=2 \quad \text{and} \quad y=1$$

Cartesian Product of Sets

Let A and B be two non-empty sets. The cartesian product of A and B denoted by $A \times B$ is defined as the set of all ordered pairs (a, b), where $a \in A$ and $b \in B$.

Symbolically, $A \times B = \{(a, b); a \in A \text{ and } b \in B\}$.

If there are three sets A, B, C and $a \in A$, $b \in B$, $c \in C$, then we form an ordered triplet (a, b, c). The set of all ordered triplets (a, b, c) is called the cartesian product of these sets A, B and C,

i.e. $A \times B \times C = \{(a, b, c) : a \in A, b \in B, c \in C\}$

Number of Elements in the Cartesian Product of Two Sets

If A and B are two finite sets, then

$$n(A \times B) = n(A) \times n(B)$$

- *If either A or B is an infinite set, then $A \times B$ is an infinite set.*
- *If A, B, C are finite sets, then $n(A \times B \times C) = n(A) \times n(B) \times n(C)$.*

Example 2. *Let $A = \{1, 2, 3\}$ and $B = \{x : x \in N$, x is a prime number less than $5\}$, then $n(A \times B)$ is*

(a) 3 *(b)* 4 *(c)* 5 *(d)* 6

Sol. (d) We have, $A = \{1, 2, 3\}$

and $B = \{x : x \in N$, x is a prime number less than $5\}$
$= \{2, 3\}$

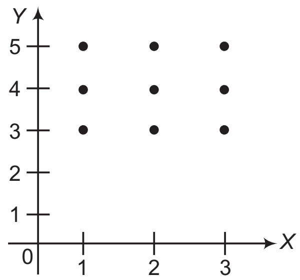
$\therefore$ $n(A) = 3$ and $n(B) = 2$

$\Rightarrow$ $n(A \times B) = n(A) \times n(B) = 3 \times 2 = 6$

Graphical Representation of Cartesian Product of Two Sets

Let A and B be two non-empty subsets of R. Then, the graph of $A \times B$ is the set of all points in the plane represented by the ordered pairs of $A \times B$.

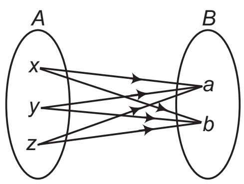
Let $A = \{1, 2, 3\}$, $B = \{3, 4, 5\}$, then $A \times B = \{(1, 3), (1, 4), (1, 5), (2, 3), (2, 4), (2, 5), (3, 3), (3, 4), (3, 5)\}$



Diagrammatic Representation of Cartesian Product of Two Sets

In order to represent $A \times B$ by an arrow diagram, we first draw Venn diagrams representing sets A and B one opposite to the other as shown in figure. Now, we draw line segments starting from each element of A and terminating to each element of set B.

If $A = \{x, y, z\}$ and $B = \{a, b\}$, then following figure gives the arrow diagram of $A \times B$.



Properties of Cartesian Product of Sets

If A, B and C are three sets, then

i.	(a) $A \times (B \cup C) = (A \times B) \cup (A \times C)$ (b) $A \times (B \cap C) = (A \times B) \cap (A \times C)$
ii.	$A \times (B - C) = (A \times B) - (A \times C)$
iii.	$A \times B = B \times A \Leftrightarrow A = B$
iv.	If $A \subseteq B \Rightarrow A \times A \subseteq (A \times B) \cap (B \times A)$
v.	If $A \subseteq B \Rightarrow A \times C \subseteq B \times C$
vi.	If $A \subseteq B$ and $C \subseteq D \Rightarrow A \times C \subseteq B \times D$
vii.	$(A \times B) \cap (C \times D) = (A \cap C) \times (B \cap D)$
viii.	$A \times (B' \cup C')' = (A \times B) \cap (A \times C)$
ix.	$A \times (B' \cap C')' = (A \times B) \cup (A \times C)$
x.	If A and B have n common elements, then $A \times B$ and $B \times A$ will have n^2 common elements.

Example 3. *If $A = \{1, 2, 3\}$, $B = \{3, 4\}$ and $C = \{4, 5, 6\}$, then $A \times (B \cap C)$ is*

(a) $\{(1, 3), (2, 3), (3, 3)\}$ *(b)* $\{(1, 4), (2, 4), (3, 4)\}$

(c) $\{(4, 1), (4, 2), (4, 3)\}$ *(d)* $\{(3, 4), (3, 5), (3, 6)\}$

Sol. (b) We have, $A = \{1, 2, 3\}$, $B = \{3, 4\}$ and $C = \{4, 5, 6\}$

Now, $B \cap C = \{4\}$

$\therefore$ $A \times (B \cap C) = \{(1, 4), (2, 4), (3, 4)\}$

Relation

Let A and B be two non-empty sets. Then, a relation R from A to B is a subset of $A \times B$.

Thus, R is a relation from A to $B \Rightarrow R \subseteq A \times B$. If R is a relation from a non-empty set A to a non-empty set B and if $(a, b) \in R$, then we write aRb which is read as 'a is related to b by the relation R'. If $(a, b) \notin R$, then we write $a \not R b$ and we say that 'a is not related to b by the relation R'.

Example 4. *Let $A = \{1, 2, 3\}$ and $B = \{-1, 0, 1\}$, then which of the following is not a relation from A to B?*

(a) $R = \{(1, -1), (2, 0), (3, 1)\}$

(b) $R = \{(1, -1), (1, 0), (2, 0), (2, 1)\}$

(c) $R = \{(2, 0), (2, 1), (1, -1), (3, 1), (3, 0)\}$

(d) $R = \{(1, -1), (2, 0), (1, 3)\}$

Sol. (d) $\because 3 \notin B$

$\therefore$ $\{(1, -1), (2, 0), (1, 3)\}$ is not a relation from A to B.

Example 5. *Let $A = \{1, 2, 3\}$, we define*
$R_1 = \{(1, 2), (3, 2), (1, 3)\}$,
$R_2 = \{(1, 3), (3, 6), (2, 1), (1, 2)\}$.
Then, on A
(a) R_1 *is relation and* R_2 *is not*
(b) R_1 *and* R_2 *are relations*
(c) R_1 *and* R_2 *are not relations*
(d) None of the above

Sol. (a) $R_1 \subseteq A \times A$, so R_1 is a relation on A. But $(3, 6) \notin A \times A$, so $R_2 \not\subseteq A \times A$. Hence, R_2 is not a relation on A.

Representation of Relation

Roster Form

In this form, a relation is represented by the set of all ordered pairs belonging to R.

e.g. The relation R defined on the set of natural number as $\{(a, b) : b$ is square of $a\}$, then roster form of this relation is

$$\{(1, 1), (2, 4), (3, 9), (4, 16), \dots\}$$

Set Builder Form

In this form, a relation is represented as

$R = \{(a, b) : a \in A, b \in B$ and a, b satisfy the rule which associates a and $b\}$

e.g. In set builder form, the relation

$R = \{(2, 8), (3, 27), (5, 125), (7, 343)\}$ is written as

$R = \{(x, x^3) : x$ is a prime number less than $10\}$

Example 6. *Let $A = \{3, 5\}$, $B = \{7, 11\}$ and $R = \{(a, b) : a + b$ is odd $a \in A, b \in B\}$.*
Then, R in roster form is
(a) $\{(3, 7), (5, 11)\}$ *(b)* $\{(3, 11), (5, 7)\}$
(c) ϕ *(d) None of these*

Sol. (c) We have, $A = \{3, 5\}$ and $B = \{7, 11\}$. Here, elements of A and B are odd numbers. Sum of two odd numbers is always even. So, there is no element that belongs to R.
Hence, $R = \phi$

Domain and Range of Relations

Let R be a relation from A to B. The domain of R is the set of all those elements $a \in A$ such that $(a, b) \in R$ for some $b \in B$.

$\therefore$ Domain of $R = \{a \in A : (a, b) \in R\}$

and range of R is the set of all those elements $b \in B$ such that $(a, b) \in R$ for some $a \in A$.

$\therefore$ Range of $R = \{b \in B : (a, b) \in R\}$

Here, B is called the codomain of R.

e.g. Let $A = \{1, 2, 3\}$ and $B = \{3, 5, 6\}$

$$aRb \Leftrightarrow a < b$$

Then, $R = \{(1, 3), (1, 5), (1, 6), (2, 3), (2, 5), (2, 6), (3, 5), (3, 6)\}$

$\therefore$ Domain of $R = \{1, 2, 3\}$, range of $R = \{3, 5, 6\}$ and codomain of $R = \{3, 5, 6\}$

Let A and B be two non-empty finite sets having p and q elements respectively, then the total number of relations from A to B $= 2^{pq}$.

Example 7. *Find the domain and range of the relation R defined by*

$$R = \{(x, x + 5) : x \in \{0, 1, 2, 3, 4, 5\}\}$$

(a) $\{0, 1, 2, 3, 4, 5\}, \{5, 6, 7, 8, 9, 10\}$
(b) $\{1, 2, 3, 4, 5\}, \{5, 6, 7, 8, 9, 10\}$
(c) $\{0, 1, 2, 3, 4, 5\}, \{6, 7, 8, 9, 10\}$
(d) None of the above

Sol. (a) Given, $R = \{(x, x + 5) : x \in \{0, 1, 2, 3, 4, 5\}\}$
Putting $x = 0, 1, 2, 3, 4, 5$, we get
$R = \{(0, 5), (1, 6), (2, 7), (3, 8), (4, 9), (5, 10)\}$
$\Rightarrow$ Domain $= \{0, 1, 2, 3, 4, 5\}$
Now, $y = x + 5 = 5, 6, 7, 8, 9, 10$ [after putting the value of x]
$\Rightarrow$ Range $= \{5, 6, 7, 8, 9, 10\}$

Example 8. *If R is a relation on a finite set having n elements, then the number of relations on A is*
(a) 2^n *(b)* 2^{n^2} *(c)* n^2 *(d)* n^n

Sol. (b) We have, a set having n elements
i.e. $n(A) = n$
and $n(A \times A) = n(A) \times n(A) = n \times n = n^2$
$\therefore$ Number of relations on $A = 2^{n(A \times A)} = 2^{n^2}$

Some Particular Types of Relations

i. **Void relation** Since, $\phi \subset A \times A$, it follows that ϕ is a relation on A, called the empty or void relation.

Example 9. *Consider the relation R on the set*
$A = \{2, 4, 6\}$, $R = \{(x, y): |x - y|$ *is odd* $x, y \in A\}$

Sol. We observe that, $|x - y|$ is always an even number for every element of A. Therefore, $(x, y) \notin R$, $\forall\, x, y \in A$.
$\Rightarrow R$ is a void relation on A.

Example 10. *A relation R on a set A is called an empty relation, if*
(a) no element of A is related to any element of A
(b) every element of A is related to every element of A
(c) some elements of A are related to some element of A
(d) None of the above

Sol. (a) A relation R on a set A is called an empty relation, if it has no element, i.e. no ordered pair, i.e. no element of A is related to any element of A.

ii. **Universal relation** Since, $A \times A \subseteq A \times A$, it follows that $A \times A$ is a relation on A, called the universal relation.

Example 11. *Consider the relation R on set* $A = \{1, 2, 3, 4, 5\}$ *defined by* $R = \{(x, y) : |x - y| \ge 0, x, y \in A\}$.

Sol. We observed that, $|x - y| \ge 0, \forall x, y \in A$

$\Rightarrow \quad (x, y) \in R, \forall (x, y) \in A \times A$

Each element of set A is related to every element of set A

$\Rightarrow \quad R = A \times A$

$\Rightarrow$ R is universal relation on set A.

iii. **Identity relation** The relation $I_A = \{(a, a); \forall a \in A\}$ is called the identity relation on A.

Example 12. *If* $A = \{1, 2, 3\}$, *then define the identity relation on A.*

Sol. The identity relation on A is given by

$$I_A = \{(1, 1), (2, 2), (3, 3)\}$$

Inverse Relation

If R is a relation on A, then the relation R^{-1} on A, defined by $R^{-1} = \{(b, a) : (a, b) \in R\}$ is called an inverse relation on A.

Clearly, $\quad$ domain $(R^{-1}) =$ range (R)

and $\quad$ range $(R^{-1}) =$ domain (R)

Example 13. *If* $A = \{1, 2, 3\}$ *and* $R = \{(1, 2), (2, 2), (3, 1), (3, 2)\}$, *then define inverse relation of R on A.*

Sol. R, being a subset of $A \times A$, is a relation on A.

Clearly, $1R2$; $2R2$; $3R1$ and $3R2$.

Domain $(R) = \{1, 2, 3\}$

and range $(R) = \{2, 1\}$

Also, $R^{-1} = \{(2, 1), (2, 2), (1, 3), (2, 3)\}$

Domain $(R^{-1}) = \{2, 1\}$

and range $(R^{-1}) = \{1, 2, 3\}$

Composition of Relations

Let $R \subseteq A \times B$, $S \subseteq B \times C$ be two relations. Then, composition of the relations R and S denoted by $SoR \subseteq A \times C$ and is defined by $(a, c) \in (SoR)$ iff $\exists\, b \in B$ such that $(a, b) \in R$, $(b, c) \in S$.

Example 14. *If* $A = \{1, 2, 3\}$, $B = \{a, b, c, d\}$, $C = \{\alpha, \beta, \gamma\}$, $R \subseteq (A \times B) = \{(1, a), (1, c), (2, d)\}$, $S \subseteq (B \times C) = \{(a, \alpha), (a, \gamma), (a, \beta)\}$, *then what is the composite of relations R and S?*

Sol. $SoR \subseteq (A \times C) = \{(1, \alpha), (1, \gamma), (1, \beta)\}$

One should be careful in computing the relation RoS. Actually, SoR starts with R and RoS starts with S.
In general, $SoR \ne RoS$
Also, $(SoR)^{-1} = R^{-1} o S^{-1}$, *known as reversal rule.*

Work Book Exercise 2.1

1 If A and B are two sets, then $A \times B = B \times A$, if and only if

a $A \subset B$ b $B \subset A$
c $A = B$ d None of these

2 If the set A has 3 elements and the set $B = \{1, 3, 4, 5\}$, then the number of elements in $(A \times B)$ is

a 11   b 12   c 13   d 15

3 Let $A = \{1, 2\}$, $B = \{1, 2, 3, 4\}$, $C = \{5, 6\}$ and $D = \{5, 6, 7, 8\}$

Following statements are given below:

I. $A \times (B \cap C) = (A \times B) \cap (A \times C)$
II. $A \times C$ is a subset of $B \times D$.

Which of the above statement is correct?

a Only I   b Only II
c Both I and II   d None of these

4 Let R be a relation from a set A to a set B, then

a $R = A \cup B$ b $R = A \cap B$
c $R \subseteq A \times B$ d $R \subseteq B \times A$

5 Let R be the relation on Z defined by $R = \{(a, b) : a, b \in Z, a - b$ is an integer$\}$. Find the domain and range of R.

a Z, Z b Z^+, Z
c Z, Z^- d None of these

6 Let a relation R be defined by $R = \{(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)\}$, then RoR is equal to

a $\{(1, 5), (1, 6), (3, 6)\}$
b $\{(1, 4), (1, 5), (3, 6)\}$
c $\{(1, 5), (1, 6), (3, 7)\}$
d $\{(1, 4), (1, 5), (3, 7)\}$

7 If the relation $R : A \to B$, where $A = \{1, 2, 3, 4\}$ and $B = \{1, 3, 5\}$ is defined by $R = \{(x, y) : x < y, x \in A, y \in B\}$, then $R^{-1}oR$ is

a $\{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)\}$
b $\{(3, 1), (5, 1), (5, 2), (5, 3), (5, 4)\}$
c $\{(3, 3), (3, 5), (5, 3), (5, 5)\}$
d None of the above

8 If R is a relation from set $A = \{2, 4, 5\}$ to set $B = \{1, 2, 3, 4, 6, 8\}$ defined by $xRy \Leftrightarrow x$ divides y, where $x \in A$, $y \in B$. Then, R^{-1} is

a $\{(2, 2), (2, 4), (2, 6), (2, 8), (4, 4), (4, 8)\}$
b $\{(2, 2), (1, 4), (1, 2), (1, 5), (2, 4), (4, 4)\}$
c $\{(2, 2), (4, 2), (6, 2), (8, 2), (4, 4), (8, 4)\}$
d None of the above

Functions or Mappings

Let A and B be two non-empty sets. Then, a function f from set A to B is a rule which associates elements of set A to elements of set B such that all elements of set A are associated to elements of set B in unique way.

If f associates $x \in A$ to $y \in B$, then we say that y is the image of the element x and denote it by $f(x)$ and write as $y = f(x)$. The element x is called the pre-image or inverse image of y.

A function is denoted by $f : A \to B$ or $A \xrightarrow{f} B$.

Example 15. *Let* $A = \{1, 2, 3\}, B = \{2, 3, 4\}$ *and* f_1, f_2 *and* f_3 *be three subsets of* $A \times B$ *as given*

$f_1 = \{(1, 2), (2, 3), (3, 4)\}$

$f_2 = \{(1, 2), (1, 3), (2, 3), (3, 4)\}$

$f_3 = \{(1, 3), (2, 4)\}$. *Then, which is/are function(s)?*

Sol. Obviously, f_1 is a function from A to B but f_2 and f_3 are not functions from A to B, f_2 is not a function from A to B because $1 \in A$ has two images 2 and 3 and f_3 is not a function from A to B, because $3 \in A$ has no image in B.

Example 16. *If* $x, y \in \{1, 2, 3, 4\}$, *then which of the following is/are function(s) in the given set?*

(a) $f_1 = \{(x, y) : y = x + 1\}$
(b) $f_2 = \{(x, y) : x + y > 4\}$
(c) $f_3 = \{(x, y) : y < x\}$
(d) $f_4 = \{(x, y) : x + y = 5\}$

Sol. (d) We have,

$f_1 = \{(1, 2), (2, 3), (3, 4)\}$

$f_2 = \{(1, 4), (4, 1), (2, 3), (3, 2), (2, 4), (4, 2), (3, 4), (4, 3)\}$

$f_3 = \{(2, 1), (3, 1), (4, 1), (3, 2), (4, 2), (4, 3)\}$

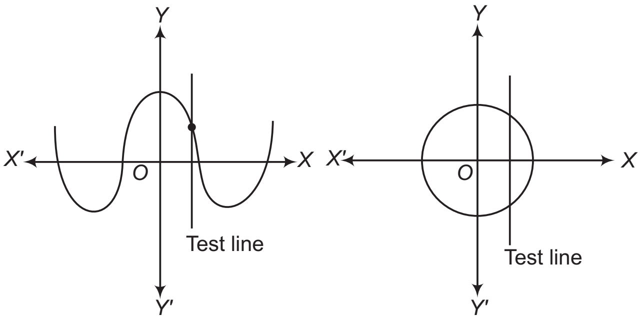
$f_4 = \{(1, 4), (2, 3), (3, 2), (4, 1)\}$

Here, f_4 is a function but f_1, f_2 and f_3 are not functions. f_1 is not a function because 4 has no image. f_2, f_3 are not functions because 3, 4 have more than one images.

- *There may exist some elements in set B which are not the images of any element in set A.*
- *To each and every independent element in A, there corresponds one and only one image in B.*
- *Every function is a relation but every relation may or may not be a function.*
- *The number of functions from a finite set A into finite set* $B = [n(B)]^{[n(A)]}$.

Difference between Relation and Function

Geometrically, if we draw a Vertical Parallel Line (VPL), i.e. any line which is parallel to Y-axis $(x = a)$, then if this line intersects the graph of the expression in more than one point, then the expression is a relation else, if it intersects at only one point, the expression is a function. e.g.



(a) Function (b) Relation

Example 17. *Let* $A = \{1, 2, 3, 4\}$, $B = \{1, 5, 9, 11, 15, 16\}$ *and* $f = \{(1, 5), (2, 9), (3, 1), (4, 5), (2, 11)\}$, *then*

(a) f is a relation from A to B
(b) f is a function from A to B
(c) Both (a) and (b)
(d) None of the above

Sol. (a) Since, first elements of the ordered pairs in f belong to A and second elements of the ordered pairs belong to B, so f is relation from A to B.

Now, 2 has two different images 9 and 11, so f is not a function.

Domain, Codomain and Range of a Function

Let $f : A \to B$. Then, the set A is known as the domain of f and the set B is known as the codomain of f. The set of all f-images of elements of A is known as the image of A or image set of A under f and is denoted by $f(A)$.

Thus, $f(A) = \{f(x) : x \in A\} = $ Range of f

Clearly, $f(A) \subseteq B$

Example 18. *Let N be the set of all natural numbers, then the rule $f : N \to N$ such that $f(x) = x^2, \forall x \in N$. Write domain, range and codomain of the given function.*

Sol. Given, $f(x) = x^2$

$f(1) = (1)^2 = 1;\ f(2) = 2^2 = 4;$

$f(3) = 3^2 = 9$ and so on.

$\therefore$ Domain $(f) = N$

Range $(f) = \{1, 4, 9, \ldots\}$

and codomain $(f) = N$

Example 19. *The domain of the real function* $f(x)=\dfrac{1}{\sqrt{4-x^2}}$ *is*

(a) *the set of all real numbers*
(b) *the set of all positive real numbers*
(c) $(-2, 2)$
(d) $[-2, 2]$

Sol. (c) We have, $f(x)=\dfrac{1}{\sqrt{4-x^2}}$

$f(x)$ is defined iff $4-x^2>0$

$\Rightarrow \quad x^2-4<0$

$\Rightarrow \quad (x+2)(x-2)<0$

$\Rightarrow \quad -2<x<2$

$\therefore$ Domain of $f=(-2,2)$

Example 20. *Let* $f=\left\{\left(x, \dfrac{x^2}{1+x^2}\right): x\in R\right\}$ *be a function from R into R. The range of f is*

(a) $[0, \infty)$ (b) $(0, 1)$
(c) $[0, 1)$ (d) $[1, \infty)$

Sol. (c) We have, $f(x)=\dfrac{x^2}{1+x^2}$

Domain of $f=R$

Range of f : Let $f(x)=y$, then

$$y=\frac{x^2}{1+x^2} \Rightarrow y+x^2y=x^2$$

$$\Rightarrow \quad x^2=\frac{y}{1-y} \Rightarrow x=\sqrt{\frac{y}{1-y}}$$

Clearly, x will take real values iff $\dfrac{y}{1-y}\geq 0$

$$\Rightarrow \quad \frac{y}{y-1}\leq 0 \Rightarrow 0\leq y<1$$

$\therefore$ Range of $f=[0,1)$

Equal Functions

Two functions f and g are said to be equal iff

(i) domain of f = domain of g.
(ii) codomain of f = codomain of g.
(iii) $f(x)=g(x)$ for every x belonging to their common domain.

If two functions f and g are equal, then we write $f=g$.

e.g. Let $A=\{1,2\}$, $B=\{3,6\}$ and $f: A\to B$ given by $f(x)=x^2+2$ and $g: A\to B$ given by $g(x)=3x$. Then, we observe that f and g have the same domain and codomain. Also, we have

$$f(1)=3=g(1)$$

and $\quad f(2)=6=g(2)$

Hence, $\quad f=g$

$\therefore$ f and g are equal functions.

Example 21. *The domain for which the functions* $f(x)=2x^2-1$ *and* $g(x)=1-3x$ *are equal, is*

(a) $\{1,2\}$ (b) $\{-2,2\}$ (c) $\left\{-2,\dfrac{1}{2}\right\}$ (d) $\{0,1\}$

Sol. (c) We have, $f(x)=2x^2-1$

and $\quad g(x)=1-3x$

$f(x)=g(x)$

$\Rightarrow \quad 2x^2-1=1-3x$

$\Rightarrow \quad 2x^2+3x-2=0$

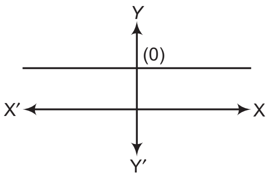
$\Rightarrow \quad (x+2)(2x-1)=0$

$\Rightarrow \quad x=-2,\ 1/2$

Thus, $f(x)$ and $g(x)$ are equal on the set $\left\{-2,\dfrac{1}{2}\right\}$.

Classification of Functions

Constant Function



A function which does not change as its parameters vary, i.e. the function whose rate of change is zero. In short, a constant function is a function that always gives or returns the same value.

or

Let k be a constant, then function $f(x)=k, \forall x\in R$ is known as constant function.

Domain of $f(x)=R$ and Range of $f(x)=\{k\}$

Polynomial Function

The function $y=f(x)=a_0x^n+a_1x^{n-1}+\ldots+a_n$, where $a_0, a_1, a_2, \ldots, a_n$ are real coefficients and n is a non-negative integer, is known as a polynomial function. If $a_0\neq 0$, then degree of polynomial function is n.

Domain of $f(x)=R$

and range varies from function to function.

Rational Function

If $P(x)$ and $Q(x)$ are polynomial functions, $Q(x)\neq 0$, then function $f(x)=\dfrac{P(x)}{Q(x)}$ is known as rational function.

Domain of $f(x)=R-[x: Q(x)=0]$

and range varies from function to function.

Irrational Function

The function containing one or more terms having non-integral rational powers of x is called irrational function.

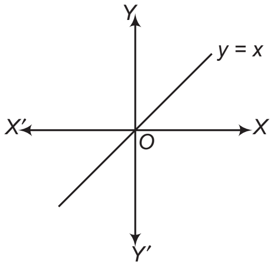
e.g. $\quad y=f(x)=\dfrac{5x^{3/2}-7x^{1/2}}{x^{1/2}-1}$

Domain varies from function to function.

Identity Function

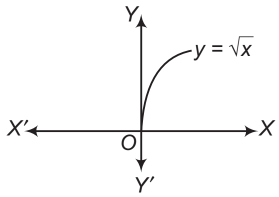
Function $f(x) = x$, $\forall x \in R$ is known as identity function. It is a straight line passing through origin and having slope unity.

Domain of $f(x) = R$
and range of $f(x) = R$



Square Root Function

The function that associates every positive real number x to $+\sqrt{x}$ is called the square root function, i.e. $f(x) = +\sqrt{x}$.

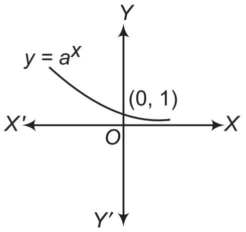


Range of $f(x) = [0, \infty)$

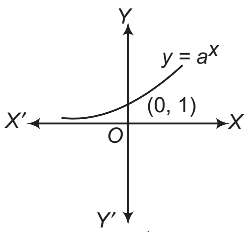
Exponential Function

A function of the form $f(x) = a^x$, a is a positive real number, is an exponential function. The value of the function depends upon the value of a. For $0 < a < 1$, function is decreasing and for $a > 1$, function is increasing.

Domain of $f(x) = R$
and range of $f(x) = [0, \infty)$



$0 < a < 1$
(a)

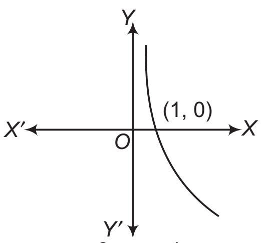


$a > 1$
(b)

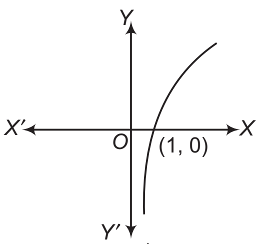
Logarithmic Function

Function $f(x) = \log_a x$, $(x, a > 0)$ and $a \neq 1$, is known as logarithmic function.

Domain of $f(x) = (0, \infty)$
and range of $f(x) = R$



$0 < a < 1$
(a)



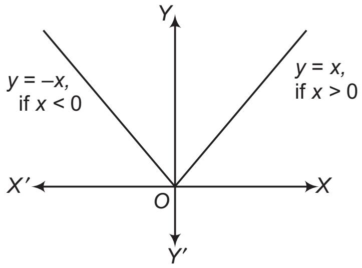
$a < 1$
(b)

Modulus Function

Function $y = f(x) = |x|$ is known as modulus function.

$$y = f(x) = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

Domain of $f(x) = x \in R$
and range of $f(x) = [0, \infty)$



Properties of Modulus Function

i.	For any real number x, $\sqrt{x^2} = \lvert x \rvert$.
ii.	If a and b are positive real numbers, then (a) $x^2 \leq a^2 \Leftrightarrow \lvert x \rvert \leq a \Leftrightarrow -a \leq x \leq a$ (b) $x^2 \geq a^2 \Leftrightarrow \lvert x \rvert \geq a \Leftrightarrow x \leq -a$ or $x \geq a$ (c) $a^2 \leq x^2 \leq b^2 \Leftrightarrow a \leq \lvert x \rvert \leq b$ $\Leftrightarrow x \in [-b, -a] \cup [a, b]$
iii.	$\lvert x \pm y \rvert \leq \lvert x \rvert + \lvert y \rvert$
iv.	$\lvert x + y \rvert \geq \lvert \lvert x \rvert - \lvert y \rvert \rvert$

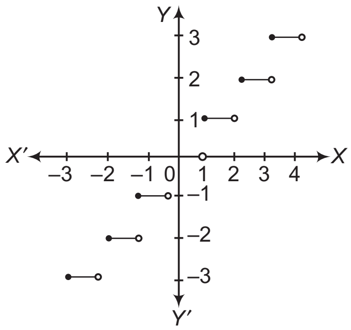
Greatest Integer Function

For any real number x, the greatest integer function $[x]$ is equal to greatest integer less than or equal to x.

In general, if n is an integer and x is any number satisfying $n \leq x < n + 1$, then $[x] = n$. It is also known as integral part function.

e.g. If $2 \leq x < 3$, then $[x] = 2$

Domain $= R$
Range $= I$



Properties of Greatest Integer Function

If n is an integer and x is any real number between n and $n+1$, then

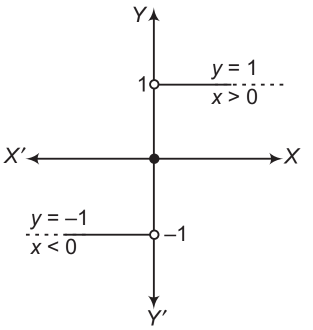
i.	$[-n] = -[n]$
ii.	$[x+n] = [x]+n$
iii.	$[-x] = -[x]-1$, x is not an integer.
iv.	$[x+y] \geq [x]+[y]$
v.	$[x] > n \Rightarrow x \geq n+1$
vi.	$[x] < n \Rightarrow x < n$
vii.	$[x+y] = [x]+[y+x-[x]]$, $\forall\, x, y \in R$
viii.	$[x]+\left[x+\frac{1}{n}\right]+\left[x+\frac{2}{n}\right]+\ldots+\left[x+\frac{n-1}{n}\right] = [nx]$, $n \in N$

Signum Function

The function defined by

$$f(x) = \frac{|x|}{x} = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$$

is called the signum function.



Domain $= R$

Range $= \{-1, 0, 1\}$

Example 22. *Which of the following is/are the polynomial function?*

I. $f(x) = x^3 - x^2 + 2, \forall\, x \in R$

II. $f(x) = x^4 + \sqrt{2}x, \forall\, x \in R$

III. $f(x) = x^{2/3} + 2x, \forall\, x \in R$

(a) I, II *(b)* II, III *(c)* I, II, III *(d) Only* I

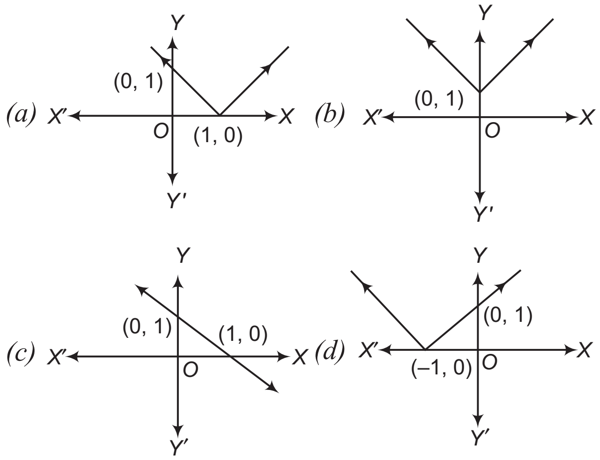
Sol. (a) A function $f : R \to R$ is said to be polynomial function if each of x in R,
$f(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$, where x is positive integer and $a_0, a_1, a_2, \ldots, a_n \in R$.

$\therefore$ I and II are polynomial functions whereas III is not a polynomial function because degree of x in III is not an integer.

Example 23. *The function f is defined by*

$$f(x) = \begin{cases} 1-x, & x < 0 \\ 1, & x = 0 \\ x+1, & x > 0 \end{cases}$$

Then, the graph of $f(x)$ is



Sol. (b) We have, $f(x) = \begin{cases} 1-x, & x < 0 \\ 1, & x = 0 \\ x+1, & x > 0 \end{cases}$

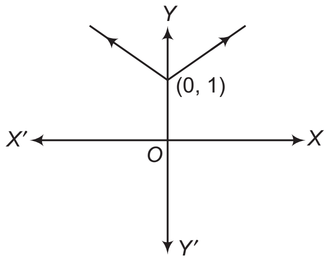
Let $f(x) = y$

$\therefore$ $x + y = 1, \quad x < 0$

$y = 1, \quad x = 0$

and $y - x = 1, \quad x > 0$

$\therefore$ Graph of this function is



Algebra of Real Functions

Let $f : X \to R$ and $g : X \to R$ be any two real functions, where $X \subset R$.

(i) Addition of two real functions

$$(f+g)(x) = f(x) + g(x)$$

(ii) Subtraction of two real functions

$$(f-g)(x) = f(x) - g(x)$$

(iii) Multiplication by a scalar

$$(\alpha \cdot f)(x) = \alpha \cdot f(x), \alpha, x \in R$$

(iv) Multiplication of two real functions

$$fg(x) = f(x) \cdot g(x)$$

(v) Quotient of two real functions

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$$

Example 24. *Let f and g be two real functions defined by* $f(x)=\dfrac{1}{x+4}$, $x\neq -4$ *and* $g(x)=(x+4)^3$, *then* f/g *is equal to*

(a) $(x+4)^2$ (b) $\dfrac{1}{(x+4)^4}$ (c) $\dfrac{1}{(x+4)^3}$ (d) $\dfrac{1}{(x+4)^2}$

Sol. (b) We have, $f(x)=\dfrac{1}{x+4}$ and $g(x)=(x+4)^3$

Now, $$\frac{f}{g}=\frac{\frac{1}{(x+4)}}{(x+4)^3}=\frac{1}{(x+4)^4},\ x\neq -4$$

Example 25. *Let* $f(x)=x$, $g(x)=\dfrac{1}{x}$ *and* $h(x)=f(x)\cdot g(x)$, *then* $h(x)=1$

(a) $\forall\, x\in R$ (b) $\forall\, x\in Q$
(c) $\forall\, x\in R-Q$ (d) $\forall\, x\in R, x\neq 0$

Sol. (d) We have, $f(x)=x$, $\forall\, x\in R$

and $g(x)=\dfrac{1}{x}$, $\forall\, x\in R-\{0\}$

Domain of $f(x)\cdot g(x)=R-\{0\}$

$\therefore$ $f(x)\cdot g(x)=x\times\dfrac{1}{x}=1$, $\forall\, x\in R-\{0\}$

i.e. $x\in R$, $x\neq 0$

Composition of Functions

Let A, B and C be three non-empty sets. Let $f:A\to B$ and $g:B\to C$. Since, $f:A\to B$, for each $x\in A$, there exists a unique element $g[f(x)]$ of C. Thus, for each $x\in A$, there is associated a unique element $g[f(x)]$ of C. Thus, from f and g, we can define a new function from A to C. This function is called the product or composite of f and g, denoted by gof and defined by

$(gof):A\to C$ such that $(gof)(x)=g[f(x)]$, $\forall\, x\in A$.

Example 26. *If* $f:R\to R$ *and* $g:R\to R$ *are defined by* $f(x)=2x+3$ *and* $g(x)=x^2+7$, *then values of x such that* $g\{f(x)\}=8$ *are*

(a) 1, 2 (b) −1, 2 (c) −1, −2 (d) 1, −2

Sol. (c) We have, $f(x)=2x+3$ and $g(x)=x^2+7$

Now, $g(f(x))=(f(x))^2+7=8$

$\Rightarrow (2x+3)^2+7=8$

$\Rightarrow (2x+3)^2=1\Rightarrow 2x+3=\pm 1$

$\Rightarrow 2x=-4$ and $2x=-2\Rightarrow x=-2, x=-1$

Example 27. *If* $f(x)=\log\left(\dfrac{1+x}{1-x}\right)$ *and* $g(x)=\dfrac{3x+x^3}{1+3x^2}$, *then* $f(g(x))$ *is equal to*

(a) $f(3x)$ (b) $[f(x)]^3$ (c) $3f(x)$ (d) $-f(x)$

Sol. (c) We have, $f(x)=\log\left(\dfrac{1+x}{1-x}\right)$

and $g(x)=\dfrac{3x+x^3}{1+3x^2}$

Now, $$f\{(g(x))\}=\log\left(\frac{1+g(x)}{1-g(x)}\right)$$
$$=\log\left[\frac{1+\frac{3x+x^3}{1+3x^2}}{1-\frac{3x+x^3}{1+3x^2}}\right]=\log\left[\frac{1+3x^2+3x+x^3}{1+3x-3x-x^3}\right]$$
$$=\log\left(\frac{1+x}{1-x}\right)^3=3\log\left(\frac{1+x}{1-x}\right)$$
$\Rightarrow f\{g(x)\}=3f(x)$

Properties of Composition of Functions

i. The composition of functions is not commutative.
i.e. $fog\neq gof$

ii. The composition of functions is associative.
i.e. $fo(goh)=(fog)oh$

iii. The composition of any function with the identity function is the function itself.
i.e. if $f:A\to B$, then $foI_A=I_B of=f$

Work Book Exercise 2.2

1 Find the range of the function $f(x)=x^2+2$.

a $(-2,2)$ b $[2,\infty)$
c $[3,\infty)$ d None of these

2 If the function $f(x)=\dfrac{a^x+a^{-x}}{2}$, $(a>2)$, then $f(x+y)+f(x-y)$ is equal to

a $2f(x)f(y)$ b $f(x)f(y)$
c $\dfrac{f(x)}{f(y)}$ d None of these

3 Domain and range of $f(x)=\dfrac{|x-3|}{x-3}$ are, respectively

a R, $[-1,1]$ b $R-\{3\}$, $\{1,-1\}$
c R^T, R d None of these

4 The domain of the function $f(x)=\sqrt{(2-2x-x^2)}$ is

a $-\sqrt{3}\le x\le\sqrt{3}$
b $(-1-\sqrt{3})\le x\le(-1+\sqrt{3})$
c $-2\le x\le 2$
d $(-2-\sqrt{3})\le x\le(-2+\sqrt{3})$

5 If $f(x)=\sin^2 x$ and the composite function $g\{f(x)\}=|\sin x|$, then the function $g(x)$ is equal to

a $\sqrt{x-1}$ b $\sqrt{x}$ c $\sqrt{x+1}$ d $-\sqrt{x}$

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. The composite mapping fog of the maps $f : R \to R,\ f(x) = \sin x,\ g : R \to R,\ g(x) = x^2$ is

(a) $\sin x + x^2$ (b) $(\sin x)^2$ (c) $\sin x^2$ (d) $\dfrac{\sin x}{x^2}$

Sol. We have,

$$(fog)(x) = f(g(x)) = f(x^2) = \sin x^2$$

Hence, (c) is the correct answer.

Ex 2. If R is a relation '<' from $A = \{1, 2, 3, 4\}$ to $B = \{1, 3, 5\}$, i.e. $(a, b) \in R$ iff $a < b$, then RoR^{-1} is

(a) $\{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)\}$
(b) $\{(3, 1), (5, 1), (3, 2), (5, 2), (5, 3), (5, 4)\}$
(c) $\{(3, 3), (3, 5), (5, 3), (5, 5)\}$
(d) $\{(3, 3), (3, 4), (4, 5)\}$

Sol. We have,

$$R = \{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)\}$$

$$\therefore \quad R^{-1} = \{(3, 1), (5, 1), (3, 2), (5, 2), (5, 3), (5, 4)\}$$

Now, $RoR^{-1} = \{(3, 3), (3, 5), (5, 3), (5, 5)\}$

Hence, (c) is the correct answer.

Ex 3. The range of the function $f(x) = \dfrac{\sin(\pi[x^2+1])}{x^4+1}$ where, [ ] is greatest integer function, is

(a) $[0, 1]$ (b) $[-1, 1]$
(c) $\{0\}$ (d) None of these

Sol. Since, $[x^2 + 1]$ is an integer.

$$\therefore \sin(\pi[x^2+1]) = 0 \quad \Rightarrow \quad f(x) = \frac{\sin(\pi[x^2+1])}{x^4+1} = 0$$

Now, range of $f = R_f = \{0\}$

Hence, (c) is the correct answer.

Ex 4. The simplified form of

$f(x) = |x-2| + |2-x|,\ -3 \le x \le 3$ is

(a) $\begin{cases} 2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$ (b) $\begin{cases} -2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ 2x, & -3 \le x < -2 \end{cases}$

(c) $\begin{cases} 3x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$ (d) None of these

Sol. $\because \ |x-2| = \begin{cases} x-2, & x \ge 2 \\ -(x-2), & x < 2 \end{cases}$

and $\ |x+2| = \begin{cases} (x+2), & x \ge -2 \\ -(x+2), & x < -2 \end{cases}$

$$\Rightarrow \quad f(x) = \begin{cases} (x-2) + (2+x), & 2 \le x \le 3 \\ -(x-2) + (x+2), & -2 \le x < 2 \\ -(x-2) - (x+2), & -3 \le x < -2 \end{cases}$$

$$= \begin{cases} x-2+2+x, & 2 \le x \le 3 \\ -x+2+x+2, & -2 \le x < 2 \\ -x+2-x-2, & -3 \le x < -2 \end{cases} = \begin{cases} 2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$$

Hence, (a) is the correct answer.

Ex 5. Let A and B be two sets such that $n(A \times B) = 6$. If three elements of $A \times B$ are (3, 2), (7, 5), (8, 5), then

(a) $A = \{3, 7, 8\}$ (b) $B = \{2, 5, 7\}$
(c) $B = \{3, 5\}$ (d) None of these

Sol. $\because (3, 2), (7, 5), (8, 5) \in A \times B$

$\therefore \quad 3, 7, 8 \in A$ and $2, 5 \in B$

Also, $\quad n(A \times B) = 6 = 3 \times 2$

$\therefore \quad A = \{3, 7, 8\}$ and $B = \{2, 5\}$

Hence, (a) is the correct answer.

Ex 6. If $f(x) = \dfrac{x-1}{x+1}$, then $f(2x)$ is equal to

(a) $\dfrac{3f(x)+1}{f(x)+3}$ (b) $\dfrac{f(x)+1}{f(x)+3}$

(c) $\dfrac{f(x)+3}{f(x)+1}$ (d) None of these

Sol.
$$\frac{3f(x)+1}{f(x)+3} = \frac{3\left(\dfrac{x-1}{x+1}\right)+1}{\dfrac{x-1}{x+1}+3}$$

$$= \frac{3x-3+x+1}{x-1+3x+3} = \frac{4x-2}{4x+2} = f(2x)$$

Hence, (a) is the correct answer.

Ex 7. Let $f : (4, 6) \to (6, 8)$ be a function defined by $f(x) = x + \left[\dfrac{x}{2}\right]$, where [ ] denotes the greatest integer function, then $f^{-1}(x)$ is equal to

(a) $x - \left[\dfrac{x}{2}\right]$ (b) $-x-2$ (c) $x-2$ (d) $\dfrac{1}{x + \left[\dfrac{\pi}{2}\right]}$

Sol. Since, $x \in (4, 6)$

$$\therefore \quad f(x) = x + \left[\frac{x}{2}\right] = x + 2$$

Let $\quad f(x) = y$

$\therefore \quad y = x + 2 \quad \Rightarrow \quad x = y - 2$

$\therefore \quad f^{-1}(x) = x - 2$

Hence, (c) is the correct answer.

Ex 8. Find the range of $f(x)=1+3\cos 2x$.

(a) [2, 3]
(b) [2, 4]
(c) [−2, 4]
(d) None of the above

Sol. $f(x)=1+3\cos 2x$

$\because \quad -1 \le \cos 2x \le 1$

$\Rightarrow \quad -3 \le 3\cos 2x \le 3$

$\Rightarrow \quad 1-3 \le 1+3\cos 2x \le 3+1$

$\Rightarrow \quad -2 \le f(x) \le 4$

$\therefore \quad \text{Range} = [-2, 4]$

Hence, (c) is the correct answer.

Ex 9. Find the domain of the function $f(x)=\dfrac{1}{\sqrt{x+|x|}}$.

(a) R (b) R^+ (c) R^- (d) $R+R$

Sol. Given, $f(x)=\dfrac{1}{\sqrt{x+|x|}}$, for the function to be defined, the denominator should not be equal to 0.

$$x+|x|>0 \qquad [\because x+|x| \nless 0]$$

$$\Rightarrow \quad |x|>-x$$

It is true for all R^+.

[R^+ means set of all positive real numbers]

$\therefore$ Domain of the given function $=R^+$

Hence, (b) is the correct answer.

Type 2. **More than One Correct Option**

Ex 10. Let $f, g: R \to R$ be defined, respectively by $f(x)=x+1$ and $g(x)=2x-3$. Then,

(a) $(f+g)(x)=3x-2$ (b) $(f-g)(2)=6$

(c) $\left(\dfrac{f}{g}\right)(2)=3$ (d) $(f-g)(x)=4-x$

Sol. We have, $f(x)=x+1$ and $g(x)=2x-3$

$$(f+g)(x)=x+1+2x-3=3x-2$$
$$(f-g)(x)=x+1-2x+3=4-x$$
$$\left(\frac{f}{g}\right)(x)=\frac{x+1}{2x-3}$$
$$\frac{f}{g}(2)=\frac{3}{4-3}=3$$
$$(f-g)(2)=4-2=2$$

Hence, (a), (c) and (d) are the correct answers.

Ex 11. If $n(A)=10$ and $n(B)=5$, then

(a) $n(A\times B)=50$
(b) $n(A\times B)=n(B\times A)$
(c) number of relations from A to B is 2^{10}
(d) All of the above

Sol. Given, $n(A)=10$, $n(B)=5$

$$n(A\times B)=n(A)\times n(B)$$
$$=10\times 5=50$$
$$n(B\times A)=n(B)\times n(A)$$
$$=5\times 10$$
$$=50$$

$\therefore$ Total number of relations from A to B is $2^{n(A\times B)}=2^{50}$

Hence, (a) and (b) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 12-13) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) *Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I*
(b) *Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I*
(c) *Statement I is true, Statement II is false*
(d) *Statement I is false, Statement II is true*

Ex 12. Let $A=\{1,2,3\}$, we define

$R_1=\{(1,3),(1,4),(2,1),(2,2),(2,3)\}$ and
$R_2=\{(1,1),(1,2),(1,3)\}$. Then,

Statement I R_1 is not a relation and R_2 is relation on A.

Statement II If R is relation on A, then $R\subseteq A\times A$.

Sol. If R_1 is a relation on A, then $R_1 \subseteq A\times A$

Here, R_1 contains $(1,4)\notin A\times A \Rightarrow R_1 \nsubseteq A\times A$

$\therefore$ R_1 is not a relation.

Whereas $R_2 \subset A\times A \Rightarrow R_2$ is relation.

Hence, (a) is the correct answer.

Ex 13. Statement I $f(x)=\dfrac{1}{1-x}$, $x\ne 0, 1$, then the graph of the function $y=f(f(f(x)))$, $x>1$ is a straight line.

Statement II If $f(x)=\dfrac{1}{1-x}$

$$\Rightarrow \quad f[f\{f(x)\}]=x, \forall x\in R$$

Sol. $f\{f(x)\}=\dfrac{1}{1-f(x)}=\dfrac{1}{1-\dfrac{1}{1-x}}=\dfrac{x-1}{x}, \forall x\in R-\{0,1\}$

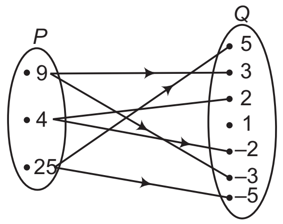
$$\therefore \quad f[f\{f(x)\}]=\frac{1}{1-f\{f(x)\}}=\frac{1}{1-\dfrac{x-1}{x}}$$
$$=x, \forall x\in R-\{0,1\}$$

$\Rightarrow$ Statement I is true, Statement II is false.

Hence, (c) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage (Ex. Nos. 14-15) *The figure shows a relation R between the sets P and Q.*



Ex 14. The relation R in set builder form is

(a) $\{(x, y): x \in P, y \in Q\}$
(b) $\{(x, y): x \in Q, y \in P\}$
(c) $\{(x, y): x$ is the square of $y, x \in P, y \in Q\}$
(d) $\{(x, y): y$ is the square of $x, x \in P, y \in Q\}$

Sol. It is obvious that the relation R is 'x is the square of y'.
In set builder form, $R = \{(x, y): x$ is the square of $y, x \in P, y \in Q\}$

Hence, (c) is the correct answer.

Ex 15. The relation R in roster form is

(a) $\{(9, 3), (4, 2), (25, 5)\}$
(b) $\{(9, -3), (4, -2), (25, -5)\}$
(c) $\{(9, -3), (9, 3), (4, -2), (4, 2), (25, -5), (25, 5)\}$
(d) None of the above

Sol. In roster form,
$R = \{(9, 3), (9, -3), (4, 2), (4, -2), (25, 5), (25, -5)\}$
Hence, (c) is the correct answer.

Type 5. **Match the Columns**

Ex 16. Let $A = \{1, 2, 3\}$, $B = \{3, 4\}$ and $C = \{4, 5, 6\}$. Then, match the following in Column I with the sets of ordered pairs in Column II.

	Column I		Column II
A.	$A \times (B \cap C)$	p.	$\{(1, 4), (2, 4), (3, 4)\}$
B.	$(A \times B) \cap (A \times C)$	q.	$\{(1, 3), (1, 4), (1, 5), (1, 6), (2, 3), (2, 4), (2, 5), (2, 6), (3, 3), (3, 4), (3, 5), (3, 6)\}$
C.	$A \times (B \cup C)$	r.	$\{(3, 4)\}$
D.	$(A \times B) \cup (A \times C)$		
E.	$(A \cap B) \times (B \cap C)$		

Sol. Given, $A = \{1, 2, 3\}$, $B = \{3, 4\}$ and $C = \{4, 5, 6\}$

A. $B \cap C = \{4\}$

$\therefore \quad A \times (B \cap C) = \{(1, 4), (2, 4), (3, 4)\}$

B. $A \times B = \{(1, 3), (1, 4), (2, 3), (2, 4), (3, 3), (3, 4)\}$

$A \times C = \{(1, 4), (1, 5), (1, 6), (2, 4), (2, 5), (2, 6), (3, 4), (3, 5), (3, 6)\}$

$\therefore (A \times B) \cap (A \times C) = \{(1, 4), (2, 4), (3, 4)\}$

C. $B \cup C = \{3, 4, 5, 6\}$

$\therefore A \times (B \cup C) = \{(1, 3), (1, 4), (1, 5), (1, 6), (2, 3), (2, 4), (2, 5), (2, 6), (3, 3), (3, 4), (3, 5), (3, 6)\}$

D. $(A \times B) \cup (A \times C) = \{(1, 3), (1, 4), (1, 5), (1, 6) (2,3), (2,4), (2,5), (2,6), (3,3), (3,4), (3,5), (3,6)\}$

E. $A \cap B = \{3\}$, $B \cap C = \{4\}$

$\therefore \quad (A \cap B) \times (B \cap C) = \{3, 4\}$

A $\to$ p; B $\to$ p; C $\to$ q; D $\to$ q; E $\to$ r

Ex 17. Let $A = \{1, 2, 3, 4, \dots, 14\}$. A relation R from A to A is defined by $R = \{(x, y): 3x - y = 0$, where $x, y \in A\}$. Then, match the terms of Column I with the terms of Column II and choose the correct option from the codes given below:

	Column I		Column II
A.	In roster form, the relation R is	p.	$\{1, 2, 3, 4\}$
B.	The domain of R is	q.	$\{3, 6, 9, 12\}$
C.	The range of R is	r.	$\{1, 2, 3, 4, \dots, 14\}$
D.	The codomain of R is	s.	$\{(1, 3), (2, 6), (3, 9), (4, 12)\}$

Sol. We have, $3x - y = 0 \Rightarrow y = 3x$

For $\quad x = 1, \quad y = 3 \in A$
$x = 2, \quad y = 6 \in A$
$x = 3, \quad y = 9 \in A$
$x = 4, \quad y = 12 \in A$
$x = 5, \quad y = 15 \notin A$

A. In roster form, $R = \{(1, 3), (2, 6), (3, 9), (4, 12)\}$

B. Domain of $R =$ Set of first elements of ordered pairs in R
$= \{1, 2, 3, 4\}$

C. Range of $R =$ Set of second elements of ordered pairs in R
$= \{3, 6, 9, 12\}$

D. Codomain of R is the set A.

A $\to$ s; B $\to$ p; C $\to$ q; D $\to$ r

Type 6. **Single Integer Answer Type Questions**

Ex 18. If $n(A) = 4$, $n(B) = 3$ and $n(A \times B \times C) = 24$, then $n(C)$ is equal to________.

Sol. (2) We have, $n(A) = 4$, $n(B) = 3$

and $\quad n(A \times B \times C) = 24$

$\Rightarrow \quad n(A) \times n(B) \times n(C) = 24$

$4 \times 3 \times n(C) = 24$

$n(C) = 2$

Ex 19. Let $A = \{x, y, z\}$ and $B = \{1, 2\}$. Then, the number of relations from A to B is 2^k, then k is equal to________.

Sol. (6) We have, $n(A) = 3$, $n(B) = 2$

$n(A \times B) = 6$

Total number of relations from A to $B = 2^{n(A \times B)} = 2^6$

$\therefore \quad k = 6$

Target Exercises

Type 1. **Only One Correct Option**

1. If two sets A and B are having 99 elements in common, then the number of elements common to each of the sets $A \times B$ and $B \times A$ are

(a) 2^{99} (b) 99^2 (c) 100 (d) 18

2. Let $n(A) = m$ and $n(B) = n$. Then, the total number of non-empty relations that can be defined from A to B is

(a) m^n (b) $n^m - 1$ (c) $mn - 1$ (d) $2^{mn} - 1$

3. Let $X = \{1, 2, 3, 4, 5\}$ and $Y = \{1, 3, 5, 7, 9\}$. Which of the following is not a relation from X to Y?

(a) $R_1 = \{(x, y) : y = x + 2, x \in X, y \in Y\}$
(b) $R_2 = \{(1, 1), (2, 1), (3, 3), (4, 3), (5, 5)\}$
(c) $R_3 = \{(1, 1), (1, 3), (3, 5), (3, 7), (5, 7)\}$
(d) $R_4 = \{(1, 3), (2, 5), (2, 4), (7, 9)\}$

4. A relation R from C to R is defined by xRy iff $|x| = y$. Which of the following is correct?

(a) $(2 + 3i)R13$ (b) $3R(-3)$
(c) $(1 + i)R2$ (d) $iR1$

5. The relation R defined on the set $A = \{1, 2, 3, 4, 5\}$ by $R = \{(x, y) : |x^2 - y^2| < 16\}$ is given by

(a) $\{(1, 1), (2, 1), (3, 1), (4, 1), (2, 3)\}$
(b) $\{(2, 2), (3, 2), (4, 2), (2, 4)\}$
(c) $\{(3, 3), (4, 3), (5, 4), (3, 4)\}$
(d) None of the above

6. A relation R is defined in the set Z of integers as follows $(x, y) \in R$ iff $x^2 + y^2 = 9$. Which of the following is false?

(a) $R = \{(0, 3), (0, -3), (3, 0), (-3, 0)\}$
(b) Domain of $R = \{-3, 0, 3\}$
(c) Range of $R = \{-3, 0, 3\}$
(d) None of the above

7. If $R = \{(x, y) : x, y \in Z, x^2 + y^2 \le 4\}$ is a relation in Z, then domain of R is

(a) $\{0, 1, 2\}$ (b) $\{-2, -1, 0\}$
(c) $\{-2, -1, 0, 1, 2\}$ (d) None of these

8. Let R be a relation in N defined by $R = \{(x, y) : x + 2y = 8\}$. The range of R is

(a) $\{2, 4, 6\}$ (b) $\{1, 2, 3\}$
(c) $\{1, 2, 3, 4, 6\}$ (d) None of these

9. Let $A = \{1, 2, 3\}$, $B = \{1, 3, 5\}$. If relation R from A to B is given by $\{(1, 3), (2, 5), (3, 3)\}$, then R^{-1} is

(a) $\{(3, 3), (3, 1), (5, 3)\}$
(b) $\{(1, 3), (2, 5), (3, 3)\}$
(c) $\{(1, 3), (5, 2)\}$
(d) None of the above

10. R is a relation from $\{11, 12, 13\}$ to $\{8, 10, 12\}$ defined by $y = x - 3$. The relation R^{-1} is

(a) $\{(11, 8), (13, 10)\}$
(b) $\{(8, 11), (10, 13)\}$
(c) $\{(8, 11), (9, 12), (10, 13)\}$
(d) None of the above

11. Let a relation R be defined by $R = \{(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)\}$. The relation $R^{-1} oR$ is given by

(a) $\{(1, 1), (4, 4), (7, 4), (4, 7), (7, 7)\}$
(b) $\{(1, 1), (4, 4), (4, 7), (7, 4), (7, 7), (3, 3)\}$
(c) $\{(1, 5), (1, 6), (3, 6)\}$
(d) None of the above

12. If R is a relation on the set $A = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$ given by $xRy \Leftrightarrow y = 3x$, then RoR^{-1} is

(a) $\{(1, 3), (2, 6), (3, 9)\}$
(b) $\{(1, 1), (2, 2), (3, 3)\}$
(c) $\{(3, 3), (6, 6), (9, 9)\}$
(d) None of the above

13. If $R \subseteq A \times B$ and $S \subseteq B \times C$ be two relations, then $(SoR)^{-1}$ is equal to

(a) $S^{-1} oR^{-1}$ (b) RoS
(c) $R^{-1} oS^{-1}$ (d) None of these

14. If R is a relation from a set A to the set B and S is a relation from B to C, then the relation SoR

(a) is from C to A (b) is from A to C
(c) does not exist (d) None of these

15. Let $A = [-1, 1]$, $B = [-1, 1]$, $C = [0, \infty)$. If $R_1 = \{(x, y) \in A \times B : x^2 + y^2 = 1\}$ and $R_2 = \{(x, y) \in A \times C : x^2 + y^2 = 1\}$, then

(a) R_1 defines a function from A into B
(b) R_2 defines a function from A into C
(c) R_1 defines a function from A onto B
(d) R_2 defines a function from A onto C

16. The relation f is defined by $f(x) = \begin{cases} x^2, & 0 \le x \le 3 \\ 3x, & 3 \le x \le 10 \end{cases}$ and the relation g is defined by $g(x) = \begin{cases} x^2, & 0 \le x \le 2 \\ 3x, & 2 \le x \le 10 \end{cases}$. Which of the following relation is a function?

(a) f
(b) g
(c) f, g
(d) None of the above

17. The domain of $F(x)=\dfrac{\log_2(x+3)}{x^2+3x+2}$ is

(a) $R-\{-1,-2\}$ (b) $(-2,\infty)$
(c) $R-\{-1,-2,-3\}$ (d) $(-3,\infty)-\{-1,-2\}$

18. The domain and range of the function f given by $f(x)=2-|x-5|$ is

(a) Domain $=R^+$, Range $=(-\infty,1]$
(b) Domain $=R$, Range $=(-\infty,2]$
(c) Domain $=R$, Range $=(-\infty,2)$
(d) Domain $=R^+$, Range $=(-\infty,2]$

19. The range of the function $f(x)=\dfrac{x-2}{2-x}$ when $x\neq 2$ is

(a) R (b) $R-\{1\}$ (c) $\{-1\}$ (d) $R-\{-1\}$

20. The range of the function $f(x)=|x|$ is

(a) $(0,\infty)$ (b) $(-\infty,0)$
(c) $[0,\infty)$ (d) None of these

21. If f and g are two functions defined as $f(x)=x+2$, $x\leq 0$; $g(x)=3$, $x\geq 0$, then the domain of $f+g$ is

(a) $\{0\}$ (b) $[0,\infty)$ (c) $(-\infty,\infty)$ (d) $(-\infty,0)$

22. If $[x]^2-5[x]+6=0$, where $[\cdot]$ denotes the greatest integer function, then

(a) $x\in[3,4]$ (b) $x\in(2,3]$ (c) $x\in[2,3]$ (d) $x\in[2,4)$

23. If $f(x)=1-\dfrac{1}{x}$, then $f\left\{f\left(\dfrac{1}{x}\right)\right\}$ is

(a) $\dfrac{1}{x}$ (b) $\dfrac{1}{1+x}$ (c) $\dfrac{x}{x-1}$ (d) $\dfrac{1}{x-1}$

24. Let $f(x)=\dfrac{x-1}{x+1}$, then $f\{f(x)\}$ is

(a) $\dfrac{1}{x}$ (b) $-\dfrac{1}{x}$ (c) $\dfrac{1}{x+1}$ (d) $\dfrac{1}{x-1}$

25. Two functions f and g are said to commute, if $(fog)(x)=(gof)(x)$, $\forall\ x$, then which one of the following functions are commute?

(a) $f(x)=x^3$, $g(x)=x+1$
(b) $f(x)=\sqrt{x}$, $g(x)=\cos x$
(c) $f(x)=x^m$, $g(x)=x^n$, $m\neq n$, $m,n\in I$ (I is the set of all integers)
(d) $f(x)=x-1$, $g(x)=x^2+1$

26. If $f(x)=x^2+1$, then the value of $(fof)(x)$ is equal to

(a) x^4+2x^2+2 (b) x^4+2x^2-2
(c) x^4+x^2+1 (d) None of these

27. If $f(x)$ is defined on $[0,1]$ by the rule

$f(x)=\begin{cases} x, & \text{if } x\in Q \\ 1-x, & \text{if } x\notin Q \end{cases}$, then for $x\in[0,1]$

(a) $(fof)(x)=1+x$ (b) $(fof)(x)=x$
(c) $(fof)(x)=1-x$ (d) None of these

28. If $f(x)=\begin{cases} x^3+1 & x<0 \\ x^2+1, & x\geq 0 \end{cases}$, $g(x)=\begin{cases} (x-1)^{1/3}, & x<1 \\ (x-1)^{1/2}, & x\geq 1 \end{cases}$, then $(gof)(x)$ is equal to

(a) x, $\forall\ x\in R$ (b) $x-1$, $\forall\ x\in R$
(c) $x+1$, $\forall\ x\in R$ (d) None of these

29. If $f(x)=[x]$ and $g(x)=x-[x]$, then which of the following is the zero function?

(a) $(f+g)(x)$ (b) $(fg)(x)$
(c) $(f-g)(x)$ (d) $(fog)(x)$

30. If $f(x)=\dfrac{x}{x-1}$, $x\neq 1$, then $(\underbrace{fofo\ldots of}_{19\text{ times}})(x)$ is equal to

(a) $\dfrac{x}{x-1}$ (b) $\left(\dfrac{x}{x-1}\right)^{19}$ (c) $\dfrac{19x}{x-1}$ (d) x

31. Let $f\left(x+\dfrac{1}{x}\right)=x^2+\dfrac{1}{x^2}$, $x\in R-\{0\}$, then $f(x)$ is equal to

(a) x^2 (b) x^2-1
(c) x^2-2, when $|x|\geq 2$ (d) None of these

32. Let $f:[0,1]\to[0,1]$ and $g:[0,1]\to[0,1]$ be two functions defined by $f(x)=\dfrac{1-x}{1+x}$ and $g(x)=4x(1-x)$, then $(fog)(x)$ is equal to

(a) $\dfrac{8x(1-x)}{(1+x)^2}$ (b) $\dfrac{4(1-x)}{1+x}$
(c) $\dfrac{1-4x+4x^2}{1+4x-4x^2}$ (d) None of these

33. Let $f(x)=|x-1|$, $x\in R$, then

(a) $f(x^2)=(f(x))^2$ (b) $f(x+y)=f(x)+f(y)$
(c) $f(|x|)=|f(x)|$ (d) None of these

Type 2. **More than One Correct Option**

34. If $A=\{a,b,c,d\}$, $B=\{1,2,3\}$, which of the following sets of ordered pairs are not relation from A to B?

(a) $\{(a,1),(a,3)\}$
(b) $\{(b,1),(c,2),(d,1)\}$
(c) $\{(a,2),(b,3),(3,b)\}$
(d) $\{(a,1),(b,2),(3,c)\}$

35. The relation R defined in $A=\{1,2,3\}$ by aRb, if $|a^2-b^2|\leq 5$. Which of the following is true?

(a) $R=\{(1,1),(2,2),(3,3),(2,1),(1,2),(2,3),(3,2)\}$
(b) $R^{-1}=R$
(c) Domain of $R=\{1,2,3\}$
(d) Range of $R=\{5\}$

Target Exercises

Type 3. **Assertion and Reason**

Directions (Q. Nos. 36-37) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d), out of which only one is correct. The choices are*

(a) *Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I*
(b) *Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I*
(c) *Statement I is true, Statement II is false*
(d) *Statement I is false, Statement II is true*

36. **Statement I** The domain of the real function f defined by $f(x)=\sqrt{x-1}$ is $R-\{1\}$.

Statement II The range of the function defined by $f(x)=\sqrt{x-1}$ is $[0,\infty)$.

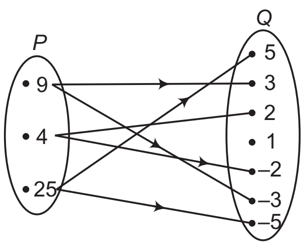
37. **Statement I** Let f and g be two real functions given by $f=\{(0,1),(2,0),(3,-4),(4,2),(5,1)\}$ and $g=\{(1,0),(2,2),(3,-1),(4,4),(5,3)\}$.

Then, domain of $f\cdot g$ is given by $\{2,3,4,5\}$.

Statement II Let f and g be two real functions. Then, $(f\cdot g)(x)=f\{g(x)\}$.

Type 4. **Linked Comprehension Based Questions**

Passage (Q. Nos. 38-39) *The figure shows a relation R between the sets P and Q.*



38. The domain of the relations R is
(a) $\{4, 9, 25\}$
(b) $\{2, 3, 5\}$
(c) $\{-2, -3, -5\}$
(d) $\{-4, -9, -25\}$

39. The range of the relation R is
(a) $\{2, 3, 4\}$
(b) $\{-2, -3, -5\}$
(c) $\{-5, -3, -2, 2, 3, 5\}$
(d) $\{-5, -3, -2, 1, 2, 3, 5\}$

Type 5. **Match the Column**

40. Match the terms of Column I with the terms of Column II.

	Column I	Column II
A.	If $P=\{x: x<3, x\in N\}$ and $Q=\{x: x\le 2, x\in N\}$, then $(P\cup Q)\times(P\cap Q)$ is equal to	p. $\{(0,8),(8,0),(0,-8),(-8,0)\}$
B.	If $A=\{x: x\in W, x<2\}$, $B=\{x: x\in N, 1<x<5\}$ and $C=\{3,5\}$, where W is the set of whole numbers, then $A\times(B\cap C)$ is equal to	q. $\{(-2,3),(-1,5),(0,7),(1,9),(2,11)\}$
C.	If $R=\{(x,y): x$ and y are integers and $\{x^2+y^2=64\}$ is a relation, then R in roster form is	r. $\{(0,3),(1,3)\}$
D.	If $R=\{(x,y): y=2x+7, x\in Z$ and $-2\le x\le 2\}$ is a relation, then R is	s. $\{(1,1),(1,2),(2,1),(2,2)\}$

Type 6. **Single Integer Answer Type Questions**

41. Let A and B be two sets having 3 elements in common. If $n(A)=5$ and $n(B)=4$, then $n[(A\times B)\cap(B\times A)]$ is equal to _______.

42. Let $f=\{(1,1),(2,3),(0,-1),(-1,-3)\}$ be a linear function from Z to Z, such that $f(x)=kx-1$, then k is equal to _______.

Entrances Gallery

AIEEE

1. The domain of the function $f(x) = \frac{1}{\sqrt{|x| - x}}$ is **[2011]**

(a) $(0, \infty)$
(b) $(-\infty, 0)$
(c) $(-\infty, \infty) - \{0\}$
(d) $(-\infty, \infty)$

2. Let for $a \neq a_1 \neq 0$, $f(x) = ax^2 + bx + c$, $g(x) = a_1x^2 + b_1x + c_1$ and $p(x) = f(x) - g(x)$. If $p(x) = 0$ only for $x = -1$ and $p(-2) = 2$, then the value of $p(2)$ is **[2011]**

(a) 18 (b) 3 (c) 9 (d) 6

3. Let $f: N \to Y$ be a function defined as $f(x) = 4x + 3$ where $Y = \{y \in N : y = 4x + 3 \text{ for some } x \in N\}$.
If f is invertible, then its inverse is **[2008]**

(a) $g(y) = \frac{y-3}{4}$
(b) $g(y) = \frac{3y+4}{3}$
(c) $g(y) = 4 + \frac{y+3}{4}$
(d) $g(y) = \frac{y+3}{4}$

4. A real valued function $f(x)$ satisfies the functional equation $f(x - y) = f(x)f(y) - f(a - x)f(a + y)$, where a is a given constant and $f(0) = 1$, $f(2a - x)$ is equal to **[2005]**

(a) $f(-x)$
(b) $f(a) + f(a - x)$
(c) $f(x)$
(d) $-f(x)$

5. If $f: R \to R$ satisfies $f(x + y) = f(x) + f(y)$, $\forall\, x, y \in R$ and $f(1) = 7$, then $\sum_{r=1}^{n} f(r)$ is **[2003]**

(a) $\frac{7n}{2}$
(b) $\frac{7(n+1)}{2}$
(c) $7n(n+1)$
(d) $\frac{7n(n+1)}{2}$

Other Engineering Entrances

6. Let $A = \{1, 2, 3, 4\}$ and R be the relation on A defined by $\{(a, b) : a, b \in A, a \times b$ is an even number$\}$, then the range of R is **[J&K CET 2014]**

(a) $\{1, 2, 4\}$
(b) $\{2, 4\}$
(c) $\{2, 3, 4\}$
(d) $\{1, 2, 4\}$

7. The domain of the function $f(x) = \frac{(x^2 + 1)}{x^2 - 3x + 3}$ is **[J&K CET 2014]**

(a) $R - \{1, 2\}$
(b) $R - \{1, 4\}$
(c) R
(d) $R - \{1\}$

8. Let $A = \{1, 2, 3, 4, 5\}$. The domain of the relation on A defined by $R = \{(x, y) : y = 2x - 1\}$ is **[J&K CET 2014]**

(a) $\{1, 2, 3\}$
(b) $\{1, 2\}$
(c) $\{1, 3, 5\}$
(d) $\{2, 4\}$

9. If $f(x) = \sqrt{x}$ and $g(x) = 2x - 3$, then domain of $(fog)(x)$ is **[Kerala CEE 2014]**

(a) $(-\infty, -3)$
(b) $\left(-\infty, -\frac{3}{2}\right)$
(c) $\left[-\frac{3}{2}, 0\right]$
(d) $\left[0, \frac{3}{2}\right]$
(e) $\left[\frac{3}{2}, \infty\right)$

10. If $f(x) = \frac{x+2}{3x-1}$, then $f\{f(x)\}$ is **[Kerala CEE 2014]**

(a) x
(b) $-x$
(c) $\frac{1}{x}$
(d) $-\frac{1}{x}$
(e) 0

11. The range of the function $f(x) = \log_e(3x^2 + 4)$ is equal to **[Kerala CEE 2012]**

(a) $[\log_e 2, \infty)$
(b) $[\log_e 3, \infty)$
(c) $[2\log_e 3, \infty)$
(d) $[0, \infty)$
(e) $[2\log_e 2, \infty)$

12. Let R be the set of real numbers and the functions $f: R \to R$ and $g: R \to R$ be defined by $f(x) = x^2 + 2x - 3$ and $g(x) = x + 1$. Then, the value of x for which $g(f(x)) = f(g(x))$ is **[WB JEE 2012]**

(a) -1
(b) 0
(c) 1
(d) 2

13. Let $A = \{x, y, z\}$ and $B = \{a, b, c, d\}$. Which one of the following is not a relation from A to B? **[Kerala CEE 2011]**

(a) $\{(x, a), (x, c)\}$
(b) $\{(y, c), (y, d)\}$
(c) $\{(z, a), (z, d)\}$
(d) $\{(z, b), (y, b), (a, d)\}$
(e) $\{(x, c)\}$

14. If $f(x) = 3 - x$, $-4 \le x \le 4$, then the domain of $\log_e(f(x))$ is **[J&K CET 2011]**

(a) $[-4, 4]$
(b) $(-\infty, 3]$
(c) $(-\infty, 3)$
(d) $[-4, 3)$

15. Let $f = \{(0, -1), (-1, 3), (2, 3), (3, 5)\}$ be a function from Z to Z defined by $f(x) = ax + b$. Then, **[AMU 2011]**

(a) $a = 1, b = -2$
(b) $a = 2, b = 1$
(c) $a = 2, b = -1$
(d) $a = 1, b = 2$

16. If $f(x) = x^2 - 1$ and $g(x) = (x+1)^2$, then $(gof)(x)$ is **[Kerala CEE 2011]**

(a) $(x+1)^4 - 1$
(b) $x^4 - 1$
(c) x^4
(d) $(x+1)^4$
(e) $(x-1)^4 - 1$

17. Let R be the set of real numbers and the mapping $f : R \to R$ and $g : R \to R$ be defined by $f(x) = 5 - x^2$ and $g(x) = 3x - 4$, then the value of $(fog)(-1)$ is **[WB JEE 2010]**

(a) -44 (b) -54 (c) -32 (d) -64

18. Let $A = \{1, 0, 1, 2\}$, $B = \{4, 2, 0, 2\}$ and $f, g : A \to B$ be functions defined by $f(x) = x^2 - x$ and $g(x) = 2\left|x - \frac{1}{2}\right| - 1$. Then, **[AMU 2010]**

(a) $f = g$
(b) $f = 2g$
(c) $g = 2f$
(d) None of the above

Explanations

Target Exercises

1. $n[(A \times B) \cap (B \times A)] = n[(A \cap B) \times (B \cap A)]$
$= n(A \cap B) \times n(B \cap A)$
$= 99 \times 99 = 99^2$

2. Given, $n(A) = m$ and $n(B) = n$
Now, total number of relations from A to $B = 2^{mn}$
$\therefore$Total number of non-empty relations from A to B
$= 2^{mn} - 1$

3. R_1 is a relation from X to Y because $R_1 \subseteq X \times Y$.
R_2 is a relation from X to Y because $R_2 \subseteq X \times Y$.
R_3 is a relation from X to Y because $R_3 \subseteq X \times Y$.
R_4 is not a relation from X to Y because (2, 4), (7, 9) $\notin X \times Y$.

4. $|\, i \,| = \sqrt{0^2 + (1)^2} = \sqrt{1} = 1$
$\therefore$ $iR1$ is correct.

5. We have, $R = \{(x, y) : |\, x^2 - y^2 | < 16\}$
$\therefore$ $R = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 1), (2, 2), (2, 3), (2, 4), (3, 1), (3, 2), (3, 3), (3, 4), (4, 1), (4, 2), (4, 3), (4, 4), (4, 5), (5, 4), (5, 5)\}$

6. $x^2 + y^2 = 9 \;\Rightarrow\; y = 9 - x^2$
$\Rightarrow$ $y = \pm\sqrt{9 - x^2}$
$\therefore$ $R = \{(0, 3), (0, -3), (3, 0), (-3, 0)\}$
Domain of $R = \{x : (x, y) \in R\} = \{0, 3, -3\}$
Range of $R = \{y : (x, y) \in R\} = \{3, -3, 0\}$

7. We have, $R = \{(x, y) : x, y \in Z, x^2 + y^2 \le 4\}$
$R = \{(0, 0), (0, -1), (0, 1), (0, -2), (0, 2), (-1, 0), (1, 0), (1, 1), (1, -1), (-1, 1), (-1, -1), (2, 0), (-2, 0)\}$
$\therefore$ Domain of $R = \{x : (x, y) \in R\} = \{0, -1, 1, -2, 2\}$

8. $R = \{(x, y) : x + 2y = 8, x, y \in N\}$
$x + 2y = 8 \;\Rightarrow\; y = \dfrac{8 - x}{2}$
$R = \{(2, 3), (4, 2), (6, 1)\}$
$\therefore$ Range of $R = \{y : (x, y) \in R\} = \{1, 2, 3\}$

9. We have, $R = \{(1, 3), (2, 5), (3, 3)\}$
$\therefore$ $R^{-1} = \{(y, x) : (x, y) \in R\} = \{(3, 1), (5, 2), (3, 3)\}$

10. We have, $R = \{(x, y) : y = x - 3, x = 11$ or 12 or 13, $y = 8$ or 10 or $12\}$
$= \{(11, 8), (13, 10)\}$
$\therefore$ $R^{-1} = \{(y, x) : (x, y) \in R\}$
$= \{(8, 11), (10, 13)\}$

11. We have, $R = \{(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)\}$
$R^{-1} = \{(5, 4), (4, 1), (6, 4), (6, 7), (7, 3)\}$
$\therefore$ $R^{-1}oR = \{(4, 4), (1, 1), (4, 7), (7, 4), (7, 7), (3, 3)\}$

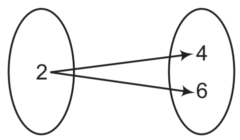
12. We have, set $A = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$
$xRy \;\Rightarrow\; y = 3x$
$\therefore$ $R = \{(1, 3), (2, 6), (3, 9)\}$
and $R^{-1} = \{(3, 1), (6, 2), (9, 3)\}$
$\therefore$ $ROR^{-1} = \{(1, 1), (2, 2), (3, 3)\}$

13. SoR is a relation from A to C.
$\therefore$ $(SoR)^{-1}$ is a relation from C to A.
R^{-1} is a relation from B to A.
S^{-1} is a relation from C to B.
$\therefore R^{-1}oS^{-1}$ is a relation from C to A.
Let $(c, a) \in (SoR)^{-1}$
$\therefore$ $(a, c) \in SoR$
$\Rightarrow$ $\exists\, b \in B : (a, b) \in R$ and $(b, c) \in S$
$\Rightarrow$ $(b, a) \in R^{-1}$ and $(c, b) \in S^{-1}$
$\Rightarrow$ $(c, a) \in R^{-1}oS^{-1}$
$\therefore$ $(SoR)^{-1} \subseteq R^{-1}oS^{-1}$
Conversely, let $(c, a) \in R^{-1}oS^{-1}$
$\Rightarrow \exists\, b \in B : (c, b) \in S^{-1}$ and $(b, a) \in R^{-1}$
$\Rightarrow$ $(b, c) \in S$ and $(a, b) \in R$
$\Rightarrow$ $(a, c) \in SoR \;\Rightarrow\; (c, a) \in (SoR)^{-1}$
$\therefore$ $R^{-1}oS^{-1} \subseteq (SoR)^{-1}$
Combining, we get $(SoR)^{-1} = R^{-1}oS^{-1}$

14. Since, $R \subseteq A \times B$ and $S \subseteq B \times C$, we have $SoR \subseteq A \times C$
$\therefore$ SoR is a relation from A to C.

15. $R_2 = \{(x, y) \in A \times C : x^2 + y^2 = 1\}$
$x^2 + y^2 = 1 \;\Rightarrow\; y = \pm\sqrt{1 - x^2}$
$\Rightarrow$ $y = \sqrt{1 - x^2}$ $\quad [\because y \ge 0]$
$\therefore R_2$ is a function from A onto C.

16. Given, $f(x) = \begin{cases} x^2, & 0 \le x \le 3 \\ 3x, & 3 \le x \le 10 \end{cases}$
$\because$ $f(x) = x^2$ is well-defined in $0 \le x \le 3$
and $f(x) = 3x$ is also well-defined in $3 \le x \le 10$
At $x = 3$, $f(x) = x^2$
$\Rightarrow$ $f(3) = 3^2 = 9$
At $x = 3$, $f(x) = 3x$
$\Rightarrow$ $f(3) = 3 \times 3 = 9$
$\Rightarrow f(x)$ is defined at $x = 3$. Hence, f is a function.
$g(x) = \begin{cases} x^2, & 0 \le x \le 2 \\ 3x, & 2 \le x \le 10 \end{cases}$
$\because g(x) = x^2$ is well-defined in $0 \le x \le 2$
and $g(x) = 3x$ is also well-defined in $2 \le x \le 10$



But at $x = 2$, $g(x) = x^2$
$\Rightarrow$ $g(2) = 2^2 = 4$
At $x = 2$, $g(x) = 3x$
$\Rightarrow$ $g(2) = 3 \times 2 = 6$
Therefore, $g(x)$ is not defined at $x = 2$.
Hence, g is not a function.

17. We have, $F(x)=\dfrac{\log_2(x+3)}{x^2+3x+2}$

$\therefore$ $F(x)$ is defined, if $x+3>0$
and $x^2+3x+2\neq 0$
$\Rightarrow$ $F(x)$ is defined, if $x>-3$
and $x\neq -1,-2$
$\Rightarrow$ Domain of $F(x)=(-3,\infty)-\{-1,-2\}$

18. Given, $f(x)=2-|x-5|$
Domain of $f(x)$ is defined for all real values of x.
$\because$ $|x-5|\geq 0 \Rightarrow -|x-5|\leq 0$
$\Rightarrow$ $2-|x-5|\leq 2 \Rightarrow f(x)\leq 2$
Hence, range of $f(x)$ is $(-\infty,2]$.

19. $f(x)=\dfrac{x-2}{2-x}=-\dfrac{x-2}{x-2}=-1$, if $x\neq 2$

$\therefore$ Range of $f=\{-1\}$

20. $f(x)=|x| \Rightarrow R(f)=[0,\infty)$

21. $D(f+g)=D(f)\cap D(g)$
$(-\infty,0]\cap[0,\infty)=\{0\}$

22. Given, $[x]^2-5[x]+6=0$
$\Rightarrow$ $[x]^2-3[x]-2[x]+6=0$
$\Rightarrow$ $[x]([x]-3)-2([x]-3)=0$
$\Rightarrow$ $([x]-3)([x]-2)=0$
$\Rightarrow$ $[x]=3$ or $[x]=2$
$\Rightarrow$ $x\in[3,4)$ or $x\in[2,3)$
$\therefore$ $x\in[2,4)$

23. $f\left\{f\left(\dfrac{1}{x}\right)\right\}=f\left(1-\dfrac{1}{(1/x)}\right)=f(1-x)=1-\dfrac{1}{1-x}$

$=\dfrac{1-x-1}{1-x}=\dfrac{x}{x-1}$

24. $f\{f(x)\}d=f\left(\dfrac{x-1}{x+1}\right)=\dfrac{\dfrac{x-1}{x+1}-1}{\dfrac{x-1}{x+1}+1}$

$=\dfrac{x-1-x-1}{x-1+x+1}=\dfrac{-2}{2x}=-\dfrac{1}{x}$

25. $(fog)(x)=(gof)(x)$ only when
$f(x)=x^m$
and $g(x)=x^n$
As $f\{g(x)\}=(x^n)^m=x^{nm}$
and $g\{f(x)\}=(x^m)^n=x^{nm}$
$\therefore$ $f\{g(x)\}=g\{f(x)\}$

26. $(fof)(x)=f\{f(x)\}=f(x^2+1)=(x^2+1)^2+1$

$=x^4+2x^2+2$

27. Let $x\in[0,1]$
***Case* I** $x\in Q$
$\therefore$ $f(x)=x$
and $(fof)(x)=f\{f(x)\}=f(x)=x$ $[\because x\in Q]$
***Case* II** $x\notin Q$
$\therefore$ $f(x)=1-x$
and $(fof)(x)=f\{f(x)\}=f(1-x)$
$=1-(1-x)=x$ $[\because 1-x\notin Q]$
Now, in both cases, $(fof)(x)=x$

28. Let $x<0$
$\therefore$ $(gof)(x)=g\{f(x)\}=g(x^3+1)$
$=[(x^3+1)-1]^{1/3}$ $[\because x<0\Rightarrow x^3+1<1]$
$=(x^3)^{1/3}=x$
Let $x\geq 0$
$\therefore$ $(gof)(x)=g(f(x))=g(x^2+1)=[(x^2+1)-1]^{1/2}$
$[\because x\geq 0\Rightarrow x^2+1\geq 1]$
$=(x^2)^{1/2}=|x|=x$ $[\because x\geq 0]$
$\therefore$ $(gof)(x)=x,\ \forall\ x\in R$

29. $(f+g)(x)=f(x)+g(x)=[x]+(x-[x])=x\neq 0$
$(fg)(x)=f(x)\cdot g(x)=[x](x-[x])\neq 0$
$(f-g)(x)=f(x)-g(x)=[x]-(x-[x])$
$=2[x]-x\neq 0$
$(fog)(x)=f(g(x))=f(x-[x])=[x-[x]]=0$
$[\because x-[x]\in[0,1)]$

30. $(fof)x=f\left(\dfrac{x}{x-1}\right)=\dfrac{\dfrac{x}{x-1}}{\left(\dfrac{x}{x-1}\right)-1}=x$

$\Rightarrow (fofof)x=f(fof)(x)=f(x)=\dfrac{x}{x-1}$

$\therefore$ $(fofof\ldots 19\text{ times})(x)=\dfrac{x}{x-1}$

31. $f\left(x+\dfrac{1}{x}\right)=x^2+\dfrac{1}{x^2}=\left(x+\dfrac{1}{x}\right)^2-2$

Let $z=x+\dfrac{1}{x}$

$\therefore$ $f(z)=z^2-2$
Replacing z by x, we get
$f(x)=x^2-2,$ when $|x|\geq 2$

32. $f\{g(x)\}=\dfrac{1-g(x)}{1+g(x)}=\dfrac{1-4(x)(1-x)}{1+4x(1-x)}$

$=\dfrac{1-4x+4x^2}{1+4x-4x^2}$

33. We have, $f(x)=|x-1|$
(a) $|x^2-1|=(|x-1|)^2$, which is not true.
(b) $|x+y-1|=|x-1|+|y-1|$, which is not true.
(c) $||x|-1|=|(|x-1|)|$, which is not true.

34. $\{(a,1),(a,3)\}\subseteq A\times B$
$\therefore$ This is a relation.
$\{(b,1),(c,2),(d,1)\}\subseteq A\times B$
$\therefore$ This is a relation.
$(3,b)\notin A\times B$
$\therefore$ $(a,2),(b,3),(3,b)$ is not a relation from A to B.
$(3,c)\notin A\times B$
$\therefore$ $\{(a,1),(b,2),(3,c)\}$ is not a relation from A to B.

35. $\because$ $R=\{(1,1),(1,2),(2,1),(2,2),(2,3),(3,2),(3,3)\}$
$R^{-1}=\{(y,x):(x,y)\in R\}$
$=\{(1,1),(2,1),(1,2),(2,2),(3,2),(2,3),(3,3)\}=R$
Domain of $R=\{x:(x,y)\in R\}=\{1,2,3\}$
and range of $R=\{y:(x,y)\in R\}=\{1,2,3\}$

36. We have, $f(x)=\sqrt{x-1}$

$f(x)$ is defined, if $x-1\geq 0$

i.e. $x\geq 1$

$\therefore$ Domain of $f=[1,\infty)$

Hence, Statement I is false.

Let $f(x)=y$

Then, $y=\sqrt{x-1}$

$\Rightarrow y^2=x-1$

$\Rightarrow x=y^2+1$

$\therefore$ Range of $f=[0,\infty)$ $[\because x\geq 1]$

37. Domain of $f=\{0,2,3,4,5\}$

Domain of $g=\{1,2,3,4,5\}$

Domain of $f\cdot g$ = Domain of $f\cap$ Domain of $g=\{2,3,4,5\}$

Hence, Statement I is true.

If f and g are two real functions.

Then, $(f\cdot g)(x)=f(x)\cdot g(x)$

Hence, Statement II is false.

38. Domain of R = Set of first elements of ordered pairs in R

$=\{4,9,25\}$

39. Range of R = Set of second elements of ordered pairs in R

$=\{-5,5,-3,3,-2,2\}$

40. A. $P=\{1,2\}, Q=\{1,2\}$

$P\cup Q=\{1,2\}, P\cap Q=\{1,2\}$

$\therefore (P\cup Q)\times(P\cap Q)=\{(1,1),(1,2),(2,1),(2,2)\}$

B. $A=\{0,1\}, B=\{2,3,4\}, C=\{3,5\}$

$B\cap C=\{3\}$

$A\times(B\cap C)=\{(0,3),(1,3)\}$

C. $R=\{(0,8),(0,-8),(8,0),(-8,0)\}$

D. $R=\{(-2,3),(-1,5),(0,7),(1,9),(2,11)\}$

41. Given, $n(A)=5, n(B)=4, n(A\cap B)=3$

$n[(A\times B)\cap(B\times A)]=n[(A\cap B)\times(B\cap A)]$

$=n(A\cap B)\times n(B\cap A)=3\times 3=9$

42. Since, $f(x)$ is a linear function, $f(x)=mx+c$

Also, $f(1)=m+c=1$

and $f(0)=c=-1$

This gives $m=2$

and $f(x)=2x-1$

$\therefore k=2$

Entrances Gallery

1. $y=\dfrac{1}{\sqrt{|x|-x}}$

For domain, $|x|-x>0$

$\Rightarrow |x|>x$

This is possible, only if $x<0$.

$\therefore x\in(-\infty,0)$

2. Given, $p(x)=f(x)-g(x)$ has only one root -1.

$\therefore p(x)=(a-a_1)x^2+(b-b_1)x+(c-c_1)$ ...(i)

$\Rightarrow \dfrac{-(b-b_1)}{(a-a_1)}=-2$ ...(ii)

and $\dfrac{(c-c_1)}{(a-a_1)}=1$ ...(iii)

Also, $p(-2)=2$

$\Rightarrow 4(a-a_1)-2(b-b_1)+(c-c_1)=2$

$\Rightarrow 4(a-a_1)-4(a-a_1)+(a-a_1)=2$

[using Eqs. (ii) and (iii)]

$\Rightarrow (a-a_1)=2$

Substituting $(a-a_1)=2$ in Eq. (i) and Eq. (ii),

$(b-b_1)=4, (c-c_1)=2$

$\therefore p(2)=4(a-a_1)+2(b-b_1)+(c-c_1)$

[from Eq. (i)]

$=8+8+2=18$

3. Since, $Y=\{y\in Y: y=4x+3$ for some $x\in N\}$

$\therefore Y=\{7,11,\ldots\infty\}$

Now, $y=4x+3$

$\Rightarrow x=\dfrac{y-3}{4}$

Inverse of $f(x)$ is $g(y)=\dfrac{y-3}{4}$.

4. Given, $f(x-y)=f(x)f(y)-f(a-x)f(a+y)$

Let $x=0=y$

$\Rightarrow f(0)=\{f(0)\}^2-\{f(a)\}^2$

$\Rightarrow 1=1-\{f(a)\}^2$ $[f(0)=1$, given$]$

$\Rightarrow f(a)=0$

$\therefore f(2a-x)=f\{a-(x-a)\}$

$=f(a)f(x-a)-f(a-a)f(x)$

$=0-f(x)\cdot 1=-f(x)$

5. $\sum_{r=1}^{n} f(r)=f(1)+f(2)+f(3)+\ldots+f(n)$

$=f(1)+2f(1)+3f(1)+\ldots+nf(1)$

[since, $f(x+y)=f(x)+f(y)$]

$=(1+2+3+\ldots+n)f(1)=f(1)\Sigma n$

$=\dfrac{7n(n+1)}{2}$ $[\because f(1)=7$, given$]$

6. Since, $A=\{1,2,3,4\}$ and R be a relation on A defined by $\{(a,b); a,b\in A, a\times b$ is an even number$\}$.

Thus, R be the set of even numbers.

$\therefore$ Range of $R=\{2,4\}$

7. $\because f(x)=\dfrac{(x^2+1)}{(x^2-3x+3)}$

$\Rightarrow (x^2+1)$ is defined for all $x\in R$.

Also, $x^2-3x=-3$ has imaginary roots.

$\therefore x^2-3x+3$ is also defined for all real numbers, i.e. $x\in R$.

Hence, domain of the function is R.

8. Since, $A=\{1,2,3,4,5\}$

$\therefore$ Relation from A to A

$R=\{(x,y): y=2x-1\}=\{(1,1),(2,3),(3,5)\}$

$\Rightarrow$ Domain $=\{1,2,3\}$

9. Given, $f(x)=\sqrt{x}$

and $g(x)=2x-3$

$\therefore (fog)(x)=f\{g(x)\}$

$=f(2x-3)=\sqrt{2x-3}$

For domain of $(fog)(x)$,

$$2x-3\ge 0 \Rightarrow 2x\ge 3$$

$$\Rightarrow \quad x\ge \frac{3}{2}$$

$$\therefore \quad x\in\left[\frac{3}{2},\infty\right)$$

10. Given, $f(x)=\dfrac{x+2}{3x-1}$

$$\therefore \quad f\{f(x)\}=f\left(\frac{x+2}{3x-1}\right)=\frac{\frac{x+2}{3x-1}+2}{3\left(\frac{x+2}{3x-1}\right)-1}$$

$$=\frac{x+2+6x-2}{3x+6-(3x-1)}$$

$$=\frac{7x}{7}=x$$

11. Given, $f(x)=\log_e(3x^2+4)$

Let $\quad y=\log_e(3x^2+4)$

$$\Rightarrow \quad 3x^2+4=e^y$$

$$\Rightarrow \quad x=\sqrt{\frac{e^y-4}{3}}$$

Here, $\quad \dfrac{e^y-4}{3}\ge 0$

$$\Rightarrow \quad e^y\ge 4$$

$$\Rightarrow \quad y\ge 2\log_e 2$$

12. Given, $\quad f(x)=x^2+2x-3$

and $\quad g(x)=x+1$

$$\because \quad f\{g(x)\}=g\{f(x)\}$$

$$\Rightarrow \quad f(x+1)=g(x^2+2x-3)$$

$$\Rightarrow (x+1)^2+2(x+1)-3=x^2+2x-3+1$$

$$\Rightarrow \quad x^2+2x+1+2x-1=x^2+2x-2$$

$$\Rightarrow \quad 2x=-2$$

$$\therefore \quad x=-1$$

13. $\{(z,b),(y,b),(a,d)\}$ is not a relation from A to B because $a\notin A$.

14. Given, $f(x)=3-x$, here $-4\le x\le 4$

To find domain of $\log_e\{f(x)\}=\log_e(3-x)$

For $\log_e\{f(x)\}$ to be defined,

$$3-x>0 \Rightarrow 3>x$$

$$\Rightarrow \quad x<3$$

$$\Rightarrow \quad \text{Domain}=[-4,3)$$

15. Here, $f(0)=0+b\Rightarrow -1=b$

and $\quad f(-1)=-a+b$

$$\Rightarrow \quad -3=-a+b$$

$$\Rightarrow \quad -a=-3+1$$

$$\Rightarrow \quad a=2$$

16. $(gof)(x)=g\{f(x)\}=g(x^2-1)=(x^2-1+1)^2=x^4$

17. $(fog)(-1)=f\{g(-1)\}=f(-7)=5-49=-44$

18. We have, $\quad A=\{1,0,1,2\}$

$$B=\{4,2,0,2\}$$

and $\quad f,g:A\to B$

Now, $\quad f(x)=x^2-x$

$$\Rightarrow \quad f(0)=0-0=0$$

and $\quad f(1)=1-1=0$

and $\quad f(2)=2^2-2=2$

Also, $\quad g(x)=2\left|x-\frac{1}{2}\right|-1$

$$\Rightarrow \quad g(0)=2\left|\frac{-1}{2}\right|-1=1-1=0$$

and $\quad g(1)=2\left|1-\frac{1}{2}\right|-1=1-1=0$

and $\quad g(2)=2\left|2-\frac{1}{2}\right|-1$

$$=\frac{2\cdot 3}{2}-1=2$$

Thus, $\quad f(x)=g(x),\forall x$

Hence, $\quad f=g$

3

Sequence and Series

Chapter Snapshot

- Introduction
- Arithmetic Progression (AP)
- Geometric Progression (GP)
- Harmonic Progression (HP)
- Arithmetico-Geometric Progression (AGP)
- Some Special Series

Introduction

Sequence Sequence is a function whose domain is the set N of natural numbers.

Real Sequence A sequence whose range is a subset of R, is called a real sequence.

Progression It is not necessary that the terms of a sequence always follow a certain pattern or they are described by some explicit formula for the nth term. Those sequences whose terms follow certain patterns, are called progressions.

Series By adding or subtracting the terms of a sequence, we get an expression which is called a series. If $a_1, a_2, a_3, a_4, \ldots, a_n, \ldots$ is a sequence, then the expression $a_1 + a_2 + a_3 + \ldots + a_n + \ldots$ is the corresponding series.

A series is finite or infinite according as corresponding sequence is finite or infinite, i.e. the number of terms in the corresponding sequence is finite or infinite.

Example 1. *The first 3 terms of the sequence which is defined by* $a_n = \dfrac{n}{n^2+1}$, *are*

(a) $2, \frac{5}{2}, \frac{10}{3}$ *(b)* $\frac{1}{2}, \frac{2}{5}, \frac{3}{10}$ *(c)* $\frac{2}{5}, \frac{1}{2}, 3$ *(d) None of these*

Sol. (b) On putting $n = 1, 2, 3$ in $a_n = \dfrac{n}{n^2+1}$, we get

$$a_1 = \frac{1}{1^2+1} = \frac{1}{2}, \quad a_2 = \frac{2}{2^2+1} = \frac{2}{5}$$

and $$a_3 = \frac{3}{3^2+1} = \frac{3}{10}$$

Hence, the first 3 terms are $\frac{1}{2}, \frac{2}{5}$ and $\frac{3}{10}$.

Arithmetic Progression (AP)

A sequence is called an arithmetic progression, if the difference of a term and the previous term is always same, i.e.

$$a_{n+1} - a_n = \text{Constant } (d), \ \forall\, n \in N$$

The constant difference, generally denoted by d is called the common difference.

Example 2. *Show that the sequence* $<a_n>$ *defined by* $a_n = 4n+5$ *is an AP. Also, find its common difference.*

Sol. We have, $a_n = 4n + 5$

On replacing n by $(n + 1)$, we get

$$a_{n+1} = 4(n + 1) + 5 = 4n + 9$$

Now, $a_{n+1} - a_n = (4n + 9) - (4n + 5)$

Clearly, $a_{n+1} - a_n = 4, \forall\, n \in N$

So, the given sequence is an AP with common difference 4.

Properties of an Arithmetic Progression

i. If a is the first term and d is the common difference of an AP, then its nth term or general term a_n is given by

$$a_n = a + (n-1)d$$

Example 3. *If the sequence* 9, 12, 15, 18, ... *is an AP, then its general term is*

(a) $3n+1$ (b) $3n+2$ (c) $3n+4$ (d) $3n+6$

Sol. (d) We have, $d = (12 - 9) = 3$

As the given sequence is an AP with common difference 3 and first term 9.

$\therefore$ General term = nth term

$$= a + (n - 1)d = 9 + (n - 1)3 = 3n + 6$$

Example 4. *Let* T_r *be the rth term of an AP for* $r = 1, 2, 3, \ldots,$ *if for some positive integers m, n, we have* $T_m = \frac{1}{n}$ *and* $T_n = \frac{1}{m}$, *then* T_{mn} *is equal to*

(a) $\frac{1}{mn}$ (b) $\frac{1}{m}+\frac{1}{n}$ (c) 1 (d) 0

Sol. (c) Let a be the first term and d be the common difference.

$\therefore$ $T_m = a + (m - 1)\,d = \frac{1}{n}$ ...(i)

and $T_n = a + (n - 1)\,d = \frac{1}{m}$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$(m - n)d = \frac{1}{n} - \frac{1}{m} = \frac{m-n}{mn}$$

$\Rightarrow$ $d = \frac{1}{mn}$

Again,
$$\begin{aligned} T_{mn} &= a + (mn - 1)d \\ &= a + (mn - n + n - 1)d \\ &= a + (n - 1)d + (mn - n)d \\ &= T_n + n(m - 1)\frac{1}{mn} \\ &= \frac{1}{m} + \frac{(m-1)}{m} = 1 \end{aligned}$$

ii. A sequence is an AP iff its nth term is of the form $An + B$, i.e. a linear expression in n. The common difference in such a case is A, i.e. the coefficient of n.

Example 5. *If the sequence* $<a_n>$ *is defined by* $a_n = 3n+2$, *then difference of any two consecutive terms is*

(a) 2 (b) 3 (c) 4 (d) 5

Sol. (b) Since, nth term is of the form $An + B$, therefore it is an AP and the common difference is coefficient of n i.e. 3.

iii. If a constant is added to or subtracted from each term of an AP, then the resulting sequence is also an AP with the same common difference.

Example 6. *If a, b and c are in AP, then which of the following will also be in AP?*

(a) $\sqrt{3}+a, \sqrt{3}+b, \sqrt{3}+c$

(b) $a-1, b-2, c-3$

(c) $a+1, b+2, c+3$

(d) $a-k, b-2k, c-3k$

Sol. (a) $a + \sqrt{3}$, $b + \sqrt{3}$ and $c + \sqrt{3}$ are in AP because each term of the given AP is being added by a constant number $\sqrt{3}$.

iv. If each term of a given AP is multiplied or divided by a non-zero constant k, then the resulting sequence is also an AP with common difference kd or d/k respectively, where d is the common difference of the given AP.

Example 7. *If a, b and c are in AP, then prove that* $a\left(\frac{1}{b}+\frac{1}{c}\right), b\left(\frac{1}{c}+\frac{1}{a}\right), c\left(\frac{1}{a}+\frac{1}{b}\right)$ *are in AP.*

Sol. Since, a, b and c are in AP.

On dividing each term by abc, the resulting sequence

$\frac{a}{abc}, \frac{b}{abc}$ and $\frac{c}{abc}$ are in AP.

$\Rightarrow$ $\frac{1}{bc}, \frac{1}{ac}$ and $\frac{1}{ab}$ are in AP.

$\Rightarrow$ $\frac{ab+bc+ca}{bc}, \frac{ab+bc+ca}{ac}, \frac{ab+bc+ca}{ab}$ are in AP

[on multiplying each term by $ab + bc + ca$]

$\Rightarrow$ $\frac{ab+bc+ca}{bc} - 1, \frac{ab+bc+ca}{ac} - 1, \frac{ab+bc+ca}{ab} - 1$ are in AP.

[on adding -1 to each term]

$\Rightarrow$ $\frac{ab+ac}{bc}, \frac{ab+bc}{ca}, \frac{bc+ca}{ab}$ are in AP.

$\Rightarrow$ $a\left(\frac{1}{b}+\frac{1}{c}\right), b\left(\frac{1}{c}+\frac{1}{a}\right), c\left(\frac{1}{a}+\frac{1}{b}\right)$ are in AP.

Hence proved.

v. In a finite AP, the sum of the terms equidistant from the beginning and end is always same and is equal to the sum of first and last term, i.e. $a_k + a_{n(k-1)} = a_1 + a_n$ for all $k = 1, 2, 3, \ldots, (n-1)$.

Example 8. *If an AP is given by* $3, a_2, \ldots, 20$, *then which of the following is the sum of second and second last terms?*

(a) 20 (b) 3 (c) 23 (d) 22

Sol. (c) As we know, $a_k + a_{n-(k-1)} = a_1 + a_n$

On putting $k = 2$, we get

$$a_2 + a_{n-1} = a_1 + a_n = 3 + 20 = 23$$

Example 9. *If* $a_1, a_2, a_3, \ldots, a_{2n+1}$ *are in AP, then* $(a_{2n+1} + a_1) + (a_{2n} + a_2) + \ldots + (a_{n+2} + a_n)$ *is equal to*

(a) $2na_n$ (b) $2na_{n-1}$

(c) $2na_{n+1}$ (d) None of these

Sol. (c) Clearly, $a_1 + a_{2n+1} = a_2 + a_{2n} = a_3 + a_{2n-1}$

$$= \ldots = a_{n+2} + a_n$$

and $a_r = a_1 + (r-1)d$

$\therefore$ $(a_{2n+1} + a_1) + (a_{2n} + a_2) + \ldots + (a_{n+2} + a_n)$

$$= n(a_{2n+1} + a_1) = n(2a_1 + 2nd)$$
$$= 2n(a_1 + nd) = 2na_{n+1}$$

vi. Three numbers a, b and c are in AP iff

$$2b = a + c$$

Example 10. *If a, b and c are in AP, then* $a + \frac{1}{bc}, b + \frac{1}{ca}$ *and* $c + \frac{1}{ab}$ *are in*

(a) HP (b) AP

(c) GP (d) None of these

Sol. (b) $a + \frac{1}{bc}, b + \frac{1}{ca}$ and $c + \frac{1}{ab}$ are in AP, if and only if

$$\left(b + \frac{1}{ca}\right) - \left(a + \frac{1}{bc}\right) = \left(c + \frac{1}{ab}\right) - \left(b + \frac{1}{ca}\right)$$

$\Rightarrow$ $(b-a) + \frac{(b-a)}{abc} = (c-b) + \frac{(c-b)}{abc}$

$\Rightarrow$ $(b-a)\{abc+1\} = (c-b)\{abc+1\}$

$\Rightarrow$ $b - a = c - b$

$\Rightarrow$ $2b = a + c$

which is true, as given a, b and c are in AP.

vii. If the terms of an AP are chosen at regular intervals, then they form an AP.

Example 11. *If* $T_1, T_2, T_3, T_4, T_5, T_6, T_7, \ldots$ *are in AP with common difference 2. Then, the difference of any two consecutive terms of the sequence* $T_1, T_4, T_7, \ldots$ *is*

(a) 3 (b) 4 (c) 6 (d) 8

Sol. (c) Clearly, $T_1, T_4, T_7, \ldots$ are in AP.

Now, $T_4 - T_1 = T_1 + 3 \times 2 - T_1 = 6$

viii. If a_n, a_{n+1} and a_{n+2} are any three consecutive terms of an AP, then

$$2a_{n+1} = a_n + a_{n+2}$$

Example 12. *Four numbers are in arithmetic progression. The sum of first and last term is 8 and the product of both middle terms is 15. The least number of the sequence is*

(a) 4 (b) 3 (c) 2 (d) 1

Sol. (d) Let A_1, A_2, A_3 and A_4 be four numbers in AP.

Given, $A_1 + A_4 = 8$ ...(i)

and $A_2 A_3 = 15$ ...(ii)

We know, $A_2 + A_3 = A_1 + A_4$

$\therefore$ $A_2 + A_3 = 8$ ...(iii)

On solving Eqs. (ii) and (iii), we get

$A_2 = 3, A_3 = 5$ or $A_2 = 5, A_3 = 3$

$\because$ $2A_2 = A_1 + A_3$ [by property]

$\Rightarrow$ $2 \times 3 = A_1 + 5$ or $2 \times 5 = A_1 + 3$

$\Rightarrow$ $A_1 = 1$ or $A_1 = 7$

Similarly, $A_4 = 7$ or $A_4 = 1$

Hence, least number of sequence is 1.

Selection of Terms in an AP

Sometimes, it is required to select a finite number of terms in AP. It is always convenient, if we select the terms in the following manner:

Selecting Odd Number of Terms of AP

i. Selecting 3 terms of AP

$$a - d, a, a + d$$

ii. Selecting 5 terms of AP

$$a - 2d, a - d, a, a + d, a + 2d$$

Example 13. *If the sum of three numbers in AP is* -3 *and their product is 8, then the numbers are*

(a) 2, 1, 4 (b) 2, −1, −4

(c) 4, 2, 1 (d) None of these

Sol. (b) Let the numbers be $a - d$, a and $a + d$.

Given, sum $= -3$

$\Rightarrow$ $(a-d) + a + (a+d) = -3$

$\Rightarrow$ $3a = -3 \Rightarrow a = -1$

and product $= 8$

$\Rightarrow$ $(a-d)\,a(a+d) = 8$

$\Rightarrow$ $a(a^2 - d^2) = 8$

$\Rightarrow$ $(-1)(1 - d^2) = 8$

$\Rightarrow$ $d^2 = 9$

$\Rightarrow$ $d = \pm 3$

If $d = 3$, then the numbers are $-4, -1, 2$.

If $d = -3$, then the numbers are $2, -1, -4$.

Example 14. *In a triangle, the lengths of the two larger sides are 10 and 9, respectively. If the angles are in AP, then the length of the third side can be*

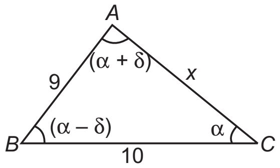
(a) $\sqrt{91}$ (b) $3\sqrt{3}$

(c) 5 (d) None of these

Sol. (d) Since, angles of a triangle are in AP.

$\therefore \quad \alpha + (\alpha - \delta) + (\alpha + \delta) = 180^\circ$

$\Rightarrow \quad \alpha = 60^\circ$



Using cosine law in ΔACB,

$$\cos 60^\circ = \frac{(10)^2 + (x)^2 - 9^2}{2 \cdot (10) \cdot (x)}$$

$$\Rightarrow \quad \frac{1}{2} = \frac{19 + x^2}{20x}$$

$$\Rightarrow \quad x^2 - 10x + 19 = 0$$

$$\Rightarrow \quad x = 5 \pm \sqrt{6}$$

Selecting Even Number of Terms of AP

i.	Selecting 2 terms of AP $a - d, a + d$
ii.	Selecting 4 terms of AP $a - 3d, a - d, a + d, a + 3d$

- *It should be noted that in case of odd number of terms, the middle term is a and the common difference is d while in case of an even number of terms the middle terms are $a - d, a + d$ and the common difference is $2d$.*
- *If sum of the numbers is not given, then the numbers can be taken as $a, a + d, a + 2d, a + 3d, \ldots$.*

Example 15. *If the sum of four numbers of AP is 20, then which of the following is first term of the given AP?*

(a) 5 (b) 4 (c) 6 (d) 10

Sol. (a) Let the four numbers in AP be $a - 3d, a - d, a + d, a + 3d$.

Now, $a - 3d + a - d + a + d + a + 3d = 20$

$\Rightarrow \quad 4a = 20 \Rightarrow a = 5$

Example 16. *Divide 32 into four parts which are in AP such that the ratio of product of extremes to the product of means is $7:15$.*

(a) 2, 6, 10, 14 (b) 3, 9, 15, 18
(c) 4, 12, 20, 28 (d) 5, 15, 25, 35

Sol. (a) Let the four parts be $a - 3d, a - d, a + d$ and $a + 3d$.

$\because \quad$ Sum = 32

$\Rightarrow \quad (a - 3d) + (a - d) + (a + d) + (a + 3d) = 32$

$\Rightarrow \quad 4a = 32 \Rightarrow a = 8$

and $\quad \dfrac{(a - 3d)(a + 3d)}{(a - d)(a + d)} = \dfrac{7}{15}$

$$\Rightarrow \quad \frac{a^2 - 9d^2}{a^2 - d^2} = \frac{7}{15}$$

$$\Rightarrow \quad \frac{64 - 9d^2}{64 - d^2} = \frac{7}{15}$$

$$\Rightarrow \quad 128d^2 = 512$$

$$\Rightarrow \quad d^2 = 4 \Rightarrow d = \pm 2$$

Thus, the four parts are 2, 6, 10, 14.

Sum of *n* Terms of an AP

The sum S_n of n terms of an AP with first term a and common difference d is given by

$$S_n = \frac{n}{2}[2a + (n-1)d]$$

Also, $\quad S_n = \dfrac{n}{2}[a + l]$

where, l = last term $= a + (n-1)d$

Example 17. *Which of the following is the sum of 20 terms of an AP 1, 4, 7, 10,...?*

(a) 690 (b) 590
(c) 591 (d) 691

Sol. (b) Let a be the first term and d be the common difference of the given AP. Then, $a = 1$ and $d = 3$.

We have to find the sum of 20 terms of the given AP. On putting $a = 1$, $d = 3$ and $n = 20$ in $S_n = \dfrac{n}{2}[2a + (n-1)d]$, we get

$$S_{20} = \frac{20}{2}[2 \times 1 + (20 - 1) \times 3]$$
$$= 10 \times 59 = 590$$

Example 18. *If S_r denotes the sum of the first r terms of an AP, then $\dfrac{S_{3r} - S_{r-1}}{S_{2r} - S_{2r-1}}$ is equal to*

(a) $2r - 1$ (b) $2r + 1$
(c) $4r + 1$ (d) $2r + 3$

Sol. (b) $\dfrac{S_{3r} - S_{r-1}}{S_{2r} - S_{2r-1}}$

$$= \frac{\frac{3r}{2}[2a + (3r-1)d] - \frac{(r-1)}{2}[2a + (r-2)d]}{\frac{2r}{2}[2a + (2r-1)d] - \frac{(2r-1)}{2}[2a + (2r-2)d]}$$

$$= \frac{2a(2r+1) + d(8r^2 - 2)}{2a + d(4r - 2)}$$

$$= \frac{(2r+1)[2a + 2(2r-1)d]}{[2a + 2(2r-1)d]} = (2r + 1)$$

A sequence is an AP if and only if the sum of its n terms is of the form $An^2 + Bn$, where A, B are constants. In such a case, the common difference of the AP is 2A.

Example 19. *If the sum of n terms of an AP is $3n^2 + 5n$, then the common difference is*

(a) 2 (b) 3
(c) 5 (d) 6

Sol. (d) Since, $S_n = 3n^2 + 5n$ is of the form $An^2 + Bn$.

Therefore, the common difference is $2A = 6$.

Arithmetic Mean of Two Given Numbers

Let a and b be two given numbers, then the arithmetic mean of a and b is a number A such that a, A, b are in AP.

Now, a, A, b are in AP.

$$\Rightarrow \quad 2A = a + b \quad \Rightarrow \quad A = \frac{a+b}{2}$$

Thus, the arithmetic mean of two numbers a and b is given by $A = \dfrac{a+b}{2}$.

Arithmetic Mean of *n* Given Numbers

Let $a, a_2, \ldots, a_n$ be n given numbers, then the arithmetic mean of $a_1, a_2, a_3, \ldots, a_n$ is given by

$$A = \frac{a_1 + a_2 + a_3 + \ldots + a_n}{n}$$

Insertion of *n* Arithmetic Means between *a* and *b*

If between two given quantities a and b, we have to insert n quantities $A_1, A_2, \ldots, A_n$ such that a, $A_1, A_2, \ldots A_n, b$ form an AP, then we say that $A_1, A_2, \ldots, A_n$ are n arithmetic means between a and b.

Let d be the common difference of this AP. Clearly, it contains $(n+2)$ terms.

$$\therefore \quad b = (n+2)\text{th term}$$

$$\Rightarrow \quad b = a + (n+1)d \quad \Rightarrow \quad d = \frac{b-a}{n+1}$$

Now, $A_1 = a + d$, $A_2 = a + 2d$, ... and $A_n = a + nd$

Sum of n AM's between a and b is $n\left(\dfrac{a+b}{2}\right)$ *i.e.* $A_1 + A_2 + \ldots + A_n = nA$.

Example 20. *Three arithmetic means between 3 and 19 are*

(a) 7, 11, 15 *(b)* 7, 10, 13
(c) 7, 12, 17 *(d) None of these*

Sol. (a) Let A_1, A_2, A_3 be three AM's between 3 and 19. Then, 3, A_1, A_2, A_3 19 are in AP whose common difference is

$$d = \frac{19-3}{3+1} = 4$$

$$\therefore \quad A_1 = 3 + d = 3 + 4 = 7$$
$$A_2 = 3 + 2d = 3 + 8 = 11$$
$$A_3 = 3 + 3d = 3 + 12 = 15$$

Hence, the required AM's are 7,11,15.

Example 21. *If* $(2n+r)r$, $n \in N$, $r \in N$ *is expressed the sum of k consecutive odd natural numbers, then k is equal to*

(a) r *(b)* n *(c)* $r+1$ *(d)* $n+1$

Sol. (a) $(2n + r)r = (n + r)^2 - n^2$

$$= \{1 + 3 + 5 + \ldots \text{ to } (n + r) \text{ terms}\} - \{1 + 3 + 5 + \ldots \text{ to } n \text{ terms}\}$$

as $(n + r)^2 - n^2 = \{1 + 3 + 5 + \ldots (n + r) \text{ terms}) - \{1 + 3 + 5 + \ldots n \text{ terms})$

$\therefore$ Sum of r consecutive odd natural numbers,

$$k = r$$

Example 22. *The sum of the products of the numbers* $\pm 1, \pm 2, \pm 3, \pm 4, \pm 5$ *taking two at a time is*

(a) 165
(b) -55
(c) 55
(d) None of the above

Sol. (b) $(1 - 1 + 2 - 2 + \ldots + 5 - 5)^2$

$$= 1^2 + 1^2 + 2^2 + 2^2 + \ldots + 5^2 + 5^2 + 2S$$

where, S is the required number.

or $\quad 0 = 2(1^2 + 2^2 + 3^2 + 4^2 + 5^2) + 2S$

$$\therefore \quad 2S = \frac{-5(5+1)(10+1)}{6} = -55$$

Example 23. *Observe that* $1^3 = 1, 2^3 = 3 + 5$, $3^3 = 7 + 9 + 11$, $4^3 = 13 + 15 + 17 + 19$. *Then,* n^3 *as a similar series is*

(a) $\left[2\left\{\dfrac{n(n-1)}{2}+1\right\}-1\right]+\left[2\left\{\dfrac{(n+1)n}{2}+1\right\}+1\right] + \ldots + \left[2\left\{\dfrac{(n+1)n}{2}+1\right\}+2n-3\right]$

(b) $(n^2 + n + 1) + (n^2 + n + 3) + (n^2 + n + 5) + \ldots + (n^2 + 3n - 1)$

(c) $(n^2 - n + 1) + (n^2 - n + 3) + (n^2 - n + 5) + \ldots + (n^2 + n - 1)$

(d) None of the above

Sol. (c) $1^3 = 1\cdot(1 - 1) + 1, 2^3 = (2\cdot 1 + 1) + 5$

$$3^3 = (3\cdot 2 + 1) + 9 + 11$$
$$4^3 = (4\cdot 3 + 1) + 15 + 17 + 19, \text{ etc.}$$
$$\therefore \quad n^3 = \{n\cdot(n-1) + 1\} + \ldots$$

next term being 2 more than the previous

$$= (n^2 - n + 1) + (n^2 - n + 3) + \ldots + (n^2 + n - 1)$$

Example 24. *Along a road lies an odd number of stones placed at intervals of* 10 *m. These stones have to be assembled around the middle stone. A person can carry only one stone at a time. A man carried out the job starting with the stone in the middle, carrying stones in succession, thereby covering a distance of* 4.8 *km. Then, the number of stones is*

(a) 15 *(b)* 29
(c) 31 *(d)* 35

Sol. (c) Let there be $2n + 1$ stone i.e. n stones on each side of the middle stone. The man will run 20 m, to pick up the first stone and return, 40 m for the second stone and so on. So, he runs $(n/2)\{2 \times 20 + (n-1)20\} = 10n(n+1)$ m to pick up the stones on one side and hence $20n(n+1)$ m to pick up all the stones.

$$\therefore \quad 20n(n+1) = 4800 \quad \text{or} \quad n = 15$$

Hence, there are $2n + 1 = 31$ stones.

Work Book Exercise 3.1

1 If the nth term of an AP 5, 8, 11, ... is 320, then n is equal to

105 104 106 112

2 If the 5th term of an AP is 11 and the 9th term is 7, then the 14th term is

-1 2 1 0

3 If $p-1$, $p+3$ and $3p-1$ are in AP, then p is equal to

a 4 **b** -4 **c** 2 **d** -2

4 The 15th term of sequence $x-7$, $x-2$ and $x+3$ is

$x+63$ $x-63$ $63-x$ $63+x$

5 If the sum of three numbers of an AP is 24, then middle term is

6 8 3 2

6 The sum of the integers from 1 to 100 that are divisible by 2 or 5, is

3000 3050
3600 None of these

7 If N which is the set of natural numbers, is partitioned into subsets $S_1=\{1\}, S_2=\{2, 3\}$, $S_3=\{4, 5, 6\}, \ldots$, then the sum of the members in S_{50} is

62255 62525
65225 62555

8 If $\dfrac{3+5+7+\ldots+n \text{ terms}}{5+8+11+\ldots+10 \text{ terms}}=7$, then the value of n is

35 36 37 40

9 The sum of the first ten terms of an AP is four times the sum of the first five terms, then the ratio of the first term to the common difference is

1/2 2 1/4 4

10 If p, q and r are in AP, then $p^3+r^3-8q^3$ is equal to

$-6pqr$ $4pqr$
$2pqr$ None of these

11 Consider an AP with first term a and common difference d. Let S_k denotes the sum of first k terms. If $\dfrac{S_{kx}}{S_x}$ is independent of x, then

$a=2d$ $a=d$
$2a=d$ None of these

12 If $a_1, a_2, a_3, \ldots$ are in AP such that

$$a_1+a_5+a_{10}+a_{15}+a_{20}+a_{24}=225,$$

then $a_1+a_2+a_3+\ldots+a_{23}+a_{24}$ is equal to

909 75 750 900

13 If the numbers a, b, c, d, e are in AP, then the value of $a-4b+6c-4d+e$ is

1 2 0 16c

14 Sum of n terms of the series

$$\frac{1}{\sqrt{2}+\sqrt{5}}+\frac{1}{\sqrt{5}+\sqrt{8}}+\frac{1}{\sqrt{8}+\sqrt{11}}+\ldots \text{ is}$$

$\sqrt{3n+2}-\sqrt{2}$ $\frac{1}{3}(\sqrt{3n+2}-\sqrt{2})$
$\sqrt{3n+2}+\sqrt{2}$ None of these

Geometric Progression (GP)

A sequence of non-zero numbers is called a geometric progression, if the ratio of a term and the term preceding to it is always a constant quantity.

The constant ratio is called the common ratio of the GP.

In other words, a sequence $a_1, a_2, a_3, \ldots, a_n, \ldots$ is called a geometric progression, if

$$\frac{a_{n+1}}{a_n}=\text{Constant}, \ \forall \ n \in N$$

Example 25. *Show that the sequence given by $a_n=3(2^n)$, $\forall n \in N$ is a GP. Also, find its common ratio.*

Sol. We have, $a_n=3(2^n)$ and $a_{n+1}=3(2^{n+1})$

Now, $$\frac{a_{n+1}}{a_n}=\frac{3(2^{n+1})}{3(2^n)}=2$$

Clearly, $\dfrac{a_{n+1}}{a_n}=2$ (constant), $\forall n \in N$. So, the given sequence is a GP with common ratio 2.

Example 26. *Which of the following is a GP?*

(a) 2, 4, 8, 16, ...

(b) $\frac{1}{9}, \frac{-1}{27}, \frac{1}{81}, \frac{-1}{243}, \ldots$

(c) 0.01, 0.0001, 0.000001,...

(d) All of the above

Sol. (d)

(a) We have, $a_1=2$, $\dfrac{a_2}{a_1}=2$, $\dfrac{a_3}{a_2}=2$, $\dfrac{a_4}{a_3}=2$ and so on

(b) We observe, $a_1=\dfrac{1}{9}$, $\dfrac{a_2}{a_1}=\dfrac{-1}{3}$,

$\dfrac{a_3}{a_2}=\dfrac{-1}{3}$, $\dfrac{a_4}{a_3}=\dfrac{-1}{3}$ and so on.

(c) We have, $a_1=0.01$, $\dfrac{a_2}{a_1}=0.01$,

$\dfrac{a_3}{a_2}=0.01$, $\dfrac{a_4}{a_3}=0.01$ and so on.

It is observed that in each case, every term except the first term bears a constant ratio to the term immediately preceding it.

Thus, options (a), (b) and (c) all are in GP.

General Term of a GP

If a is the first term of a GP and r is the common ratio, then its nth term (general term) t_n is given by

$$t_n = ar^{n-1}$$

Example 27. *The nth and 10th terms of a GP 5, 25, 125, ..., are respectively*

(a) $5^{n-1}, 5^9$ (b) $5^{n-2}, 5^8$
(c) $5^n, 5^{10}$ (d) None of these

Sol. (c) Here, $a = 5$ and $r = 5$. Thus, the nth term of the given GP is given by $a_n = ar^{n-1}$

$\Rightarrow \quad a_n = 5(5)^{n-1} = 5^n$

Now, for $n = 10$, we have $a_{10} = 5^{10}$

Example 28. *The third term of a geometric progression is 4. The product of the first five terms is*

(a) 4^3 (b) 4^5
(c) 4^4 (d) None of these

Sol. (b) Here, $t_3 = 4 \Rightarrow ar^2 = 4$

$\therefore$ Product of first five terms $= a \cdot ar \cdot ar^2 \cdot ar^3 \cdot ar^4$

$= a^5 r^{10} = (ar^2)^5 = 4^5$

Selection of Terms in GP

Sometimes, it is required to select a finite number of terms in GP. It is always convenient, if we select the terms in the following manner:

Number of terms	Terms	Common ratio
3	$\frac{a}{r}$, a, ar	r
4	$\frac{a}{r^3}, \frac{a}{r}, ar, ar^3$	r^2
5	$\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$	r

If the product of the numbers is not given, then the numbers can be taken as $a, ar, ar^2, ar^3, \ldots$.

Example 29. *If the sum of three numbers in GP is 38 and their product is 1728, then numbers are*

(a) 8, 12, 18 (b) 8, 16, 32
(c) 18, 12, 8 (d) None of these

Sol. (a,c) Let the three numbers be $\frac{a}{r}$, a and ar.

Then, product = 1728

$\Rightarrow \quad \frac{a}{r} \cdot a \cdot ar = 1728$

$\Rightarrow \quad a^3 = 1728$

$\Rightarrow \quad a = 12$

$\because \quad$ Sum = 38

$\therefore \quad \frac{a}{r} + a + ar = 38 \Rightarrow a\left(\frac{1}{r} + 1 + r\right) = 38$

$\Rightarrow \quad 12\left(\frac{1 + r + r^2}{r}\right) = 38$

$\Rightarrow \quad 6 + 6r + 6r^2 = 19r$

$\Rightarrow \quad 6r^2 - 13r + 6 = 0$

$\Rightarrow \quad (3r - 2)(2r - 3) = 0$

$\Rightarrow \quad r = 3/2$ and $2/3$

Hence, on putting the values of a and r, the required numbers are 8, 12, 18 or 18, 12, 8.

Example 30. *If four numbers in GP are such that the third number is greater than the first by 9 and the second number is greater than the fourth by 18, then the numbers are*

(a) 3, 6, 12, 24 (b) – 3, 6, – 12, 24
(c) 3, – 6, 12, – 24 (d) None of these

Sol. (c) Let the four numbers be a, ar, ar^2 and ar^3.

It is given that, $ar^2 - a = 9$

and $ar - ar^3 = 18$

$\Rightarrow \quad a(r^2 - 1) = 9 \quad$ ...(i)

and $ar(1 - r^2) = 18 \quad$ ...(ii)

On dividing Eq. (ii) by Eq. (i), we get

$$\frac{ar(1 - r^2)}{a(r^2 - 1)} = \frac{18}{9} \Rightarrow r = -2$$

On putting $r = -2$ in $a(r^2 - 1) = 9$, we get $a = 3$

Hence, the numbers are 3, – 6, 12, – 24.

Properties of Geometric Progressions

i. If all the terms of a GP is multiplied or divided by the same non-zero constant, then it remains a GP with the same common ratio.

Example 31. *If 5, 25, 125,... are in GP, then 1, 5, 25,... are in*

(a) AP (b) GP
(c) HP (d) None of these

Sol. (b) $\because$ 5, 25, 125,... are in GP.

On dividing each term by 5, we get the following sequence 1, 5, 25 ,..., which is again a GP as here $a_1 = 1, \frac{a_2}{a_1} = 5, \frac{a_3}{a_2} = 5$ and so on.

ii. The reciprocals of the terms of a given GP form a GP.

Example 32. *If $\frac{1}{2}, \frac{1}{2^2}, \frac{1}{2^3}, \frac{1}{2^4}, \ldots$ are in GP, then $2, 2^2, 2^3, \ldots$ are in*

(a) AP (b) GP
(c) HP (d) None of these

Sol. (b) On reciprocating each term of a GP, we get the following sequence $2, 2^2, 2^3, 2^4, \ldots$ which is again a GP as here $a_1 = 2, \frac{a_2}{a_1} = 2, \frac{a_3}{a_2} = 2$ and so on.

iii. If each term of a GP is raised to the same power, then the resulting sequence also form a GP.

Example 33. *If a, b and c are in GP, then $a^{1/2}, b^{1/2}, c^{1/2}$ are in*

(a) AP *(b) GP*
(c) HP *(d) None of these*

Sol. (b) Since, a, b and c are in GP.

$$\frac{b}{a} = \frac{c}{b} \Rightarrow \left(\frac{b}{a}\right)^{1/2} = \left(\frac{c}{b}\right)^{1/2} \Rightarrow \frac{b^{1/2}}{a^{1/2}} = \frac{c^{1/2}}{b^{1/2}}$$

Hence, $a^{1/2}, b^{1/2}$ and $c^{1/2}$ are in GP.

iv. In a finite GP, the product of the terms equidistant from the beginning and the end is always same and is equal to the product of the first and the last terms.

Example 34. *If $2, a, 2^3, b$ and 2^5 are in GP, then ab is*

(a) 32 *(b)* 64 *(c)* 128 *(d)* 55

Sol. (b) Since, $2, a, 2^3, b$ and 2^5 are in GP.

$\therefore$ Product of a and b = Product of first and last terms

$$= 2 \cdot 2^5 = 2^6 = 64$$

v. Three non-zero numbers a, b and c are in GP iff $b^2 = ac$.

Example 35. *If $\sum_{n=1}^{n} n, \frac{\sqrt{10}}{3} \cdot \sum_{n=1}^{n} n^2$ and $\sum_{n=1}^{n} n^3$ are in GP, then the value of n is*

(a) 2 *(b)* 3
(c) 4 *(d) None of these*

Sol. (c) Since, $\sum_{n=1}^{n} n, \frac{\sqrt{10}}{3} \cdot \sum_{n=1}^{n} n^2$ and $\sum_{n=1}^{n} n^3$ are in GP.

$$\Rightarrow \frac{n(n+1)}{2}, \frac{\sqrt{10}}{3} \cdot \frac{n(n+1)(2n+1)}{6}, \frac{n^2 (n+1)^2}{4} \text{ are in GP.}$$

$$\Rightarrow \frac{10 \cdot n^2 (n+1)^2 (2n+1)^2}{9 \cdot 36} = \frac{n(n+1)}{2} \cdot \frac{n^2 (n+1)^2}{4}$$

$$\Rightarrow 20(2n+1)^2 = 81n(n+1)$$

$$\Rightarrow n^2 + n - 20 = 0 \Rightarrow n = 4$$

vi. If the terms of a given GP are chosen at regular intervals, then the new sequence so formed also form a GP.

Example 36. *If 1, 5, 25, 125, 625,... forms a GP, then the sequence consisting odd term of the given GP, is*

(a) AP *(b) GP* *(c) HP* *(d) None of these*

Sol. (b) Clearly, the sequence of odd terms of the given GP is 1, 25, 625 ,..., which is a GP as every term except the first term bears a constant ratio to the term immediately preceding it.

vii. If $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in GP of non-zero non-negative terms, then $\log a_1, \log a_2, \ldots, \log a_n \ldots$ are in AP and *vice-versa*.

Example 37. *If $3, 3^2, 3^3$ are in GP, then $\log 3, \log 9$ and $\log 27$ are in*

(a) AP *(b) GP*
(c) HP *(d) None of these*

Sol. (a) Since, 3, 9 and 27 are in GP.

$$\therefore \quad 9^2 = 3 \times 27$$

$$\Rightarrow \quad \log 9^2 = \log(3 \times 27)$$

$$\Rightarrow \quad 2\log 9 = \log 3 + \log 27$$

Hence, $\log 3$, $\log 9$ and $\log 27$ are in AP.

Example 38. *If $\log\left(\frac{5c}{a}\right), \log\left(\frac{3b}{5c}\right)$ and $\log\left(\frac{a}{3b}\right)$ are in AP, where a, b and c are in GP, then a, b, c are the lengths of sides of*

(a) an isosceles triangle *(b) an equilateral triangle*
(c) a scalene triangle *(d) None of these*

Sol. (d) Since, $\log\left(\frac{5c}{a}\right), \log\left(\frac{3b}{5c}\right)$ and $\log\left(\frac{a}{3b}\right)$ are in AP.

$$\Rightarrow \frac{5c}{a}, \frac{3b}{5c} \text{ and } \frac{a}{3b} \text{ are in GP.}$$

$$\Rightarrow \quad \left(\frac{3b}{5c}\right)^2 = \frac{5c}{a} \cdot \frac{a}{3b}$$

$$\Rightarrow \quad 3b = 5c$$

Also, $\quad b^2 = ac$

$$\therefore \quad 9ac = 25c^2$$

$$\Rightarrow \quad 9a = 25c$$

$$\Rightarrow \quad \frac{9a}{5} = 5c = 3b$$

$$\Rightarrow \quad \frac{a}{5} = \frac{b}{3} = \frac{c}{9/5}$$

$\Rightarrow b + c < a$

Since, sum of two sides is smaller than the third side. So, triangle is not formed.

Example 39. *A circle of radius r is inscribed in a square. The mid-points of sides of the square have been connected by line segment and a new square resulted. The sides of the resulting square were also connected by segment so that a new square was obtained and so on, then the radius of the circle inscribed in the nth square is*

(a) $\left[2^{\frac{1-n}{2}}\right] r$

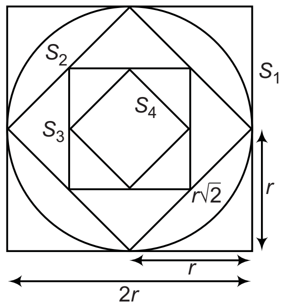
(b) $\left[2^{\frac{3-3n}{2}}\right] r$

(c) $\left[2^{-\frac{n}{2}}\right] r$

(d) $\left[2^{-\frac{5-3n}{2}}\right] r$

Sol. (a) Side of square $S_1 = 2r$

Side of square $S_2 = r\sqrt{2}$



$$= \frac{2r}{2}\left(\frac{1}{\sqrt{2}}\right)^{2-1} = 2r\left[\frac{1}{\sqrt{2}}\right]^{2-1}$$

Side of square $S_3 = 2r\left(\frac{1}{\sqrt{2}}\right)^{3-1} = 2r\left(\frac{1}{\sqrt{2}}\right)^{2}$ and so on.

Side of square $S_n = 2r\left(\frac{1}{\sqrt{2}}\right)^{n-1}$

$\therefore$ Radius $= r(2^{-1/2})^{n-1} = r(2^{(1-n)/2})$ and so on.

Side of square $S_n = r(2^{-1/2})^{n-1} = r[2^{(1-n)/2}]$

Sum of *n* Terms of a GP

i. The sum of n terms of a GP with first term a and common ratio r is given by

$$S_n = \begin{cases} \dfrac{a(1-r^n)}{1-r}, & |r|<1 \\ \dfrac{a(r^n-1)}{r-1}, & |r|>1 \\ an & r=1 \end{cases}$$

Example 40. *The sum of 7 terms of a GP 3, 6, 12, ... is*

(a) 200

(b) 320

(c) 381

(d) None of the above

Sol. (c) Here, $a = 3$ and $r = 2$

$$\therefore \quad S_7 = a\left(\frac{r^7-1}{r-1}\right) = 3\left(\frac{2^7-1}{2-1}\right)$$

$$= 3(128-1)$$

$$= 381$$

Example 41. *If*

$$S_n = \sum_{r=1}^{n} \frac{1+2+2^2+\ldots \text{upto } r \text{ terms}}{2^r}, \text{ then } S_n \text{ is}$$

equal to

(a) $2^n - (n+1)$ *(b)* $1-\frac{1}{2^n}$

(c) $n-1+\frac{1}{2^n}$ *(d)* $2^n - 1$

Sol. (c) $S_n = \sum_{r=1}^{n} \frac{2^r-1}{2^r} = \sum_{r=1}^{n}\left(1-\frac{1}{2^r}\right)$

$$= n - \left(\frac{1}{2}+\frac{1}{2^2}+\ldots+\frac{1}{2^n}\right)$$

$$= n - \frac{\frac{1}{2}\left(1-\frac{1}{2^n}\right)}{1-\frac{1}{2}} = n-1+\frac{1}{2^n}$$

ii. If l is the last term of a GP, then $l = ar^{n-1}$.

$$\Rightarrow \quad S_n = \frac{a-lr}{1-r} \quad \text{or} \quad S_n = \frac{lr-a}{r-1}, r \neq 1$$

Example 42. *In a GP, if* $\{a_n\}$, $a_1 = 3$, $a_n = 96$ *and* $S_n = 189$, *then the value of r is*

(a) 5 *(b)* 2 *(c)* 3 *(d)* 8

Sol. (b) Here, $a_1 = 3$, $a_n = l = 96$ and $S_n = 189$

$$\because \quad S_n = \frac{a-lr}{1-r} \Rightarrow 189 = \frac{3-96r}{1-r}$$

$$\Rightarrow 189 - 189r = 3 - 96r \Rightarrow 186 = 93r$$

$$\Rightarrow r = 2$$

iii. If $|r|<1$, then $\lim_{n\to\infty} r^n = 0$. Therefore, the sum S of an infinite GP with common ratio r satisfying $|r|<1$ is given by

$$S = \lim_{n\to\infty} S_n = \lim_{n\to\infty} a\left(\frac{1-r^n}{1-r}\right) \Rightarrow S = \frac{a}{1-r}$$

Thus, the sum S of an infinite GP with first term a and common ratio $r(-1<r<1)$ is given by $S = \dfrac{a}{1-r}$

Example 43. *The sum to infinity of the GP* $\frac{-5}{4}, \frac{5}{16}, \frac{-5}{64}, \ldots,$ *is*

(a) 1 *(b)* 0

(c) -1 *(d) None of these*

Sol. (c) The given GP has first term $(a) = \frac{-5}{4}$ and the common ratio $(r) = \frac{-1}{4}$. Also, $|r|<1$

Hence, the sum to infinity is given by

$$S = \frac{a}{1-r} = \frac{-\frac{5}{4}}{1-\left(\frac{-1}{4}\right)} = -1$$

Example 44. *If* $S_k = \lim_{n\to\infty} \sum_{i=0}^{n} \frac{1}{(k+1)^i}$, *then* $\sum_{k=1}^{n} k\,S_k$ *is equal to*

(a) $\frac{n(n+1)}{2}$ *(b)* $\frac{n(n-1)}{2}$ *(c)* $\frac{n(n+2)}{2}$ *(d)* $\frac{n(n+3)}{2}$

Sol. (d) $S_k = 1 + \frac{1}{k+1} + \frac{1}{(k+1)^2} + \ldots = \frac{1}{1-\frac{1}{k+1}} = \frac{k+1}{k}$

$\therefore \quad k S_k = k + 1$

Now, $\sum_{k=1}^{n} k S_k = \sum_{k=1}^{n} (k+1) = 2 + 3 + \ldots + (n+1)$

$= \frac{n}{2}[2 + (n+1)] = \frac{n(n+3)}{2}$

Geometric Mean of Two Given Numbers

Let a and b be two given numbers. Then, the geometric mean of a and b is a number G, such that a, G, b are in GP.

Now, a, G, b in GP.

$$\Rightarrow \quad \frac{G}{a} = \frac{b}{G} \quad \Rightarrow \quad G^2 = ab \quad \Rightarrow \quad G = \sqrt{ab}$$

This, the geometric mean of a and b is given by $G = \sqrt{ab}$.

Geometric Mean of *n* Given Numbers

Let $a_1, a_2, a_3, \ldots, a_n$ be n given numbers, then the geometric mean of $a_1, a_2, \ldots, a_n$ is given by

$$G = (a_1 a_2 \ldots a_n)^{1/n}$$

Insertion of *n* Geometric Means between *a* and *b*

Let a and b be two given numbers. If n numbers $G_1, G_2, \ldots, G_n$ are inserted between a and b such that the sequence $a, G_1, G_2, \ldots, G_n, b$ is a GP. Then, the numbers $G_1, G_2, \ldots, G_n$ are known as n geometric means (GM's) between a and b.

Now, sequence $a, G_1, G_2, \ldots, G_n, b$ is a GP consisting of $(n+2)$ terms. Let r be the common ratio of this GP.

Then, $\quad b = (n+2)\text{th term} = ar^{n+1}$

$$\Rightarrow \quad r^{n+1} = \frac{b}{a} \quad \Rightarrow \quad = \left(\frac{b}{a}\right)^{1(n+1)}$$

$$\therefore \quad G_1 = ar = a\left(\frac{b}{a}\right)^{1/(n+1)}$$

$$G_2 = ar^2 = a\left(\frac{b}{a}\right)^{2/(n+1)}$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$G_n = ar^n = a\left(\frac{b}{a}\right)^{n/(n+1)}$$

➘ *Product of n GM's between a and b, i.e.* $G_1 \times G_2 \times G_3 \times \ldots \times G_m = (ab)^{n/2} = G^n$

Example 45. *The five geometric means between 576 and 9 are*

(a) 192, 96, 48, 24, 12 (b) 288, 144, 72, 36, 18
(c) 208, 104, 52, 26, 13 (d) None of these

Sol. (b) Let G_1, G_2, G_3, G_4 and G_5 be five geometric means between $a = 576$ and $b = 9$.

Then, $576, G_1, G_2, G_3, G_4, G_5, 9$ are in GP with common ratio r given by

$$r = \left(\frac{9}{576}\right)^{\frac{1}{5+1}} = \left(\frac{1}{64}\right)^{\frac{1}{6}} = \frac{1}{2} \qquad \left[\because \; r = \left(\frac{b}{a}\right)^{\frac{1}{n+1}}\right]$$

$\therefore \quad G_1 = ar = 576 \times \frac{1}{2} = 288$, $G_2 = ar^2 = 576 \times \frac{1}{4} = 144$

$G_3 = ar^3 = 576 \times \frac{1}{8} = 72$, $G_4 = ar^4 = 576 \times \frac{1}{16} = 36$

and $G_5 = ar^5 = 576 \times \frac{1}{32} = 18$

Hence, 288, 144, 72, 36, 18 are the required geometric means between 576 and 9.

Example 46. *If a is the AM of b and c and the two geometric means are* G_1 *and* G_2, *then* $G_1^3 + G_2^3$ *is equal to*

(a) abc (b) $2abc$ (c) $3abc$ (d) $5abc$

Sol. (b) It is given that a is the AM of b and c.

$\therefore \quad a = \frac{b+c}{2} \Rightarrow b + c = 2a$ ...(i)

Since, G_1 and G_2 are two geometric means between b and c.

Therefore, b, G_1, G_2, c are in GP with common ratio $r = \left(\frac{c}{b}\right)^{\frac{1}{3}}$.

Now, $\quad G_1 = br = b\left(\frac{c}{b}\right)^{1/3} = c^{1/3}\, b^{2/3}$

and $\quad G_2 = br^2 = b\left(\frac{c}{b}\right)^{2/3} = b^{1/3} c^{2/3}$

$\Rightarrow \quad G_1^3 = b^2 c$ and $G_2^3 = bc^2$

$\Rightarrow \quad G_1^3 + G_2^3 = b^2 c + bc^2 = bc(b+c)$

$\Rightarrow \quad G_1^3 + G_2^3 = 2abc$ [from Eq. (i)]

Example 47. *If the arithmetic mean and geometric mean of a and b are A and G respectively, then the value of* $A - G$ *will be*

(a) $\frac{a-b}{2}$ (b) $\frac{a+b}{2}$ (c) $\left[\frac{\sqrt{a}-\sqrt{b}}{\sqrt{2}}\right]^2$ (d) $\frac{2ab}{a+b}$

Sol. (c) Arithmetic mean of a and $b = A = \frac{a+b}{2}$

Geometric mean of a and $b = G = \sqrt{ab}$

$\therefore \quad A - G = \frac{a+b}{2} - \sqrt{ab} = \frac{a+b-2\sqrt{ab}}{2}$

$$= \frac{(\sqrt{a})^2 + (\sqrt{b})^2 - 2\sqrt{a}\sqrt{b}}{2} = \left[\frac{\sqrt{a}-\sqrt{b}}{\sqrt{2}}\right]^2$$

Example 48. *In the sequence* 1, 2, 2, 4, 4, 4, 4, 8, 8, 8, 8, 8, 8,…, *where n consecutive terms have the value n, then* 1025*th term is*

(a) 2^9 (b) 2^{10} (c) 2^{11} (d) 2^8

Sol. (b) Let the 1025th term be 2^n. Then,

$1 + 2 + 4 + 8 + \ldots + 2^{n-1} < 1025 < 1 + 2 + 4 + 8 + \ldots + 2^n$

$\therefore \quad 2^n - 1 < 1025 < 2^{n+1} - 1$ or $2^n < 1026 < 2^{n+1}$

$\Rightarrow \quad n = 10$

Hence, 1025th term is 2^{10}.

Work Book Exercise 3.2

1 The common ratio of a GP having 10th term and 1st term equal to 1536 and – 3, is

2   1   – 2   2

2 Any geometric series can be summed till infinite number of terms by the formula

$S_\infty = \frac{a}{1-r}; r \in R$ $S_\infty = \frac{a}{1-r}; |r| < 1$

$S_\infty = \frac{a}{1-r}; |r| > 1$ None of these

3 If x, $2x+2$ and $3x+3$ are in GP, then the 4th term is

27   – 27   13.5   – 13.5

4 If 1, x, y, z and 2 are in GP, then xyz is equal to

4   2

8   None of these

5 Which term of the sequence $2, 1, 2^{-1}, 4^{-1}, 8^{-1}, \ldots$ is 128^{-1}?

9th   8th

7th   10th

6 If $a_1, a_2, \ldots, a_n$ are in AP, then $\log a_1, \log a_2, \ldots, \log a_n$ are in

GP

not GP

AP

None of the above

7 If the sum of the first 10 terms of a certain GP is equal to 244 times the sum of first 5 terms. Then, the common ratio is

4   7

2   3

8 If $a, 2b, 3c$ are in AP and a, b, c (distinct) are in GP, then the common ratio of a GP is

1   3   1/3   2

9 If a GP having an even number of terms and the sum of all terms is five times the sum of terms occupying odd places, then the common ratio will be

3   5   4   1/4

10 For $n \ge 3$, the nth roots of unity form

an HP   an AP

a GP   None of these

11 If $1 + a + a^2 + a^3 + \ldots + a^n = (1+a)(1+a^2)(1+a^4)$, then n is equal to

3   5   7   9

12 The rational number 2.357357357 ... is

$\frac{2355}{10001}$ $\frac{2379}{999}$ $\frac{2355}{999}$ $\frac{2379}{10001}$

13 $9^{1/3} \cdot 9^{1/9} \cdot 9^{1/27} \ldots$ is equal to

9   3   81 $\sqrt[3]{81}$

14 If b_1, b_2 and b_3 $(b_1 > 0)$ are three successive terms of a GP with common ratio r, then the possible value of r for which the inequality $b_3 > 4b_2 - 3b_1$ holds, is given by

4   2   2.5

15 If S denotes the sum to infinity and S_n denotes the sum of n terms of the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots$, such that $S - S_n < \frac{1}{1000}$, then the least value of n is

8   9   10   11

Harmonic Progression (HP)

A sequence $a_1, a_2, \ldots, a_n, \ldots$ of non-zero numbers is called a harmonic progression, if the sequence $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots, \frac{1}{a_n}, \ldots$ is an arithmetic progression.

The sequence $1, \frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \ldots$ are in HP, because the sequence 1, 3, 5, 7..., are in AP.

Harmonic Mean of Two Given Numbers

If a and b are two non-zero numbers, then the harmonic mean of a and b is a number H such that the sequence a, H and b are in HP.

Now, a, H and b are in HP.

$$\Rightarrow \quad \frac{1}{a}, \frac{1}{H} \text{ and } \frac{1}{b} \text{ are in AP.}$$

$$\Rightarrow \quad \frac{2}{H} = \frac{1}{a} + \frac{1}{b} \Rightarrow H = \frac{2ab}{a+b}$$

Thus, the harmonic mean H of two numbers a and b is given by

$$H = \frac{2ab}{a+b}$$

Harmonic Mean of *n* Numbers

If $a_1, a_2, a_3, \ldots, a_n$ are n non-zero numbers, then the harmonic mean H of these numbers is given by

$$\frac{1}{H} = \frac{\frac{1}{a_1} + \frac{1}{a_2} + \ldots + \frac{1}{a_n}}{n}$$

Example 49. *Which of the following is harmonic mean of numbers $\frac{1}{3}$ and $\frac{1}{7}$?*

(a) 1   (b) $\frac{1}{5}$ (c) $\frac{1}{10}$ (d) 5

Sol. (b) $\because$ $H = \dfrac{2ab}{a+b}$

On putting $a = \dfrac{1}{3}$ and $b = \dfrac{1}{7}$, we get

$$H = \frac{2\left(\frac{1}{3}\right)\left(\frac{1}{7}\right)}{\frac{1}{3}+\frac{1}{7}} = \frac{1}{5}$$

Example 50. *The harmonic mean of the roots of the equation* $(5+\sqrt{2})x^2 - (4+\sqrt{5})x + 8 + 2\sqrt{5} = 0$ *is*

(a) 2 *(b)* 4 *(c)* 6 *(d)* 8

Sol. (b) Let α and β be the roots of given quadratic equation. Then,

$$\alpha + \beta = \frac{4+\sqrt{5}}{5+\sqrt{2}} \quad \text{and} \quad \alpha\beta = \frac{8+2\sqrt{5}}{5+\sqrt{2}}$$

Let H be the harmonic mean between α and β, then

$$H = \frac{2\alpha\beta}{\alpha+\beta} = \frac{16+4\sqrt{5}}{4+\sqrt{5}} = 4$$

Insertion of *n* Harmonic Means between *a* and *b*

The n numbers $H_1, H_2, \dots, H_n$ are said to be harmonic means between a and b, if $a, H_1, H_2, \dots, H_n, b$ are in HP, i.e. if $\dfrac{1}{a}, \dfrac{1}{H_1}, \dfrac{1}{H_2}, \dots, \dfrac{1}{H_n}, \dfrac{1}{b}$ are in AP. Let d be the common difference of this AP. Then,

$$\frac{1}{b} = \frac{1}{a} + (n+2-1)d$$

$$\Rightarrow \quad d = \frac{1}{n+1}\left(\frac{1}{b} - \frac{1}{a}\right) = \frac{a-b}{(n+1)ab}$$

Thus, $$\frac{1}{H_1} = \frac{1}{a} + \frac{a-b}{(n+1)ab}$$

$$\Rightarrow \quad \frac{1}{H_2} = \frac{1}{a} + \frac{2(a-b)}{(n+1)ab}$$

$$\vdots \qquad \vdots$$

$$\frac{1}{H_n} = \frac{1}{a} + \frac{n(a-b)}{(n+1)ab}$$

Example 51. *Insert two harmonic means between* 3 *and* 5.

(a) $\dfrac{30}{11}, \dfrac{30}{13}$ *(b)* $\dfrac{45}{13}, \dfrac{45}{11}$

(c) $\dfrac{30}{12}, \dfrac{45}{14}$ *(d) None of these*

Sol. (b) $a = 3$, $b = 5$ and $n = 2$

$$\therefore \quad \frac{1}{H_1} = \frac{1}{3} + \frac{(3-5)}{(2+1)(15)} = \frac{13}{45} \Rightarrow H_1 = \frac{45}{13}$$

$$\text{and} \quad \frac{1}{H_2} = \frac{1}{3} + \frac{2(3-5)}{(2+1)(15)} = \frac{11}{45} \Rightarrow H_2 = \frac{45}{11}$$

Properties of Arithmetic, Geometric and Harmonic Means between Two Given Numbers

Let A, G and H be arithmetic, geometric and harmonic means of two positive numbers a and b. Then,

$$A = \frac{a+b}{2}, G = \sqrt{ab} \quad \text{and} \quad H = \frac{2ab}{a+b}$$

i. These three means possess the following properties: $A \ge G \ge H$

Example 52. *The minimum value of* $4^x + 4^{1-x}$, $x \in R$, *is*

(a) 2 *(b)* 4

(c) 1 *(d) None of these*

Sol. (b) $\because$ AM $\ge$ GM for positive numbers.

So, $$\frac{4^x + \frac{4}{4^x}}{2} \ge \sqrt{4^x \cdot \frac{4}{4^x}} = 2$$

$$\Rightarrow \quad 4^x + 4^{1-x} \ge 4$$

Example 53. *If* $\sqrt{3}$, *A and* $\sqrt{2}$ *are in AP, then* $\dfrac{\sqrt{3}+\sqrt{2}}{2}$ *is greater than or equal to*

(a) $\sqrt{5}$ *(b)* $\sqrt{6}$

(c) $\sqrt{8}$ *(d) None of these*

Sol. (b) $\because \sqrt{3}$, A and $\sqrt{2}$ are in AP.

$\therefore$ $A = \dfrac{\sqrt{3}+\sqrt{2}}{2}$ is the AM of $\sqrt{3}$ and $\sqrt{2}$.

Thus, $\dfrac{\sqrt{3}+\sqrt{2}}{2} \ge \sqrt{3}\cdot\sqrt{2} = \sqrt{6}$

Example 54. *If the product of n positive numbers is unity, then their sum is*

(a) a positive integer *(b) divisible by n*

(c) equal to $n + \dfrac{1}{n}$ *(d) never less than n*

Sol. (d) Since, product of n positive numbers is unity.

$$\therefore \quad x_1 \cdot x_2 \cdot x_3 \dots x_n = 1 \qquad \dots(\text{i})$$

Using AM $\ge$ GM, we have

$$\frac{x_1 + x_2 + x_3 + \dots + x_n}{n} \ge (x_1 \cdot x_2 \cdot x_3 \dots x_n)^{1/n}$$

$$\Rightarrow \quad x_1 + x_2 + \dots + x_n \ge n(1)^{1/n}$$

Hence, sum of n positive numbers is never less than n.

ii. A, G, H form a GP i.e. $G^2 = AH$

Example 55. *If AM of two terms is* 9 *and HM is* 36, *then GM will be*

(a) 18 *(b)* 12

(c) 16 *(d) None of these*

Sol. (a) $\because$ (AM)(HM) = (GM)^2

$$\therefore \quad 9 \cdot 36 = (\text{GM})^2 \Rightarrow \text{GM} = 18$$

iii. If A, G and H are arithmetic, geometric and harmonic means between three given numbers a, b and c, then the equation having a, b, c as its roots, is

$$x^3 - 3Ax^2 + \frac{3G^3}{H}x - G^3 = 0$$

Example 56. *If α, β and γ are the roots of the equation $x^3 - 6x^2 + 11x - 6 = 0$. Then, HM of the roots is*

(a) 6 (b) 11

(c) $\frac{11}{6}$ (d) $\frac{18}{11}$

Sol. (d) We know that, if α, β and γ are the roots and A, G, H are AM, GM and HM of the roots, then equation is

$$x^3 - 3Ax^2 + \frac{3G^3}{H}x - G^3 = 0$$

Given, $x^3 - 6x^2 + 11x - 6 = 0$

On comparing, we get

$$3A = 6 \quad \ldots\text{(i)}$$

$$\frac{3G^3}{H} = 11 \quad \ldots\text{(ii)}$$

and $G^3 = 6 \quad \ldots$(iii)

From Eqs. (ii) and (iii), we get

$$H = \frac{18}{11}$$

Arithmetico-Geometric Progression (AGP)

A sequence of the form

$$a, (a+d)r, (a+2d)r^2, \ldots, [a+(n-1)d]r^{n-1}, \ldots$$

is called an arithmetico-geometric progression.

Arithmetico-Geometric Series

Let $a, (a+d)r, (a+2d)r^2, (a+3d)r^3, \ldots$ be an arithmetico-geometric progression.

Then, $a + (a+d)r + (a+2d)r^2 + (a+3d)r^3 + \ldots$ is an arithmetico-geometric series.

Example 57. *The 8th term of the sequence* 1, 4, 12, 32, 80, ... *is*

(a) 1000 (b) 1200

(c) 1024 (d) None of these

Sol. (c) The given sequence can be rewritten as

$$1, (1+1)\cdot 2, (1+2\cdot 1)\cdot 2^2, (1+3\cdot 1)\cdot 2^3, \ldots$$

Clearly, the sequence is an arithmetico-geometric progression with $a = 1, d = 1$ and $r = 2$.

$\therefore$ 8th term $= (a+7d)\cdot r^7$

$$= (1+7\cdot 1)\cdot 2^7 = 8\cdot 2^7$$

$$= 2^3 \cdot 2^7 = 2^{10} = 1024$$

Sum of *n* Terms of an Arithmetico-Geometric Progression

The sum of n terms of an arithmetico-geometric progression $a, (a+d)r, (a+2d)r^2, (a+3d)r^3, \ldots$ is given by

$$S_n = \begin{cases} \dfrac{a}{1-r} + dr\dfrac{(1-r^{n-1})}{(1-r)^2} - \dfrac{\{a+(n-1)d\}r^n}{1-r}, & \text{when } r \neq 1 \\ \dfrac{n}{2}[2a+(n-1)d], & \text{when } r = 1 \end{cases}$$

Proof Let S_n denotes the sum of n terms of the given sequence.

Then, $S_n = a + (a+d)r + (a+2d)r^2 + \ldots + \{a+(n-1)d\}r^{n-1} \quad \ldots$(i)

$\Rightarrow rS_n = ar + (a+d)r^2 + \ldots + \{a+(n-2)d\}r^{n-1} + \{a+(n-1)d\}r^n \quad \ldots$(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$S_n - rS_n = a + [dr + dr^2 + \ldots + dr^{n-1}] - \{a+(n-1)d\}r^n$$

$$\Rightarrow S_n(1-r) = a + dr\left(\frac{1-r^{n-1}}{1-r}\right) - \{a+(n-1)d\}r^n; r \neq 1$$

$$\Rightarrow S_n = \frac{a}{1-r} + dr\frac{1-r^{n-1}}{(1-r)^2} - \frac{[a+(n-1)d]r^n}{1-r}; r \neq 1$$

For $r = 1$,

$$S_n = a + (a+d) + (a+2d) + \ldots + [a+(n-1)d]$$

$$= \frac{n}{2}[2a+(n-1)d]$$

Example 58. *The sum of 10 terms of the sequence 1, 6, 27, 108, ... is*

(a) 280481 (b) 280482

(c) 280484 (d) 280483

Sol. (d) The given sequence can be rewritten as

$$1, (1+1)\cdot 3, (1+2\cdot 1)\cdot 3^2, (1+3\cdot 1)\cdot 3^3, \ldots$$

which is an arithmetico-geometric progression with $a = 1, d = 1$ and $r = 3$.

Hence, $S_{10} = \dfrac{a}{1-r} + dr\dfrac{1-r^9}{(1-r)^2} - \dfrac{[a+9d]r^{10}}{1-r}$

$$= \frac{1}{-2} + 3\frac{(1-3^9)}{(1-3)^2} - \frac{[1+9]3^{10}}{(1-3)}$$

$$= \frac{-1}{2} + \frac{(3-3^{10})}{4} + \frac{3^{10}\cdot 10}{2}$$

$$= \frac{-2+3-3^{10}+20\cdot 3^{10}}{4}$$

$$= \frac{1+19\cdot 3^{10}}{4} = 280483$$

Sum of an Infinite Arithmetico-Geometric Progression

Let $|r|<1$, then $r^n, r^{n-1} \to 0$ as $n \to \infty$ and it can also be shows that $n \cdot r^n \to 0$ as $n \to \infty$. So, from

$$S_n = \frac{a}{1-r} + dr\frac{(1-r^{n-1})}{(1-r)^2} - \frac{[a+(n-1)d]r^n}{1-r}, \text{ we get}$$

$$S_n \to \frac{a}{1-r} + \frac{dr}{(1-r)^2} \text{ as } n \to \infty$$

In other words, when $|r|<1$, then sum to infinity of an arithmetico-geometric series is

$$S_\infty = \frac{a}{1-r} + \frac{dr}{(1-r)^2}$$

Example 59. *The sum of*

$0.2 + 0.004 + 0.00006 + 0.0000008 + \ldots$ *is*

(a) $\frac{200}{891}$

(b) $\frac{2000}{9801}$

(c) $\frac{1000}{9801}$

(d) None of the above

Sol. (b) Sum $= \frac{2}{10} + \frac{4}{10^3} + \frac{6}{10^5} + \frac{8}{10^7} + \ldots$

$$= \frac{2}{10}\left(1 + \frac{2}{10^2} + \frac{3}{10^4} + \ldots\right) = \frac{2}{10}S_1$$

Clearly, S_1 is an arithmetico-geometric series with $a = 1$, $d = 1$ and $r = \frac{1}{10^2}$.

$$\therefore \quad S_1 = \frac{a}{1-r} + \frac{dr}{(1-r)^2}$$

$$= \frac{1}{1-\frac{1}{10^2}} + \frac{\frac{1}{10^2}}{\left(1-\frac{1}{10^2}\right)^2}$$

$$= \frac{10^2}{10^2-1} + \frac{10^4}{10^2(10^2-1)^2}$$

$$= 10^2\left[\frac{10^2-1+1}{(10^2-1)^2}\right] = \frac{10^4}{(10^2-1)^2}$$

$$\therefore \quad S = \frac{2}{10} \times \frac{10^4}{(10^2-1)^2} = \frac{2000}{9801}$$

Aliter

Let $\quad S = \frac{2}{10} + \frac{4}{10^3} + \frac{6}{10^5} + \frac{8}{10^7} + \ldots$

$$\therefore \quad S - \frac{S}{10^2} = \frac{2}{10} + \frac{2}{10^3} + \frac{2}{10^5} + \ldots$$

$$\Rightarrow \quad \frac{99S}{100} = \frac{\frac{2}{10}}{1-\frac{1}{10^2}} = \frac{2}{10} \times \frac{10^2}{10^2-1} = \frac{20}{99}$$

$$\Rightarrow \quad S = \frac{20 \times 100}{(99)^2} = \frac{2000}{9801}$$

Example 60. *Find the value of the expression* $\sum_{i=1}^{n}\sum_{j=1}^{i}\sum_{k=1}^{j} 1$.

Sol. $$\sum_{i=1}^{n}\sum_{j=1}^{i}\sum_{k=1}^{j} 1 = \sum_{i=1}^{n}\sum_{j=1}^{i} j$$

$$= \frac{1}{2}\left[\sum_{i=1}^{n} i^2 + \sum_{i=1}^{n} i\right]$$

$$= \frac{1}{2}\left[\frac{n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}\right]$$

$$= \frac{n(n+1)}{n}[2n+1+3]$$

$$= \frac{n(n+1)(n+2)}{6}$$

Work Book Exercise 3.3

1 The first term of HP having kth term equal to $\frac{1}{a+(k-1)d}$, is

a a b $\frac{1}{a}$ c $\frac{1}{k}$ d k

2 If a, b, c and d are distinct positive real numbers in HP, then

a $ab > cd$ b $ac > bd$
c $ad > bc$ d None of these

3 The 4th term of the sequence $3, \frac{3}{2}, 1, \ldots$ is

a $\frac{3}{4}$
b $\frac{4}{3}$
c $\frac{2}{3}$
d None of the above

4 If $|x| < 1$, then $1 + 3x + 5x^2 + 7x^3 + \ldots$ is equal to

a $\frac{1+x}{(1-x)^2}$ b $\frac{2+x}{(1-x)^2}$
c $\frac{x}{(1-x)^2}$ d None of these

5 The sum of n terms of the series $1 + 2\left(1+\frac{1}{n}\right) + 3\left(1+\frac{1}{n}\right)^2 + \ldots$ is

a n^2+1 b $n(n+1)$ c $n\left(1+\frac{1}{n}\right)^2$ d n^2

6 If a, b, c, d and p are distinct real numbers such that $(a^2+b^2+c^2)p^2 - 2(ab+bc+cd)p + (b^2+c^2+d^2) \le 0$, then a, b, c and d are in

a GP b AP
c HP d None of these

7 If x, y, z and w are non-zero real numbers such that $(x^2+y^2+z^2)(y^2+z^2+w^2) \le (xy+yz+zw)^2$, then x, y, z and w are in

a GP **b** AP
c HP **d** None of these

8 If $0 \le \theta < \dfrac{\pi}{2}$, then $\cos\theta + \sec\theta$ is

a < 2 **b** ≥ 2
c can have any value **d** None of these

9 If a, b and c are three positive real numbers such that $b+c-a, c+a-b$ and $a+b-c$ are positive, then the expression $(b+c-a)(c+a-b)(a+b-c)-abc$ is

a positive **b** negative
c non-positive **d** non-negative

10 The least value of the expression $5^{\sin x-1}+5^{-\sin x-1}$ is

a $\dfrac{2}{5}$ **b** $\dfrac{1}{5}$ **c** 5 **d** $\dfrac{5}{2}$

Some Special Series

- Sum of first n natural numbers,
$$\sum n = 1+2+3+\ldots+n = \frac{n(n+1)}{2}$$
- Sum of squares of first n natural numbers,
$$\sum n^2 = 1^2+2^2+3^2+\ldots+n^2 = \frac{n(n+1)(2n+1)}{6}$$
- Sum of cubes of first n natural numbers,
$$\sum n^3 = 1^3+2^3+3^3+\ldots+n^3 = \left[\frac{n(n+1)}{2}\right]^2$$

Example 61. *The sum of first* 12 *terms of the series* $\dfrac{1^3}{1}+\dfrac{1^3+2^3}{1+3}+\dfrac{1^3+2^3+3^3}{1+3+5}+\ldots$ *to n terms is equal to*

(a) $\dfrac{509}{2}$ *(b)* $\dfrac{309}{2}$
(c) $\dfrac{409}{2}$ *(d) None of these*

Sol. (c) Here nth term, $T_n = \dfrac{1^3+2^3+3^3+\ldots+n^3}{1+3+5+\ldots+(2n-1)} = \dfrac{\sum n^3}{n^2}$

$$= \frac{1}{4}n^2 + \frac{1}{2}n + \frac{1}{4}$$

Sum of n terms, $S_n = \sum T_n$
$$= \frac{1}{4}\sum n^2 + \frac{1}{2}\sum n + \frac{1}{4}n$$
$$= \frac{1}{4}\cdot\frac{1}{6}\cdot n(n+1)(2n+1) + \frac{1}{2}\cdot\frac{1}{2}n(n+1) + \frac{1}{4}n$$
$$= \frac{n}{24}(2n^2+9n+13)$$

So, $S_{12} = \dfrac{12}{24}[2\cdot(12)^2 + 9\times 12 + 13]$
$$= \frac{409}{2}$$

Method of Difference

Sometimes, the nth term of a series cannot be determined by the methods discussed so far. If a series is such that the difference between successive terms are either in AP or in GP, then we determine its nth term by method of difference and then find the sum of the series by using the formulae of $\sum n$, $\sum n^2$ and $\sum n^3$.

First Way

i. If the differences T_2-T_1, T_3-T_2 and T_4-T_3 are in AP, then the nth term is given by $T_n = an^2+bn+c$, where a, b and c are constants. Determine constants a, b and c by putting $n = 1, 2, 3$ and equating them with values of corresponding terms of the given series.

Example 62. *The sum of n terms of the series* $1+5+12+22+35+\ldots$ *is*

(a) $\dfrac{n(n^2+1)}{2}$ *(b)* $\dfrac{n^2(n+1)}{2}$
(c) $\dfrac{n(n^2-1)}{4}$ *(d) None of these*

Sol. (b) The given series is $1+5+12+22+\ldots$
The differences of successive terms are 4, 7, 10, 13 which are in AP.

$\therefore$ $T_n = an^2+bn+c$

On putting $n = 1, 2, 3$, we get

$T_1 = a+b+c = 1$ ...(i)
$T_2 = 4a+2b+c = 5$ ...(ii)
and $T_3 = 9a+3b+c = 12$ ...(iii)

On solving Eqs. (i), (ii) and (iii), we get

$$a = \frac{3}{2},\ b = -\frac{1}{2} \text{ and } c = 0$$

$\therefore$ $T_n = \dfrac{3}{2}n^2 - \dfrac{1}{2}n = \dfrac{1}{2}(3n^2-n)$

Now, $S_n = \sum T_n = \dfrac{1}{2}\sum(3n^2-n) = \dfrac{3}{2}\sum n^2 - \dfrac{1}{2}\sum n$
$$= \frac{3}{2}\left\{\frac{(n)(n+1)(2n+1)}{6}\right\} - \frac{1}{2}\left\{\frac{n(n+1)}{2}\right\}$$
$$= \frac{n^2(n+1)}{2}$$

ii. If the difference T_2-T_1, T_3-T_2 and T_4-T_3 are in GP with common ratio r, then $T_n = ar^{n-1}+bn+c$, where a, b and c are constants.
Determine constants a, b and c by putting $n = 1, 2, 3$ and equating with value of corresponding terms of the given series.

Example 63. *The sum of n terms of the series* $5+7+13+31+85+\ldots$ *is*

(a) $\frac{1}{2}(3^n+8n-1)$ (b) $\frac{1}{2}(3^n+7n+1)$

(c) $\frac{1}{2}(3^n+5n)$ (d) $\frac{1}{2}(3^n+7n)$

Sol. (a) The given series is $5+7+13+31+85+\ldots$

The differences of successive terms are 2, 6, 18, 54, which are in GP with common ratio i.e. 3.

$\therefore \quad T_n = a(3)^{n-1}+bn+c$

On putting $n=1,2,3$, we get

$$T_1 = a+b+c=5 \quad \ldots(i)$$
$$T_2 = 3a+2b+c=7 \quad \ldots(ii)$$

and $$T_3 = 9a+3b+c=13 \quad \ldots(iii)$$

On solving Eqs. (i), (ii) and (iii), we get

$a=1, b=0$ and $c=4$

$\therefore \quad T_n = 3^{n-1}+4$

$$\therefore \quad S_n = \sum T_n = \sum(3^{n-1}+4)$$
$$= \sum 3^{n-1} + \sum 4 = \frac{3^n-1}{3-1}+4n$$
$$= \frac{3^n-1}{2}+4n = \frac{1}{2}(3^n+8n-1)$$

Example 64. *Find the sum to n terms* $3+7+13+21+\ldots$.

Sol. Let $S = 3+7+13+21+\ldots+T_n \quad \ldots(i)$

and $S = \quad 3+7+13+\ldots+T_{n-1}+T_n \quad \ldots(ii)$

On subtracting Eq. (ii) from Eq. (i), we get

$$T_n = 3+4+6+8+\ldots+(T_n-T_{n-1})$$
$$= 3+\frac{n-1}{2}[8+(n-2)2] = 3+(n-1)(n+2)$$
$$= n^2+n+1$$

Hence, $S = \Sigma(n^2+n+1)$
$$= \Sigma n^2 + \Sigma n + \Sigma 1$$
$$= \frac{n(n+1)(2n+1)}{6}+\frac{n(n+1)}{2}+n$$
$$= \frac{n}{3}(n^2+3n+5)$$

Example 65. *Find the sum to n terms* $1+4+10+22+\ldots$.

Sol. Let $S = 1+4+10+22+\ldots+T_n \quad \ldots(i)$

and $S = \quad 1+4+10+\ldots+T_{n-1}+T_n \quad \ldots(ii)$

On subtracting Eq. (ii) from Eq. (i), we get

$$T_n = 1+(3+6+12+\ldots+T_n-T_{n-1})$$
$$\Rightarrow \quad T_n = 1+3\left(\frac{2^{n-1}-1}{2-1}\right)$$
$$\Rightarrow \quad T_n = 3\cdot 2^{n-1}-2$$

So, $S = \Sigma T_n = 3\Sigma 2^{n-1} - \Sigma 2$
$$= 3\cdot\left(\frac{2^n-1}{2-1}\right)-2n$$
$$= 3\cdot 2^n - 2n - 3$$

Second Way

We can find nth term of the series by the following steps:

i. Denote the nth term by T_n and the sum of the series upto n terms by S_n.

ii. Rewrite the given series with each term shifted by one place to the right.

iii. By subtracting the later series from the former, find T_n.

iv. From T_n, S_n can be found by appropriate summation.

Example 66. *The sum of n terms of the series* $1+2+5+12+25+46+\ldots$ *is*

(a) $\frac{1}{12}n(n-1)(n^2-3n+8)$

(b) $\frac{1}{24}n(n+1)(n^2-3n+8)$

(c) $\frac{1}{12}n(n+1)(n^2-3n+8)$

(d) None of the above

Sol. (c) Let the sum of the series be S_n and nth term of the series be T_n. Then,

$$S_n = 1+2+5+12+25+46+\ldots+T_{n-1}+T_n \quad \ldots(i)$$
$$S_n = \quad 1+2+5+12+25+\ldots+T_{n-1}+T_n \quad \ldots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$0 = 1+1+3+7+13+21+\ldots+(T_n-T_{n-1})-T_n$$
$$\Rightarrow \quad T_n = 1+1+3+7+13+21+\ldots+t_{n-1}+t_n \quad \ldots(iii)$$

[since, nth term of T_n is t_n]

$$\Rightarrow \quad T_n = 1+1+3+7+13+\ldots+t_{n-1}+t_n \quad \ldots(iv)$$

On subtracting Eq. (iv) from Eq. (iii), we get

$$0 = 1+0+2+4+6+8+\ldots+(t_n-t_{n-1})-t_n$$
$$\Rightarrow \quad t_n = 1+2+4+6+8+\ldots+(n-1) \text{ terms}$$
$$= 1+[2+4+6+8+\ldots+(n-2) \text{ terms}$$
$$= 1+\frac{n-2}{2}[2\cdot 2+(n-2-1)2]$$
$$= 1+(n-2)(2+n-3)$$
$$= n^2-3n+3$$

$$\therefore \quad T_n = \Sigma t_n = \Sigma n^2 - 3\Sigma n + 3n$$
$$= \frac{n(n+1)(2n+1)}{6} - 3\cdot\frac{n(n+1)}{2}+3n$$
$$= \frac{n}{3}(n^2-3n+5)$$

$$\therefore \quad S_n = \frac{1}{3}\Sigma n^3 - \Sigma n^2 + 5\Sigma n$$
$$= \frac{1}{3}\left[\frac{n(n+1)}{2}\right]^2 - \frac{1}{6}\cdot\frac{n(n+1)(2n+1)}{1}+\frac{5}{3}\cdot\frac{n(n+1)}{2}$$
$$= \frac{n(n+1)}{6\times 2}\cdot[n^2+n-4n-2+10]$$
$$= \frac{1}{12}\cdot n(n+1)(n^2-3n+8)$$

Example 67. *Find the sum to n terms of the series* $1\cdot2+2\cdot3+3\cdot4+\dots$.

Sol. Let T_r be the general term of the series.

So, $T_r = r(r+1)$

To express $t_r = f(r) - f(r-1)$ multiply and divide t_r by $[(r+2)-(r-1)]$.

So, $T_r = \frac{r}{3}(r+1)[(r+2)-(r-1)]$

$= \frac{1}{3}[r(r+1)(r+2)-(r-1)r(r+1)]$

Let $f(r) = \frac{1}{3}r(r+1)(r+2)$

So, $T_r = [f(r) - f(r-1)]$

Now, $S = \sum_{r=1}^{n} T_r = T_1 + T_2 + T_3 + \dots + T_n$

$$T_1 = \frac{1}{3}[1\cdot2\cdot3 - 0]$$
$$T_2 = \frac{1}{3}[2\cdot3\cdot4 - 1\cdot2\cdot3]$$
$$T_3 = \frac{1}{3}[3\cdot4\cdot5 - 2\cdot3\cdot4]$$
$$\vdots \quad \vdots$$
$$T_n = \frac{1}{3}[n(n+1)(n+2)-(n-1)n(n+1)]$$

$\therefore \quad S = \frac{1}{3}n(n+1)(n+2)$

Hence, the sum of series is $f(n) - f(0)$.

Example 68. *Find the sum to n terms of the series given below*

$$\frac{4}{1\cdot2\cdot3}+\frac{5}{2\cdot3\cdot4}+\frac{6}{3\cdot4\cdot5}+\dots$$

Sol. Let $T_r = \frac{r+3}{r(r+1)(r+2)}$

$$= \frac{1}{(r+1)(r+2)} + \frac{3}{r(r+1)(r+2)}$$
$$= \left[\frac{1}{r+1} - \frac{1}{r+2}\right] + \frac{3}{2}\left[\frac{1}{r(r+1)} - \frac{1}{(r+1)(r+2)}\right]$$
$$\therefore \quad S = \left[\frac{1}{2} - \frac{1}{n+2}\right] + \frac{3}{2}\left[\frac{1}{2} - \frac{1}{(n+1)(n+2)}\right]$$
$$= \frac{5}{4} - \frac{1}{n+2}\left[1 + \frac{3}{2(n+1)}\right]$$
$$= \frac{5}{4} - \frac{1}{2(n+1)(n+2)}[2n+5]$$

V_n Method

To find the sum of the series of the forms

i. $\frac{1}{a_1a_2a_3\dots a_r} + \frac{1}{a_2a_3\dots a_{r+1}} + \dots + \frac{1}{a_na_{n+1}\dots a_{n+r-1}}$

ii. $a_1a_2\dots a_r + a_2a_3\dots a_{r+1} + \dots + a_na_{n+1}\dots a_{n+r-1}$

where, $a_1, a_2, a_3\dots a_n\dots$ are in AP.

Solution of Form (i) Let d be the common difference of an AP. Then, $a_n = a_1 + (n-1)d$

Let sum of the series and nth term be denoted by S_n and T_n, respectively. Then,

$$S_n = \frac{1}{a_1a_2\dots a_r} + \frac{1}{a_2a_3\dots a_{r+1}} + \dots + \frac{1}{a_na_{n+1}\dots a_{n+r-1}}$$

$$T_n = \frac{1}{a_n\,a_{n+1}\,a_{n+2}\dots a_{n+r-2}\,a_{n+r-1}} \quad \dots\text{(i)}$$

$$\text{Let } V_n = \frac{1}{a_{n+1}\,a_{n+2}\dots a_{n+r-2}\,a_{n+r-1}} \quad \dots\text{(ii)}$$

[avoiding first term for V_n i.e. a_n in T_n]

$$V_{n-1} = \frac{1}{a_n\,a_{n+1}\dots a_{n+r-3}\,a_{n+r-2}}$$

$$\therefore \quad V_n - V_{n-1} = \frac{1}{a_{n+1}a_{n+2}\dots a_{n+r-2}\,a_{n+r-1}} - \frac{1}{a_na_{n+1}\dots a_{n+r-2}}$$

$$V_n - V_{n-1} = \frac{a_n - a_{n+r-1}}{a_na_{n+1}a_{n+2}\dots a_{n+r-2}a_{n+r-1}}$$

$$V_n - V_{n-1} = T_n(a_n - a_{n+r-1}) \quad \text{[from Eq. (i)]}$$
$$= T_n\{[a_1+(n-1)d] - [a_1+(n+r-2)d]\}$$
$$= d(1-r)T_n$$

$$\therefore \quad T_n = \frac{(V_n - V_{n-1})}{d(1-r)}$$

$$\Rightarrow \quad T_n = \frac{1}{d(r-1)}\{V_{n-1} - V_n\}$$

Putting $n = 1, 2, 3, 4, \dots, n$, we get

$$T_1 = \frac{1}{d(r-1)}(V_0 - V_1)$$
$$T_2 = \frac{1}{d(r-1)}(V_1 - V_2)$$
$$T_3 = \frac{1}{d(r-1)}(V_2 - V_3)$$
$$\vdots \quad \vdots \quad \vdots$$
$$T_n = \frac{1}{d(r-1)}(V_{n-1} - V_n)$$

Adding the above equations, we get

$$T_1 + T_2 + T_3 + \dots + T_n = \frac{1}{(r-1)d}(V_0 - V_n)$$

$$\therefore \ S_n = \frac{1}{(r-1)d}\left\{\frac{1}{a_1a_2\dots a_{r-1}} - \frac{1}{a_{n+1}a_{n+2}\dots a_{n+r-1}}\right\}$$

Hence, the sum of n terms is

$$S_n = \frac{1}{(r-1)(a_2-a_1)} \left\{\frac{1}{a_1a_2\ldots a_{r-1}} - \frac{1}{a_{n+1}a_{n+2}\ldots a_{n+r-1}}\right\}$$

Corollary If $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in AP, then

For $r = 2$

$$\frac{1}{a_1a_2} + \frac{1}{a_2a_3} + \cdots + \frac{1}{a_na_{n+1}}$$
$$= \frac{1}{(a_2-a_1)}\left(\frac{1}{a_1} - \frac{1}{a_{n+1}}\right)$$
$$= \frac{a_{n+1}-a_1}{(a_2-a_1)a_1a_{n+1}}$$
$$= \frac{a_1+(n+1-1)d-a_1}{da_1a_{n+1}}$$
$$= \frac{nd}{da_1a_{n+1}} = \frac{n}{a_1a_{n+1}}$$

For $r = 3$

$$\frac{1}{a_1a_2a_3} + \frac{1}{a_2a_3a_4} + \cdots + \frac{1}{a_na_{n+1}a_{n+2}}$$
$$= \frac{1}{2(a_2-a_1)}\left[\frac{1}{a_1a_2}a_2 - \frac{1}{a_{n+1}a_{n+2}}\right]$$

For $r = 4$

$$\frac{1}{a_1a_2a_3a_4} + \frac{1}{a_2a_3a_4a_5} + \cdots + \frac{1}{a_na_{n+1}a_{n+2}a_{n+3}}$$
$$= \frac{1}{3(a_2-a_1)}\left[\frac{1}{a_1a_2a_3} - \frac{1}{a_{n+1}a_{n+2}+a_{n+3}}\right]$$

Solution of Form (ii) Let S_n be the sum and T_n be the nth term of the series, then

$$S_n = a_1a_2\ldots a_r + a_2a_3\ldots a_{r+1} + \cdots + a_na_{n+1}\ldots a_{n+r-1}$$

$\therefore \quad T_n = a_na_{n+1}\ a_{n+2}\ldots a_{n+r-2}\ a_{n+r-1}$

Let $\quad V_n = a_na_{n+1}a_{n+2}\ldots a_{n+r-2}a_{n+r-2}a_{n+r}$

[taking one extra term in T_n for V_n]

$\therefore\ V_n - 1 = a_{n-1}a_na_{n+1}\ldots a_{n+r-3}a_{n+r-2}a_{n+r-1}$

$\Rightarrow V_n - V_{n-1} = a_na_{n+1}\ a_{n+2}\ldots$

$a_{n+r-1}\ (a_{n+r} - a_{n-1})$ [from Eq. (i)]

$= T_n\{([a_1+(n+r-1)d]-[a_1+(n-2)d])\}$

$= (r+1)d\ T_n$

$$\Rightarrow \quad T_n = \frac{1}{(r+1)d}(V_n - V_{n-1})$$

Putting $n = 1, 2, 3, \ldots, n$, we get

$$T_1 = \frac{1}{(r+1)d}(V_1 - V_0)$$
$$T_2 = \frac{1}{(r+1)d}(V_2 - V_1)$$
$$T_3 = \frac{1}{(r+1)d}(V_3 - V_2)$$
$$\vdots \qquad \vdots \qquad \vdots$$
$$T_n = \frac{1}{(r+1)d}(V_n - V_{n-1})$$

Adding the above equations, we get

$$T_1 + T_2 + T_3 + \ldots + T_n = \frac{1}{(r+1)d}(V_n - V_0)$$

$$\therefore \quad S_n = \frac{1}{(r+1)(a_2-a_1)}(a_na_{n+1}\ldots a_{n+r} - a_0a_1a_2\ldots a_r)$$

$[\because\ a_0 = a_1 - d]$

Hence, the sum of n terms is

$$S_n = \frac{1}{(r+1)(a_2-a_1)}\{a_na_{n+1}\ldots a_{n+r} - a_0a_1a_2\ldots a_r\}$$

Corollary If $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in AP, then

For $r = 2$

$$a_1a_2 + a_2a_3 + \ldots + a_na_{n+1} = \frac{1}{3(a_2-a_1)}\{a_na_{n+1}a_{n+2} - a_0a_1a_2\}$$

For $r = 3$

$$a_1a_2a_3 + a_2a_3a_4 + \ldots + a_na_{n+1}a_{n+2} = \frac{1}{4(a_2-a_1)}\{a_na_{n+1}a_{n+2}a_{n+3} - a_0a_1a_2a_3\}$$

Example 69. *The sum of n terms of the series* $\frac{4}{1\cdot2\cdot3} + \frac{5}{2\cdot3\cdot4} + \frac{6}{3\cdot4\cdot5} + \ldots$ *is*

(a) $\frac{n+3}{n(n+1)(n+2)}$

(b) $\frac{n(n+1)}{n(n+1)(n+2)}$

(c) $\frac{5}{4} - \frac{2n+5}{2(n+1)(n+2)}$

(d) None of the above

Sol. (c) Here, $T_n = \dfrac{n+3}{n(n+1)(n+2)}$

$$\Rightarrow \quad T_n = \frac{1}{(n+1)(n+2)} + \frac{3}{n(n+1)(n+2)}$$

$$\Rightarrow \quad T_n = \left[\frac{1}{n+1} - \frac{1}{n+2}\right] + \frac{3}{2}\left[\frac{1}{n(n+1)} - \frac{1}{(n+1)(n+2)}\right]$$

$$\therefore \quad T_1 = \left(\frac{1}{2} - \frac{1}{3}\right) + \frac{3}{2}\left(\frac{1}{1\cdot 2} - \frac{1}{2\cdot 3}\right)$$

$$T_2 = \left(\frac{1}{3} - \frac{1}{4}\right) + \frac{3}{2}\left(\frac{1}{2\cdot 3} + \frac{1}{3\cdot 4}\right)$$

and so on.

Now, $S = T_1 + T_2 + T_3 + \ldots$

$$\Rightarrow \quad S = \left[\frac{1}{2} - \frac{1}{n+2}\right] + \frac{3}{2}\left[\frac{1}{2} - \frac{1}{(n+1)(n+2)}\right]$$

$$\therefore \quad S = \frac{5}{4} - \frac{2n+5}{2(n+1)(n+2)}$$

Example 70. If $\sum_{r=1}^{n} T_r = \dfrac{n}{8}(n+1)(n+2)(n+3)$, then find $\sum_{r=1}^{n} \dfrac{1}{T_r}$.

Sol. $\because T_n = S_n - S_{n-1}$, $\sum_{r=1}^{n} T_r - \sum_{r=1}^{n-1} T_r$

$$= \frac{n(n+1)(n+2)(n+3)}{8} - \frac{(n-1)n(n+1)(n+2)}{8}$$

$$= \frac{n(n+1)(n+2)}{8}[(n+3)-(n-1)]$$

$$= \frac{n(n+1)(n+2)}{8}(4) = \frac{n(n+1)(n+2)}{2}$$

$$\Rightarrow \quad \frac{1}{T_n} = \frac{2}{n(n+1)(n+2)} \quad \ldots\text{(i)}$$

$$\therefore \quad V_n = \frac{2}{(n+1)(n+2)}$$

Then, $V_{n-1} = \dfrac{2}{n(n+1)}$

$$\therefore \quad V_n - V_{n-1} = \frac{2}{(n+1)(n+2)} - \frac{2}{n(n+1)}$$

$$= -\frac{4}{n(n+1)(n+2)} = -2\left(\frac{1}{T_n}\right) \quad \text{[from Eq. (i)]}$$

$$\therefore \quad \frac{1}{T_n} = -\frac{1}{2}(V_n - V_{n-1})$$

Putting $n = 1, 2, 3, \ldots, n$, we get

$$\frac{1}{T_1} = -\frac{1}{2}(V_1 - V_0)$$

$$\frac{1}{T_2} = -\frac{1}{2}(V_2 - V_1)$$

$$\frac{1}{T_3} = -\frac{1}{2}(V_3 - V_2)$$

$$\vdots \quad \vdots$$

$$\frac{1}{T_n} = -\frac{1}{2}(V_n - V_{n-1})$$

$$\therefore \quad \frac{1}{T_1} + \frac{1}{T_2} + \frac{1}{T_3} + \ldots + \frac{1}{T_n} = -\frac{1}{2}(V_n - V_0)$$

$$\Rightarrow \quad \sum_{r=1}^{n} \frac{1}{T_r} = -\frac{1}{2}\left[\frac{2}{(n+1)(n+2)} - \frac{2}{2}\right]$$

$$= \frac{(n+1)(n+2)-2}{2(n+1)(n+2)}$$

$$= \frac{n^2+3n}{2(n+1)(n+2)}$$

Some Important Series

(i) $e^x = 1 + \dfrac{x}{1!} + \dfrac{x^2}{2!} + \dfrac{x^3}{3!} + \ldots + \dfrac{x^n}{n!} + \ldots$

(ii) $\log(1+x) = x - \dfrac{x^2}{2} + \dfrac{x^3}{3} - \dfrac{x^4}{4} + \ldots + (-1)^{n+1}\dfrac{x^n}{n} + \ldots$

(iii) $(1+x)^{\alpha} = 1 + \dfrac{\alpha}{1!}x + \dfrac{\alpha(\alpha-1)}{2!}x^2 + \ldots + \dfrac{\alpha(\alpha-1)\ldots(\alpha-n+1)}{n!}x^n + \ldots, (-1 < x < 1)$

Work Book Exercise 3.4

1 The sum of n terms of the series $2^2 + 4^2 + 6^2 + \ldots$ is

a $\dfrac{n(n+1)(2n+1)}{3}$

b $\dfrac{2n(n+1)(2n+1)}{3}$

c $\dfrac{n(n+1)(2n+1)}{6}$

d $\dfrac{n(n+1)(2n+1)}{9}$

2 The sum of n terms of $1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + \ldots$ is

a $\dfrac{n(n+1)(n+2)(n+3)}{4}$

b $\dfrac{2n(n+1)(n+2)(n+3)}{3}$

c $\dfrac{(n+2)(n+1)(n+3)}{4}$

d $\dfrac{n(n-1)(n-2)(n-3)}{4}$

3 The sum of n terms of the series $\dfrac{1}{1\cdot 2} + \dfrac{1}{2\cdot 3} + \dfrac{1}{3\cdot 4} + \ldots$ is

a $\dfrac{n}{(n+1)(n+2)}$

b $\dfrac{1}{n} - \dfrac{1}{n+1}$

c $\dfrac{n}{n+1}$

d None of these

4 The sum of n terms of the series $\dfrac{3}{1^2} + \dfrac{5}{1^2+2^2} + \dfrac{7}{1^2+2^2+3^2} + \ldots$ is

a $\dfrac{n+1}{n}$

b $\dfrac{n}{n+1}$

c $\dfrac{6n}{n+1}$

d $\dfrac{6(n-1)}{n}$

5 If $\sum_{r=1}^{n} T_r = (3^n - 1)$, then find the sum of $\sum_{r=1}^{n} \frac{1}{T_r}$.

a $\frac{3}{4}\left[1-\left(\frac{1}{3}\right)^n\right]$ b $\frac{3}{2}(3^n - 1)$

c $\frac{3}{4}(1 - 3^n)$ d $\frac{1}{2}\left[1-\left(\frac{1}{3}\right)^n\right]$

6 The sum of n terms of the series $5 + 7 + 13 + 31 + 85 + \ldots$ is

a $\frac{1}{2} n(2n + 1)$

b $\frac{1}{2}(3^n + 8n - 1)$

c $\frac{1}{2}(3^{2n} - 2n)$

d None of the above

7 The sum of the series $\sum_{k=1}^{360}\left(\frac{1}{k\sqrt{k+1} + (k+1)\sqrt{k}}\right)$ is

a $\frac{18}{19}$ b $\frac{15}{19}$

c $\frac{17}{19}$ d $\frac{16}{19}$

8 The sum of the series $\sum_{r=1}^{n} \frac{r}{(r+1)!}$, where $n! = 1 \cdot 2 \cdot 3 \ldots n$, is

a $\frac{n}{(n+1)!}$ b $1 - \frac{1}{(n+1)!}$

c $\frac{1}{(n+1)!}$ d $\frac{n+1}{n!}$

9 The sum of first n terms of the series $1^3 + 3 \times 2^2 + 3^3 + 3 \times 4^2 + 5^3 + 3 \times 6^2 + \ldots$, when n is even, is

a $\frac{n+1}{8}(n^3 + 7n^2 - 3n - 1)$ b $\frac{n}{8}(n^3 + 7n^2 - 4n + 1)$

c $\frac{n}{8}(n^3 + 4n^2 + 10n + 8)$ d None of these

10 The sum of first n terms of the series $\frac{1}{1 + 1^2 + 1^4} + \frac{2}{1 + 2^2 + 2^4} + \frac{3}{1 + 3^2 + 3^4} + \ldots$ is

a $\frac{1}{4}\left(1 - \frac{1}{n^2 + n + 1}\right)$ b $\frac{1}{n^2 + n + 1}$

c $\frac{1}{n + n^2 + n^4}$ d $\frac{1}{2}\left(1 - \frac{1}{n^2 + n + 1}\right)$

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. If S_1, S_2 and S_3 denote the sum of first n_1, n_2 and n_3 terms respectively of an AP, then $\frac{S_1}{n_1}(n_2 - n_3) + \frac{S_2}{n_2}(n_3 - n_1) + \frac{S_3}{n_3}(n_1 - n_2)$ is equal to

(a) 0

(b) 1

(c) $S_1 S_2 S_3$

(d) $n_1 n_2 n_3$

Sol. We have, $S_1 = \frac{n_1}{2}[2a + (n_1 - 1)d]$

$$\Rightarrow \quad \frac{2S_1}{n_1} = 2a + (n_1 - 1)d$$

$$S_2 = \frac{n_2}{2}[2a + (n_2 - 1)d]$$

$$\Rightarrow \quad \frac{2S_2}{n_2} = 2a + (n_2 - 1)d$$

and $$S_3 = \frac{n_3}{2}[2a + (n_3 - 1)d]$$

$$\Rightarrow \quad \frac{2S_3}{n_3} = 2a + (n_3 - 1)d$$

$$\therefore \quad \frac{2S_1}{n_1}(n_2 - n_3) + \frac{2S_2}{n_2}(n_3 - n_1) + \frac{2S_3}{n_3}(n_1 - n_2)$$

$$= [2a + (n_1 - 1)d](n_2 - n_3) + [2a + (n_2 - 1)d](n_3 - n_1) + [2a + (n_3 - 1)d](n_1 - n_2)$$

$$= 0$$

Hence, (a) is the correct answer.

Ex 2. Let a and b be two given numbers. If A denotes the single AM and S denotes the sum of n AM's between a and b, then S/A depends on

(a) n, a, b (b) n, b (c) n, a (d) n

Sol. $\because$ A is the single AM between a and b.

$$\therefore \quad A = \frac{a + b}{2}$$

Let $A_1, A_2, \ldots, A_n$ be n AM's between a and b.

$\therefore$ $a, A_1, A_2, \ldots, A_n, b$ is an AP with common difference

$$d = \frac{b - a}{n + 1}$$

Now, $S = A_1 + A_2 + \ldots + A_n = \frac{n}{2}(A_1 + A_n)$

$$= \frac{n}{2}(a + d + b - d) = \frac{n}{2}(a + b)$$

$$\therefore \quad S = n\left(\frac{a + b}{2}\right) = nA$$

$$\Rightarrow \quad \frac{S}{A} = n$$

Hence, (d) is the correct answer.

Ex 3. The sum of the products of $2n$ numbers $\pm 1, \pm 2, \pm 3, \ldots, \pm n$ taking two at a time is

(a) $-\frac{n(n + 1)}{2}$ (b) $\frac{n(n + 1)(2n + 1)}{6}$

(c) $-\frac{n(n + 1)(2n + 1)}{6}$ (d) None of these

Sol. We have, $(1 - 1 + 2 - 2 + 3 - 3 + \ldots + n - n)^2$

$$= 1^2 + 1^2 + 2^2 + 2^2 + \ldots + n^2 + n^2 + 2S$$

where, S is the required sum.

$$\Rightarrow \quad 0 = 2(1^2 + 2^2 + \ldots + n^2) + 2S$$

$$\Rightarrow \quad S = -(1^2 + 2^2 + \ldots + n^2) = -\frac{n(n + 1)(2n + 1)}{6}$$

Hence, (c) is the correct answer.

Ex 4. The number of terms common to two AP's 3, 7, 11, ..., 407 and 2, 9, 16, ..., 709 is

(a) 21 (b) 28

(c) 14 (d) None of these

Sol. By inspection, first common term to both the sequences is 23. Second common term = 51

Third term = 79 and so on.

These numbers form an AP 23, 51, 79, ...

$\because \quad T_{15} = 23 + 14\,(28) = 23 + 392 = 415 > 407$

and $\quad T_{14} = 23 + 13\,(28) = 387 < 407$

$\therefore$ Number of common terms = 14

Hence, (c) is the correct answer.

Aliter

Let $\quad t_m = t_n$

$$\Rightarrow \quad 3 + (m - 1)\,4 = 2 + (n - 1)\,7$$

$$\Rightarrow \quad 4m - 1 = 7n - 5$$

$$\Rightarrow \quad 4\,(m + 1) = 7n$$

$$\Rightarrow \quad \frac{m + 1}{7} = \frac{n}{4} = \lambda,$$

where, $\quad m \le 102$

and $\quad n \le 102$

$\therefore$ $m = 7\lambda - 1$, $n = 4\lambda$

$$\lambda \le 14\frac{5}{7} \quad \text{and} \quad \lambda \le 25\frac{2}{4}$$

$\therefore$ $\lambda \le 14$, number of common terms = 14

Hence, (c) is the correct answer.

Ex 5. The sum of all the numbers of the form n^3 which lie between 100 and 10000, is

(a) 43261

(b) 53261

(c) 63261

(d) None of the above

Sol. The smallest and the largest numbers between 100 and 10000, which can be written in the form n^3, are

$$5^3 = 125 \quad \text{and} \quad 21^3 = 9261$$

$\therefore$ Required sum

$$= 5^3 + 6^3 + 7^3 + \ldots + 21^3 = \sum_{n=1}^{21} n^3 - \sum_{n=1}^{4} n^3$$

$$= \left[\frac{1}{4}n^2 (n+1)^2\right]_{n=21} - \left[\frac{1}{4}n^2 (n+1)^2\right]_{n=4}$$

$$= 53361 - 100 = 53261$$

Hence, (b) is the correct answer.

Ex 6. If 1, $\log_y x$, $\log_z y$ and $-15 \log_x z$ are in AP, then

(a) $z^3 = x$ (b) $x = y^{-2}$

(c) $z^{-2} = y$ (d) None of these

Sol. Let d be the common difference.

Then, $\log_y x = 1 + d \Rightarrow x = y^{1+d}$

$\log_z y = 1 + 2d \Rightarrow y = z^{1+2d}$

and $-15 \log_x z = 1 + 3d$

$\Rightarrow z = x^{-(1+3d)/15}$

$\therefore x = y^{1+d} = z^{(1+2d)(1+d)}$

$= x^{-(1+d)(1+2d)(1+3d)/15}$

$\Rightarrow (1+d)(1+2d)(1+3d) = -15$

$\Rightarrow 6d^3 + 11d^2 + 6d + 16 = 0$

$\Rightarrow (d+2)(6d^2 - d + 8) = 0$

$\Rightarrow d = -2$

$\therefore x = y^{1+d} = y^{-1}, \; y = z^{1-4} = z^{-3}$

and $x = (z^{-3})^{-1} = z^3$

Hence, (a) is the correct answer.

Ex 7. $L = \lim\limits_{n\to\infty} \dfrac{1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + 3\cdot 4\cdot 5 + \ldots \text{ upto } n \text{ terms}}{n\,(1\cdot 2 + 2\cdot 3 + 3\cdot 4 + \ldots \text{upto } n \text{ terms})}$ is equal to

(a) $\frac{3}{4}$ (b) $\frac{1}{4}$

(c) $\frac{1}{2}$ (d) $\frac{5}{4}$

Sol. Numerator $= \sum_{r=2}^{n+1} (r-1)\, r\, (r+1)$

$$= \sum_{r=2}^{n+1} (r^3 - r) = \sum_{r=1}^{n+1} (r^3 - r)$$

$$= \frac{1}{4}(n+1)^2 (n+2)^2 - \frac{1}{2}(n+1)(n+2)$$

Also, $\sum_{r=1}^{n} r(r+1) = \sum_{r=1}^{n} [(r+1)^2 - (r+1)]$

$$= \sum_{s=2}^{n+1} (s^2 - s) = \sum_{s=1}^{n+1} (s^2 - s)$$

$$= \frac{1}{6}(n+1)(n+2)(2n+3) - \frac{1}{2}(n+1)(n+2)$$

Thus,

$$L = \lim_{n\to\infty} \frac{\frac{1}{4}\left(1+\frac{1}{n}\right)^2\left(1+\frac{2}{n}\right)^2 - \frac{1}{2n^2}\left(1+\frac{1}{n}\right)\left(1+\frac{2}{n}\right)}{\frac{1}{6}\left(1+\frac{1}{n}\right)\left(1+\frac{2}{n}\right)\left(2+\frac{3}{n}\right) - \frac{1}{2n}\left(1+\frac{1}{n}\right)\left(1+\frac{2}{n}\right)}$$

$$= \frac{1}{4} \times \frac{6}{2} = \frac{3}{4}$$

Hence, (a) is the correct answer.

Ex 8. If three positive real numbers a, b and c are in AP such that $abc = 4$, then the minimum possible value of b is

(a) $2^{3/2}$ (b) $2^{2/3}$ (c) $2^{1/3}$ (d) $2^{5/2}$

Sol. Let d be the common difference of an AP, then

$$4 = abc = (b-d)\, b\, (b+d)$$
$$= b\,(b^2 - d^2)$$

$\Rightarrow b^3 = 4 + bd^2 \ge 4 \quad [\because b > 0, d^2 \ge 0]$

$\Rightarrow b \ge 2^{2/3}$

Thus, minimum possible value of b is $2^{2/3}$, that is the case when $d = 0$.

Hence, (b) is the correct answer.

Ex 9. If the lengths of sides of a right triangle are in AP, then the sines of the acute angle are

(a) $\frac{3}{5}, \frac{4}{5}$ (b) $\sqrt{\frac{2}{3}}, \sqrt{\frac{1}{3}}$

(c) $\sqrt{\frac{\sqrt{5}-1}{2}}, \sqrt{\frac{\sqrt{5}+1}{2}}$ (d) $\sqrt{\frac{\sqrt{3}-1}{2}}, \sqrt{\frac{\sqrt{3}+1}{2}}$

Sol. Let the sides of the triangle be $a-d$, a, $a+d$, where $a > d > 0$. By Pythagoras theorem, we have

$$(a+d)^2 = (a-d)^2 + a^2$$

$\Rightarrow 4ad = a^2 \Rightarrow d = \frac{a}{4}$

We have, $\sin\theta = \dfrac{a}{a+d} = \dfrac{4}{5}$

and $\sin(90° - \theta) = \dfrac{3}{5}$

Hence, (a) is the correct answer.

Ex 10. If $S_n = \sum_{r=1}^{n} t_r = \frac{1}{6} n(2n^2 + 9n + 13)$, then $\sum_{r=1}^{n} \sqrt{t_r}$ is equal to

(a) $\frac{1}{2} n(n+1)$ (b) $\frac{1}{2} n(n+2)$

(c) $\frac{1}{2} n(n+3)$ (d) $\frac{1}{2} n(n+5)$

Sol. We have, $t_n = S_n - S_{n-1}, \forall\, n \ge 1$

$$\therefore t_n = \frac{1}{6} n(2n^2 + 9n + 13) - \frac{1}{6}(n-1)\{2(n-1)^2 + 9(n-1) + 13\}$$

$$= \frac{1}{6}[2\{(n)^3 - (n-1)^3\} + 9\{n^2 - (n-1)^2\} + 13(n - n + 1)]$$

$$= \frac{1}{6}[6n^2 - 6n + 2 + 9(2n-1) + 13]$$

$$= \frac{1}{6}(6n^2 + 12n + 6) = (n+1)^2$$

$$\therefore \sum_{r=1}^{n} \sqrt{t_r} = \sum_{r=1}^{n} (r+1) = \frac{1}{2}(n+1)(n+2) - 1$$

$$= \frac{1}{2} n(n+3)$$

Hence, (c) is the correct answer.

Ex 11. Let a_n be the nth term of an AP. If $\sum_{r=1}^{10^{99}} a_{2r} = 10^{100}$ and $\sum_{r=1}^{10^{99}} a_{2r-1} = 10^{99}$, then the common difference of an AP is

(a) 1 (b) 9 (c) 10 (d) 10^{99}

Sol. Let d be the common difference of an AP, then

$$a_{2r} = a_{2r-1} + d$$

$$\Rightarrow \sum_{r=1}^{10^{99}} a_{2r} = \sum_{r=1}^{10^{99}} (a_{2r-1} + d)$$

$$\Rightarrow \sum_{r=1}^{10^{99}} a_{2r} = \sum_{r=1}^{10^{99}} a_{2r-1} + 10^{99}\, d$$

$$\Rightarrow 10^{100} = 10^{99} + 10^{99}\, d$$

$$\Rightarrow d = \frac{10^{100} - 10^{99}}{10^{99}} = \frac{10^{99}\,(10-1)}{10^{99}} = 9$$

Hence, (b) is the correct answer.

Ex 12. Let $S(n)$ denotes the sum of first n terms of an AP. Then, the value of $\dfrac{S(3n)}{S(2n) - S(n)}$ is

(a) 3 (b) $\frac{1}{3}$

(c) 9 (d) None of these

Sol. $S(3n) = \dfrac{3n}{2}[2a + (3n-1)d]$

$S(2n) = \dfrac{2n}{2}[2a + (2n-1)d]$

$S(n) = \dfrac{n}{2}[2a + (n-1)\,d]$

$$\therefore S(2n) - S(n) = \frac{n}{2}[2\{2a + (2n-1)\,d\} - 2a - (n-1)d]$$

$$= \frac{n}{2}[2a + (3n-1)d] = \frac{S(3n)}{3}$$

$$\therefore \frac{S(3n)}{S(2n) - S(n)} = 3$$

Hence, (a) is the correct answer.

Ex 13. The lengths of three unequal edges of a rectangular solid block are in GP. The volume of the block is 216 cm^3 and the total surface area is 252 cm^2. The length of the longest edge is

(a) 12 cm (b) 6 cm (c) 18 cm (d) 3 cm

Sol. Let the edges be $\frac{a}{r}$, a and ar, where $r > 1$.

According to the question,

$$\frac{a}{r}\cdot a \cdot ar = 216 \Rightarrow a^3 = 216 \Rightarrow a = 6$$

and $2\left(\dfrac{a}{r}\cdot a + a\cdot ar + \dfrac{a}{r}\cdot ar\right) = 252$

$$\therefore \frac{1}{r} + r + 1 = \frac{7}{2} \Rightarrow r = \frac{1}{2}, 2$$

Since, $a = 6$ and $r = 2$, so the longest side $= ar = 12$

Hence, (a) is the correct answer.

Ex 14. The sum of infinite terms of a decreasing GP is equal to the greatest value of the function $f(x) = x^3 + 3x - 9$ in the interval $[-2, 3]$ and the difference between the first two terms is $f'(0)$. Then, the common ratio of a GP is

(a) $-\frac{2}{3}$

(b) $\frac{4}{3}$

(c) $\frac{2}{3}$

(d) $-\frac{4}{3}$

Sol. Let the GP be $a, ar, ar^2, \ldots\ (0 < r < 1)$.

According to the question,

$$\frac{a}{1-r} = 3^3 + 3\cdot 3 - 9 \quad \ldots\text{(i)}$$

$$\left[\begin{array}{l} f'(x) = 3x^2 + 3 > 0. \text{ So } f(x) \text{ is monotonically} \\ \text{increasing and } f(3) \text{ is the greatest value in } [-2, 3] \end{array}\right]$$

Also, $f'(0) = 3$

$\therefore$ $a - ar = 3$ ...(ii)

On solving Eqs. (i) and (ii), i.e. $a = 27(1-r)$ and $a(1-r) = 3$, we get $r = \frac{2}{3}, \frac{4}{3}$ but $r < 1$

Hence, (c) is the correct answer.

Ex 15. The value of

$$\sum_{r=1}^{n} \frac{1}{\sqrt{a+rx} + \sqrt{a+(r-1)x}} \text{ is}$$

(a) $\dfrac{n}{\sqrt{a} + \sqrt{a+nx}}$

(b) $\dfrac{\sqrt{a+nx} + \sqrt{a}}{x}$

(c) $\dfrac{n(\sqrt{a+nx} - a)}{x}$

(d) None of the above

Sol. Let $t_r = \dfrac{1}{\sqrt{a+rx} + \sqrt{a+(r-1)x}}$

$$= \frac{\sqrt{a+rx} - \sqrt{a+(r-1)x}}{a + rx - a - (r-1)x}$$

$$= \frac{1}{x}[\sqrt{a+rx} - \sqrt{a+(r-1)x}\,]$$

$$\therefore t_1 + t_2 + \ldots + t_n = \frac{1}{x}[\{\sqrt{a+x} - \sqrt{a}\} + \{\sqrt{a+2x} - \sqrt{a+x}\} + \ldots + \{\sqrt{a+nx} - \sqrt{a+(n-1)x}\}]$$

$$= \frac{1}{x}[\sqrt{a+nx} - \sqrt{a}\,]$$

$$= \frac{a + nx - a}{x(\sqrt{a+nx} + \sqrt{a})}$$

$$= \frac{n}{\sqrt{a} + \sqrt{a+nx}}$$

Hence, (a) is the correct answer.

Ex 16. If $\sum_{k=1}^{n}\left(\sum_{m=1}^{k} m^2\right) = an^4 + bn^3 + cn^2 + dn + e$, then

(a) $a = \frac{1}{12}$ (b) $b = \frac{1}{2}$

(c) $d = \frac{1}{5}$ (d) $e = 1$

Sol. $\sum_{k=1}^{n}\left(\sum_{m=1}^{k} m^2\right) = \sum_{k=1}^{n} \frac{k(k+1)(2k+1)}{6}$

$= \frac{1}{6}\sum_{k=1}^{n}(2k^3 + 3k^2 + k)$

$= \frac{1}{3}\cdot\left\{\frac{n(n+1)}{2}\right\}^2 + \frac{1}{2}\left[\frac{n(n+1)(2n+1)}{6}\right] + \frac{1}{6}\left[\frac{n(n+1)}{2}\right]$

$a =$ Coefficient of $n^4 = \frac{1}{3}\cdot\frac{1}{4} = \frac{1}{12}$

Hence, (a) is the correct answer.

Ex 17. The value of $(0.2)^{\log_{\sqrt{5}}\left(\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\dots\right)}$ is

(a) 1 (b) 2 (c) $\frac{1}{2}$ (d) 4

Sol. We have, $\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\dots = \frac{\frac{1}{4}}{1-\frac{1}{2}} = \frac{1}{2} = 2^{-1}$

$\therefore (0.2)^{\log_{\sqrt{5}}\left(\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\dots\right)} = \left(\frac{1}{5}\right)^{\log_{\sqrt{5}} 2^{-1}}$

$= (5^{-1})^{\frac{-1}{1/2}\log_5 2} = 5^{2\log_5 2} = 5^{\log_5 (2)^2} = 2^2 = 4$

Hence, (d) is the correct answer.

Ex 18. If $x+y+z=1$ and x, y and z are positive numbers such that $(1-x)(1-y)(1-z) \geq kxyz$, then k is equal to

(a) 2 (b) 4

(c) 8 (d) 16

Sol. $\because$ AM $\geq$ GM

$$\therefore \quad \frac{y+z}{2} \geq \sqrt{yz} \quad \dots\text{(i)}$$

$$\frac{z+x}{2} \geq \sqrt{zx} \quad \dots\text{(ii)}$$

$$\text{and} \quad \frac{x+y}{2} \geq \sqrt{xy} \quad \dots\text{(iii)}$$

On multiplying Eqs. (i), (ii) and (iii), we get

$$\frac{(y+z)(z+x)(x+y)}{8} \geq xyz$$

or $(1-x)(1-y)(1-z) \geq 8xyz$

Hence, (c) is the correct answer.

Ex 19. If $a+b+c=3$ and $a>0$, $b>0$, $c>0$, then the greatest value of $a^2b^3c^2$ is

(a) $\frac{3^{10}\cdot 2^4}{7^7}$ (b) $\frac{3^9\cdot 2^4}{7^7}$

(c) $\frac{3^8\cdot 2^4}{7^7}$ (d) None of these

Sol. On taking AM and GM of 7 numbers $\frac{a}{2}, \frac{a}{2}, \frac{b}{3}, \frac{b}{3}, \frac{b}{3}, \frac{c}{2}, \frac{c}{2}$, we get

$$\frac{2\cdot\frac{a}{2} + 3\cdot\frac{b}{3} + 2\cdot\frac{c}{2}}{7} \geq \left\{\left(\frac{a}{2}\right)^2\left(\frac{b}{3}\right)^3\left(\frac{c}{2}\right)^2\right\}^{\frac{1}{7}}$$

$$\Rightarrow \quad \frac{3}{7} \geq \left(\frac{a^2b^3c^2}{2^2 3^3 2^2}\right)^{\frac{1}{7}}$$

$$\Rightarrow \quad \frac{3^7}{7^7} \geq \frac{a^2b^3c^2}{2^2\cdot 3^3\cdot 2^2}$$

$$\Rightarrow \quad a^2b^3c^2 \leq \frac{3^{10}\cdot 2^4}{7^7}$$

$\therefore$ Greatest value of $a^2b^3c^2$

$$= \frac{3^{10}\cdot 2^4}{7^7}$$

Hence, (a) is the correct answer.

Ex 20. If a, b and c are digits, then the rational number represented by $0.\,cababab\dots$, is

(a) $\frac{99c+ba}{990}$ (b) $\frac{99c+10a+b}{99}$

(c) $\frac{99c+10a+b}{990}$ (d) None of these

Sol. Let $R = 0.cababab\dots$

$= 0.c + 0.0ab + 0.000ab + \dots$

$= \frac{c}{10} + \frac{ab}{10^3} + \frac{ab}{10^5} + \dots$

$= \frac{c}{10} + \left[\frac{\frac{ab}{10^3}}{1-\frac{1}{10^2}}\right] = \frac{c}{10} + \left[\frac{ab}{10^3}\times\frac{10^2}{99}\right]$

$= \frac{c}{10} + \frac{ab}{990} = \frac{99c+ab}{990} = \frac{99c+10a+b}{990}$

Hence, (c) is the correct answer.

Aliter

Let $R = 0.\,cababab\dots$

$\Rightarrow \quad 10R = c.\,ababab\dots \quad \dots\text{(i)}$

and $\quad 10^3R = cab.\,ababab\dots \quad \dots\text{(ii)}$

From Eqs. (i) and (ii), we get

$10^3R - 10R = cab - c$

$$\Rightarrow \quad R = \frac{c\,ab - c}{990}$$

$$\Rightarrow \quad R = \frac{100c + 10a + b - c}{990}$$

$$\Rightarrow \quad R = \frac{99c + 10a + b}{990}$$

Hence, (c) is the correct answer.

Ex 21. If $f(n) = \left[\frac{1}{2} + \frac{n}{100}\right]$, where $[x]$ denotes the integral part of x, then the value of $\sum_{n=1}^{100} f(n)$ is

(a) 50 (b) 51

(c) 1 (d) None of these

Sol. $f(1) = \left[\frac{1}{2} + \frac{1}{100}\right] = 0, \ldots,$

$$\vdots \qquad \vdots \qquad \vdots$$

$$f(49) = \left[\frac{1}{2} + \frac{49}{100}\right] = \left[\frac{99}{100}\right] = 0$$

$$f(50) = \left[\frac{1}{2} + \frac{50}{100}\right] = 1, f(51) = \left[\frac{1}{2} + \frac{51}{100}\right] = 1,$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$f(100) = \left[\frac{1}{2} + \frac{100}{100}\right] = 1$$

$$\therefore \sum_{n=1}^{100} f(n) = \underbrace{(0 + 0 + \ldots + 0)}_{49 \text{ terms}} + \underbrace{(1 + 1 + \ldots + 1)}_{51 \text{ terms}} = 51$$

Hence, (b) is the correct answer.

Ex 22. $A_r, r = 1, 2, 3, \ldots, n$ are n points on the parabola $y^2 = 4x$ in the first quadrant. If $A_r = (x_r, y_r)$, where $x_1, x_2, x_3, \ldots, x_n$ are in GP and $x_1 = 1$, $x_2 = 2$, then y_n is equal to

(a) $2^{\frac{n+1}{2}}$ (b) 2^{n+1} (c) $(\sqrt{2})^{n+1}$ (d) $2^{n/2}$

Sol. $y = 2\sqrt{x}$, being in the first quadrant.

The sequence of x-coordinates is 1, 2, 4, 8, ...

$\therefore$ The sequence of y-coordinates is

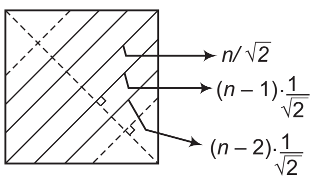
$$2, 2\sqrt{2}, 2\sqrt{4}, 2\sqrt{8}, \ldots$$

where, the common ratio is $\sqrt{2}$.

$$\therefore \qquad y_n = 2 \cdot (\sqrt{2})^{n-1} = 2^{\frac{n+1}{2}}$$

Hence, (a) is the correct answer.

Ex 23. In the given square, a diagonal is drawn and parallel line segments joining points on the adjacent sides are drawn on both sides of the diagonal. The length of the diagonal is $n\sqrt{2}$ cm. If the distance between consecutive line segments is $\frac{1}{\sqrt{2}}$ cm, then the sum of the lengths of all possible line segments and the diagonal is



(a) $n(n+1)\sqrt{2}$ cm (b) n^2 cm

(c) $n(n+2)$ cm (d) $n^2\sqrt{2}$ cm

Sol. Lengths of line segments on one side of the diagonal are $\sqrt{2}, 2\sqrt{2}, 3\sqrt{2}, \ldots, (n-1)\sqrt{2}$.

$\therefore$ Required sum

$$= 2\{\sqrt{2} + 2\sqrt{2} + 3\sqrt{2} + \ldots + (n-1)\sqrt{2}\} + n\sqrt{2}$$

$$= 2\sqrt{2}\{1 + 2 + 3 + \ldots + (n-1)\} + n\sqrt{2}$$

$$= 2\sqrt{2} \cdot \frac{n(n-1)}{2} + n\sqrt{2} = n^2\sqrt{2}$$

Hence, (d) is the correct answer.

Ex 24. $ABCD$ is a square of length a, $a \in N$, $a > 1$. Let $L_1, L_2, L_3, \ldots, L_{a-1}$ be points on BC such that $BL_1 = L_1L_2 = L_2L_3 = \ldots = 1$ and $M_1, M_2, M_3, \ldots, M_{a-1}$ be points on CD such that $CM_1 = M_1M_2 = M_2M_3 = \ldots = 1$. Then, $\sum_{n=1}^{a-1}(AL_n^2 + L_nM_n^2)$ is equal to

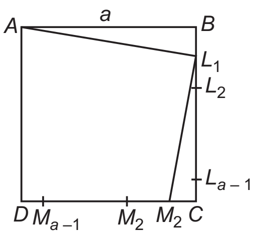
(a) $\frac{1}{2}a(a-1)^2$

(b) $\frac{1}{2}a(a-1)(4a-1)$

(c) $\frac{1}{2}(a-1)(2a-1)(4a-1)$

(d) None of the above

Sol.



$$AL_1^2 + L_1M_1^2 = (a^2 + 1^2) + \{(a-1)^2 + 1^2\}$$

$$AL_2^2 + L_2M_2^2 = (a^2 + 2^2) + \{(a-2)^2 + 2^2\}$$

$$\vdots \qquad \vdots$$

$$AL_{a-1}^2 + L_{a-1}M_{a-1}^2 = a^2 + (a-1)^2 + \{1^2 + (a-1)^2\}$$

$\therefore$ Required sum

$$= (a-1)a^2 + \{1^2 + 2^2 + \ldots + (a-1)^2\} + 2\{1^2 + 2^2 + \ldots + (a-1)^2\}$$

$$= (a-1)a^2 + 3 \cdot \frac{(a-1)a(2a-1)}{6}$$

$$= a(a-1)\left\{a + \frac{2a-1}{2}\right\} = \frac{a(a-1)(4a-1)}{2}$$

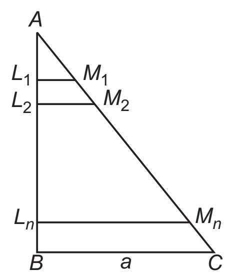
Hence, (b) is the correct answer.

Ex 25. ABC is a right angled triangle in which $\angle B = 90°$ and $BC = a$. If n points $L_1, L_2, \ldots, L_n$ on AB are such that AB is divided in $n+1$ equal parts and $L_1M_1, L_2M_2, \ldots, L_nM_n$ are line segments parallel to BC and $M_1, M_2, \ldots, M_n$ are on AC, then the sum of the lengths of $L_1M_1, L_2M_2, \ldots, L_nM_n$ is

(a) $\frac{a(n+1)}{2}$ (b) $\frac{a(n-1)}{2}$

(c) $\frac{an}{2}$ (d) None of these

Sol.



$\because \quad \dfrac{AL_1}{AB} = \dfrac{L_1M_1}{BC}$

$\therefore \quad \dfrac{1}{n+1} = \dfrac{L_1M_1}{a}$

$\Rightarrow \quad L_1M_1 = \dfrac{a}{n+1}$ and $\dfrac{AL_2}{AB} = \dfrac{L_2M_2}{BC}$

$\Rightarrow \quad \dfrac{2}{n+1} = \dfrac{L_2M_2}{a}$

$\Rightarrow \quad L_2M_2 = \dfrac{2a}{n+1}$ and so on.

$\therefore$ Required sum

$$= \frac{a}{n+1} + \frac{2a}{n+1} + \frac{3a}{n+1} + \ldots + \frac{na}{n+1}$$

$$= \frac{a}{n+1}(1+2+\ldots+n) = \frac{a}{n+1} \cdot \frac{n(n+1)}{2} = \frac{an}{2}$$

Hence, (c) is the correct answer.

Ex 26. If a, b, c and d are in HP, then $ab + bc + cd$ is equal to

(a) ad (b) $2ad$
(c) $3ad$ (d) None of these

Sol. Since, a, b, c and d are in HP, therefore $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ and $\frac{1}{d}$ are in AP.

$\therefore \quad \dfrac{1}{b} - \dfrac{1}{a} = \dfrac{1}{c} - \dfrac{1}{b} = \dfrac{1}{d} - \dfrac{1}{c} = k$ [say]

$\Rightarrow \quad \dfrac{1}{b} - \dfrac{1}{a} = k, a - b = kab$ …(i)

$\dfrac{1}{c} - \dfrac{1}{b} = k, b - c = kbc$ …(ii)

and $\dfrac{1}{d} - \dfrac{1}{c} = k, c - d = kcd$ …(iii)

On adding Eqs. (i), (ii) and (iii), we get

$$\frac{1}{d} - \frac{1}{a} = 3k, a - d = k(ab + bc + cd)$$

or $\quad a - d = 3kad, a - d = k(ab + bc + cd)$

$\therefore \quad 3ad = (ab + bc + cd)$

Hence, (c) is the correct answer.

Ex 27. If a, b and c are in HP, then $\dfrac{a}{b+c}, \dfrac{b}{c+a}$ and $\dfrac{c}{a+b}$ are in

(a) AP (b) GP
(c) HP (d) None of these

Sol. $\because a, b$ and c are in HP.

$\therefore \frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in AP.

$\Rightarrow \quad \dfrac{a+b+c}{a}, \dfrac{a+b+c}{b}, \dfrac{a+b+c}{c}$ are in AP

$\Rightarrow 1 + \dfrac{b+c}{a}, 1 + \dfrac{c+a}{b}, 1 + \dfrac{a+b}{c}$ are in AP

$\Rightarrow \quad \dfrac{b+c}{a}, \dfrac{c+a}{b}, \dfrac{a+b}{c}$ are in AP.

$\Rightarrow \quad \dfrac{a}{b+c}, \dfrac{b}{c+a}, \dfrac{c}{a+b}$ are in HP.

Hence, (c) is the correct answer.

Ex 28. If $x > 1, y > 1$ and $z > 1$ are in GP, then $\dfrac{1}{1+\ln x}, \dfrac{1}{1+\ln y}$ and $\dfrac{1}{1+\ln z}$ are in

(a) AP (b) GP
(c) HP (d) None of these

Sol. Since, x, y and z are in GP.

$\therefore \quad y^2 = xz$

Taking log on both sides, we get

$$2\ln y = \ln x + \ln z$$

$\Rightarrow \quad 2 + 2\ln y = (1 + \ln x) + (1 + \ln z)$

$\Rightarrow \quad 2(1 + \ln y) = (1 + \ln x) + (1 + \ln z)$

$\therefore \quad 1 + \ln x, 1 + \ln y$ and $1 + \ln z$ are in AP.

$\Rightarrow \quad \dfrac{1}{1+\ln x}, \dfrac{1}{1+\ln y}$ and $\dfrac{1}{1+\ln z}$ are in HP.

Hence, (c) is the correct answer.

Ex 29. If $a, a_1, a_2, a_3, \ldots, a_{2n}, b$ are in AP and $a, g_1, g_2, \ldots, g_{2n}, b$ are in GP and h is the HM of a and b, then $\dfrac{a_1 + a_{2n}}{g_1 g_{2n}} + \dfrac{a_2 + a_{2n-1}}{g_2 g_{2n-1}} + \ldots + \dfrac{a_n + a_{n+1}}{g_n g_{n+1}}$ is equal to

(a) $2nh$ (b) $\dfrac{n}{h}$ (c) nh (d) $\dfrac{2n}{h}$

Sol. Since, $a, a_1, a_2, a_3, \ldots, a_{2n}, b$ are in AP.

$\therefore \quad a + b = a_1 + a_{2n} = a_2 + a_{2n-1} = \ldots = a_n + a_{n+1}$

Also, $a, g_1, g_2, \ldots, g_{2n}, b$ are in GP.

$\therefore \quad ab = g_1 g_{2n} = g_2 g_{2n-1} = \ldots = g_n g_{n+1}$

Now, the given expression

$$\frac{a_1 + a_{2n}}{g_1 g_{2n}} + \frac{a_2 + a_{2n-1}}{g_2 g_{2n-1}} + \ldots + \frac{a_n + a_{n+1}}{g_n g_{n+1}}$$

$$= \frac{n(a+b)}{ab} = \frac{2n}{h} \quad \left[\because h = \frac{2ab}{a+b}\right]$$

Hence, (d) is the correct answer.

Ex 30. If $0.272727\ldots, x$ and $0.727272\ldots$ are in HP, then x must be

(a) rational (b) integer
(c) irrational (d) None of these

Sol. Let $A = 0.272727\ldots$

$\Rightarrow \quad 10^2 A = 27.2727\ldots$

$\Rightarrow \quad A = \dfrac{27}{99} = \dfrac{3}{11}$

Similarly, $0.727272\ldots = \dfrac{8}{11}$

Since, $0.272727\ldots, x$ and $0.727272\ldots$ are in HP.

$\Rightarrow \dfrac{3}{11}, x, \dfrac{8}{11}$ are in HP.

Now, $\quad x = \dfrac{2 \cdot \frac{3}{11} \cdot \frac{8}{11}}{\frac{3}{11} + \frac{8}{11}} = \dfrac{48}{121}$

$\therefore x$ is rational.

Hence, (a) is the correct answer.

Ex 31. The arithmetic mean, geometric mean and harmonic mean between two positive real quantities are themselves in

(a) AP (b) GP

(c) HP (d) None of these

Sol. Relation between arithmetic mean (A), geometric mean (G) and harmonic mean (H) is given by $G^2 = AH$ or $G = \sqrt{AH}$. Clearly, A, G and H are in GP.

Hence, (b) is the correct answer.

Ex 32. A person purchases 1 kg tomatoes from each of the 4 places at the rate of 1 kg, 2 kg, 3 kg and 4 kg per rupee respectively. On the average, he has purchased x kg tomatoes per rupee, then the value of x is

(a) 2 (b) 2.5

(c) 1.92 (d) None of these

Sol. Since, we are given rate per rupees, harmonic mean will gives the correct answer.

$$\therefore \quad \text{HM} = \frac{4}{\frac{1}{1}+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}} = \frac{4\times 12}{12+6+4+3}$$

$$= \frac{48}{25} = 1.92 \text{ kg per rupee}$$

Hence, (c) is the correct answer.

Ex 33. If m is the root of the equation $(1-ab)x^2 - (a^2+b^2)x - (1+ab) = 0$ and m harmonic means are inserted between a and b, then the difference between the last and the first of the means equals

(a) $ab(a-b)$ (b) $a(b-a)$

(c) $ab(b-a)$ (d) $b-a$

Sol. According to the question,

$$(1-ab)m^2 - (a^2+b^2)m - (1+ab) = 0$$

$$\Rightarrow \quad m(a^2+b^2) + (m^2+1)ab = m^2 - 1 \quad \ldots\text{(i)}$$

Now, H_1 = First HM between a and b

$$= \frac{(m+1)ab}{a+mb} \quad \text{and} \quad H_m = \frac{(m+1)ab}{b+ma}$$

$$\therefore \quad H_m - H_1 = (m+1)ab\left[\frac{1}{b+ma} - \frac{1}{a+mb}\right]$$

$$= (m+1)ab\left[\frac{(m-1)(b-a)}{(b+ma)(a+mb)}\right]$$

$$= \frac{(m^2-1)ab(b-a)}{m(a^2+b^2)+(m^2+1)ab}$$

$$= \frac{(m^2-1)ab(b-a)}{m^2-1} \quad \text{[from Eq. (i)]}$$

$$= ab(b-a)$$

Hence, (c) is the correct answer.

Ex 34. If a, b and c are in AP and a, mb, c are in GP, then a, m^2b and c are in

(a) HP (b) GP

(c) AP (d) None of these

Sol. Since, a, b and c are in AP.

$$\therefore \quad 2b = a + c \quad \ldots\text{(i)}$$

Since, a, mb and c are in GP.

$$\therefore \quad mb = \sqrt{ac} \Rightarrow m^2b^2 = ac \quad \ldots\text{(ii)}$$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{2b}{m^2b^2} = \frac{a+c}{ac}$$

i.e. $$\frac{2}{m^2b} = \frac{1}{a} + \frac{1}{c}$$

$\Rightarrow a, m^2b$ and c are in HP.

Hence, (a) is the correct answer.

Ex 35. The AM, HM and GM between two numbers are $\frac{144}{15}$, 15 and 12 but not necessarily in this order. Then, HM, GM and AM respectively are

(a) $\frac{144}{15}, 12, 15$ (b) $\frac{144}{15}, 15, 12$

(c) $15, 12, \frac{144}{15}$ (d) $12, 15, \frac{144}{15}$

Sol. Since, $A > G > H$, i.e. $H < G < A$

$\therefore$ Required numbers are $\frac{144}{15}, 12, 15$, respectively.

Hence, (a) is the correct answer.

Ex 36. Given that α, γ are roots of the equation $Ax^2 - 4x + 1 = 0$ and β, δ are the roots of the equation $Bx^2 - 6x + 1 = 0$, then values of A and B such that α, β, γ and δ are in HP, are

(a) $A = 3, B = 8$ (b) $A = -3, B = 8$

(c) $A = 3, B = -8$ (d) None of these

Sol. α, β, γ and δ are in HP $\Rightarrow \frac{1}{\alpha}, \frac{1}{\beta}, \frac{1}{\gamma}$ and $\frac{1}{\delta}$ are in AP.

Let d be the common difference of this AP.

Now, α and γ are roots of $Ax^2 - 4x + 1 = 0$.

$$\therefore \quad \frac{\alpha+\gamma}{\alpha\gamma} = \frac{4/A}{1/A} = 4 \Rightarrow \frac{1}{\alpha} + \frac{1}{\gamma} = 4$$

i.e. $$\frac{1}{\alpha} + \frac{1}{\alpha} + 2d = 4 \Rightarrow \frac{1}{\alpha} + d = 2 \quad \ldots\text{(i)}$$

Since, β and δ are roots of $Bx^2 - 6x + 1 = 0$.

$$\therefore \quad \frac{\beta+\delta}{\beta\delta} = \frac{1}{\beta} + \frac{1}{\delta} = \frac{6/B}{1/B} = 6$$

or $$\frac{1}{\alpha} + d + \frac{1}{\alpha} + 3d = 6$$

$$\Rightarrow \quad \frac{1}{\alpha} + 2d = 3 \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{1}{\alpha} = 1, d = 1$$

$$\therefore \quad \frac{1}{\alpha} = 1, \frac{1}{\beta} = 2, \frac{1}{\gamma} = 3 \text{ and } \frac{1}{\delta} = 4$$

Since, $$\frac{1}{\alpha\gamma} = A \Rightarrow A = 3$$

Also, $$\frac{1}{\beta\delta} = B \Rightarrow B = 8$$

Thus, $A = 3$ and $B = 8$

Hence, (a) is the correct answer.

Ex 37. If $\log(x+z)+\log(x+z-2y)=2\log(x-z)$, then x, y and z are in

(a) GP (b) AP
(c) HP (d) None of these

Sol. Given, $\log(x+z)+\log(x+z-2y)=2\log(x-z)$

$\Rightarrow \quad \log[(x+z-2y)(x+z)]=\log(x-z)^2$

$\Rightarrow \quad (x+z-2y)(x+z)=(x-z)^2$

$\Rightarrow \quad x^2+2xz+z^2-2yz-2xy=x^2+z^2-2xz$

$\Rightarrow \quad 4xz=2yz+2xy \Rightarrow 2xz=y(x+z)$

$\therefore \quad y=\dfrac{2xz}{x+z}$

So, x, y and z are in HP.

Hence, (c) is the correct answer.

Ex 38. If $H_1, H_2, \dots, H_n$ are n harmonic means between a and $b(\neq a)$, then value of $\dfrac{H_1+a}{H_1-a}+\dfrac{H_n+b}{H_n-b}$ is

(a) $n+1$ (b) $n-1$
(c) $2n$ (d) $2n+3$

Sol. As $a, H_1, H_2, \dots, H_n, b$ are in HP.

$\Rightarrow \dfrac{1}{a}, \dfrac{1}{H_1}, \dfrac{1}{H_2}, \dots, \dfrac{1}{H_n}, \dfrac{1}{b}$ are in AP.

Let d be the common difference of an AP, then

$$\frac{1}{b}=\frac{1}{a}+(n+1)d$$

$$\Rightarrow \quad d=\frac{1}{n+1}\cdot\frac{a-b}{ab}$$

Thus, $\dfrac{1}{H_1}=\dfrac{1}{a}+d$ and $\dfrac{1}{H_n}=\dfrac{1}{b}-d$

$\Rightarrow \quad \dfrac{a}{H_1}=1+ad$ and $\dfrac{b}{H_n}=1-bd$

Now, $\dfrac{H_1+a}{H_1-a}+\dfrac{H_n+b}{H_n-b}=\dfrac{1+\dfrac{a}{H_1}}{1-\dfrac{a}{H_1}}+\dfrac{1+\dfrac{b}{H_n}}{1-\dfrac{b}{H_n}}$

$$=\frac{1+1+ad}{1-1-ad}+\frac{1+1-bd}{1-1+bd}$$

$$=\frac{2+ad}{-ad}+\frac{2-bd}{bd}=\frac{2a-abd-2b-abd}{abd}$$

$$=\frac{2[(a-b)-abd]}{abd}$$

$$=\frac{2[(n+1)\,dab-abd]}{abd}=2n$$

Hence, (c) is the correct answer.

Ex 39. If $a_1=0$ and $a_1, a_2, a_3, \dots, a_n$ are real numbers such that $|a_i|=|a_{i-1}+1|$ for all i, then the AM of the numbers $a_1, a_2, \dots, a_n$ has value x, where

(a) $x\le-\dfrac{1}{2}$ (b) $x\ge-\dfrac{1}{2}$

(c) $x<-\dfrac{1}{2}$ (d) None of these

Sol. We have, $|a_i|=|a_{i-1}+1|$

$\Rightarrow \quad a_i^2=a_{i-1}^2+2a_{i-1}+1$

Putting $i=1, 2, 3, \dots, n+1$, we get

$$a_1^2=0$$
$$a_2^2=a_1^2+2a_1+1$$
$$a_3^2=a_2^2+2a_2+1$$
$$\vdots \quad \vdots \quad \vdots$$
$$a_n^2=a_{n-1}^2+2a_{n-1}+1$$
$$a_{n+1}^2=a_n^2+2a_n+1$$

On adding, we get $\displaystyle\sum_{i=1}^{n+1}a_i^2=\sum_{i=1}^{n}a_i^2+2\sum_{i=1}^{n}a_i+n$

$$\Rightarrow \quad 2\sum_{i=1}^{n}a_i=-n+a_{n+1}^2\ge-n$$

$$\Rightarrow \quad \frac{a_1+a_2+\dots+a_n}{n}\ge-\frac{1}{2}$$

According to the question,

$$x=\frac{a_1+a_2+\dots+a_n}{n} \Rightarrow x\ge-\frac{1}{2}$$

Hence, (b) is the correct answer.

Ex 40. The sum of first n terms of the series $1^2+2\cdot2^2+3^2+2\cdot4^2+5^2+2\cdot6^2+\dots$ is $\dfrac{n(n+1)^2}{2}$, when n is even. When n is odd, the sum is

(a) $\dfrac{n^2(n+1)}{2}$ (b) $\dfrac{n(n+1)^2}{2}$

(c) $\left[\dfrac{n(n+1)^2}{2}\right]$ (d) $\dfrac{n(n+1)}{2}$

Sol. When n is odd, last term will be n^2.

Then, the sum is

$1^2+2\cdot2^2+3^2+2\cdot4^2+5^2+2\cdot6^2+\dots+2(n-1)^2+n^2$

$$=\frac{(n-1)n^2}{2}+n^2 \quad \left[\text{replacing } n \text{ by } n-1 \text{ in } \frac{n(n+1)^2}{2}\right]$$

$$=\frac{n^3-n^2+2n^2}{2}$$

$$=\frac{n^3+n^2}{2}=\frac{n^2(n+1)}{2}$$

Hence, (a) is the correct answer.

Ex 41. If three positive real numbers a, b, c are in AP such that $abc=4$, then the minimum possible value of b is

(a) $2^{3/2}$ (b) $2^{2/3}$ (c) $2^{1/3}$ (d) $2^{5/2}$

Sol. Let d be the common difference of an AP, then $4=abc=(b-d)\,b(b+d)=b(b^2-d^2)$

$\Rightarrow \quad b^3=4+bd^2\ge4 \quad [\because b>0, d^2\ge0]$

$\Rightarrow \quad b\ge2^{2/3}$

Thus, minimum possible value of b is $2^{2/3}$, that is the case when $d=0$.

Hence, (b) is the correct answer.

Type 2. **More than One Correct Option**

Ex 42. If a, b and c are in HP, then

(a) $\dfrac{a}{b+c-a}, \dfrac{b}{c+a-b}, \dfrac{c}{a+b-c}$ are in HP

(b) $\dfrac{2}{b}=\dfrac{1}{b-a}+\dfrac{1}{b-c}$

(c) $a-\dfrac{b}{2}, \dfrac{b}{2}, c-\dfrac{b}{2}$ are in GP

(d) $\dfrac{a}{b+c}, \dfrac{b}{c+a}, \dfrac{c}{a+b}$ are in HP

Sol. Since, a, b and c are in HP.

So, $\dfrac{1}{a}, \dfrac{1}{b}, \dfrac{1}{c}$ are in AP.

$\Rightarrow \dfrac{a+b+c}{a}, \dfrac{a+b+c}{b}, \dfrac{a+b+c}{c}$ are in AP.

$\Rightarrow \dfrac{b+c}{a}, \dfrac{c+a}{b}, \dfrac{a+b}{c}$ are in AP.

[on subtracting 1 from each term]

$\Rightarrow \dfrac{b+c}{a}-1, \dfrac{c+a}{b}-1, \dfrac{a+b}{c}-1$ are in AP.

$\Rightarrow \dfrac{b+c-a}{a}, \dfrac{c+a-b}{b}, \dfrac{a+b-c}{c}$ are in AP.

Thus, $\dfrac{a}{b+c}, \dfrac{b}{c+a}, \dfrac{c}{a+b}$ are in HP.

and $\dfrac{a}{b+c-a}, \dfrac{b}{c+a-b}, \dfrac{c}{a+b-c}$ are also in HP.

Also we have, $b=\dfrac{2ac}{a+c}$

So,
$$\frac{1}{b-a}+\frac{1}{b-c}=\frac{2b-(a+c)}{(b-a)(b-c)}=\frac{2b-(a+c)}{b^2-b(a+c)+ac}=\frac{2b-\dfrac{2ac}{b}}{b^2-b\cdot\dfrac{2ac}{b}+ac}=\frac{2}{b}\cdot\frac{b^2-ac}{b^2-ac}=\frac{2}{b}$$

Lastly,
$$\left(a-\frac{b}{2}\right)\left(c-\frac{b}{2}\right)=ac-\frac{b}{2}(a+c)+\frac{b^2}{4}=ac-\frac{b}{2}\cdot\frac{2ac}{b}+\frac{b^2}{4}=\frac{b^2}{4}$$

$\therefore a-\dfrac{b}{2}, \dfrac{b}{2}, c-\dfrac{b}{2}$ are in GP.

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 43. For a positive integer n, let

$$a(n)=1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+\ldots+\frac{1}{(2^n)-1}.$$ Then,

(a) $a(n)<n$ (b) $a(n)>\dfrac{n}{2}$

(c) $a(2n)>n$ (d) $a(2n)<2n$

Sol. We have,

$$a(n)=1+\left(\frac{1}{2}+\frac{1}{3}\right)+\left(\frac{1}{4}+\ldots+\frac{1}{7}\right)+\left(\frac{1}{8}+\ldots+\frac{1}{15}\right)+\ldots+\left(\frac{1}{2^{n-1}}+\frac{1}{2^{n-1}+1}+\ldots+\frac{1}{(2^n)-1}\right)$$
$$<1+\frac{2}{2}+\frac{4}{4}+\frac{8}{8}+\ldots+\frac{2^{n-1}}{2^{n-1}}=n$$

Thus, $a(n)<n \Rightarrow a(2n)<2n$

Now,
$$a(n)=1+\frac{1}{2}+\left(\frac{1}{3}+\frac{1}{4}\right)+\left(\frac{1}{5}+\ldots+\frac{1}{8}\right)+\ldots+\left(\frac{1}{2^{n-1}+1}+\ldots+\frac{1}{2^n}\right)-\frac{1}{2^n}$$
$$>\left(1+\frac{1}{2}+\frac{2}{4}+\frac{4}{8}+\ldots+\frac{2^{n-1}}{2^n}-\frac{1}{2^n}\right)\geq\underbrace{\frac{1}{2}+\frac{1}{2}+\ldots+\frac{1}{2}}_{n\text{ times}}=\frac{n}{2}$$

Thus, $a(n)>\dfrac{n}{2}\Rightarrow a(2n)>n$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 44. If a, b, c are in AP and a^2, b^2, c^2 are in HP, then

(a) $a=b=c$

(b) a, b and $-\dfrac{1}{2}c$ are in GP

(c) a, b and c are in GP

(d) $-\dfrac{1}{2}a, b$ and c are in GP

Sol. From the given condition,

$$2b=a+c \quad\text{and}\quad b^2=\frac{2a^2c^2}{a^2+c^2}$$

On eliminating b, we get $\left(\dfrac{a+c}{2}\right)^2=\dfrac{2a^2c^2}{a^2+c^2}$

$\Rightarrow (a^2+c^2)^2+2ac(a^2+c^2)-8a^2c^2=0$

$\Rightarrow (a^2+c^2+4ac)(a^2+c^2-2ac)=0$

$\Rightarrow [(a+c)^2+2ac](a-c)^2=0$

$\Rightarrow 4\left(b^2+\dfrac{1}{2}ac\right)(a-c)^2=0$

$\Rightarrow a-c=0$ or $b^2=-\dfrac{1}{2}ac$

If $a=c$, we get $a=b=c$ and a, b, c are in GP.

If $b^2=-\dfrac{1}{2}ac$, then either $a, b, -\dfrac{1}{2}c$ are in GP

or $-\dfrac{1}{2}a, b, c$ are in GP.

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 45. Let $a_n=(\underbrace{111\ldots1}_{n\text{ times}})$, then

(a) a_{912} is not prime (b) a_{951} is not prime

(c) a_{480} is not prime (d) a_{91} is not prime

Sol. As a_{912}, a_{951} and a_{480} are divisible by 3, none of them is prime. For a_{91}, we have

$$a_{91} = \frac{1}{9}\underbrace{(99...9)}_{91\text{ times}} = \frac{1}{9}(10^{91}-1)$$
$$= \frac{1}{9}[(10^7)^{13}-1]$$
$$= \left[\frac{(10^7)^{13}-1}{10^7-1}\right]\left[\frac{10^7-1}{10-1}\right]$$
$$= [(10^7)^{12}+(10^7)^{11}+...+10^7+1] \times [10^6+10^5+...+10+1]$$

$\Rightarrow$ a_{91} is not prime.

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 46. If a, b, c and d are four unequal positive numbers which are in AP, then

(a) $\frac{1}{a}+\frac{1}{d}=\frac{1}{b}+\frac{1}{c}$ (b) $\frac{1}{a}+\frac{1}{d}<\frac{1}{b}+\frac{1}{c}$

(c) $\frac{1}{a}+\frac{1}{d}>\frac{1}{b}+\frac{1}{c}$ (d) $\frac{1}{b}+\frac{1}{c}>\frac{4}{a+d}$

Sol. Let $b = a + p$, $c = a + 2p$, $d = a + 3p$

$$\frac{\frac{1}{a}+\frac{1}{d}}{\frac{1}{b}+\frac{1}{c}} = \frac{\frac{1}{a}+\frac{1}{a+3p}}{\frac{1}{a+p}+\frac{1}{a+2p}}$$
$$= \frac{(a+p)(a+2p)}{a(a+3p)}$$
$$= \frac{a^2+3ap+2p^2}{a^2+3ap} > 1$$
$$\Rightarrow \quad \frac{1}{a}+\frac{1}{d} > \frac{1}{b}+\frac{1}{c}$$
$$\therefore \left(\frac{1}{b}+\frac{1}{c}\right)(a+d) = \left(\frac{1}{a+p}+\frac{1}{a+2p}\right)(a+a+3p)$$
$$= \frac{(2a+3p)^2}{a^2+3ap+2p^2}$$
$$= 4 + \frac{p^2}{a^2+3ap+2p^2} > 4$$

Hence, (c) and (d) are the correct answers.

Ex 47. The sum of the series

$$\tan^{-1}\left(\frac{1}{2}\right)+\tan^{-1}\left(\frac{2}{9}\right)+\tan^{-1}\left(\frac{1}{8}\right)+\tan^{-1}\left(\frac{2}{25}\right)+\tan^{-1}\left(\frac{1}{18}\right)+\ldots \text{ is}$$

(a) $\tan^{-1}(3)$ (b) $\cot^{-1}\left(\frac{1}{3}\right)$

(c) $\tan^{-1}\left(\frac{1}{3}\right)$ (d) None of these

Sol. Let $T_r = \tan^{-1}\left(\frac{\sqrt{2}}{r+1}\right)^2$, then

$$S_n = \sum_{r=1}^{n}\tan^{-1}\left(\frac{2}{r^2+2r+1}\right) = \sum_{r=1}^{n}\tan^{-1}\frac{r+2-r}{1+r(r+2)}$$
$$= \sum_{r=1}^{n}(\tan^{-1}(r+2)-\tan^{-1}r)$$
$$S_n = \tan^{-1}(n+2)+\tan^{-1}(n+1)-\tan^{-1}2-\tan^{-1}1$$
$$= \tan^{-1}\left(\frac{3n^2+7n}{n^2+9n+10}\right)$$
$$\therefore S_\infty = \tan^{-1}(3) = \cot^{-1}\left(\frac{1}{3}\right)$$

Hence, (a) and (b) are the correct answers.

Ex 48. If a, b and c are three unequal positive quantities in HP, then

(a) $a^{100}+c^{100}>2b^{100}$ (b) $a^3+c^3>2b^3$

(c) $a^5+c^5>2b^5$ (d) $a^2+c^2>2b^2$

Sol. Since, b is the HM of a and c and their GM $=\sqrt{ac}$

$\therefore$ GM > HM

$\Rightarrow$ $\sqrt{ac} > b$

and AM of a^n and c^n > GM of a^n and c^n

$$\frac{a^n+c^n}{2} > \sqrt{a^nc^n}$$
$$a^n+c^n > 2(\sqrt{ac})^n > 2b^n$$

Put $n = 100, 3, 5, 2$

Hence, (a), (b), (c) and (d) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 49-52) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 49. Statement I If $a+2b+3c=1$ and $a>0, b>0, c>0$, then the greatest value of a^3b^2c is $\frac{1}{5184}$.

Statement II There exists an AP such that sum upto its n terms is given by $S_n = an^3+bn^2+cn+d$.

Sol. We can use AM ≥ GM to have,

$$\frac{\frac{3a}{3}+2b+\frac{c}{1/3}}{6} \ge \left(\frac{a^3}{27}\cdot b^2\cdot 3c\right)^{1/6}$$

$$\Rightarrow \left(\frac{1}{6}\right)^6 \geq \frac{a^3b^2c}{9} \quad \text{or} \quad a^3b^2c \leq \frac{9}{6^6} \Rightarrow a^3b^2c \leq \frac{1}{5184}$$

Also, sum upto n terms of an AP is always a quadratic expression in n. Clearly, Statement I is true and Statement II is false.

Hence, (c) is the correct answer.

Ex 50. Statement I If a, b and c are non-zero real numbers such that $3(a^2+b^2+c^2+1) = 2(a+b+c+ab+bc+ca)$, then a, b and c are in AP as well as in GP.

Statement II A series is an AP as well as a GP, if all the terms in the series are equal and non-zero.

Sol. We have, $3(a^2+b^2+c^2+1)$

$$-2(a+b+c+ab+bc+ca)=0$$

$$\Rightarrow (a-1)^2+(b-1)^2+(c-1)^2+(a-b)^2+(b-c)^2 + (c-a)^2 = 0$$

$$\Rightarrow \quad a=b=c=1$$

Hence, (a) is the correct answer.

Ex 51. Statement I Given, 1, 2, 4, 8,... is a GP; 4, 8, 16, 32,... is a GP, then $1+4, 2+8, 4+16, 8+32, \ldots$ is also a GP.

Statement II If general term of a GP with common ratio r be T_{k+1} and general term of another GP with common ratio r be T'_{k+1}, then the series whose general term $T''_{k+1} = T_{k+1} + T'_{k+1}$ is also a GP with common ratio r.

Sol. Let $T_{k+1} = ar^k$ and $T'_{k+1} = br^k$

$\because \; T''_{k+1} = ar^k + br^k = (a+b)r^k$

$\therefore T''_{k+1}$ is general term of a GP with common ratio r.

Hence, (a) is the correct answer.

Ex 52. Statement I If one AM, A and two GM's, p and q are inserted between any two numbers, then $p^3+q^3=2Apq$.

Statement II If x, y and z are in GP, then $y^2 = xz$.

Sol. Statement I a, A and b are in AP.

$$\Rightarrow \quad 2A = a+b \quad \ldots\text{(i)}$$

Since, a, p, q and b are in GP.

$$\therefore \quad pq = ab \quad \ldots\text{(ii)}$$

Let common ratio of GP be r.

$$\therefore \quad b = ar^3$$

$$\Rightarrow \quad r = \left(\frac{b}{a}\right)^{1/3}$$

$$\because \quad p = ar$$

$$\Rightarrow \quad p = a\left(\frac{b}{a}\right)^{1/3} \Rightarrow p^3 = a^2b \quad \ldots\text{(iii)}$$

and $$q = ar^2 \Rightarrow q = a\left(\frac{b}{a}\right)^{2/3}$$

$$\Rightarrow \quad q^3 = ab^2 \quad \ldots\text{(iv)}$$

From Eqs. (i), (ii), (iii) and (iv), we get

$$p^3+q^3 = 2Apq$$

Statement II is obviously true.

Hence, (b) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 53-55) *We know that, if $a_1, a_2, \ldots, a_n$ are in HP, then $\frac{1}{a_1}, \frac{1}{a_2}, \ldots, \frac{1}{a_n}$ are in AP and vice-versa. If $a_1, a_2, \ldots, a_n$ are in AP with common difference d, then for any $b\,(b>0)$, the numbers $b^{a_1}, b^{a_2}, b^{a_3}, \ldots, b^{a_n}$ are in GP with common ratio b^d. If $a_1, a_2, \ldots, a_n$ are positive and in GP with common ratio (r), then for any base $b\,(b>0)$, $\log_b a_1, \log_b a_2, \ldots, \log_b a_n$ are in AP with common difference $\log_b r$.*

Ex 53. If x, y and z are respectively the pth, qth and rth terms of an AP as well as of a GP, then $x^{y-z} \cdot y^{z-x} \cdot z^{x-y}$ is equal to

(a) p (b) q (c) r (d) 1

Sol. Let the base be taken as e. Again, let, x, y and z be terms of a GP with common ratio R, then $\ln x, \ln y, \ln z$ are terms of AP with common difference $\ln R$. Also, let x, y and z be terms of AP with common difference d.

Now, $x-y=(p-q)\,d$ etc., and

$\ln x - \ln y = (p-q)\ln r$ etc.

Let $\quad E = x^{y-z} \cdot y^{z-x} \cdot z^{x-y}$

$$\begin{aligned}\therefore \ln E &= (y-z)\ln x + (z-x)\ln y + (x-y)\ln z \\ &= (q-r)\,d\ln x + (r-p)\,d\ln y + (p-q)\,d\ln z \\ &= d[p(\ln z - \ln y) + q(\ln x - \ln z) + r(\ln y - \ln x)] \\ &= d\ln r\,[p(r-q) + q(p-r) + r(q-p)] = 0\end{aligned}$$

$\Rightarrow E = 1$

Hence, (d) is the correct answer.

Ex 54. If a, b, c, d are in GP and $a^x = b^y = c^z = d^v$, then x, y, z, v are in

(a) AP (b) GP

(c) HP (d) None of these

Sol. Let a, b, c, d be in GP with common ratio r then $\ln a$, $\ln b$, $\ln c$, $\ln d$ are in AP with common difference $\ln r$. Also, $a^x = b^y = c^z = d^v$

$\Rightarrow \; x\ln a = y\ln b = z\ln c = v\ln d$

$\Rightarrow \; x\ln a = y(\ln a + \ln r) = z(\ln a + 2\ln r) = v(\ln a + 3\ln r)$

$$\Rightarrow \quad \frac{x-z}{z} = 2\cdot\frac{x-y}{y} \quad \text{and} \quad \frac{y-v}{v} = 2\cdot\frac{y-z}{z}$$

$$\Rightarrow \quad \frac{1}{x}+\frac{1}{z}=\frac{2}{y} \quad \text{and} \quad \frac{1}{y}+\frac{1}{v}=\frac{2}{z}$$

So, x, y, z and v are in HP.

Hence, (c) is the correct answer.

Ex 55. If p, q and r are in AP, then pth, qth and rth terms of any GP are in

(a) AP (b) GP (c) HP (d) AGP

Sol. Since, p, q and r are in AP.

$\therefore b^p, b^q, b^r$ are in GP for any b ($b > 0$)

$\Rightarrow \quad b^{p-1}, b^{q-1}, b^{r-1}$ are in GP.

$\Rightarrow \quad ab^{p-1}, ab^{q-1}, ab^{r-1}$ are in GP for any a ($a \neq 0$)

. So, pth, qth and rth terms of any GP are in GP.

Hence, (b) is the correct answer.

Passage II (Ex. Nos. 56-60) *Let $A_1, A_2, A_3, \ldots, A_m$ be arithmetic means between -2 and 1027 and $G_1, G_2, G_3, \ldots, G_n$ be geometric means between 1 and 1024. Product of geometric means is 2^{45} and sum of arithmetic means is 1025×171.*

Ex 56. The value of n is

(a) 7 (b) 9
(c) 11 (d) None of these

Sol. $G_1 G_2 \ldots G_n = (\sqrt{1 \times 1024})^n = 2^{5n}$

$\therefore \quad 2^{5n} = 2^{45} \Rightarrow n = 9$

Hence, (b) is the correct answer.

Ex 57. The value of m is

(a) 340 (b) 342 (c) 344 (d) 346

Sol. $\because A_1 + A_2 + A_3 + \ldots + A_{m-1} + A_m$

$= 1025 \times 171$

$\therefore \quad m\left(\dfrac{-2 + 1027}{2}\right) = 1025 \times 171$

$\Rightarrow \quad m = 342$

Hence, (b) is the correct answer.

Ex 58. The value of $G_1 + G_2 + G_3 + \ldots + G_n$ is

(a) 1022 (b) 2044
(c) 512 (d) None of these

Sol. $\because n = 9$

$\therefore \quad r = (1024)^{\frac{1}{9+1}} = 2$

So, $\quad G_1 = 2$ and $r = 2$

Now, $G_1 + G_2 + \ldots + G_n = \dfrac{2(2^9 - 1)}{2 - 1}$

$= 1024 - 2 = 1022$

Hence, (a) is the correct answer.

Ex 59. The common difference of the progression $A_1, A_3, A_5, \ldots, A_{m-1}$ is

(a) 6 (b) 3 (c) 2 (d) 1

Sol. Common difference of sequence $A_1, A_2, \ldots, A_m$

$= \dfrac{1027 + 2}{342 + 1} = 3$

$\therefore$ Common difference of sequence $A_1, A_3, A_5, \ldots, A_{m-1}$ is 6.

Hence, (a) is the correct answer.

Ex 60. The numbers $2A_{171}, G_5^2 + 1$ and $2A_{172}$ are in

(a) AP
(b) GP
(c) HP
(d) AGP

Sol. We have, $A_{171} + A_{172} = -2 + 1027 = 1025$

$\therefore \quad \dfrac{2A_{171} + 2A_{172}}{2} = 1025$

Also, $\quad G_5 = 1 \times 2^5 = 32$

Now, $\quad G_5^2 = 1024$

i.e. $\quad G_5^2 + 1 = 1025$

So, $2A_{171}, G_5^2 + 1$ and $2A_{172}$ are in AP.

Hence, (a) is the correct answer.

Passage III (Ex. Nos. 61-63) *There are two sets A and B each of which consists of three numbers in AP whose sum is 15 and where D and d are the common difference such that $D - d = 1$. If $\dfrac{p}{q} = \dfrac{7}{8}$, where p and q are the product of the numbers respectively and $d > 0$, in the two sets.*

Ex 61. The value of p is

(a) 100 (b) 120
(c) 105 (d) 110

Ex 62. The value of q is

(a) 100 (b) 120
(c) 105 (d) 110

Ex 63. The value of $D + d$ is

(a) 1 (b) 2
(c) 3 (d) 4

Sol. (Ex. Nos. 61-63) Let numbers in set A be $a - D, a, a + D$ and in set B be $b - d, b, b + d$.

$3a = 3b = 15$

$\Rightarrow \quad a = b = 5$

Now, $\quad$ set $A = \{5 - D, 5, 5 + D\}$

and $\quad$ set $B = \{5 - d, 5, 5 + d\}$

where, $\quad D = d + 1$

$\therefore \quad \dfrac{p}{q} = \dfrac{5(25 - D^2)}{5(25 - d^2)} = \dfrac{7}{8}$

$\Rightarrow \quad 25(8 - 7) = 8(d + 1)^2 - 7d^2$

$\Rightarrow \quad d = -17, 1$ but $d > 0$

$\Rightarrow \quad d = 1$

So, numbers in set A are $\{3, 5, 7\}$ and in set B are $\{4, 5, 6\}$.

Now, $\quad p = 3 \times 5 \times 7 = 105$

and $\quad q = 4 \times 5 \times 6 = 120$

Hence, value of $D + d = 3$

61. (c)

62. (b)

63. (c)

Passage IV (Ex. Nos. 64-66) *Four different integers form an increasing AP. One of these numbers is equal to the sum of the squares of the other three numbers.*

Ex 64. The smallest number is

(a) -2 (b) 0 (c) -1 (d) 2

Ex 65. The common difference of the four numbers is

(a) 2 (b) 1
(c) 3 (d) 4

Ex 66. The sum of all the four numbers is

(a) 10 (b) 8
(c) 2 (d) 6

Sol. (Ex. Nos. 64-66) Let four integers be $a-d, a, a+d$ and $a+2d$, where a and d are integers and $d>0$.

$\because \quad a+2d=(a-d)^2+a^2+(a+d)^2$

$\Rightarrow 2d^2-2d+3a^2-a=0$

$\therefore \quad d=\frac{1}{2}[1\pm\sqrt{1+2a-6a^2}]$ …(i)

Since, d is positive integer.

$\therefore \quad 1+2a-6a^2>0$

$\Rightarrow \quad 6a^2-2a-1<0$

$\Rightarrow \quad \frac{1-\sqrt{7}}{6}<a<\frac{1+\sqrt{7}}{6}$

$\because$ a is an integer.

$\therefore$ $a=0$, put in Eq. (i),

$d=1$ or 0 but $d>0$

$\therefore \quad d=1$

Now, the four numbers are $-1, 0, 1, 2$ and their sum is 2.

64. (c)
65. (b)
66. (c)

Type 5. **Match the Columns**

Ex 67. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	Suppose that $F(n+1)=\frac{2F(n)+1}{2}$ for $n=1, 2, 3, \ldots$ and $F(1)=2$. Then, $F(101)$ equals	p.	42
B.	If $a_1, a_2, a_3, \ldots, a_{21}$ are in AP and $a_3+a_5+a_{11}+a_{17}+a_{19}=10$, then the value of $\sum_{i=1}^{21} a_i$ is	q.	1620
C.	10th term of the series $S=1+5+13+29+\ldots$ is	r.	52
D.	The sum of all two digit numbers which are not divisible by 2 or 3, is	s.	2045

Sol. A. $F(n+1)=\frac{2F(n)+1}{2}=F(n)+\frac{1}{2}$

$\therefore$ $F(1), F(2), F(3), \ldots$ is an AP with common difference $\frac{1}{2}$. Thus, $F(101)=2+100\times\frac{1}{2}=52$

B. $a_1+2d+a_1+4d+a_1+10d+a_1+16d+a_1+18d$

$=5a_1+50d=5(a_1+10d)=10$ i.e. $a_1+10d=2$

Now, $\sum_{i=1}^{21} a_i=\frac{21}{2}[2a_1+20d]=21(a_1+10d)=42$

C. $S=1+5+13+29+\ldots+t_{10}$ …(i)

$S=1+5+13+\ldots+t_9+t_{10}$ …(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$t_{10}=1+4+8+16+\ldots$ upto 10 terms

$=1+(4+8+16+\ldots$ upto 9 terms$)=2045$

D. Sum of all two digit numbers $=\frac{90}{2}(10+99)$

$=(45)(109)$

Sum of all two digit numbers divisible by 2

$=\frac{45}{2}(10+98)=(45)(54)$

Sum of all two digit numbers divisible by 3

$=\frac{30}{2}(12+99)=15(111)$

Sum of all two digit numbers divisible by 6

$=\frac{15}{2}(12+96)$

$=15(54)$

$\therefore$ Required sum

$=45(109)+15(54)-(45)(54)-15(111)=1620$

$A\to r$; $B\to p$; $C\to s$; $D\to q$

Ex 68. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	The arithmetic mean of two positive numbers is 6 and their geometric mean G and harmonic mean H satisfy $G^2+3H=48$, then the product of number is	p.	$\frac{240}{77}$
B.	The sum of the series $\frac{5}{1^2\cdot4^2}+\frac{11}{4^2\cdot7^2}+\frac{17}{7^2\cdot10^2}+\ldots$ is	q.	32
C.	If the first two terms of a harmonic progression are $\frac{1}{2}$ and $\frac{1}{3}$, then the harmonic mean of the first four terms is	r.	$\frac{1}{3}$

Sol. A. $a+b=12$

$\therefore \quad ab+\frac{6ab}{a+b}=48$

$\Rightarrow \quad ab+\frac{ab}{2}=48$

$\therefore \quad ab=32$

B. $S=\frac{5}{1^2\cdot4^2}+\frac{11}{4^2\cdot7^2}+\frac{17}{7^2\cdot10^2}+\ldots$

$\Rightarrow 3S=\frac{3\cdot5}{1^2\cdot4^2}+\frac{3\cdot11}{4^2\cdot7^2}+\frac{3\cdot17}{7^2\cdot10^2}+\ldots$

$$\Rightarrow \quad 3S = \frac{(4-1)\cdot(4+1)}{1^2\cdot 4^2} + \frac{(7-4)(7+4)}{4^2\cdot 7^2} + \frac{(10-7)(10+7)}{7^2\cdot 10^2} + \ldots$$

$$\Rightarrow \quad 3S = \frac{4^2-1^2}{1^2\cdot 4^2} + \frac{7^2-4^2}{4^2\cdot 7^2} + \frac{10^2-7^2}{7^2\cdot 10^2} + \ldots$$

$$\Rightarrow \quad 3S = 1 - \frac{1}{4^2} + \frac{1}{4^2} - \frac{1}{7^2} + \frac{1}{7^2} - \frac{1}{10^2} + \ldots$$

$$\Rightarrow \quad 3S = 1$$

$$\Rightarrow \quad S = \frac{1}{3}$$

C. HM of $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}$

$$= \frac{4}{\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+\frac{1}{5}} = \frac{240}{77}$$

$A \to q$; $B \to r$; $C \to p$

Type 6. **Single Integer Answer Type Questions**

Ex 69. The largest term of the sequence $\frac{1}{503}, \frac{4}{524}, \frac{9}{581}, \frac{16}{692}, \ldots$ is T_p. Then, the value of p is ________ .

Sol. (7) $T_n = \dfrac{n^2}{500+3n^3}$

$$\Rightarrow \quad \frac{dT_n}{dn} = \frac{(500+3n^3)\cdot 2n - n^2\cdot 9n^2}{(500+3n^3)^2} = \frac{n(1000-3n^3)}{(500+3n^3)^2}$$

For maximum of T_n, put

$$\frac{dT_n}{dn} = 0$$

$$\Rightarrow \quad n = \left(\frac{1000}{3}\right)^{1/3}$$

Now, $6 < \left(\frac{1000}{3}\right)^{1/3} < 7$

Hence, T_7 is the largest term, so largest term in the given sequence is $\frac{49}{1529}$.

Ex 70. For $x > 1$, evaluate $\dfrac{x}{x+1} + \dfrac{x^2}{(x+1)(x^2+1)} + \dfrac{x^4}{(x+1)(x^2+1)(x^4+1)} + \ldots$

Sol. (1) Let $S = \dfrac{x}{x+1} + \dfrac{x^2}{(x+1)(x^2+1)} + \dfrac{x^4}{(x+1)(x^2+1)(x^4+1)} + \ldots$

Now, we can write

$$\frac{x}{x+1} = 1 - \frac{1}{x+1}$$

$$\frac{x^2}{(x+1)(x^2+1)} = \frac{1}{x+1} - \frac{1}{(x+1)(x^2+1)}$$

$$\frac{x^4}{(x+1)(x^2+1)(x^4+1)} = \frac{1}{(x+1)(x^2+1)} - \frac{1}{(x+1)(x^2+1)(x^4+1)}$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$\frac{x^{2^{n-1}}}{(x+1)(x^2+1)\ldots(x^{2^{n-1}}+1)} = \frac{1}{(x+1)(x^2+1)\ldots(x^{2^{n-2}}+1)} - \frac{1}{(x+1)(x^2+1)\ldots(x^{2^{n-1}}+1)}$$

$$S_n = 1 - \frac{1}{(x+1)(x^2+1)\ldots(x^{2^{n-1}}+1)}$$

$$S_\infty = 1$$

Ex 71. If $f(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_n x^n + \ldots$ and $\dfrac{f(x)}{1-x} = b_0 + b_1 x + b_2 x^2 + \ldots + b_n x^n + \ldots$ where, $a_0 = 1$, $b_1 = 3$ and $b_{10} = k^{11} - 1$, then k is ________ .

Given that $a_0, a_1, a_2, \ldots$ are in GP.

Sol. (2) $\because$ $f(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_n x^n + \ldots$

and $f(x)(1-x)^{-1} = b_0 + b_1 x + b_2 x^2 + \ldots + b_n x^n + \ldots$,

$\therefore f(x)\{1 + x + x^2 + \ldots + x^n + \ldots\}$

$$= b_0 + b_1 x + b_2 x^2 + \ldots + b_n x^n + \ldots$$

On comparing the coefficient of x^n both sides, we get

$$a_0 + a_1 + a_2 + \ldots + a_{n-1} + a_n = b_n$$

$$b_0 = a_0 \quad \text{and} \quad b_1 = a_0 + a_1$$

$$\Rightarrow \quad b_0 = 1 \quad \text{and} \quad 3 = a_0 + a_1 \quad \Rightarrow \quad a_1 = 2$$

Since, $a_0, a_1, a_2, \ldots$ are in GP.

So, first term is 1 and common ratio is 2.

Now, $b_{10} = a_0 + a_1 + a_2 + \ldots + a_{10}$

$$= 1 + 2 + 2^2 + \ldots + 2^{10} = 2^{11} - 1$$

Target Exercises

Type 1. **Only One Correct Option**

1. The next term of the sequence 1, 5, 14, 30, 55, ... is
(a) 91 (b) 85 (c) 90 (d) 95

2. The next term of the sequence 1, 3, 6, 10, ... is
(a) 16 (b) 13 (c) 15 (d) 14

3. In a certain AP, 5 times the 5th term is equal to 8 times the 8th term, then 13th term is
(a) – 13 (b) – 12 (c) – 1 (d) 0

4. If $a_1 = a_2 = 2, a_n = a_{n-1} - 1\,(n > 2)$, then a_5 is
(a) 0 (b) – 2 (c) – 1 (d) 1

5. The second term of an AP is $(x - y)$ and the fifth term is $(x + y)$, then its first term is
(a) $x - \frac{1}{3}y$ (b) $x - \frac{2}{3}y$ (c) $x - \frac{4}{3}y$ (d) $x - \frac{5}{3}y$

6. If a, b and c are the sides of a ΔABC are in AP, then $\cot\frac{C}{2}$ is equal to
(a) $3\tan\frac{A}{2}$ (b) $3\tan\frac{B}{2}$
(c) $3\cot\frac{A}{2}$ (d) $3\cot\frac{B}{2}$

7. If a, b, c, d, e and f are in AP, then $e - c$ is equal to
(a) $2(c - a)$ (b) $2(d - c)$
(c) $2(f - d)$ (d) $d - c$

8. If $\cos x = b$, then for what b do the roots of the equation form an AP?
(a) – 1 (b) $\frac{1}{2}$
(c) $\frac{\sqrt{3}}{2}$ (d) None of these

9. If $\log_3 2, \log_3 (2^x - 5)$ and $\log_3 (2^x - 7/2)$ are in AP, then x is equal to
(a) 2 (b) 3 (c) 4 (d) 2, 3

10. If the pth term of an AP is q and the qth term is p, then the rth term is
(a) $q - p + r$ (b) $p - q + r$
(c) $p + q + r$ (d) $p + q - r$

11. The consecutive terms $\frac{1}{1+\sqrt{x}}, \frac{1}{1-x}, \frac{1}{1-\sqrt{x}}$ of a series are in
(a) HP (b) GP
(c) AP (d) AGP

12. If $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in AP, then $\left(\frac{1}{a} + \frac{1}{b} - \frac{1}{c}\right)\left(\frac{1}{b} + \frac{1}{c} - \frac{1}{a}\right)$ is equal to
(a) $\frac{4}{ac} - \frac{3}{b^2}$ (b) $\frac{b^2 - ac}{a^2 b^2 c^2}$
(c) $\frac{4}{ac} - \frac{1}{b^2}$ (d) None of these

13. If 7th and 13th terms of an AP are 34 and 64 respectively, then its 18th term is
(a) 87 (b) 88 (c) 89 (d) 90

14. If the roots of the equation $x^3 - 12x^2 + 39x - 28 = 0$ are in AP, then the common difference will be
(a) ± 1 (b) ± 2 (c) ± 3 (d) ± 4

15. Given that a, b and c are in AP. The determinant $\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$ in its simplest form is equal to
(a) $x^3 + 3ax + 7c$ (b) 0
(c) 15 (d) $10x^2 + 5x + 2c$

16. If $a\left(\frac{1}{b} + \frac{1}{c}\right), b\left(\frac{1}{c} + \frac{1}{a}\right)$ and $c\left(\frac{1}{a} + \frac{1}{b}\right)$ are in AP, then
(a) $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in AP (b) a, b and c are in HP
(c) $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in GP (d) a, b and c are in AP

17. If a, b and c are in AP, then $(a + 2b - c)(2b + c - a)(c + a - b)$ equals
(a) $\frac{abc}{2}$ (b) abc (c) $2abc$ (d) $4\,abc$

18. If a, b and c are in arithmetic progression, then $\frac{1}{\sqrt{a} + \sqrt{b}}, \frac{1}{\sqrt{a} + \sqrt{c}}$ and $\frac{1}{\sqrt{b} + \sqrt{c}}$ are in
(a) AP (b) GP
(c) HP (d) None of these

19. If $\frac{1}{p+q}, \frac{1}{q+r}$ and $\frac{1}{r+p}$ are in AP, then
(a) p, q and r are in AP
(b) q^2, p^2 and r^2 are in AP
(c) p^2, q^2 and r^2 are in AP
(d) p, q and r are in GP

20. The number of numbers lying between 100 and 500 that are divisible by 7 but not by 21, is

(a) 57 (b) 19
(c) 38 (d) None of these

21. If the first, second and last terms of an AP are a, b, c respectively, then the sum is

(a) $\frac{(a+b)(a+c-2b)}{2(b-a)}$ (b) $\frac{(b+c)(a+b-2c)}{2(b-a)}$
(c) $\frac{(a+c)(b+c-2a)}{2(b-a)}$ (d) None of these

22. The maximum sum of the series

$$20+19\frac{1}{3}+18\frac{2}{3}+18+\dots \text{ is}$$

(a) 310 (b) 290
(c) 320 (d) None of these

23. The sum of all natural numbers less than 200 that are divisible neither by 3 nor by 5, is

(a) 10730 (b) 10732
(c) 15375 (d) None of these

24. The four numbers are in AP, such that their sum is 50 and greatest of them is 4 times the least, are

(a) 7, 11, 15, 19 (b) 6, 11, 16, 21
(c) 5, 10, 15, 20 (d) None of these

25. If the sum of four integers in AP is 24 and their product is 945, then the numbers are

(a) 3, 5, 7, 9 (b) 5, 8, 11, 14
(c) 4, 8, 12, 16 (d) None of these

26. If the sum of any number of terms in a sequence is always three times the squared number of these terms, then the sequence is

(a) an AP (b) a GP
(c) an HP (d) None of these

27. The sum of all two digit numbers which when divided by 4, yield unity as remainder, is

(a) 1100 (b) 1200
(c) 1210 (d) None of these

28. The sum of numbers of three digits which are divisible by 7, is

(a) 70336 (b) 70331
(c) 70330 (d) None of these

29. The sum of all odd numbers of four digits which are divisible by 9, is

(a) 2754000 (b) 2753000
(c) 2752000 (d) None of these

30. The sum of positive terms of the series

$$10+9\frac{4}{7}+9\frac{1}{7}+\dots \text{ is}$$

(a) $\frac{352}{7}$ (b) $\frac{437}{7}$
(c) $\frac{852}{7}$ (d) None of these

31. The maximum sum of an AP 40, 38, 36, 34, ... is

(a) 390 (b) 420
(c) 460 (d) None of these

32. A man arranges to pay off a debt of ₹ 3600 by 40 annual instalments which are in AP. When 30 of the instalments are paid, he dies leaving one-third of the debt unpaid. The value of 8th instalment is

(a) ₹ 35 (b) ₹ 50
(c) ₹ 65 (d) None of these

33. A polygon has 25 sides, the lengths of which starting from the smallest side are in AP. If the perimeter of the polygon is 2100 cm and the length of the largest side 20 times that of the smallest, then the length of the smallest side and the common difference of an AP are

(a) 8 cm, $6\frac{1}{3}$ cm (b) 6 cm, $6\frac{1}{3}$ cm
(c) 8 cm, $5\frac{1}{3}$ cm (d) None of these

34. A club consists of members whose ages are in AP, the common difference being 3 months. If the youngest member of the club is just 7 yr old and the sum of the ages of all the members is 250 yr, then the number of members in the club is

(a) 15 (b) 25 (c) 20 (d) 30

35. The sum of the series 2, 5, 8, 11, ... is 60100, then n is equal to

(a) 100 (b) 200
(c) 150 (d) 250

36. If the sum of n terms of an AP is $3n^2+5n$, then which of its terms is 164?

(a) 26th (b) 27th
(c) 28th (d) None of these

37. The first and last terms of an AP are 1 and 11. If the sum of its terms is 36, then the number of terms will be

(a) 5 (b) 6 (c) 7 (d) 8

38. Sum of n terms of the series $\sqrt{2}+\sqrt{8}+\sqrt{18}+\sqrt{32}+\dots$ is

(a) $\frac{n(n+1)}{2}$ (b) $2n(n+1)$
(c) $\frac{n(n+1)}{\sqrt{2}}$ (d) 1

39. The sum of n terms of the series

$$\frac{1}{\sqrt{1}+\sqrt{3}}+\frac{1}{\sqrt{3}+\sqrt{5}}+\frac{1}{\sqrt{5}+\sqrt{7}}+\dots \text{ is}$$

(a) $\frac{\sqrt{2n+1}}{2}$ (b) $\frac{-1+\sqrt{2n+1}}{2}$
(c) $\frac{1}{\sqrt{2n+1}}$ (d) $\sqrt{2n-1}$

40. The sum of all two digit odd numbers is
(a) 2475 (b) 2530 (c) 4905 (d) 5049

41. If the sum of p terms of an AP is q and that of q terms is p, then the sum of $p+q$ terms will be
(a) 0 (b) $p-q$
(c) $p+q$ (d) $-(p+q)$

42. If the sum of n terms of an AP is $3n^2 - n$ and its common difference is 6, then its first term is
(a) 2 (b) 3 (c) 1 (d) 4

43. If $S_n = nP + \frac{n}{2}(n-1)Q$, where S_n denotes the sum of first n terms of an AP, then the common difference is
(a) $P+Q$ (b) $2P+3Q$
(c) $2Q$ (d) Q

44. If the sum of first n terms of a series is $5n^2 + 2n$, then its second term is
(a) 16 (b) 17 (c) $\frac{27}{14}$ (d) $\frac{56}{15}$

45. If the nth term of a series is $\left(\frac{n}{x}\right) + y$, then sum of r terms will be
(a) $\left\{\frac{r(r+1)}{2x}\right\} + ry$ (b) $\left\{\frac{r(r-1)}{2x}\right\}$
(c) $\left\{\frac{r(r-1)}{2x}\right\} - xy$ (d) $\left\{\frac{r(r+1)}{2x}\right\} - rx$

46. If S_n denotes the sum of n terms of an AP, then $S_{n+3} - 3S_{n+2} + 3S_{n+1} - S_n$ is equal to
(a) 0 (b) 1 (c) $\frac{1}{2}$ (d) 2

47. If $\frac{a+be^y}{a-be^y} = \frac{b+ce^y}{b-ce^y} = \frac{c+de^y}{c-de^y}$, then a, b, c and d are in
(a) AP (b) GP
(c) HP (d) None of these

48. In a GP, if $(m+n)$th term is p and $(m-n)$th term is q, then its mth term is
(a) 0 (b) pq (c) $\sqrt{pq}$ (d) $\frac{1}{2}(p+q)$

49. If $\frac{1}{2}\operatorname{cosec}^2\theta, 2\cot\theta, \sec\theta, 0<\theta<\frac{\pi}{2}$ are in GP, then θ is equal to
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) None of these

50. If 10th term of a GP is 9 and 4th term is 4, then its 7th term is
(a) 6 (b) 14 (c) $\frac{27}{14}$ (d) $\frac{56}{15}$

51. If 4th, 7th and 10th terms of a GP are p, q and r respectively, then
(a) $p^2 = q^2 + r^2$ (b) $p^2 + qr$
(c) $q^2 = pr$ (d) $r^2 = p^2 + q^2$

52. If 6th term of a GP is 32 and its 8th term is 128, then the value of the common ratio is
(a) -1 (b) 2
(c) 4 (d) -4

53. If x_1, x_2, x_3 as well as y_1, y_2, y_3 are in GP with same common ratio, then the points $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3)
(a) lie on a straight line
(b) lie on an ellipse
(c) lie on a circle
(d) are vertices of a triangle

54. If $a^x = b^y = c^z$ and a, b, c are in GP, then x, y and z are in
(a) AP (b) GP
(c) HP (d) None of these

55. If p, q, r are in AP and x, y, z are in GP, then $x^{q-r} \cdot y^{r-p} \cdot z^{p-q}$ is equal to
(a) 1 (b) 2
(c) -1 (d) None of these

56. The sum of three numbers in GP is 56. If we subtract 1, 7, 21 from these numbers in that order, we obtain an AP. Then, three numbers are
(a) 8, 16, 32 (b) 10, 18, 26
(c) 9, 16, 23 (d) None of these

57. If the sides of a right angled triangle are in GP, then the cosine of the greater acute angle is
(a) $\frac{2}{1+\sqrt{5}}$ (b) $\frac{1}{1-\sqrt{5}}$
(c) $\frac{1+\sqrt{5}}{2}$ (d) None of these

58. The consecutive numbers of a three digit number form a GP. If we subtract 792 from this number, then we get a number consisting of the same digits written in the reverse order and if we increase the second digit of the required number by 2, then resulting number forms an AP. The number is
(a) 139 (b) 193
(c) 931 (d) None of these

59. Three non-zero numbers a, b and c are in AP. If increasing a by 1 or increasing c by 2, the numbers are in GP, then b equals
(a) 10 (b) 14
(c) 12 (d) 16

60. The sum of the series $0.4 + 0.004 + 0.00004 + \ldots$ is
(a) $\frac{11}{25}$ (b) $\frac{41}{100}$ (c) $\frac{40}{99}$ (d) $\frac{2}{5}$

61. If $x > 0$, then the sum of the series $e^{-x} - e^{-2x} + e^{-3x} - \dots$ is

(a) $\frac{1}{1-e^{-x}}$ (b) $\frac{1}{e^{x}-1}$
(c) $\frac{1}{1+e^{-x}}$ (d) $\frac{1}{1+e^{x}}$

62. The n th term of a GP is 128 and the sum to its n terms is 255. If its common ratio is 2, then its first term is

(a) 1 (b) 3
(c) 8 (d) None of these

63. The sum of $(x+2)^{n-1} + (x+2)^{n-2}(x+1) + (x+2)^{n-3}(x+1)^2 + \dots + (x+1)^{n-1}$ is equal to

(a) $(x+2)^{n-2} - (x+1)^n$
(b) $(x+2)^{n-1} - (x+1)^{n-1}$
(c) $(x+2)^n - (x+1)^n$
(d) None of the above

64. If $(a, b), (c, d), (e, f)$ are the vertices of a triangle such that a, c, e are in GP with common ratio r and b, d, f are in GP with common ratio s, then the area of the triangle is

(a) $\frac{ab}{2}(r+1)(s+2)(s+r)$
(b) $\frac{ab}{2}(r-1)(s-2)(s-r)$
(c) $\frac{ab}{2}(r-1)(s-1)(s-r)$
(d) $\frac{ab}{2}(r+1)(s+1)(s-r)$

65. If sum of all terms of an infinite GP is $\frac{1}{5}$ times the sum of odd terms. Then, common ratio is

(a) 2 (b) 3
(c) $-\frac{4}{5}$ (d) 5

66. The sum of 10 terms of the series $\sqrt{2} + \sqrt{6} + \sqrt{18} + \dots$ is

(a) $121(\sqrt{6} + \sqrt{2})$
(b) $243(\sqrt{3} + 1)$
(c) $\frac{121}{\sqrt{3}-1}$
(d) $242(\sqrt{3} - 1)$

67. If $(1.05)^{50} = 11.658$, then $\sum_{n=1}^{49} (1.05)^n$ equals

(a) 208.34 (b) 212.12
(c) 212.16 (d) 213.16

68. If the second term of a GP is 2 and the sum of its infinite terms is 8, then its first term is

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) 2 (d) 4

69. Let a_n be the nth term of a GP of positive numbers. If $\sum_{n=1}^{100} a_{2n} = \alpha$ and $\sum_{n=1}^{100} a_{2n-1} = \beta$, such that $\alpha \neq \beta$, then the common ratio is

(a) $\frac{\alpha}{\beta}$ (b) $\frac{\beta}{\alpha}$
(c) $\sqrt{\frac{\alpha}{\beta}}$ (d) $\sqrt{\frac{\beta}{\alpha}}$

70. If $f(x)$ is a function satisfying $f(x+y) = f(x) f(y)$, $\forall x, y \in N$ such that $f(1) = 3$ and $\sum_{x=1}^{n} f(x) = 120$. Then, the value of n is

(a) 4 (b) 5
(c) 6 (d) None of these

71. The value of $0.4\overline{23}$ is

(a) $\frac{419}{999}$ (b) $\frac{419}{990}$
(c) $\frac{423}{1000}$ (d) None of these

72. If $x = 1 + y + y^2 + \dots$, then y is

(a) $\frac{x}{x-1}$ (b) $\frac{x}{1-x}$ (c) $\frac{x-1}{x}$ (d) $\frac{1-x}{x}$

73. The sum of first four terms of a GP is $12(1-\sqrt{5})$. If the common ratio is $-\sqrt{5}$, then the first term of a GP is

(a) 1 (b) 2
(c) 3 (d) 4

74. The length of a side of a square is a metre. A second square is formed by joining the mid-points of these square. Then, a third square is formed by joining the mid-points of the second square and so on. Then, the sum of the area of the squares which carried upto infinity, is

(a) a^2 (b) $2a^2$ (c) $3a^2$ (d) $4a^2$

75. The sum of an infinite geometric series is 3. A series which is formed by squares of its terms also have sum equal to 3. Then, the sequence corresponding to the series will be

(a) $\frac{3}{2}, \frac{3}{4}, \frac{3}{8}, \frac{3}{16}, \dots$ (b) $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \dots$
(c) $\frac{1}{3}, \frac{1}{9}, \frac{1}{27}, \frac{1}{81}, \dots$ (d) $1, -\frac{1}{3}, \frac{1}{3^2}, \frac{1}{3^3}, \dots$

76. The product of $x^{1/2} \cdot x^{1/4} \cdot x^{1/8} \dots$ equals

(a) 0 (b) 1 (c) x (d) ∞

77. Let $S_1, S_2, \dots$ be squares such that for each $n \geq 1$, the length of a side of S_n equals the length of the diagonal of S_{n+1}. If the length of a side of S_1 is 10 cm and the area of S_n less than 1 sq cm, then the least value of n is

(a) 7 (b) 8 (c) 9 (d) 10

78. Let α, β be the roots of $x^2 - x + p = 0$ and γ, δ be the roots of $x^2 - 4x + q = 0$. If $\alpha, \beta, \gamma, \delta$ are in GP, then integral values of p and q respectively are

(a) $-2, -32$ (b) $-2, 3$
(c) $-6, 3$ (d) $-6, -32$

79. Sum of the series $(1+x)+(1+x+x^2)+(1+x+x^2+x^3)+\dots$ n terms is

(a) $\frac{1}{1-x}\left[n - \frac{x^2(1-x^n)}{1-x}\right]$ (b) $\frac{1}{1-x}\left[n - \frac{x^3(1-x^n)}{1-x}\right]$

(c) $\frac{1}{1-x}\left[n - \frac{x(1-x^n)}{1-x}\right]$ (d) None of these

80. Sum of the series $9 + 99 + 999 + \dots$ upto n terms is

(a) $\frac{1}{9}(10^n - 9n - 10)$

(b) $\frac{1}{9}(10^{n+1} - 9n - 10)$

(c) $\frac{1}{9}(10^{n+1} + 9n - 10)$

(d) None of the above

81. Sum of the series $0.5 + 0.55 + 0.555 + \dots$ upto n terms is

(a) $\frac{5}{9}\left[n - \frac{2}{9}\left(1 - \frac{1}{10^n}\right)\right]$ (b) $\frac{3}{9}\left[3 - \frac{1}{9}\left(1 - \frac{1}{10^n}\right)\right]$

(c) $\frac{7}{9}\left[n - \frac{2}{9}\left(1 - \frac{1}{10^n}\right)\right]$ (d) $\frac{5}{9}\left[n - \frac{1}{9}\left(1 - \frac{1}{10^n}\right)\right]$

82. A number consists of three digits in GP. If the sum of extreme digits is greater than twice middle digit by 1 and the sum of the left hand and middle digit is two-third of the sum of the middle and right hand digits, then the number is

(a) 4, 6, 9 (b) 3, 7, 6
(c) 4, 6, 8 (d) None of these

83. If one geometric mean G and two arithmetic means p and q are inserted between two numbers, then G^2 is equal to

(a) $(3p - q)(3q - p)$ (b) $(2p - q)(2q - p)$
(c) $(4p - q)(4q - p)$ (d) None of these

84. If in a GP of $3n$ terms, S_1 denotes the sum of the first n terms, S_2 denotes the sum of the second block of n terms and S_3 denotes the sum of the last n terms, then S_1, S_2 and S_3 are in

(a) AP (b) GP
(c) HP (d) None of these

85. The product of $(32) \cdot (32)^{1/6} \cdot (32)^{1/36} \cdot \dots$ is equal to

(a) 16 (b) 64 (c) 32 (d) 0

86. The sum of the series $1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \dots$ is

(a) $\frac{16}{25}$ (b) $\frac{11}{8}$ (c) $\frac{35}{16}$ (d) $\frac{8}{11}$

87. The sum of the series $1 + 2x + 3x^2 + 4x^3 + \dots$ (where, x lies between 0 and 1, i.e. $0 < x < 1$) is

(a) $\frac{1}{1+x}$ (b) $\frac{1}{1-x}$ (c) $\frac{1}{1-2x}$ (d) $\frac{1}{(1-x)^2}$

88. The sum of the series $1 + 2 \cdot 2 + 3 \cdot 2^2 + 4 \cdot 2^3 + \dots + 100 \cdot 2^{99}$ is

(a) $100 \cdot 2^{100} + 1$ (b) $99 \cdot 2^{100} + 1$
(c) $99 \cdot 2^{99} - 1$ (d) $100 \cdot 2^{100} - 1$

89. The sum of the series

$$\frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \dots \text{ upto 16 terms is}$$

(a) 246 (b) 346 (c) 446 (d) 546

90. The sum of $\frac{\frac{1}{2} \cdot \frac{2}{2}}{1^3} + \frac{\frac{2}{2} \cdot \frac{3}{2}}{1^3 + 2^3} + \frac{\frac{3}{2} \cdot \frac{4}{2}}{1^3 + 2^3 + 3^3} + \dots$ upto n term is

(a) $\frac{n-1}{2}$ (b) $\frac{n}{n+1}$ (c) $\frac{n+1}{n+2}$ (d) $\frac{n+1}{n}$

91. The sum of the series $S = 1^2 - 2^2 + 3^2 - 4^2 + \dots - 2002^2 + 2003^2$ is

(a) 2007006 (b) 1005004
(c) 2000506 (d) None of these

92. The value of n for which $704 + \frac{1}{2}(704) + \frac{1}{4}(704) + \dots$ n terms $= 1984 - \frac{1}{2}(1984) + \frac{1}{4}(1984) - \dots n$ upto terms, is

(a) 5 (b) 3 (c) 4 (d) 10

93. The positive integer n for which $2 \cdot 2^2 + 3 \cdot 2^3 + 4 \cdot 2^4 + \dots + n \cdot 2^n = 2^{n+10}$, is

(a) 510 (b) 511 (c) 512 (d) 513

94. If $1^2 + 2^2 + 3^2 + \dots + 2003^2 = (2003)(4007)(334)$ and $(1)(2003) + (2)(2002) + (3)(2001) + \dots + (2003)(1) = (2003)(334)(x)$, then x equals

(a) 2005 (b) 2004
(c) 2003 (d) 2001

95. If $x > 0$ and $\log_2 x + \log_2(\sqrt{x}) + \log_2(\sqrt[4]{x}) + \log_2(\sqrt[8]{x}) + \log_2(\sqrt[16]{x}) + \dots = 4$, then x equals

(a) 2 (b) 3 (c) 4 (d) 5

96. If $x_1, x_2, \dots, x_n$ are n non-zero real numbers such that

$$(x_1^2 + x_2^2 + \dots + x_{n-1}^2)(x_2^2 + x_3^2 + \dots + x_n^2) \le (x_1x_2 + x_2x_3 + \dots + x_{n-1}x_n)^2,$$

then $x_1, x_2, \dots, x_n$ are in

(a) AP (b) GP
(c) HP (d) None of these

97. If $\sum_{r=1}^{n} r^4 = f(n)$, then $\sum_{r=1}^{n} (2r-1)^4$ is equal to

(a) $f(2n) - 16f(n)$ (b) $f(2n) - 7f(n)$
(c) $f(2n-1) - 8f(n)$ (d) None of these

98. The value of $\lim_{n\to\infty} \sum_{r=1}^{n} \tan^{-1}\left(\frac{1}{2r^2}\right)$ is

(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$
(c) 1 (d) None of these

99. If $1^3 = 1, 2^3 = 3+5, 3^3 = 7+9+11$
and $4^3 = 13+15+17+19$,
then n^3 as a similar series is

(a) $\left[2\left\{\frac{n(n-1)}{2}+1\right\}-1\right]+\left[2\left\{\frac{(n+1)n}{2}+1\right\}+1\right]+\ldots+\left[2\left\{\frac{(n+1)n}{2}+1\right\}+2n-3\right]$

(b) $(n^2+n+1)+(n^2+n+3)+(n^2+n+5)+\ldots+(n^2+3n-1)$

(c) $(n^2-n+1)+(n^2-n+3)+(n^2-n+5)+\ldots+(n^2+n-1)$

(d) None of the above

100. $\sum_{r=1}^{n} \frac{r^2-r-1}{(r+1)!}$ is equal to

(a) $\frac{n}{(n+1)!}$

(b) $\frac{-1}{(n+1)(n-1)!}$

(c) $\frac{n}{(n+1)!} - 1$

(d) None of the above

101. Solution set for $(\sqrt{2+\sqrt{2}})^x + (\sqrt{2-\sqrt{2}})^x = 2\cdot 2^{x/4}$ is

(a) $\{2\}$
(b) $\{0\}$
(c) $[0, 2]$
(d) None of the above

102. If $x^2 - (a+b+c)x + (ab+bc+ca) = 0$ has imaginary roots, where $a, b, c \in R^+$, then $\sqrt{a}, \sqrt{b}$ and $\sqrt{c}$

(a) can be sides of a triangle
(b) can't be sides of a triangle
(c) nothing can be said
(d) None of the above

103. If first three terms of sequence $\frac{1}{16}, a, b, \frac{1}{6}$ are in geometric series and the last three terms are in harmonic series, then the values of a and b will be

(a) $a = -\frac{1}{4}, b = 1$ (b) $a = \frac{1}{12}, b = \frac{1}{9}$
(c) Both (a) and (b) are true (d) None of these

104. If the roots of the equation $a(b-c)x^2 + b(c-a)x + c(a-b) = 0$ are equal, then a, b and c are in

(a) AP (b) GP
(c) HP (d) None of these

105. If AM between two numbers is 5 and their GM is 4, then the HM will be

(a) $\frac{16}{5}$ (b) $\frac{14}{5}$
(c) $\frac{11}{5}$ (d) None of these

106. If $\log(a+c), \log(c-a)$ and $\log(a-2b+c)$ are in AP, then

(a) a, b and c are in AP (b) a^2, b^2 and c^2 are in AP
(c) a, b and c are in GP (d) a, b and c are in HP

107. If $\cos(x-y), \cos x$ and $\cos(x+y)$ are in HP, then $\cos x \sec\left(\frac{y}{2}\right)$ is equal to

(a) $\pm\sqrt{2}$ (b) $\pm\frac{1}{\sqrt{2}}$
(c) ± 2 (d) None of these

108. $\log_3 2, \log_6 2$ and $\log_{12} 2$ are in

(a) AP (b) GP
(c) HP (d) None of these

109. If a, b and c are in HP, then correct statement is

(a) $a^2 + c^2 > b^2$ (b) $a^2 + c^2 > 2b^2$
(c) $a^2 + c^2 < 2b^2$ (d) $a^2 + c^2 = 2b^2$

110. The AM, GM and HM of two numbers are x, y and z, respectively. Then, which of the following is true?

(a) $z < y < x$ (b) $y < x < z$ (c) $x < y < z$ (d) $z < x < y$

111. If a, b and c are in HP, then the straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ always passes through a fixed point and that point is

(a) $(-1, -2)$ (b) $(-1, 2)$ (c) $(1, -2)$ (d) $\left(1, -\frac{1}{2}\right)$

112. Let $a_1, a_2, \ldots, a_{10}$ be in AP and $h_1, h_2, \ldots, h_{10}$ be in HP. If $a_1 = h_1 = 2$ and $a_{10} = h_{10} = 3$, then $a_4 h_7$ is

(a) 2 (b) 3 (c) 5 (d) 6

113. If x, y and z are in HP, where $z > y > x$. Then, value of $\log(x+z) + \log(x-2y+z)$ is

(a) $2\log(y-z)$ (b) $2\log(z-x)$
(c) $4\log(x-z)$ (d) $\log(x-z)$

114. If $H_1, H_2, H_3, \ldots, H_{2n+1}$ are in HP, then $\sum_{i=1}^{2n} (-1)^i \left(\frac{H_i + H_{i+1}}{H_i - H_{i+1}}\right)$ is equal to

(a) $2n-1$ (b) $2n+1$ (c) $2n$ (d) $2n+2$

Type 2. **More than One Correct Option**

115. For the AP given by $a_1, a_2, \ldots, a_n, \ldots$, the equation satisfied is

(a) $a_1 + 2a_2 + a_3 = 0$
(b) $a_1 - 2a_2 + a_3 = 0$
(c) $a_1 + 3a_2 - 3a_3 - a_4 = 0$
(d) $a_1 - 4a_2 + 6a_3 - 4a_4 + a_5 = 0$

116. If sum of the first three consecutive terms of an AP is 9 and the sum of their squares is 35. Then, sum to n terms of the series is

(a) $n(n+1)$ (b) n^2
(c) $n(4-n)$ (d) $n(6-n)$

117. If $a_1, a_2, \ldots, a_n$ are in AP with common difference d, then $\cot^{-1}\left[\frac{1+a_1a_2}{d}\right] + \cot^{-1}\left[\frac{1+a_2a_3}{d}\right] + \cot^{-1}\left[\frac{1+a_3a_4}{d}\right] + \ldots + \cot^{-1}\left[\frac{1+a_na_{n-1}}{d}\right]$ is equal to

(a) $\tan^{-1} a_n - \tan^{-1} a_1$ (b) $\cot^{-1} a_1 + \cot^{-1} a_n$
(c) $\cot^{-1} a_1 - \cot^{-1} a_n$ (d) None of these

118. If a, b and c are three terms of an AP such that $a \neq b$, then $\frac{b-c}{a-b}$ may be equal to

(a) $\sqrt{2}$ (b) $\sqrt{3}$ (c) 1 (d) 2

119. The roots of the equation $x^5 - 40x^4 + Px^3 + Qx^2 + Rx - S = 0$ are in GP. If the sum of their reciprocals is 10, then the value of S can be equal to

(a) 32 (b) $-\frac{1}{32}$
(c) -32 (d) $\frac{1}{32}$

120. Consider an AP $a_1, a_2, \ldots, a_n, \ldots$ and the GP $b_1, b_2, \ldots, b_n, \ldots$ such that $a_1 = b_1 = 1$, $a_9 = b_9$ and $\sum_{r=1}^{9} a_r = 369$, then

(a) $b_6 = 27$ (b) $b_7 = 27$ (c) $b_8 = 81$ (d) $b_9 = 81$

121. If $\sin\beta$ is the geometric mean between $\sin\alpha$ and $\cos\alpha$, then $\cos 2\beta$ is equal to

(a) $2\sin^2\left(\frac{\pi}{4} - \alpha\right)$ (b) $2\cos^2\left(\frac{\pi}{4} - \alpha\right)$
(c) $2\cos^2\left(\frac{\pi}{4} + \alpha\right)$ (d) $2\sin^2\left(\frac{\pi}{4} + \alpha\right)$

122. If the first and $(2n+1)$th terms of an AP, a GP and an HP of positive terms are equal and their $(n+1)$th terms are a, b and c respectively, then

(a) $a = b = c$ (b) $a \geq b \geq c$
(c) $a + c = 2b$ (d) $ac = b^2$

Type 3. **Assertion and Reason**

Directions (Q. Nos. 123-129) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choice are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

123. If positive numbers x, y and z satisfy $x + y + z = 1$, then

Statement I $\left[\frac{(1-2x)+(1-2y)+(1-2z)}{3}\right] \geq (1-2x)(1-2y)(1-2z)^{1/3}$

Statement II For any three positive numbers a, b and c, AM $\geq$ GM.

124. Statement I If $\frac{a}{a_1}, \frac{b}{b_1}$ and $\frac{c}{c_1}$ are in AP, then a_1, b_1 and c_1 are in GP.

Statement II If $ax^2 + bx + c = 0$ and $a_1x^2 + b_1x + c_1 = 0$ have a common root and $\frac{a}{a_1}, \frac{b}{b_1}, \frac{c}{c_1}$ are in AP, then a_1, b_1 and c_1 are in GP.

125. Statement I If all terms of a series with positive terms are smaller than 10^{-5}, then the sum of the series upto infinity will be finite.

Statement II If $S_n > \frac{n}{10^5}$, then $\lim_{n\to\infty} S_n$ is infinite.

126. Statement I If three positive numbers in GP represent sides of a triangle, then the common ratio of a GP must lie between $\frac{\sqrt{5}-1}{2}$ and $\frac{\sqrt{5}+1}{2}$.

Statement II Three positive real numbers can form a triangle, if sum of any two numbers is greater than the third number.

127. **Statement I** There exists an AP, whose three terms are $\sqrt{2}, \sqrt{3}$ and $\sqrt{5}$.

Statement II There does not exist distinct real numbers p, q and r satisfying

$$\sqrt{2} = A + (p-1)d$$

$$\sqrt{3} = A + (q-1)d \quad \text{and} \quad \sqrt{5} = A + (r-1)d$$

128. **Statement I** $\lim\limits_{n \to \infty} \dfrac{x^n}{n!} = 0, \forall\, x > 0$.

Statement II Every sequence whose nth term contains $n!$ in the denominator converges to zero.

129. **Statement I** If the sequence $\{a_n\}$ is monotonically increasing, then the sequence $\{S_n\}$, where $S_n = \dfrac{a_1 + a_2 + \ldots + a_n}{n}$ is monotonically increasing too.

Statement II If $\{a_n\}$ is monotonically increasing, then the expression $na_{n+1} - (a_1 + a_2 + \ldots + a_n)$ is positive.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 130-132) *If A, G and H are respectively arithmetic, geometric and harmonic means between a and b, both being unequal and positive, then*

$$A = \frac{a+b}{2} \Rightarrow a + b = 2A,$$

$$G = \sqrt{ab} \Rightarrow ab = G^2$$

and $$H = \frac{2ab}{a+b} \Rightarrow G^2 = AH$$

From above discussion, we can say that a and b are the roots of the equation $x^2 - 2Ax + G^2 = 0$.

Now, quadratic equations $x^2 - Px + Q = 0$ and $a(b-c)x^2 + b(c-a)x + c(a-b) = 0$ have both root common and satisfy the relation $b = \dfrac{2ac}{(a+c)}$, where a, b and c are real numbers.

130. The value of $\dfrac{a(b-c)}{b(c-a)}$ is

(a) -2 (b) 2 (c) $-1/2$ (d) $1/2$

131. The value of $[P]$, where, [] denotes the greatest integer function, is

(a) -2 (b) -1
(c) 2 (d) 1

132. The value of $[2P - Q]$, where [] denotes the greatest integer function, is

(a) 2 (b) 3
(c) 5 (d) 6

Passage II (Q. Nos. 133-135) *Let the sequence $a_1, a_2, a_3, \ldots, a_n$ be in GP. If the area bounded by the parabolas $y^2 = 4a_n x$ and $y^2 = 4a_n(a_n - x)$ is A_n.*

133. The sequence $A_1, A_2, A_3, \ldots$, lies in

(a) AP
(b) GP
(c) HP
(d) None of the above

134. For $a_n = 1$, the point of intersection of the curves are

(a) $\left(\frac{1}{2}, \sqrt{2}\right)$ (b) $\left(\frac{4}{3}, \sqrt{2}\right)$ (c) $\left(\frac{8}{3}, \sqrt{2}\right)$ (d) $\left(\frac{16}{3}, \sqrt{2}\right)$

135. For $a_n = 1$, the area of region bounded by both the curves is

(a) $4\sqrt{2}$ sq units (b) $\dfrac{4\sqrt{2}}{3}$ sq units
(c) $\dfrac{8\sqrt{2}}{3}$ sq units (d) $\dfrac{16\sqrt{2}}{3}$ sq units

Type 5. **Match the Columns**

136. Let a, b and c be positive integers such that $a + b + c = n$. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	$(a^a b^b c^c)^{1/n}$ is less than or equal to	p.	$\dfrac{ab + bc + ca}{n}$
B.	$(a^b b^c c^a)^{1/n}$ is less than or equal to	q.	$\dfrac{a^2 + b^2 + c^2}{n}$
C.	$(a^c b^a c^b)^{1/n}$ is less than or equal to	r.	abc
D.	$(a^a b^b c^c)^{1/n} + (a^b b^c c^a)^{1/n} + (a^c b^a c^b)^{1/n}$ is less than or equal to	s.	n

137. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	The AM of two positive numbers a and b exceed their GM by 3/2 and the GM exceed their HM by 6/5 such that $a+b=\alpha, \lvert a-b \rvert = \beta$, then	p.	$\alpha + \beta^2 = 96$
B.	The AM of two positive numbers a and b exceed their GM by 2 and HM is one-fifth of the greater of a and b such that $a+b=\alpha, \lvert a-b \rvert = \beta$, then	q.	$\alpha + \beta^2 = 74$
C.	The HM of two positive numbers a and b is 4, their AM is A and GM G satisfy the relation $2A + G^2 = 27$. If $a+b=\alpha, \lvert a-b \rvert = \beta$, then	r.	$\alpha^2 + \beta = 234$
		s.	$\alpha^2 + \beta = 84$
		t.	$1 + \left(\frac{\alpha}{\beta}\right) + \left(\frac{\alpha}{\beta}\right)^2 + \ldots + \left(\frac{\alpha}{\beta}\right)^5 = 364$

Type 6. Single Integer Answer Type Questions

138. If a sequence $a_1, a_2, a_3, \ldots, a_n$ of real numbers is such that $a_1 = 0$, $|a_2| = |a_1 + 1|$, $|a_3| = |a_2 + 1|$, ..., $|a_n|$ is equal to $|a_{n-1} + 1|$, where the arithmetic mean of $a_1, a_2, \ldots, a_n$ cannot be less than $-\lambda/\mu$, then find the value of $\lambda + \mu$.

139. If $(m+1)$ th, $(n+1)$ th and $(r+1)$ th terms of an AP are in GP and m, n, r are in HP, where the ratios of the common difference to the first term in the AP is $-\lambda/n$, then find the value of λ.

140. Find the HCF of the minimum non-negative values of a, b and c, given that the equation $x^4 + ax^3 + bx^2 + cx + 1 = 0$ has only real roots.

141. If K is a positive integer such that $36 + K$, $300 + K$ and $596 + K$ are the squares of three consecutive terms of an arithmetic progression, then find $(K - 920)$.

Entrances Gallery

JEE Advanced/IIT JEE

1. Let a, b and c be positive integers such that b/a is an integer. If a, b and c are in geometric progression and the arithmetic mean of a, b, c is $b + 2$, then the value of $\frac{a^2 + a - 14}{a+1}$ is ________ . **[2014]**

2. The value of $\cot\left\{\sum_{n=1}^{23} \cot^{-1}\left(1 + \sum_{k=1}^{n} 2k\right)\right\}$ is **[2013]**

(a) $\frac{23}{25}$ (b) $\frac{25}{23}$
(c) $\frac{23}{24}$ (d) $\frac{24}{23}$

3. If $S_n = \sum_{2}^{4n} (-1)^{\frac{k(k+1)}{2}} k^2$, then S_n can take value(s) **[2013]**

(a) 1056
(b) 1088
(c) 1120
(d) 1332

4. If $a_1, a_2, a_3, \ldots$ are in a harmonic progression with $a_1 = 5$ and $a_{20} = 25$. Then, least positive integer n for which $a_n < 0$, is **[2012]**

(a) 22 (b) 23 (c) 24 (d) 25

5. Let $a_1, a_2, a_3, \ldots, a_{100}$ be an arithmetic progression with $a_1 = 3$ and $S_p = \sum_{i=1}^{p} a_i, 1 \le p \le 100$. For any integer n with $1 \le n \le 20$, let $m = 5n$. If $\frac{S_m}{S_n}$ does not depend on n, then a_2 is__________ . **[2011]**

6. The minimum value of the sum of real numbers $a^{-5}, a^{-4}, 3a^{-3}, 1, a^8$ and a^{10} with $a > 0$ is___. **[2011]**

7. If S_k, $k = 1, 2 \ldots 100$, denotes the sum of the infinite geometric series, whose first term is $\frac{k-1}{k!}$ and the common ratio is $1/k$. Then, the value of $\frac{100^2}{100!} + \sum_{k=1}^{100} |(k^2 - 3k + 1) S_k$ is _________ . **[2010]**

8. Let $a_1, a_2, a_3, \ldots, a_{11}$ be real numbers satisfying $a_1 = 15$, $27 - 2a_2 > 0$ and $a_k = 2a_{k-1} - a_{k-2}$ for $k = 3, 4, \ldots, 11$. If $\frac{a_1^2 + a_2^2 + \ldots + a_{11}^2}{11} = 90$, then the value of $\frac{a_1 + a_2 + \ldots + a_{11}}{11}$ is _______ . **[2010]**

9. If m is the AM of two distinct real numbers l and $n(l, n > 1)$ and G_1, G_2 and G_3 are three geometric means between l and n, then $G_1^4 + 2G_2^4 + G_3^4$ equals **[2015]**

(a) $4\ l^2mn$ (b) $4\ lm^2n$ (c) $4\ lmn^2$ (d) $4\ l^2m^2n^2$

10. The sum of first 9 terms of the series $\frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \ldots$ is **[2015]**

(a) 71 (b) 96 (c) 142 (d) 192

11. Let α and β be the roots of equation $px^2 + qx + r = 0$, $p \neq 0$. If p, q and r are in AP and $\frac{1}{\alpha} + \frac{1}{\beta} = 4$, then the value of $|\alpha - \beta|$ is **[2014]**

(a) $\frac{\sqrt{61}}{9}$ (b) $\frac{2\sqrt{17}}{9}$ (c) $\frac{\sqrt{34}}{9}$ (d) $\frac{2\sqrt{13}}{9}$

12. If $(10)^9 + 2(11)^1\ (10)^8 + 3(11)^2\ (10)^7 + \ldots + 10(11)^9 = k(10)^9$, then k is equal to **[2014]**

(a) $\frac{121}{10}$ (b) $\frac{441}{100}$ (c) 100 (d) 110

13. Three positive numbers form an increasing GP. If the middle term in this GP is doubled, then new numbers are in AP. Then, the common ratio of a GP is **[2014]**

(a) $\sqrt{2} + \sqrt{3}$ (b) $3 + \sqrt{2}$
(c) $2 - \sqrt{3}$ (d) $2 + \sqrt{3}$

14. The sum of first 20 terms of the sequence 0.7, 0.77, 0.777,… is **[2013]**

(a) $\frac{7}{81}(179 - 10^{-20})$ (b) $\frac{7}{9}(99 - 10^{-20})$
(c) $\frac{7}{81}(179 + 10^{-20})$ (d) $\frac{7}{9}(99 + 10^{-20})$

15. If 100 times the 100th term of an AP with non-zero common difference equal to 50 times its 50th term, then the 150th term of this AP is **[2012]**

(a) – 150 (b) 150 times its 50th term
(c) 150 (d) 0

16. **Statement I** The sum of the series $1 + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + \ldots + (361 + 380 + 400)$ is 8000.

Statement II $\sum_{k=1}^{n} [k^3 - (k-1)^3] = n^3$ for any natural number n. **[2012]**

(a) Statement I is false, Statement II is true

(d) Statement I is true, Statement II is false

17. A man saves ₹ 200 in each of the first three months of his service. In each of the subsequent months, his savings increases by ₹40 more than the savings of immediately previous month. His total saving from the start of service will be ₹ 11040 after **[2011]**

(a) 19 months (b) 20 months
(c) 21 months (d) 18 months

18. A person is to count 4500 currency notes. Let a_n denotes the number of notes he counts in the nth minute. If $a_1 = a_2 = \ldots = a_{10} = 150$ and $a_{10}, a_{11}, \ldots$ are in AP with common difference –2, then the time taken by him to count all notes, is **[2010]**

(a) 24 min (b) 34 min (c) 125 min (d) 135 min

19. The sum of the series $1 + \frac{2}{3} + \frac{6}{3^2} + \frac{10}{3^3} + \frac{14}{3^4} + \ldots$ is **[2009]**

(a) 3 (b) 4 (c) 6 (d) 2

20. The first two terms of a geometric progression add upto 12. The sum of the third and fourth terms is 48. If the terms of the geometric progression are alternately positive and negative, then the first term is **[2008]**

(a) – 4 (b) – 12 (c) 12 (d) 4

21. In a geometric progression consisting of positive terms, each term equals the sum of the next two terms. Then, the common ratio of this progression equals **[2007]**

(a) $\frac{1}{2}(1 - \sqrt{5})$ (b) $\frac{1}{2}\sqrt{5}$ (c) $\sqrt{5}$ (d) $\frac{1}{2}(\sqrt{5} - 1)$

22. Let $a_1, a_2, a_3, \ldots$ be terms of an AP. If $\frac{a_1 + a_2 + \ldots + a_p}{a_1 + a_2 + \ldots + a_q} = \frac{p^2}{q^2}$, $p \neq q$, then $\frac{a_6}{a_{21}}$ equals **[2006]**

(a) $\frac{7}{2}$ (b) $\frac{2}{7}$ (c) $\frac{11}{41}$ (d) $\frac{41}{11}$

23. If $a_1, a_2, \ldots, a_n$ are in HP, then the expression $a_1a_2 + a_2a_3 + \ldots + a_{n-1}a_n$ is equal to **[2006]**

(a) $(n-1)(a_1 - a_n)$ (b) na_1a_n
(c) $(n-1)a_1a_n$ (d) $n(a_1 - a_n)$

24. If $x = \sum_{n=0}^{\infty} a^n$, $y = \sum_{n=0}^{\infty} b^n$, $z = \sum_{n=0}^{\infty} c^n$, where a, b, c are in AP and $|a| < 1, |b| < 1, |c| < 1$, then x, y and z are in **[2005]**

(a) HP (b) AGP (c) AP (d) GP

25. The sum of the series $1 + \frac{1}{4 \cdot 2!} + \frac{1}{16 \cdot 4!} + \frac{1}{64 \cdot 6!} + \ldots$ is **[2005]**

(a) $\frac{e+1}{2\sqrt{e}}$ (b) $\frac{e-1}{2\sqrt{e}}$
(c) $\frac{e+1}{\sqrt{e}}$ (d) $\frac{e-1}{\sqrt{e}}$

26. Let T_r be the rth term of an AP, whose first term is a and common difference is d. If for some positive integers $m, n, m \neq n, T_m = \frac{1}{n}$ and $T_n = \frac{1}{m}$, then $a - d$ equals **[2004]**

(a) 0 (b) 1 (c) $\frac{1}{mn}$ (d) $\frac{1}{m} + \frac{1}{n}$

27. The sum of the first n terms of the series $1^2 + 2\cdot 2^2 + 3^2 + 2\cdot 4^2 + 5^2 + 2\cdot 6^2 + \ldots$ is $\frac{n(n+1)^2}{2}$, where n is even. When n is odd, then the sum is **[2004]**

(a) $\frac{3n(n+1)}{2}$ (b) $\frac{n^2(n+1)}{2}$

(c) $\frac{n(n+1)^2}{4}$ (d) $\left[\frac{n(n+1)}{2}\right]^2$

28. The sum of the series $\frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + \ldots$ is **[2004]**

(a) $\frac{(e^2-1)}{2}$ (b) $\frac{(e-1)^2}{2e}$ (c) $\frac{(e^2-1)}{2e}$ (d) $\frac{(e^2-2)}{e}$

29. The sum of the series $\frac{1}{1\cdot 2} - \frac{1}{2\cdot 3} + \frac{1}{3\cdot 4} - \ldots$ is **[2003]**

(a) $2\log_e 2$ (b) $\log_e 2 - 1$ (c) $\log_e 2$ (d) $\log_e\left(\frac{4}{e}\right)$

30. If 1, $\log_3\sqrt{(3^{1-x}+2)}$, $\log_3(4\cdot 3^x - 1)$ are in AP. Then, x equals **[2002]**

(a) $\log_3 4$ (b) $1 - \log_3 4$ (c) $1 - \log_4 3$ (d) $\log_4 3$

31. The value of $2^{1/4}\cdot 4^{1/8}\cdot 8^{1/16}\ldots$ is **[2002]**

(a) 1 (b) 2

(c) $\frac{3}{2}$ (d) 4

32. If term of a GP is 2, then the product of its 9 terms is **[2002]**

(a) 256
(b) 512
(c) 1024
(d) None of the above

33. $\sum_{n=0}^{\infty} \frac{(\log_e x)^n}{n!}$ is equal to **[2002]**

(a) $\log_e x$ (b) x

(c) $\log_x e$ (d) None of these

34. $e^{(x-1) - \frac{1}{2}(x-1)^2 + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4} + \ldots}$ is equal to **[2002]**

(a) $\log(x-1)$
(b) $\log x$
(c) x
(d) None of the above

Other Engineering Entrances

35. If V_r denotes the sum of the first r terms of an arithmetic progression (AP), whose first term is r and the common difference is $(2r-1)$. Then, the sum of $V_1 + V_2 + \ldots + V_n$ is **[AMU 2014]**

(a) $\frac{1}{12}n(n+1)(3n^2 - n + 1)$

(b) $\frac{1}{12}n(n+1)(3n^2 + n + 2)$

(c) $\frac{1}{2}n(2n^2 - n + 1)$

(d) $\frac{1}{3}(2n^3 - 2n + 3)$

36. If a, b and c are positive numbers in a GP, then the roots of the quadratic equation $(\log_e a)x^2 - (2\log_e b)x + (\log_e c) = 0$ are **[WB JEE 2014]**

(a) -1 and $\frac{\log_e c}{\log_e a}$ (b) 1 and $-\frac{\log_e c}{\log_e a}$

(c) 1 and $\log_a c$ (d) -1 and $\log_c a$

37. If $f(x) = x + 1/2$, then the number of real values of x for which the three unequal terms $f(x), f(2x), f(4x)$ are in HP, is **[WB JEE 2014]**

(a) 1 (b) 0 (c) 3 (d) 2

38. If p, q, r and s are positive real numbers such that $p + q + r + s = 2$, then $M = (p+q)(r+s)$ satisfies the relation **[BITSAT 2014]**

(a) $0 < M \leq 1$ (b) $1 \leq M \leq 2$ (c) $2 \leq M \leq 3$ (d) $3 \leq M \leq 4$

39. Let α and β denote the cube roots of unity other than 1 and $\alpha \neq \beta$. If $S = \sum_{n=0}^{302} (-1)^n \left(\frac{\alpha}{\beta}\right)^n$, then the value of S is **[WB JEE 2014]**

(a) either -2ω or $-2\omega^2$ (b) either -2ω or $2\omega^2$

(c) either 2ω or $-2\omega^2$ (d) either 2ω or $2\omega^2$

40. If α and β are the roots of the equation $x^2 - px + q = 0$, then the value of $(\alpha+\beta)x - \left(\frac{\alpha^2+\beta^2}{2}\right)x^2 + \left(\frac{\alpha^3+\beta^3}{3}\right)x^3 + \ldots$ is **[BITSAT 2014]**

(a) $\log(1 - px + qx^2)$ (b) $\log(1 + px - qx^2)$

(c) $\log(1 + px + qx^2)$ (d) None of the above

41. The sum of the series $\log_4 2 - \log_8 2 + \log_{16} 2 - \ldots$ is **[BITSAT 2014]**

(a) e^2 (b) $\log_e 2 + 1$

(c) $\log_e 3 - 2$ (d) $1 - \log_e 2$

42. If $\frac{e^x}{1-x} = B_0 + B_1 x + B_2 x^2 + \ldots + B_n x^n + \ldots$, then the value of $B_n - B_{n-1}$ is **[BITSAT 2014]**

(a) 1 (b) $\frac{1}{n}$

(c) $\frac{1}{n!}$ (d) None of these

43. If $a=\sum_{n=0}^{\infty}\frac{x^{3n}}{(3n)!}$, $b=\sum_{n=1}^{\infty}\frac{x^{3n-2}}{(3n-2)!}$ and $c=\sum_{n=1}^{\infty}\frac{x^{3n-1}}{(3n-1)!}$, then the value of $a^3+b^3+c^3-3abc$ is **[BITSAT 2014]**

(a) 1 (b) 0
(c) – 1 (d) – 2

44. For every real number x, let
$f(x)=\frac{x}{1!}+\frac{3}{2!}x^2+\frac{7}{3!}x^3+\frac{15}{4!}x^4+\ldots$. Then, the equation $f(x)=0$ has **[WB JEE 2014]**

(a) no real solution
(b) exactly one real solution
(c) exactly two real solutions
(d) infinite number of real solutions

45. Let S denotes the sum of the series $1+\frac{8}{2!}+\frac{21}{3!}+\frac{40}{4!}+\frac{65}{5!}+\ldots$, then **[WB JEE 2014]**

(a) $S<8$ (b) $S>12$ (c) $8<S<12$ (d) $S=8$

46. In an arithmetical progression $a_1, a_2, a_3, \ldots$, sum $(S)=a_1^2-a_2^2+a_3^2-a_4^2+\ldots-a_{2k}^2$ is equal to **[BITSAT 2013]**

(a) $\frac{k}{2k-1}(a_1^2-a_{2k}^2)$ (b) $\frac{2k}{k-1}(a_{2k}^2-a_1^2)$
(c) $\frac{k}{k+1}(a_1^2-a_{2k}^2)$ (d) None of these

47. If $\log_x ax$, $\log_x bx$ and $\log_x cx$ are in AP, where a, b, c, x belong to $(1,\infty)$, then a, b and c are in **[UP SEE 2013]**

(a) AP (b) HP
(c) GP (d) None of these

48. Six numbers are in AP such that their sum is 3. The first term is 4 times the third term. Then, the fifth term is **[WB JEE 2012]**

(a) – 15 (b) – 3
(c) 9 (d) – 4

49. If $\log_{10} 2$, $\log_{10}(2^x-1)$ and $\log_{10}(2^x+3)$ are in AP, then x is equal to **[AMU 2012]**

(a) $\log_2 5$ (b) $\log_2(-1)$ (c) $\log_2\left(\frac{1}{5}\right)$ (d) $\log_5 2$

50. $0.2+0.22+0.222+\ldots$ upto n terms is equal to **[BITSAT 2012]**

(a) $\left(\frac{2}{9}\right)-\left(\frac{2}{81}\right)(1-10^{-n})$ (b) $n-\left(\frac{1}{9}\right)(1-10^{-n})$
(c) $\left(\frac{2}{9}\right)\left[n-\left(\frac{1}{9}\right)(1-10^{-n})\right]$ (d) $\left(\frac{2}{9}\right)$

51. The sum of the series
$1+\frac{1}{3}+\frac{1\cdot3}{3\cdot6}+\frac{1\cdot3\cdot5}{3\cdot6\cdot9}+\frac{1\cdot3\cdot5\cdot7}{3\cdot6\cdot9\cdot12}+\ldots$ is **[WB JEE 2013]**

(a) $\sqrt{2}$ (b) $\sqrt{3}$
(c) $\sqrt{\frac{3}{2}}$ (d) $\sqrt{\frac{1}{3}}$

52. If $H_n=1+\frac{1}{2}+\ldots+\frac{1}{n}$, then the value of $S_n=1+\frac{3}{2}+\frac{5}{3}+\ldots+\frac{2n-1}{n}$ is **[AMU 2012]**

(a) H_n+2n (b) $n-1+H_n$ (c) H_n-2n (d) $2n-H_n$

53. If AM and HM between two numbers are 27 and 12 respectively, then their GM is **[BITSAT 2011]**

(a) 9 (b) 18
(c) 24 (d) 36

54. If x, y and z are in geometric progression, then $\log_x 10$, $\log_y 10$ and $\log_z 10$ are in **[UP SEE 2011]**

(a) AP (b) GP
(c) HP (d) None of these

55. The value of $4+2(1+2)\log 2+\frac{2(1+2^2)}{2!}(\log 2)^2+\frac{2(1+2^3)}{3!}(\log 2)^3+\ldots$ is **[UP SEE 2011]**

(a) 10 (b) 12
(c) $\log(3^2\cdot4^2)$ (d) $\log(2^2\cdot3^2)$

56. The value of $\frac{2}{1!}+\frac{2+4}{2!}+\frac{2+4+6}{3!}+\ldots$ is **[BITSAT 2011]**

(a) e (b) $2e$
(c) $3e$ (d) None of these

57. If the sum to first n terms of an AP 2, 4, 6,… is 240, then the value of n is **[BITSAT 2010]**

(a) 14 (b) 15
(c) 16 (d) 17

58. If sum of an infinite geometric series is $\frac{4}{3}$ and its lst term is $\frac{3}{4}$, then its common ratio is **[BITSAT 2010]**

(a) $\frac{7}{16}$ (b) $\frac{9}{16}$ (c) $\frac{1}{9}$ (d) $\frac{7}{9}$

59. The value of n for which $\frac{x^{n+1}+y^{n+1}}{x^n+y^n}$ is the geometric mean of x and y, is **[WB JEE 2010]**

(a) $n=-\frac{1}{2}$ (b) $n=\frac{1}{2}$ (c) $n=1$ (d) $n=-1$

60. GM and HM of two numbers are 10 and 8 respectively. The numbers are **[WB JEE 2010]**

(a) 5, 20 (b) 4, 25
(c) 2, 50 (d) 1,100

61. Sum of n terms of the series $1^3+3^3+5^3+7^3+\ldots$ is **[WB JEE 2010]**

(a) $n^2(2n^2-1)$ (b) $n^3(n-1)$
(c) n^3+8n+4 (d) $2n^4+3n^2$

62. The value of $\frac{2}{3!}+\frac{4}{5!}+\frac{6}{7!}+\ldots$ is **[WB JEE 2010]**

(a) $e^{1/2}$ (b) e^{-1} (c) e (d) $e^{-1/3}$

Explanations

Target Exercises

1. We have,
$$5 = 2^2 + 1,$$
$$14 = 3^2 + 5,$$
$$30 = 4^2 + 14,$$
$$55 = 5^2 + 30,$$
i.e. square of term is added to previous term.

$\therefore$ Next term $= 6^2 + 55 = 36 + 55 = 91$

2. We have,
$$3 = 1 + 2$$
$$6 = 3 + 3$$
$$10 = 6 + 4$$
$\therefore$ Next term $= 10 + 5 = 15$

3. Given, $5T_5 = 8T_8$
$$\Rightarrow \quad 5(a + 4d) = 8(a + 7d)$$
$$\therefore \quad 3a + 36d = 0$$
$$\Rightarrow \quad a + 12d = 0$$
$$\Rightarrow \quad T_{13} = 0$$

4. We have, $a_3 = a_2 - 1 = 2 - 1 = 1$
$$a_4 = a_3 - 1 = 1 - 1 = 0$$
$$a_5 = a_4 - 1 = 0 - 1 = -1$$

5. Let a and d be the first term and common difference respectively of given AP. Then,
$$T_2 = x - y$$
$$\Rightarrow \quad a + d = x - y$$
and
$$T_5 = x + y$$
$$\Rightarrow \quad a + 4d = x + y$$
$$\Rightarrow \quad a = x - \frac{5}{3}y$$

6. Given a, b and c are in AP.
$$\Rightarrow \quad 2b = a + c$$
$$\Rightarrow \quad 3b = a + b + c = 2s$$
Now, $\cot \frac{C}{2} = \sqrt{\frac{s(s-c)}{(s-a)(s-b)}}$
$$= \sqrt{\frac{2s(2s-2c)}{(2s-2a)(2s-2b)}} = \sqrt{\frac{3b(2s-2c)}{(2s-2a)(3b-2b)}}$$
$$= \sqrt{\frac{3(s-c)}{s-a}} = 3\sqrt{\frac{s-c}{3(s-a)}}$$
$$= 3\sqrt{\frac{b(s-c)}{3b(s-a)}} = 3\sqrt{\frac{(2s-2b)(s-c)}{2s(s-a)}}$$
$$= 3\sqrt{\frac{(s-b)(s-c)}{s(s-a)}}$$
$$= 3\tan\frac{A}{2}$$

7. Let x be the common difference of AP a, b, c, d, e, f.

Then,
$$e - c = (a + 4x) - (a + 2x)$$
$$= 2x = 2(d - c)$$

8. From given options, if we consider $b = -1$, $\cos x = b$

$\Rightarrow \cos x = -1$, which is satisfied for $x = \pi, 3\pi, 5\pi, \ldots$, which form an AP with common difference 2π. For other values of b, the roots of the equation are not in AP.

9. Given, $\log_3 2, \log_3(2^x - 5)$ and $\log_3\left(2^x - \frac{7}{2}\right)$ are in AP.
$$\therefore \quad 2\log_3(2^x - 5) = \log_3 2 + \log_3\left(2^x - \frac{7}{2}\right)$$
$$\Rightarrow \quad 2^x = 8 \quad \text{or} \quad 2^x = 4$$
$$\Rightarrow \quad x = 3 \quad \text{or} \quad x = 2$$
Neglecting $x = 2$ as $(2^x - 5) < 0$ for $x = 2$
$$\Rightarrow \quad x = 3$$

10. Given, $T_p = q \Rightarrow a + (p-1)d = q$ ...(i)

and $T_q = p \Rightarrow a + (q-1)d = p$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get
$$\Rightarrow \quad (p-q)d = -(p-q) \Rightarrow d = -1$$
On putting $d = -1$ in Eq. (i), we get
$$a + (p-1)(-1) = q$$
$$\Rightarrow \quad a = p + q - 1$$
$$\therefore \quad T_r = a + (r-1)d$$
$$= (p + q - 1) + (r-1)(-1)$$
$$= p + q - 1 - r + 1 = p + q - r$$

11. Here,
$$\frac{1}{1-x} - \frac{1}{1+\sqrt{x}} = \frac{\sqrt{x}}{1-x}$$
and
$$\frac{1}{1-\sqrt{x}} - \frac{1}{1-x} = \frac{\sqrt{x}}{1-x}$$
Hence, these terms are in AP.

12. Since, $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ are in AP.
$$\therefore \quad \frac{1}{a} + \frac{1}{c} = \frac{2}{b} \quad \ldots\text{(i)}$$
Now, $\left(\frac{1}{a} + \frac{1}{b} - \frac{1}{c}\right)\left(\frac{1}{b} + \frac{1}{c} - \frac{1}{a}\right)$
$$= \left\{\frac{1}{a} + \frac{1}{b} - \left(\frac{2}{b} - \frac{1}{a}\right)\right\}\left\{\frac{1}{b} + \frac{1}{c} - \left(\frac{2}{b} - \frac{1}{c}\right)\right\}$$
[from Eq. (i)]
$$= \left(\frac{2}{a} - \frac{1}{b}\right)\left(\frac{2}{c} - \frac{1}{b}\right) = \frac{4}{ac} - \frac{2}{b}\left(\frac{1}{a} + \frac{1}{c}\right) + \frac{1}{b^2}$$
$$= \frac{4}{ac} - \frac{2}{b}\left(\frac{2}{b}\right) + \frac{1}{b^2} = \frac{4}{ac} - \frac{3}{b^2}$$

13. Let a and d be the first term and common difference, respectively of given AP, then
$$a_7 = 34 \Rightarrow a + 6d = 34 \quad \ldots\text{(i)}$$
and
$$a_{13} = 64 \Rightarrow a + 12d = 64 \quad \ldots\text{(ii)}$$
On solving Eqs. (i) and (ii), we get
$$a = 4, d = 5$$
$$\therefore \quad a_{18} = a + 17d = 4 + 85 = 89$$

14. Let roots of given equation in AP be $a - d$, a and $a + d$.

Then, $(a-d) + a + (a+d) = 12$
$$\Rightarrow \quad a = 4$$
Also, $(a-d)a(a+d) = 28$
$$\Rightarrow \quad a(a^2 - d^2) = 28 \Rightarrow 4(16 - d^2) = 28$$
$$\Rightarrow \quad 16 - d^2 = 7 \Rightarrow d^2 = 9 \Rightarrow d = \pm 3$$

Target Exercises

15. $\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$

Applying $C_1 \to C_1 - C_2$

$$= \begin{vmatrix} -1 & x+2 & x+a \\ -1 & x+3 & x+b \\ -1 & x+4 & x+c \end{vmatrix}$$

$$= (-1) \begin{vmatrix} 1 & x+2 & x+a \\ 1 & x+3 & x+b \\ 1 & x+4 & x+c \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1, R_3 \to R_3 - R_1$

$$= (-1) \begin{vmatrix} 1 & x+2 & x+a \\ 0 & 1 & b-a \\ 0 & 2 & c-a \end{vmatrix}$$

$$= (-1)[c + a - 2b] = 0$$

[since, a, b and c are in AP, so $2b = a + c$]

16. Given $a\left(\frac{1}{b}+\frac{1}{c}\right), b\left(\frac{1}{c}+\frac{1}{a}\right)$ and $c\left(\frac{1}{a}+\frac{1}{b}\right)$ are in AP.

$\Rightarrow$ $\frac{a(b+c)}{bc}, \frac{b(c+a)}{ca}, \frac{c(a+b)}{ab}$ are in AP.

$\Rightarrow$ $(b-a)(cb+ca+ab) = (c-b)(ac+ab+cb)$

$\Rightarrow$ $b - a = c - b$

$\Rightarrow$ a, b and c are in AP.

17. Given a, b and c are in AP.

$\therefore$ $2b = a + c$ ...(i)

Now, $(a+2b-c)(2b+c-a)(c+a-b)$

$= (a+a+c-c)(a+c+c-a)(2b-b)$ [from Eq. (i)]

$= (2a)(2c)(b) = 4abc$

18. We know, $\frac{1}{\sqrt{a}+\sqrt{b}}, \frac{1}{\sqrt{a}+\sqrt{c}}$ and $\frac{1}{\sqrt{b}+\sqrt{c}}$ are in AP, if

$$\frac{1}{\sqrt{a}+\sqrt{c}} - \frac{1}{\sqrt{a}+\sqrt{b}} = \frac{1}{\sqrt{b}+\sqrt{c}} - \frac{1}{\sqrt{a}+\sqrt{c}}$$

i.e. $\frac{\sqrt{b}-\sqrt{c}}{\sqrt{a}+\sqrt{b}} = \frac{\sqrt{a}-\sqrt{b}}{\sqrt{b}+\sqrt{c}}$

i.e. $b - c = a - b$, which is true.

19. Given, $\frac{1}{p+q}, \frac{1}{q+r}$ and $\frac{1}{r+p}$ are in AP.

$\Rightarrow$ $\frac{1}{q+r} - \frac{1}{p+q} = \frac{1}{r+p} - \frac{1}{q+r}$

$\Rightarrow$ $p^2 - r^2 = q^2 - p^2$

So, q^2, p^2 and r^2 are in AP.

20. The numbers between 100 and 500 that are divisible by 7 are 105, 112, 119, 126, 133, 140, 147, ..., 483, 490, 497.

Let such numbers be n.

Then, $497 = 105 + (n-1) \times 7$

$\Rightarrow$ $n = 57$

The number between 100 and 500 that are divisible by 21 are 105, 126, 147, ..., 483.

Let such numbers be m.

Then, $483 = 105 + (m-1) \times 21$

$\Rightarrow$ $m = 19$

$\therefore$ Required number $= n - m = 57 - 19 = 38$

21. We have, first term $= a$

$\therefore$ $T_1 = a$

and second term $= b$

$\therefore$ $T_2 = b$

Then, common difference

$$d = T_2 - T_1 = b - a$$

Also, last term $= c \Rightarrow c = a + (n-1)d$

$\Rightarrow$ $n = \frac{c-a+d}{d}$

$\Rightarrow$ $n = \frac{(b+c-2a)}{(b-a)}$ $[\because d = b - a]$

$\therefore$ Sum of n terms,

$$S_n = \frac{n}{2}(a+l) = \frac{(b+c-2a)(a+c)}{2(b-a)}$$

22. The given series is arithmetic whose first term is 20 and common difference is $-\frac{2}{3}$.

As the common difference is negative, the terms will become negative after some stage. So, the sum is maximum, if only positive terms are added.

Now, $t_n = 20 + (n-1)\left(-\frac{2}{3}\right) \ge 0,$

if $60 - 2(n-1) \ge 0 \Rightarrow 62 \ge 2n \Rightarrow 31 \ge n$

So, the first 31 terms are non-negative.

$\therefore$ Maximum sum,

$$S_{31} = \frac{31}{2}\left\{2 \times 20 + (31-1)\left(-\frac{2}{3}\right)\right\}$$

$$= \frac{31}{2}\{40 - 20\} = 310$$

23. Required sum

$= (1 + 2 + 3 + \dots + 199) - (3 + 6 + 9 + \dots + 198)$

$- (5 + 10 + 15 + \dots + 195) + (15 + 30 + 45 + \dots + 195)$

$= \frac{199}{2}(1+199) - \frac{66}{2}(3+198)$

$- \frac{39}{2}(5+195) + \frac{13}{2}(15+195)$

$= 199 \times 100 - 33 \times 201 - 39 \times 100 + 13 \times 105 = 10732$

24. Let the four numbers in AP be

$$\alpha - 3\beta, \alpha - \beta, \alpha + \beta, \alpha + 3\beta.$$

Given, $\alpha - 3\beta + \alpha - \beta + \alpha + \beta + \alpha + 3\beta = 50$

$\Rightarrow$ $4\alpha = 50 \Rightarrow \alpha = \frac{25}{2}$

and $\alpha + 3\beta = 4(\alpha - 3\beta)$

$\Rightarrow$ $3\alpha = 15\beta$

$\therefore$ $\beta = \frac{\alpha}{5} = \frac{25}{5 \times 2} = \frac{5}{2}$

Hence, the four numbers are 5, 10, 15 and 20.

25. Let the four numbers in AP be

$\alpha - 3\beta, \alpha - \beta, \alpha + \beta$ and $\alpha + 3\beta$.

Given, $\alpha - 3\beta + \alpha - \beta + \alpha + \beta + \alpha + 3\beta = 24$

$\Rightarrow$ $4\alpha = 24$

and $(\alpha - 3\beta)(\alpha - \beta)(\alpha + \beta)(\alpha + 3\beta) = 945$

$\Rightarrow$ $(\alpha^2 - 9\beta^2)(\alpha^2 - \beta^2) = 945$

$\Rightarrow$ $(36 - 9\beta^2)(36 - \beta^2) = 945$

$\Rightarrow$ $\beta^4 - 40\beta^2 + 144 = 105$

$\Rightarrow$ $\beta^4 - 40\beta^2 + 39 = 0$

$\Rightarrow \quad \beta^4 - \beta^2 - 39\beta^2 + 39 = 0$

$\Rightarrow \quad (\beta^2 - 1)(\beta^2 - 39) = 0$

Since, numbers are integers.

$\therefore \quad \beta^2 \neq 39$

$\therefore \quad \beta^2 - 1 = 0$

$\Rightarrow \quad \beta = \pm 1$

Hence, the four integers are 3, 5, 7 and 9.

26. Given, $S_n = 3n^2$

$\therefore \quad T_n = S_n - S_{n-1}$

$= 3n^2 - 3(n-1)^2 = 6n - 3$

On putting $n = 1, 2, 3, \dots$, the sequence is 3, 9, 15, 21, ... which is clearly an AP.

27. The first two digit number which when divided by 4 leaves remainder 1 is $4 \cdot 3 + 1 = 13$ and last is $4 \cdot 24 + 1 = 97$.

Thus, we have to find the sum of the series

$$13 + 17 + 21 + \dots + 97$$

which is an AP.

$\therefore \quad 97 = 13 + (n-1)4$

$\Rightarrow \quad n = 22$

and $\quad S_n = \frac{n}{2}[a + l] = 11[13 + 97]$

$= 11 \times 110 = 1210$

28. The least and the greatest numbers of three digits divisible by 7 are 105 and 994, respectively.

So, it is required to find the sum of the series

$$105 + 112 + 119 + \dots + 994$$

Here, $a = 105, d = 7, a_n = 994$

Now, $\quad a_n = a + (n-1)d$

$\Rightarrow \quad 994 = 105 + (n-1) \times 7$

$\Rightarrow \quad 994 - 105 = 7(n-1)$

$\Rightarrow \quad 889 = 7(n-1)$

$\Rightarrow \quad n - 1 = \frac{889}{7}$

$\therefore \quad n - 1 = 127$

$\Rightarrow \quad n = 127 + 1 = 128$

$\therefore \quad \text{Sum} = \frac{n}{2}[2a + (n-1)d]$

$= \frac{128}{2}[2 \times 105 + (128 - 1) \times 7]$

$= 64(210 + 889)$

$= 64 \times 1099$

$= 70336$

29. The odd numbers of four digits which are divisible by 9 are 1017, 1035, …, 9999.

These are in AP with common difference 18.

$$a = 1017, d = 18 \text{ and } l = 9999$$

$\therefore$ nth term, $a_n = a + (n-1)d$

$\Rightarrow \quad 9999 = 1017 + (n-1) \times 18$

$\Rightarrow \quad 18n = 9999 - 999 = 9000$

$\Rightarrow \quad n = 500$

$\therefore \quad S_n = \frac{n}{2}(a_1 + a_n)$

$= \frac{500}{2}(1017 + 9999)$

$= 250 \times 11016$

$= 2754000$

30. Here, $a = 10$ and $d = -\frac{3}{7}$

Then, $t_n = 10 + (n-1)\left(-\frac{3}{7}\right)$

Now, t_n is positive, if

$$10 + (n-1)\left(-\frac{3}{7}\right) \geq 0$$

$\Rightarrow \quad 70 - 3(n-1) \geq 0$

$\Rightarrow \quad 73 \geq 3n \Rightarrow 24\frac{1}{3} \geq n$

So, first 24 terms are positive.

Now, sum of the positive terms,

$$S_{24} = \frac{24}{2}\left[2 \times 10 + 23 \times \left(\frac{-3}{7}\right)\right]$$

$$= 12\left[20 - \frac{69}{7}\right] = \frac{852}{7}$$

31. Let nth term be the first negative term.

Then, nth term, $t_n < 0$

$\therefore \quad 40 + (n-1)(-2) < 0 \Rightarrow 42 - 2n < 0$

$\Rightarrow \quad 2n > 42 \Rightarrow n > 21$

$\therefore$ Least value of $n = 22$

Hence, first 21 terms of an AP are non-negative.

Since, sum will be maximum, if no negative terms is taken.

$\therefore$ Maximum sum, $S_{21} = \frac{21}{2}[2 \cdot 40 + (20)(-2)]$

$= \frac{21}{2} \times 40 = 420$

32. Let the first instalment be a and common difference of an AP be d.

Given, $3600 =$ Sum of 40 terms

$\Rightarrow \quad 3600 = \frac{40}{2}[2a + (40-1)d]$

$\Rightarrow \quad 3600 = 20[2a + 39d]$

$\Rightarrow \quad 180 = 2a + 39d \quad \dots(i)$

After 30 instalments, one-third of the debt is unpaid.

Hence, $\frac{3600}{3} = 1200$ is unpaid and 2400 is paid.

Now, $\quad 2400 = \frac{30}{2}[2a + (30-1)d]$

$\Rightarrow \quad 160 = 2a + 29d \quad \dots(ii)$

On subtracting Eq. (ii) from Eq. (i), we get

$$20 = 10d$$

$\therefore \quad d = 2$

From Eq. (i),

$$180 = 2a + 39 \cdot 2$$

$\Rightarrow \quad 2a = 180 - 78 = 102$

$\therefore \quad a = 51$

Now, the value of 8th instalment

$$= a + (8-1)d = 51 + 7 \cdot 2 = ₹\,65$$

33. Let a be the length of the smallest side and d be the common difference.

Here, $\quad n = 25$ and $S_{25} = 2100$

Now, $\quad S_n = \frac{n}{2}[2a + (n-1)d]$

$\Rightarrow \quad 2100 = \frac{25}{2}[2a + (25-1)d]$

$\Rightarrow \quad a + 12d = 84 \quad \dots(i)$

The largest side = 25th side

$$= a + (25-1)d = a + 24d$$

$\therefore \quad a + 24d = 20a$ [given] ...(ii)

On solving Eqs. (i) and (ii), we get

$$a = 8,\ d = 6\frac{1}{3}$$

34. $S_n = \frac{n}{2}[2a + (n-1)d]$

Here, a = 1st term = 7 yr, d = 3 months = $\frac{1}{4}$ yr

$$S_n = 250 \text{ yr}$$

$\Rightarrow \quad 250 = \frac{n}{2}\left[2 \times 7 + (n-1) \times \frac{1}{4}\right]$

$\Rightarrow \quad 250 = \frac{n}{2}\left(\frac{n+55}{4}\right)$

$\Rightarrow \quad 2000 = n^2 + 55n$

$\Rightarrow \quad n^2 + 55n - 2000 = 0$

$\Rightarrow \quad (n-25)(n+80) = 0$

$\Rightarrow \quad n = 25$

$\therefore$ Number of members in the club = 25

35. $S_n = \frac{n}{2}[2a + (n-1)d]$

$\Rightarrow \quad 60100 = \frac{n}{2}[4 + (n-1)(3)]$

$\Rightarrow \quad \frac{n}{2}[3n+1] = 60100$

$\Rightarrow \quad n = 200$

36. $T_n = S_n - S_{n-1}$

$$= [3n^2 + 5n] - [3(n-1)^2 + 5(n-1)]$$

$$= [3n^2 + 5n] - [3(n^2 - 2n + 1) + 5(n-1)]$$

$$= 6n + 2$$

Let $T_n = 164$

Then, $164 = 6n + 2 \Rightarrow 6n = 162 \Rightarrow n = 27$

Hence, 164 is 27th term.

37. Here, $a = 1$, $l = 11$ and $S_n = 36$

$\because \quad S_n = \frac{n}{2}(a + l)$

$\therefore \quad 36 = \frac{n}{2}(1 + 11) = 6n \Rightarrow n = 6$

38. Given series is $\sqrt{2} + 2\sqrt{2} + 3\sqrt{2} + 4\sqrt{2} + \dots$

$$= \sqrt{2}\,[1 + 2 + 3 + 4 + \dots \text{ upto } n \text{ terms}]$$

$$= \sqrt{2}\,(\Sigma n) = \sqrt{2}\left[\frac{n(n+1)}{2}\right] \quad \left[\because \Sigma n = \frac{n(n+1)}{2}\right]$$

$\therefore \quad S_n = \frac{n(n+1)}{\sqrt{2}}$

39. Let $S_n = \frac{1}{\sqrt{1}+\sqrt{3}} + \frac{1}{\sqrt{3}+\sqrt{5}} + \frac{1}{\sqrt{5}+\sqrt{7}} + \dots + \frac{1}{\sqrt{2n-1}+\sqrt{2n+1}}$

$$= \left(\frac{\sqrt{3}-1}{2}\right) + \left(\frac{\sqrt{5}-\sqrt{3}}{2}\right) + \left(\frac{\sqrt{7}-\sqrt{5}}{2}\right) + \dots + \left(\frac{\sqrt{2n+1}-\sqrt{2n-1}}{2}\right)$$

$$= \frac{\sqrt{2n+1}-1}{2}$$

40. Two digit odd numbers are 11, 13, ..., 99. These clearly form an AP with $a = 11$, $d = 2$ and $n = 45$.

$\therefore$ Required sum

$$= \frac{n}{2}(a + l) = \frac{45}{2}(11 + 99) = 2475$$

41. $S_p - S_q = 2a(p-q) + (p^2 - q^2 - p + q)d = 2(q-p)$

$\Rightarrow \quad 2a + (p + q - 1)d = -2$

$\therefore \quad S_{p+q} = \frac{(p+q)}{2}[2a + (p+q-1)d]$

$$= \frac{-2(p+q)}{2}$$

$$= -(p+q)$$

42. Given, $S_n = 3n^2 - n$

If t_n is the nth term of an AP, then

$$t_n = S_n - S_{n-1}$$

$$= (3n^2 - n) - [3(n-1)^2 - (n-1)] = 6n - 4$$

$\therefore \quad t_1 = 6 - 4 = 2$

43. We have, $S_n = \frac{n}{2}[2P + (n-1)Q]$

By definition, $d = Q$

44. Given, $S_n = 5n^2 + 2n$

$\Rightarrow \quad S_1 = 5 + 2 = 7$

and $\quad S_2 = 5(4) + 2(2) = 24$

$\therefore \quad T_2 = S_2 - S_1$

$$= 24 - 7 = 17$$

45. Given, $t_n = \frac{n}{x} + y$

$\Rightarrow \quad t_1 = \frac{1}{x} + y$ and $t_2 = \frac{2}{x} + y$

$\Rightarrow \quad d = t_2 - t_1 = \frac{1}{x}$

where, d is common difference of given AP.

$\therefore \quad S_r = \frac{r}{2}[2a_1 + (r-1)d]$

$$= \frac{r(r+1)}{2x} + ry \quad \left[\because a_1 = \frac{1}{x} + y\right]$$

46. $S_{n+3} - 3S_{n+2} + 3S_{n+1} - S_n$

$$= (S_{n+3} - S_{n+2}) - 2(S_{n+2} - S_{n+1}) + (S_{n+1} - S_n)$$

$$= T_{n+3} - 2T_{n+2} + T_{n+1}$$

$$= (T_{n+3} - T_{n+2}) - (T_{n+2} - T_{n+1})$$

$$= d - d = 0$$

47. $\frac{a + be^y}{a - be^y} = \frac{b + ce^y}{b - ce^y} = \frac{c + de^y}{c - de^y}$

Applying componendo and dividendo rule, we get

$$\frac{b}{a} = \frac{c}{b} = \frac{d}{c}$$

$\Rightarrow a, b, c$ and d are in GP.

48. Given, $T_{m+n} = p$ and $T_{m-n} = q$

$\Rightarrow \quad ar^{m+n-1} = p$ ...(i)

and $\quad ar^{m-n-1} = q$ ...(ii)

On multiplying Eqs. (i) and (ii), we get

$$a^2 r^{2m-2} = pq$$

$\Rightarrow \quad (ar^{m-1})^2 = pq \Rightarrow ar^{m-1} = \sqrt{pq}$

$\Rightarrow \quad T_m = \sqrt{pq}$

49. Since, $1/2 \operatorname{cosec}^2\theta$, $2\cot\theta$ and $\sec\theta$ are in GP.

$\therefore \quad \frac{1}{2}\operatorname{cosec}^2\theta \cdot \sec\theta = 4\cot^2\theta$

$\Rightarrow \quad \cos\theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$

50. Let a and r be the first term and the common ratio respectively of GP.

Then, $T_{10} = 9 \Rightarrow ar^9 = 9$

and $T_4 = 4 \Rightarrow ar^3 = 4$

$\therefore \quad T_7 = ar^6 = (ar^9 \cdot ar^3)^{1/2} = (9 \times 4)^{1/2} = 6$

51. Let A and R be the first term and the common ratio respectively of given GP. Then,

$T_4 = p \Rightarrow AR^3 = p$

$T_7 = q \Rightarrow AR^6 = q$

and $T_{10} = r \Rightarrow AR^9 = r$

Now, $(AR^3)(AR^9) = A^2R^{12} = (AR^6)^2 \Rightarrow pr = q^2$

52. Let a and r be the first term and the common ratio respectively of GP.

Then, $a_6 = 32 \Rightarrow ar^5 = 32 \quad \ldots(i)$

and $a_8 = 128 \Rightarrow ar^7 = 128 \quad \ldots(ii)$

On dividing Eq. (ii) by Eq. (i), we get

$r^2 = 4 \Rightarrow r = \pm 2$

53. Let r be the common ratio of a GP, then

Area formed by three points

$$= \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_1 r & y_1 r & 1 \\ x_1 r^2 & y_1 r^2 & 1 \end{vmatrix} = \frac{1}{2}x_1 y_1 \begin{vmatrix} 1 & 1 & 1 \\ r & r & 1 \\ r^2 & r^2 & 1 \end{vmatrix} = 0$$

So, points are collinear, i.e. lie on a straight line.

54. Let $a^x = b^y = c^z = k$

$\Rightarrow \quad a = k^{1/x}, b = k^{1/y}$ and $c = k^{1/z}$

Since, a, b and c are in GP.

$\therefore \quad b^2 = ac \Rightarrow (k^{1/y})^2 = k^{1/x}k^{1/z}$

$\Rightarrow \quad k^{2/y} = k^{1/x + 1/z} \Rightarrow \frac{2}{y} = \frac{1}{x} + \frac{1}{z}$

$\Rightarrow \quad \frac{1}{x}, \frac{1}{y}$ and $\frac{1}{z}$ are in AP.

$\Rightarrow \quad x, y$ and z are in HP.

55. Let d be the common difference of an AP and $R\ (\neq 0)$ be the common ratio of a GP. Then,

$q = p + d, r = p + 2d$ and $y = xR, z = xR^2$

$\because \quad q - r = -d, r - p = 2d$ and $p - q = -d$

$$\therefore \quad x^{q-r} \cdot y^{r-p} \cdot z^{p-q} = x^{-d} \cdot (xR)^{2d} \cdot (xR^2)^{-d}$$
$$= (x^{-d} \cdot x^{2d} \cdot x^{-d})(R^{2d} \cdot R^{-2d})$$
$$= (x^{-d+2d-d}) \cdot (R^{2d-2d})$$
$$= x^0 \cdot R^0 = 1 \times 1 = 1$$

56. Let the three numbers in GP be a, ar and ar^2.

$\therefore \quad a + ar + ar^2 = 56 \quad$ [given] $\ldots(i)$

On subtracting 1, 7, 21 from the numbers, we get $a - 1, ar - 7, ar^2 - 21$, which are given to be in AP.

$\therefore \quad (ar - 7) - (a - 1) = (ar^2 - 21) - (ar - 7)$

$\Rightarrow \quad ar - a - 6 = ar^2 - ar - 14$

$\Rightarrow \quad a - 2ar + ar^2 = 8 \quad \ldots(ii)$

On subtracting Eq. (ii) from Eq. (i), we get

$3ar = 48 \Rightarrow a = \frac{16}{r} \quad \ldots(iii)$

On substituting $a = \frac{16}{r}$ in Eq. (i), we get

$\frac{16}{r} + 16 + 16r = 56$

$\Rightarrow \quad 16r^2 - 40r + 16 = 0$

$\Rightarrow \quad 2r^2 - 5r + 2 = 0$

$\Rightarrow \quad (r - 2)(2r - 1) = 0$

$\therefore \quad r = 2, \frac{1}{2}$

If $r = 2$, then from Eq. (iii), $a = 8$ and the numbers are 8, 16, 32.

If $r = \frac{1}{2}$, then from Eq. (iii), $a = 32$ and the numbers are 32, 16, 8.

57. Let the sides of the right angled triangle be a, ar and ar^2, out of which ar^2 is the hypotenuse, then $r > 1$.

Now, $a^2r^4 = a^2 + a^2r^2$

$\Rightarrow \quad r^4 - r^2 - 1 = 0 \Rightarrow r^2 = \frac{1 \pm \sqrt{5}}{2}$

$\because \quad r > 1$

$\therefore \quad r^2 > 1$

$\Rightarrow \quad r^2 = \frac{1 + \sqrt{5}}{2}$

Let $\angle C$ be the greater acute angle.

Now, $\cos C = \frac{a}{ar^2} = \frac{1}{r^2} = \frac{2}{1 + \sqrt{5}}$

58. Let the three digits be a, ar and ar^2.

According to the hypothesis,

$100a + 10ar + ar^2 - 792 = 100ar^2 + 10ar + a$

$\Rightarrow \quad a(1 - r^2) = 8 \quad \ldots(i)$

and $a, ar + 2, ar^2$ are in AP.

$\therefore \quad 2(ar + 2) = a + ar^2$

$\Rightarrow \quad a(r^2 - 2r + 1) = 4 \quad \ldots(ii)$

On dividing Eq. (i) by Eq. (ii), we get

$\frac{a(1 - r^2)}{a(r^2 - 2r + 1)} = \frac{8}{4}$

$\Rightarrow \quad \frac{(1 + r)(1 - r)}{(r - 1)^2} = 2 \Rightarrow \frac{r + 1}{1 - r} = 2$

$\therefore \quad r = 1/3$

From Eq. (i), $a = 9$

Thus, digits are 9, 3, 1 and so the required number is 931.

59. Given a, b and c are in AP.

$\Rightarrow \quad 2b = a + c \quad \ldots(i)$

Also, given $a + 1, b, c$ are in GP and $a, b, c + 2$ are also in GP.

$b^2 = (a + 1)c \quad \ldots(ii)$

and $b^2 = a(c + 2) \quad \ldots(iii)$

On solving Eqs. (i), (ii) and (iii), we get

$a = 8, b = 12$ and $c = 16$

Hence, $b = 12$

60. The given series is a GP with $a = 0.4$.

$$r = \frac{1}{100}$$

$$\therefore \quad S = \frac{a}{1-r} = \frac{40}{99} \qquad \left[\because S_\infty = \frac{a}{1-r}\right]$$

61. The given series is a GP with

$$a = e^{-x}, r = \frac{-e^{-2x}}{e^{-x}} = -e^{-x}$$

$$\therefore \quad S = \frac{a}{1-r} = \frac{e^{-x}}{1+e^{-x}} = \frac{1}{1+e^x} \quad [\because -e^{-x} < 1, \text{ for } x > 0]$$

62. We have, $\frac{128r - a}{r-1} = 255 \Rightarrow \frac{256-a}{2-1} = 255 \qquad [\because r = 2]$

$$\Rightarrow \quad 256 - a = 255 \Rightarrow a = 1$$

63. Clearly, $\frac{(x+2)^n - (x+1)^n}{(x+2)-(x+1)}$

$$= (x+2)^{n-1} + (x+2)^{n-2}(x+1) + (x+2)^{n-3}(x+1)^2 + \ldots + (x+1)^{n-1}$$

$\therefore$ Required sum $= (x+2)^n - (x+1)^n$

$$[\because (x+2)-(x+1) = 1]$$

64. Here, $c = ar, e = ar^2, d = bs, f = bs^2$

$$\therefore \quad \text{Area of triangle} = \frac{1}{2}\begin{vmatrix} a & b & 1 \\ c & d & 1 \\ e & f & 1 \end{vmatrix}$$

$$= \frac{1}{2}ab(s-r)(s-1)(r-1)$$

65. Let S denotes the sum of all terms and S_1 denotes the sum of odd terms.

$$S_1 = \frac{a}{1-r^2} \quad \text{(i.e. sum of odd terms)}$$

Given, $S = \frac{1}{5}\cdot S_1 \Rightarrow \frac{a}{1-r} = \frac{1}{5}\cdot\frac{a}{1-r^2}$

$$\Rightarrow \quad 1 + r = \frac{1}{5} \Rightarrow r = -\frac{4}{5}$$

66. The given series is a GP with $a = \sqrt{2}, r = \sqrt{3} > 1$

$$\therefore \quad S_{10} = \frac{a(r^{10}-1)}{r-1} = \frac{\sqrt{2}[(\sqrt{3})^{10} - 1]}{\sqrt{3}-1}$$

$$= \frac{\sqrt{2}}{2}(242)(\sqrt{3}+1) = 121(\sqrt{6}+\sqrt{2})$$

67. $\sum_{n=1}^{49}(1.05)^n = 1.05 + (1.05)^2 + (1.05)^3 + \ldots + (1.05)^{49}$

$$= \frac{1.05[(1.05)^{49} - 1]}{1.05 - 1}$$

$$= 212.16$$

68. Let a and r be the first term and the common ratio respectively of given infinite GP. Then,

$$ar = 2 \qquad \ldots\text{(i)}$$

Also, $\frac{a}{1-r} = 8 \qquad \ldots\text{(ii)}$

From Eq. (i), $r = \frac{2}{a}$

On putting the value of r in Eq. (ii), we get

$$a = 4$$

69. Let a and r be the first term and the common ratio respectively of given GP. Then,

$$\alpha = \sum_{n=1}^{100} a_{2n}$$

$$\Rightarrow \quad \alpha = \frac{ar(1-r^{200})}{(1-r^2)} \qquad \left[\because S_n = \frac{a(1-r^n)}{1-r}\right]$$

$$\Rightarrow \quad \beta = \frac{a(1-r^{200})}{1-r^2}$$

$$\Rightarrow \quad \frac{\alpha}{\beta} = r$$

70. Given, $f(x+y) = f(x)f(y), \forall x, y \in N$

For any $x \in N$, $f(x) = [f(1)]^x = 3^x \qquad [\because f(1) = 3]$

$$\therefore \quad \sum_{x=1}^{n} f(x) = 120$$

$$\Rightarrow \quad \sum_{x=1}^{n} 3^x = 120$$

$$\Rightarrow \quad 3^1 + 3^2 + 3^3 + \ldots + 3^n = 120$$

$$\Rightarrow \quad 3^n - 1 = 80$$

$$\Rightarrow \quad 3^n = 81 = 3^4 \Rightarrow n = 4$$

71. $0.4\overline{23} = 0.4 + 0.023 + 0.00023 + \ldots$

$$= \frac{4}{10} + \frac{23}{10^3} + \frac{23}{10^5} + \frac{23}{10^7} + \ldots = \frac{419}{990}$$

72. Given, $x = 1 + y + y^2 + \ldots$

$$\Rightarrow \quad x = \frac{1}{1-y} \Rightarrow 1 - y = \frac{1}{x}$$

$$\Rightarrow \quad y = 1 - \frac{1}{x} = \frac{x-1}{x}$$

73. Let the GP be a, ar, ar^2 and ar^3.

Then, $a(1 + r + r^2 + r^3)$

$$= a \times \left[\frac{1-r^4}{1-r}\right]$$

$$= 12(1-\sqrt{5}) \qquad \text{[given]}$$

$$= \frac{12(1+\sqrt{5})(1-\sqrt{5})}{1+\sqrt{5}}$$

$$= \frac{-48}{1+\sqrt{5}}$$

$$\Rightarrow \quad \frac{a(1-25}{1+\sqrt{5}} = \frac{-48}{1+\sqrt{5}}$$

$$\Rightarrow \quad a = 2$$

74. Sum of areas of all the squares

$$= a^2 + \frac{a^2}{2} + \frac{a^2}{4} + \ldots$$

$$= \frac{a^2}{1-\frac{1}{2}} = 2a^2$$

75. Let a be the first term and r ($|r| < 1$) be the common ratio of infinite GP. Then,

$$\frac{a}{1-r} = 3 \text{ and } \frac{a^2}{1-r^2} = 3 \qquad \ldots\text{(i)}$$

Also, $\frac{a^2}{(1-r)^2} = 9 \qquad \ldots\text{(ii)}$

On solving Eqs. (i) and (ii), we get

$$a=\frac{3}{2}$$

and $$r=\frac{1}{2}$$

Hence, the sequence corresponding to the series will be $\frac{3}{2},\frac{3}{4},\frac{3}{8},\ldots$

76. Given product $= x^{\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+\ldots} = x^{\frac{\left(\frac{1}{2}\right)}{1-\left(\frac{1}{2}\right)}} = x$

77. $\because$ Length of a side of S_n = Length of a diagonal of S_{n+1}

$\Rightarrow$ Length of a side of $S_n = \sqrt{2}$(Length of a side of S_{n+1})

$$\Rightarrow \frac{\text{Length of a side of } S_{n+1}}{\text{Length of a side of } S_n}=\frac{1}{\sqrt{2}}, \forall\, n\ge 1$$

$\Rightarrow$ Side of $S_1, S_2, \ldots, S_n$ form a GP with common ratio $\frac{1}{\sqrt{2}}$ and first term 10.

$$\therefore \quad \text{Side of } S_n = 10\left(\frac{1}{\sqrt{2}}\right)^{n-1} = \frac{10}{2^{\left(\frac{n-1}{2}\right)}}$$

$$\Rightarrow \quad \text{Area of } S_n = (S_n)^2 = \frac{100}{2^{n-1}}$$

$\because$ Area of $S_n < 1$ [given]

$$\Rightarrow \frac{100}{2^{n-1}}<1$$

$$\Rightarrow 2^{n-1} > 100$$

$$\Rightarrow n-1 \ge 7$$

$$\Rightarrow n \ge 8$$

78. Let r be the common ratio of the given GP Then, terms of GP are $\alpha, \alpha r\ \alpha r^2$ and αr^3.

According to the question,

$\alpha(1+r)=1, \alpha^2 r = p, \alpha r^2(1+r)=4, \alpha^2 r^5 = q$

On solving, we get $(p,q)=(-2,-32)$

79. Consider, $(1+x)+(1+x+x^2)$
$+(1+x+x^2+x^3)+\ldots$ upto n terms

$$=\frac{1-x^2}{1-x}+\frac{1-x^3}{1-x}+\frac{1-x^4}{1-x}+\ldots \text{ upto } n \text{ terms}$$

$$=\frac{1}{1-x}[(1+1+1+\ldots \text{ to } n \text{ terms}) - (x^2+x^3+x^4+\ldots \text{upto } n \text{ terms})]$$

$$=\frac{1}{1-x}\left[n-\frac{x^2(1-x^n)}{1-x}\right]$$

80. We have, $9+99+999+\ldots$ upto n terms

$=(10-1)+(10^2-1)+(10^3-1)+\ldots$ upto n terms

$=(10+10^2+10^3+\ldots$ upto n terms$)-n$

$$=\frac{10(10^n-1)}{10-1}-n$$

$$=\frac{10(10^n-1)}{9}-n$$

$$=\frac{1}{9}(10^{n+1}-9n-10)$$

81. Let $S_n = 0.5+0.55+0.555+\ldots$ upto n terms

$$=\frac{5}{9}[0.9+0.99+0.999+\ldots \text{ upto } n \text{ terms}]$$

$$=\frac{5}{9}\left[\left(1-\frac{1}{10}\right)+\left(1-\frac{1}{100}\right)+\left(1-\frac{1}{1000}\right)+\ldots\right]$$

$$=\frac{5}{9}\left[(1+1+1+\ldots)-\left(\frac{1}{10}+\frac{1}{10^2}+\frac{1}{10^3}+\ldots\right)\right]$$

$$=\frac{5}{9}\left[n-\frac{1}{10}\cdot\frac{\left(1-\frac{1}{10^n}\right)}{1-\frac{1}{10}}\right]=\frac{5}{9}\left[n-\frac{1}{10}\times\frac{10}{9}\left(1-\frac{1}{10^n}\right)\right]$$

$$=\frac{5}{9}\left[n-\frac{1}{9}\left(1-\frac{1}{10^n}\right)\right]$$

82. Let the three digits be a, ar and ar^2.

Given, $a+ar^2 = 2ar+1$

$\Rightarrow a(r^2-2r+1)=1$

$\Rightarrow a(r-1)^2 = 1$ ...(i)

Also, given $a+ar=\frac{2}{3}(ar+ar^2)$

$\Rightarrow 3a(1+r)=2ra(1+r)$

$\Rightarrow (1+r)(3-2r)=0$ $[\because a\ne 0]$

$\therefore r=\frac{3}{2}, -1$

If $r=\frac{3}{2}$, then from Eq. (i), $a=\frac{1}{(r-1)^2}=\frac{1}{\left(\frac{3}{2}-1\right)^2}=4$

If $r=-1$, then from Eq. (i), $a=\frac{1}{4}$, which is not possible, as a is an integer.

Hence, $a=4$, $ar=4\cdot\frac{3}{2}=6$ and $ar^2=4\cdot\frac{9}{4}=9$

83. Let the two numbers be a and b, then

$$G=\sqrt{ab} \text{ or } G^2=ab$$

Also, p and q are two AM's between a and b.

$\therefore$ a, p, q and b are in AP.

Now, $p-a=q-p$ and $q-p=b-q$

$\therefore$ $a=2p-q$ and $b=2q-p$

Hence, $G^2=ab=(2p-q)(2q-p)$

84. Let the $3n$ terms of a GP be $a, ar, ar^2, \ldots, ar^{n-1}, ar^n, ar^{n+1}, ar^{n+2}, \ldots, ar^{2n-1}, ar^{2n}, ar^{2n+1}, ar^{2n+2}, \ldots, ar^{3n-1}$.

Then, $S_1 = a+ar+ar^2+\ldots+ar^{n-1}$

$$=\frac{a(1-r^n)}{1-r}$$

$$S_2=ar^n+ar^{n+1}+ar^{n+2}+\ldots+ar^{2n-1} = \frac{ar^n(1-r^n)}{1-r}$$

$$S_3=ar^{2n}+ar^{2n+1}+ar^{2n+2}+\ldots+ar^{3n-1}=\frac{ar^{2n}(1-r^n)}{1-r}$$

Now, $$(S_2)^2=a^2r^{2n}\frac{(1-r^n)^2}{(1-r)^2} = \frac{a(1-r^n)}{1-r}\cdot ar^{2n}\frac{(1-r^n)}{1-r}=S_1S_3$$

Hence, S_1, S_2 and S_3 are in GP.

85. $(32)(32)^{1/6}(32)^{1/36}\ldots = 32^{1+\frac{1}{6}+\frac{1}{36}+\ldots} = 32^{\left(\frac{1}{1-\frac{1}{6}}\right)}$

$= 32^{6/5} = (2^5)^{6/5} = 2^6 = 64$

86. Let $S = 1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots$

$\Rightarrow \frac{1}{5}S = \frac{1}{5} + \frac{4}{5^2} + \frac{7}{5^3} + \ldots$

On subtracting, we get

$$\frac{4}{5}S = 1 + \frac{3}{5} + \frac{3}{5^2} + \frac{3}{5^3} + \ldots$$

$\Rightarrow \quad S = \frac{7}{4} \times \frac{5}{4} = \frac{35}{16}$

87. Let $S = 1 + 2x + 3x^2 + 4x^3 + \ldots$

$xS = x + 2x^2 + 3x^3 + \ldots$

On subtracting, we get

$$(1-x)S = 1 + x + x^2 + x^3 + \ldots$$

$\Rightarrow \quad (1-x)S = \frac{1}{1-x} \Rightarrow S = \frac{1}{(1-x)^2}$

88. Let $S = 1 + 2\cdot 2 + 3\cdot 2^2 + 4\cdot 2^3 + \ldots + 100\cdot 2^{99}$

$2S = 1\cdot 2 + 2\cdot 2^2 + 3\cdot 2^3 + 4\cdot 2^4 + \ldots + 99\cdot 2^{99} + 100\cdot 2^{100}$

On subtracting, we get

$-S = 1 + (1\cdot 2 + 1\cdot 2^2 + 1\cdot 2^3 + \ldots \text{ to 99 terms} - 100\cdot 2^{100})$

$= 1 + 2(2^{99} - 1) - 100\cdot 2^{100}$

$\Rightarrow \quad S = 99\cdot 2^{100} + 1$

89. Here, $T_n = \dfrac{\Sigma n^3}{\frac{n}{2}[2\times 1 + (n-1)2]} = \dfrac{\frac{n^2(n+1)^2}{4}}{n^2}$

$\Rightarrow \quad S_{16} = \frac{1}{4}\sum_{k=1}^{16}(k+1)^2$

$= 446$

90. $T_n = \dfrac{\frac{n(n+1)}{2\cdot 2}}{\Sigma n^3} = \dfrac{\frac{n(n+1)}{4}}{\frac{n^2(n+1)^2}{4}}$

$= \frac{1}{n(n+1)} = \frac{1}{n} - \frac{1}{n+1}$

$\therefore \quad S_n = 1 - \frac{1}{n+1} = \frac{n}{n+1}$

91. We can write S as

$S = (1-2)(1+2) + (3-4)(3+4) + \ldots + (2001-2002)(2001+2002) + 2003^2$

$= -[1 + 2 + 3 + 4 + \ldots + 2002] + 2003^2$

$= -\frac{1}{2}(2002)(2003) + (2003)^2 = 2007006$

92. According to the given condition,

$$(704)(2)\left\{1 - \frac{1}{2^n}\right\} = \frac{1984(2)}{3}\left\{1 - \frac{(-1)^n}{2^n}\right\}$$

$\Rightarrow \quad 128 = \frac{2112}{2^n} - 1984\frac{(-1)^n}{2^n}$

If n is odd, then we get $2^n = 32 \Rightarrow n = 5$

If n is even, then we get $128 = \frac{128}{2^n} \Rightarrow n = 0$

93. We have, $2^{n+10} = 2\cdot 2^2 + 3\cdot 2^3 + 4\cdot 2^4 + \ldots + n\cdot 2^n$

$\Rightarrow \quad 2(2^{n+10}) = 2\cdot 2^3 + 3\cdot 2^4 + \ldots + (n-1)\cdot 2^n + n\cdot 2^{n+1}$

On subtracting, we get

$-2^{n+10} = 2\cdot 2^2 + 2^3 + 2^4 + \ldots + 2^n - n\cdot 2^{n+1}$

$= 8 + \frac{8(2^{n-2}-1)}{2-1} - n\cdot 2^{n+1}$

$= 8 + 2^{n+1} - 8 - n\cdot 2^{n+1} = 2^{n+1} - (n)2^{n+1}$

$\Rightarrow \quad 2^{10} = 2n - 2$

$\Rightarrow \quad n = 513$

94. Let $S = (1)(2003) + (2)(2002) + (3)(2001) + \ldots + (2003)(1)$ and $K = 1^2 + 2^2 + 3^2 + \ldots + 2003^2$

On adding, we get

$$S + K = (2004)[1 + 2 + 3 + \ldots + 2003]$$

$\Rightarrow (2003)(334)(x) + (2003)(4007)(334)$

$= (2004)(1002)(2003)$

$\Rightarrow \quad x = 2005$

95. We can write the given equation as

$$\log_2 x^{1+\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\ldots} = 4$$

$\Rightarrow \quad \log_2(x^2) = 4 \quad\Rightarrow\quad x^2 = 2^4 \quad\Rightarrow\quad x = 4$

96. We shall make use of the identity

$(a_1^2 + a_2^2 + \ldots + a_m^2)(b_1^2 + b_2^2 + \ldots + b_m^2) - (a_1b_1 + a_2b_2 + \ldots + a_mb_m)^2$

$= (a_1b_2 - a_2b_1)^2 + (a_1b_3 - a_3b_1)^2 + \ldots + (a_{m-1}b_m - a_mb_{m-1})^2$

Thus, $(x_1^2 + x_2^2 + \ldots + x_{n-1}^2)(x_2^2 + x_3^2 + \ldots + x_n^2) - (x_1x_2 + x_2x_3 + \ldots + x_{n-1}x_n)^2 \le 0$

$\Rightarrow \quad (x_1x_3 - x_2x_2)^2 + (x_1x_4 - x_3x_3)^2 + \ldots + (x_{n-2}x_n - x_{n-1}x_{n-1})^2 \le 0$

As $x_1, x_2, \ldots, x_n$ are real, this is possible if and only if $x_1x_3 - x_2^2 = x_2x_4 - x_3^2 = \ldots = x_{n-2}x_n - x_{n-1}^2 = 0$

$\Rightarrow \quad \frac{x_1}{x_2} = \frac{x_2}{x_3} = \frac{x_3}{x_4} = \ldots = \frac{x_n}{x_{n-1}}$

$\Rightarrow x_1, x_2, \ldots, x_n$ are in GP.

97. We have,

$$\sum_{r=1}^{n}(2r-1)^4 = \sum_{r=1}^{2n} r^4 - \sum_{r=1}^{n}(2r)^4$$

$= f(2n) - 16f(n)$

98. We have, $\quad \frac{1}{2r^2} = \frac{2}{4r^2} = \frac{(2r+1)-(2r-1)}{1+(2r+1)(2r-1)}$

$\tan^{-1}\left(\frac{1}{2r^2}\right) = \tan^{-1}\left\{\frac{(2r+1)-(2r-1)}{1+(2r+1)(2r-1)}\right\}$

$= \tan^{-1}(2r+1) - \tan^{-1}(2r-1)$

$\Rightarrow \sum_{r=1}^{n}\tan^{-1}\left(\frac{1}{2r^2}\right) = \sum_{r=1}^{n}\{\tan^{-1}(2r+1) - \tan^{-1}(2r-1)\}$

$= \tan^{-1}(2n+1) - \tan^{-1}(1)$

$= \tan^{-1}(2n+1) - \frac{\pi}{4}$

$\Rightarrow \lim_{n\to\infty}\sum_{r=1}^{n}\tan^{-1}\left(\frac{1}{2r^2}\right) = \lim_{n\to\infty}\left\{\tan^{-1}(2n+1) - \frac{\pi}{4}\right\}$

$= \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}$

99. $1^3 = 1\cdot(1-1)+1$

$2^3 = (2\cdot 1+1)+5$,

$3^3 = (3\cdot 2+1)+9+11$,

$4^3 = (4\cdot 3+1)+15+17+19$, etc

$\therefore$ $n^3 = \{n\cdot(n-1)+1\}+\dots$, in which next term being 2 more than the previous

$\therefore n^3 = (n^2-n+1)+(n^2-n+3)+\dots+(n^2+n-1)$

100. $$\sum_{r=1}^{n}\frac{r^2-r-1}{(r+1)!}=\sum_{r=1}^{n}\left(\frac{r-1}{r!}-\frac{r}{(r+1)!}\right)=\frac{-n}{(n+1)!}$$
$$=-\frac{n}{(n+1)n\cdot(n-1)!}$$
$$=-\frac{1}{(n+1)(n-1)!}$$

101. Applying AM $\geq$ GM

Since, AM = GM

$\therefore$ $(\sqrt{2+\sqrt{2}})^x = (\sqrt{2-\sqrt{2}})^x$ i.e. for $x=0$

[$\because$ AM = GM iff $a=b$]

102. As, $D<0$

$\Rightarrow (a+b+c)^2-4(ab+bc+ca)<0$

$\Rightarrow$ $(a-b+c)^2<4ac$

$\Rightarrow$ $-2\sqrt{ac}<a-b+c$

$\Rightarrow$ $(\sqrt{a}+\sqrt{c})>\sqrt{b}$

103. Given $\frac{1}{16}$, a and b are in GP.

$\Rightarrow$ $a^2=\frac{b}{16}$ …(i)

Also, a, b and $\frac{1}{6}$ are in HP.

$\Rightarrow$ $b=\dfrac{2\times a\times\frac{1}{6}}{a+\frac{1}{6}}=\dfrac{2a}{6a+1}$ …(ii)

On solving Eqs. (i) and (ii), we get

$a=\frac{1}{12},-\frac{1}{4}$

and $b=\frac{1}{9},1$

104. Since, $a(b-c)+b(c-a)+c(a-b)=0$

$\therefore$ $x=1$ is a root of the given equation.

Since, both the roots are equal, therefore the other root is also 1.

$\therefore$Their sum $=1+1=2$

$\Rightarrow$ $\dfrac{-b(c-a)}{a(b-c)}=2$

$\Rightarrow$ $-bc+ab=2ab-2ac$

$\Rightarrow$ $2ac=b(a+c)$

$\therefore$ $b=\dfrac{2ac}{a+c}$

Hence, a, b and c are in HP.

105. Let two numbers be a and b. Then,

$\frac{a+b}{2}=5 \Rightarrow a+b=10$

Also, $\sqrt{ab}=4 \Rightarrow ab=16$

$\therefore$HM between a and $b=\dfrac{2ab}{a+b}=\dfrac{2(16)}{10}=\dfrac{16}{5}$

106. Given, $\log(a+c)$, $\log(c-a)$ and $\log(a-2b+c)$ are in AP.

$\Rightarrow$ $2\log(c-a)=\log(a+c)+\log(a-2b+c)$

$\Rightarrow$ $(c-a)^2=(a+c)(a-2b+c)$

$\Rightarrow$ $(c-a)^2=(a+c)^2-2b(a+c)$

$\Rightarrow$ $2b(a+c)=(a+c)^2-(c-a)^2=4ac$

$\Rightarrow$ $b=\dfrac{2ac}{a+c}$

$\Rightarrow$ a, b and c are in HP.

107. Given, $\cos(x-y)$, $\cos x$ and $\cos(x+y)$ are in HP.

$\Rightarrow$ $\cos x=\dfrac{2\cos(x-y)\cos(x+y)}{\cos(x-y)+\cos(x+y)}$

$\Rightarrow$ $\cos x=\dfrac{2(\cos^2 x-\sin^2 y)}{2\cos x\cos y}$

$\Rightarrow$ $\cos^2 x=1+\cos y=2\cos^2\frac{y}{2}$

$\Rightarrow$ $\cos^2 x\sec^2\frac{y}{2}=2$

$\Rightarrow$ $\cos x\sec\frac{y}{2}=\pm\sqrt{2}$

108. $\log_2 6=\log_2(3\times 2)=\log_2 3+\log_2 2=1+\log_2 3$

and $\log_2 12=\log_2(2^2\times 3)$

$=\log_2 3+2\log_2 2$

$=2+\log_2 3$

Since, $\log_2 3, 1+\log_2 3, 2+\log_2 3$ are in AP.

$\Rightarrow \log_2 3, \log_2 6, \log_2 12$ are in AP.

$\Rightarrow \log_3 2, \log_6 2, \log_{12} 2$ are in HP.

109. Given a, b and c are in HP $\Rightarrow b$ is HM of a and c

$\Rightarrow$ $\dfrac{a+c}{2}>b$ [$\because$ AM > HM]

Now, $\dfrac{a^2+c^2}{2}>\left(\dfrac{a+c}{2}\right)^2$

$\Rightarrow$ $\dfrac{a^2+c^2}{2}>b^2$

$\Rightarrow$ $a^2+c^2>2b^2$

110. $\because$ AM > GM > HM

$\therefore$ $x>y>z \Rightarrow z<y<x$

111. Given a, b and c are in HP.

$\Rightarrow$ $\frac{1}{a},\frac{1}{b},\frac{1}{c}$ are in AP.

$\Rightarrow$ $\frac{2}{b}=\frac{1}{a}+\frac{1}{c}$

$\Rightarrow$ $\frac{1}{a}-\frac{2}{b}+\frac{1}{c}=0$

Hence, the straight line $\frac{x}{a}+\frac{y}{b}+\frac{1}{c}=0$ passes through a fixed point $(1,-2)$.

112. Given, $a_{10}=3 \Rightarrow a_1+9d=3$

$\Rightarrow 2+9d=3$ [$\because a_1=2$]

$\Rightarrow$ $d=\frac{1}{9}$

$\therefore$ $a_4=a_1+3d=2+\frac{1}{3}=\frac{7}{3}$

$h_{10}=3 \Rightarrow \frac{1}{h_{10}}=\frac{1}{3}$

$\Rightarrow \quad D = -\dfrac{1}{54}$

$\therefore \quad \dfrac{1}{h_7} = \dfrac{1}{h_1} + 6D$

$= \dfrac{1}{2} - \dfrac{1}{9}$

$= \dfrac{7}{18}$

$\Rightarrow \quad h_7 = \dfrac{18}{7}$

$\therefore \quad a_4 h_7 = \dfrac{7}{3} \times \dfrac{18}{7} = 6$

113. Since, x, y and z are in HP.

$\therefore \quad y = \dfrac{2xz}{x+z}$

$\Rightarrow \quad x - 2y + z = x + z - \dfrac{4xz}{x+z}$

$= \dfrac{(x+z)^2 - 4xz}{x+z}$

$= \dfrac{(z-x)^2}{x+z}$

$\Rightarrow \quad (x+z)(x-2y+z) = (z-x)^2$

$\Rightarrow \log(x+z) + \log(x-2y+z) = 2\log(z-x)$

114. Let $\dfrac{1}{H_{i+1}} - \dfrac{1}{H_i} = K$

$\therefore \quad \displaystyle\sum_{i=1}^{2n} (-1)^i \left(\dfrac{H_i + H_{i+1}}{H_i - H_{i+1}}\right)$

$= \displaystyle\sum_{i=1}^{2n} \dfrac{(-1)^i}{K} \left(\dfrac{1}{H_{i+1}} + \dfrac{1}{H_i}\right) = 2n$

115. Let the given AP be $a_1, a_1 + d, a_1 + 2d, \ldots$

By substituting the value, we can find that only options (b) and (d) are correct.

116. Let the AP be $a, a+d, a+2d, a+3d, \ldots$

Given that, $\quad 3a + 3d = 9$

$\Rightarrow \quad a + d = 3$

and $\quad a^2 + (a+d)^2 + (a+2d)^2 = 35$

$\Rightarrow \quad a^2 + (3)^2 + (3+d)^2 = 35$

$\Rightarrow \quad (3-d)^2 + 3^2 + (3+d)^2 = 35$

$\Rightarrow \quad d = \pm 2$

and $\quad a = 1, 5$

$\therefore \quad S_n = \dfrac{n}{2}[2a + (n-1)d]$

where $d = 2, a = 1$

$\Rightarrow \quad S_n = n^2$

When $d = -2$, $a = 5$, then $S_n = n(6-n)$

117. $\cot^{-1}\left[\dfrac{1 + a_1 a_2}{a_2 - a_1}\right] + \cot^{-1}\left[\dfrac{1 + a_2 a_3}{a_3 - a_2}\right]$

$+ \cot^{-1}\left[\dfrac{1 + a_3 a_4}{a_4 - a_3}\right] + \ldots + \cot^{-1}\left[\dfrac{1 + a_n a_{n-1}}{a_n - a_{n-1}}\right]$

$= \cot^{-1} a_1 - \cot^{-1} a_2 + \cot^{-1} a_2 - \cot^{-1} a_3$

$+ \ldots + \cot^{-1} a_{n-1} - \cot^{-1} a_n$

$= \cot^{-1} a_1 - \cot^{-1} a_n = \tan^{-1} a_n - \tan^{-1} a_1$

118. If a, b and c are pth, qth and rth terms of an AP, then $\dfrac{b-c}{a-b}$ is always a rational number.

119. Let the roots be a_1, a_2, a_3, a_4, a_5, then

$$\dfrac{1}{a_1} + \dfrac{1}{a_2} + \dfrac{1}{a_3} + \dfrac{1}{a_4} + \dfrac{1}{a_5} = 10$$

$\Rightarrow \quad \dfrac{\Sigma a_1 a_2 a_3 a_4}{a_1 a_2 a_3 a_4 a_5} = 10$

$\Rightarrow \quad 10S = \Sigma a_1 a_2 a_3 a_4$

Since, a_1, a_2, a_3, a_4, a_5 are in GP, then consider a_1, a_2, a_3, a_4 and a_5 as a, ar, ar^2, ar^3, ar^4

$\Rightarrow \quad 10S = 10a^5 r^{10} = a^3 r^6 \ (a + ar + ar^2 + ar^3 + ar^4)$

$\Rightarrow \quad 10a^5 r^{10} = a^3 r^6 (40) \quad [\because \text{sum of roots} = 40]$

$\Rightarrow \quad a^2 r^4 = 4$

$\Rightarrow \quad ar^2 = \pm 2$

$\Rightarrow \quad S = a^3 r^6 (4) = (\pm 2)^3 \ (4) = \pm 32$

120. Since, $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in AP and $b_1, b_2, \ldots b_n, \ldots$ are in GP.

$\Rightarrow 1, (1+d), \ldots, [1 + (n-1)d] \ldots$ are in AP

$\Rightarrow 1, r, r^2, \ldots, r^{n-1}, \ldots$ are in GP.

Also, $\quad a_9 = b_9 \quad \Rightarrow \quad 1 + 8d = r^8$

$\therefore \quad S_9 = \dfrac{9}{2}[2 + (9-1)d] = 369$

$\Rightarrow \quad 2 + 8d = 41 \times 2$

$\Rightarrow \quad d = 10$

$\Rightarrow \quad r^8 = 81$

$\Rightarrow \quad r^8 = (\sqrt{3})^8$

$\Rightarrow \quad r = \sqrt{3}$

$\therefore \quad b_7 = (\sqrt{3})^6 = 9 \times 3 = 27$

and $\quad b_9 = 81$

121. Given, $\quad \sin\beta = \sqrt{\sin\alpha\cos\alpha}$

$\Rightarrow \quad \sin^2\beta = \sin\alpha\cos\alpha$

Now, $\quad \cos 2\beta = 1 - 2\sin^2\beta = 1 - 2\sin\alpha\cos\alpha$

$= (\sin\alpha - \cos\alpha)^2$

$= 2\sin^2\left(\dfrac{\pi}{4} - \alpha\right)$

or $\quad 2\cos^2\left(\dfrac{\pi}{4} + \alpha\right)$

122. Since, a is AM between 1st and $(2n+1)$th terms, b is GM between 1st and $(2n+1)$th terms and c is HM between 1st and $(2n+1)$th terms.

$\Rightarrow \quad \text{AM} \ge \text{GM} \ge \text{HM} \quad$ and $\quad \text{AM} \times \text{HM} = (\text{GM})^2$

123. If each of x, y and z is less than 1, then Statement I is obviously true.

Also, $\ 1 - 2x + 1 - 2y + 1 - 2z = 3 - 2(x + y + z) = 1$,

The sum of the three given numbers is positive also at must one of x, y and z can be more than 1.

If one of x, y and z is more than or equal to $\dfrac{1}{2}$, then their product is less than equal to zero, hence still remains true.

Statement II is always true but it does not explain Statement I.

124. Since, $ax^2 + bx + c = 0$ and $a_1x^2 + b_1x + c_1 = 0$ have common root.

$$(a_1c - ac_1)^2 = 4(ab_1 - ba_1)(bc_1 - b_1c) \quad \dots(i)$$

If $\frac{a}{a_1}, \frac{b}{b_1}, \frac{c}{c_1}$ are in AP, then

$$\frac{ba_1 - ab_1}{a_1b_1} = \frac{cb_1 - c_1b}{b_1c_1} = k$$

and $$\frac{ca_1 - ac_1}{a_1c_1} = 2k$$

On putting these values in Eq. (i), we get

$$c_1a_1 = b_1^2$$

125. Statement I is false, since each term of the series $\frac{1}{10^6} + \frac{1}{10^6} + \frac{1}{10^6} + \frac{1}{10^6} + \dots$ is smaller than 10^{-5} but its sum upto infinity is infinity.

Statement II is true, since $\lim_{n \to \infty} \frac{n}{10^5}$ is not finite as

$$n \to \infty$$

126. Statement I can be proved by taking the intersection of the inequalities.

$$a > 0,\ ar > 0,\ ar^2 > 0$$

at $\quad a + ar > ar^2,\ ar + ar^2 > a,\ ar^2 + a > ar$

The inequalities follow from reason.

127. If we could show that Statement II is true, then Statement I will be false. Indeed if Statement II is false, then

$$\sqrt{2} - \sqrt{3} = (p - q)d \quad \dots(i)$$

and $$\sqrt{3} - \sqrt{5} = (q - r)d \quad \dots(ii)$$

On dividing Eq. (i) by Eq. (ii) we get

$$\frac{\sqrt{2} - \sqrt{3}}{\sqrt{3} - \sqrt{5}} = \frac{p - q}{q - r}$$

$\Rightarrow$ Rational = Irrational

Hence, Statement I is false and Statement II is true.

128. Statement I is true, since for any $x > 0$, we can choose sufficiently larger n such that $\frac{x^n}{n!}$ is small. Statement II is false, since $\frac{(n!)^2}{n!}$ contains $n!$ in the denominator but diverges to ∞.

129. We can show that Statement I is true and follows from Statement II. Indeed

$$S_{n+1} - S_n = \frac{a_1 + a_2 + \dots + a_n + a_{n+1}}{n+1} - \frac{a_1 + a_2 + \dots + a_n}{n}$$

$$= \frac{na_{n+1} - (a_1 + a_2 + \dots + a_n)}{n(n+1)}$$

$$= \frac{(a_{n+1} - a_1) + (a_{n+1} - a_2) + \dots + (a_{n+1} - a_n)}{n(n+1)} > 0$$

$$[\because a_{n+1} > a_1, a_{n+1} > a_2, \dots, \text{etc.}]$$

Solutions (Q. Nos. 130-132)

Given, $\quad a(b - c)x^2 + b(c - a)x + c(a - b) = 0 \quad \dots(i)$

Since, $a(b - c) + b(c - a) + c(a - b) = 0$, therefore $x = 1$ is a root of Eq. (i).

Let other root be α, then

$$1 \times \alpha = \frac{c(a - b)}{a(b - c)}$$

$$= \frac{c\left(a - \frac{2ac}{a + c}\right)}{a\left(\frac{2ac}{a + c} - c\right)} = 1$$

$\therefore \quad \alpha = 1$

Hence, both roots of Eq. (i) are 1, 1.

Then, roots of $x^2 - Px + Q = 0$ are also 1, 1.

Now, $\quad 1 + 1 = P,\ 1 \cdot 1 = Q$

$\therefore \quad P = 2, Q = 1$

$\therefore \quad [P] = [2] = 2$

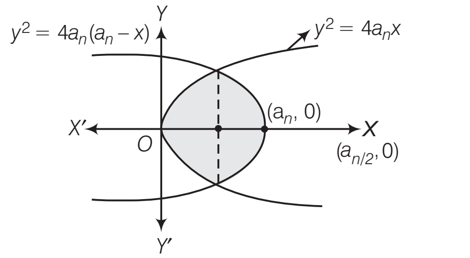
Now, $\quad [2P - Q] = [4 - 1] = 3$

$\because$ Roots of Eq. (i) are 1, 1, then

$$1 + 1 = -\frac{b(c - a)}{a(b - c)}$$

$$\Rightarrow \quad \frac{a(b - c)}{b(c - a)} = -\frac{1}{2}$$

133. $A_n = 2\int_0^{a_{n/2}} 2\sqrt{a_n}\sqrt{x}\,dx + 2\int_{a_{n/2}}^{a_n} 2\sqrt{a_n}\sqrt{a_n - x}\,dx$



$$= 4\sqrt{a_n} \cdot \frac{2}{3}\left[x^{\frac{3}{2}}\right]_0^{a_{n/2}} - 4\sqrt{a_n} \cdot \frac{2}{3}\left[(a_n - x)^{\frac{3}{2}}\right]_{a_{n/2}}^{a_n}$$

$$= \frac{8}{3}\sqrt{a_n}\left(\frac{a_n\sqrt{a_n}}{2\sqrt{2}}\right) - \frac{8}{3}\sqrt{a_n}\left(0 - \frac{a_n\sqrt{a_n}}{2\sqrt{2}}\right)$$

$$= \frac{2 \cdot 8a_n^2}{3 \cdot 2\sqrt{2}} = \frac{4\sqrt{2}}{3}a_n^2 \text{ sq units}$$

134. We have, $y^2 = 4x$ and $y^2 = 4 - 4x$

$\Rightarrow \quad 8x = 4$

$\Rightarrow \quad x = \frac{1}{2}$

and $\quad y = \pm\sqrt{2}$

135. For $a_n = 1$,

$$A_n = \frac{4\sqrt{2}}{3} \text{ sq units}$$

136. $a^ab^bc^c = (aa \dots a \text{ times})\ (bb \dots b \text{ times})\ (cc \dots c \text{ times})$

Applying AM-GM inequality,

$(a^ab^bc^c)^{1/n}$

$$\le \frac{\begin{bmatrix} a + a + \dots + a \text{ times}) + (b + b + \dots + b \text{ times}) \\ + (c + c + \dots + c \text{ times}) \end{bmatrix}}{n}$$

$$= \frac{a^2 + b^2 + c^2}{n}$$

Similarly, $(a^b b^c c^a)^{1/n} \le \dfrac{ab+bc+ca}{n} \le \dfrac{a^2+b^2+c^2}{n}$

Also, $(a^c b^a c^b)^{1/n} \le \dfrac{ac+ba+cb}{n} \le \dfrac{a^2+b^2+c^2}{n}$

So, $(a^a b^b c^c)^{1/n} + (a^b b^c c^a)^{1/n} + (a^c b^a c^b)^{1/n}$

$$\le \frac{(a+b+c)^2}{n} = n$$

Further, $a < n \Rightarrow a^a < a^n$

$\therefore$ $(a^a b^b c^c) < (abc)^n \Rightarrow (a^a b^b c^c)^{1/n} < (abc)$

137. A. $\because$ $A = G + \dfrac{3}{2}$ ...(i)

and $G = H + \dfrac{6}{5}$ ...(ii)

$\because$ $G^2 = AH$

$\Rightarrow$ $G^2 = \left(G+\dfrac{3}{2}\right)\left(G-\dfrac{6}{5}\right)$ [from Eqs. (i) and (ii)]

$\therefore$ $G = 6, A = \dfrac{15}{2}$ [from Eq. (i)]

Since, a and b are the roots of $x^2 - 15x + 36 = 0$.

On solving, we get $a = 12, b = 3$ or $a = 3, b = 12$

$\therefore$ $\alpha = 15, \beta = 9$

$\Rightarrow$ $\alpha + \beta^2 = 15 + 81 = 96$

and $\alpha^2 + \beta = 225 + 9 = 234$

B. $\because$ $A = G + 2$ ...(i)

and $H = \dfrac{1}{5}b$ [if $b > a$]

$\because$ $G^2 = AH = \dfrac{bA}{5}$

$\Rightarrow$ $5ab = bA$

$\Rightarrow$ $A = 5a$

$\Rightarrow$ $\dfrac{a+b}{2} = 5a$

$\Rightarrow$ $b = 9a$

From Eq. (i), $5a = \sqrt{ab} + 2$

$\Rightarrow$ $5a = 3a + 2$

$\therefore$ $a = 1$ and $b = 9$

$\Rightarrow$ $\alpha = a + b = 10$

and $\beta = |a - b| = 8$

$\therefore$ $\alpha + \beta^2 = 10 + 64 = 74$

C. $\because$ $H = 4$

$\Rightarrow$ $2A + G^2 = 27$

$\Rightarrow$ $2A + AH = 27$ [$\because G^2 = AH$]

$\Rightarrow$ $6A = 27$

$\Rightarrow$ $A = \dfrac{9}{2}$

and $G^2 = \dfrac{9}{2} \times 4 = 18$

Since, a and b are the roots of $x^2 - 9x + 18 = 0$.

$\therefore$ $a = 6, b = 3$ or $a = 3, b = 6$

Now, $\alpha = a + b = 9, \beta = |a - b| = 3$

$\therefore$ $\alpha^2 + \beta = 81 + 3 = 84$

and $1 + \left(\dfrac{\alpha}{\beta}\right) + \left(\dfrac{\alpha}{\beta}\right)^2 + \left(\dfrac{\alpha}{\beta}\right)^3 + \left(\dfrac{\alpha}{\beta}\right)^4 + \left(\dfrac{\alpha}{\beta}\right)^5$

$$= 1 + 3 + 3^2 + 3^3 + 3^4 + 3^5$$
$$= 364$$

138. Let us add one more number a_{n+1} to the given sequence. The number a_{n+1} is such that $|a_{n+1}| = |a_n + 1|$. On squaring all the numbers, we have

$$a_1^2 = 0$$
$$a_2^2 = a_1^2 + 2a_1 + 1$$
$$a_3^2 = a_2^2 + 2a_2 + 1$$
$$a_4^2 = a_3^2 + 2a_3 + 1$$
$$\vdots \quad \vdots \quad \vdots \quad \vdots$$
$$a_n^2 = a_{n-1}^2 + 2a_{n-1} + 1$$
$$a_{n+1}^2 = a_n^2 + 2a_n + 1$$

On adding the above equalities, we get

$$a_1^2 + a_2^2 + \ldots + a_n^2 + a_{n+1}^2$$
$$= a_1^2 + a_2^2 + \ldots + a_n^2 + 2(a_1 + a_2 + \ldots + a_n) + n$$

$\Rightarrow$ $2(a_1 + a_2 + \ldots + a_n) = -n + a_{n+1}^2 \ge -n$

$\Rightarrow$ $\dfrac{a_1 + a_2 + \ldots + a_n}{n} \ge -\dfrac{1}{2} = -\dfrac{\lambda}{\mu}$

$\therefore$ $\lambda + \mu = 3$

139. Let a be the first term and d be the common difference of an AP. Again, let x, y, z be the $(m+1)$ th, $(n+1)$ th and $(r+1)$ th terms of an AP. Then, $x = a + md$, $y = a + nd$ and $z = a + rd$.

Since, x, y and z are in GP.

$\therefore$ $y^2 = xz$ i.e. $(a + nd)^2 = (a + rd)(a + md)$

So, $\dfrac{d}{a} = \dfrac{r + m - 2n}{n^2 - rm}$

Now, m, n and r are in HP.

$\Rightarrow$ $\dfrac{2}{n} = \dfrac{1}{m} + \dfrac{1}{r}$

$\Rightarrow$ $\dfrac{2}{n} = \dfrac{m+r}{mr}$

Hence, $\dfrac{d}{a} = \dfrac{2\left(\dfrac{r+m}{2} - n\right)}{n\left(n - \dfrac{rm}{n}\right)} = \dfrac{2\left(\dfrac{mr}{n} - n\right)}{n\left(n - \dfrac{rm}{n}\right)} = \dfrac{-2}{n} = -\dfrac{\lambda}{n}$

$\Rightarrow$ $\lambda = 2$

140. Let $f(x) = x^4 + ax^3 + bx^2 + cx + 1$

As a, b and c are non-negative, no root of the equation $f(x) = 0$ can be positive. Further as $f(0) \ne 0$, all the roots of the equation, say x_1, x_2, x_3 and x_4 are negative.

We have,

$\Sigma x_1 = -a$, $\Sigma x_1 x_2 = b$, $\Sigma x_1 x_2 x_3 = -c$ and $x_1 x_2 x_3 x_4 = 1$

Using AM $\ge$ GM for positive numbers $-x_1, -x_2, -x_3$ and $-x_4$, we get

$$\frac{a}{4} \ge 1 \Rightarrow a \ge 4$$

Using AM $\ge$ GM for positive numbers $x_1x_2, x_1x_3, x_1x_4, x_2x_3, x_2x_4$ and x_3x_4, we get

$$\frac{b}{6} \ge 1 \Rightarrow b \ge 6$$

Finally, using AM $\ge$ GM for positive numbers $-x_1x_2x_3, -x_1x_2x_4, -x_1x_3x_4$ and $-x_2x_3x_4$, we get

$$\frac{c}{4} \ge 1 \Rightarrow c \ge 4$$

$\therefore$ HCF of $\{a, b, c\}$ = HCF of $\{4, 6, 4\} = 2$

141. Let the three consecutive terms be

$a-d, a, a+d$, where $d>0$

Then, $a^2-2ad+d^2=36+K$ ...(i)

$a^2=300+K$ ...(ii)

and $a^2+2ad+d^2=596+K$ ...(iii)

On subtracting Eq. (i) from Eq. (ii) we get

$d(2a-d)=264$ ...(iv)

On subtracting Eq. (ii) from Eq. (iii), we get

$d(2a+d)=296$ ...(v)

Again, subtracting Eq. (iv) from Eq. (v), we get

$2d^2=32 \Rightarrow d^2=16 \Rightarrow d=4$

$[\because d=-4$, rejected$]$

From Eq. (iv),

$4(2a-4)=264$

$\Rightarrow 2a-4=66$

$\Rightarrow 2a=70 \Rightarrow a=35$

$\therefore K=35^2-300=1225-300=925$

$\Rightarrow K-920=5$

Entrances Gallery

1. $\frac{b}{a}=\frac{c}{b}=$ (integer)

$\Rightarrow b^2=ac \Rightarrow c=\frac{b^2}{a}$ ...(i)

Also, $\frac{a+b+c}{3}=b+2$

$\Rightarrow a+b+c=3b+6$

$\Rightarrow a-2b+c=6$

$\Rightarrow a-2b+\frac{b^2}{a}=6 \quad \left[\text{from Eq. (i), } c=\frac{b^2}{a}\right]$

$\Rightarrow 1-\frac{2b}{a}+\frac{b^2}{a^2}=\frac{6}{a}$

$\left(\frac{b}{a}-1\right)^2=\frac{6}{a}$

$\Rightarrow a=6$ only

$\Rightarrow \frac{a^2+a-14}{a+1}=4$

2. $\cot\left[\sum_{n=1}^{23}\cot^{-1}\left(1+\sum_{k=1}^{n}2k\right)\right]$

$=\cot\left(\sum_{n=1}^{23}\cot^{-1}(1+2+4+6+8+\ldots+2n)\right)$

$=\cot\left(\sum_{n=1}^{23}\cot^{-1}\{1+n(n+1)\}\right)$

$=\cot\left(\sum_{n=1}^{23}\tan^{-1}\frac{1}{1+n(n+1)}\right)$

$=\cot\left(\sum_{n=1}^{23}\tan^{-1}\left\{\frac{n+1-n}{1+n(n+1)}\right\}\right)$

$=\cot\left\{\sum_{n=1}^{23}[\tan^{-1}(n+1)-\tan^{-1}n]\right\}$

$=\cot[(\tan^{-1}2-\tan^{-1}1)+(\tan^{-1}3-\tan^{-1}2)$

$+(\tan^{-1}4-\tan^{-1}3)+\ldots+(\tan^{-1}24-\tan^{-1}23)]$

$=\cot\{\tan^{-1}24-\tan^{-1}1\}$

$=\cot\left(\tan^{-1}\frac{24-1}{1+24\cdot(1)}\right)=\cot\left(\tan^{-1}\frac{23}{25}\right)$

$=\cot\left(\cot^{-1}\frac{25}{23}\right)$

$=\frac{25}{23}$

3. $S_n=\sum_{k=1}^{4n}(-1)^{\frac{k(k+1)}{2}}\cdot k^2$

$=-(1)^2-2^2+3^2+4^2-5^2-6^2+7^2+8^2+\ldots$

$=(3^2-1^2)+(4^2-2^2)+(7^2-5^2)+(8^2-6^2)+\ldots$

$=2\{\underbrace{(4+12+20+\ldots)}_{n \text{ terms}}+\underbrace{(6+14+22+\ldots)}_{n \text{ terms}}\}$

$=2\left[\frac{n}{2}\{2\times4+(n-1)8\}+\frac{n}{2}\{2\times6+(n-1)8\}\right]$

$=2[n(4+4n-4)+n(6+4n-4)]$

$=2[4n^2+4n^2+2n]=4n(4n+1)$

Here, $1056=32\times33$, $1088=32\times34$,

$1120=32\times35$, $1332=36\times37$

Hence, 1056 and 1332 are possible answers.

4. Here, $a_1=5, a_{20}=25$ for HP

$\therefore \frac{1}{a}=5$

and $\frac{1}{a+19d}=25$

$\Rightarrow \frac{1}{5}+19d=\frac{1}{25}$

$\Rightarrow 19d=\frac{1}{25}-\frac{1}{5}=-\frac{4}{25}$

$\therefore d=\frac{-4}{19\times25}$

$\because a_n<0 \Rightarrow \frac{1}{a+(n-1)d}<0$

$\Rightarrow \frac{1}{5}+(n-1)d<0$

$\Rightarrow \frac{1}{5}-\frac{4}{19\times25}(n-1)<0 \Rightarrow (n-1)>\frac{95}{4}$

$\Rightarrow n>1+\frac{95}{4} \Rightarrow n>24.75$

Hence, the least positive value of n is 25.

5. Given, $a_1=3$, $m=5n$ and $a_1, a_2, \ldots, a_{100}$ are in AP.

Also, $\frac{S_m}{S_n}=\frac{S_{5n}}{S_n}$ is independent of n.

Consider $\frac{S_m}{S_n}=\frac{\frac{5n}{2}[2\times3+(5n-1)d]}{\frac{n}{2}[2\times3+(n-1)d]}$

$=\frac{5\{(6-d)+5nd\}}{(6-d)+nd}$

For independent of n, put $6-d=0$

$\Rightarrow \quad d=6$

$\therefore \quad a_2=a_1+d=3+6=9$

Also, if $d=0$, then $\dfrac{S_m}{S_n}$ is independent of n.

$\therefore \quad a_2=3$

6. Using AM $\geq$ GM,

$$\frac{a^{-5}+a^{-4}+a^{-3}+a^{-3}+a^{-3}+1+a^8+a^{10}}{8} \geq (a^{-5}\cdot a^{-4}\cdot a^{-3}\cdot a^{-3}\cdot a^{-3}\cdot 1\cdot a^8\cdot a^{10})^{1/8}$$

$$\Rightarrow \quad a^{-5}+a^{-4}+3a^{-3}+1+a^8+a^{10} \geq 8\cdot 1$$

Hence, the minimum value is 8.

7. We have, $S_k=\dfrac{\frac{k-1}{k!}}{1-\frac{1}{k}}=\dfrac{1}{(k-1)!}$

Now, $(k^2-3k+1)S_k=\{(k-2)(k-1)-1\}\times\dfrac{1}{(k-1)!}$

$$=\frac{1}{(k-3)!}-\frac{1}{(k-1)!}$$

$$\Rightarrow \sum_{k=1}^{100}|(k^2-3k+1)S_k|$$

$$=1+1+2-\left(\frac{1}{99!}+\frac{1}{98!}\right)$$

$$=4-\frac{100^2}{100!}$$

$$\Rightarrow \frac{100^2}{100!}+\sum_{k=1}^{100}|(k^2-3k+1)S_k|=4$$

8. Since, $a_k=2a_{k-1}-a_{k-2}$

So, $a_1, a_2, \ldots a_{11}$ are in AP.

$$\therefore \frac{a_1^2+a_2^2+\ldots+a_{11}^2}{11}=\frac{11a_1^2+35\times 11d^2+10\times 11a_1d}{11}=90$$

$\Rightarrow \quad 225+35d^2+150d=90$

$\Rightarrow \quad 35d^2+150d+135=0$

$\Rightarrow \quad d=-3, -\dfrac{9}{7}$

Given, $\quad a_2<\dfrac{27}{2}$

$\therefore \quad d=-3$ and $d\neq -\dfrac{9}{7}$

$$\Rightarrow \frac{a_1+a_2+\ldots+a_{11}}{11}=\frac{1}{2}[30-10\times 3]=0$$

9. Given, m is the AM of l and n.

$\therefore \quad l+n=2m \quad \ldots$(i)

and G_1, G_2, G_3 are geometric means between l and n.

$\therefore \quad l, G_1, G_2, G_3, n$ are in GP.

Let r be the common ratio of this GP.

$\therefore \quad G_1=lr$

$G_2=lr^2$

$G_3=lr^3$

$n=lr^4$

$\Rightarrow \quad r=\left(\dfrac{n}{l}\right)^{\frac{1}{4}}$

Now, $G_1^4+2G_2^4+G_3^4=(lr)^4+2(lr^2)^4+(lr^3)^4$

$$=l^4\times r^4(1+2r^4+r^8)$$

$$=l^4\times r^4(r^4+1)=l^4\times\frac{n}{l}\left(\frac{n+l}{l}\right)^2$$

$$=ln\times 4lm^2=4lm^2n$$

10. Given, series is

$$\frac{1^3}{1}+\frac{1^3+2^3}{1+3}+\frac{1^3+2^3+3^3}{1+3+5}+\ldots\infty$$

Let T_n be the nth term of the given series.

$$\therefore \quad T_n=\frac{1^3+2^3+3^3+\ldots n^3}{1+3+5+\ldots+\text{ to } n \text{ terms}}$$

$$=\frac{\left(\frac{n(n+1)}{2}\right)^2}{n^2}=\frac{(n+1)^2}{4}$$

$$\therefore \quad S_9=\sum_{n=1}^{9}\frac{(n+1)^2}{4}=\frac{1}{4}[(2^2+3^2+\ldots+10^2)+1^2-1^2]$$

$$=\frac{1}{4}\left[\frac{10(10+1)(20+1)}{6}-1\right]=\frac{384}{4}=96$$

11. Given, α and β are roots of $px^2+qx+r=0$, $p\neq 0$.

$\therefore \quad \alpha+\beta=\dfrac{-q}{p}, \alpha\beta=\dfrac{r}{p} \quad \ldots$(i)

Since, p, q and r are in AP.

$\therefore \quad 2q=p+r \quad \ldots$(ii)

Also, $\quad \dfrac{1}{\alpha}+\dfrac{1}{\beta}=4$

$\Rightarrow \quad \dfrac{\alpha+\beta}{\alpha\beta}=4$

$\Rightarrow \quad \alpha+\beta=4\alpha\beta \Rightarrow \dfrac{-q}{p}=\dfrac{4r}{p}$ [from Eq. (i)]

$\Rightarrow \quad q=-4r$

On putting the value of q in Eq. (ii), we get

$2(-4r)=p+r$

$\Rightarrow \quad p=-9r$

Now, $\quad \alpha+\beta=\dfrac{-q}{p}=\dfrac{4r}{p}=\dfrac{4r}{-9r}=-\dfrac{4}{9}$

and $\quad \alpha\beta=\dfrac{r}{p}=\dfrac{r}{-9r}=\dfrac{1}{-9}$

$\therefore \quad (\alpha-\beta)^2=(\alpha+\beta)^2-4\alpha\beta=\dfrac{16}{81}+\dfrac{4}{9}=\dfrac{16+36}{81}$

$\Rightarrow \quad (\alpha-\beta)^2=\dfrac{52}{81} \Rightarrow |\alpha-\beta|=\dfrac{2}{9}\sqrt{13}$

12. Given, $k\cdot 10^9=10^9+2(11)^1(10)^8+3(11)^2(10)^7+\ldots+10(11)^9$

$$\Rightarrow \quad k=1+2\left(\frac{11}{10}\right)+3\left(\frac{11}{10}\right)^2+\ldots+10\left(\frac{11}{10}\right)^9 \quad \ldots\text{(i)}$$

$$\Rightarrow \left(\frac{11}{10}\right)k=1\left(\frac{11}{10}\right)+2\left(\frac{11}{10}\right)^2+\ldots+9\left(\frac{11}{10}\right)^9+10\left(\frac{11}{10}\right)^{10} \quad \ldots\text{(ii)}$$

On subtracting Eq. (ii) from Eq. (i), we get

$$k\left(1-\frac{11}{10}\right)=1+\frac{11}{10}+\left(\frac{11}{10}\right)^2+\ldots+\left(\frac{11}{10}\right)^9-10\left(\frac{11}{10}\right)^{10}$$

$$\Rightarrow \quad k\left(\frac{10-11}{10}\right)=\frac{1\left[\left(\frac{11}{10}\right)^{10}-1\right]}{\left(\frac{11}{10}-1\right)}-10\left(\frac{11}{10}\right)^{10}$$

$\left[\because \text{ in GP, sum of } n \text{ terms} = \frac{a(r^n-1)}{r-1}, \text{ when } r>1\right]$

$$\Rightarrow \quad -k=10\left[10\left(\frac{11}{10}\right)^{10}-10-10\left(\frac{11}{10}\right)^{10}\right]$$

$$\therefore \quad k=100$$

13. Let a, ar and ar^2 be in GP $(r>1)$.

On multiplying middle term by 2, then the numbers a, $2ar$ and ar^2 are in AP.

$$\Rightarrow \quad 4ar=a+ar^2$$

$$\Rightarrow \quad r^2-4r+1=0$$

$$\Rightarrow \quad r=\frac{4\pm\sqrt{16-4}}{2}=2\pm\sqrt{3}$$

$$\Rightarrow \quad r=2+\sqrt{3} \qquad [\because \text{ GP is increasing}]$$

14. Let $S=\frac{7}{10}+\frac{77}{10^2}+\frac{777}{10^3}+\ldots \text{ upto 20 terms}$

$$=\frac{7}{9}\left[\frac{9}{10}+\frac{99}{100}+\frac{999}{1000}+\ldots \text{ upto 20 terms}\right]$$

$$=\frac{7}{9}\left[\left(1-\frac{1}{10}\right)+\left(1-\frac{1}{10^2}\right)+\left(1-\frac{1}{10^3}\right)+\ldots \text{ upto 20 terms}\right]$$

$$=\frac{7}{9}\left[(1+1+\ldots \text{ upto 20 terms})-\left(\frac{1}{10}+\frac{1}{10^2}+\frac{1}{10^3}+\ldots \text{ upto 20 terms}\right)\right]$$

$$=\frac{7}{9}\left[20-\frac{1}{10}\left(\frac{1-\left(\frac{1}{10}\right)^{20}}{1-\frac{1}{10}}\right)\right]$$

$$=\frac{7}{9}\left[20-\frac{1}{10}\times\frac{10}{9}\left\{\left(1-\left(\frac{1}{10}\right)^{20}\right)\right\}\right]$$

$$=\frac{7}{9}\left[20-\frac{10}{9}(1-10^{-20})\right]=\frac{7}{81}(180-1+10^{-20})$$

$$=\frac{7}{81}(179+10^{-20})$$

15. Here, $T_{100}=a+(100-1)d=a+99d$

$$T_{50}=a+(50-1)d=a+49d$$

$$T_{150}=a+(150-1)d=a+149d$$

Now, according to the given condition,

$$100\times T_{100}=50\times T_{50}$$

$$\Rightarrow \quad 100(a+99d)=50(a+49d)$$

$$\Rightarrow \quad 2(a+99d)=(a+49d)$$

$$\Rightarrow \quad a+149d=0$$

$$\Rightarrow \quad T_{150}=0$$

16. Statement I Let $S=(1)+(1+2+4)+(4+6+9)+\ldots+(361+380+400)$

$S=(0+0+1)+(1+2+4)+(4+6+9)+\ldots+(361+380+400)$

Now, we can clearly observe the first elements in each bracket.

In second bracket, the first element is $1=1^2$

In third bracket, the first element is $4=2^2$

In fourth bracket, the first element is $9=3^2$

In last bracket, the first element is $361=19^2$

Hence, we can conclude that there are 20 brackets in all.

Also, in each of the bracket, there are 3 terms out of which the first and last terms are perfect squares of consecutive integers and the middle term is their product.

Now, the general term of the series is

$$T_r=(r-1)^2+(r-1)r+(r)^2$$

So, the sum of n terms of the series is

$$S_n=\sum_{r=1}^{n}\{(r-1)^2+(r-1)r+(r)^2\}$$

$$\Rightarrow \quad S_n=\sum_{r=1}^{n}\left\{\frac{r^3-(r-1)^3}{r-(r-1)}\right\}$$

$$\Rightarrow \quad S_n=\sum_{r=1}^{n}\{r^3-(r-1)^3\}$$

Now, let $S_n=\sum_{k=1}^{n}\{k^3-(k-1)^3\}$

On substituting the value of k and rearranging the terms, we get

$$S_n=-0^3+(1^3-1^3)+\ldots+[(n-1)^3-(n-1)^3]+n^3$$

$$\Rightarrow \quad S_n=n^3$$

Since, the number of terms is 20, hence substituting $n=20$, we get

$$S_{20}=8000$$

Statement II We have already proved in the Statement I that

$$S_n=\sum_{k=1}^{n}\{k^3-(k-1)^3\}=n^3$$

17. Let the time taken to save ₹ 11040 be $(n+3)$ months.

For first 3 months, he save ₹ 200 each month.

In $(n+3)$ months, his total savings is

$$3\times200+\frac{n}{2}[2(240)+(n-1)\times40]=11040$$

$$\Rightarrow \quad 600+20n(n+11)=11040$$

$$\Rightarrow \quad 20n(n+11)=10440$$

$$\Rightarrow \quad n(n+11)=522$$

$$\Rightarrow \quad n^2+11n-522=0$$

$$\Rightarrow \quad n^2+29n-18n-522=0$$

$$\Rightarrow \quad n(n+29)-18(n+29)=0$$

$$\Rightarrow \quad n=18$$

$$\text{or} \quad n=-29$$

$$\therefore \quad n=18 \quad [\text{neglecting } n=-29]$$

Hence, total time $=n+3$

$$=18+3=21 \text{ months}$$

18. Number of notes that the person counts in 10 min

$$=10\times150=1500$$

We have, a_{10}, a_{11}, a_{12}, ... are in AP with common difference -2.

Let n be the time taken to count remaining 3000 notes, then

$$\frac{n}{2}[2\times 148+(n-1)\times(-2)]=3000$$

$$\Rightarrow \quad n^2-149n+3000=0$$

$$\Rightarrow \quad (n-24)(n-125)=0$$

$$\Rightarrow \quad n=24,125$$

Hence, total time taken by the person to count all notes

$$=10+24=34 \text{ min}$$

$$[\because n\neq 125 \text{ as } a_{135}=148+124(-2)<0]$$

19. Let $S=1+\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\dots$

$$\Rightarrow S-1=\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\dots \quad \text{...(i)}$$

$$\Rightarrow \frac{S-1}{3}=\frac{2}{3^2}+\frac{6}{3^3}+\frac{10}{3^4}+\frac{14}{3^5}+\dots \quad \text{...(ii)}$$

On subtracting Eq. (ii) from Eq. (i), we get

$$\frac{2}{3}(S-1)=\frac{2}{3}+\frac{4}{3^2}+\frac{4}{3^3}+\frac{4}{3^4}+\dots$$

$$\Rightarrow \quad S-1=1+\frac{2}{3}+\frac{2}{3^2}+\frac{2}{3^3}+\dots$$

$$\Rightarrow \quad S=2+\frac{\frac{2}{3}}{1-\frac{1}{3}}=2+1=3$$

20. Since, $a+ar=a(1+r)=12$ ...(i)

and $ar^2+ar^3=ar^2(1+r)=48$ ...(ii)

From Eqs. (i) and (ii), we get

$$r^2=4 \Rightarrow r=-2$$

On putting the value of r in Eq. (i), we get

$$a=-12$$

21. Since, each term is equal to the sum of the next two terms.

$$\therefore \quad ar^{n-1}=ar^n+ar^{n+1}\Rightarrow 1=r+r^2$$

$$\Rightarrow \quad r^2+r-1=0$$

$$r=\frac{\sqrt{5}-1}{2} \qquad \left[\because r\neq\frac{-\sqrt{5}-1}{2}\right]$$

22. Since, $\frac{a_1+a_2+\dots+a_p}{a_1+a_2+\dots+a_q}=\frac{p^2}{q^2}$

$$\therefore \quad \frac{\frac{p}{2}[2a_1+(p-1)d]}{\frac{q}{2}[2a_1+(q-1)d]}=\frac{p^2}{q^2}$$

$$\Rightarrow \quad \frac{(2a_1-d)+pd}{(2a_1-d)+qd}=\frac{p}{q}$$

$$\Rightarrow \quad (2a_1-d)(p-q)=0$$

$$\Rightarrow \quad a_1=\frac{d}{2} \qquad [\because p\neq q]$$

Now, $\frac{a_6}{a_{21}}=\frac{a_1+5d}{a_1+20d}=\frac{\frac{d}{2}+5d}{\frac{d}{2}+20d}=\frac{11d}{41d}=\frac{11}{41}$

23. Since, $a_1,a_2,a_3,\dots,a_n$ are in HP.

$\therefore \frac{1}{a_1},\frac{1}{a_2},\frac{1}{a_3},\dots,\frac{1}{a_n}$ are in AP.

Let d be the common difference of AP.

$$\therefore \quad \frac{1}{a_2}-\frac{1}{a_1}=d$$

$$\Rightarrow \quad a_1-a_2=a_1a_2d$$

Similarly, $\quad a_2-a_3=a_2a_3d$

$$\vdots \quad \vdots \quad \vdots$$

$$a_{n-1}-a_n=a_{n-1}a_nd$$

On adding all the equations, we get

$$a_1-a_n=d\{a_1a_2+a_2a_3+\dots+a_{n-1}a_n\} \quad \text{...(i)}$$

Also, $\quad \frac{1}{a_n}=\frac{1}{a_1}+(n-1)d$

$$\Rightarrow \quad d=\frac{a_1-a_n}{a_1a_n(n-1)}$$

On putting the value of d in Eq. (i), we get

$$a_1-a_n=\frac{a_1-a_n}{a_1a_n(n-1)}\{a_1a_2+a_2a_3+\dots+a_{n-1}a_n\}$$

$$\Rightarrow \quad a_1a_2+a_2a_3+\dots+a_{n-1}a_n=a_1a_n(n-1)$$

24. Given that, $x=\sum_{n=0}^{\infty}a^n, y=\sum_{n=0}^{\infty}b^n, z=\sum_{n=0}^{\infty}c^n$

$$\Rightarrow \quad x=1+a+a^2+\dots=\frac{1}{1-a} \quad \text{...(i)}$$

Similarly, $\quad y=\frac{1}{1-b}$ ...(ii)

and $\quad z=\frac{1}{1-c}$ ...(iii)

Now, a,b and c are in AP.

$\Rightarrow -a,-b$ and $-c$ are in AP.

$\Rightarrow 1-a,1-b$ and $1-c$ are also in AP.

$\Rightarrow \frac{1}{1-a},\frac{1}{1-b}$ and $\frac{1}{1-c}$ are in HP.

$\Rightarrow x,y,z$ are in HP.

Aliter

From Eqs. (i), (ii) and (iii),

$$x=\frac{1}{1-a}, y=\frac{1}{1-b} \text{ and } z=\frac{1}{1-c}$$

$$\Rightarrow \quad a=\frac{x-1}{x}, b=\frac{y-1}{y} \text{ and } c=\frac{z-1}{z}$$

Since, a,b and c are in AP.

$$\therefore \quad 2b=a+c$$

$$\Rightarrow \quad 2\left(\frac{y-1}{y}\right)=\frac{x-1}{x}+\frac{z-1}{z}$$

$$\Rightarrow \quad 2-\frac{2}{y}=1-\frac{1}{x}+1-\frac{1}{z}$$

$$\Rightarrow \quad \frac{2}{y}=\frac{1}{x}+\frac{1}{z}$$

Hence, x,y and z are in HP.

25. We know that,

$$\frac{e^x+e^{-x}}{2}=1+\frac{x^2}{2!}+\frac{x^4}{4!}+\frac{x^6}{6!}+\dots$$

On putting $x=\frac{1}{2}$ in both sides, we get

$$\frac{e^{1/2}+e^{-1/2}}{2}=1+\left(\frac{1}{2}\right)^2\frac{1}{2!}+\left(\frac{1}{2}\right)^4\frac{1}{4!}+\dots$$

$$\Rightarrow \quad \frac{e+1}{2\sqrt{e}}=1+\frac{1}{4\cdot 2!}+\frac{1}{16\cdot 4!}+\frac{1}{64\cdot 6!}+\dots$$

26. Given, $T_m = \frac{1}{n}$

$\Rightarrow \quad a + (m-1)d = \frac{1}{n}$ ...(i)

and $T_n = \frac{1}{m}$

$\Rightarrow \quad a + (n-1)d = \frac{1}{m}$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$a = d = \frac{1}{mn}$$

$\therefore \quad a - d = 0$

27. Given that the sum of n terms of given series is $\frac{n(n+1)^2}{2}$, if n is even.

Let n be odd, i.e. $n = 2m+1$

Then, $S_{2m+1} = S_{2m} + (2m+1)\text{th term}$

$$= \frac{(n-1)n^2}{2} + n\text{th term}$$

$$= \frac{(n-1)n^2}{2} + n^2$$

$$= n^2\left(\frac{n-1+2}{2}\right)$$

$$= \frac{(n+1)n^2}{2}$$

28. We know that,

$$e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots \quad \text{...(i)}$$

and $$e^{-1} = 1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \dots \quad \text{...(ii)}$$

On adding Eqs. (i) and (ii), we get

$$e + e^{-1} = 2 + \frac{2}{2!} + \frac{2}{4!} + \dots$$

$$\Rightarrow \quad \frac{e^2+1}{e} - 2 = \frac{2}{2!} + \frac{2}{4!} + \dots$$

$$\Rightarrow \quad \frac{e^2+1-2e}{e} = 2\left(\frac{1}{2!} + \frac{1}{4!} + \dots\right)$$

$$\Rightarrow \quad \frac{(e-1)^2}{2e} = \frac{1}{2!} + \frac{1}{4!} + \dots$$

29. Consider, $\frac{1}{1\cdot 2} - \frac{1}{2\cdot 3} + \frac{1}{3\cdot 4} - \dots$

$$= \left(1 - \frac{1}{2}\right) - \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) - \dots$$

$$= 1 - 2\cdot\frac{1}{2} + 2\cdot\frac{1}{3} - 2\cdot\frac{1}{4} + \dots$$

$$= 2\left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots\right) - 1$$

$$= 2\log(1+1) - 1$$

$$= \log 2^2 - \log e = \log\frac{4}{e}$$

30. Since, 1, $\log_3\sqrt{3^{1-x}+2}$ and $\log_3(4\cdot 3^x - 1)$ are in AP.

$\therefore \quad 2\log_3(3^{1-x}+2)^{1/2} = \log_3 3 + \log_3(4\cdot 3^x - 1)$

$\Rightarrow \quad \log_3(3^{1-x}+2) = \log_3 3(4\cdot 3^x - 1)$

$\Rightarrow \quad 3^{1-x} + 2 = 12\cdot 3^x - 3$

$\therefore \quad \frac{3}{t} + 2 = 12t - 3$ [let $3^x = t$]

$\Rightarrow \quad 12t^2 - 5t - 3 = 0$

$\Rightarrow \quad (3t+1)(4t-3) = 0$

$\Rightarrow \quad t = -\frac{1}{3}, \frac{3}{4}$

$\Rightarrow \quad 3^x = \frac{3}{4}$ [$\because 3^x$ cannot be negative]

$\Rightarrow \quad \log_3\left(\frac{3}{4}\right) = x$

$\Rightarrow \quad x = 1 - \log_3 4$

31. Let $S = 2^{1/4}\cdot 4^{1/8}\cdot 8^{1/16}\dots$

$$= 2^{1/4}\cdot 2^{2/8}\cdot 2^{3/16}\dots$$

$$= 2^{\frac{1}{4}\left[1+\frac{2}{2}+\frac{3}{2^2}+\dots\right]} = 2^{\frac{1}{4}(S_1)}$$

where, $S_1 = 1 + \frac{2}{2} + \frac{3}{2^2} + \dots$

It is an infinite arithmetico-geometric progression.

$$\therefore \quad S_1 = \frac{a}{1-r} + \frac{d\cdot r}{(1-r)^2}$$

$$= \frac{1}{1-\frac{1}{2}} + \frac{1\cdot\frac{1}{2}}{\left(1-\frac{1}{2}\right)^2} = 2 + 2 = 4$$

$$\therefore \quad S = 2^{\frac{1}{4}(4)} = 2$$

32. Since, 5th term of a GP $= 2$

$\therefore \quad ar^4 = 2$ ...(i)

where, a and r are the first term and common ratio respectively of a GP.

Now, required product

$$= a\times ar\times ar^2\times ar^3\times ar^4\times ar^5\times ar^6\times ar^7\times ar^8$$

$$= a^9r^{36} = (ar^4)^9$$

$$= 2^9 = 512 \quad \text{[from Eq. (i)]}$$

33. $\sum_{n=0}^{\infty}\frac{(\log_e x)^n}{n!} = 1 + \frac{\log_e x}{1!} + \frac{(\log_e x)^2}{2!} + \dots$

$$= e^{\log_e x} = x$$

34. $e^{(x-1)-\frac{1}{2}(x-1)^2+\frac{1}{3}(x-1)^3-\dots} = e^{\log(1+x-1)} = x$

35. $V_r =$ Sum of first r terms of an AP whose first term is r and common difference $(2r-1)$

$$= \frac{r}{2}[2r + (r-1)(2r-1)]$$

$$= \frac{r}{2}[2r + 2r^2 - 3r + 1]$$

$$= \frac{r}{2}[2r^2 - r + 1]$$

$$= \frac{1}{2}[2r^3 - r^2 + r]$$

Now, $$\sum_{r=1}^{n}V_r = \frac{1}{2}\left[2\sum_{r=1}^{n}r^3 - \sum_{r=1}^{n}r^2 + \sum_{r=1}^{n}r\right]$$

$$= \frac{1}{2}\left[2\cdot\left(\frac{n(n+1)}{2}\right)^2 - \frac{n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}\right]$$

$$= \frac{1}{2}\left[\frac{n^2(n+1)^2}{2} - \frac{n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}\right]$$

$$= \frac{n(n+1)}{4}\left[n(n+1) - \frac{(2n+1)}{3} + 1\right]$$
$$= \frac{n(n+1)}{4}\left[\frac{3n^2 + 3n - 2n - 1 + 3}{3}\right]$$
$$= \frac{n(n+1)}{12}(3n^2 + n + 2)$$

36. Since, a, b and c are in GP.

$\therefore \quad b^2 = ac$

Given equation is

$(\log_e a)x^2 - (2\log_e b)x + (\log_e c) = 0 \quad \ldots(i)$

On putting $x = 1$ in Eq. (i), we get

$$\log_e a - 2\log_e b + \log_e c = 0$$
$$\Rightarrow \quad 2\log_e b = \log_e a + \log_e c$$
$$\Rightarrow \quad \log_e b^2 = \log_e ac$$
$$\Rightarrow \quad b^2 = ac, \text{ which is true.}$$

Hence, one of the roots of given equation is 1.
Let another root be α.

$$\therefore \quad \text{Sum of roots, } 1 + \alpha = \frac{2\log_e b}{\log_e a} = \frac{\log_e b^2}{\log_e a}$$
$$\Rightarrow \quad \alpha = \frac{\log_e ac}{\log_e a} - 1 = \frac{(\log_e a + \log_e c)}{\log_e a} - 1$$
$$= \frac{\log_e c}{\log_e a} = \log_a c$$

Hence, roots are 1 and $\log_a c$.

37. Given, $f(x) = x + \frac{1}{2} = \frac{2x+1}{2}$

$$\therefore \quad f(2x) = 2x + \frac{1}{2} \Rightarrow f(2x) = \frac{4x+1}{2}$$
$$\text{and} \quad f(4x) = 4x + \frac{1}{2}$$
$$\Rightarrow \quad f(4x) = \frac{8x+1}{2}$$

Since, $f(x), f(2x)$ and $f(4x)$ are in HP.

$$\therefore \quad \frac{1}{f(x)}, \frac{1}{f(2x)} \text{ and } \frac{1}{f(4x)} \text{ are in AP.}$$
$$\Rightarrow \quad \frac{1}{f(2x)} = \frac{\frac{1}{f(x)} + \frac{1}{f(4x)}}{2}$$
$$\Rightarrow \quad \frac{2}{4x+1} = \frac{\frac{2}{2x+1} + \frac{2}{8x+1}}{2}$$
$$\Rightarrow \quad \frac{2}{4x+1} = \frac{10x+2}{(2x+1)(8x+1)}$$
$$\Rightarrow \quad (2x+1)(8x+1) = (5x+1)(4x+1)$$
$$\Rightarrow \quad 16x^2 + 10x + 1 = 20x^2 + 9x + 1$$
$$\Rightarrow \quad 4x^2 - x = 0$$
$$\Rightarrow \quad x(4x-1) = 0$$
$$\Rightarrow \quad x = \frac{1}{4} \quad [\because x \neq 0]$$

Hence, one real value of x for which the three unequal terms are in HP.

38. $\because$ AM $\geq$ GM

$$\therefore \quad \frac{(p+q)+(r+s)}{2} \geq \sqrt{(p+q)(r+s)}$$
$$\Rightarrow \quad \frac{2}{2} \geq \sqrt{M}$$
$$\Rightarrow \quad \sqrt{M} \leq 1 \Rightarrow M \leq 1$$

Also, $(p+q)(r+s) > 0 \quad [\because p, q, r, s > 0]$

$\therefore \quad M > 0$

Hence, $\quad 0 < M \leq 1$

39. ***Case* I** Let $\alpha = \omega$ and $\beta = \omega^2$

$$\therefore \quad S = \sum_{n=0}^{302}(-1)^n\left(\frac{\omega}{\omega^2}\right)^n = \sum_{n=0}^{302}(-1)^n(\omega^2)^n$$
$$= 1 - \omega^2 + \omega^4 - \omega^6 + \omega^8 - \omega^{10} + \omega^{12} + \ldots + \omega^{600} - \omega^{602} + \omega^{604}$$
$$= 1 - \omega^2 + \omega - 1 + \omega^2 - \omega + 1 + \ldots + 1 - \omega^2 + \omega$$
$$= 0 + \ldots + 1 - \omega^2 + \omega$$
$$= -\omega^2 - \omega^2 = -2\omega^2 \quad [\because 1 + \omega + \omega^2 = 0]$$

***Case* II** Let $\alpha = \omega^2$ and $\beta = \omega$

$$\therefore \quad S = \sum_{n=0}^{302}(-1)^n\left(\frac{\omega^2}{\omega}\right)^n = \sum_{n=0}^{302}(-1)^n\left(\frac{\omega^4}{\omega^3}\right)^n$$
$$= \sum_{n=0}^{302}(-1)^n(\omega)^n$$
$$= 1 - \omega + \omega^2 - \omega^3 + \omega^4 - \omega^5 + \omega^6 - \ldots + \omega^{300} - \omega^{301} + \omega^{302}$$
$$= 1 - \omega + \omega^2 - 1 + \omega - \omega^2 + 1 - \ldots + 1 - \omega + \omega^2$$
$$= 0 + \ldots + 1 + \omega^2 - \omega = -\omega - \omega = -2\omega$$

40. Given, $(\alpha+\beta)x - \left(\frac{\alpha^2+\beta^2}{2}\right)x^2 + \left(\frac{\alpha^3+\beta^3}{3}\right)x^3 + \ldots$

$$= \left[\alpha x - \frac{1}{2}(\alpha x)^2 + \frac{1}{3}(\alpha x)^3 - \ldots\right] + \left[\beta x - \frac{1}{2}(\beta x)^2 + \frac{1}{3}(\beta x)^3 - \ldots\right]$$
$$= \log(1 + \alpha x) + \log(1 + \beta x)$$
$$= \log[1 + (\alpha+\beta)x + \alpha\beta x^2]$$

Now, $\alpha + \beta = p$ and $\alpha\beta = q$

Hence, $(\alpha+\beta)x - \left(\frac{\alpha^2+\beta^2}{2}\right)x^2 + \left(\frac{\alpha^3+\beta^3}{3}\right)x^3 + \ldots$

$$= \log(1 + px + qx^2)$$

41. Given, $\log_4 2 - \log_8 2 + \log_{16} 2 - \ldots$

$$= \frac{1}{\log_2 4} - \frac{1}{\log_2 8} + \frac{1}{\log_2 16} - \ldots$$
$$= \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \ldots$$
$$= 1 - \left[1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \ldots\right]$$
$$= 1 - \log_e 2$$

42. We have, $e^x = (1-x)(B_0 + B_1x + B_2x^2 + \ldots + B_{n-1}x^{n-1} + B_nx^n + \ldots)$

By the expansion of e^x, we get

$$1 + \frac{x}{1!} + \frac{x^2}{2!} + \ldots + \frac{x^n}{n!} + \ldots$$
$$= (1-x)(B_0 + B_1x + B_2x^2 + \ldots + B_{n-1}x^{n-1} + B_nx^n + \ldots)$$

On equating the coefficient of x^n both sides, we get

$$B_n - B_{n-1} = \frac{1}{n!}$$

43. We have, $a=\sum_{n=0}^{\infty}\frac{x^{3n}}{(3n)!}$, $b=\sum_{n=1}^{\infty}\frac{x^{3n-2}}{(3n-2)!}$

and $c=\sum_{n=1}^{\infty}\frac{x^{3n-1}}{(3n-1)!}$

Now, $a+b+c=\sum_{n=0}^{\infty}\frac{x^{3n}}{(3n)!}+\sum_{n=1}^{\infty}\frac{x^{3n-2}}{(3n-2)!}+\sum_{n=1}^{\infty}\frac{x^{3n-1}}{(3n-1)!}$

$$=1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\ldots=e^x$$

$$a+b\omega+c\omega^2=1+\omega x+\frac{\omega^2x^2}{2!}+\frac{\omega^3x^3}{3!}+\ldots=e^{\omega x}$$

and $a+b\omega^2+c\omega=e^{\omega^2x}$, ω is an imaginary cube root of unity.

Now, $a^3+b^3+c^3-3abc$

$$=(a+b+c)(a+b\omega+c\omega^2)(a+b\omega^2+c\omega)$$

$$=e^x\cdot e^{\omega x}\cdot e^{\omega^2x}=e^{x(1+\omega+\omega^2)}=e^{0\cdot x}=1$$

44. Given, $f(x)=\frac{x}{1!}+\frac{3}{2!}x^2+\frac{7}{3!}x^3+\frac{15}{4!}x^4+\ldots$

$$=\frac{2x}{1!}+\frac{(2x)^2}{2!}+\frac{(2x)^3}{3!}+\frac{(2x)^4}{4!}+\ldots-\left(\frac{x}{1!}+\frac{x^2}{2!}+\frac{x^3}{3!}+\frac{x^4}{4!}+\ldots\right)$$

$$=1+\frac{2x}{1!}+\frac{(2x)^2}{2!}+\frac{(2x)^3}{3!}+\frac{(2x)^4}{4!}+\ldots-\left(1+\frac{x}{1!}+\frac{x^2}{2!}+\frac{x^3}{3!}+\frac{x^4}{4!}+\ldots\right)$$

$\Rightarrow\quad f(x)=e^{2x}-e^x$

Put $f(x)=0$, we get

$$e^{2x}-e^x=0$$

$\Rightarrow\quad e^x(e^x-1)=0$

$\Rightarrow\quad e^x=0$ or $e^x=1$

$\Rightarrow\quad x=0$

Hence, exactly one real solution exists.

45. We have, $S=1+\frac{8}{2!}+\frac{21}{3!}+\frac{40}{4!}+\frac{65}{5!}+\ldots$

Let $S_1=1+8+21+40+65+\ldots+T_n$ ...(i)

and $S_1=1+8+21+40+\ldots+T_{n-1}+T_n$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$0=1+7+13+19+25+\ldots-T_n$$

$$T_n=1+7+13+19+25+\ldots\text{upto } n \text{ terms}$$

$$=\frac{n}{2}[2(1)+(n-1)6]$$

$$=n[1+3(n-1)]=n(3n-2)$$

$\therefore\quad S=\Sigma\frac{n(3n-2)}{n!}=\Sigma\frac{3n-2}{(n-1)!}$

$$=\Sigma\frac{3n-3+1}{(n-1)!}$$

$\Rightarrow\quad S=\Sigma\frac{3}{(n-2)!}+\Sigma\frac{1}{(n-1)!}=3e+e=4e$

$$\left[\because e=1+\frac{1}{1!}+\frac{1}{2!}+\ldots\right]$$

We know that, $2<e<3$

$\therefore\quad 8<4e<12$

$\Rightarrow\quad 8<S<12$

46. Since, $a_1, a_2, \ldots, a_n$ are in AP, therefore

$a_2-a_1=a_3-a_2=\ldots=a_{2k}-a_{2k-1}=d$ [say]

Now, $a_1^2-a_2^2=(a_1-a_2)(a_1+a_2)$

$$=-d(a_1+a_2)$$

$$a_3^2-a_4^2=-d(a_3+a_4)$$

$$a_{2k-1}^2-a_{2k}^2=-d(a_{2k-1}+a_{2k})$$

On adding, we get

$$S=-d(a_1+a_2+\ldots+a_{2k})$$

$$=-d\left[\frac{2k}{2}(a_1+a_{2k})\right]$$

$$=-dk(a_1+a_{2k})=\frac{-dk}{(a_1-a_{2k})}(a_1^2-a_{2k}^2)$$

$$=\frac{-dk(a_1^2-a_{2k}^2)}{[(a_1-a_2)+(a_2-a_3)+(a_3-a_4)+\ldots+(a_{2k-2}-a_{2k-1})+(a_{2k-1}-a_{2k})]}$$

$$=\frac{-dk(a_1^2-a_{2k}^2)}{(-d)(2k-1)}=\frac{k}{2k-1}(a_1^2-a_{2k}^2)$$

47. Given, $\log_x(ax), \log_x(bx)$ and $\log_x(cx)$ are in AP.

$\Rightarrow\quad 1+\log_x a, 1+\log_x b, 1+\log_x c$ are in AP.

$\Rightarrow\quad \log_x a, \log_x b, \log_x c$ are in AP.

$\therefore\quad \frac{\log a}{\log x}+\frac{\log c}{\log x}=2\frac{\log b}{\log x}$

$\Rightarrow\quad \log a+\log c=2\log b \Rightarrow ac=b^2$

48. Let the six numbers in AP be

$$a-5d, a-3d, a-d, a+d, a+3d, a+5d$$

$\therefore\quad a-5d+a-3d+a-d+a+d+a+3d+a+5d=3$ $[\because \text{sum}=3]$

$\Rightarrow\quad 6a=3$

$\Rightarrow\quad a=\frac{1}{2}$

Also, $T_1=4T_3$, where T_1, T_3 are respectively first and third terms of an AP.

$\Rightarrow\quad a-5d=4(a-d)\Rightarrow d=-3a=-\frac{3}{2}$

So, the fifth term $=a+3d$

$$=\frac{1}{2}+3\left(-\frac{3}{2}\right)=\frac{1}{2}-\frac{9}{2}=-4$$

49. Since, $\log_{10}2, \log_{10}(2^x-1)$ and $\log_{10}(2^x+3)$ are in AP.

$\therefore\quad \log_{10}(2^x-1)=\frac{\log_{10}2+\log_{10}(2^x+3)}{2}$

$\Rightarrow\quad 2\log_{10}(2^x-1)=\log_{10}2(2^x+3)$

$\Rightarrow\quad \log_{10}(2^x-1)^2=\log_{10}2(2^x+3)$

$\Rightarrow\quad (2^x-1)^2=2(2^x+3)$

$\Rightarrow\quad 2^{2x}+1-2^{x+1}=2^{x+1}+6$

$\Rightarrow\quad 2^{2x}+1-2\cdot2^{x+1}=6$

$\Rightarrow\quad 2^{2x}-4\cdot2^x-5=0$

Now, let $2^x=t$

$\Rightarrow\quad t^2-4t-5=0$

$\Rightarrow\quad (t-5)(t+1)=0$

$\Rightarrow\quad t=5$ or $t=-1$

$\Rightarrow\quad 2^x=5$

[neglecting $2^x=-1$ as 2^x is always positive]

$\Rightarrow\quad x\log_2 2=\log_2 5$

$\Rightarrow\quad x=\log_2 5$

50. $S_n = 0.2 + 0.22 + 0.222 + \dots$ upto n terms

$= 2\,[0.1 + 0.11 + 0.111 + \dots$ upto n terms$]$

$= \dfrac{2}{9}[0.9 + 0.99 + 0.999 + \dots$ upto n terms$]$

$$= \frac{2}{9}[(1-0.1) + \{1-(0.1)^2\} + \{1-(0.1)^3\} + \dots \text{upto } n \text{ terms}]$$

$$= \frac{2}{9}[n - \{(0.1) + (0.1)^2 + (0.1)^3 + \dots \text{upto } n \text{ terms}\}]$$

$$= \frac{2}{9}\left[n - (0.1)\frac{\{1-(0.1)^n\}}{1-0.1}\right] = \frac{2}{9}\left[n - \frac{1}{9}(1-10^{-n})\right]$$

51. $1 + \dfrac{1}{3} + \dfrac{1\cdot 3}{3\cdot 6} + \dfrac{1\cdot 3\cdot 5}{3\cdot 6\cdot 9} + \dfrac{1\cdot 3\cdot 5\cdot 7}{3\cdot 6\cdot 9\cdot 12} + \dots$

$$= 1 + \frac{1}{3} + \frac{\frac{1}{2}\cdot\frac{3}{2}}{1\cdot 2}\left(\frac{2}{3}\right)^2 + \frac{\frac{1}{2}\cdot\frac{3}{2}\cdot\frac{5}{2}}{1\cdot 2\cdot 3}\left(\frac{2}{3}\right)^3 + \dots$$

$$= 1 + \frac{1}{2}\cdot\frac{2}{3} + \frac{\frac{1}{2}\left(\frac{1}{2}+1\right)}{2!}\left(\frac{2}{3}\right)^2 + \frac{\frac{1}{2}\left(\frac{1}{2}+1\right)\left(\frac{1}{2}+2\right)}{3!}\left(\frac{2}{3}\right)^3 + \dots$$

$$= \left(1 - \frac{2}{3}\right)^{-1/2} = 3^{1/2} = \sqrt{3}$$

52. We have, $H_n = 1 + \dfrac{1}{2} + \dots + \dfrac{1}{n}$

Consider, $S_n = 1 + \dfrac{3}{2} + \dfrac{5}{3} + \dots + \dfrac{2n-1}{n}$

$$= 1 + \left(2 - \frac{1}{2}\right) + \left(2 - \frac{1}{3}\right) + \dots + \left(2 - \frac{1}{n}\right)$$

$$= \underbrace{[1 + \{2 + 2 + \dots + 2\}]}_{(n-1)\text{ times}} - \left[\frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right]$$

$$= [1 + 2\,(n-1)] - \left[1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right] + 1$$

$$= 2n - \left[1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right] = 2n - H_n$$

53. Let the numbers be a and b.

$\therefore \quad \dfrac{a+b}{2} = 27$ and $\dfrac{2ab}{a+b} = 12$

$\Rightarrow \quad a + b = 54$ and $2ab = 12\,(a+b)$

$\Rightarrow \quad 2ab = 12\,(54)$

$\Rightarrow \quad ab = 6\,(54) = 324$

$\Rightarrow \quad \sqrt{ab} = 18$

Thus, GM $= 18$

54. Since, x, y and z are in GP.

$\therefore \quad y^2 = xz$

Now, taking $\log_{10}$ on both sides, we get

$2\log_{10} y = \log_{10} x + \log_{10} z$

$\Rightarrow \quad 2\left(\dfrac{1}{\log_y 10}\right) = \dfrac{1}{\log_x 10} + \dfrac{1}{\log_z 10}$

$\Rightarrow \quad \dfrac{1}{\log_x 10}, \dfrac{1}{\log_y 10}, \dfrac{1}{\log_z 10}$ are in AP.

$\Rightarrow \log_x 10, \log_y 10$ and $\log_z 10$ are in HP.

55. $4 + 2\,(1+2)\log 2 + \dfrac{2\,(1+2^2)\,(\log 2)^2}{2!} + \dfrac{2(1+2^3)\,(\log 2)^3}{3!} + \dots$

$$= 2\left(1 + \log 2 + \frac{(\log 2)^2}{2!} + \dots\right) + 2\left(1 + 2\log 2 + \frac{(2\log 2)^2}{2!} + \dots\right)$$

$= 2\,(e^{\log 2}) + 2\,(e^{2\log 2})$

$= 2 \times 2 + 2e^{\log 4}$

$= 4 + 2 \times 4 = 12$

56. Let T_n be the nth term of the given series.

$\therefore \quad T_n = \dfrac{n(n+1)}{n!} = \dfrac{n+1}{(n-1)!} = \dfrac{(n-1)+2}{(n-1)!}$

$= \dfrac{1}{(n-2)!} + \dfrac{2}{(n-1)!}$

$\therefore \quad S = \displaystyle\sum_{n=1}^{\infty} T_n = \sum_{n=2}^{\infty}\frac{1}{(n-2)!} + 2\sum_{n=1}^{\infty}\frac{1}{(n-1)!}$

$= e + 2e = 3e$

57. Given, sum of n terms of an AP $= 240$

$\therefore \quad \dfrac{n}{2}[2 \times 2 + (n-1) \times 2] = 240$

$\Rightarrow \quad n(2 + n - 1) = 240$

$\Rightarrow \quad n(n+1) = 15 \times 16$

$\Rightarrow \quad n = 15$

58. Given, $S_\infty = \dfrac{4}{3}$ and $a = \dfrac{3}{4}$

Let r be the common ratio.

$\therefore \quad \dfrac{a}{1-r} = \dfrac{4}{3}$

$\Rightarrow \quad \dfrac{4}{3} - \dfrac{4}{3}r = \dfrac{3}{4}$

$\Rightarrow \quad \dfrac{16-9}{12} = \dfrac{4}{3}r$

$\Rightarrow \quad \dfrac{7}{12} = \dfrac{4}{3}r$

$\Rightarrow \quad r = \dfrac{7}{16}$

59. We have, $\dfrac{x^{n+1} + y^{n+1}}{x^n + y^n} = \sqrt{xy}$, for some n

$\Rightarrow \quad x^{n+1} + y^{n+1} = (xy)^{1/2}(x^n + y^n)$

$\Rightarrow \quad x^n \cdot x + y^n \cdot y = x^n \cdot x^{1/2}y^{1/2} + y^n \cdot x^{1/2}y^{1/2}$

$\Rightarrow \quad x^n(x - \sqrt{xy}) + y^n(y - \sqrt{xy}) = 0$

$\Rightarrow x^n \cdot \sqrt{x}(\sqrt{x} - \sqrt{y}) + \sqrt{y}\cdot y^n(\sqrt{y} - \sqrt{x}) = 0$

$\Rightarrow \quad (\sqrt{x} - \sqrt{y})(x^n \cdot \sqrt{x} - y^n \cdot \sqrt{y}) = 0$

For $x \ne y$, $\quad x^n\sqrt{x} = y^n\sqrt{y}$

$\Rightarrow \quad \left(\dfrac{x}{y}\right)^{n+\frac{1}{2}} = 1$

$\Rightarrow \quad n + \dfrac{1}{2} = 0$

$\Rightarrow \quad n = -\dfrac{1}{2}$

60. Let the numbers be a and b.

$\therefore \quad \sqrt{ab} = 10$

$\Rightarrow \quad ab = 100 \quad \ldots(i)$

and $\quad \dfrac{2ab}{a+b} = 8$

$\Rightarrow \quad \dfrac{200}{a+b} = 8$

$\Rightarrow \quad a + b = 25 \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$a = 5 \quad \text{and} \quad b = 20$

or $\quad a = 20 \quad \text{and} \quad b = 5$

61. $T_n = (2n-1)^3 = 8n^3 - 1^3 - 3 \cdot 2n \cdot 1(2n-1)$

$= 8n^3 - 1 - 12n^2 + 6n$

$= 8n^3 - 12n^2 + 6n - 1$

$\therefore \quad S_n = \Sigma T_n$

$= 8\Sigma n^3 - 12\Sigma n^2 + 6\Sigma n - \Sigma 1$

$$= 8\left[\frac{n(n+1)}{2}\right]^2 - 12\left[\frac{n(n+1)(2n+1)}{6}\right] + 6\left[\frac{n(n+1)}{2}\right] - n$$

$= 2n^2(n+1)^2 - 2n(n+1)(2n+1) + 3n(n+1) - n$

$= n(n+1)[2n(n+1) - 2(2n+1) + 3] - n$

$= n(n+1)[2n^2 + 2n - 4n - 2 + 3] - n$

$= n(n+1)[2n^2 - 2n + 1] - n$

$= n(n+1) \cdot 2n(n-1) + n(n+1) - n$

$= 2n^2(n^2-1) + n^2 = n^2(2n^2 - 1)$

62. Here, $T_n = \dfrac{2n}{(2n+1)!} = \dfrac{1}{2n!} - \dfrac{1}{(2n+1)!}$

$\Sigma T_n = \dfrac{1}{2!} - \dfrac{1}{3!} + \dfrac{1}{4!} - \dfrac{1}{5!} + \ldots$

$= 1 - \dfrac{1}{1!} + \dfrac{1}{2!} - \dfrac{1}{3!} + \dfrac{1}{4!} - \dfrac{1}{5!} + \ldots = e^{-1}$

4

Complex Numbers

The Real Number System

Natural Numbers (N) The numbers which are used for counting are known as natural numbers (also known as set of positive integers), i.e. $N = \{1, 2, 3, \ldots\}$.

Whole Numbers (W) If '0' is included in the set of natural numbers, then we get the set of whole numbers, i.e.
$W = \{0, 1, 2, \ldots\} = \{N\} + \{0\}$.

Integers (Z or I) If negative natural numbers are included in the set of whole numbers, then we get set of integers, i.e.
Z or $I = \{\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots\}$.

Rational Numbers (Q) The numbers which are in the form of $\frac{p}{q}$, (where $p, q \in I$, $q \neq 0$), are called as rational numbers.
e.g. $\frac{2}{3}, 3, \frac{1}{3}, 0.76, 1.2333, \frac{22}{7}$ etc.

Irrational Numbers (Q') The numbers which are not rational, i.e. which cannot be expressed in $\frac{p}{q}$ form or whose decimal part is non-terminating, non-repeating but which may represent magnitude of physical quantities are called irrational numbers.
e.g. $\sqrt{2}, 5^{1/3}, \pi, e$, etc.

Real Numbers (R) The set of rational and irrational numbers is called a set of real numbers, i.e.

$$N \subset W \subset Z \subset Q \subset R$$

Chapter Snapshot

- *The real number system is totally ordered for any two numbers $a, b \in R$. We must say, either $a < b$ or $b < a$ or $b = a$.*
- *All real numbers can be represented by points on a straight line. This line is called as number line.*
- *Division by zero is meaningless.*
- *Number zero is neither positive nor negative but it is an even number.*
- *Square of a real number is always non-negative.*
- *An integer is said to be even, if it is divisible by 2, otherwise it is an odd number.*
- *Number '0' is an additive identity.*
- *The magnitude of a physical quantity may be expressed as a real number times, a standard unit.*
- *Number '1' is multiplicative identity.*
- *A positive integer p is called prime, if its only divisors are ± 1 and $\pm p$.*
- *Between two real numbers, there lie infinite real numbers.*
- *Infinity (∞) is the concept of the number greater than greatest you can imagine. It is not a number, it is just a concept, so we do not associate equality with it.*

Example 1. *The value of* $\dfrac{10^{25}}{\infty}$ *is*

(a) 1 (b) 2 (c) 10^{50} (d) 0

Sol. (d) As we know, ∞ is the number greater than greatest we imagine. Also, the value of 1 upon ∞ is tending to zero.

Hence, $\dfrac{10^{25}}{\infty} = 0$.

Intervals

Let a, x, b are real numbers, so that

$x \in [a, b] \Rightarrow a \le x \le b$, $[a, b]$ is known as the closed interval a, b.

$x \in (a, b) \Rightarrow a < x < b$, (a, b) is known as the open interval a, b.

$x \in (a, b] \Rightarrow a < x \le b$, $(a, b]$ is known as open, closed interval a, b.

$x \in [a, b) \Rightarrow a \le x < b$, $[a, b)$ is known as closed, open interval a, b.

Example 2. *If $a = \sqrt{3} + 1$, $b = 2\sqrt{2}$, then the value of $\dfrac{a}{b}$ lies in the interval*

(a) $(-1, 0)$ (b) $(0, 1]$ (c) $[0.5, 1.5]$ (d) $(0, 1)$

Sol. (b, c, d) Consider $\dfrac{a}{b} = \dfrac{\sqrt{3}+1}{2\sqrt{2}} = 0.966$

Clearly, $0.966 \in (0, 1), (0, 1]$ and $[0.5, 1.5]$.

Modulus of a Real Number

The modulus of a real number x is defined as follows:

$$|x| = \begin{cases} x, & \text{when } x > 0 \\ 0, & \text{when } x = 0 \\ -x, & \text{when } x < 0 \end{cases}$$

$$|x - a| = \begin{cases} x - a, & \text{when } x \ge a \\ -(x - a), & \text{when } x < a \end{cases}$$

Example 3. *If $f(x) = |x - 2| + |x| + |x + 3|$, then the value of $f(x)$ for $x \le -3$ is*

(a) $3x - 1$

(b) $-3x + 1$

(c) $x - 3$

(d) $-(3x + 1)$

Sol. (d) $\because$ $|x - 2| = -(x - 2) = 2 - x$ for $x \le -3$

$|x| = -x$ for $x \le -3$

and $|x + 3| = -(x + 3)$ for $x \le -3$

$\therefore$ $f(x) = 2 - x - x - x - 3$

$= -3x - 1$

$= -(3x + 1)$

Imaginary Number

Square root of a negative real number is imaginary number. While solving equation $x^2 + 1 = 0$, we get $x = \pm\sqrt{-1}$ which is imaginary. So, the quantity $\sqrt{-1}$ is denoted by 'i' called 'iota'. Thus, $i = \sqrt{-1}$.

e.g. $\sqrt{-2}, \sqrt{-3}, \sqrt{-4}, \ldots$ may expressed as $i\sqrt{2}, i\sqrt{3}, 2i, \ldots$.

Integral powers of iota As we have seen

$i = \sqrt{-1}$, so $i^2 = -1$, $i^3 = -i$ and $i^4 = 1$.

Hence, $n \in N$, $i^n = i, -1, -i, 1$ attains four values according to the value of n, so

$$i^{4n+1} = i$$
$$i^{4n+2} = -1$$
$$i^{4n+3} = -i$$
$$i^{4n} \text{ or } i^{4n+4} = 1$$

In other words,

$$i^n = \begin{cases} (-1)^{n/2}, & \text{if } n \text{ is an even integer} \\ (-1)^{\frac{n-1}{2}} i, & \text{if } n \text{ is an odd integer} \end{cases}$$

- $i^2 = \sqrt{-1} \times \sqrt{-1} \ne \sqrt{1}$
- *$\sqrt{-a} \times \sqrt{-b} \ne \sqrt{ab}$, so for two real numbers a and b but $\sqrt{a \cdot b} = \sqrt{a} \cdot \sqrt{b}$ possible, if both a, b are non-negative.*
- *i is neither positive, zero nor negative. Due to this reason, order relations are not defined for imaginary numbers.*
- *The sum of any four consecutive powers of i is zero, i.e.* $i^{4n+1} + i^{4n+2} + i^{4n+3} + i^{4n+4} = 0$

Example 4. *The value of i^{2014} is*

(a) i

(b) $-i$

(c) 1

(d) -1

Sol. (d) Consider

$$i^{2014} = (i^2)^{1007}$$
$$= (-1)^{1007} = -1$$

Example 5. *If $a<0$, $b>0$, then $\sqrt{a}\cdot\sqrt{b}$ is equal to*

(a) $-\sqrt{|a|\cdot b}$ (b) $\sqrt{|a|\cdot b}\cdot i$

(c) $\sqrt{|a|\,b}$ (d) None of these

Sol. (b) As we can only multiply the positive values in square root.

$\therefore \quad \sqrt{a}\sqrt{b}=\sqrt{-|a|}\sqrt{b}$, as $a<0$ and $b>0$

i.e. $\sqrt{-1}\cdot\sqrt{|a|}\sqrt{b}=i\sqrt{|a|}\sqrt{b}=\sqrt{|a|b}\cdot i$

Example 6. *The value of the sum $\sum_{n=1}^{13}(i^n+i^{n+1})$, where $i=\sqrt{-1}$ is*

(a) i (b) $i-1$ (c) $-i$ (d) 0

Sol. (b) Since, the sum of any four consecutive powers of i, is zero.

$$\therefore \quad \sum_{n=1}^{13}(i^n+i^{n+1})=\sum_{n=1}^{13}i^n+\sum_{n=1}^{13}i^{n+1} \quad \ldots\text{(i)}$$

$$=(i+i^2+i^3+\ldots+i^{13})+(i^2+i^3+i^4+\ldots+i^{14})$$

$$=i-1 \quad \text{[from Eq. (i)]}$$

Example 7. *The value of $\dfrac{2^n}{(1+i)^{2n}}+\dfrac{(1+i)^{2n}}{2^n}$, $n\in I$, is equal to*

(a) 0 (b) 2

(c) $\{1+(-1)^n\}\cdot i^n$ (d) None of these

Sol. (c) Here, $\dfrac{2^n}{(1+i)^{2n}}+\dfrac{(1+i)^{2n}}{2^n}$

$$=\frac{2^n}{(1+i^2+2i)^n}+\frac{(1+i^2+2i)^n}{2^n}$$

$$=\frac{2^n}{(2i)^n}+\frac{(2i)^n}{2^n}=\frac{1}{i^n}+i^n$$

$$=\frac{i^n}{i^{2n}}+i^n=\frac{i^n}{(-1)^n}+i^n=i^n\left\{\frac{1}{(-1)^n}+1\right\}$$

$$=i^n\cdot\{(-1)^n+1\}$$

Example 8. *If $i=\sqrt{-1}$, then the number of values of i^n+i^{-n} for different $n\in I$ is*

(a) 3 (b) 2 (c) 4 (d) 1

Sol. (a) As i^n+i^{-n} can be written as

$$x=i^n+\frac{1}{i^n}=\frac{i^{2n}+1}{i^n}$$

If $n=4$, $x=\dfrac{1+1}{1}=2$

If $n=5$, $x=\dfrac{i^2+1}{i}=0$

If $n=6$, $x=\dfrac{1+1}{-1}=-2$

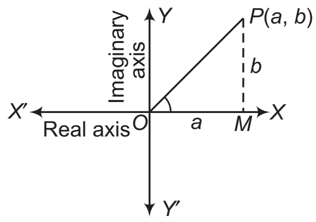
If $n=7$, $x=\dfrac{i^2+1}{-1}=0$

and so on.

Which shows there exist three different solutions for $n\in I$.

Complex Number

The complex number $z=a+ib=(a,b)$ can be represented by a point P, whose coordinates are referred to rectangular axes XOX' and YOY', which are called real and imaginary axis respectively. The plane formed by rectangular axes is called argand plane or argand diagram or complex plane or Gaussian plane.



(i) A number of the form $z=x+iy=\text{Re } z+i\text{Im } z$ is called a complex number.

(ii) Two complex numbers are said to be equal, if and only if their real parts and imaginary parts are separately equal, i.e. $a+ib=c+id \iff a=c$ and $b=d$.

(iii) The complex numbers do not possess the property of order, i.e. $x+iy<\text{(or)}>c+id$ is not defined.

(iv) A complex number z is purely real, if $\text{Im}(z)=0$ and said to be purely imaginary, if $\text{Re}(z)=0$. The complex number $0=0+i.\,0$ is both purely real and purely imaginary.

Example 9. *If $z=(-5\,i)\left(\frac{1}{8}i\right)$, then $\text{Im}(z)$ is equal to*

(a) 1 (b) 0

(c) -1 (d) None of these

Sol. (b) Consider $z=(-5\,i)\left(\frac{1}{8}i\right)$

Let us first express z in the format $a+ib$, then

$$z=\frac{-5}{8}i^2=-\frac{5}{8}(-1)=\frac{5}{8}+i0 \Rightarrow \text{Im}(z)=0$$

Example 10. *If $4x+i(3x-y)=3+i(-6)$, where x and y are real numbers, then the value of x and y respectively are*

(a) 3, 33 (b) $\dfrac{3}{5}, \dfrac{33}{5}$

(c) $\dfrac{3}{4}, \dfrac{33}{4}$ (d) None of these

Sol. (c) We have,

$$4x+i(3x-y)=3+i(-6) \quad \ldots\text{(i)}$$

Equating the real and imaginary parts of Eq. (i), we get

$$4x=3 \quad \text{and} \quad 3x-y=-6,$$

which on solving simultaneously, we get

$$x=\frac{3}{4}$$

and $\quad y=\dfrac{33}{4}$

4 Algebra of Complex Numbers

Addition of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ be two complex numbers, then

$$z_1 + z_2 = x_1 + iy_1 + x_2 + iy_2$$
$$= (x_1 + x_2) + i(y_1 + y_2)$$
$$\Rightarrow \quad \text{Re}(z_1 + z_2) = \text{Re}(z_1) + \text{Re}(z_2)$$
and $$\text{Im}(z_1 + z_2) = \text{Im}(z_1) + \text{Im}(z_2)$$

Properties of Addition of Complex Numbers

(a) $z_1 + z_2 = z_2 + z_1$ [commutative law]
(b) $z_1 + (z_2 + z_3) = (z_1 + z_2) + z_3$ [associative law]
(c) $z + 0 = 0 + z$ (where, $0 = 0 + i\,0$) [additive identity law]

Example 11. *The value of* $3(7 + i7) + i(7 + i7)$ *is*

(a) $15 + 27\,i$ *(b)* $14 + 28\,i$ *(c)* $14 - 28\,i$ *(d)* $14 + 23\,i$

Sol. (b) We have, $3(7 + i7) + i(7 + i7)$

$$= 21 + 21i + 7i + 7i^2$$
$$= 21 + 28i - 7 \qquad [\because i^2 = -1]$$
$$= 14 + 28i$$

Subtraction of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ be two complex numbers, then

$$z_1 - z_2 = (x_1 + iy_1) - (x_2 + iy_2)$$
$$= (x_1 - x_2) + i(y_1 - y_2)$$
$$\Rightarrow \quad \text{Re}(z_1 - z_2) = \text{Re}(z_1) - \text{Re}(z_2)$$
and $$\text{Im}(z_1 - z_2) = \text{Im}(z_1) - \text{Im}(z_2)$$

Example 12. *The value of*
$$\left[\left(\frac{1}{3} + i\frac{7}{3}\right) + \left(4 + i\frac{1}{3}\right)\right] - \left(-\frac{4}{3} + i\right)$$ *is*

(a) $\frac{5}{3} - i\frac{17}{3}$

(b) $\frac{17}{3} - i\frac{5}{3}$

(c) $\frac{17}{3} + i\frac{5}{3}$

(d) $\frac{17}{5} - i\frac{4}{3}$

Sol. (c) $\left(\frac{1}{3} + i\frac{7}{3} + 4 + i\frac{1}{3}\right) + \frac{4}{3} - i$

$$= \left(\frac{1}{3} + 4 + \frac{4}{3}\right) + i\left(\frac{7}{3} + \frac{1}{3} - 1\right)$$
$$= \left(\frac{1}{3} + \frac{4}{1} + \frac{4}{3}\right) + i\left(\frac{7}{3} + \frac{1}{3} - \frac{1}{1}\right)$$
$$= \frac{(1 + 12 + 4)}{3} + i\left(\frac{7 + 1 - 3}{3}\right)$$
$$= \frac{17}{3} + i\frac{5}{3}$$

Multiplication of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ be two complex numbers, then

$$z_1 \cdot z_2 = (x_1 + iy_1)(x_2 + iy_2)$$
$$= (x_1x_2 - y_1y_2) + i(x_1y_2 + x_2y_1)$$
$$\Rightarrow \quad z_1 \cdot z_2 = [\text{Re}(z_1)\text{Re}(z_2) - \text{Im}(z_1)\,\text{Im}(z_2)]$$
$$+ i\,[\text{Re}(z_1)\,\text{Im}(z_2) + \text{Re}(z_2)\text{Im}(z_1)]$$

Properties of Multiplication of Complex Numbers

(a) $z_1 \cdot z_2 = z_2 \cdot z_1$ [commutative law]
(b) $(z_1 \cdot z_2)z_3 = z_1(z_2 \cdot z_3)$ [associative law]
(c) *If* $z_1 \cdot z_2 = 1 = z_2 \cdot z_1$, then z_1 and z_2 are multiplicative inverse of each other.
(d) (i) $z_1(z_2 + z_3) = z_1 \cdot z_2 + z_1 \cdot z_3$ [left distribution law]
(ii) $(z_2 + z_3)\,z_1 = z_2 \cdot z_1 + z_3 \cdot z_1$ [right distribution law]

Example 13. *The real values of x and y, if*
$$\frac{(1+i)\,x - 2i}{(3+i)} + \frac{(2-3i)\,y + i}{(3-i)} = i,$$ *are respectively*

(a) 3, −1 *(b)* 3, 1
(c) −3, 1 *(d)* −3, −1

Sol. (a) $\frac{(1+i)x - 2i}{(3+i)} + \frac{(2-3i)y + i}{(3-i)} = i$

$$\Rightarrow \quad \{(1+i)x - 2i\}(3-i) + \{(2-3i)y + i\}(3+i) = i(3+i)(3-i)$$
$$\Rightarrow \quad (1+i)(3-i)x - 2i(3-i) + (2-3i)(3+i)y + i(3+i) = 10i$$
$$\Rightarrow \quad (4+2i)x - 6i - 2 + (9-7i)y + 3i - 1 = 10i$$
$$\Rightarrow \quad (4x - 2 + 9y - 1) + i(2x - 6 - 7y + 3) = 10i$$
$$\Rightarrow \quad (4x + 9y - 3) + i(2x - 7y - 3) = 10i$$

On equating real and imaginary parts on both sides, we get

$$4x + 9y = 3 \qquad \ldots\text{(i)}$$
and $$x - 7y = 13 \qquad \ldots\text{(ii)}$$

On solving Eqs. (i) and (ii), we get $x = 3,\ y = -1$

Example 14. *The multiplicative inverse of* $4 - 3i$ *is*

(a) $\frac{4}{25} - \frac{3i}{25}$ *(b)* $\frac{4}{25} + \frac{3i}{25}$

(c) $\frac{4}{16} + \frac{3i}{25}$ *(d) None of these*

Sol. (b) Let $z = 4 - 3i$

Then, its multiplicative inverse is

$$\frac{1}{z} = \frac{1}{4-3i} = \frac{1}{4-3i} \times \frac{4+3i}{4+3i} = \frac{4+3i}{16-9i^2}$$
$$[\because (a-b)(a+b) = a^2 - b^2]$$
$$= \frac{4+3i}{16+9} \qquad [\because i^2 = -1]$$
$$= \frac{4+3i}{25} = \frac{4}{25} + \frac{3i}{25}$$

Division of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2 (\neq 0)$ be two complex numbers, then

$$\frac{z_1}{z_2} = \frac{x_1 + iy_1}{x_2 + iy_2}$$

$$= \frac{1}{x_2^2 + y_2^2}[(x_1x_2 + y_1y_2) + i(x_2y_1 - x_1y_2)]$$

Example 15. *The value of* $\frac{z_1}{z_2}$, *where* $z_1 = 2 + 3i$ *and* $z_2 = 1 + 2i$, *is*

(a) $\frac{8}{5} + \frac{1}{5}i$ *(b)* $\frac{8}{5} - \frac{1}{5}i$

(c) $\frac{1}{5} - \frac{8}{5}i$ *(d) None of these*

Sol. (b) $\because z_1 = 2 + 3i$ and $z_2 = 1 + 2i$

$$\therefore \quad z_2^{-1} = \frac{1}{1 + 2i} = \frac{1 - 2i}{(1 + 2i)(1 - 2i)}$$

$$= \frac{1 - 2i}{1 + 4} = \frac{1}{5} - \frac{2}{5}i$$

Then, $\frac{z_1}{z_2} = z_1 \cdot z_2^{-1} = (2 + 3i)\left(\frac{1}{5} - \frac{2}{5}i\right)$

$$= \left(\frac{2}{5} + \frac{6}{5}\right) + i\left(-\frac{4}{5} + \frac{3}{5}\right) = \frac{8}{5} - \frac{1}{5}i$$

Aliter

Here, $x_1 = 2$, $y_1 = 3$, $x_2 = 1$ and $y_2 = 2$.

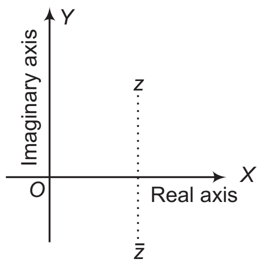
$$\therefore \quad \frac{z_1}{z_2} = \frac{1}{x_2^2 + y_2^2}\{(x_1x_2 + y_1y_2) + i(x_2y_1 - x_1y_2)\}$$

$$= \frac{1}{1^2 + 2^2}\{(2 \times 1 + 3 \times 2) + i(3 \times 1 - 2 \times 2)\}$$

$$= \frac{1}{5}\{(2 + 6) + i(3 - 4)\} = \frac{8}{5} - \frac{1}{5}i$$

Conjugate of a Complex Number

Geometrically, the conjugate of z is the reflection of point image of z in the real axis.



$\therefore \quad z = x + iy$ and $\bar{z} = x - iy$.

e.g. If $z = 3 + 4i$, then $\bar{z} = 3 - 4i$.

Properties of Conjugate

$\bar{z}$ is the mirror image of z along real axis.

(i) $\overline{(\bar{z})} = z$

(ii) $z = \bar{z} \Leftrightarrow z$ is purely real

(iii) $z = -\bar{z} \Leftrightarrow z$ is purely imaginary.

(iv) $\text{Re}(z) = \text{Re}(\bar{z}) = \frac{z + \bar{z}}{2}$

(v) $\text{Im}(z) = \frac{z - \bar{z}}{2i}$

(vi) $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$

(vii) $\overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2$

(viii) $\overline{z_1 z_2} = \bar{z}_1 \bar{z}_2$

(ix) $\overline{\left(\frac{z_1}{z_2}\right)} = \left(\frac{\bar{z}_1}{\bar{z}_2}\right), (z_2 \neq 0)$

(x) $z_1\bar{z}_2 + \bar{z}_1 z_2 = 2\text{Re}(\bar{z}_1 z_2) = 2\text{Re}(z_1\bar{z}_2)$

(xi) $\bar{z}^n = (\bar{z})^n = (\overline{z^n})$

(xii) If $z = f(z_1)$, then $\bar{z} = f(\bar{z}_1)$

Example 16. *If* $z_1 = 9y^2 - 4 - 10ix$ *and* $z_2 = 8y^2 + 20i$, *where* $z_1 = \bar{z}_2$, *then* $z = x + iy$ *is equal to*

(a) $-2 + 2i$

(b) $-2 \pm 2i$

(c) $-2 \pm i$

(d) None of the above

Sol. (b) Given, $z_1 = \bar{z}_2$

$$\Rightarrow \quad 9y^2 - 4 - 10ix = 8y^2 + 20i$$

$$\Rightarrow \quad (y^2 - 4) - 10i(x + 2) = 0$$

Since, complex number is zero.

$$\Rightarrow \quad y^2 - 4 = 0 \quad \text{and} \quad x + 2 = 0$$

$\therefore \quad y = \pm 2$

and $\quad x = -2$

Thus, $\quad z = x + iy = -2 \pm 2i$

Example 17. *If* $(1 + i)z = (1 - i)\bar{z}$, *then* z *is*

(a) $x(1 - i), x \in R$

(b) $x(1 + i), x \in R$

(c) $\frac{x}{1 + i}, x \in R^+$

(d) None of the above

Sol. (a) $(1 + i)(x + iy) = (1 - i)(x - iy)$

$$\Rightarrow \quad (x - y) + i(x + y) = (x - y) - i(x + y)$$

$$\Rightarrow \quad x + y = 0$$

$$\therefore \quad z = x - ix = x(1 - i)$$

Modulus of a Complex Number

Let $z = x + iy$ be any complex number. Then, $|z| = \sqrt{(x^2 + y^2)}$ is called the modulus of the complex number z, where modulus $|z|$ represents distance of z from origin.

e.g. If $z = 3 + 2i$ is a complex number, then

$$|z| = \sqrt{3^2 + 2^2}$$

$$= \sqrt{9 + 4} = \sqrt{13}$$

Example 18. *If z is a complex number satisfying the relation $|z+1| = z + 2(1+i)$, then z is*

(a) $\frac{1}{2}(1+4i)$

(b) $\frac{1}{2}(3+4i)$

(c) $\frac{1}{2}(1-4i)$

(d) $\frac{1}{2}(3-4i)$

Sol. (c) Let $z = x + iy$

$$\therefore \quad |x + iy + 1| = x + iy + 2(1+i)$$
$$\Rightarrow \quad \sqrt{(x+1)^2 + y^2} = (x+2) + i(y+2)$$
$$\Rightarrow \quad \sqrt{(x+1)^2 + y^2} = x + 2 \quad \text{and} \quad y + 2 = 0$$
$$\Rightarrow \quad (x+1)^2 + 4 = (x+2)^2 \quad \text{and} \quad y = -2$$
$$\Rightarrow \quad 2x + 5 = 4x + 4 \quad \text{and} \quad y = -2$$
$$\Rightarrow \quad x = \frac{1}{2} \quad \text{and} \quad y = -2$$
$$\Rightarrow \quad z = \frac{1}{2}(1 - 4i)$$

Example 19. *If $z = 1 + i\tan\alpha$, where $\pi < \alpha < \frac{3\pi}{2}$, then $|z|$ is equal to*

(a) $\sec\alpha$

(b) $-\sec\alpha$

(c) $\operatorname{cosec}\alpha$

(d) None of the above

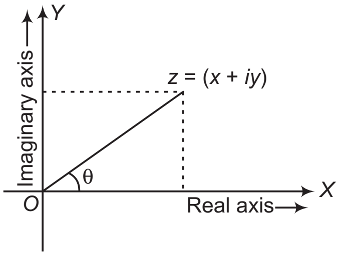
Sol. (b) As $z = 1 + i\tan\alpha$

$$\therefore \quad |z| = \sqrt{1 + \tan^2\alpha} = |\sec\alpha|$$
$$\Rightarrow \quad |z| = -\sec\alpha, \text{ as } \pi < \alpha < \frac{3\pi}{2}$$

Argument (or Amplitude) of a Complex Number

Argument of $z = \theta$

Argument of z is not unique. General value of argument of z is $2n\pi + \theta$.

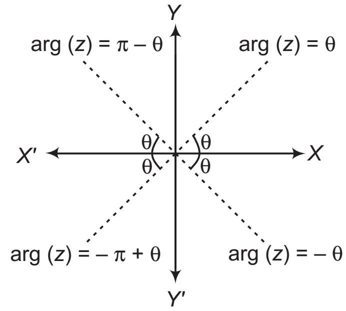


Principal Value of Argument

The value of θ of the argument, which satisfies the inequality $-\pi < \theta \le \pi$ is called the principal value of the argument.

Principal values of the argument are θ, $\pi - \theta$, $-\pi + \theta$, $-\theta$ according as the complex number lies on the Ist, IInd, IIIrd or IVth quadrant.

Here, $\theta = \tan^{-1}\frac{|y|}{|x|}$, where $z = x + iy$



e.g. $\quad \arg(1+i) = \tan^{-1}\frac{1}{1} = \frac{\pi}{4}$

$$\arg(1-i) = \tan^{-1}\left(\frac{-1}{1}\right) = \frac{-\pi}{4}$$
$$\arg(-1-i) = \tan^{-1}\left(\frac{-1}{-1}\right) = -\pi + \frac{\pi}{4}$$
$$\arg(-1+i) = \tan^{-1}\left(\frac{-1}{1}\right) = \pi - \frac{\pi}{4}$$

- *Argument of 0 is not defined.*
- *If $z_1 = z_2$, then $|z_1| = |z_2|$ and $\arg(z_1) = \arg(z_2)$*
- *Argument of purely imaginary number is* $\frac{\pi}{2}$ *or* $-\frac{\pi}{2}$
- *Argument of purely real number is 0 or π.*

Example 20. *The modulus and argument of the complex number $\frac{1+2i}{1-3i}$ is*

(a) $\frac{1}{\sqrt{2}}, \frac{3\pi}{4}$

(b) $\frac{1}{\sqrt{2}}, -\frac{3\pi}{4}$

(c) $\frac{1}{2}, \frac{3\pi}{4}$

(d) None of the above

Sol. (a) Given, $z = \frac{1+2i}{1-3i}$

$$\therefore \quad z = \frac{1+2i}{1-3i} \times \frac{1+3i}{1+3i} = \frac{1 + 3i + 2i + 6i^2}{1^2 - (3i)^2}$$
$$[\because (a+b)(a-b) = a^2 - b^2]$$
$$= \frac{1 + 5i + 6(-1)}{1 - 9i^2} \qquad [\because i^2 = -1]$$
$$= \frac{1 + 5i - 6}{1 + 9} = \frac{-5 + 5i}{10} = \frac{-1 + i}{2}$$

$\Rightarrow \quad z = -\frac{1}{2} + \frac{1}{2}i$

$\therefore \quad |z| = \sqrt{\left(-\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^2} \quad [\because |a + ib| = \sqrt{a^2 + b^2}]$

$= \sqrt{\frac{1}{4} + \frac{1}{4}} = \sqrt{\frac{2}{4}} = \sqrt{\frac{1}{2}} = \frac{1}{\sqrt{2}}$

$\therefore$ Now, $\tan\theta = \left|\frac{\frac{1}{2}}{\frac{1}{-2}}\right| \quad \left[\because \theta = \tan^{-1}\left|\left(\frac{\text{Im}(z)}{\text{Re}(z)}\right)\right|\right]$

$\Rightarrow \quad \tan\theta = 1 = \tan\frac{\pi}{4} \Rightarrow \theta = \frac{\pi}{4}$

Since, the real part of z is negative and imaginary part of z is positive, so the point lies in IInd quadrant.

$\therefore \quad \arg(z) = \pi = \theta = \pi - \frac{\pi}{4} = \frac{3\pi}{4}$

Hence, modulus $= \frac{1}{\sqrt{2}}$

and $\arg(z) = \frac{3\pi}{4}$

Work Book Exercise 4.1

1 If $\frac{x-3}{3+i} + \frac{y-3}{3-i} = i$, where $x, y \in R$, then

a $x = 2$ and $y = -8$ **b** $x = -2$ and $y = 8$
c $x = -2$ and $y = -6$ **d** $x = 2$ and $y = 8$

2 What is the real part of $(1+i)^{50}$?

a 0 **b** 2^{25}
c -2^{25} **d** -2^{50}

3 The complex number z satisfies $z + |z| = 2 + 8i$. Then, the value of $|z|$ is

a 10 **b** 13 **c** 17 **d** 23

4 If $z + z^3 = 0$, then which of the following must be true on the complex plane?

a $\text{Re}(z) < 0$ **b** $\text{Re}(z) = 0$
c $\text{Im}(z) = 0$ **d** $z^4 = 1$

5 The sequences $S = i + 2i^2 + 3i^3 + \ldots$ upto 100 terms simplifies to, where $i = \sqrt{-1}$

a $50(1-i)$ **b** $25i$
c $25(1+i)$ **d** $100(1-i)$

6 Given $i = \sqrt{-1}$, then the value of the sum

$$\frac{1}{1+i} + \frac{1}{1-i} + \frac{1}{-1+i} + \frac{1}{-1-i} + \frac{2}{1+i} + \frac{2}{1-i} + \frac{2}{-1+i} + \frac{2}{-1-i} + \frac{3}{1+i} + \frac{3}{1-i} + \frac{3}{-1+i} + \frac{3}{-1-i} + \ldots + \frac{n}{1+i} + \frac{n}{1-i} + \frac{n}{-1+i} + \frac{n}{-1-i}$$ is

a $2n^2 + 2n$ **b** $2in^2 + 2in$
c $(1+i)n^2$ **d** None of these

7 Let $i = \sqrt{-1}$. The product of the real part of the roots of $z^2 - z = 5 - 5i$ is

a -25 **b** -6 **c** -5 **d** 25

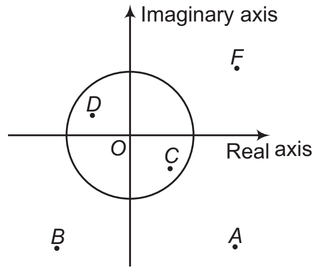
8 Number of complex numbers z satisfying $z^3 = \bar{z}$ is

a 1 **b** 2
c 4 **d** 5

9 Number of real solution of the equation, $z^3 + iz - 1 = 0$ is

a zero **b** one
c two **d** three

10 The diagram shows several numbers in the complex plane. The circle is the unit circle centered at the origin. One of these numbers is the reciprocal of F, which is



a A **b** B **c** C **d** D

11 Identify the incorrect statement.

a No non-zero complex number z satisfies the equation $\bar{z} = -4z$
b $z = z$ implies that z is purely real
c $z = -z$ implies that z is purely imaginary
d If z_1, z_2 are the roots of the quadratic equation $az^2 + bz + c = 0$ such that $\text{Im}(z_1 z_2) \neq 0$, then a, b, c must be real numbers

12 If $z = (3 + 7i)(p + iq)$, where $p, q \in I - \{0\}$, is purely imaginary, then minimum value of $|z|^2$ is

a 0 **b** 58
c $\frac{3364}{3}$ **d** 3364

13 Consider two complex numbers α and β as

$\alpha = \left(\frac{a+bi}{a-bi}\right)^2 + \left(\frac{a-bi}{a+bi}\right)^2$, where $a, b \in R$ and

$\beta = \frac{z-1}{z+1}$, where $|z| = 1$, then

a both α and β are purely real
b both α and β are purely imaginary
c α is purely real and β is purely imaginary
d β is purely real and α is purely imaginary

14 If z is a complex number having the argument θ, $0 < \theta < \frac{\pi}{2}$ and satisfying the equality $|z - 3i| = 3$.

Then, $\cot\theta - \frac{6}{z}$ is equal to

a 1 **b** -1 **c** i **d** $-i$

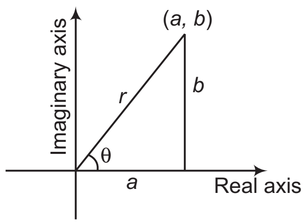
4 Various Forms of a Complex Number

Polar Form

Let $z = a + ib$ be any complex number, then by taking

$$a = r\cos\theta \quad \text{and} \quad b = r\sin\theta$$

We have,
$$z = a + ib$$
$$= r(\cos\theta + i\sin\theta)$$
(known as polar form)



where, $r = |z|$ and $\theta =$ Principal value of argument of z.

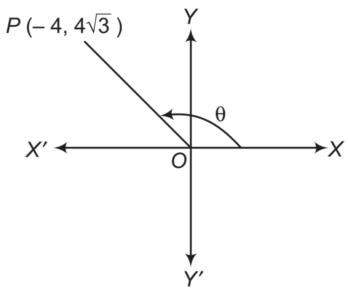
Example 21. *The polar form of the complex number* $\dfrac{-16}{1+i\sqrt{3}}$ *is*

(a) $4\left(\cos\dfrac{\pi}{3} + i\sin\dfrac{\pi}{3}\right)$ (b) $\left(\cos\dfrac{2\pi}{3} + i\sin\dfrac{2\pi}{3}\right)$

(c) $8\left(\cos\dfrac{2\pi}{3} + i\sin\dfrac{2\pi}{3}\right)$ (d) None of these

Sol. (c) Given complex number $= \dfrac{-16}{1+i\sqrt{3}}$

$$= \frac{-16}{1+i\sqrt{3}} \times \frac{(1-i\sqrt{3})}{(1-i\sqrt{3})}$$
$$= \frac{-16(1-i\sqrt{3})}{1-(i\sqrt{3})^2}$$
$$= \frac{-16\,(1-i\sqrt{3})}{1+3}$$
$$= -4(1-i\sqrt{3})$$
$$= -4 + i4\sqrt{3}$$



Let $-4 = r\cos\theta$, $4\sqrt{3} = r\sin\theta$

By squaring and adding, we get

$$16 + 48 = r^2(\cos^2\theta + \sin^2\theta)$$

which gives, $r^2 = 64$, i.e. $r = 8$

Hence, $\cos\theta = \dfrac{-1}{2}$

$\sin\theta = \dfrac{\sqrt{3}}{2}$

$\Rightarrow \theta = \pi - \dfrac{\pi}{3} = \dfrac{2\pi}{3}$

Thus, the required polar form is

$$8\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$$

Example 22. *Let z and w be two non-zero complex numbers, such that* $|z| = |w|$ *and* $\arg(z) + \arg(w) = \pi$. *Then, z is equal to*

(a) w (b) $-w$ (c) $-\overline{w}$ (d) $\overline{w}$

Sol. (c) Given $|z| = |w| = r$ and $\arg(w) = \theta$

Also, $\arg(z) + \arg(w) = \pi$

$\Rightarrow \arg(z) = \pi - \theta$

Now,
$$z = r[\cos(\pi - \theta) + i\sin(\pi - \theta)]$$
$$= r[-\cos\theta + i\sin\theta]$$
$$= -r\overline{(\cos\theta + i\sin\theta)} = -\overline{w}$$

Eulerian Form of a Complex Number

We have,

$$e^{i\theta} = \cos\theta + i\sin\theta \quad \text{and} \quad e^{-i\theta} = \cos\theta - i\sin\theta.$$

These two are called Euler's notations.

Let z be any complex number, such that $|z| = r$ and $\arg(z) = \theta$. Then, in polar form, z can be written as

$$z = r(\cos\theta + i\sin\theta)$$

Using Euler's notations, we have

$$z = re^{i\theta}$$

This form of z is known as the Eulerian form.

Example 23. *Express the following complex numbers in Eulerian form.*

(i) $1 + i$ (ii) $-2 + 2i$ (iii) $-1 - i\sqrt{3}$

Sol. (i) Given, $z = 1 + i$.

Then, $r = |z| = \sqrt{1^2 + 1^2} = \sqrt{2}$

Let θ be the argument of z. Then, $\tan\theta = \dfrac{1}{1} = 1 \Rightarrow \theta = \dfrac{\pi}{4}$

So, Eulerian form of z is $\sqrt{2}e^{\frac{i\pi}{4}}$.

(ii) Given, $z = -2 + 2i$

Then, $r = |z| = \sqrt{(-2)^2 + 2^2} = 2\sqrt{2}$

Let θ be the argument of z. Then,

$$\tan\theta = \frac{2}{-2} = -1 \Rightarrow \theta = \frac{3\pi}{4}$$

So, Eulerian form of z is $2\sqrt{2}e^{\frac{i3\pi}{4}}$.

(iii) Given, $z = -1 - i\sqrt{3}$

Then, $r = |z| = \sqrt{(-1)^2 + (-\sqrt{3})^2} = 2$

Let θ be the argument of z. Then,

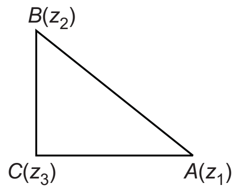
$$\tan\theta = \frac{-\sqrt{3}}{-1} = \sqrt{3} \Rightarrow \theta = -\frac{2\pi}{3}$$

So, Eulerian form of z is $2e^{-i\frac{2\pi}{3}}$.

Example 24. *Complex numbers z_1, z_2, z_3 are the vertices A, B, C respectively of an isosceles right angled triangle with right angle at C. Show that*

$$(z_1 - z_2)^2 = 2(z_1 - z_3)(z_3 - z_2).$$

Sol. In an isosceles ΔABC, $AC = BC$ and BC perpendicular to AC. It means that AC is rotated through angle $\frac{\pi}{2}$ to occupy the position BC.



We have,

$$\frac{z_2 - z_3}{z_1 - z_3} = e^{i\pi/2} = i$$

$$\Rightarrow \quad z_2 - z_3 = +i(z_1 - z_3)$$

$$\Rightarrow z_2^2 + z_3^2 - 2z_2z_3 = -(z_1^2 + z_3^2 - 2z_1z_3)$$

$$\Rightarrow z_1^2 + z_2^2 - 2z_1z_2 = 2z_1z_3 + 2z_2z_3 - 2z_1z_2 - 2z_3^2$$

$$= 2(z_1 - z_3)(z_3 - z_2)$$

$$\Rightarrow \quad (z_1 - z_2)^2 = 2(z_1 - z_3)(z_3 - z_2)$$

Properties of Modulus of Complex Number

i.	$\lvert z\rvert \ge 0 \Rightarrow \lvert z\rvert = 0$ iff $z = 0$ and $\lvert z\rvert > 0$ iff $z \ne 0$
ii.	$-\lvert z\rvert \le \text{Re}(z) \le \lvert z\rvert$ and $-\lvert z\rvert \le \text{Im}(z) \le \lvert z\rvert$
iii.	$\lvert z\rvert = \lvert\bar{z}\rvert = \lvert -z\rvert = \lvert -\bar{z}\rvert$
iv.	$z\bar{z} = \lvert z\rvert^2$
v.	$\lvert z_1z_2\rvert = \lvert z_1\rvert\lvert z_2\rvert$ In general, $\lvert z_1z_2z_3 \dots z_n\rvert = \lvert z_1\rvert\lvert z_2\rvert\lvert z_3\rvert \dots \lvert z_n\rvert$
vi.	$\left\lvert\frac{z_1}{z_2}\right\rvert = \frac{\lvert z_1\rvert}{\lvert z_2\rvert}, (z_2 \ne 0)$
vii.	$\lvert z_1 \pm z_2\rvert \le \lvert z_1\rvert + \lvert z_2\rvert$ In general, $\lvert z_1 \pm z_2 \pm z_3 \pm \dots \pm z_n\rvert$ $\le \lvert z_1\rvert + \lvert z_2\rvert + \lvert z_3\rvert + \dots + \lvert z_n\rvert$
viii.	$\lvert z_1 \pm z_2\rvert \ge \lvert\lvert z_1\rvert - \lvert z_2\rvert\rvert$
ix.	$\lvert z^n\rvert = \lvert z_z\rvert^n$
x.	$\lvert\lvert z_1\rvert - \lvert z_2\rvert\rvert \le \lvert z_1 + z_2\rvert \le \lvert z_1\rvert + \lvert z_2\rvert$ Thus, $\lvert z_1\rvert + \lvert z_2\rvert$ is the greatest possible value of $\lvert z_1 + z_2\rvert$ and $\lvert\lvert z_1\rvert - \lvert z_2\rvert\rvert$ is the least possible value of $\lvert z_1 + z_2\rvert$.
xi.	$\lvert z_1 \pm z_2\rvert^2 = (z_1 \pm z_2)(\bar{z}_1 \pm \bar{z}_2)$ $= \lvert z_1\rvert^2 + \lvert z_2\rvert^2 \pm (z_1\bar{z}_2 + \bar{z}_1z_2)$ $= \lvert z_1\rvert^2 + \lvert z_2\rvert^2 \pm 2\text{Re}(z_1\bar{z}_2)$
xii.	$\lvert z_1 + z_2\rvert^2 = \lvert z_1\rvert^2 + \lvert z_2\rvert^2$ $\Leftrightarrow \frac{z_1}{z_2}$ is purely imaginary.
xiii.	$\lvert z_1 + z_2\rvert^2 + \lvert z_1 - z_2\rvert^2 = 2\{\lvert z_1\rvert^2 + \lvert z_2\rvert^2\}$
xiv.	$\lvert az_1 - bz_2\rvert^2 + \lvert bz_1 + az_2\rvert^2$ $= (a^2 + b^2)(\lvert z_1\rvert^2 + \lvert z_2\rvert^2)$, where $a, b \in R$.

- *If z is unimodular, then $|z| = 1$. Now, if $f(z)$ is a unimodular, then it is always be expressed as $f(z) = \cos\theta + i\sin\theta, \theta \in R$.*
- *Square root of $z = a + ib$ is given by*

$$\sqrt{z} = \pm\left\{\sqrt{\frac{|z| + a}{2}} + i\sqrt{\frac{|z| - a}{2}}\right\}, a = \text{Re}(z)$$

To find the square root of $a - ib$, replace i by $-i$ in the above result.

- *If $x, y \in R$, then*

$$\sqrt{x + iy} + \sqrt{x - iy} = \sqrt{2(\sqrt{x^2 + y^2} + x)}$$

$$\sqrt{x + iy} - \sqrt{x - iy} = i\sqrt{2(\sqrt{x^2 + y^2} - x)}$$

Example 25. *If $x - iy = \sqrt{\frac{a - ib}{c - id}}$, then $(x^2 + y^2)^2$ is equal to*

(a) $\frac{a^2 - b^2}{c^2 - d^2}$ *(b)* $\frac{a^2 + b^2}{c^2 + d^2}$

(c) $\frac{a^2 + b^2}{c^2 - d^2}$ *(d) None of these*

Sol. (b) Given, $x - iy = \sqrt{\frac{a - ib}{c - id}}$

$$\Rightarrow \quad x + i(-y) = \left(\frac{a - ib}{c - id}\right)^{1/2}$$

On taking modulus both sides, we get

$$|x + i(-y)| = \left|\left(\frac{a - ib}{c - id}\right)^{1/2}\right|$$

$$\Rightarrow \quad \sqrt{x^2 + (-y)^2} = \left|\frac{a - ib}{c - id}\right|^{1/2}$$

$$[\because |x + iy| = \sqrt{x^2 + y^2} \text{ and } |z^n| = |z|^n]$$

$$\Rightarrow \quad \sqrt{x^2 + y^2} = \left|\frac{a - ib}{c - id}\right|^{1/2}$$

On squaring both sides, we get

$$x^2 + y^2 = \left|\frac{a - ib}{c - id}\right|$$

$$\Rightarrow \quad x^2 + y^2 = \frac{|a - ib|}{|c - id|} \quad \left[\because \left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}\right]$$

$$\Rightarrow \quad (x^2 + y^2) = \frac{\sqrt{a^2 + b^2}}{\sqrt{c^2 + d^2}} \quad [\because |x - iy| = \sqrt{x^2 + y^2}]$$

On squaring both sides, we get

$$(x^2 + y^2)^2 = \frac{a^2 + b^2}{c^2 + d^2}$$

Example 26. *For a complex number z, the minimum value of* $|z|+|z-2|$ *is*

(a) 1 (b) 2

(c) 3 (d) None of these

Sol. (b) By using $|z_1|+|z_2| \geq |z_1 - z_2|$

We have, $|z|+|z-2| \geq |z-(z-2)|$

$\therefore$ $|z|+|z-2| \geq 2$

Example 27. *If* $|z_1 - 1| < 1$, $|z_2 - 2| < 2$ *and* $|z_3 - 3| < 3$, *then* $|z_1 + z_2 + z_3|$

(a) is less than 6 (b) is more than 3

(c) is less than 12 (d) lies between 6 and 12

Sol. (c) $|z_1 + z_2 + z_3| = |(z_1 - 1) + (z_2 - 2) + (z_3 - 3) + 6|$

$\leq |z_1 - 1| + |z_2 - 2| + |z_3 - 3| + 6$

$< 1 + 2 + 3 + 6 = 12$

Example 28. *If* α, β *are two complex numbers, then* $|\alpha|^2 + |\beta|^2$ *is equal to*

(a) $\frac{1}{2}(|\alpha+\beta|^2 - |\alpha-\beta|^2)$ (b) $\frac{1}{2}(|\alpha+\beta|^2 + |\alpha-\beta|^2)$

(c) $|\alpha+\beta|^2 + |\alpha-\beta|^2$ (d) None of these

Sol. (b) $|\alpha+\beta|^2 = (\alpha+\beta)\overline{(\alpha+\beta)} = (\alpha+\beta)(\bar{\alpha}+\bar{\beta})$

$= \alpha\bar{\alpha} + \beta\bar{\beta} + \alpha\bar{\beta} + \bar{\alpha}\beta$

$= |\alpha|^2 + |\beta|^2 + \alpha\bar{\beta} + \bar{\alpha}\beta$ ...(i)

$|\alpha-\beta|^2 = (\alpha-\beta)(\bar{\alpha}-\bar{\beta}) = \alpha\bar{\alpha} + \beta\bar{\beta} - \alpha\bar{\beta} - \bar{\alpha}\beta$

$= |\alpha|^2 + |\beta|^2 - \alpha\bar{\beta} - \bar{\alpha}\beta$ ...(ii)

Adding Eqs. (i) and (ii), we get

$$|\alpha|^2 + |\beta|^2 = \frac{1}{2}\{|\alpha+\beta|^2 + |\alpha-\beta|^2\}$$

Example 29. *If* z_1 *and* z_2 *are two complex numbers, such that* $|z_1| < 1 < |z_2|$, *then prove that* $\left|\dfrac{1 - z_1\bar{z}_2}{z_1 - z_2}\right| < 1$.

Sol. Given, $|z_1| < 1$ and $|z_2| > 1$ ...(i)

Then, to prove

$$\frac{|1 - z_1\bar{z}_2|}{|z_1 - z_2|} < 1 \quad \left[\because \left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}\right]$$

$\Rightarrow$ $|1 - z_1\bar{z}_2| < |z_1 - z_2|$ ...(ii)

On squaring both sides, we get

$(1 - z_1\bar{z}_2)(1 - \bar{z}_1 z_2) < (z_1 - z_2)(\bar{z}_1 - \bar{z}_2)$ $(\because |z|^2 = z\bar{z})$

$\Rightarrow$ $1 - z_1\bar{z}_2 - \bar{z}_1 z_2 + z_1\bar{z}_1 z_2\bar{z}_2 < z_1\bar{z}_1 - z_1\bar{z}_2 - z_2\bar{z}_1 + z_2\bar{z}_2$

$\Rightarrow$ $1 + |z_1|^2|z_2|^2 < |z_1|^2 + |z_2|^2$

$\Rightarrow 1 - |z_1|^2 - |z_2|^2 + |z_1|^2|z_2|^2 < 0$

$\Rightarrow$ $(1 - |z_1|^2)(1 - |z_2|^2) < 0$ ...(iii)

which is true by Eq. (i) as $|z_1| < 1$ and $|z_2| > 1$.

$\therefore$ $(1 - |z_1|^2) > 0$

and $(1 - |z_2|^2) < 0$

$\therefore$ Eq. (iii) is true, whenever Eq. (i) is true.

$\Rightarrow$ $\left|\dfrac{1 - z_1\bar{z}_2}{z_1 - z_2}\right| < 1$ **Hence proved.**

Example 30. *The value of* $\sqrt{-8-6i}$ *is equal to*

(a) $1 \pm 3i$ (b) $\pm(1-3i)$ (c) $\pm(1+3i)$ (d) $\pm(3-i)$

Sol. (b) Given, $\sqrt{-8-6i} = x + iy = z$

Then, $\sqrt{z} = \pm\left[\sqrt{\dfrac{|z|+x}{2}} - i\sqrt{\dfrac{|z|-x}{2}}\right]$ $[\because \text{Im}(z) < 0]$

$\Rightarrow$ $\sqrt{z} = \pm\left[\sqrt{\dfrac{10-8}{2}} - i\sqrt{\dfrac{10+8}{2}}\right]$ $[\because |z| = \sqrt{x^2+y^2}]$

$\Rightarrow$ $\sqrt{z} = \pm(1-3i)$

Example 31. *The value of* $(4 + 3\sqrt{-20})^{1/2} + (4 - 3\sqrt{-20})^{1/2}$ *is*

(a) ± 6 (b) 0 (c) $\pm\sqrt{5}$ (d) ± 3

Sol. (a) We may write, $(4 + 3\sqrt{-20}) = (4 + 6i\sqrt{5})$

Let $(4 + 3\sqrt{-20})^{1/2} = (x + iy)$

Then, $(4 + 6i\sqrt{5})^{1/2} = (x + iy)$

$\Rightarrow$ $4 + 6i\sqrt{5} = (x^2 - y^2) + (2xy)i$

$\Rightarrow$ $x^2 + y^2 = 4$ and $2xy = 6\sqrt{5}$

$\therefore$ $x^2 + y^2 = \sqrt{(x^2-y^2)^2 + 4x^2y^2}$

$= \sqrt{(16 + 180)} = \sqrt{196} = 14$

On solving the equations $x^2 = y^2 = 14$ and $x^2 - y^2 = 4$, we get

$x^2 = 9$ and $y^2 = 5$

$\therefore$ $x = \pm 3$ and $y = \pm\sqrt{5}$

Since, $xy > 0$, it follows that x and y are of the same sign.

$\therefore$ $x = 3, y = \sqrt{5}$ or $x = -3, = -\sqrt{5}$

So, $(4 + 3\sqrt{-20})^{1/2} = (4 + 6i\sqrt{5})^{1/2}$

$= \pm(3 + \sqrt{5}i)$ ...(i)

$\therefore$ $(4 - 3\sqrt{-20})^{1/2} = \pm(3 - \sqrt{5}i)$ ...(ii)

Hence, $(4 + 3\sqrt{-20})^{1/2} + (4 - 3\sqrt{20})^{1/2} = \pm 6$

[on adding Eqs. (i) and (ii)]

Aliter

Here, $x = 4, y = 6\sqrt{5}$

$\therefore$ $= (4 + 3\sqrt{-20})^{1/2} + (4 - 3\sqrt{-20})^{1/2}$

$= \sqrt{2\{\sqrt{4^2 + (6\sqrt{5})^2} + 4\}} = \sqrt{2(\sqrt{16 + 180 + 4})}$

$= \sqrt{2(14 + 4)} = \sqrt{36} = \pm 6$

Properties of Arguments

i. $\arg(z_1 z_2) = \arg(z_1) + \arg(z_2) + 2k\pi$. $(k = 0 \text{ or } 1 \text{ or } -1)$

In general,

$\arg(z_1 z_2 z_3 \ldots z_n) = \arg(z_1) + \arg(z_2) + \arg(z_3) + \ldots + \arg(z_n) + 2k\pi$ $(k = 0 \text{ or } 1 \text{ or } -1)$

ii. $\arg\left(\dfrac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2) + 2k\pi$ $(k = 0 \text{ or } 1 \text{ or } -1)$

iii. $\arg\left(\dfrac{z}{\bar{z}}\right) = 2\arg(z) + 2k\pi$ $(k = 0 \text{ or } 1 \text{ or } -1)$

iv. $\arg(z^n) = n\arg(z) + 2k\pi$ $(k = 0 \text{ or } 1 \text{ or } -1)$

v. If $\arg\left(\dfrac{z_2}{z_1}\right) = \theta$, then $\arg\left(\dfrac{z_1}{z_2}\right) = 2k\pi - \theta$, where $k \in I$.

vi. $\arg(\bar{z}) = -\arg(z) = \arg\left(\frac{1}{2}\right)$

vii. If $\arg(z) = 0 \Rightarrow z$ is real.

viii. $\arg(z_1 \bar{z}_2) = \arg(z_1) - \arg(z_2)$

ix. $|z_1 + z_2| = |z_1 - z_2| \Rightarrow \arg(z_1) - \arg(z_2) = \frac{\pi}{2}$

x. $|z_1 + z_2| = |z_1| + |z_2| \Rightarrow \arg(z_1) = \arg(z_2)$

xi. If $|z_1| \le 1, |z_2| \le 1$, then

(a) $|z_1 - z_2|^2 \le (|z_1| - |z_2|)^2 + [\arg(z_1) - \arg(z_2)]^2$

(b) $|z_1 + z_2|^2 \ge (|z_1| + |z_2|)^2 - [\arg(z_1) - \arg(z_2)]^2$

xii. $|z_1 \pm z_2|^2 = |z_1|^2 + |z_2|^2 \pm 2|z_1||z_2| \cos(\theta_1 - \theta_2)$

xiii. $z_1 \bar{z}_2 + \bar{z}_1 z_2 = 2|z_1||z_2| \cos(\theta_1 - \theta_2)$

where, $\theta_1 = \arg(z_1)$ and $\theta_2 = \arg(z_2)$

Proper value of k must be chosen, so that RHS of (i), (ii), (iii) and (iv) lies in $(-\pi, \pi)$.

Example 32. *If $z = \frac{\sqrt{3} + i}{\sqrt{3} - i}$, then the fundamental amplitude of z is*

(a) $-\frac{\pi}{3}$ (b) $\frac{\pi}{3}$

(c) $\frac{\pi}{6}$ (d) None of these

Sol. (b) $\text{amp}(z) = \text{amp}\left(\frac{\sqrt{3} + i}{\sqrt{3} - i}\right)$

$= \text{amp}(\sqrt{3} + i) - \text{amp}(\sqrt{3} - i)$

$= \tan^{-1}\frac{1}{\sqrt{3}} - \tan^{-1}\left(\frac{-1}{\sqrt{3}}\right) = \frac{\pi}{6} + \frac{\pi}{6} = \frac{\pi}{3}$

Example 33. *The value of $\text{amp}(i\omega) + \text{amp}(i\omega^2)$, where $i = \sqrt{-1}$ and $\omega = \sqrt[3]{1}$ = non-real, is*

(a) 0 (b) $\frac{\pi}{2}$

(c) π (d) None of these

Sol. (c) $\text{amp}(i\omega) + \text{amp}(i\omega^2) = \text{amp}(i^2 \cdot \omega^3) = \text{amp}(-1) = \pi$

Example 34. *If z_1, z_2 and z_3, z_4 are two pairs of conjugate complex numbers, then $\arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right)$ equals to*

(a) 0 (b) $\frac{\pi}{2}$ (c) $\frac{3\pi}{2}$ (d) π

Sol. (a) We have, $z_2 = \bar{z}_1$ and $z_4 = \bar{z}_3$

$\therefore$ $z_1 z_2 = |z_1|^2$ and $z_3 z_4 = |z_3|^2$

Now, $\arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right) = \arg\left(\frac{z_1 z_2}{z_4 z_3}\right)$

$= \arg\left(\frac{|z_1|^2}{|z_3|^2}\right) = \arg\left(\left|\frac{z_1}{z_3}\right|^2\right) = 0$

[$\because$ argument of positive real number is zero]

De-Moivre's Theorem

(a) If $n \in I$ (the set of integers), then $(\cos\theta + i\sin\theta)^n = \cos n\theta + i\sin n\theta$.

(b) If $n \in Q$ (the set of rational numbers), then $\cos n\theta + i\sin n\theta$ is one of the values of $(\cos\theta + i\sin\theta)^n$.

Remark

(i) The theorem is also true for $(\cos\theta - i\sin\theta)$, i.e. $(\cos\theta - i\sin\theta)^n = \cos n\theta - i\sin n\theta$, because

$$(\cos\theta - i\sin\theta)^n = [\cos(-\theta) + i\sin(-\theta)]^n$$
$$= \cos(n(-\theta)) + i\sin(n(-\theta))$$
$$= \cos(-n\theta) + i\sin(-n\theta)$$
$$= \cos n\theta - i\sin n\theta$$

(ii) $\frac{1}{\cos\theta + i\sin\theta} = (\cos\theta + i\sin\theta)^{-1} = \cos\theta - i\sin\theta$

(iii) If $z = (\cos\theta_1 + i\sin\theta_1)(\cos\theta_2 + i\sin\theta_2) \ldots (\cos\theta_n + i\sin\theta_n)$

Then, $z = \cos(\theta_1 + \theta_2 + \ldots + \theta_n) + i\sin(\theta_1 + \theta_2 + \ldots + \theta_n)$

(iv) If $z = r(\cos\theta + i\sin\theta)$ and n is a positive integer, then

$$z^{1/n} = r^{1/n}\left[\cos\left(\frac{2k\pi + \theta}{n}\right) + i\sin\left(\frac{2k\pi + \theta}{n}\right)\right],$$

where $k = 0, 1, 2, \ldots, (n-1)$

- $(\sin\theta \pm i\cos\theta)^n \ne \sin n\theta \pm i\cos n\theta$
- $(\sin\theta + i\cos\theta)^n = \left[\cos\left(\frac{\pi}{2} - \theta\right) + i\sin\left(\frac{\pi}{2} - \theta\right)\right]^n$
$= \cos\left(\frac{n\pi}{2} - n\theta\right) + i\sin\left(\frac{n\pi}{2} - n\theta\right)$
- $(\cos\theta + i\sin\phi)^n \ne \cos n\theta + i\sin n\phi$

Example 35. *If $z = \frac{\cos\theta + i\sin\theta}{\cos\theta - i\sin\theta}$, $\frac{\pi}{4} < \theta < \frac{\pi}{2}$. Then, $\arg(z)$ is*

(a) 2θ (b) $2\theta - \pi$

(c) $\pi + 2\theta$ (d) None of these

Sol. (a) $z = (\cos\theta + i\sin\theta)^2 = \cos 2\theta + i\sin 2\theta$

where, $\frac{\pi}{2} < 2\theta < \pi$

$\because$ Clearly, $\arg(z) = 2\theta$ $\left[\because \frac{\pi}{2} < \arg(z) < \pi\right]$

Example 36. *If* $x_r = \cos\left(\frac{\pi}{2^r}\right) + i\sin\left(\frac{\pi}{2^r}\right)$, *then the value of* $x_1 x_2 x_3 \dots \infty$ *is*

(a) -1 (b) 1
(c) 0 (d) None of these

Sol. (a) $\because x_r = \cos\left(\frac{\pi}{2^r}\right) + i\sin\left(\frac{\pi}{2^r}\right)$

$$\therefore \quad x_1 = \cos\frac{\pi}{2} + i\sin\frac{\pi}{2}$$

$$x_2 = \cos\frac{\pi}{2^2} + i\sin\frac{\pi}{2^2}$$

$$\vdots \qquad \vdots$$

$$\Rightarrow x_1 x_2 x_3 \dots = \left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)\left(\cos\frac{\pi}{2^2} + i\sin\frac{\pi}{2^2}\right)\dots$$

$$= \cos\left(\frac{\pi}{2} + \frac{\pi}{2^2} + \dots\right) + i\sin\left(\frac{\pi}{2} + \frac{\pi}{2^2} + \dots\right)$$

$$= \cos\left(\frac{\frac{\pi}{2}}{1-\frac{1}{2}}\right) + i\sin\left(\frac{\frac{\pi}{2}}{1-\frac{1}{2}}\right)$$

$$= \cos\pi + i\sin\pi = -1$$

Example 37. $\frac{(\cos\theta + i\sin\theta)^4}{(\sin\theta + i\cos\theta)^5}$ *is equal to*

(a) $\cos\theta - i\sin\theta$ (b) $\cos 9\theta - i\sin 9\theta$
(c) $\sin\theta - i\cos\theta$ (d) $\sin 9\theta - i\cos 9\theta$

Sol. (d) $\frac{(\cos\theta + i\sin\theta)^4}{(\sin\theta + i\cos\theta)^5} = \frac{(\cos\theta + i\sin\theta)^4}{i^5\left(\frac{1}{i}\sin\theta + \cos\theta\right)^5}$

$$= \frac{(\cos\theta + i\sin\theta)^4}{i(\cos\theta - i\sin\theta)^5} = \frac{(\cos\theta + i\sin\theta)^4}{i(\cos\theta + i\sin\theta)^{-5}}$$

$$= \frac{1}{i}(\cos\theta + i\sin\theta)^9 = \sin 9\theta - i\cos 9\theta$$

Example 38. *If* $z = \left(\frac{\sqrt{3}}{2} + \frac{i}{2}\right)^5 + \left(\frac{\sqrt{3}}{2} - \frac{i}{2}\right)^5$, *then*

(a) $\text{Re}(z) = 0$ (b) $\text{Im}(z) = 0$
(c) $\text{Re}(z) > 0, \text{Im}(z) > 0$ (d) $\text{Re}(z) > 0, \text{Im}(z) < 0$

Sol. (b) Given,

$$z = \left(\frac{\sqrt{3}}{2} + \frac{i}{2}\right)^5 + \left(\frac{\sqrt{3}}{2} - \frac{i}{2}\right)^5$$

$$= \left[\cos\left(\frac{\pi}{6}\right) + i\sin\left(\frac{\pi}{6}\right)\right]^5 + \left[\cos\left(\frac{\pi}{6}\right) - i\sin\left(\frac{\pi}{6}\right)\right]^5$$

$$= \cos\frac{5\pi}{6} + i\sin\frac{5\pi}{6} + \cos\frac{5\pi}{6} - i\sin\frac{5\pi}{6} = 2\cos\frac{5\pi}{6}$$

Hence, $\text{Im}(z) = 0$.

Example 39. *The product of all the values of* $\left(\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right)^{3/4}$ *is*

(a) -1 (b) 1 (c) 3/2 (d) $-1/2$

Sol. (b) Given, $\left[\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right]^{3/4} = [\cos\pi + i\sin\pi]^{1/4}$

Since, the expression has only 4 different roots, therefore on putting $n = 0, 1, 2, 3$ in

$\cos\left[\frac{2n\pi + \pi}{4}\right] + i\sin\left[\frac{2n\pi + \pi}{4}\right]$ and multiplying them,

we get $\left[\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right]\left[\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right]$

$$\left[\cos\frac{5\pi}{4} + i\sin\frac{5\pi}{4}\right]\left[\cos\frac{7\pi}{4} + i\sin\frac{7\pi}{4}\right]$$

$$= \left[\frac{1}{\sqrt{2}} + i\frac{1}{\sqrt{2}}\right]\left[\frac{-1}{\sqrt{2}} + i\frac{1}{\sqrt{2}}\right]\left[\frac{-1}{\sqrt{2}} + i\frac{-1}{\sqrt{2}}\right]\left[\frac{1}{\sqrt{2}} - i\frac{1}{\sqrt{2}}\right]$$

$$= \left(-\frac{1}{2} - \frac{1}{2}\right)\left(\frac{-1}{2} - \frac{1}{2}\right) = (-1)(-1) = 1$$

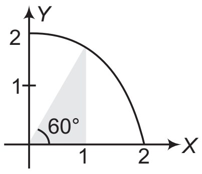
Work Book Exercise 4.2

1 The maximum and minimum values of $|z + 1|$, when $|z + 3| \le 3$ are

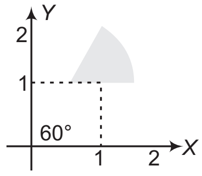
a (5, 0) b (6, 0) c (7, 1) d (5, 1)

2 The region represented by inequalities $\arg z \le \frac{\pi}{3}, |z| \le 2, \text{Im}(z) \ge 1$ in the argand diagram is given by

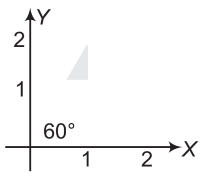
a



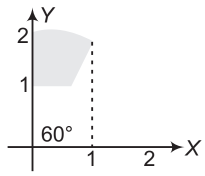
b



c



d



3 If $\frac{1+2i}{2+i} = r(\cos\theta + i\sin\theta)$, then

a $r = 1, \theta = \tan^{-1}\frac{3}{4}$ b $r = \sqrt{5}, \theta = \tan^{-1}\frac{4}{3}$
c $r = 1, \theta = \tan^{-1}\frac{4}{3}$ d None of these

4 If z_1 and z_2 are two non-zero complex numbers, such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg(z_1) - \arg(z_2)$ is equal to

a $-\pi$ b $-\frac{\pi}{2}$ c 0 d $\frac{\pi}{2}$

5 If $z = 1 - \sin\alpha + i\cos\alpha$, where $\alpha \in \left(0, \frac{\pi}{2}\right)$, then the modulus and the principal value of the argument of z are respectively

a $\sqrt{2(1-\sin\alpha)}, \left(\frac{\pi}{4} + \frac{\alpha}{2}\right)$ b $\sqrt{2(1-\sin\alpha)}, \left(\frac{\pi}{4} - \frac{\alpha}{2}\right)$
c $\sqrt{2(1+\sin\alpha)}, \left(\frac{\pi}{4} + \frac{\alpha}{2}\right)$ d $\sqrt{2(1+\sin\alpha)}, \left(\frac{\pi}{4} - \frac{\alpha}{2}\right)$

6 The expression $\left[\dfrac{1+\sin\dfrac{\pi}{8}+i\cos\dfrac{\pi}{8}}{1+\sin\dfrac{\pi}{8}-i\cos\dfrac{\pi}{8}}\right]^8$ is equal to

a 1 **b** -1 **c** i **d** $-i$

7 If $z_r = \cos\dfrac{2r\pi}{5} + i\sin\dfrac{2r\pi}{5}$, $r = 0, 1, 2, 3, 4, \ldots$, then $z_1z_2z_3z_4z_5$ is equal to

a -1 **b** 0
c 1 **d** None of these

8 If $z_n = \cos\dfrac{\pi}{(2n+1)(2n+3)} + i\sin\dfrac{\pi}{(2n+1)(2n+3)}$, then $\lim\limits_{n\to\infty}(z_1\cdot z_2\cdot z_3 \ldots z_n)$ is equal to

a $\cos\dfrac{\pi}{3} + i\sin\dfrac{\pi}{3}$ **b** $\cos\dfrac{\pi}{6} + i\sin\dfrac{\pi}{6}$
c $\cos\dfrac{\pi}{12} + i\sin\dfrac{\pi}{12}$ **d** None of these

9 If z_1, z_2 are two complex numbers and a, b are two real numbers, then $|az_1 - bz_2|^2 + |bz_1 + az_2|^2$ is equal to

a $(a+b)^2[|z_1|^2 + |z_2|^2]$
b $(a+b)[|z_1|^2 + |z_2|^2]$
c $(a^2-b^2)[|z_1|^2 + |z_2|^2]$
d $(a^2+b^2)[|z_1|^2 + |z_2|^2]$

10 All real numbers x, which satisfy the inequality $|1 + 4i - 2^{-x}| \le 5$, where $i = \sqrt{-1}, x \in R$ are

a $[-2, \infty)$ **b** $(-\infty, 2]$
c $[0, \infty)$ **d** $[-2, 0]$

11 Square root of $x^2 + \dfrac{1}{x^2} - \dfrac{4}{i}\left(x - \dfrac{1}{x}\right) - 6$, where $x \in R$ is equal to

a $\pm\left(x - \dfrac{1}{x} + 2i\right)$ **b** $\pm\left(x - \dfrac{1}{x} - 2i\right)$
c $\pm\left(x + \dfrac{1}{x} + 2i\right)$ **d** $\pm\left(x + \dfrac{1}{x} - 2i\right)$

12 The minimum value of $|1+z| + |1-z|$, where z is a complex number, is

a 2 **b** $\dfrac{3}{2}$
c 1 **d** 0

13 If $\arg(z+a) = \dfrac{\pi}{6}$ and $\arg(z-a) = \dfrac{2\pi}{3}$, $a \in R^+$, then

a z is independent of a **b** $|a| = |z + a|$
c $z = a, c$ is $\dfrac{\pi}{6}$ **d** $z = a, c$ is $\dfrac{\pi}{3}$

14 Let z be a complex number satisfying the equation $(z^3+3)^2 = -16$, then $|z|$ has the value equal to

a $5^{1/2}$ **b** $5^{1/3}$ **c** $5^{2/3}$ **d** 5

15 For $z_1 = \sqrt[6]{\dfrac{1-i}{1+i\sqrt{3}}}$, $z_2 = \sqrt[6]{\dfrac{1-i}{\sqrt{3}+i}}$, $z_3 = \sqrt[6]{\dfrac{1+i}{\sqrt{3}-i}}$, which of the following holds good?

a $\Sigma|z_1|^2 = \dfrac{3}{2}$
b $|z_1|^4 + |z_2|^4 = |z_3|^{-8}$
c $\Sigma|z_1|^3 + |z_2|^3 = |z_3|^{-6}$
d $|z_1|^4 + |z_2|^4 = |z_3|^8$

Roots of Unity

Cube Roots of Unity

Let $\quad x = \sqrt[3]{1}$

$\Rightarrow \quad x^3 - 1 = 0$

$\Rightarrow \quad (x-1)(x^2+x+1) = 0$

Therefore, $x = 1, \dfrac{-1+i\sqrt{3}}{2}, \dfrac{-1-i\sqrt{3}}{2}$

If second root is represented by ω, then third root will be ω^2. Therefore, cube roots of unity are $1, \omega, \omega^2$ and ω, ω^2 are called the imaginary cube roots of unity.

Properties

i.	$1 + \omega^r + \omega^{2r} = \begin{cases} 0, \text{ if } r \text{ is not a multiple of } 3 \\ 3, \text{ if } r \text{ is not a multiple of } 3 \end{cases}$
ii.	$\omega^3 = 1$ or $\omega^{3r} = 1$
iii.	$\omega^{3r+1} = \omega, \omega^{3r+2} = \omega^2$
iv.	It always forms an equilateral triangle.

Important Identities

(i) $x^2 + x + 1 = (x-\omega)(x-\omega^2)$

(ii) $x^2 - x + 1 = (x+\omega)(x+\omega^2)$

(iii) $x^2 + xy + y^2 = (x - y\omega)(x - y\omega^2)$

(iv) $x^2 - xy + y^2 = (x + y\omega) + (x + y\omega^2)$

(v) $x^2 + y^2 = (x+iy)(x-iy)$

(vi) $x^3 + y^3 = (x+y)(x+y\omega)(x+y\omega^2)$

(vii) $x^3 - y^3 = (x-y) = (x-y\omega)(x-y\omega^2)$

(viii) $x^2 + y^2 + z^2 - xy - yz - zx$
$= (x + y\omega + z\omega^2)(x + y\omega^2 + z\omega)$
or $\quad (x\omega + y\omega^2 + z)(x\omega^2 + y\omega + z)$
or $\quad (x\omega + y + z\omega^2)(x\omega^2 + y + z\omega)$

(ix) $x^3 + y^3 + z^3 - 3xyz$
$= (x+y+z)(x + \omega y + \omega^2 y)(x + \omega y^2 + \omega z)$

(x) Two points $P(z_1)$ and $Q(z_2)$ lie on the same side or opposite side of the line $\bar{a}z + a\bar{z} + b$ accordingly as $\bar{a}z_1 + a\bar{z}_1 + b$ and $\bar{a}z_2 + a\bar{z}_2 + b$ have same sign or opposite sign.

Example 40. *If $x^2 - x + 1 = 0$, then the value of $\sum_{n=1}^{5}\left(x^n + \frac{1}{x^n}\right)^2$ is*

(a) 8
(b) 10
(c) 12
(d) None of the above

Sol. (a) $x^2 - x + 1 = 0 \Rightarrow x = \frac{1 \pm \sqrt{3}i}{2} = -\omega, -\omega^2$

$$\therefore \sum_{n=1}^{5}\left(x^{2n} + \frac{1}{x^{2n}} + 2\right)$$

$$= \left(x^2 + \frac{1}{x^2} + 2\right) + \left(x^4 + \frac{1}{x^4} + 2\right) + \left(x^6 + \frac{1}{x^6} + 2\right) + \left(x^8 + \frac{1}{x^8} + 2\right) + \left(x^{10} + \frac{1}{x^{10}} + 2\right)$$

$$= (\omega^2 + \omega^4 + \omega^6 + \omega^8 + \omega^{10}) + \left(\frac{1}{\omega^2} + \frac{1}{\omega^4} + \frac{1}{\omega^6} + \frac{1}{\omega^8} + \frac{1}{\omega^{10}}\right) + 10$$

$[\because x = -\omega \text{ or } -\omega^2]$

$$= -1 - 1 + 10 = 8$$

Example 41. *If $3^{49}(x + iy) = \left(\frac{3}{2} + \frac{\sqrt{3}}{2}i\right)^{100}$ and $x = ky$, then k is*

(a) $-\frac{1}{3}$
(b) $\sqrt{3}$
(c) $-\sqrt{3}$
(d) $-\frac{1}{\sqrt{3}}$

Sol. (d) As $3^{49}(x + iy) = \left(\frac{3}{2} + \frac{\sqrt{3}}{2}i\right)^{100} = \left[i\sqrt{3}\left(\frac{1 - i\sqrt{3}}{2}\right)\right]^{100}$

$$\Rightarrow \quad 3^{49}(x + iy) = i^{100} \cdot 3^{50} \cdot (-\omega)^{100}$$

$$\Rightarrow \quad 3^{49}(x + iy) = 3^{50} \cdot \omega = 3^{50} \cdot \left(-\frac{1}{2} + \frac{i\sqrt{3}}{2}\right)$$

$$\therefore \quad x + iy = -\frac{3}{2} + \frac{3\sqrt{3}}{2}i$$

$$\Rightarrow \quad x = -\frac{1}{\sqrt{3}}y$$

$$\therefore \quad k = -\frac{1}{\sqrt{3}}$$

Example 42. *If $z^2 - z + 1 = 0$, then $z^n - z^{-n}$, where n is a multiple of 3, is*

(a) $2(-1)^n$
(b) 0
(c) $(-1)^{n+1}$
(d) None of the above

Sol. (b) As $z^2 - z + 1 = 0 \Rightarrow z = -\omega, -\omega^2$

$$\therefore \quad z^n - z^{-n} = (-1)^n\omega^n - (-1)^{-n}\omega^{-n}$$

$= (-1)^n(\omega^n - \omega^{-n})$, if n is a multiple of 3.

$$= (-1)^n(1 - 1) = 0$$

*n*th Roots of Unity

Let $z = 1^{1/n}$. Then,

$$z = (\cos 0° + i\sin 0°)^{1/n}$$

$$z = (\cos 2r\pi + i\sin 2r\pi)^{1/n}, r \in Z$$

$$\Rightarrow z = \cos\frac{2r\pi}{n} + i\sin\frac{2r\pi}{n}, r = 0, 1, 2, \ldots, (n-1)$$

[using De-Moivre's theorem]

$$\Rightarrow z = e^{\frac{i2r\pi}{n}}, r = 0, 1, 2, \ldots, (n-1)$$

$$\Rightarrow z = \{e^{i2\pi/n}\}^r, r = 0, 1, 2, \ldots, (n-1)$$

$$z = \alpha^r, \alpha = e^{\frac{i2\pi}{n}}, r = 0, 1, 2, \ldots, (n-1)$$

Thus, nth roots of unity are $1, \alpha, \alpha^2, \ldots, \alpha^{n-1}$, where

$$\alpha = e^{\frac{i2\pi}{n}} = \cos\frac{2\pi}{n} + i\sin\frac{2\pi}{n}$$

Properties of *n*th Roots of Unity

i. nth roots of unity form a GP with common ratio $e^{\frac{i2\pi}{n}}$.

ii. Sum of nth roots of unity is always zero.

iii. Sum of pth powers of nth roots of unity is zero, if p is not a multiple of n.

iv. Sum of pth powers of nth roots of unity is n, if p is a multiple of n.

v. Product of nth roots of unity is $(-1)^{n-1}$.

vi. nth roots of unity lie on the unit circle $|z| = 1$ and divide its circumference into n equal parts.

Example 43. *If $z_1, z_2, z_3, \ldots, z_n$ are nth, roots of unity, then for $k = 1, 2, \ldots, n$*

(a) $|z_k| = k|z_{k+1}|$
(b) $|z_{k+1}| = k|z_k|$
(c) $|z_{k+1}| = |z_k| + |z_{k+1}|$
(d) $|z_k| = |z_{k+1}|$

Sol. (d) The nth roots of unity are given by

$$z_k = e^{\frac{i2\pi(k-1)}{n}}, k = 1, 2, \ldots, n$$

$$\therefore \quad |z_k| = \left|e^{\frac{i2\pi(k-1)}{n}}\right| = 1, \ \forall \ k = 1, 2, \ldots, n$$

$$\Rightarrow \quad |z_k| = |z_{k+1}|, \forall k = 1, 2, \ldots, n$$

Example 44. *If n is a positive integer greater than unity and z is a complex number satisfying the equation $z^n = (z+1)^n$, then*

(a) Re $(z) < 0$
(b) Re $(z) > 0$
(c) Re $(z) = 0$
(d) None of these

Sol. (a) We have, $z^n = (1+z)^n \Rightarrow \left(\frac{z}{z+1}\right)^n = 1$

$\Rightarrow \quad \frac{z}{z+1} = 1^{1/n}$

$\Rightarrow \frac{z}{z+1}$ is nth root of unity.

$\Rightarrow \quad \left|\frac{z}{z+1}\right| = 1 \Rightarrow \frac{|z|}{|z+1|} = 1$

$\Rightarrow \quad |z| = |z+1|$

$\Rightarrow \quad x + \frac{1}{2} = 0$ [taking $z = x + iy$]

$\Rightarrow \quad x = \frac{-1}{2} \Rightarrow \text{Re}(z) < 0$

Example 45. *If α is non-real and $\alpha = \sqrt[5]{1}$, then the value of $2^{\left|1+\alpha+\alpha^2+\alpha^{-2}-\alpha^{-1}\right|}$ is equal to*

(a) 4 *(b)* 2
(c) 1 *(d) None of these*

Sol. (a) $\because \alpha^5 = 1$

$\therefore \left|1+\alpha+\alpha^2+\alpha^{-2}-\alpha^{-1}\right| = \left|1+\alpha+\alpha^2+\alpha^3-\alpha^4\right|$

$= \left|1+\alpha+\alpha^2+\alpha^3+\alpha^4-2\alpha^4\right|$

$= \left|\frac{1-\alpha^5}{1-\alpha} - 2\alpha^4\right| = \left|2\alpha^4\right| = 2|\alpha|^4 = 2\times 1 = 2$

$\therefore \quad 2^2 = 4$

Work Book Exercise 4.3

1 If ω is a non-real cube root of unity, then the expression $(1-\omega)(1-\omega^2)(1+\omega^4)(1+\omega^8)$ is equal to

a 0 **b** 3 **c** 1 **d** 2

2 $x^{3m} + x^{3n-1} + x^{3r-2}$, where $m, n, r \in N$, is divisible by

a $x^2 - x + 1$ **b** $x^2 + x + 1$
c $x^2 + x - 1$ **d** None of these

3 If ω is a non-real cube root of unity, then $\frac{1+2\omega+3\omega^2}{2+3\omega+\omega^2} + \frac{2+3\omega+\omega^2}{3+\omega+2\omega^2}$ is equal to

a -1 **b** 2ω **c** 0 **d** -2ω

4 If $(\sqrt{3}+i)^n = (\sqrt{3}-i)^n$, $n \in N$, then least value of n is

a 3 **b** 4
c 6 **d** None of these

5 If $x^3 - 1 = 0$ has the non-real complex roots α, β, then the value of $(1+2\alpha+\beta)^3 - (3+3\alpha+5\beta)^3$ is

a -7 **b** 6
c -5 **d** 0

6 If $(\sqrt{3}-i)^n = 2^n$, $n \in I$, the set of integers, then n is a multiple of

a 6 **b** 10 **c** 9 **d** 12

7 If z is a complex number satisfying $z^4 + z^3 + 2z^2 + z + 1 = 0$, then $|z|$ is equal to

a $\frac{1}{2}$ **b** $\frac{3}{4}$
c 1 **d** None of these

8 If z is a non-real root of $\sqrt[7]{-1}$, then $z^{86} + z^{175} + z^{289}$ is equal to

a 0 **b** -1 **c** 3 **d** 1

9 Non-real complex number z satisfying the equation $z^3 + 2z^2 + 3z + 2 = 0$ are

a $\frac{-1\pm\sqrt{-7}}{2}$ **b** $\frac{1+\sqrt{7}i}{2}, \frac{1-\sqrt{7}i}{2}$
c $-i, \frac{-1+\sqrt{7}i}{2}, \frac{-1-\sqrt{7}i}{2}$ **d** None of these

10 If α is the non-real nth root of unity, then $1 + 3\alpha + 5\alpha^2 + \ldots + (2n-1)\alpha^{n-1}$ is equal to

a $\frac{2n}{1-\alpha}$ **b** $\frac{n}{1-\alpha}$
c $\frac{n}{2(1-\alpha)}$ **d** None of these

11 $\sqrt{-1-\sqrt{-1-\sqrt{-1\ldots\infty}}}$ is equal to, where ω is the imaginary cube of root of unity and $i = \sqrt{-1}$.

a ω or ω^2 **b** $-\omega$ or $-\omega^2$
c $1+i$ or $1-i$ **d** $-1+i$ or $-1-i$

12 If $\alpha = e^{i2\pi/n}$, then $(11-\alpha)(11-\alpha^2)\ldots(11-\alpha^{n-1})$ is equal to

a 11^{n-1} **b** $\frac{11^n-1}{10}$ **c** $\frac{11^{n-1}-1}{10}$ **d** $\frac{11^{n-1}-1}{11}$

13 The complex number w satisfying the equation $\omega^3 = 8i$ and lying in the IInd quadrant on the complex plane is

a $-\sqrt{3}+i$ **b** $-\frac{\sqrt{3}}{2}+\frac{1}{2}i$
c $-2\sqrt{3}+i$ **d** $-\sqrt{3}+2i$

14 Let z be a complex number satisfying the equation $z^6 + z^3 + 1 = 0$. If this equation has a root $re^{i\theta}$ with $90° < \theta < 180°$, then the value of θ is

a 100° **b** 110° **c** 160° **d** 170°

15 If ω is an imaginary cube root of unity, then the value of $(p+q)^3 + (p\omega+q\omega^2)^3 + (p\omega^2+q\omega)^3$ is

a $p^3 + q^3$
b $3(p^3+q^3)$
c $3(p^3+q^3) - pq(p+q)$
d $3(p^3+q^3) + pq(p+q)$

16 If $z^2 - z + 1 = 0$, then the value of $\left(z+\frac{1}{z}\right)^2 + \left(z^2+\frac{1}{z^2}\right)^2 + \left(z^3+\frac{1}{z^3}\right)^2 + \ldots + \left(z^{24}+\frac{1}{z^{24}}\right)$ is equal to

a 24 **b** 32
c 48 **d** None of these

17 If $p = a + b\omega + c\omega^2$ $q = b + c\omega + a\omega^2$ and $r = c + a\omega + b\omega^2$, where $a, b, c \neq 0$ and ω is the complex cube root of unity, then

a $p + q + r = a + b + c$
b $p^2 + q^2 + r^2 = a^2 + b^2 + c^2$
c $p^2 + q^2 + r^2 = -2(pq + qr + rp)$
d None of the above

18 If a and b are imaginary cube roots of unity, then $\alpha^n + \beta^n$ is equal to

a $2\cos\frac{2n\pi}{3}$ **b** $\cos\frac{2n\pi}{3}$
c $2i\sin\frac{2n\pi}{3}$ **d** $i\sin\frac{2n\pi}{3}$

19 If the six solutions of $x^6 = -64$ are written in the form $a + bi$, where a and b are real, then the product of those solutions with $a > 0$ is

a 4 **b** 8 **c** 16 **d** 64

20 If $\cos\theta + i\sin\theta$ is a root of the equation

$x^n + a_1 x^{n-1} + a_2 x^{n-2} + \ldots + a_{n-1}x + a_n = 0$, then

the value of $\sum_{r=1}^{n} a_r \cos r\theta$ is

a 0
b 1
c -1
d None of the above

21 If ω is a complex nth root of unity, then $\sum_{r=1}^{n} (ar + b)\omega^{r-1}$ is equal to

a $\frac{n(n+1)a}{2}$ **b** $\frac{nb}{1-n}$
c $\frac{na}{n-1}$ **d** None of these

22 If α, β respectively are the fifth and fourth non-real roots of unity, then the value of $(1+\alpha)(1+\beta)(1+\alpha^2)(1+\beta^2)(1+\beta^3)(1+\alpha^3)$ is

a 0 **b** $(1 + \alpha + \alpha^2)(1 - \beta^2)$
c $(1 + \alpha)(1 + \beta + \beta^2)$ **d** 1

23 When the polynomial $5x^3 + Mx + N$ is divided by $x^2 + x + 1$, the remainder is 0. The value of $(M + N)$ is equal to

a -3 **b** 5 **c** -5 **d** 15

24 If z and w are two complex numbers simultaneously satisfying the equations,

$$z^3 + w^5 = 0 \quad \text{and} \quad z^2 \cdot \overline{w}^4 = 1, \text{ then}$$

a z and w both are purely real
b z is purely real and w is purely imaginary
c w is purely real and z is purely imaginary
d z and w both are imaginary

25 Number of ordered pairs (z, ω) of the complex numbers z and ω satisfying the system of equations, $z^3 + \omega^7 = 0$ and $z^5 \cdot \omega^{11} = 1$ is

a 7 **b** 5 **c** 3 **d** 2

26 If $1, z_1, z_2, z_3, \ldots, z_{n-1}$ is the nth roots of unity and w is a non-real complex cube root of unity, then the product of $\prod_{r=1}^{n-1} (\omega - z_r)$ is cannot be equal to

a 0 **b** 1 **c** -1 **d** $1 + \omega$

27. If Z_r, $r = 1, 2, 3, \ldots, 50$ are the roots of the equation $\sum_{r=0}^{50} (Z)^r = 0$, then the value of $\sum_{r=1}^{50} \frac{1}{Z_r - 1}$ is

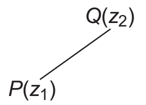
a -85 **b** -25 **c** 25 **d** 75

Geometrical Applications of Complex Numbers

Basic Concepts in Geometry

Distance formula The distance between two points $P(z_1)$ and $Q(z_2)$ is given by

$$PQ = |z_2 - z_1| = |\text{affix of } Q - \text{affix of } P|$$



For any complex number z,

$$|z| = |z - 0| = |z - (0 + i0)|$$

Thus, modulus of a complex number z represented by a point in the argand plane is its distance from origin.

Example 46. *Length of the line segment joining the points $-1 - i$ and $2 + 3i$ is*

(a) -5 *(b)* 15 *(c)* 5 *(d)* 25

Sol. (c) Let $z_1 = -1 - i$ and $z_2 = 2 + 3i$

Then, required distance $= |z_2 - z_1|$
$= |2 + 3i + 1 + i|$
$= 5$

Section formulae If $R(z)$ divides the line segment joining $P(z_1)$ and $Q(z_2)$ in the ratio $m_1 : m_2$ $(m_1, m_2 > 0)$, then

(i) For internal division, $z = \dfrac{m_1 z_2 + m_2 z_1}{m_1 + m_2}$

(ii) For external division, $z = \dfrac{m_1 z_2 - m_2 z_1}{m_1 - m_2}$

If $R(z)$ is the mid-point of PQ, then affix of R is $\dfrac{z_1 + z_2}{2}$

Example 47. *If A, B, C are three points in the argand plane representing the complex numbers* z_1, z_2, z_3 *such that* $z_1 = \frac{\lambda z_2 + z_3}{\lambda + 1}$, *where* $\lambda \in R$, *then the distance of A from the line BC is*

(a) λ

(b) $\frac{\lambda}{\lambda+1}$

(c) 1

(d) 0

Sol. (d) As $z_1 = \frac{\lambda z_2 + z_3}{\lambda + 1}$

which shows z_1 divides z_2, z_3 in the ratio of $1 : \lambda$.
Thus, the points are collinear.
$\therefore$ Distance of A from line BC is zero.

Example 48. *Find the relation, if* z_1, z_2, z_3, z_4 *are the affixes of the vertices of a parallelogram taken in order.*

Sol. As the diagonals of a parallelogram bisect each other, therefore affix of the mid-point of AC is same as the affix of the mid-point of BD.

i.e. $\frac{z_1 + z_3}{2} = \frac{z_2 + z_4}{2}$

$\Rightarrow \quad z_1 + z_3 = z_2 + z_4$

Equation of the Straight Line

Equation of the Line Passing through the Points z_1 and z_2

Let z be any point on the line joining z_1 and z_2, then

$$\arg \frac{z - z_1}{z_2 - z_1} = \pi \text{ or } 0$$

$\Rightarrow \frac{z - z_1}{z_2 - z_1}$ must be real.

$\therefore$ Required equation is

$$\frac{z - z_1}{z_2 - z_1} = \frac{\bar{z} - \bar{z}_1}{\bar{z}_2 - \bar{z}_1} \Rightarrow \begin{vmatrix} z & \bar{z} & 1 \\ z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow z(\bar{z}_1 - \bar{z}_2) - \bar{z}(z_1 - z_2) + z_1\bar{z}_2 - z_2\bar{z}_1 = 0$$

General Equation of a Line

$\bar{a}z + a\bar{z} + b = 0$, represents a straight line, where b is a real number and a is a complex number.

Parametric Equation of a Line

$z = z_1 + t(z_2 - z_1)$, where t is real parameter

$= (1 - t) z_1 + t z_2$, represents the complete line through z_1 and z_2.

Example 49. *Find the general equation of line joining the points* $z_1 = (1 + i)$ *and* $z_2 = (1 - i)$.

Sol. Clearly, the equation of a line is given by

$z(\bar{z}_1 - \bar{z}_2) - \bar{z}(z_1 - z_2) + z_1\bar{z}_2 - z_2\bar{z}_1 = 0$

where, $z_1 = 1 + i$ and $z_2 = i - i$

On substituting the values of z_1 and z_2, we get

$z(1 - i - 1 - i) - \bar{z}(1 + i - 1 + i) + (1 + i)(1 + i) - (1 - i)(1 - i) = 0$

$\Rightarrow z(-2i) - \bar{z}(2i) + (1 - 1 + 2i) - (1 - 1 - 2i) = 0$

$\Rightarrow -2iz - 2i\bar{z} + 4i = 0$

$\Rightarrow z + \bar{z} - 2 = 0$, which is the required equation.

Condition of Collinearity

Three points z_1, z_2 and z_3 are collinear, if

$$\begin{vmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{vmatrix} = 0$$

Example 50. *If* z_1, z_2, z_3 *are three complex numbers such that* $5z_1 - 13z_2 + 8z_3 = 0$, *then prove that*

$$\begin{vmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{vmatrix} = 0.$$

Sol. $5z_1 - 13z_2 + 8z_3 = 0$

$\Rightarrow \quad \frac{5z_1 + 8z_3}{5 + 8} = z_2$

$\Rightarrow z_1, z_2$ and z_3 are collinear.

$\Rightarrow \quad \begin{bmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{bmatrix} = 0$ [condition of collinear points]

Hence proved.

Length of Perpendicular

The length of perpendicular from a point z_1 to $\bar{a}z + a\bar{z} + b = 0$ is given by

$$\frac{|\bar{a}z_1 + a\bar{z}_1 + b|}{2|a|}$$

Example 51. *The length of perpendicular from* $P(2 - 3i)$ *to the line* $(3 + 4i)z + (3 - 4i)\bar{z} + 9 = 0$ *is equal to*

(a) 9

(b) $\frac{9}{4}$

(c) $\frac{9}{2}$

(d) None of these

Sol. (c) Let PM be the required length, then

$$PM = \frac{|(2 - 3i)(3 + 4i) + (3 - 4i)(2 + 3i) + 9|}{2|3 - 4i|}$$

$$= \frac{45}{10} = \frac{9}{2}$$

Slope of a Line

Slope of the Line Segment Joining Two Points

If A, B represent complex numbers z_1, z_2 in the argand plane, then the complex slope of AB is defined by

$$\frac{z_1 - z_2}{\bar{z}_1 - \bar{z}_2}$$

and real slope is defined by $\dfrac{\text{Re}\,(z_2 - z_1)}{\text{Im}\,(z_2 - z_1)}$.

Slope of Line $\bar{a}z + a\bar{z} + b = 0$

The complex slope of the line

$\bar{a}z + a\bar{z} + b = 0$ is $\dfrac{-a}{\bar{a}} = \dfrac{-\text{Coefficient of } \bar{z}}{\text{Coefficient of } z}$

and real slope of the line $\bar{a}z + a\bar{z} + b = 0$ is

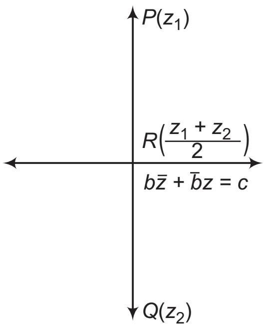
$$-\frac{\text{Re}\,(a)}{\text{Im}\,(a)} = \frac{-i\,(a + \bar{a})}{(a - \bar{a})}$$

- *If w_1 and w_2 are the complex slope of two lines on the argand plane, then the lines are*
  (a) perpendicular, if $w_1 + w_2 = 0$
  (b) parallel, if $w_1 = w_2$
- *The equation of a line parallel to the line $a\bar{z} + \bar{a}z + b = 0$ is $a\bar{z} + \bar{a}z + \lambda = 0$, where $\lambda \in R$.*
- *The equation of a line perpendicular to the line $a\bar{z} + \bar{a}z + b = 0$ is $a\bar{z} - \bar{a}z + i\lambda = 0$, where $\lambda \in R$.*

Example 52. *If a point z_1 is the reflection of a point z_2 through the line $b\bar{z} + \bar{b}z = c$, $b \neq 0$ in the argand plane, then $\bar{b}z_2 + b\bar{z}_1$ is equal to*

(a) 4c *(b)* 2c
(c) c *(d) None of these*

Sol. (c) If $P(z_1)$ is the reflection of $Q(z_2)$ through the line $b\bar{z} + \bar{b}z = c$ in the argand plane. Then,



$R\left(\dfrac{z_1 + z_2}{2}\right)$ lies on the line.

$$b\left(\frac{\bar{z}_1 + \bar{z}_2}{2}\right) + \bar{b}\left(\frac{z_1 + z_2}{2}\right) = c$$

$$\Rightarrow \quad b\,\bar{z}_1 + \bar{b}\,z_1 + b\,\bar{z}_2 + \bar{b}\,z_2 = 2c \qquad \text{...(i)}$$

Since, PQ is perpendicular to the line $b\bar{z} + \bar{b}z = c$. Therefore,

Slope of PQ + Slope of the line = 0

$$\Rightarrow \quad \frac{z_2 - z_1}{\bar{z}_2 - \bar{z}_1} + \left(\frac{-b}{\bar{b}}\right) = 0$$

$$\Rightarrow \quad \bar{b}\,(z_2 - z_1) - b\,(\bar{z}_2 - \bar{z}_1) = 0$$

$$\Rightarrow \quad \bar{b}z_2 - \bar{b}z_1 - b\bar{z}_2 + b\bar{z}_1 = 0 \qquad \text{...(ii)}$$

Adding Eqs. (i) and (ii), we get

$$2(b\bar{z}_1 + \bar{b}z_2) = 2c \quad \Rightarrow \quad b\bar{z}_1 + \bar{b}z_2 = c$$

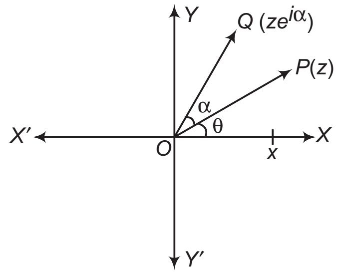
Concept of Rotation

In this section, we shall learn about the effect of multiplication of a complex number by $e^{i\alpha}$ which will also be interpreted geometrically.

Complex Number as a Rotating Arrow in the Argand Plane

1. Let $z = r(\cos\theta + i\sin\theta) = re^{i\theta}$ be a complex number, represented by a point P in the argand plane. Then,

$$OP = r \quad \text{and} \quad \angle XOP = \theta$$

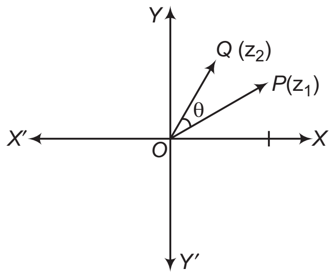


Now, $\quad ze^{i\alpha} = re^{i\theta} \cdot e^{i\alpha} = re^{i(\theta + \alpha)}$

This shows that $ze^{i\alpha}$ is the complex number whose modulus is r and argument $\theta + \alpha$. Clearly, $ze^{i\alpha}$ is represented by a point Q in the argand plane such that $OQ = r$ and $\angle XOQ = \theta + \alpha$.

In other words, to obtain the point representing $ze^{i\alpha}$, we rotate **OP** through angle α in anti-clockwise sense. Thus, multiplication by $e^{i\alpha}$ to z rotates the vector **OP** in anti-clockwise sense through an angle α and *vice-versa*. Similarly, multiplication of z with $e^{-i\alpha}$ will rotate the vector **OP** in clockwise sense.

Remark Let z_1 and z_2 be two complex numbers represented by points P and Q in the argand plane, such that $\angle POQ = \theta$. Then, $z_1e^{i\theta}$ is vector of magnitude $|z_1| =$ **OP** along **OQ** and $\dfrac{z_1\,e^{i\theta}}{|z_1|}$ is a unit vector



along OQ. Consequently, $|z_2| \cdot \dfrac{z_1\,e^{i\theta}}{|z_1|}$ is a vector of magnitude $|z_2| =$ **OQ** along **OQ**.

i.e. $\quad z_2 = \dfrac{|z_2|}{|z_1|} z_1 e^{i\theta} \quad \Rightarrow \quad z_2 = \left|\dfrac{z_2}{z_1}\right| \cdot z_1 e^{i\theta}$

Example 53. *The point represented by the complex number $2-i$ is rotated about origin through an angle $\frac{\pi}{2}$ in the clockwise direction, the new position of point is*

(a) $1+2i$ (b) $-1-2i$
(c) $2+i$ (d) $-1+2i$

Sol. (b) Here, $z = 2 - i$

Let z_1 be the required complex number.

$\because \quad z_1 = ze^{-i\pi/2}$

$\therefore \quad z_1 = (2-i)\left[\cos\left(-\frac{\pi}{2}\right) + i\sin\left(-\frac{\pi}{2}\right)\right]$

$= (2-i)\left(\cos\frac{\pi}{2} - i\sin\frac{\pi}{2}\right)$

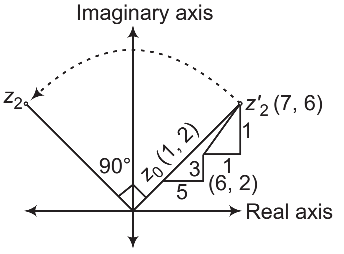
$= (2-i)(0-i)$

$= -(2i - i^2) = -2i - 1$

Example 54. *A particle P starts from the point $z_0 = 1+2i$, where $i = \sqrt{-1}$. It moves first horizontally away from origin by 5 units and then vertically away from origin by 3 units to reach a point z_1. From z_1, the particle moves $\sqrt{2}$ units in the direction of the vector $\hat{\mathbf{i}} + \hat{\mathbf{j}}$ and then it moves through an angle $\pi/2$ in anti-clockwise direction on a circle with centre at origin to reach a point z_2. The point z_2 is given by*

(a) $6+7i$ (b) $-7+6i$
(c) $7+6i$ (d) $-6+7i$

Sol. (d)



$z'_2 = (6 + \sqrt{2}\cos 45°, 5 + \sqrt{2}\sin 45°)$

$= (7, 6) = 7 + 6i$

By rotation about (0, 0),

$\frac{z_2}{z'_2} = e^{i\pi/2} \Rightarrow z_2 = z_2'\left(e^{i\frac{\pi}{2}}\right)$

$z_2 = (7+6i)\left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)$

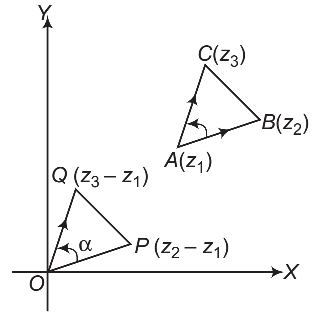
$= (7+6i)(i) = -6+7i$

2. Let z_1, z_2 and z_3 be the vertices of a ΔABC described in anti-clockwise sense. Draw OP and OQ parallel and equal to AB and AC, respectively. Then, point P is $z_2 - z_1$ and Q is $z_3 - z_1$. If OP is rotated through $\angle\alpha$ in anti-clockwise sense, it coincides with OQ.

Then, $\quad \frac{z_3 - z_1}{z_2 - z_1} = \frac{OQ}{OP}(\cos\alpha + i\sin\alpha)$

$= \frac{CA}{BA}e^{i\alpha}$

$= \frac{|z_3 - z_1|}{|z_2 - z_1|}e^{i\alpha}$



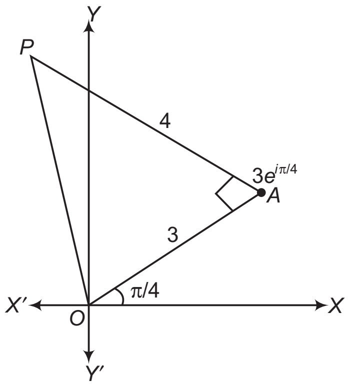
$\left[\because \Delta OPQ \text{ and } \Delta ABC \text{ are congruent}, \therefore \frac{OQ}{OP} = \frac{CA}{BA}\right]$

or $\quad \text{amp}\left(\frac{z_3 - z_1}{z_2 - z_1}\right) = \alpha$

Example 55. *A man walks a distance of 3 units from the origin towards the North-East ($N\,45°\,E$) direction. From there, he walks a distance of 4 units towards the North- West ($N\,45°\,W$) direction to reach a point P. Then, the position of P in the argand plane is*

(a) $3e^{i\pi/4} + 4i$ (b) $(3-4i)e^{i\pi/4}$
(c) $(4+3i)e^{i\pi/4}$ (d) $(3+4i)e^{i\pi/4}$

Sol. (d) Let $OA = 3$ units, so that the complex number associated with A is $3e^{i\pi/4}$. If z is the complex number associated with P, then



$\frac{z - 3e^{i\pi/4}}{0 - 3e^{i\pi/4}} = \frac{4}{3}e^{-i\pi/2}$

$= -\frac{4i}{3}$

$\Rightarrow \quad 3z - 9e^{i\pi/4} = 12e^{i\pi/4}$

$\Rightarrow \quad z = (3+4i)e^{i\pi/4}$

Example 56. *The complex numbers z_1, z_2 and z_3 satisfying $\frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2}$ are the vertices of a triangle which is*

(a) of area zero *(b) right angled isosceles*
(c) equilateral *(d) obtuse angled isosceles*

Sol. (c) $\frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2}$

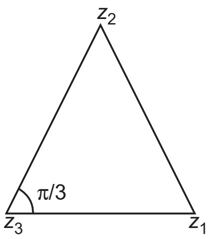
$$= \frac{(1 - i\sqrt{3})(1 + i\sqrt{3})}{2(1 + i\sqrt{3})} = \frac{1 - i^2 3}{2(1 + i\sqrt{3})}$$

$$\frac{4}{2(1 + i\sqrt{3})} = \frac{2}{(1 + i\sqrt{3})}$$

$$\Rightarrow \frac{z_2 - z_3}{z_1 - z_3} = \frac{1 + i\sqrt{3}}{2}$$

$$= \cos\frac{\pi}{3} + i\sin\frac{\pi}{3}$$

$$\Rightarrow \left|\frac{z_2 - z_3}{z_1 - z_3}\right| = 1 \quad \text{and} \quad \arg\left(\frac{z_2 - z_3}{z_1 - z_3}\right) = \frac{\pi}{3}$$



Hence, the triangle is an equilateral.

Area of Triangle

(i) Area of the triangle with vertices z_1, z_2 and z_3 is $\left|\sum\left[\frac{(z_2 - z_3)|z_1|^2}{4iz_1}\right]\right|$ sq unit.

(ii) The area of triangle whose vertices are z, iz and $z + iz$ is $\frac{1}{2}|z|^2$.

(iii) The area of triangle whose vertices are z, ωz and $z + \omega z$ is $\frac{\sqrt{3}}{4}|z|^2$.

Example 57. *If the area of the triangle on the complex plane formed by the points z, iz and $z + iz$ is 50 sq units, then $|z|$ is*

(a) 5 *(b)* 10
(c) 15 *(d) None of these*

Sol. (b) We know that, the area of the triangle formed by the points z, iz and $z + iz$ is $\frac{1}{2}|z|^2$.

$$\therefore \quad \frac{1}{2}|z|^2 = 50$$

$$\Rightarrow \quad |z| = 10$$

Example 58. *If the area of the triangle on the complex plane formed by complex numbers z, ωz and $z + \omega z$ is $4\sqrt{3}$ sq units, then $|z|$ is*

(a) 4 *(b)* 2 *(c)* 6 *(d)* 3

Sol. (a) The area of the triangle formed by z, ωz and $z + \omega z$ is $\frac{\sqrt{3}}{4}|z|^2$.

$$\therefore \quad \frac{\sqrt{3}}{4}|z|^2 = 4\sqrt{3}$$

$$\Rightarrow \quad |z| = 4$$

Applications of Triangle

1. **Centroid** The centroid of the triangle (in the argand plane) formed by z_1, z_2 and z_3 is given by
$$\frac{1}{3}(z_1 + z_2 + z_3)$$

2. **Incentre** The incentre of the triangle (in the argand plane), formed by z_1, z_2 and z_3 is $\frac{az_1 + bz_2 + cz_3}{a + b + c}$, where
$a = |z_2 - z_3|$, $b = |z_3 - z_1|$, $c = |z_1 - z_2|$

3. **Excentres** The excentres of the triangle (in the argand plane), for meet by z_1, z_2 and z_3 are given by

(i) $I_1 = \frac{-az_1 + bz_2 + cz_3}{-a + b + c}$

(ii) $I_2 = \frac{az_1 - bz_2 + cz_3}{a - b + c}$

(iii) $I_3 = \frac{az_1 + bz_2 - cz_3}{a + b - c}$

where, $a = |z_2 - z_3|$, $b = |z_3 - z_1|$ and $c = |z_1 - z_2|$

4. **Circumcentre** The circumcentre of the triangle (in the argand plane), formed by z_1, z_2, z_3 is given by $\frac{\sum z_1 \bar{z}_1 (z_2 - z_3)}{\sum \bar{z}_1 (z_2 - z_3)}$

5. **Orthocentre** The orthocentre of the triangle (in the argand plane), formed by z_1, z_2, z_3 is given by
$$\frac{\sum z_1^2(\bar{z}_2 - \bar{z}_3) + \sum |z_1|^2 (z_2 - z_3)}{\sum (z_1\bar{z}_2 - \bar{z}_1 z_2)}$$

Example 59. *If z_1, z_2 and z_3 are affixes of the vertices A, B and C, respectively of a ΔABC having centroid at G such that $z = 0$ is the mid-point of AG, then*

(a) $z_1 + z_2 + z_3 = 0$ *(b)* $z_1 + 4z_2 + z_3 = 0$
(c) $z_1 + z_2 + 4z_3 = 0$ *(d)* $4z_1 + z_2 + z_3 = 0$

Sol. (d) The affix of G is $\frac{z_1 + z_2 + z_3}{3}$. Since, $z = 0$ is the mid-point of AG. Therefore, affix of the mid-point of AG is 0.

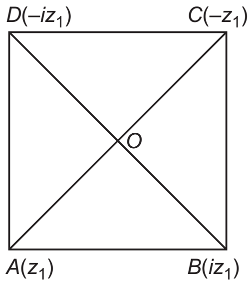
$$\Rightarrow \frac{\frac{z_1 + z_2 + z_3}{3} + z_1}{1 + 1} = 0 \Rightarrow 4z_1 + z_2 + z_3 = 0$$

Example 60. *The centre of a square ABCD is at the origin and point A is represented by z_1. The centroid of ΔBCD is represented by*

(a) $\frac{z_1}{3}$ *(b)* $-\frac{z_1}{3}$
(c) $\frac{iz_1}{3}$ *(d)* $-\frac{iz_1}{3}$

Sol. (b) The affixes of the vertices B, C and D are $iz_1 - z_1$ and $-iz_1$, respectively. Therefore, the affix of the centroid of ΔBCD is

$$\frac{iz_1 - z_1 - iz_1}{3} = -\frac{z_1}{3}$$



Example 61. *Let $P(e^{i\theta_1}), Q(e^{i\theta_2})$ and $R(e^{i\theta_3})$ be the vertices of ΔPQR in the argand plane. Then, the orthocentre of the ΔPQR is*

(a) $e^{i(\theta_1+\theta_2+\theta_3)}$ *(b)* $\frac{2}{3}e^{i(\theta_1+\theta_2+\theta_3)}$

(c) $e^{i\theta_1}+e^{i\theta_2}+e^{i\theta_3}$ *(d) None of these*

Sol. (c) We have, $|e^{i\theta_1}| = |e^{i\theta_2}| = |e^{i\theta_3}| = 1$

$\Rightarrow$ $OP = OQ = OR = 1$, where O is the origin.

$\Rightarrow$ Origin O is the circumcentre of ΔPQR.

The affix of the centroid is

$$\frac{1}{3}(e^{i\theta_1}+e^{i\theta_2}+e^{i\theta_3})$$

Let z be the affix of the orthocentre. Since, centroid divides the segment joining circumcentre and orthocentre in the ratio 1 : 2.

$$\therefore \frac{1}{3}(e^{i\theta_1}+e^{i\theta_2}+e^{i\theta_3}) = \frac{1\cdot z + 2\times 0}{1+2}$$

$$\Rightarrow \quad z = e^{i\theta_1}+e^{i\theta_2}+e^{i\theta_3}$$

6. **Equilateral Triangle**

(i) The triangle whose vertices are the points z_1, z_2 and z_3 on the argand plane, is an equilateral triangle, if

$$z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_2z_3 + z_3z_1$$

$$\text{or} \quad \frac{1}{z_1 - z_2} + \frac{1}{z_2 - z_3} + \frac{1}{z_3 - z_1} = 0$$

(ii) If the complex numbers z_1, z_2 and z_3 are the vertices of an equilateral triangle and z_0 is the circumcentre of the triangle, then $z_1^2 + z_2^2 + z_3^2 = 3z_0^2$.

7. **Isosceles Triangle**

(i) If z_1, z_2 and z_3 are the vertices of a right angled isosceles triangle, then

$$(z_1 - z_2)^2 = 2(z_1 - z_3)(z_3 - z_2)$$

(ii) If z_1, z_2 and z_3 are the vertices of an isosceles triangle, right angled at z_2, then

$$z_1^2 + z_2^2 + z_3^2 = 2z_2(z_1 + z_3)$$

Example 62. *Prove that the complex numbers z_1, z_2 and the origin form an equilateral triangle only, if $z_1^2 + z_2^2 - z_1z_2 = 0$.*

Sol. If z_1, z_2 and z_3 form an equilateral triangle, then

$$\Rightarrow \quad z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_2z_3 + z_3z_1$$

$$\Rightarrow \quad z_1^2 + z_2^2 + 0^2 = z_1z_2 + z_2\cdot 0 + 0\cdot z_1$$

$$\Rightarrow \quad z_1^2 + z_2^2 = z_1z_2 \quad \Rightarrow \quad z_1^2 + z_2^2 - z_1z_2 = 0$$

Hence proved.

Example 63. *Let z_1 and z_2 be two complex numbers such that $\frac{z_1}{z_2} + \frac{z_2}{z_1} = 1$, then*

(a) z_1, z_2 are collinear

(b) z_1, z_2 and the origin form a right angled triangle

(c) z_1, z_2 and the origin form an equilateral triangle

(d) None of the above

Sol. (c) We have, $\frac{z_1}{z_2} + \frac{z_2}{z_1} = 1 \Rightarrow z_1^2 + z_2^2 = z_1z_2$

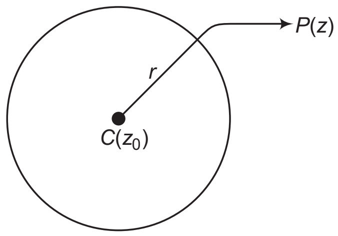
$\Rightarrow$ $z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_1z_3 + z_2z_3$, where $z_3 = 0$

$\Rightarrow$ z_1, z_2 and the origin form an equilateral triangle.

Circle

Equation of a Circle

(i) The equation of a circle whose centre is at point having affix z_0 and radius r, is $|z - z_0| = r$.



(ii) If the centre of the circle is at origin and radius r, then its equation is $|z| = r$.

(iii) $|z - z_0| < r$ represents interior of a circle $|z - z_0| = r$ and $|z - z_0| > r$ represents exterior of the circle $|z - z_0| = r$.

(iv) **General equation of a circle** The general equation of the circle is $z\bar{z} + a\bar{z} + \bar{a}z + b = 0$, where a is complex number and $b \in R$.

$\therefore$ Centre and radius are $-a$ and $\sqrt{|a|^2 - b}$, respectively.

(v) **Equation of circle in diametric form** If end points of diameter represented by $A(z_1)$ and $B(z_2)$ and $P(z)$ is any point on the circle, then

$(z - z_1)(\bar{z} - \bar{z}_2) + (z - z_2)(\bar{z} - \bar{z}_1) = 0$

which is required equation of circle in diametric form.

Example 64. *A circle whose radius is r and centre z_0, then the equation of the circle is*

(a) $z\bar{z} - z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$
(b) $z\bar{z} + z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$
(c) $z\bar{z} - z\bar{z}_0 + \bar{z}z_0 - z_0\bar{z}_0 = r^2$
(d) None of the above

Sol. (a) Equation of circle $|z - z_0|^2 = r^2$

$\Rightarrow \quad (z - z_0)(\overline{z - z_0}) = r^2 \Rightarrow (z - z_0)(\bar{z} - \bar{z}_0) = r^2$

$z\bar{z} - z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$

Example 65. *The set of values of k for which the equation* $z\bar{z} + (-3 + 4i)\bar{z} - (3 + 4i)z + k = 0$ represents a circle is

(a) $(-\infty, 25)$ *(b)* $(25, \infty)$ *(c)* $(5, \infty)$ *(d)* $(-\infty, 5)$

Sol. (a) We have,

$$z\bar{z} + (-3 + 4i)\bar{z} - (3 + 4i)z + k = 0$$

This equation represents a circle with centre $a + (3 - 4i)$ and Radius $= \sqrt{(-3 - 4i)^2 - k} = \sqrt{25 - k}$

For circle to exist, we must have

$$25 - k > 0 \Rightarrow k < 25$$

Hence, the given equation will represent a circle if $k < 25$.

Loci in Complex Plane

If z is a variable point and z_1, z_2 are two fixed points in the argand plane, then

(i) $|z - z_1| = |z - z_2|$
$\Rightarrow$ Locus of z is the perpendicular bisector of the line segment joining z_1 and z_2.

(ii) $|z - z_1| + |z - z_2| = k$, if $|k| > |z_1 - z_2|$
$\Rightarrow$ Locus of z is an ellipse.

(iii) $|z - z_1| + |z - z_2| = |z_1 - z_2|$
$\Rightarrow$ Locus of z is the line segment joining z_1 and z_2

(iv) $|z - z_1| - |z - z_2| = |z_1 - z_2|$
$\Rightarrow$ Locus of z is a straight line joining z_1 and z_2 but z does not lie between z_1 and z_2.

(v) $|z - z_1| - |z - z_2| = k$, where $|k| < |z_1 - z_2|$
$\Rightarrow$ Locus of z is a hyperbola.

(vi) $|z - z_1|^2 + |z - z_2|^2 = |z_1 - z_2|^2$
$\Rightarrow$ Locus of z is a circle with z_1 and z_2 as the extremities of diameter.

(vii) $|z - z_1| = k|z - z_2|, (k \neq 1)$
$\Rightarrow$ Locus of z is a circle.

(viii) $\arg\left(\dfrac{z - z_1}{z - z_2}\right) = \alpha$ (fixed)
$\Rightarrow$ Locus of z is a segment of circle.

(ix) $\arg\left(\dfrac{z - z_1}{z - z_2}\right) = \pm\pi/2$
$\Rightarrow$ Locus of z is a circle with z_1 and z_2 as the vertices of diameter.

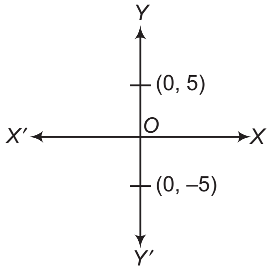
(x) $\arg\left(\dfrac{z - z_1}{z - z_2}\right) = 0$ or π
$\Rightarrow$ Locus of z is a straight line passing through z_1 and z_2.

Example 66. *The complex numbers $z = x + iy$ which satisfy the equation $\left|\dfrac{z - 5i}{z + 5i}\right| = 1$, lie on*

(a) the X-axis
(b) the straight line $y = 5$
(c) a circle passing through the origin
(d) None of the above

Sol. (a) Given, $\left|\dfrac{z - 5i}{z + 5i}\right| = 1 \Rightarrow |z - 5i| = |z + 5i|$

[if $|z - z_1| = |z - z_2|$, then it is a perpendicular bisector of z_1 and z_2]



$\therefore$ Perpendicular bisector of (0, 5) and (0, – 5) is X-axis.

Example 67. *The equation*

$$|z - i| + |z + i| = k, k > 0$$

can represent an ellipse, if k^2 is

(a) < 1 (b) < 2
(c) > 4 (d) None of these

Sol. (c) $|z - z_1| + |z - z_2| = k$ represents ellipse, if $|k| > |z_1 - z_2|$

Thus, $|z - i| + |z - i| = k$ represents ellipse, if

$|k| > |i + i|$ or $|k| > |2i|$

$\therefore \quad |k| > 2$ or $k^2 > 4$

Example 68. *The equation $|z + i| - |z - i| = k$ represents a hyperbola if*

(a) $-2 < k < 2$ (b) $k > 2$
(c) $0 < k < 2$ (d) None of these

Sol. (a) $|z - z_1| - |z - z_2| = k$, represents hyperbola, if $|k| < |z_1 - z_2|$

Thus, $|z + i| - |z - i| = k$, represents hyperbola, if $|k| < |i + i|$ or $|k| < 2$

$\Rightarrow \quad -2 < k < 2$

Example 69. *If $z = 1 - t + i\sqrt{t^2 + t + 2}$, where t is a real parameter. The locus of z in the argand plane is*

(a) a hyperbola (b) an ellipse
(c) a straight line (d) None of these

Sol. (a) $x + iy = 1 - t + i\sqrt{t^2 + t + 2}$

$\Rightarrow \quad x = 1 - t\ ,\ y = \sqrt{t^2 + t + 2}$

Eliminating t, $y^2 = t^2 + t + 2$

$= (1 - x)^2 + 1 - x + 2$

$= \left(x - \frac{3}{2}\right)^2 + \frac{7}{4}$

or $y^2 - \left(x - \frac{3}{2}\right)^2 = \frac{7}{4}$

which is a hyperbola.

Example 70. *Identify the locus of z, if*

$\bar{z} = \bar{a} + \dfrac{r^2}{z - a}, > 0.$

Sol. $\bar{z} = \bar{a} + \dfrac{r^2}{z - a} \quad \Rightarrow \quad \bar{z} - \bar{a} = \dfrac{r^2}{z - a}$

$\Rightarrow \quad (z - a)(\bar{z} - \bar{a}) = r^2$

$\Rightarrow \quad |z - a|^2 = r^2$

$\Rightarrow \quad |z - a| = r$

Hence, locus of z is circle having centre a and radius r.

Example 71. *If the equation* $|z - z_1|^2 + |z - z_2|^2 = k$ *represents the equation of a circle, where* $z_1 = 2 + 3i$, $z_2 = 4 + 3i$ *are the extremities of a diameter, then the value of k is*

(a) $\frac{1}{4}$ *(b)* 4

(c) 2   *(d) None of these*

Sol. (b) As z_1 and z_2 are the extremities of diameter.

$\Rightarrow \quad |z - z_1|^2 + |z - z_2|^2 = |z_1 - z_2|^2$

$\Rightarrow \quad k = |z_1 - z_2|^2 = |2 + 3i - 4 - 3i|^2 = |-2|^2 = 4$

Example 72. *If* $|z + 1| = \sqrt{2}\,|z - 1|$, *then the locus described by the point z in the argand diagram is a*

(a) straight line   *(b) circle*

(c) parabola   *(d) None of these*

Sol. (b) $|z + 1| = \sqrt{2}\,|z - 1|$

Putting $z = x + iy \Rightarrow |x + iy + 1|$
$= \sqrt{2}|x + iy - 1|$

$\Rightarrow \quad |(x + 1) + iy| = \sqrt{2}\,|(x - 1) + iy|$

$\Rightarrow \quad (x + 1)^2 + y^2 = 2[(x - 1)^2 + y^2]$

$\Rightarrow \quad x^2 + y^2 - 6x + 1 = 0$

which is the equation of a circle.

Example 73. *The locus of z given by* $\left|\dfrac{z - 1}{z - i}\right| = 1$ *is*

(a) a circle   *(b) an ellipse*

(c) a straight line   *(d) a parabola*

Sol. (c) $\left|\dfrac{z - 1}{z - i}\right| = 1 \Rightarrow |z - 1| = |z - i|$

$\Rightarrow \quad |(x - 1) + iy| = |x + i(y - 1)|$

$\Rightarrow \quad \sqrt{(x - 1)^2 + y^2} = \sqrt{x^2 + (y - 1)^2}$

$\Rightarrow \quad 2x = 2y$

or $\quad x - y = 0$

which is the equation of a straight line.

Example 74. *If* $z = x + iy$ *and* $|z - 2 + i| = |z - 3 - i|$, *then locus of z is*

(a) $2x + 4y - 5 = 0$ *(b)* $2x - 4y - 5 = 0$

(c) $x + 2y = 0$ *(d)* $x - 2y + 5 = 0$

Sol. (a) $|z - 2 + i| = |z - 3 - i|$

$\Rightarrow \quad |(x - 2) + i(y + 1)| = |(x - 3) + i(y - 1)|$

$\Rightarrow \quad \sqrt{(x - 2)^2 + (y + 1)^2} = \sqrt{(x - 3)^2 + (y - 1)^2}$

$\Rightarrow x^2 + 4 - 4x + y^2 + 1 + 2y = x^2 + 9 - 6x + y^2 + 1 - 2y$

$\Rightarrow \quad 2x + 4y - 5 = 0$

Example 75. *If* $\bar{z} = \bar{z}_0 + A(z - z_0)$, *where A is a constant, then prove that locus of z is a straight line.*

Sol. $\bar{z} = \bar{z}_0 + A(z - z_0)$

$\Rightarrow \quad Az - \bar{z} - Az_0 + \bar{z}_0 = 0 \quad \ldots$(i)

$\Rightarrow \quad \bar{A}\bar{z} - z - \bar{A}\bar{z}_0 + z_0 = 0 \quad \ldots$(ii)

Adding Eqs. (i) and (ii), we get

$(A - 1)z + (\bar{A} - 1)\bar{z} - (\bar{A}\bar{z}_0 + Az_0) + z_0 + \bar{z}_0 = 0$

This is of the form

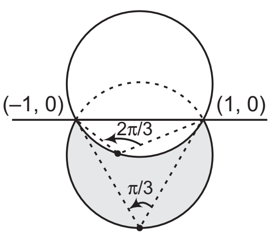
$\bar{a}z + a\bar{z} + b = 0$, where

$a = \bar{A} - 1$ and $b = -(Az_0 + \bar{A}\bar{z}_0) + z_0 + \bar{z}_0 \in R$

Hence, locus of z is a straight line.

Example 76. *Plot the region represented by* $\dfrac{\pi}{3} \le \arg\left(\dfrac{z + 1}{z - 1}\right) \le \dfrac{2\pi}{3}$ *in the argand plane.*

Sol. Let us take $\arg\left(\dfrac{z + 1}{z - 1}\right) = \dfrac{2\pi}{3}$, clearly z lies on the minor arc of the circle passing through (1, 0) and (–1, 0).



Similarly, $\arg\left(\dfrac{z + 1}{z - 1}\right) = \dfrac{\pi}{3}$

means that z is lying on the major arc of the circle passing through (1, 0) and (–1, 0).

Now, if we take any point in the region included between the two arcs, say $P_1(z_1)$, we get

$$\frac{\pi}{3} \le \arg\left(\frac{z + 1}{z - 1}\right) \le \frac{2\pi}{3}$$

Thus, $\dfrac{\pi}{3} \le \arg\left(\dfrac{z + 1}{z - 1}\right) \le \dfrac{2\pi}{3}$ represents the shaded region excluding the points (1, 0) and (–1, 0).

Some Important Results

i. Four points z_1, z_2, z_3 and z_4 in anti-clockwise order will be concyclic, if and only if

$$\theta = \arg\left(\frac{z_2 - z_4}{z_1 - z_4}\right) = \arg\left(\frac{z_2 - z_3}{z_1 - z_3}\right)$$

$$\Rightarrow \arg\left(\frac{z_2 - z_4}{z_1 - z_4}\right) - \arg\left(\frac{z_2 - z_3}{z_1 - z_3}\right) = 2n\pi,\ n \in I$$

$$\Rightarrow \quad \arg\left[\left(\frac{z_2 - z_4}{z_1 - z_4}\right)\left(\frac{z_1 - z_3}{z_2 - z_3}\right)\right] = 2n\pi$$

$$\Rightarrow \left(\frac{z_2 - z_4}{z_1 - z_4}\right)\left(\frac{z_1 - z_3}{z_2 - z_3}\right) \text{ is real and positive.}$$

Points z_1, z_2, z_3 and z_4 (not necessarily in order) will be concyclic, if $\left(\frac{z_2 - z_4}{z_1 - z_4}\right)\left(\frac{z_1 - z_3}{z_2 - z_3}\right)$ is positive or negative.

Example 77. *Show that the points $3 + 4i$, $3 - 4i$, $-4 + 3i$, $-4 - 3i$ are concyclic.*

Sol. Let $z_1 = 3 + 4i$, $z_2 = 3 - 4i$, $z_3 = -4 + 3i$
and $z_4 = -4 - 3i$
Then,

$$\left(\frac{z_2 - z_4}{z_1 - z_4}\right)\left(\frac{z_1 - z_3}{z_2 - z_3}\right) = \frac{(7 - i)(7 + i)}{(7 + 7i)(7 - 7i)}$$

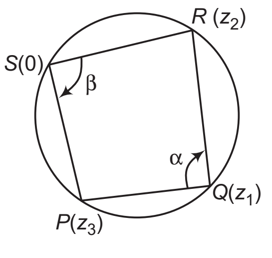
$$= \frac{50}{49 + 49} = \frac{25}{49}$$

$$= \text{a real number}$$

Hence, the given points are concyclic.

Example 78. *If z_1, z_2 and z_3 are complex numbers, such that $\frac{2}{z_1} = \frac{1}{z_2} + \frac{1}{z_3}$, then show that the points represented by z_1, z_2 and z_3 lie on a circle passing through the origin.*

Sol.



$$\frac{2}{z_1} = \frac{1}{z_2} + \frac{1}{z_3} \quad \Rightarrow \quad \frac{1}{z_1} - \frac{1}{z_2} = \frac{1}{z_3} - \frac{1}{z_1}$$

$$\Rightarrow \quad \frac{z_2 - z_1}{z_1 z_2} = \frac{z_1 - z_3}{z_3 z_1} \quad \Rightarrow \quad \frac{z_2 - z_1}{z_3 - z_1} = -\frac{z_2}{z_3}$$

$$\Rightarrow \quad \arg\left(\frac{z_2 - z_1}{z_3 - z_1}\right) = \arg\left(-\frac{z_2}{z_3}\right)$$

$$\Rightarrow \quad \arg\left(\frac{z_2 - z_1}{z_3 - z_1}\right) = \pi + \arg\left(\frac{z_2}{z_3}\right)$$

$$\Rightarrow \quad \arg\left(\frac{z_2 - z_1}{z_3 - z_1}\right) = \pi - \arg\left(\frac{z_3}{z_2}\right)$$

$$\Rightarrow \quad \alpha = \pi - \beta \quad \Rightarrow \quad \alpha + \beta = \pi$$

Hence, the points are concyclic.

ii. If $\left|z + \frac{1}{z}\right| = a$, then the greatest and least values of $|z|$ are respectively $\frac{a + \sqrt{a^2 + 4}}{2}$ and $\frac{-a + \sqrt{a^2 + 4}}{2}$

Example 79. *If $\left|z + \frac{4}{z}\right| = a$, then find the greatest and least values of $|z|$.*

Sol. $\left|\frac{z}{2} + \frac{2}{z}\right| = \frac{a}{2}$. Now, put $\frac{z}{2} = w$

$$\therefore \quad \left|w + \frac{1}{w}\right| = \frac{a}{2}$$

Now, greatest value of $|w| = \dfrac{\frac{a}{2} + \sqrt{\frac{a^2}{4} + 4}}{2}$ and $|z| = 2|w|$

Greatest value of $|z| = \frac{a}{2} + \sqrt{\frac{a^2}{4} + 4}$

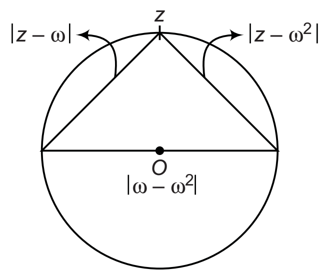
Similarly, we can find least value of

$$|z| = -\frac{a}{2} + \sqrt{\frac{a^2}{4} + 4}$$

Example 80. *Let z_1 and z_2 be two non-real complex cube roots of unity and $|z - z_1|^2 + |z - z_2|^2 = \lambda$ be the equation of a circle with z_1, z_2 as ends of a diameter, then the value of λ is*

(a) 4 *(b)* 3 *(c)* 2 *(d)* $\sqrt{2}$

Sol. (b) $|z - \omega|^2 + |z - \omega^2|^2 - \lambda$ could be shows as given below :



$$\Rightarrow \lambda = |\omega - \omega^2|^2$$

$$= \left|\frac{-1 + i\sqrt{3}}{2} - \frac{-1 - i\sqrt{3}}{2}\right|^2$$

$$= \left|\frac{-1 + i\sqrt{3} + 1 + i\sqrt{3}}{2}\right|^2$$

$$= |i\sqrt{3}|^2 = 3$$

Logarithm of Complex Numbers

Let $\quad z = \alpha + i\beta = re^{i(\theta + 2n\pi)}$

$$\log z = \log(re^{i(\theta + 2n\pi)}) = \log r + i(\theta + 2n\pi)$$

$$= \log|z| + i \arg z + 2n\pi i$$

If we put $n = 0$, we get principal value of $\log z$.

$\therefore$ Principal value of $\log z = \log|z| + i \arg z$.

Example 81. *The value of i^i is*

(a) $e^{-\pi/2}$ *(b)* $e^{\pi/2}$

(c) $e^{\pi/4}$ *(d) None of these*

Sol. (a) Let $z = i^i$, $\log_e z = \log_e i^i = i \log_e i = i \log_e e^{i\pi/2}$

$$= i^2 \frac{\pi}{2} \log_e e = -\frac{\pi}{2}$$

$$\Rightarrow \quad z = e^{-\pi/2}$$

Example 82. *If* $z = i \log_e (2-\sqrt{3})$, *then the value of* $\cos z$ *is*

(a) 2 *(b)* −2 *(c)* $2i$ *(d)* $-2i$

Sol. (a) We know that, $\cos z = \dfrac{e^{iz} + e^{-iz}}{2}$

$$= \frac{e^{i^2 \log_e (2-\sqrt{3})} + e^{-i^2 \log_e (2-\sqrt{3})}}{2}$$

$$= \frac{e^{\log_e (2-\sqrt{3})^{-1}} + e^{\log_e (2-\sqrt{3})}}{2}$$

$$= \frac{(2-\sqrt{3})^{-1} + (2-\sqrt{3})}{2}$$

$$= \frac{1}{2}\left[\frac{1}{2-\sqrt{3}} + 2 - \sqrt{3}\right] = \frac{1}{2}\left[\frac{2+\sqrt{3}}{4-3} + (2-\sqrt{3})\right]$$

$$= \frac{1}{2}[2+\sqrt{3}+2-\sqrt{3}] = 2$$

Work Book Exercise 4.4

1 $\left|\dfrac{z-1}{z+1}\right| = 1$, represents

a a circle **b** an ellipse
c a straight line **d** None of these

2 $|z-4| < |z-2|$, represents the region given by

a $\text{Re}(z) > 0$ **b** $\text{Re}(z) < 0$
c $\text{Re}(z) > 2$ **d** None of these

3 If $2z_1 - 3z_2 + z_3 = 0$, then z_1, z_2, z_3 are represented by

a three vertices of a triangle
b three collinear points
c three vertices of a rhombus
d None of the above

4 If $z = x + iy$, such that $|z+1| = |z-1|$ and $\text{amp}\left(\dfrac{z-1}{z+1}\right) = \dfrac{\pi}{4}$, then

a $x = \sqrt{2}+1, y = 0$
b $x = 0, y = \sqrt{2}+1$
c $x = 0, y = \sqrt{2}-1$
d $x = \sqrt{2}-1, y = 0$

5 If $z^8 = (z-1)^8$, then the roots of this equation are

a collinear
b concyclic
c the vertices of irregular polygon
d None of the above

6 The equation $z\bar{z} + a\bar{z} + \bar{a}z + b = 0$, $b \in R$ represents a circle, if

a $|a|^2 = b$ **b** $|a|^2 \geq b$
c $|a|^2 < b$ **d** None of these

7 If $z = (\lambda + 3) + i\sqrt{3-\lambda^2}$, where $|\lambda| < \sqrt{3}$, then locus of z is

a circle **b** parabola
c line **d** None of these

8 If a point P denoting the complex number z moves on the complex plane such that $|\text{Re}(z)| + |\text{Im}(z)| = 1$, then the locus of z is

a a square **b** a circle
c two intersecting lines **d** a line

9 The figure formed by four points $1 + 0i$, $-1 + 0i$, $3 + 4i$ and $\dfrac{25}{-3-4i}$ on the argand plane is

a a parallelogram but not a rectangle
b a trapezium which is not equilateral
c a cyclic quadrilateral
d None of the above

10 If $i = \sqrt{-1}$, then define a sequence of complex number by $z_1 = 0$, $z_{n+1} = z_n^2 + i$ for $n \geq 1$. In the complex plane, how far from the origin is z_{111}?

a 1 **b** $\sqrt{2}$ **c** $\sqrt{3}$ **d** $\sqrt{110}$

11 The complex numbers whose real and imaginary parts are integers and satisfy the relation $z\bar{z}^3 + z^3\bar{z} = 350$, forms a rectangle on the argand plane, the length of whose diagonal is

a 5 units **b** 10 units **c** 15 units **d** 25 units

12 The locus of z, for $\arg z = -\dfrac{\pi}{3}$ is

a same as the locus of z for $\arg z = \dfrac{2\pi}{3}$
b same as the locus of z for $\arg z = \dfrac{\pi}{3}$
c the part of the straight line $\sqrt{3}x + y = 0$ with $y < 0$, $x > 0$
d the part of the straight line $\sqrt{3}x + y = 0$ with $y > 0$, $x < 0$

13 If z_1 and z_2 are two complex numbers and $\arg \dfrac{z_1+z_2}{z_1-z_2} = \dfrac{\pi}{2}$ but $|z_1+z_2| \neq |z_1-z_2|$, then the figure formed by the points represented by $0, z_1, z_2$ and z_1+z_2 is

a a parallelogram but not a rectangle or a rhombus
b a rectangle but not a square
c a rhombus but not a square
d a square

14 z_1 and z_2 are two distinct points in an argand plane. If $a|z_1| = b|z_2|$, where $a, b \in R$, then the point $\dfrac{az_1}{bz_2} + \dfrac{bz_2}{az_1}$ is a point on the

a line segment $[-2, 2]$ of the real axis
b line segment $[-2, 2]$ of the imaginary axis
c unit circle $|z| = 1$
d the line with $\arg z = \tan^{-1} 2$

15 The roots z_1, z_2, z_3 of the equation $z^3 + 3\alpha z^2 + 3\beta z + \gamma = 0$ correspond to the points A, B and C on the complex plane. Then, the triangle is equilateral, if

a $\alpha^2 = \beta$ **b** $\alpha = \beta^2$
c $\alpha^2 = 3\beta^2$ **d** $3\alpha^2 = \beta^2$

16 If $z_1^2 + z_2^2 + 2z_1z_2\cos\theta = 0$, then the points represents by z_1, z_2 and the origin form

a equilateral triangle **b** right angled triangle
c isosceles triangle **d** None of these

17 Complex numbers z_1, z_2, z_3 are the vertices A, B and C, respectively of an isosceles right angled triangle, right angled at C. Then, $(z_1 - z_2)^2$ is equal to

a $2(z_1 - z_3)(z_3 - z_2)$ **b** $\frac{1}{2}(z_1 + z_3)(z_3 - z_1)$
c $(z_1 - z_3)(z_3 - z_2)$ **d** None of these

18 A, B and C are points represented by complex numbers z_1, z_2 and z_3. If the circumcentre of the ΔABC is at the origin and the altitude AD of the triangle meets the circumcircle again at P, then the complex number representing point P is

a $z = \frac{z_1z_2}{z_3}$ **b** $z = -\frac{z_3z_2}{z_1}$
c $z = -\frac{z_1z_2}{z_3}$ **d** $z = \frac{z_3z_2}{z_1}$

19 If z_1 and z_2 are the roots of the equation $z^2 + pz + q = 0$, where the coefficients p and q may be complex number. Let A and B represent z_1 and z_2 in the complex plane. If $\angle AOB = \alpha \neq 0$ and $OA = OB$, where O is the origin, then p^2 is equal to

a $4q\cos^2\left(\frac{\alpha}{2}\right)$ **b** $2q\cos^2\alpha$
c $q\cos^2\frac{\alpha}{4}$ **d** None of these

20 If $\operatorname{Re}\left(\frac{z+4}{2z-i}\right) = \frac{1}{2}$, then z is represented by a point lying on

a a circle **b** an ellipse
c a straight line **d** None of these

21 Suppose z_1, z_2 and z_3 are the vertices of an equilateral triangle inscribed in the circle $|z| = 2$. If $z_1 = 1 + \sqrt{3}\,i$ and z_1, z_2 and z_3 are in the clockwise sense, then

a $z_2 = 1 - \sqrt{3}i$, $z_3 = 2$
b $z_2 = 2$, $z_3 = 1 - \sqrt{3}i$
c $z_2 = -1 + \sqrt{3}i$, $z_3 = -2$
d None of the above

22 Suppose z_1, z_2 and z_3 are the vertices of an equilateral triangle circumscribing in the circle $|z| = 2$. If $z_1 = 1 + \sqrt{3}\,i$ and z_1, z_2 and z_3 are in the anti-clockwise sense, then z_2 is

a $1 - \sqrt{3}\,i$
b 2
c $\frac{1}{2}(1 - \sqrt{3}\,i)$
d None of the above

23 The straight line $(1 + 2i)z + (2i - 1)z = 10\,i$ on the complex plane, has intercept on the imaginary axis equal to

a 5 **b** $\frac{5}{2}$ **c** $-\frac{5}{2}$ **d** -5

24 If the complex number z satisfies the condition $|z| \geq 3$, then the least value of $z + \frac{1}{z}$ is equal to

a $\frac{5}{3}$ **b** $\frac{8}{3}$
c $\frac{11}{3}$ **d** None of these

25. If $z_1 = \frac{a}{1-i}$, $z_2 = \frac{b}{2+i}$, $z_3 = a - bi$, for $a, b \in R$ and $z_1 - z_2 = 1$, then the centroid of the triangle formed by the points z_1, z_2, z_3 in the argand plane is given by

a $\frac{1}{9}(1 + 7i)$ **b** $\frac{1}{3}(1 + 7i)$ **c** $\frac{1}{3}(1 - 3i)$ **d** $\frac{1}{9}(1 - 3i)$

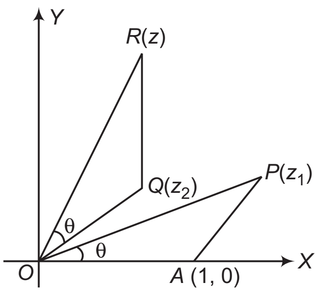
26. Let $\lambda \in R$. If the origin and the non-real roots of $2z^2 + 2z + \lambda = 0$ form three vertices of an equilateral triangle in the argand plane, then λ is

a 1 **b** $2/3$
c 2 **d** -1

27 If a, b, c and u, v, w are complex numbers representing the vertices of two triangles, such that $c = (1 - r)a + rb$ and $w = (1 - r)u + rv$. When r is a complex number, then the two triangles

a have the same area **b** are similar
c are congruent **d** None of these

28. On the complex plane, ΔOAP and ΔOQR are similar and $l(OA) = 1$. If the points P and Q denote the complex numbers z_1 and z_2, then the complex numbers z denoted by the point R is given by



a z_1z_2 **b** $\frac{z_1}{z_2}$
c $\frac{z_2}{z_1}$ **d** $\frac{z_1 + z_2}{z_2}$

29 Intercept made by the circle $zz + \alpha z + \alpha z + r = 0$ on the real axis on complex plane, is

a $\sqrt{(\alpha + \bar{\alpha}) - r}$ **b** $\sqrt{(\alpha + \bar{\alpha})^2 - 2r}$
c $\sqrt{(\alpha + \bar{\alpha})^2 + r}$ **d** $\sqrt{(\alpha + \bar{\alpha})^2 - 4r}$

30 The equation of the radical axis of the two circles represented by the equations, $|z - 2| = 3$ and $|z - 2 - 3i| = 4$ on the complex plane is

a $3y + 1 = 0$
b $3y - 1 = 0$
c $2y - 1 = 0$
d None of the above

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. If $a = \cos\alpha + i\sin\alpha$, $b = \cos\beta + i\sin\beta$, $c = \cos\gamma + i\sin\gamma$ and $\frac{a}{b} + \frac{b}{c} + \frac{c}{a} = 1$, then $\cos(\alpha - \beta) + \cos(\beta - \gamma) + \cos(\gamma - \alpha)$ is equal to

(a) $\frac{3}{2}$ (b) $-\frac{3}{2}$

(c) 0 (d) 1

Sol. $\frac{a}{b} + \frac{b}{c} + \frac{c}{a} = 1$

$$\Rightarrow \frac{\text{cis}\,\alpha}{\text{cis}\,\beta} + \frac{\text{cis}\,\beta}{\text{cis}\,\gamma} + \frac{\text{cis}\,\gamma}{\text{cis}\,\alpha} = 1,$$

where, cis θ represents $\cos\theta + i\sin\theta$.

$\Rightarrow \text{cis}(\alpha - \beta) + \text{cis}(\beta - \gamma) + \text{cis}(\gamma - \alpha) = 1$

Equation real parts of both sides

$$\cos(\alpha + \beta) + \cos(\beta - \gamma) + \cos(\gamma - \alpha) = 1$$

Hence, (d) is the correct answer.

Ex 2. The locus of the centre of a circle which touches the circles $|z - z_1| = a$ and $|z - z_2| = b$ externally (z, z_1 and z_2 are complex numbers) will be

(a) an ellipse (b) a hyperbola

(c) a circle (d) None of these

Sol. Let $A(z_1)$, $B(z_2)$ be the centres of given circles and P be the centre of the variable circle which touches given circles externally, then

$$|AP| = a + r \quad \text{and} \quad |BP| = b + r,$$

where r is the radius of the variable circle. On subtraction, we get

$$|AP| - |BP| = a - b$$

$\Rightarrow \quad ||AP| - |BP|| = |a - b|$, a constant.

Hence, locus of P is

(i) right bisector AB, if $a = b$.

(ii) a hyperbola, if $|a - b| < |AB| = |z_2 - z_1|$.

(iii) an empty set, if $|a - b| > |AB| = |z_2 - z_1|$.

(iv) set of all points on line AB except those which lie between A and B, if $|a - b| = |AB| \neq 0$.

Hence, (d) is the correct answer.

Ex 3. If $\arg(\bar{z}_1) = \arg(z_2)$, then

(a) $z_2 = kz_1^{-1}, k > 0$ (b) $z_2 = kz_1, k > 0$

(c) $|z_2| = |\bar{z}_1|$ (d) None of these

Sol. $\bar{z}_1 = \frac{z_1\bar{z}_1}{z_1} = |z_1|^2 z_1^{-1}$

$\Rightarrow \quad \arg(z_1^{-1}) = \arg(\bar{z}_1) = \arg(z_2)$

$\Rightarrow \quad z_2 = kz_1^{-1} \; (k > 0)$

Hence, (a) is the correct answer.

Ex 4. If $\dfrac{\tan\alpha - i\left(\sin\frac{\alpha}{2} + \cos\frac{\alpha}{2}\right)}{1 + 2i\sin\frac{\alpha}{2}}$ is purely imaginary, then α is given by

(a) $n\pi + \frac{\pi}{4}$ (b) $n\pi - \frac{\pi}{4}$

(c) $(2n + 1)\pi$ (d) $2n\pi + \frac{\pi}{4}$

Sol. $$\text{Re}\left(\frac{\tan\alpha - i\left(\sin\frac{\alpha}{2} + \cos\frac{\alpha}{2}\right)}{1 + 2i\sin\frac{\alpha}{2}}\right) = 0$$

$$\Rightarrow \text{Re}\left(\frac{\left\{\tan\alpha - i\left(\sin\frac{\alpha}{2} + \cos\frac{\alpha}{2}\right)\right\}\left(1 - 2i\sin\frac{\alpha}{2}\right)}{1 + 4\sin^2\frac{\alpha}{2}}\right) = 0$$

$$\Rightarrow \quad \text{Re}\left\{\frac{\tan\alpha - 2\sin\frac{\alpha}{2}\left(\cos\frac{\alpha}{2} + \sin\frac{\alpha}{2}\right) - i\left(\tan\alpha \cdot 2\sin\frac{\alpha}{2} + \sin\frac{\alpha}{2} + \cos\frac{\alpha}{2}\right)}{1 + 4\sin^2\frac{\alpha}{2}}\right\} = 0$$

$\Rightarrow \quad \tan\alpha = 2\sin^2\frac{\alpha}{2} + \sin\alpha$

$\Rightarrow \quad \frac{\sin\alpha}{\cos\alpha} = \sin\alpha + 1 - \cos\alpha$

$\Rightarrow \quad \sin\alpha = \sin\alpha \cdot \cos\alpha + \cos\alpha - \cos^2\alpha$

$\Rightarrow \quad \sin\alpha(1 - \cos\alpha) = \cos\alpha(1 - \cos\alpha)$

$\Rightarrow \quad \sin\alpha = \cos\alpha, \cos\alpha = 1$

$\Rightarrow \quad \alpha = n\pi + \frac{\pi}{4}$

or $\quad \alpha = 2n\pi, n \in I$

Hence, (a) is the correct answer.

Ex 5. The expression $\tan\left[i\log\left(\frac{a - ib}{a + ib}\right)\right]$ reduces to

(a) $\frac{ab}{a^2 + b^2}$ (b) $\frac{2ab}{a^2 - b^2}$

(c) $\frac{ab}{a^2 - b^2}$ (d) $\frac{2ab}{a^2 + b^2}$

Sol. Given, $\tan\left[i\log\left(\frac{a - ib}{a + ib}\right)\right]$

Let $a + ib = re^{i\theta}$, $r^2 = a^2 + b^2$

$\Rightarrow \quad a - ib = re^{-i\theta}$, $\tan\theta = \frac{b}{a}$

$$\Rightarrow \quad \frac{a-ib}{a+ib} = e^{-2i\theta}$$

$$i\log\left(\frac{a-ib}{a+ib}\right) = i\log(e^{-2i\theta}) = 2\theta$$

$$\Rightarrow \quad \tan\left[i\log\left(\frac{a-ib}{a+ib}\right)\right] = \tan 2\theta$$

$$= \frac{2\tan\theta}{1-\tan^2\theta}$$

$$= \frac{2b/a}{1-\frac{b^2}{a^2}} = \frac{2ab}{a^2-b^2}$$

Hence, (b) is the correct answer.

Ex 6. If $z_1 = a+ib$ and $z_2 = c+id$ are complex numbers such that $|z_1| = |z_2| = 1$ and $\text{Re}(z_1\bar{z}_2) = 0$, then the pair of complex numbers $a+ic = w_1$ and $b+id = w_2$ satisfies

(a) $|w_1| \neq 1$ (b) $|w_2| \neq 1$
(c) $\text{Re}(w_1\bar{w}_2) = 0$ (d) None of these

Sol. $z_1 = a+ib, z_2 = c+id$

$$|z_1| = |z_2| = 1$$

$$\Rightarrow \quad a^2+b^2 = c^2+d^2 = 1$$

$$w_1 = a+ic, w_2 = b+id$$

$$z_1\bar{z}_2 = (a+ib)(c-id)$$

$$= (ac+bd) + i(bc-ad)$$

As $\quad \text{Re}(z_1\bar{z}_2) = 0$

$$\Rightarrow \quad ac+bd = 0 \quad \Rightarrow \quad ac = -bd$$

$$w_1\bar{w}_2 = (a+ic)(b-id)$$

$$= (ab+cd) + i(bc-ad)$$

We have, $a^2+b^2 = c^2+d^2$

$$\Rightarrow \quad a^2-c^2 = d^2-b^2$$

$$\Rightarrow a^2-c^2+2i\,ac = d^2-b^2-2ibd \quad [\because \text{ as } ac = -bd]$$

$$\Rightarrow \quad (a+ic)^2 = (d-ib)^2$$

$$\Rightarrow \quad a+ic = (d-ib) \quad \text{or} \quad -d+ib$$

$$\Rightarrow \quad a = d \text{ and } c = -b \text{ or } a = -d, b = c$$

$$\Rightarrow \quad c^2+d^2 = b^2+d^2$$

$$a^2+c^2 = a^2+b^2$$

$$\Rightarrow \quad a^2+c^2 = 1, b^2+d^2 = 1$$

$$\Rightarrow \quad |w_1| = |w_2| = 1$$

Also, $\quad ab+cd = -cd+cd = 0$

$$\Rightarrow \quad \text{Re}(w_1\bar{w}_2) = 0$$

Hence, (c) is the correct answer.

Ex 7. If $\left|\frac{z_1}{z_2}\right| = 1$ and $\arg(z_1z_2) = 0$, then

(a) $z_1 = z_2$ (b) $|z_2|^2 = z_1z_2$
(c) $z_1z_2 = 1$ (d) None of these

Sol. Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$, then $\left|\frac{z_1}{z_2}\right| = 1$

$$\Rightarrow \quad |z_1| = |z_2|$$

$$\Rightarrow \quad |z_1| = |z_2| = r_1$$

Now, $\quad \arg(z_1, z_2) = 0$

$$\Rightarrow \arg(z_1) + \arg(z_2) = 0$$

$$\Rightarrow \quad \arg(z_2) = -\theta_1$$

Therefore, $\quad z_2 = r_1[\cos(-\theta_1) + i\sin(-\theta_1)]$

$$= r_1(\cos\theta_1 - i\sin\theta_1) = \bar{z}_1$$

$$\Rightarrow \quad \bar{z}_2 = \overline{(\bar{z}_1)} = z_1 \quad \Rightarrow \quad |z_2|^2 = z_1z_2$$

Hence, (b) is the correct answer.

Ex 8. If z is a complex number, then $z^2 + \bar{z}^2 = 2$ represents

(a) a circle (b) a straight line
(c) a hyperbola (d) an ellipse

Sol. Let $z = x+iy$, then

$$z^2 + \bar{z}^2 = 2$$

$$\Rightarrow \quad (x+iy)^2 + (x-iy)^2 = 2$$

$$\Rightarrow \quad x^2 - y^2 = 1$$

which represents a hyperbola.

Hence, (c) is the correct answer.

Ex 9. If $\frac{1-i\alpha}{1+i\alpha} = A+iB$, then A^2+B^2 equals

(a) 1 (b) α^2 (c) -1 (d) $-\alpha^2$

Sol. $A+iB = \frac{1-i\alpha}{1+i\alpha} \Rightarrow A-iB = \frac{1+i\alpha}{1-i\alpha}$

$$\Rightarrow \quad (A+iB)(A-iB) = \frac{(1-i\alpha)(1+i\alpha)}{(1+i\alpha)(1-i\alpha)} = 1$$

$$\Rightarrow \quad A^2+B^2 = 1$$

Hence, (a) is the correct answer.

Ex 10. If $|z_1| = |z_2|$ and $\arg(z_1) + \arg(z_2) = \pi/2$, then

(a) z_1z_2 is purely real
(b) z_1z_2 is purely imaginary
(c) $(z_1+z_2)^2$ is purely real
(d) $\arg(z_1^{-1}) + \arg(z_2^{-1}) = \frac{\pi}{2}$

Sol. Let $|z_1| = |z_2| = r$

$$\Rightarrow \quad z_1 = r(\cos\theta + i\sin\theta)$$

and $\quad z_2 = r\left[\cos\left(\frac{\pi}{2}-\theta\right) + i\sin\left(\frac{\pi}{2}-\theta\right)\right]$

$\Rightarrow \quad z_1z_2 = r^2i$, which is purely imaginary.

$$z_1+z_2 = r[(\cos\theta+\sin\theta) + i(\cos\theta+\sin\theta)]$$

$$\Rightarrow (z_1+z_2)^2 = 2r^2\cdot(\cos\theta+\sin\theta)^2\cdot i$$

which is purely imaginary.

Also, $\quad \arg(z_1^{-1}) + \arg(z_2^{-1}) = -\frac{\pi}{2}$

Hence, (b) is the correct answer.

Ex 11. The value of the expression

$$2\left(1+\frac{1}{\omega}\right)\left(1+\frac{1}{\omega^2}\right) + 3\left(2+\frac{1}{\omega}\right)\left(2+\frac{1}{\omega^2}\right) + 4\left(3+\frac{1}{\omega}\right)\left(3+\frac{1}{\omega^2}\right) + \ldots + (n+1)\left(n+\frac{1}{\omega}\right)\left(n+\frac{1}{\omega^2}\right),$$

where ω is an imaginary cube root of unity, is

(a) $\dfrac{n(n^2+2)}{3}$ (b) $\dfrac{n(n^2-2)}{3}$

(c) $\dfrac{n^2(n+1)^2+4n}{4}$ (d) None of these

Sol. $t_n = (n+1)\left(n+\dfrac{1}{\omega}\right)\left(n+\dfrac{1}{\omega^2}\right) n^3 + n^2\left(\dfrac{1}{\omega^2}+\dfrac{1}{\omega}+1\right)$

$$+ n\left(1+\frac{1}{\omega^2}+\frac{1}{\omega}\right)+1$$

$$= n^3 + n^2(\omega+\omega^2+1) + n(\omega+\omega^2+1) + 1 = n^3+1$$

$$\therefore S_n = \sum_{r=1}^{n} t_r = \sum_{r=1}^{n}(r^3+1) = \frac{n^2(n+1)^2}{4} + n$$

Hence, (c) is the correct answer.

Ex 12. If z_1 and z_2 are two complex numbers satisfying the equation $\left|\dfrac{z_1+iz_2}{z_1-iz_2}\right| = 1$, then $\dfrac{z_1}{z_2}$ is

(a) purely real
(b) of unit modulus
(c) purely imaginary
(d) None of the above

Sol. $(z_1+iz_2)(\bar{z}_1 - i\bar{z}_2) = (z_1 - iz_2)(\bar{z}_1 + i\bar{z}_2)$

$\Rightarrow \quad \bar{z}_1 z_2 = z_1\bar{z}_2$

$\Rightarrow \quad \dfrac{z_1}{z_2} = \dfrac{\bar{z}_1}{\bar{z}_2}$

$\Rightarrow \dfrac{z_1}{z_2}$ is purely real.

Hence, (a) is the correct answer.

Ex 13. If $z = -2+2\sqrt{3}i$, then $z^{2n} + 2^{2n}z^n + 2^{4n}$ may be equal to

(a) 2^{2n}
(b) 0
(c) $3\cdot 4^{2n}$, n is multiple of 3
(d) None of the above

Sol. $z = -2+2\sqrt{3}i = 4\omega$

$$\therefore z^{2n} + 2^{2n}z^n + 2^{4n} = 4^{2n}\omega^{2n} + 2^{2n}\cdot 4^n\cdot\omega^n + 2^{4n}$$

$$= 4^{2n}[\omega^{2n}+\omega^n+1]$$

$= 0$, if n is not a multiple of 3.

$= 3\cdot 4^{2n}$, if n is a multiple of 3.

Hence, (c) is the correct answer.

Ex 14. The complex number $z = 1+i$ is rotated through an angle $3\pi/2$ in anti-clockwise direction about the origin and stretched by additional $\sqrt{2}$ units, then the new complex number is

(a) $-\sqrt{2}-\sqrt{2}\,i$
(b) $\sqrt{2}-\sqrt{2}\,i$
(c) $2-\sqrt{2}\,i$
(d) None of the above

Sol. If z_1 is the new complex number, then

$$|z_1| = |z| + \sqrt{2} = 2\sqrt{2}$$

Also, $\dfrac{z_1}{z} = \dfrac{|z_1|}{|z|}\cdot e^{i3\pi/2}$

$\Rightarrow \quad z_1 = z\cdot 2\left(\cos\dfrac{3\pi}{2} + i\sin\dfrac{3\pi}{2}\right)$

$$= 2(1+i)(0-i) = -2i+2 = 2(1-i)$$

Hence, (d) is the correct answer.

Ex 15. If $2\cos\theta = x + \dfrac{1}{x}$ and $2\cos\phi = y + \dfrac{1}{y}$, then

(a) $\dfrac{x}{y} + \dfrac{y}{x} = 2\cos(\theta+\phi)$

(b) $x^m y^n + \dfrac{1}{x^m y^n} = 2\cos(m\theta + n\phi)$

(c) $\dfrac{x^m}{y^n} + \dfrac{y^n}{x^m} = 2\cos(m\theta + n\phi)$

(d) $xy + \dfrac{1}{xy} = 2\cos(\theta-\phi)$

Sol. $2\cos\theta = x + \dfrac{1}{x}$, $2\cos\phi = y + \dfrac{1}{y}$

$\Rightarrow x^2 - 2x\cos\theta + 1 = 0$

$\Rightarrow \quad x = \dfrac{2\cos\theta \pm \sqrt{4\cos^2\theta - 4}}{2}$

$\Rightarrow \quad x = \cos\theta \pm i\sin\theta = e^{\pm i\theta}$

Similarly, $\quad y = e^{\pm i\phi}$

$\Rightarrow \quad \dfrac{x}{y} + \dfrac{y}{x} = 2\cos(\theta - \phi)$

$$x^m y^n + \frac{1}{x^m y^n} = 2\cos(m\theta + n\phi)$$

$$\frac{x^m}{y^n} + \frac{y^n}{x^m} = 2\cos(m\theta - n\phi)$$

$$xy + \frac{1}{xy} = 2\cos(\theta+\phi)$$

Hence, (b) is the correct answer.

Ex 16. The complex numbers z_1 and z_2 are such that $z_1 \ne z_2$ and $|z_1| = |z_2|$. If z_1 has positive real part and z_2 has negative imaginary part, then $\left(\dfrac{z_1+z_2}{z_1-z_2}\right)$ may be

(a) zero
(b) real and positive
(c) real and negative
(d) purely imaginary

Sol. Given, $|z_1| = |z_2|$

$$\text{Re}(z_1) > 0,\ \text{Im}(z_2) < 0$$

$$\text{Re}\left(\frac{z_1+z_2}{z_1-z_2}\right) = \frac{1}{2}\left(\frac{z_1+z_2}{z_1-z_2} + \frac{\bar{z}_1+\bar{z}_2}{\bar{z}_1-\bar{z}_2}\right)$$

$$= \frac{1}{2}\left(\frac{(z_1+z_2)(\bar{z}_1-\bar{z}_2) + (\bar{z}_1+\bar{z}_2)(z_1-z_2)}{(z_1-z_2)(\bar{z}_1-\bar{z}_2)}\right)$$

$$=\frac{1}{2}\left(\frac{z_1\bar{z}_1 - z_1\bar{z}_2 + z_2\bar{z}_1 - z_2\bar{z}_2 + z_1\bar{z}_1 + z_1\bar{z}_2 - z_2\bar{z}_1 - z_2\bar{z}_2}{|z_1 - z_2|^2}\right)$$

$$=\frac{1}{2}\left(\frac{2|z_1|^2 - |z_2|^2}{|z_1 - z_2|^2}\right) = 0$$

$\Rightarrow \left(\frac{z_1 + z_2}{z_1 - z_2}\right)$ is purely imaginary.

Hence, (d) is the correct answer.

Ex 17. If $\left|\frac{z_1 z - z_2}{z_1 z + z_2}\right| = k, (z_1, z_2 \neq 0)$, then

(a) for $k \neq 1$, locus z is a straight line
(b) for $k \notin \{1, 0\}$, z lies on a circle
(c) for $k \neq 0$, z represents a point
(d) for $k \neq 1$, z lies on the perpendicular bisector of the line segment joining $\frac{z_2}{z_1}$ and $-\frac{z_2}{z_1}$

Sol. Given, $\left|\frac{z_1 z - z_2}{z_1 z + z_2}\right| = k \Rightarrow \left|\frac{z - \frac{z_2}{z_1}}{z + \frac{z_2}{z_1}}\right| = k$

Clearly, if $k \neq 0$, 1 then z would lie on a circle.
If $k = 1$, z would lie on a perpendicular bisector of the line segment joining $\frac{z_2}{z_1}$ and $-\frac{z_2}{z_1}$.
If $k = 0$, z represents a point.
Hence, (b) is the correct answer.

Ex 18. If $A(z_1)$, $B(z_2)$ and $C(z_3)$ are the vertices of a ΔABC in which $\angle ABC = \frac{\pi}{4}$ and $\frac{AB}{BC} = \sqrt{2}$, then the value of z_2 is equal to

(a) $z_3 + i(z_1 + z_3)$
(b) $z_3 - i(z_1 - z_3)$
(c) $z_3 + i(z_1 - z_3)$
(d) None of the above

Sol. Given, $\frac{AB}{BC} = \sqrt{2}$

Considering the rotation about B, we get

$$\frac{z_1 - z_2}{z_3 - z_2} = \frac{|z_1 - z_2|}{|z_3 - z_2|} \cdot e^{i\pi/4} = \frac{AB}{BC} \cdot e^{i\pi/4}$$

$$= \sqrt{2}\left(\frac{1}{\sqrt{2}} + \frac{i}{\sqrt{2}}\right) = 1 + i$$

$\Rightarrow \quad z_1 - z_2 = (1 + i)(z_3 - z_2)$
$\Rightarrow \quad z_1 - (1 + i)z_3 = z_2(1 - 1 - i)$
$\Rightarrow \quad iz_2 = -z_1 + (1 + i)z_3$
$\Rightarrow \quad z_2 = iz_1 - i(1 + i)z_3$
$\therefore \quad z_2 = z_3 + i(z_1 - z_3)$

Hence, (c) is the correct answer.

Ex 19. If $z_1 z_2 \in C$, $z_1^2 + z_2^2 \in R$, $z_1(z_1^2 - 3z_2^2) = 2$ and $z_2(3z_1^2 - z_2^2) = 11$, then the value of $z_1^2 + z_2^2$ is

(a) 5 (b) 6 (c) 10 (d) 12

Sol. Here, $z_1(z_1^2 - 3z_2^2) = 2$ ...(i)

$z_2(3z_1^2 - z_2^2) = 11$ ...(ii)

On multiplying Eq. (ii) by i and adding it to Eq. (i), we get

$z_1^3 - 3z_2^2 z_1 + i(3z_1^2 z_2 - z_2^3) = 2 + 11i$

$\Rightarrow \quad (z_1 + iz_2) = 2 + 11i$ ...(iii)

Again multiplying Eq. (ii) by i and subtracting it from Eq. (i), we get

$z_1^3 - 3z_2^2 z_1 - i(3z_1^2 z_2 - z_2^3) = 2 - 11i$

$\Rightarrow \quad (z_1 - iz_2)^3 = 2 + 11i$ ...(iv)

On multiplying Eqs. (iii) and (iv), we get

$(z_1^2 + z_2^2)^3 = 4 + 121 \Rightarrow z_1^2 + z_2^2 = 5$

Hence, (a) is the correct answer.

Ex 20. $\sqrt{1 - c^2} = nc - 1$ and $z = e^{i\theta}$, then $\frac{c}{2n}(1 + nz)\left(1 + \frac{n}{z}\right)$ is equal to

(a) $1 - c\cos\theta$ (b) $1 + 2c\cos\theta$
(c) $1 + c\cos\theta$ (d) $1 - 2c\cos\theta$

Sol. Here, $\sqrt{1 - c^2} = nc - 1$

$\Rightarrow \quad 1 - c^2 = n^2c^2 - 2nc + 1$

$\therefore \quad \frac{c}{2n} = \frac{1}{1 + n^2}$ ...(i)

or $\frac{c}{2n}(1 + nz)\left(1 + \frac{n}{z}\right) = \frac{1}{1 + n^2}\left\{1 + n^2 + n\left(z + \frac{1}{z}\right)\right\}$

$$= \frac{1}{1 + n^2}\{1 + n^2 + n \cdot (2\cos\theta)\}$$

$$= \frac{(1 + n^2) + 2n\cos\theta}{1 + n^2}$$

$$= 1 + \left(\frac{2n}{1 + n^2}\right)\cos\theta$$

[using Eq. (i)]

$$= 1 + c\cos\theta$$

Hence, (c) is the correct answer.

Ex 21. Consider an ellipse having its foci at $A(z_1)$ and $B(z_2)$ in the argand plane. If the eccentricity of the ellipse is e and it is known that origin is an interior point of the ellipse, then

(a) $e \in \left(0, \frac{|z_1 + z_2|}{|z_1| + |z_2|}\right)$
(b) $e \in \left(0, \frac{|z_1 - z_2|}{|z_1| + |z_2|}\right)$
(c) $e \in \left(0, \frac{|z_1 + z_2|}{|z_1| - |z_2|}\right)$
(d) Can't be determined

Sol. If $P(z)$ is any point on the ellipse. Then, equation of the ellipse is

$$|z - z_1| + |z - z_2| = \frac{|z_1 - z_2|}{e} \quad \text{...(i)}$$

If we replace z by z_1 or z_2, Eq. (i) becomes $|z_1 - z_2|$.
For $P(z)$ to lie on ellipse, we have

$$|z - z_1| + |z - z_2| < \frac{|z_1 - z_2|}{e}$$

It is given that origin is an interior point of the ellipse.

$$\Rightarrow \qquad |0 - z_1| + |0 - z_2| < \frac{|z_1 - z_2|}{e}$$

$$\Rightarrow \qquad e \in \left(0, \frac{|z_1 - z_2|}{|z_1| + |z_2|}\right)$$

Hence, (b) is the correct answer.

Ex 22. If $|z - 2 - i| = |z| \left| \sin\left(\frac{\pi}{4} - \arg(z)\right) \right|$, then locus of z is

(a) a pair of straight lines
(b) a circle
(c) a parabola
(d) an ellipse

Sol. We have, $|(x-2) + i(y-1)| = |z| \left| \frac{1}{\sqrt{2}} \cos\theta - \frac{1}{\sqrt{2}} \sin\theta \right|$

where, $\theta = \arg(z)$

$$\sqrt{(x-2)^2 + (y-1)^2} = \frac{1}{\sqrt{2}} |x - y|$$

which is a parabola.

Hence, (c) is the correct answer.

Ex 23. $\alpha_1, \alpha_2, \alpha_3, \ldots, \alpha_{100}$ are all the 100th roots of unity. The numerical value of $\sum\limits_{1 \le i < j \le 100} \sum (\alpha_i \alpha_j)^5$ is

(a) 20 (b) 0
(c) $(20)^{1/20}$ (d) None of these

Sol. $\sum\limits_{1 \le i < j \le 100} \sum \alpha_i^5 \alpha_j^5 = (\alpha_1^5 + \alpha_2^5 + \alpha_3^5 + \alpha_4^5 + \alpha_5^5 + \ldots)^2$

$$- (\alpha_1^{10} + \alpha_2^{10} + \alpha_3^{10} + \alpha_4^{10} + \alpha_5^{10} + \ldots)$$

$$= 0 - 0 = 0$$

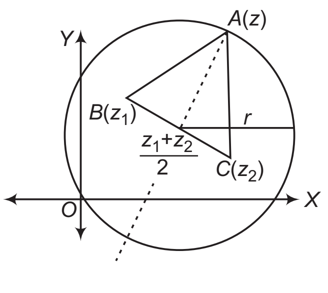
Because $(\alpha_1^r + \alpha_2^r + \ldots + \alpha_{100}^r) = \begin{cases} 100, \text{ if } r = 100k \\ 0, \text{ if } r \ne 100k \end{cases}$

Hence, (b) is the correct answer.

Ex 24. The maximum area of the triangle formed by the complex coordinates z, z_1 and z_2, which satisfy the relations $|z - z_1| = |z - z_2|$, $\left| z - \left(\frac{z_1 + z_2}{2}\right) \right| \le r$, where $r > |z_1 - z_2|$, is

(a) $\frac{1}{2}|z_1 - z_2|^2$ (b) $\frac{1}{2}|z_1 - z_2| r$
(c) $\frac{1}{2}|z_1 - z_2|^2 r^2$ (d) $\frac{1}{2}|z_1 - z_2| r^2$

Sol.



By the given conditions, the area of ΔABC is

$$\frac{1}{2}|z_1 - z_2| r$$

Hence, (b) is the correct answer.

Ex 25. Locus of z, if

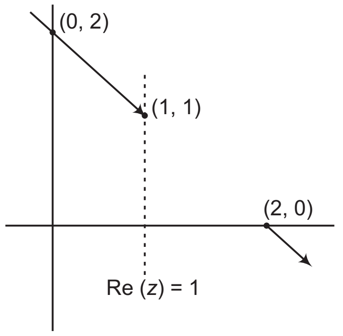
$$\arg[z - (1 + i)] = \begin{cases} \frac{3\pi}{4}, \text{ when } |z| \le |z - 2| \\ \frac{-\pi}{4}, \text{ when } |z| > |z - 2| \end{cases}, \text{ is}$$

(a) straight line passing through (2, 0)
(b) straight line passing through (2, 0), (1, 1)
(c) a line segment
(d) a set of two rays

Sol. The given equation is written as

$$\arg[z - (1 + i)] = \begin{cases} \frac{3\pi}{4}, \text{ when } x \le 2 \\ \frac{-\pi}{4}, \text{ when } x > 2 \end{cases}$$

The locus is a set of two rays.

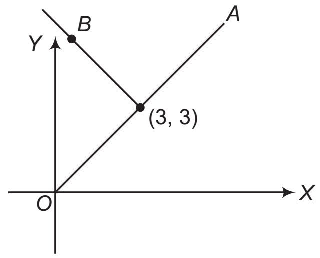


Hence, (d) is the correct answer.

Ex 26. If $A = \left\{ z \mid \arg(z) = \frac{\pi}{4} \right\}$ and $B = \left\{ z \mid \arg(z - 3 - 3i) = \frac{2\pi}{3} \right\}, z \in C.$ Then, $n(A \cap B)$ is equal to

(a) 1
(b) 2
(c) 3
(d) 0

Sol. We can observe that, $3 + 3i \in A$ but $\notin B$.



$$\therefore \qquad n(A \cap B) = 0$$

Hence, (d) is the correct answer.

Ex 27. Dividing $f(z)$ by $z-i$, we obtain the remainder i and dividing it by $z+i$, we get the remainder $1+i$. The remainder upon the division of $f(z)$ by z^2+1, is

(a) $\frac{1}{2}(z+1)+i$ (b) $\frac{1}{2}(iz+1)+i$

(c) $\frac{1}{2}(iz-1)+i$ (d) $\frac{1}{2}(z+i)+1$

Sol. $f(z) = g(z)(z-i)(z+i) + az + b$; where $a, b \in C$

$$f(i) = i \Rightarrow ai + b = i \quad \ldots\text{(i)}$$

$$f(-i) = 1+i \Rightarrow a(-i) + b = 1+i \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$a = \frac{i}{2},\ b = \frac{1}{2} + i$$

Hence, required remainder $= az + b = \frac{1}{2}iz + \frac{1}{2} + i$

Hence, (b) is the correct answer.

Type 2. More than One Correct Option

Ex 28. If $z_1 = a_1 + ib_1$ and $z_2 = a_2 + ib_2$ are complex numbers such that $|z_1| = 1$, $|z_2| = 2$ and $\text{Re}(z_1 z_2) = 0$, then the pair of complex numbers $\omega_1 = a_1 + \frac{ia_2}{2}$ and $\omega_2 = 2b_1 + ib_2$, satisfy

(a) $|\omega_1| = 1$ (b) $|\omega_2| = 2$

(c) $\text{Re}(\omega_1\omega_2) = 0$ (d) $\text{Im}(\omega_1\omega_2) = 0$

Sol. $a_1^2 + b_1^2 = 1$, $a_2^2 + b_2^2 = 4$ and $a_1 a_2 = b_1 b_2$

$$a_2^2 + b_2^2 = 4a_1^2 + 4b_1^2$$

$$(a_2 + 2ia_1)^2 = (2b_1 + ib_2)^2 \Rightarrow a_2 = \pm 2b_1$$

$$|\omega_1|^2 = a_1 + a_1^2 + \frac{a_2^2}{4} = a_1^2 + b_1^2 = 1$$

$$\Rightarrow \quad |\omega_1| = 1 \text{ and } |\omega_2|^2 = 4b_1^2 + b_2^2 = 4$$

$$\Rightarrow \quad |\omega_2| = 2$$

$$\text{Re}(\omega_1\omega_2) = 2a_1 b_1 - \frac{a_2 b_2}{2} = 0$$

$$\text{Im}(\omega_1\omega_2) = a_1 b_2 + a_2 b_1 = 2a_1^2 + 2b_1^2 = 2$$

Hence, (a), (b) and (c) are the correct answers.

Ex 29. If from a point P representing the complex number z_1 on the curve $|z| = 2$, pair of tangents are drawn to the curve $|z| = 1$, meeting at point $Q(z_2)$ and $R(z_3)$, then

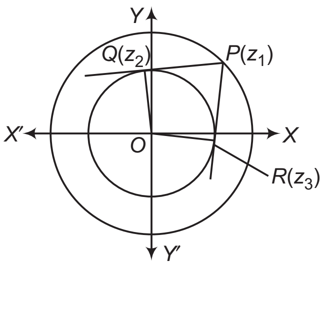
(a) complex number $\frac{z_1 + z_2 + z_3}{3}$ will lie on the curve $|z| = 1$

(b) $\left(\frac{4}{\bar{z}_1} + \frac{1}{\bar{z}_2} + \frac{1}{\bar{z}_3}\right)\left(\frac{4}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right) = 9$

(c) $\arg\left(\frac{z_2}{z_3}\right) = \frac{2\pi}{3}$

(d) orthocentre and circumcentre of ΔPQR will coincide

Sol. Options (a) and (d) are true as PQR is an equilateral triangle, so orthocentre, circumcentre and centroid will coincide.



(b) $\left|\frac{z_1 + z_2 + z_3}{3}\right| = 1 \Rightarrow |z_1 + z_2 + z_3|^2 = 9$

$$\Rightarrow \quad (z_1 + z_2 + z_3)(\bar{z}_1 + \bar{z}_2 + \bar{z}_3) = 9$$

$$\Rightarrow \quad \left(\frac{4}{\bar{z}_1} + \frac{1}{\bar{z}_2} + \frac{1}{\bar{z}_3}\right)\left(\frac{4}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right) = 9$$

(c) $\angle QOR = 120°$

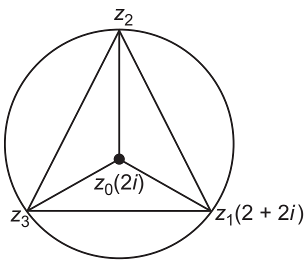
Hence, (a), (b), (c) and (d) are the correct answers.

Ex 30. One vertex of the triangle of maximum area that can be inscribed in the curve $|z - 2i| = 2$, is $2 + 2i$, remaining vertices is/are

(a) $-1 + i(2 + \sqrt{3})$ (b) $-1 - i(2 + \sqrt{3})$

(c) $-1 + i(2 - \sqrt{3})$ (d) $-1 - i(2 - \sqrt{3})$

Sol. Clearly, the inscribed triangle is equilateral.



$$\Rightarrow \quad \frac{z_2 - z_0}{z_1 - z_0} = e^{i\frac{2\pi}{3}},\ \frac{z_3 - z_0}{z_1 - z_0} = e^{-i\frac{2\pi}{3}}$$

$$\Rightarrow \quad z_2 = -1 + i(2 + \sqrt{3})$$

and $\quad z_3 = -1 + i(2 - \sqrt{3})$

Hence, options (a) and (c) are the correct answers.

Ex 31. Let z be a complex number and a be a real parameter, such that $z^2 + az + a^2 = 0$, then

(a) locus of z is a pair of straight lines

(b) locus of z is a circle

(c) $\arg(z) = \pm\frac{2\pi}{3}$

(d) $|z| = |a|$

Sol. $z^2 + az + a^2 = 0$

$$\Rightarrow \quad z = a\omega, a\omega^2$$

where, ω is non-real root of cube unity.

$\Rightarrow$ Locus of z is a pair of straight lines

and $\arg(z) = \arg(a) + \arg(\omega)$ or $\arg(a) + \arg(\omega^2)$

$$\Rightarrow \quad \arg(z) = \pm\frac{2\pi}{3}$$

Also, $|z| = |a||\omega|$ or $|a||\omega^2| \Rightarrow |z| = |a|$

Hence, (a), (c) and (d) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 32-36) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices* (a), *(b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

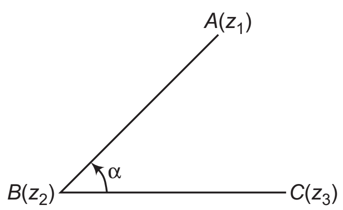
(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

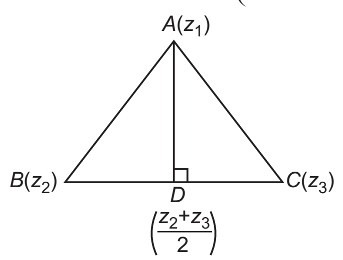
Ex 32. Statement I If $A(z_1)$, $B(z_2)$, $C(z_3)$ are the vertices of an equilateral ΔABC, then

$$\arg\left(\frac{z_2+z_3-2z_1}{z_3-z_2}\right)=\frac{\pi}{4}$$

Statement II If $\angle B=\alpha$, then $\dfrac{z_1-z_2}{z_3-z_2}=\dfrac{AB}{BC}e^{i\alpha}$ or $\arg\left(\dfrac{z_1-z_2}{z_3-z_2}\right)=\alpha$



Sol. $\because \arg\left(\dfrac{z_2+z_3-2z_1}{z_3-z_2}\right)=\arg\left(\dfrac{\dfrac{z_2+z_3}{2}-z_1}{z_3-z_2}\right)$



$$=\frac{\pi}{2} \quad [\text{as } AD\perp BC]$$

Hence, (d) is the correct answer.

Ex 33. Statement I If $x+\dfrac{1}{x}=1$ and $p=x^{4000}+\dfrac{1}{x^{4000}}$ and q is the digit at unit place in the number $2^{2^n}+1$, $n\in N$ and $n>1$, then the value of $p+q=8$.

Statement II ω, ω^2 are the roots of $x+\dfrac{1}{x}=-1$, $x^3+\dfrac{1}{x^3}=2$.

Sol. $x+\dfrac{1}{x}=1 \Rightarrow x^2-x+1=0$

$\therefore \quad x=-\omega,-\omega^2$

Now, for $x=-\omega$, $p=\omega^{4000}+\dfrac{1}{\omega^{4000}}=\omega+\dfrac{1}{\omega}=-1$

Similarly, for $x=-\omega^2$, $p=-1$

For $n>1$, $2^n=4k$

$\therefore (2)^{2^n}=2^{4k}=(16)^k=a$ number with last $=6$

$\Rightarrow \quad q=6+1=7$

Hence, $\quad p+q=-1+7=6$

Hence, (d) is the correct answer.

Ex 34. Statement I If z_1,z_2,z_3 are complex numbers represent the points A,B,C such that $\dfrac{2}{z_1}=\dfrac{1}{z_2}+\dfrac{1}{z_3}$. Then, A,B,C passes through origin.

Statement II If $2z_2=z_1+z_3$, then z_1,z_2,z_3 are concyclic.

Sol. $\dfrac{2}{z_1}=\dfrac{1}{z_2}+\dfrac{1}{z_3}\Rightarrow\dfrac{1}{z_1}-\dfrac{1}{z_2}=\dfrac{1}{z_3}-\dfrac{1}{z_1}$

$\Rightarrow \quad \dfrac{z_2-z_1}{z_1z_2}=\dfrac{z_1-z_3}{z_1z_3}$

$\Rightarrow \quad \dfrac{z_2-z_1}{z_3-z_1}=-\dfrac{z_2}{z_3}$

$\Rightarrow \quad \arg\left(\dfrac{z_2-z_1}{z_3-z_1}\right)=\arg\left(-\dfrac{z_2}{z_3}\right)$

$\Rightarrow \quad \arg\left(\dfrac{z_2-z_1}{z_3-z_1}\right)=\pi-\arg\left(\dfrac{z_2}{z_3}\right)=\pi-\arg\left(\dfrac{z_2}{z_3}\right)$

$\Rightarrow \angle CAB=\pi-\angle COB\Rightarrow\angle CAB+\angle COB=\pi$

$\Rightarrow$ Points O, A, B, C are concyclic.

Hence, (b) is the correct answer.

Ex 35. Statement I $3+ix^2y$ and x^2+y+4i are complex conjugate numbers, then $x^2+y^2=4$.

Statement II If sum and product of two complex numbers is real, then they are conjugate complex number.

Sol. If $3+ix^2y$ and x^2+y+4i are conjugate, then

$$x^2y=-4 \quad\text{and}\quad x^2+y=3$$

$\Rightarrow \quad x^2=4, y=-1 \Rightarrow x^2+y^2=5$

Hence, (d) is the correct answer.

Ex 36. Statement I If $|z|<\sqrt{2}-1$, then $|z^2+2z\cos\alpha|<1$

Statement II $|z_1+z_2|\le|z_1|+|z_2|$, also $|\cos\alpha|\le 1$.

Sol. $|z^2+2z\cos\alpha|<|z^2|+|2z\cos\alpha|$

$<|z|^2+2|z|\,|\cos\alpha|$

$<(\sqrt{2}-1)^2+2(\sqrt{2}-1)<1$

$[\because |\cos\alpha|\le 1]$

Hence, (a) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 37-39) *In argand plane, $|z|$ represents the distance of a point z from the origin. In general, $|z_1 - z_2|$ represents the distance between two points z_1 and z_2. Also, for a general moving point z in argand plane, if $\arg(z) = \theta$, then $z = |z|e^{i\theta}$, where $e^{i\theta} = \cos\theta + i\sin\theta$.*

Ex 37. The equation $|z - z_1| + |z - z_2| = 10$, if $z_1 = 3 + 4i$ and $z_2 = -3 - 4i$ represents

(a) point circle (b) ordered pair (0, 0)
(c) ellipse (d) None of these

Sol. As $|z_1 - z_2| = |6 + 8i| = 10$

$\therefore \quad |z - z_1| + |z - z_2| = |z_1 - z_2|$

$\Rightarrow z$ lies between z_1 and z_2.

i.e. a line segment.

Hence, (d) is the correct answer.

Ex 38. $||z - z_1| - |z - z_2|| = t$, $t > 10$ where t is a real parameter, always represents

(a) ellipse (b) hyperbola
(c) circle (d) None of these

Sol. Given equation can represent a hyperbola, since

$$|z_1 - z_2| = 10$$

$\Rightarrow z$ lies on hyperbola.

Hence, (b) is the correct answer.

Ex 39. If $|z - (3 + 2i)| = \left|z \cos\left(\frac{\pi}{4} - \arg(z)\right)\right|$, then locus of z is a/an

(a) circle (b) parabola
(c) ellipse (d) hyperbola

Sol. Given, $|z - (3 + 2i)| = |(x - 3) + i(y - 2)|$

$$= |z|\left|\frac{1}{\sqrt{2}}\cos\theta + \frac{1}{\sqrt{2}}\sin\theta\right|, \text{ where } \theta = \arg(z)$$

$$\Rightarrow \sqrt{(x-3)^2 + (y-2)^2} = \frac{1}{\sqrt{2}}|x + y|$$

which is a parabola.

Hence, (b) is the correct answer.

Passage II (Ex. Nos. 40-42) *The complex slope of a line passing through two points represented by complex numbers z_1 and z_2 is defined by $\frac{z_2 - z_1}{\bar{z}_2 - \bar{z}_1}$ and we shall denote by ω. If z_0 is complex number and c is a real number, then $z_0\bar{z} + \bar{z}_0 z = 0$ represents a straight line. Its complex slope is $-\frac{z_0}{\bar{z}_0}$. Now ,consider two lines*

$$\bar{\alpha}z + \alpha\bar{z} + i\beta = 0 \ldots\text{(i)} \quad \textit{and} \quad \bar{a}z + a\bar{z} + b = 0 \ \ldots\text{(ii)}$$

where, α, β and a, b are complex constants and let their complex slopes be denoted by ω_1 and ω_2, respectively.

Ex 40. If the lines are inclined at an angle of 120° to each other, then

(a) $\omega_2\bar{\omega}_1 = \omega_1\bar{\omega}_2$ (b) $\omega_2\bar{\omega}_1^2 = \omega_1\bar{\omega}_2^2$
(c) $\omega_1^2 = \omega_2^2$ (d) $\omega_1 + 2\omega_2 = 0$

Sol. $\omega_1 = \omega_2 e^{i\frac{4\pi}{3}}$

$\Rightarrow \omega_1^3 = \omega_2^3 \Rightarrow \omega_1^3\,\bar{\omega}_1^2\bar{\omega}_2^2 = \omega_2^3\,\bar{\omega}_1^2\bar{\omega}_2^2$

$\Rightarrow \quad \omega_1|\omega_1|^2\,\bar{\omega}_2^2 = \omega_2|\omega_2|^2\bar{\omega}_1^2$

$\Rightarrow \omega_1\,\bar{\omega}_1^2 = \omega_2\,\bar{\omega}_1^2$, as $|\omega_1| = |\omega_2|$

$\therefore \quad \omega_2\,\bar{\omega}_1^2 = \omega_1\,\bar{\omega}_2^2$

Hence, (b) is the correct answer.

Ex 41. Which of the following must be true?

(a) a must be pure imaginary
(b) β must be pure imaginary
(c) a must be real
(d) β must be imaginary

Sol. Since, $i\beta$ is real.

$\therefore \beta$ is pure imaginary.

Hence, (b) is the correct answer.

Ex 42. If line (i) makes an angle of 45° with real axis, then $(1 + i)\left(-\frac{2\alpha}{\bar{\alpha}}\right)$ is

(a) $2\sqrt{2}$ (b) $2\sqrt{2}i$ (c) $2(1 - i)$ (d) $-2(1 + i)$

Sol. $-\frac{\alpha}{\bar{\alpha}} = e^{\pm i\frac{\pi}{2}} = \pm i$

$$\therefore \quad (1 + i)\left(-\frac{2\alpha}{\bar{\alpha}}\right) = \pm 2(-1 + i)$$

Hence, (c) is the correct answer.

Passage III (Ex. Nos. 43-45) *Consider ΔABC in argand plane. Let $A(0)$, $B(1)$ and $C(1 + i)$ be its vertices and M be the mid-point of CA. Let z be a variable complex number in the plane. Let us another variable complex number defined as, $u = z^2 + 1$.*

Ex 43. Locus of u, when z is on BM, is a/an

(a) circle (b) parabola
(c) ellipse (d) hyperbola

Ex 44. Axis of locus of u, when z is on BM, is

(a) real axis (b) imaginary axis
(c) $z + \bar{z} = 2$ (d) $z - z = 2i$

Ex 45. Directrix of locus of z, when z is on BM, is

(a) real axis (b) imaginary axis
(c) $z + \bar{z} = 2$ (d) $z - \bar{z} = 2i$

Sol. (Ex. Nos. 43-45)

$$BM \equiv y - 0 = -1(x - 1)$$

$$x + y = 1$$

$$\therefore \quad \sqrt{u - 1} = t + i(1 - t)$$

$$u = 2t + 2i\,t(1 - t)$$

$x = 2t$ and $y = 2t(1 - t)$, where $u = x + iy$

$(x - 1)^2 = -2\left(y - \frac{1}{2}\right)$, which is parabola.

Axis is $x = 1$, i.e. $z + \bar{z} = 2$

Directrix is $y = 1$, i.e. $z - \bar{z} = 2i$

43. (b) **44.** (c) **45.** (d)

Type 5. **Match the Columns**

Ex 46. Match the following :

	Column I		Column II
A.	Locus of the point z satisfying the equation $\text{Re}(z^2) = \text{Re}(z + \bar{z})$, is a/an	p.	circle
B.	Locus of the point z satisfying the equation $\lvert z - z_1\rvert + \lvert z - z_2\rvert = \lambda$, $\lambda \in R^+$ and $\lambda \nless \lvert z_1 - z_2\rvert$, is a/an	q.	straight line
C.	Locus of the point satisfying the equation $\left\lvert\frac{2z - i}{z + 1}\right\rvert = m$, where $i = \sqrt{-1}$, is a/an	r.	ellipse and $m \in R^+$
D.	If $\lvert z\rvert = 25$, then the points representing the complex number $-1 + 75\bar{z}$, is a/an	s.	rectangular hyperbola

Sol. A. Put $z = x + iy$

$\therefore \quad \text{Re}(x + iy)^2 = \text{Re}(x + iy + x - iy)$

$$x^2 - y^2 = 2x$$

or $\quad x^2 - y^2 - 2x = 0$

Rectangular hyperbola, eccentricity $= \sqrt{2}$

B. For ellipse, $\lambda > |z_1 - z_2|$

and for straight line,

$$\lambda = |z_1 - z_2|$$

C. $\because \left|\frac{2z - i}{z + 1}\right| = m$

$$\Rightarrow \quad \left|\frac{z - \frac{i}{2}}{z + 1}\right| = \frac{m}{2}$$

For $m = 2$,

$$\Rightarrow \quad \left|\frac{z - \frac{1}{2}}{z + 1}\right| = 1$$

$\Rightarrow \left|z - \frac{i}{2}\right| = |z + 1|$, i.e. straight line

D. Given, $|z| = 25$

Let $\quad z_1 = -1 + 75\,\bar{z}$

$\therefore \quad |75\,\bar{z}| = z_1 + 1$ or $|75\,\bar{z}| = |z_1 + 1|$

$\Rightarrow \quad 75 \times 25 = |z_1 + 1|$

$\therefore \quad |z_1 - (-1)| = 1875$

$\Rightarrow z_1$ lies on circle.

Ex. 47. If z_1, z_2, z_3, z_4 are the roots of the equation $z^4 + z^3 + z^2 + z + 1 = 0$, then

	Column I		Column II
A.	$\left\lvert\sum_{i=1}^{4} z_i^4\right\rvert$ is equal to	p.	0
B.	$\sum_{i=1}^{4} z_i^5$ is equal to	q.	4
C.	$\prod_{i=1}^{4}(z_i + 2)$ is equal to	r.	1
D.	Least value of $[\lvert z_1 + z_2\rvert]$, where [ ] represents greatest integer function, is	s.	11

Sol. The given equation is $\frac{z^5 - 1}{z - 1} = 0$, which means that z_1, z_2, z_3, z_4 are four out of five roots of unity except 1.

A. $z_1^4 + z_2^4 + z_3^4 + z_4^4 + 1^4 = 0$

$$\Rightarrow \quad \left|\sum_{i=1}^{4} z_i^4\right| = 1$$

B. $z_1^5 + z_2^5 + z_3^5 + z_4^5 + 1 = 5$

$$\Rightarrow \quad \sum_{i=1}^{4} z_i^5 = 4$$

C. $z^4 + z^3 + z^2 + z + 1$

$= (z - z_1)(z - z_2)(z - z_3)(z - z_4)$

Putting $z = -2$ on both the sides, we get

$$\prod_{i=1}^{4}(z_i + 2) = 11$$

D. $|z_1 + z_2| = \sqrt{2 + 2\cos 144°}$ for minimum

$$= 2\cos 72° = \frac{\sqrt{5} - 1}{2}$$

whose greatest integer is 0.

A $\to$ r; B $\to$ q; C $\to$ s; D $\to$ p

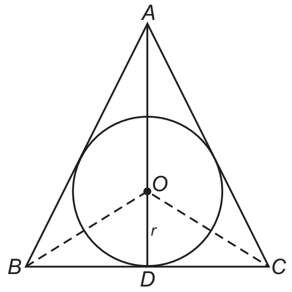
Type 6. **Single Integer Answer Type Questions**

Ex 48. Consider an equilateral triangle having vertices at points

$$A\left(\frac{2}{\sqrt{3}}e^{\frac{i\pi}{2}}\right), B\left(\frac{2}{\sqrt{3}}e^{\frac{-i\pi}{6}}\right) \text{ and}$$

$C\left(\frac{2}{\sqrt{3}}e^{\frac{-i\,5\pi}{6}}\right)$. If $P(z)$ is any point on its incircle, then $AP^2 + BP^2 + CP^2$ is equal to _______ .

Sol. (5) $A(z_1) = \frac{2i}{\sqrt{3}}$



$$B(z_2)=\frac{2}{\sqrt{3}}\left\{\frac{\sqrt{3}}{2}-i\,\frac{1}{2}\right\}=1-\frac{i}{\sqrt{3}}$$

$$C(z_3)=\frac{2}{\sqrt{3}}\left\{-\frac{\sqrt{3}}{2}-\frac{i}{2}\right\}=-1-\frac{i}{\sqrt{3}}$$

Radius of incircle of ΔABC, i.e. $r=\frac{1}{\sqrt{3}}$ unit.

Hence, any point on incircle i.e. $P(z)$ is

$\frac{1}{\sqrt{3}}\cos\alpha, \frac{1}{\sqrt{3}}\sin\alpha$ i.e. $\frac{1}{\sqrt{3}}(\cos\alpha+i\sin\alpha)$

Solving for $|AP|^2+|BP|^2+|CP|^2$, we get

$$AP^2+BP^2+CP^2=5$$

Ex 49. Let $A_1, A_2, \ldots.. A_n$ be the vertices of a regular polygon of n sides in a circle of radius unity and

$$a=|A_1A_2|^2+|A_1A_3|^2+\ldots.+|A_1A_n|^2,$$

$$b=|A_1A_2||A_1A_3|\ldots.|A_1A_n|, \text{ then } \frac{a}{b}= \_\_\_\_.$$

Sol. (2) Let us assume that O is the centre of the polygon and $z_0, z_1, \ldots, z_{n-1}$ represent the affixes of $A_1, A_2, \ldots, A_n$ such that

$z_0=1, z_1=\alpha, z_2=\alpha^2, \ldots, z_{n-1}=\alpha^{n-1}$, where $\alpha=e^{\frac{i2\pi}{n}}$

Now, $|A_1A_r|^2=|\alpha^r-1|^2=|1-\alpha^r|^2$

$$=\left|1-\cos\frac{2r\pi}{n}-i\sin\frac{2r\pi}{n}\right|^2$$

$$=\left(1-\cos\frac{2r\pi}{n}\right)^2+\left(\sin\frac{2r\pi}{n}\right)^2=2-2\cos\frac{2r\pi}{n}$$

$$\therefore \sum_{r=1}^{n}|A_1A_2|^2=\sum_{r=1}^{n}\left(2-2\cos\frac{r\pi}{n}\right)$$

$$=2(n-1)\left\{\cos\frac{2\pi}{n}+\cos\frac{4\pi}{n}+\ldots+\cos\frac{2(n-1)\pi}{n}\right\}$$

$$=2(n-1)-2\cdot\text{Real part of }(\alpha+\alpha^2+\ldots+\alpha^{n-1})$$

$$=2(n-1)-2(1)$$

[since, $\{1+\alpha+\alpha^2+\ldots+\alpha^{n-1}=0\}$]

$$\therefore \quad |A_1A_2|^2+|A_1A_3|^2+\ldots+|A_1A_n|^2=2n$$

Also, let $E=|A_1A_2|\,|A_1A_3|\ldots|A_1A_n|$

$$=|1-\alpha|\,|1-\alpha^2|\,|1-\alpha^3|\ldots|1-\alpha^{n-1}|$$

$$=(|1-\alpha)(1-\alpha^2)(1-\alpha^3)\ldots(1-\alpha^{n-1})|$$

Since, $1\,\alpha, \alpha^2, \ldots, \alpha^{n-1}$ are the roots of $z^n-1=0$.

$$\Rightarrow (z-1)(z-\alpha)(z-\alpha^2)\ldots(z-\alpha^{n-1})=\frac{z^n-1}{z-1}$$

$$\Rightarrow \quad (z-\alpha)(z-\alpha^2)(z-\alpha^{n-1})=z^n-1$$

$$=1+z+z^2+\ldots+z^{n-1}$$

Substituting $z=1$, we have

$$(1-\alpha)(1-\alpha^2)\ldots(1-\alpha^{n-1})=n$$

$$|1-\alpha|\,|1-\alpha^2|\ldots|1-\alpha^{n-1}|=n$$

Hence, the value of $\frac{a}{b}=\frac{2n}{n}=2$

Target Exercises

Type 1. **Only One Correct Option**

1. The value of $\dfrac{i^{592}+i^{590}+i^{588}+i^{586}+i^{584}}{i^{582}+i^{580}+i^{578}+i^{576}+i^{574}}-1$ is

(a) -1 (b) -2
(c) -3 (d) -4

2. $i^{57}+\dfrac{1}{i^{125}}$, when simplified has the value

(a) 0 (b) $2i$
(c) $-2i$ (d) 2

3. $i^{n}+i^{n+1}+i^{n+2}+i^{n+3}$ is equal to

(a) 1 (b) -1
(c) 0 (d) None of these

4. $1+i^2+i^4+i^6+\ldots+i^{2n}$ is

(a) positive (b) negative
(c) 0 (d) Can't be determined

5. The value of $\left[i^{19}+\left(\dfrac{1}{i}\right)^{25}\right]^2$ is

(a) 4 (b) -4 (c) 2 (d) -2

6. If n is any positive integer, then the value of $\dfrac{i^{4n+1}-i^{4n-1}}{2}$ equals

(a) 1 (b) -1 (c) i (d) $-i$

7. For a positive integer n, the expression $(1-i)^n\left(1-\dfrac{1}{i}\right)^n$ equals

(a) 0 (b) $2i^n$ (c) 2^n (d) 4^n

8. If the number $\dfrac{(1-i)^n}{(1+i)^{n-2}}$ is real and positive, then n is

(a) any integer (b) 2λ
(c) $4\lambda+1$ (d) None of these

9. The smallest positive integer n for which $\left(\dfrac{1+i}{1-i}\right)^n=-1$ is

(a) 1 (b) 2
(c) 3 (d) 4

10. The smallest positive number n for which $(1+i)^{2n}=(1-i)^{2n}$ is

(a) 4 (b) 8
(c) 2 (d) 12

11. The complex number $\dfrac{1+2i}{1-i}$ lies in the

(a) I quadrant (b) II quadrant
(c) III quadrant (d) IV quadrant

12. The value of $\dfrac{(1-i)^3}{1-i^3}$ is equal to

(a) i (b) -1 (c) 1 (d) -2

13. $\left(\dfrac{1+i}{1-i}\right)^2+\left(\dfrac{1-i}{1+i}\right)^2$ is equal to

(a) $2i$ (b) $-2i$
(c) -2 (d) 2

14. The value of $\text{Re}\left[\dfrac{(1+i)^2}{3-i}\right]$ is equal to

(a) $-\dfrac{1}{5}$ (b) $\dfrac{1}{5}$ (c) $\dfrac{1}{10}$ (d) $-\dfrac{1}{10}$

15. If $a^2+b^2=1$, then $\dfrac{(1+b+ia)}{(1+b-ia)}$ is equal to

(a) 1 (b) 2
(c) $b+ia$ (d) $a+ib$

16. If $b+ic=(1+a)z$ and $a^2+b^2+c^2=1$, then $\dfrac{1+iz}{1-iz}$ equals

(a) $\dfrac{a-ib}{1-c}$ (b) $\dfrac{a-ib}{1+c}$ (c) $\dfrac{a+ib}{1-c}$ (d) $\dfrac{a+ib}{1+c}$

17. If $\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix}=x+iy$, then

(a) $x=3,\ y=1$ (b) $x=1,\ y=3$
(c) $x=0,\ y=3$ (d) $x=0,\ y=0$

18. $\sqrt{2i}$ equals

(a) $1+i$ (b) $1-i$
(c) $-\sqrt{2i}$ (d) None of these

19. If z is a complex number such that $|z|\neq 0$ and $\text{Re}(z)=0$, then

(a) $\text{Re}(z^2)=0$ (b) $\text{Im}(z^2)=0$
(c) $\text{Re}(z^2)=\text{Im}(z^2)$ (d) None of these

20. If $(x+iy)^{1/3}=a+ib$, then $\dfrac{x}{a}+\dfrac{y}{b}$ is equal to

(a) $2(a^2-b^2)$ (b) $4(a^2-b^2)$
(c) $8(a^2-b^2)$ (d) None of these

21. If $8iz^3 + 12z^2 - 18z + 27i = 0$, then

(a) $|z| = \frac{3}{2}$ (b) $|z| = \frac{2}{3}$ (c) $|z| = 1$ (d) $|z| = \frac{3}{4}$

22. If $z = 1 + i$, then the multiplicative inverse of z^2 is

(a) $1 - i$ (b) $\frac{i}{2}$ (c) $-\frac{i}{2}$ (d) $2i$

23. If $\left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy$, then (x, y) is equal to

(a) (0, 2) (b) (– 2, 0)
(c) (0, –2) (d) None of these

24. The multiplicative inverse of $(6 + 5i)^2$ is

(a) $\frac{11}{60} - \frac{60}{61}i$ (b) $\frac{11}{61} - \frac{60}{61}i$
(c) $\frac{9}{61} - \frac{60}{61}i$ (d) None of these

25. The multiplicative inverse of $\frac{3 + 4i}{4 - 5i}$ is

(a) $-\frac{8}{25} + \frac{31}{25}i$ (b) $\frac{8}{25} - \frac{31}{25}i$
(c) $-\frac{8}{25} - \frac{31}{25}i$ (d) None of these

26. If $z = x + iy$ lies in III quadrant, then $\frac{\bar{z}}{z}$ also lies in III quadrant, if

(a) $x > y > 0$ (b) $x < y < 0$
(c) $y < x < 0$ (d) $y > x > 0$

27. The conjugate complex number of $\frac{2 - i}{(1 - 2i)^2}$ is

(a) $\frac{2}{25} + \frac{11}{25}i$ (b) $\frac{2}{25} - \frac{11}{25}i$
(c) $-\frac{2}{25} + \frac{11}{25}i$ (d) $-\frac{2}{25} - \frac{11}{25}i$

28. $\left|(1 + i)\left(\frac{2 + i}{3 + i}\right)\right|$ is equal to

(a) $-\frac{1}{2}$ (b) $\frac{1}{2}$ (c) 1 (d) – 1

29. The value of $|\sqrt{2i} - \sqrt{-2i}\,|$ is

(a) 2 (b) $\sqrt{2}$ (c) 0 (d) $2\sqrt{2}$

30. If $\frac{1 - ix}{1 + ix} = a - ib$ and $a^2 + b^2 = 1$, where a and b are real, then x is equal to

(a) $\frac{2a}{(1 + a)^2 + b^2}$ (b) $\frac{2b}{(1 + a)^2 + b^2}$
(c) $\frac{2a}{(1 + b)^2 + a^2}$ (d) $\frac{2b}{(1 + b)^2 + a^2}$

31. The modulus of $\frac{(3 + 2i)^2}{(4 - 3i)}$ is

(a) $\frac{13}{5}$ (b) $\frac{11}{5}$ (c) $\frac{9}{5}$ (d) $\frac{7}{5}$

32. If $x + iy = \frac{u + iv}{u - iv}$, then $x^2 + y^2$ is equal to

(a) 1 (b) –1
(c) 0 (d) None of these

33. If $(1 + i)(1 + 2i)(1 + 3i)\ldots(1 + ni) = \alpha + i\beta$, then $2 \cdot 5 \cdot 10 \ldots (1 + n^2)$ is equal to

(a) $\alpha - i\beta$ (b) $\alpha^2 - \beta^2$
(c) $\alpha^2 + \beta^2$ (d) None of these

34. The principal argument of the complex number $\frac{(1 + i)^5\,(1 + \sqrt{3}i)^2}{-2i\,(-\sqrt{3} + i)}$ is

(a) $\frac{19\pi}{12}$ (b) $-\frac{7\pi}{12}$ (c) $-\frac{5\pi}{12}$ (d) $\frac{5\pi}{12}$

35. The complex number $i + \sqrt{3}$ in polar form can be written as

(a) $\frac{1}{\sqrt{2}}\left(\sin\frac{\pi}{6} + i\cos\frac{\pi}{6}\right)$ (b) $2\left(\cos\frac{\pi}{6} + i\sin\frac{\pi}{6}\right)$
(c) $\frac{1}{2}\left(\sin\frac{\pi}{6} + i\cos\frac{\pi}{6}\right)$ (d) $4\left(\cos\frac{\pi}{6} + i\cos\frac{\pi}{6}\right)$

36. If z is a complex number, then

(a) $|z^2| > |z|^2$ (b) $|z^2| = |z|^2$ (c) $|z^2| < |z|^2$ (d) $|z^2| \geq |z|^2$

37. If $z = x + iy$, x and y are real, then $|x| + |y| \leq k\,|z|$, where k is equal to

(a) 1 (b) $\sqrt{2}$
(c) $\sqrt{3}$ (d) None of these

38. If z is any complex number such that $|z + 4| \leq 3$, then the least value and greatest value of $|z + 1|$ are

(a) 1, 6 (b) 0, 6
(c) 2, 8 (d) None of these

39. If z satisfies $|z + 1| < |z - 2|$, then $w = 3z + 2 + i$ satisfies

(a) $|w + 1| < |w - 8|$ (b) $|w + 1| < |w - 7|$
(c) $|w + \bar{w}| > 7$ (d) $|w + 5| < |w - 4|$

40. For any complex number z, the minimum value of $|z| + |z - 1|$ is

(a) 1 (b) 0 (c) $\frac{1}{2}$ (d) $\frac{3}{2}$

41. The greatest positive argument of complex number satisfying $|z - 4| = \text{Re}\,(z)$, is

(a) $\frac{\pi}{3}$ (b) $\frac{2\pi}{3}$
(c) $\frac{\pi}{2}$ (d) $\frac{\pi}{4}$

42. The square roots of $-2 + 2\sqrt{3}\,i$ are

(a) $\pm\,(1 + \sqrt{3}\,i)$ (b) $\pm\,(1 - \sqrt{3}\,i)$
(c) $\pm\,(-1 + \sqrt{3}\,i)$ (d) None of these

43. If $z = a + ib$, where $a > 0$, $b > 0$, then

(a) $|z| \geq \frac{1}{\sqrt{2}}(a - b)$ (b) $|z| \geq \frac{1}{\sqrt{2}}(a + b)$
(c) $|z| < \frac{1}{\sqrt{2}}(a + b)$ (d) None of these

44. If for the complex numbers z_1 and z_2, $|1-\bar{z}_1 z_2|^2 - |z_1 - z_2|^2 = k(1-|z_1|^2)(1-|z_2|^2)$, then k is equal to

(a) 1 (b) −1 (c) 2 (d) 4

45. The range of real number α for which the equation $z + \alpha|z-1| + 2i = 0$ has a solution, is

(a) $\left[-\frac{\sqrt{5}}{2}, \frac{\sqrt{5}}{2}\right]$ (b) $\left[-\frac{\sqrt{3}}{2}, \frac{\sqrt{3}}{2}\right]$

(c) $\left[0, \frac{\sqrt{5}}{2}\right]$ (d) $\left(-\infty, -\frac{\sqrt{5}}{2}\right] \cup \left[\frac{\sqrt{5}}{2}, \infty\right)$

46. If $|z| = 2$ and locus of $5z - 1$ is the circle having radius a and $z_1^2 + z_2^2 - 2z_1 z_2 \cos\theta = 0$, then $|z_1| : |z_2|$ is equal to

(a) $a : 1$ (b) $2a : 1$
(c) $a : 10$ (d) None of these

47. The maximum value of $|z|$ when z satisfies the condition $\left|z + \frac{2}{z}\right| = 2$ is

(a) $\sqrt{3} - 1$ (b) $\sqrt{3} + 1$
(c) $\sqrt{3}$ (d) $\sqrt{2} + \sqrt{3}$

48. If $z_1 \ne z_2$ and $|z_1 + z_2| = \left|\frac{1}{z_1} + \frac{1}{z_2}\right|$, then

(a) atleast one of z_1, z_2 is unimodular
(b) $z_1 \cdot z_2$ is unimodular
(c) $z_1 \cdot z_2$ is non-unimodular
(d) None of the above

49. If $1, \omega, \omega^2, \ldots, \omega^{n-1}$ are the n, nth roots of unity and z_1, z_2 are any two complex numbers, then $\sum_{k=0}^{n-1} |z_1 + \omega^k z_2|^2$ is equal to

(a) $n[|z_1|^2 + |z_2|^2]$ (b) $(n-1)[|z_1|^2 + |z_2|^2]$
(c) $(n+1)[|z_1|^2 + |z_2|^2]$ (d) None of these

50. If z satisfies the equation $|z| - z = 1 + 2i$, then z is equal to

(a) $\frac{3}{2} + 2i$ (b) $\frac{3}{2} - 2i$
(c) $2 - \left(\frac{3}{2}\right)i$ (d) $2 + \left(\frac{3}{2}\right)i$

51. If $\sqrt{3} + i = (a + ib)(c + id)$, then $\tan^{-1}\frac{b}{a} + \tan^{-1}\frac{d}{c}$ is equal to

(a) $\frac{\pi}{2} + 2n\pi$, for some integer n
(b) $-\frac{\pi}{3} + n\pi$, for some integer n
(c) $\frac{\pi}{6} + n\pi$, for some integer n
(d) $-\frac{\pi}{6} + 2n\pi$, for some integer n

52. If z is any complex number satisfying $|z - 1| = 1$, then which of the following is correct?

(a) $\arg(z-1) = 2\arg(z)$
(b) $2\arg(z) = 2/3 \arg(z^2 - z)$
(c) $\arg(z-1) = \arg(z+1)$
(d) $\arg(z) = 2\arg(z+1)$

53. If $z = -1$, then the principal value of $\arg(z^{2/3})$ is equal to

(a) $\frac{\pi}{3}$ (b) $\frac{2\pi}{3}$ or 2π or $\frac{10\pi}{3}$
(c) $\frac{5\pi}{3}$ (d) π

54. If $z_1 = 8 + 4i$, $z_2 = 6 + 4i$ and $\arg\left(\frac{z - z_1}{z - z_2}\right) = \frac{\pi}{4}$, then z satisfies

(a) $|z - 7 - 4i| = 1$ (b) $|z - 7 - 5i| = \sqrt{2}$
(c) $|z - 4i| = 8$ (d) $|z - 7i| = \sqrt{18}$

55. If $\arg(z) < 0$, then $\arg(-z) - \arg(z)$ is equal to

(a) π (b) $-\pi$ (c) $-\frac{\pi}{2}$ (d) $\frac{\pi}{2}$

56. If z is a point on the argand plane such that $|z - 1| = 1$, then $\frac{z-2}{z}$ is equal to

(a) tan (arg z) (b) cot (arg z)
(c) i tan (arg z) (d) None of these

57. If $C^2 + S^2 = 1$, then $\frac{1 + C + iS}{1 + C - iS}$ is equal to

(a) $C + iS$ (b) $C - iS$ (c) $S + iC$ (d) $S - iC$

58. The imaginary part of $(z-1)(\cos\alpha - i\sin\alpha) + (z-1)^{-1} \times (\cos\alpha + i\sin\alpha)$ is zero, if

(a) $|z - 1| = 2$ (b) $\arg(z-1) = 2\alpha$
(c) $\arg(z-1) = \alpha$ (d) $|z| = 1$

59. The value of $\frac{\left(\sin\frac{\pi}{8} + i\cos\frac{\pi}{8}\right)^8}{\left(\sin\frac{\pi}{8} - i\cos\frac{\pi}{8}\right)^8}$ is

(a) −1 (b) 0 (c) 1 (d) $2i$

60. If $a = \cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}$, then the value of $\left(\frac{1+a}{2}\right)^{3n}$ is

(a) $(-1)^n$ (b) $\frac{(-1)^n}{2^{3n}}$ (c) $\frac{1}{2^{3n}}$ (d) $(-1)^n + 1$

61. The value of $\left(\frac{1+i}{\sqrt{2}}\right)^8 + \left(\frac{1-i}{\sqrt{2}}\right)^8$ is equal to

(a) 4 (b) 6 (c) 8 (d) 2

62. The value of $\sum_{k=1}^{10}\left(\sin\frac{2\pi k}{11} - i\cos\frac{2\pi k}{11}\right)$ is

(a) 1 (b) −1
(c) i (d) $-i$

63. The value of $\dfrac{4(\cos 75^\circ + i\sin 75^\circ)}{0.4(\cos 30^\circ + i\sin 30^\circ)}$ is

(a) $\dfrac{10}{\sqrt{2}}(1+i)$ (b) $\dfrac{10}{\sqrt{2}}(1-i)$

(c) $\dfrac{5}{\sqrt{2}}(1+i)$ (d) None of these

64. The value of
$\dfrac{(\cos 2\theta - i\sin 2\theta)^7 (\cos 3\theta + i\sin 3\theta)^{-5}}{(\cos 4\theta + i\sin 4\theta)^{12} (\cos 5\theta + i\sin 5\theta)^{-6}}$ is

(a) $\cos 33\theta + i\sin 33\theta$ (b) $\cos 33\theta - i\sin 33\theta$

(c) $\cos 47\theta + i\sin 47\theta$ (d) $\cos 47\theta - i\sin 47\theta$

65. $(\cos 2\theta + i\sin 2\theta)^{-5} (\cos 3\theta - i\sin 3\theta)^6$ $(\sin\theta - i\cos\theta)^3$ is equal to

(a) $\cos 25\theta + i\sin 25\theta$

(b) $\cos 25\theta - i\sin 25\theta$

(c) $\sin 25\theta + i\cos 25\theta$

(d) $\sin 25\theta - i\cos 25\theta$

66. The principal value of the arg (z) and $|z|$ of the complex number $z = \dfrac{(1+\cos\theta + i\sin\theta)^5}{(\cos\theta + i\sin\theta)^3}$ are

(a) $-\dfrac{\theta}{2}, 32\cos^5\dfrac{\theta}{2}$ (b) $\dfrac{\theta}{2}, 32\cos^5\dfrac{\theta}{2}$

(c) $-\dfrac{\theta}{2}, 16\cos^4\dfrac{\theta}{2}$ (d) None of these

67. If $z = \cos\theta + i\sin\theta$, then

(a) $z^n + \dfrac{1}{z^n} = 2\cos n\theta$ (b) $z^n + \dfrac{1}{z^n} = 2^n\cos n\theta$

(c) $z^n - \dfrac{1}{z^n} = 2^n i\sin n\theta$ (d) $z^n - \dfrac{1}{z^n} = (2i)^n\sin n\theta$

68. If $z = \cos\theta + i\sin\theta$, then $\dfrac{z^{2n}-1}{z^{2n}+1}$, where n is an integer, is equal to

(a) $i\cot n\theta$ (b) $i\tan n\theta$ (c) $\tan n\theta$ (d) $\cot n\theta$

69. If $a = \cos 2\alpha + i\sin 2\alpha$, $b = \cos 2\beta + i\sin 2\beta$, $c = \cos 2\gamma + i\sin 2\gamma$ and $d = \cos 2\delta + i\sin 2\delta$, then $\sqrt{abcd} + \dfrac{1}{\sqrt{abcd}}$ is equal to

(a) $\sqrt{2}\cos(\alpha+\beta+\gamma+\delta)$ (b) $2\cos(\alpha+\beta+\gamma+\delta)$

(c) $\cos(\alpha+\beta+\gamma+\delta)$ (d) None of these

70. $e^{2mi\cot^{-1}p} \cdot \left(\dfrac{pi+1}{pi-1}\right)^m$ is equal to

(a) 0 (b) 1

(c) -1 (d) None of these

71. If $\alpha = \cos\left(\dfrac{8\pi}{11}\right) + i\sin\left(\dfrac{8\pi}{11}\right)$, then $\text{Re}(\alpha + \alpha^2 + \alpha^3 + \alpha^4 + \alpha^5)$ is equal to

(a) $\dfrac{1}{2}$ (b) $-\dfrac{1}{2}$

(c) 0 (d) None of these

72. If $\omega (\neq 1)$ is cube root of unity satisfying $\dfrac{1}{a+\omega} + \dfrac{1}{b+\omega} + \dfrac{1}{c+\omega} = 2\omega^2$ and $\dfrac{1}{a+\omega^2} + \dfrac{1}{b+\omega^2} + \dfrac{1}{c+\omega^2} = 2\omega$, then the value of $\dfrac{1}{a+1} + \dfrac{1}{b+1} + \dfrac{1}{c+1}$ is equal to

(a) 2 (b) -2

(c) $-1+\omega^2$ (d) None of these

73. If α and β are the roots of the equation $x^2 - 2x + 4 = 0$, then the value of $\alpha^6 + \beta^6$ is

(a) 64 (b) 128

(c) 256 (d) None of these

74. If z is any complex number such that $z + \dfrac{1}{z} = 1$, then the value of $z^{99} + \dfrac{1}{z^{99}}$ is

(a) 1 (b) -1

(c) 2 (d) -2

75. The value of $(-1+\sqrt{-3})^{62} + (-1-\sqrt{-3})^{62}$ is

(a) 2^{62} (b) 2^{64}

(c) -2^{62} (d) 0

76. If ω is a cube root of unity, then $(3+5\omega+3\omega^2)^2 (3+3\omega+5\omega^2)^2$ is equal to

(a) 4 (b) 0

(c) -4 (d) None of these

77. The value of $\left(\dfrac{1+i\sqrt{3}}{1-i\sqrt{3}}\right)^6 + \left(\dfrac{1-i\sqrt{3}}{1+i\sqrt{3}}\right)^6$ is

(a) 2 (b) -2 (c) 1 (d) 0

78. If $z_1 = \sqrt{3} + i\sqrt{3}$ and $z_2 = \sqrt{3} + i$, then the complex number $\left(\dfrac{z_1}{z_2}\right)^{50}$ lies in the quadrant number

(a) I (b) II (c) III (d) IV

79. If $x = a + b$, $y = a\omega + b\omega^2$, $z = a\omega^2 + b\omega$, then xyz is equal to

(a) $(a+b)^3$ (b) $a^3 + b^3$

(c) $a^3 - b^3$ (d) $(a+b)^3 + 3ab(a+b)$

80. If 1, ω and ω^2 are the cube roots of unity, then the value of $(1+\omega)^3 - (1+\omega^2)^3$ is

(a) 2ω (b) 2 (c) -2 (d) 0

81. If 1, ω and ω^2 are the three cube roots of unity and α, β and γ are the roots of p, $p < 0$, then for any x, y and z, the expression $\dfrac{x\alpha + y\beta + z\gamma}{x\beta + y\gamma + z\alpha}$ equals

(a) 1

(b) ω

(c) ω^2

(d) None of the above

82. The value of the expression $1(2-\omega)(2-\omega^2)+2(3-\omega)(3-\omega^2)+\ldots+(n-1)(n-\omega)(2-\omega^2)$, where ω is an imaginary cube root of unity, is

(a) $\left(\frac{n(n+1)}{2}\right)^2$ (b) $\left(\frac{n(n+1)}{2}\right)^2-n$

(c) $\left(\frac{n(n+1)}{2}\right)^2+n$ (d) None of these

83. If α and β are the complex cube roots of unity, then $\alpha^3+\beta^3+\alpha^{-2}\beta^{-2}$ is equal to

(a) 0 (b) 3
(c) -3 (d) None of these

84. If ω is a complex cube root of unity, then $(1-\omega+\omega^2)(1-\omega^2+\omega^4)(1-\omega^4+\omega^8)(1-\omega^8+\omega^{16})$ is equal to

(a) 12 (b) 14
(c) 16 (d) None of these

85. If $x=\omega-\omega^2-2$, then the value of $x^4+3x^3+2x^2-11x-6$ is

(a) 1 (b) -1
(c) 2 (d) None of these

86. If 1, ω and ω^2 are the three cube roots of unity, then $(1+\omega)(1+\omega^2)(1+\omega^4)(1+\omega^8)\ldots$ to $2n$ factors is equal to

(a) 1 (b) -1
(c) 0 (d) None of these

87. If $x=a+b+c$, $y=a\alpha+b\beta+c$ and $z=a\beta+b\alpha+c$ where, α and β are complex cube roots of unity, then xyz is equal to

(a) $2(a^3+b^3+c^3)$ (b) $2(a^3-b^3-c^3)$
(c) $a^3+b^3+c^3-3abc$ (d) $a^3-b^3-c^3$

88. The common roots of the equations $z^3+2z^2+2z+1=0$ and $z^{1985}+z^{100}+1=0$ are

(a) $-1,\omega$
(b) $-1,\omega^2$
(c) ω,ω^2
(d) None of the above

89. The values of $(16)^{1/4}$ are

(a) $\pm 2, \pm 2i$
(b) $\pm 4, \pm 4i$
(c) $\pm 1, \pm i$
(d) None of the above

90. If p, q and r are positive integers and ω is an imaginary cube root of unity and $f(x)=x^{3p}+x^{3q+1}+x^{3r+2}$, then $f(\omega)$ is equal to

(a) ω
(b) $-\omega^2$
(c) 0
(d) None of the above

91. If $1,\alpha,\alpha^2,\ldots,\alpha^{n-1}$ are the n, nth roots of unity, then $\sum_{i=1}^{n-1}\frac{1}{2-\alpha^i}$ is equal to

(a) $\frac{(n-2)2^{n-1}+1}{2^n-1}$ (b) $(n-2)\cdot 2^n$

(c) $\frac{(n-2)\cdot 2^{n-1}}{2^n-1}$ (d) None of these

92. The triangle formed by the points 1, $\frac{1+i}{\sqrt{2}}$ and i as vertices in the argand diagram is a/an

(a) scalene (b) equilateral
(c) isosceles (d) right angled

93. If the points represented by complex numbers $z_1=a+ib$, $z_2=a'+ib'$ and z_1-z_2 are collinear, then

(a) $ab'+a'b=0$ (b) $ab'-a'b=0$
(c) $ab+a'b'=0$ (d) $ab-a'b'=0$

94. If $\alpha+i\beta=\tan^{-1}z$, $z=x+iy$ and α is constant, then the locus of z is

(a) $x^2+y^2+2x\cot 2\alpha=1$ (b) $(x^2+y^2)\cot 2\alpha=1+x$
(c) $x^2+y^2+2y\tan 2\alpha=1$ (d) $x^2+y^2+2x\sin 2\alpha=1$

95. The equation $|z+1-i|=|z+i-1|$ represents

(a) a straight line (b) a circle
(c) a parabola (d) a hyperbola

96. If the roots of $(z-1)^n=i(z+1)^n$ are plotted in the argand plane, they as

(a) on a parabola (b) concyclic
(c) collinear (d) the vertices of a triangle

97. Locus of the point z satisfying the equation $|iz-1|+|z-i|=2$ is

(a) a straight line (b) a circle
(c) an ellipse (d) a pair of straight lines

98. For $x_1, x_2, y_1, y_2, \in R$, if $0<x_1,<x_2, y_1=y_2$ and $z_1=x_1+iy_1$, $z_2=x_2+iy_2$ and $z_3=\frac{1}{2}(z_1+z_2)$, then z_1, z_2, z_3 satisfy

(a) $|z_1|=|z_2|=|z_3|$ (b) $|z_1|<|z_2|<|z_3|$
(c) $|z_1|>|z_2|>|z_3|$ (d) $|z_1|<|z_3|<|z_2|$

99. The equation not representing a circle is given by

(a) $\text{Re}\left(\frac{1+z}{1-z}\right)=0$

(b) $z\bar{z}+iz-i\bar{z}+1=0$

(c) $\arg\left(\frac{z-1}{z+1}\right)=\frac{\pi}{2}$

(d) $\left|\frac{z-1}{z+1}\right|=1$

100. If z_1, z_2 and z_3 are three complex numbers in AP, then they lie on

(a) a circle (b) a straight line
(c) a parabola (d) an ellipse

101. If the area of the triangle on the argand plane formed by the complex numbers $-z, iz, z - iz$ is 600 sq units, then $|z|$ is equal to

(a) 10 (b) 20
(c) 30 (d) None of these

102. The complex numbers given by $1-3i, 4+3i$ and $3+i$ represent the vertices of

(a) a right angled triangle
(b) an isosceles triangle
(c) an equilateral triangle
(d) None of the above

103. If $\text{Re}\left(\dfrac{z+2i}{z+4}\right) = 0$, then z lies on a circle with centre

(a) $(-2, -1)$ (b) $(-2, 1)$
(c) $(2, -1)$ (d) $(2, 1)$

104. If $\text{Im}\left(\dfrac{z+2i}{z+2}\right) = 0$, then z lies on the curve

(a) $x^2 + y^2 + 2x + 2y = 0$
(b) $x^2 + y^2 - 2x = 0$
(c) $x + y + 2 = 0$
(d) None of the above

105. In the argand plane, all the complex numbers satisfying $|z-4i| + |z+4i| = 10$ lie on

(a) a straight line (b) a circle
(c) an ellipse (d) a parabola

106. If $z = x + iy$ and a is a real number such that $|z - ai| = |z + ai|$, then locus of z is

(a) X-axis
(b) Y-axis
(c) $x = y$
(d) $x^2 + y^2 = 1$

107. If P represents $z = x + iy$ in the argand plane and $|z-1|^2 + |z+1|^2 = 4$, then the locus of P is

(a) $x^2 + y^2 = 2$
(b) $x^2 + y^2 = 1$
(c) $x^2 + y^2 = 4$
(d) $x + y = 2$

108. All the roots of the equation $a_1 z^3 + a_2 z^2 + a_3 z + a_4 = 3$, where $|a_i| \le 1$, $i = 1, 2, 3, 4$, lie outside the circle with centre origin and radius

(a) 1
(b) $\dfrac{1}{3}$
(c) $\dfrac{2}{3}$
(d) None of the above

109. The region of argand diagram defined by $|z-1| + |z+1| \le 4$ is

(a) interior of an ellipse
(b) exterior of a circle
(c) interior and boundary of an ellipse
(d) None of the above

110. The locus of the complex number z in an argand plane satisfying the inequality

$$\log_{1/2}\left(\frac{|z-1|+4}{3|z-1|-2}\right) > 1 \left(\text{where, } |z-1| \ne \frac{2}{3}\right) \text{ is}$$

(a) a circle
(b) interior of a circle
(c) exterior of a circle
(d) None of the above

111. The closest distance of the origin from a curve given as $a\bar{z} + \bar{a}z + a\bar{a} = 0$ (a is a complex number), is

(a) 1 (b) $\dfrac{|a|}{2}$
(c) $\dfrac{\text{Re}(a)}{|a|}$ (d) $\dfrac{\text{Im}(a)}{|a|}$

112. Let a be a complex number such that $|a| < 1$ and $z_1, z_2, \ldots, z_n$ be the vertices of a polygon such that $z_k = 1 + a + a^2 + \ldots a^k$, then the vertices of the polygon lie within the circle

(a) $|z - a| = \dfrac{1}{|1-a|}$
(b) $|z - 1| = \dfrac{1}{|1-a|}$
(c) $\left|z - \dfrac{1}{1-a}\right| = \dfrac{1}{|1-a|}$
(d) None of these

113. If z_1, z_2, z_3 and z_4 are the four complex numbers represented by the vertices of a quadrilateral taken in order such that $z_1 - z_4 = z_2 - z_3$ and $\text{amp}\left(\dfrac{z_4 - z_1}{z_2 - z_1}\right) = \dfrac{\pi}{2}$, then the quadrilateral is a

(a) square
(b) rhombus
(c) cyclic quadrilateral
(d) None of the above

114. The locus of z satisfying $\text{Im}(z^2) = 4$ is

(a) a circle
(b) a rectangular hyperbola
(c) a pair of straight lines
(d) None of the above

115. The curve represented by $\text{Re}(z^2) = 4$ is

(a) a parabola
(b) an ellipse
(c) a circle
(d) a rectangular hyperbola

116. A point z is equidistant from three distinct points z_1, z_2, z_3 in argand plane. If z, z_1 and z_2 are collinear, then $\arg\left(\dfrac{z_3 - z_1}{z_3 - z_2}\right)$ will be (z_1, z_2, z_3 in anti-clockwise sense)

(a) $\dfrac{\pi}{2}$ (b) $\dfrac{\pi}{4}$
(c) $\dfrac{\pi}{6}$ (d) $\dfrac{2\pi}{3}$

Type 2. More than One Correct Option

117. If z_1, z_2, z_3 and z_4 are roots of the equation
$$a_0 z^4 + a_1 z^3 + a_2 z^2 + a_3 z + a_4 = 0$$
where, a_0, a_1, a_2, a_3 and a_4 are real, then
(a) $\bar{z}_1, \bar{z}_2, \bar{z}_3, \bar{z}_4$ are also roots of equation
(b) z_1 is equal to atleast one of $\bar{z}_1, \bar{z}_2, \bar{z}_3, \bar{z}_4$
(c) $-\bar{z}_1, -\bar{z}_2, -\bar{z}_3, -\bar{z}_4$ are also roots of equation
(d) None of the above

118. If $z^3 + (3+2i)z + (-1+ia) = 0$ has one real root, then the value of a lies in the interval $(a \in R)$
(a) $(-2, 1)$ (b) $(-1, 0)$
(c) $(0, 1)$ (d) $(-2, 3)$

119. The real value of θ for which the expression $\dfrac{i + i\cos\theta}{1 - 2i\cos\theta}$ is a real number, is
(a) $2n\pi + \dfrac{\pi}{2}, n \in I$ (b) $2n\pi - \dfrac{\pi}{2}, n \in I$
(c) $2n\pi \pm \dfrac{\pi}{2}, n \in I$ (d) $2n\pi \pm \dfrac{\pi}{4}, n \in I$

120. If α is a complex constant such that $\alpha z + z + \bar{a} = 0$ has a real root, then
(a) $\alpha + \bar{\alpha} = 1$
(b) $\alpha + \bar{\alpha} = 0$
(c) $\alpha + \bar{\alpha} = -1$
(d) the absolute value of the real root is 1

121. If $|z_1| = |z_2| = 1$ and $\arg z_1 + \arg z_2 = 0$, then
(a) $z_1 z_2 = 1$
(b) $z_1 + z_2 = 0$
(c) $z_1 = \bar{z}_2$
(d) None of the above

122. If $|z_1| = 15$ and $|z_2 - 3 - 4i| = 5$, then
(a) $|z_1 - z_2|_{\min} = 5$ (b) $|z_1 - z_2|_{\min} = 10$
(c) $|z_1 - z_2|_{\max} = 20$ (d) $|z_1 - z_2|_{\max} = 25$

123. If $|z - (1/z)| = 1$, then
(a) $|z|_{\max} = \dfrac{1+\sqrt{5}}{2}$ (b) $|z|_{\min} = \dfrac{\sqrt{5}-1}{2}$
(c) $|z|_{\max} = \dfrac{\sqrt{5}-2}{2}$ (d) $|z|_{\min} = \dfrac{\sqrt{5}-1}{\sqrt{2}}$

124. If z_1 and z_2 are two complex numbers $(z_1 \neq z_2)$ satisfying $|z_1^2 - z_2^2| = |\bar{z}_1^2 + \bar{z}_2^2 - 2\bar{z}_1 \bar{z}_2|$, then
(a) $\dfrac{z_1}{z_2}$ is purely imaginary (b) $\dfrac{z_1}{z_2}$ is purely real
(c) $|\arg z_1 - \arg z_2| = \pi$ (d) $|\arg z_1 - \arg z_2| = \dfrac{\pi}{2}$

125. If $|z - 1| = 1$, then
(a) $\arg\{(z-1-i)/z\}$ can be equal to $-\pi/4$
(b) $(z-2)/z$ is purely imaginary number
(c) $(z-2)/z$ is purely real number
(d) If $\arg(z) = \theta$, where $z \neq 0$ and θ is acute, then $1 - 2/z = i\tan\theta$

126. Let complex number z of the form $x + iy$ satisfy $\arg\left(\dfrac{3z - 6 - 3i}{2z - 8 - 6i}\right) = \dfrac{\pi}{4}$ and $|z - 3 + i| = 3$. Then, the ordered pairs (x, y) are
(a) $\left(4 - \dfrac{4}{\sqrt{5}}, 1 + \dfrac{2}{\sqrt{5}}\right)$ (b) $\left(4 + \dfrac{4}{\sqrt{5}}, 1 - \dfrac{2}{\sqrt{5}}\right)$
(c) $(6, -1)$ (d) $(0, -1)$

127. If $z = \omega, \omega^2$, where ω is a non-real complex cube root of unity, are two vertices of an equilateral triangle in the argand plane, then the third vertex may be represented by
(a) $z = 1$ (b) $z = 0$
(c) $z = -2$ (d) $z = -1$

128. If amp $(z_1 z_2) = 0$ and $|z_1| = |z_2| = 1$, then
(a) $z_1 + z_2 = 0$ (b) $z_1 z_2 = 1$
(c) $z_1 = \bar{z}_2$ (d) None of these

129. If z is complex number satisfying $z + z^{-1} = 1$, then $z^n + z^{-n}, n \in N$ has the value
(a) $2(-1)^n$, when n is a multiple of 3
(b) $(-1)^{n-1}$, when n is not a multiple of 3
(c) $(-1)^{n+1}$, when n is a multiple of 3
(d) 0, when n is not a multiple of 3

130. Let z_1, z_2 be two complex numbers represented by points on the circle $|z| = 1$ and $|z| = 2$ respectively, then
(a) max $|2z_1 + z_2| = 4$ (b) min $|z_1 - z_2| = 1$
(c) $\left|z_2 + \dfrac{1}{z_1}\right| \leq 3$ (d) None of these

131. $ABCD$ is a square, vertices being taken in the anti-clockwise sense. If A represents the complex number z and the intersection of the diagonals is the origin, then
(a) B represents the complex number iz
(b) D represents the complex number iz
(c) B represents the complex number iz
(d) D represents the complex number $-iz$

132. If z_0, z_1 represent point P, Q on the locus $|z - 1| = 1$ and the line segment PQ subtend an angle $\dfrac{\pi}{2}$ at the point $z = 1$, then z_1 is equal to
(a) $1 + i(z_0 - 1)$ (b) $\dfrac{i}{z_0 - 1}$
(c) $1 - i(z_0 - 1)$ (d) $i(z_0 - 1)$

133. If $|z_1| = |z_2| = |z_3| = 1$ and z_1, z_2 and z_3 are represented by the vertices of an equilateral triangle, then
(a) $z_1 + z_2 + z_3 = 0$ (b) $z_1 z_2 z_3 = 1$
(c) $z_1 z_2 + z_2 z_3 + z_3 z_1 = 0$ (d) None of these

Type 3. **Assertion and Reason**

Direction (Q. Nos. 134-144) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true, Statement II is false.

(d) Statement I is false, Statement II is true.

134. Consider $|z_1| = 1, |z_2| = 2$ and $|z_3| = 3$.

Statement I If $|z_1 + 2z_2 + 3z_3| = 6$, then the value of $|z_2 z_3 + 8z_3 z_1 + 27 z_1 z_2|$ is 36.

Statement II $|z_1 + z_2 + z_3| \le |z_1| + |z_2| + |z_3|$

135. **Statement I** $7 + i > 5 + i$

Statement II Cancellation laws does not hold true in complex numbers.

136. **Statement I** If z_1 and z_2 are two complex numbers such that $|z_1| = |z_2| + |z_1 - z_2|$, then $\text{Im}\left(\frac{z_1}{z_2}\right) = 0$.

Statement II $\arg(z) = 0 \Rightarrow z$ is purely real.

137. **Statement I** If $z + \frac{1}{z} = 1$ ($z \ne 0$ is a complex number), then the maximum value of $|z|$ is $\frac{\sqrt{5}+1}{2}$.

Statement II On the locus $z + \frac{1}{z} = 1$, the farthest distance from origin is $\frac{\sqrt{5}+1}{2}$.

138. **Statement I** The number of complex numbers z satisfying $|z|^2 + a|z| + b = 0$ $(a, b \in R)$ is atmost 2.

Statement II A quadratic equation in which all the coefficients are non-zero can have atmost two roots.

139. **Statement I** If $\cos(1 - i) = a + ib$, where $a, b \in R$ and $i = \sqrt{-1}$, then $a = \frac{1}{2}\left(e + \frac{1}{e}\right)\cos 1$, $b = \frac{1}{2}\left(e - \frac{1}{2}\right)\sin 1$.

Statement II $e^{i\theta} = \cos\theta + i\sin\theta$

140. **Statement I** The product of all values of $(\cos\alpha + i\sin\alpha)^{3/5}$ is $\cos 3a + i\sin 3a$.

Statement II The product of fifth roots of unity is 1.

141. **Statement I** The locus of the centre of a circle which touches the circles $|z - z_1| = a$ and $|z - z_2| = b$ externally (z, z_1 and z_2 are complex numbers) will be hyperbola.

Statement II $|z - z_1| - |z - z_2| < |z_2 - z_1|$

$\Rightarrow z$ lies on hyperbola.

142. **Statement I** Consider an ellipse having its foci at $A(z_1)$ and $B(z_2)$ in the argand plane. If the eccentricity of the ellipse is e and it is known that origin is an interior point of the ellipse, then

$$e \in \left(\frac{|z_1 + z_2|}{|z_1| + |z_2|}, \frac{|z_1 + z_2|}{|z_1| + |z_2|}\right)$$

Statement II If z_0 is the point interior to curve

$$|z - z_1| + |z - z_2| = \lambda$$
$$|z_0 - z_1| + |z_0 - z_2| < \lambda$$

143. **Statement I** The equation $|z - i| + |z + i| = k, k > 0$, can represent an ellipse, if $k > 2i$.

Statement II $|z - z_1| + |z - z_2| = k$, represents an ellipse, if $|k| > |z_1 - z_2|$.

144. **Statement I** The equation $z\bar{z} + \bar{a}z + a\bar{z} + \lambda = 0$, where a is a complex number represents a circle in argand plane, if λ is real.

Statement II The radius of the circle $z\bar{z} + \bar{a}z + a\bar{z} + \lambda = 0$ is $\sqrt{a\bar{a} - \lambda}$.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 145-147) *Consider the complex numbers z_1 and z_2 satisfying the relation* $|z_1 + z_1|^2 = |z_1|^2 + |z_2|^2$.

145. Complex number $z_1 \bar{z}_2$ is

(a) purely real
(b) purely imaginary
(c) zero
(d) None of these

146. Complex number z_1 / z_2 is

(a) purely real
(b) purely imaginary
(c) zero
(d) None of the above

147. One of the possible argument of complex number $i(z_1 / z_2)$ is

(a) $\frac{\pi}{2}$
(b) $-\frac{\pi}{2}$
(c) 0
(d) None of these

Passage II (Q. Nos. 148-150) *If z satisfy the relation* $|z - \{(\alpha^2 - 7\alpha + 11) + i\}| = 1, \alpha \in R$. *Also,* $\arg(z) \ge \frac{\pi}{2}$ *is satisfied by atleast one z.*

148. The values of α lies in the interval

(a) $[2, 6]$
(b) $\left[1, \frac{7}{2}\right]$
(c) $[2, 5]$
(d) $[-4, -2]$

149. Maximum value of $|z-i|$ is

(a) $\frac{7}{2}$ (b) $\frac{4}{9}$ (c) $\frac{5}{9}$ (d) $\frac{9}{4}$

150. Maximum value of arg (z), for which $|z-i|$ is maximum, is

(a) $\pi - \tan^{-1}\left(\frac{4}{9}\right)$ (b) $\pi - \tan^{-1}\left(\frac{9}{4}\right)$

(c) $\pi - \tan^{-1}\left(\frac{1}{9}\right)$ (d) $\pi - \tan^{-1}\left(\frac{4}{5}\right)$

Passage III (Q. Nos. 151-153) *On the sides AB and BC of a ΔABC, squares are drawn with centres D and E such that points C and D lies on the same side of line AB and points A and E lies in the opposite side of line BC. If A, B and C are represent by the complex numbers* 1, ω and ω^2 *respectively.*

151. Angle between AC and DE is equal to

(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$

152. The length of DE is

(a) $\frac{\sqrt{3}}{2}$ (b) $\sqrt{3}$ (c) $\sqrt{2}$ (d) $\sqrt{6}$

153. The length of AE is

(a) $\frac{3-\sqrt{3}}{2}$ (b) $\frac{3+\sqrt{3}}{2}$ (c) $3-\sqrt{3}$ (d) $3+\sqrt{3}$

Type 5. **Match the Columns**

154. Match the following:

Column I	Column II
A. $\arg\left(\frac{z^2-1}{z^2+1}\right)=0;\ z \neq \pm i, \pm 1$	P. Portions of a line
B. $\left\| \|z-\cos^{-1}\cos 12\| - \|z-\sin^{-1}\sin 12\| \right\| = 8(\pi-3)$	q. Point of intersection of hyperbola
C. $z^2+k_1 = i\|z_1\|^2+k_2; k_1 \neq k_2 \in R-\{0\}$	r. Pair of open rays
D. $\left\|z-1-\sin^{-1}\frac{1}{\sqrt{3}}\right\| + \left\|z+\cos^{-1}\frac{1}{\sqrt{3}}-\frac{\pi}{2}\right\| = 1$	s. line segment

155. For the equation $z^6 - 6z + 20 = 0$, match the items of Column I with that of Column II.

Column I	Column II
A. The number of the roots in the first quadrant can be	p. 1
B. The number of the roots in the second quadrant can be	q. 2
C. The number of the roots in the third quadrant can be	r. 3
D. The number of the roots in the fourth quadrant can be	s. 4

156. Match the following:

Column I	Column II
A. $z^4-1=0$	p. $z=\cos\frac{\pi}{8}+i\sin\frac{\pi}{8}$
B. $z^4+1=0$	q. $z=\cos\frac{\pi}{8}-i\sin\frac{\pi}{8}$
C. $iz^4+1=0$	r. $z=\cos\frac{\pi}{4}+i\sin\frac{\pi}{4}$
D. $iz^4-1=0$	s. $z=\cos 0+i\sin 0$

157. Match the following:

Column I	ColumnI
A. $\sqrt{-1-\sqrt{-1-\sqrt{\ldots\infty}}}$ is	p. 0
B. If z_i, $i=1,2,\ldots,6$ are the vertices of the six sided regular polygon inscribed in a circle $\|z\|=2$, then $\sum_{i=1}^{6} z_i^2$ is equal to	q. $\frac{n}{\omega-1}$
C. If ω_k, $k \in I$; $0 \le k \le n-1$ are the nth roots of unity, then the maximum value of $(n!)^{1/n}\ \omega^{(n-1)/2}$ is	r. ω
D. If z_1, z_2, z_3 are the affixes points and A, B and C are lying on circle centred at origin. If the altitude is drawn from vertex A to base BC, such that it meets the circumcircle at $P(z)$, then $zz_1 + z_2z_3$ is	s. ω^2

Type 6. **Single Integer Answer Type Questions**

158. If $x=a+bi$ is a complex number such that $x^2=3+4i$ and $x^3=2+11i$, where $i=\sqrt{-1}$, then $(a+b)$ equals ________.

159. If the complex numbers z is simultaneously satisfy equations $\left|\frac{z-12}{z-8i}\right|=\frac{5}{3}, \left|\frac{z-4}{z-8}\right|=1$, then Re (z) is ___.

160. If $|z| \ge 3$, then the least value of $\left|z+\frac{1}{z}\right|$ is $\frac{\lambda}{3}$, where λ is __________ .

161. If z is a complex number satisfying $z^4+z^3+2z^2+z+1=0$, then $|z|$ is equal to _____ .

162. $ABCD$ is a rhombus. Its diagonals AC and BD intersect at the point M and satisfy $BD=2AC$. Its points D and M represent the complex numbers $1+i$ and $2-i$ respectively. Then, the complex number represented by A is z, has Re $(z)=\{\lambda_1, \lambda_2\}$, then the value of $\lambda_1+\lambda_2$ is __________ .

JEE Advanced/IIT JEE

1. Match the following : **[2014]**

Let $z_k = \cos\left(\frac{2k\pi}{10}\right) + i \sin\left(\frac{2k\pi}{10}\right)$; $k = 1, 2, \ldots, 9$.

	Column I		Column II
A.	For each z_k, there exists a z_j such $z_k \cdot z_j = 1$	p.	True
B.	There exists $k \in \{1, 2, \ldots, 9\}$, such that $z_1 \cdot z = z_k$ has no solution z in the set of complex numbers	q.	False
C.	$\frac{\lvert 1 - z_1 \rvert \lvert 1 - z_2 \rvert \ldots \lvert 1 - z_9 \rvert}{10}$ equals	r.	1
D.	$1 - \sum_{k=1}^{9} \cos\left(\frac{2k\pi}{10}\right)$ equals	s.	2

Codes

	A	B	C	D		A	B	C	D
(a)	p	q	s	r	(b)	q	p	r	s
(c)	p	q	r	s	(d)	q	p	s	r

2. Let complex numbers α and $\frac{1}{\alpha}$ lie on the circles $(x - x_0)^2 + (y - y_0)^2 = r^2$ and $(x - x_0)^2 + (y - y_0)^2 = 4r^2$, respectively. If $z_0 = x_0 + iy_0$ satisfies the equation $2|z_0|^2 = r^2 + 2$, then $|\alpha|$ equals **[2013]**

(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$ (c) $\frac{1}{\sqrt{7}}$ (d) $\frac{1}{3}$

3. Let $w = \frac{\sqrt{3} + i}{2}$ and $P = \{w^n : n = 1, 2, 3, \ldots\}$. Further $H_1 = \left\{z \in C : \text{Re}(z) > \frac{1}{2}\right\}$ and $H_2 = \left\{z \in C : \text{Re}(z) \frac{-1}{2}\right\}$, where C is the set of all complex numbers. If $z_1 \in P \cap H_1$, $z_2 \in P \cap H_2$ and O represents the origin, then $\angle z_1 O z_2$ equals **[2013]**

(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{6}$ (c) $\frac{2\pi}{3}$ (d) $\frac{5\pi}{6}$

Passage (Q. Nos. 4-5) *Let* $S = S_1 \cap S_2 \cap S_3$

where, $S_1 = \{z \in C : |z| < 4\}$,

$$S_2 = \left\{z \in C : \text{Im}\left[\frac{z - 1 + \sqrt{3}\,i}{1 - \sqrt{3}\,i}\right] > 0\right\}$$

and S_3 $\{z \in C : \text{Re}\, z > 0\}$.

4. The area of S equals **[2013]**

(a) $\frac{10\pi}{3}$ (b) $\frac{20\pi}{3}$ (c) $\frac{16\pi}{3}$ (d) $\frac{32\pi}{3}$

5. $\min_{z \in S} |1 - 3i - z|$ equals **[2013]**

(a) $\frac{2 - \sqrt{3}}{2}$ (b) $\frac{2 + \sqrt{3}}{2}$ (c) $\frac{3 - \sqrt{3}}{2}$ (d) $\frac{3 + \sqrt{3}}{2}$

6. Let z be a complex number such that the imaginary part of z is non-zero and $a = z^2 + z + 1$ is real. Then, a cannot take the value **[2012]**

(a) -1 (b) $\frac{1}{3}$

(c) $\frac{1}{2}$ (d) $\frac{3}{4}$

7. If z is any complex number satisfying $|z - 3 - 2i| \le 2$, then the minimum value of $|2z - 6 + 5i|$ is ________ **[2011]**

8. Let $\omega = e^{\frac{2i\pi}{3}}$ and a, b, c, x, y, z be non-zero complex numbers, such that $a + b + c = x$, $a + b\omega + c\omega^2 = y$ and $a + b\omega^2 + c\omega = z$. Then, the value of $\frac{|x|^2 + |y|^2 + |z|^2}{|a|^2 + |b|^2 + |c|^2}$ is ________ . **[2011]**

9. Let z_1 and z_2 be two distinct complex numbers and $z = (1 - t)z_1 + tz_2$ for some real number t with $0 < t < 1$. If arg (w) denotes the principal argument of a non-zero complex number w, then **[2010]**

(a) $|z - z_1| + |z - z_2| = |z_1 - z_2|$

(b) $\arg(z - z_1) = \arg(z - z_2)$

(c) $\begin{vmatrix} z - z_1 & \bar{z} - \bar{z}_1 \\ z_2 - z_1 & \bar{z}_2 - \bar{z}_1 \end{vmatrix} = 0$

(d) $\arg(z - z_1) = \arg(z_2 - z_1)$

10. Match the statement in Column I with those in Column II.

Here, z takes the values in the complex plane and Im z *and* Re z *denote, respectively the imaginary part and the real part of z.* **[2010]**

	Column I		Column II
A.	The set of point z satisfying $\lvert z - i\lvert z\rvert\rvert = \lvert z + i\lvert z\rvert\rvert$ is contained in or equal to	p.	an ellipse with eccentricity $\frac{4}{5}$
B.	The set of point z satisfying $\lvert z + 4\rvert + \lvert z - 4\rvert = 10$ is contained in or equal to	q.	the set of point z satisfying Im $z = 0$
C.	If $\lvert\omega\rvert = 2$, then the set of point $z = \omega - 1/\omega$ is contained in or equal to	r.	the set of point z satisfying $\lvert\text{Im}(z)\rvert \le 1$
D.	If $\lvert\omega\rvert = 1$, then the set of point $z = \omega + 1/\omega$ is contained in or equal to	s.	the set of point z satisfying $\lvert\text{Re}(z)\rvert \le 1$
		t.	the set of point z satisfying Im $\lvert z\rvert \le 5$

JEE Main/AIEEE

11. A complex number z is said to be unimodular, if $|z| = 1$. Suppose z_1 and z_2 are complex numbers such that $\dfrac{z_1 - 2z_2}{2 - z_1\bar{z}_2}$ is unimodular and z_2 is not unimodular. Then, the point z_1 lies on a **[2015]**
(a) straight line parallel to X-axis
(b) straight line parallel to Y-axis
(c) circle of radius 2
(d) circle of radius $\sqrt{2}$.

12. If z is a complex number such that $|z| \geq 2$, then the minimum value of $\left|z + \dfrac{1}{2}\right|$ **[2014]**
(a) is equal to $\dfrac{5}{2}$
(b) lies in the interval (1, 2)
(c) is strictly greater than $\dfrac{5}{2}$
(d) is strictly greater than $\dfrac{3}{2}$ but less than $\dfrac{5}{2}$

13. If z is a complex number of unit modulus and argument θ, then $\arg\left(\dfrac{1+z}{1+\bar{z}}\right)$ equals **[2013]**
(a) $-\theta$ (b) $\dfrac{\pi}{2} - \theta$ (c) θ (d) $\pi - \theta$

14. If $z \neq 1$ and $\dfrac{z^2}{z-1}$ is real, then the point represented by the complex number z lies **[2012]**
(a) either on the real axis or on a circle passing through the origin
(b) on a circle with centre at the origin
(c) either on the real axis or on a circle not passing through the origin
(d) on the imaginary axis

15. Let α and β be real and z be a complex number. If $z^2 + \alpha z + \beta = 0$ has two distinct roots on the line $\text{Re}(z) = 1$, then it is necessary that **[2012]**
(a) $\beta \in (-1, 0)$ (b) $|\beta| = 1$
(c) $\beta \in (1, \infty)$ (d) $\beta \in (0, 1)$

16. If $\omega\ (\neq 1)$ is a cube root of unity and $(1+\omega)^7 = A + B\omega$. Then, (A, B) equals **[2011]**
(a) (1, 1) (b) (1, 0)
(c) (–1, 1) (d) (0, 1)

17. The number of complex numbers z such that $|z-1| = |z+1| = |z-i|$ equals **[2010]**
(a) 0 (b) 1
(c) 2 (d) ∞

18. If α and β are the roots of the equation $x^2 - x + 1 = 0$, then $\alpha^{2009} + \beta^{2009}$ is equal to **[2010]**
(a) – 2 (b) – 1
(c) 1 (d) 2

19. If $\left|z - \dfrac{4}{z}\right| = 2$, then the maximum value of $|z|$ is equal to **[2009]**
(a) $\sqrt{3} + 1$ (b) $\sqrt{5} + 1$ (c) 2 (d) $2 + \sqrt{2}$

20. The conjugate of a complex number is $\dfrac{1}{i-1}$. Then, that complex number is **[2008]**
(a) $-\dfrac{1}{i-1}$ (b) $\dfrac{1}{i+1}$ (c) $-\dfrac{1}{i+1}$ (d) $\dfrac{1}{i-1}$

21. If $|z+4| \leq 3$, then the maximum value of $|z+1|$ is **[2007]**
(a) 4 (b) 10 (c) 6 (d) 0

22. The value of $\displaystyle\sum_{k=1}^{10}\left(\sin\frac{2k\pi}{11} + i\cos\frac{2k\pi}{11}\right)$ is **[2006]**
(a) 1 (b) – 1 (c) $-i$ (d) i

23. If $z^2 + z + 1 = 0$, where z is complex number, then the value of $\left(z + \dfrac{1}{z}\right)^2 + \left(z^2 + \dfrac{1}{z^2}\right)^2 + \left(z^3 + \dfrac{1}{z^3}\right)^2 + \ldots + \left(z^6 + \dfrac{1}{z^6}\right)^2$ is **[2006]**
(a) 54 (b) 6 (c) 12 (d) 18

24. If the cube roots of unity are $1, \omega, \omega^2$, then the roots of the equation $(x-1)^3 + 8 = 0$, are **[2005]**
(a) $-1, 1+2\omega, 1+2\omega^2$ (b) $-1, 1-2\omega, 1-2\omega^2$
(c) $-1, -1, -1$ (d) $-1, -1+2\omega, -1-2\omega^2$

25. If z_1 and z_2 are two non-zero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg(z_1) - \arg(z_2)$ is equal to **[2005]**
(a) $-\dfrac{\pi}{2}$ (b) 0 (c) $-\pi$ (d) $\dfrac{\pi}{2}$

26. If $w = \dfrac{z}{z - \frac{i}{3}}$ and $|w| = 1$, then z lies on **[2005]**
(a) a parabola (b) a straight line
(c) a circle (d) an ellipse

27. Let z and w be two complex numbers such that $\bar{z} + i\bar{w} = 0$ and $\arg(zw) = \pi$. Then, $\arg(z)$ equals **[2004]**
(a) $\dfrac{\pi}{4}$ (b) $\dfrac{\pi}{2}$
(c) $\dfrac{3\pi}{4}$ (d) $\dfrac{5\pi}{4}$

28. If $z = x - iy$ and $z^{1/3} = p + iq$, then $\left(\dfrac{x}{p} + \dfrac{y}{q}\right)/(p^2 + q^2)$ is equal to **[2004]**
(a) 1 (b) – 1 (c) 2 (d) – 2

29. If $|z^2 - 1| = |z|^2 + 1$, then z lies on **[2004]**
(a) the real axis (b) the imaginary axis
(c) a circle (d) an ellipse

30. Let z_1 and z_2 be two roots of the equation $z^2 + az + b = 0$, z being complex. Further, assume that the origin, z_1 and z_2 form an equilateral triangle. Then, **[2003]**
(a) $a^2 = b$ (b) $a^2 = 2b$ (c) $a^2 = 3b$ (d) $a^2 = 4b$

31. If z and w are two non-zero complex numbers such that $|zw| = 1$, and $\arg(z) - \arg(w) = \dfrac{\pi}{2}$, then $\bar{z}(w)$ is equal to **[2003]**
(a) 1 (b) -1 (c) i (d) $-i$

32. If $\left(\dfrac{1+i}{1-i}\right)^x = 1$, then **[2003]**
(a) $x = 4n$, where n is any positive integer
(b) $x = 2n$, where n is any positive integer
(c) $x = 4n + 1$, where n is any positive integer
(d) $x = 2n + 1$, where n is any positive integer

33. If ω is an imaginary cube root of unity, then $(1 + \omega - \omega^2)^7$ equals **[2002]**
(a) $128\,\omega$
(b) $-128\,\omega$
(c) $128\,\omega^2$
(d) $-128\,\omega^2$

Other Engineering Entrances

34. If α and β are two different complex numbers with $|\beta| = 1$, then $\left|\dfrac{\beta - \alpha}{1 - \bar{\alpha}\beta}\right|$ is equal to **[Karnataka CET 2014]**
(a) 1/2 (b) 0
(c) -1 (d) 1

35. If $z = \dfrac{(\sqrt{3} + i)^3\,(3i + 4)^2}{(8 + 6i)^2}$, then $|z|$ is equal to **[Kerala CEE 2014]**
(a) 8 (b) 2 (c) 5
(d) 4 (e) 10

36. Let $w \neq \pm 1$ be complex number. If $|w| = 1$ and $z = \dfrac{w - 1}{w + 1}$, then Re (z) is equal to **[Kerala CEE 2014]**
(a) 1 (b) $\dfrac{1}{|w + 1|}$ (c) Re (w) (d) 0
(e) $w + \bar{w}$

37. The value of $|z|^2 + |z - 3|^2 + |z - i|^2$ is minimum, when z equals **[WB JEE 2014]**
(a) $2 - \dfrac{2}{3}i$ (b) $45 + 3i$
(c) $1 + \dfrac{i}{3}$ (d) $1 - \dfrac{i}{3}$

38. Convert $(i + 1)/\left(\cos\dfrac{\pi}{4} - i\sin\dfrac{\pi}{4}\right)$ in polar form. **[J&K CET 2014]**
(a) $\cos(\pi/4) + i\sin(\pi/4)$
(b) $\cos(\pi/2) - i\sin(\pi/2)$
(c) $\sqrt{2}\,[\cos(\pi/4) + i\sin(\pi/4)]$
(d) $\sqrt{2}\,[\cos(\pi/2) + i\sin(\pi/2)]$

39. Let $z_1 \neq z_2$ and $|z_1| = |z_2|$. If z_1 has positive real part and z_2 has negative imaginary part. Then, $\dfrac{z_2 + z_1}{z_1 - z_2}$ may be **[Manipal 2014]**
(a) 0 (b) real and positive
(c) real and negative (d) None of these

40. If $z = e^{2\pi/3}$, then $1 + z + 3z^2 + 2z^3 + 2z^4 + 3z^5$ is equal to **[Kerala CEE 2014]**
(a) $-3e^{\pi i/3}$ (b) $3e^{\pi i/3}$ (c) $3e^{2\pi i/3}$
(d) $-3e^{2\pi i/3}$ (e) 0

41. If ω, ω^2 are the cube roots of unity, then roots of equation $(x - 1)^3 + 5 = 0$ are **[RPET 2014]**
(a) $-5, -5\omega, -5\omega^2$
(b) $-4, 1 - 5\omega, 1 - 5\omega^2$
(c) $6, 1 - 5\omega, 1 + 5\omega^2$
(d) None of the above

42. The complex number $z = x + iy$, which satisfies the equation $\left|\dfrac{z - 3i}{z + 3i}\right| = 1$, lie on **[BITSAT 2014]**
(a) the X-axis
(b) the straight line $y = 3$
(c) a circle passing through the origin
(d) None of the above

43. If the complex numbers z_1, z_2 and z_3 denote the vertices of an isosceles triangle, right angled at z_1, then $(z_1 - z_2)^2 + (z_1 - z_3)^2$ is equal to **[Kerala CEE 2014]**
(a) 0 (b) $(z_2 + z_3)^2$ (c) 2
(d) 3 (e) $(z_2 - z_3)^2$

44. Let z_1 and z_2 be two fixed complex numbers in the argand plane and z be an arbitrary point satisfying $|z - z_1| + |z - z_2| = 2|z_1 - z_2|$. Then, the locus of z will be **[WB JEE 2014]**
(a) an ellipse
(b) a straight line joining z_1 and z_2
(c) a parabola
(d) a bisector of the line segment joining z_1 and z_2

45. Let z_1 be a fixed point on the circle of radius 1 centred at the origin in the argand plane and $z_1 \neq \pm 1$. Consider an equilateral triangle inscribed in the circle with z_1, z_2 and z_3 as the vertices taken in the counter clockwise direction. Then, $z_1 z_2 z_3$ is equal to **[WB JEE 2014]**
(a) z_1^2
(b) z_1^3
(c) z_1^4
(d) z_1

46. Suppose that z_1, z_2 and z_3 are three vertices of an equilateral triangle in the argand plane. Let $\alpha = \frac{1}{2}(\sqrt{3} - i)$ and β be a non-zero complex numbers. The points $\alpha z_1 + \beta, \alpha z_2 + \beta, \alpha z_3 + \beta$ will be **[WB JEE 2014]**

(a) the vertices of an equilateral triangle
(b) the vertices of an isosceles triangle
(c) collinear
(d) the vertices of a scalene triangle

47. In the argand plane, the distinct roots of $1 + z + z^3 + z^4 = 0$ (z is a complex number) represent vertices of **[WB JEE 2014]**

(a) a square
(b) an equilateral triangle
(c) a rhombus
(d) a rectangle

48. If $z_1 = 2\sqrt{2}(1+i)$ and $z_2 = 1 + i\sqrt{3}$, then $z_1^2 z_2^3$ is equal to **[Kerala CEE 2013]**

(a) $128i$ (b) $64i$ (c) $-64i$
(d) $-128i$ (e) 256

49. The value of $(1+i)^3 + (1-i)^3$ is equal to **[J&K CET 2013]**

(a) 1 (b) -2 (c) 0 (d) -4

50. If $z(2 - i2\sqrt{3})^2 = i(\sqrt{3} + i)^4$, then amplitude of z is **[UP SEE 2013]**

(a) $\frac{-\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{6}$ (d) None of these

51. If z_1, z_2 and z_3 are complex numbers such that $|z_1| = |z_2| = |z_3| = \left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right| = 1$, then $|z_1 + z_2 + z_3|$ is **[AMU 2013]**

(a) 3 (b) 1
(c) greater than 3 (d) less than 1

52. If $(\sqrt{3}\, i + 1)^{100} = 2^{99}(a + ib)$, then $a^2 + b^2$ is equal to **[RPET 2013]**

(a) 4 (b) 3
(c) 2 (d) 0

53. The value of $(1 + \sqrt{3}i)^4 + (1 - \sqrt{3}i)^4$ is **[RPET 2013]**

(a) – 16 (b) 16
(c) 14 (d) – 14

54. If the fourth roots of unity are z_1, z_2, z_3 and z_4, then $z_1^2 + z_2^2 + z_3^2 + z_4^2$ is equal to **[Karnataka CET 2013]**

(a) 0 (b) 2
(c) 3 (d) None of these

55. Among the complex number z satisfying condition $|z + 1 - i| \le 1$, the number having the least positive argument is **[OJEE 2013]**

(a) $1 - i$
(b) $1 + i$
(c) $-i$
(d) None of the above

56. If z_1 and z_2 are two complex numbers such that $|z_1| = |z_2| + |z_1 - z_2|$, then **[Manipal 2012]**

(a) $\text{Im}\left(\frac{z_1}{z_2}\right) = 0$ (b) $\text{Re}\left(\frac{z_1}{z_2}\right) = 0$
(c) $\text{Re}\left(\frac{z_1}{z_2}\right) = \text{Im}\left(\frac{z_1}{z_2}\right)$ (d) None of these

57. If the conjugate of $(x + iy)(1 - 2i)$ is $1 + i$, then **[Karnataka CET 2012]**

(a) $x - iy = \frac{1-i}{1-2i}$ (b) $x + iy = \frac{1-i}{1-2i}$
(c) $x = \frac{1}{5}$ (d) $x = -\frac{1}{5}$

58. If $\left(\frac{3}{2} + i\frac{\sqrt{3}}{2}\right)^{50} = 3^{25}(x + iy)$, where x and y are real, then the ordered pair (x, y) is **[WB JEE 2012]**

(a) $(-3, 0)$ (b) $(0, 3)$
(c) $(0, -3)$ (d) $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$

59. If $|z - \bar{z}| + |z + \bar{z}| = 2$, then z lies on **[AMU 2012]**

(a) a circle (b) a square (c) an ellipse (d) a line

60. If $2x = 3 + 5i$, then the value of $2x^3 + 2x^2 - 7x + 72$ is **[MP PET 2011]**

(a) 4 (b) -4
(c) 8 (d) -8

61. If $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$, then $\frac{z_1}{z_2}$ is **[MP PET 2011]**

(a) purely real
(b) purely imaginary
(c) zero of purely imaginary
(d) neither real nor imaginary

62. The value of $\left|\frac{1 + i\sqrt{3}}{\left(1 + \frac{1}{i+1}\right)^2}\right|$ is **[Karnataka CET 2011]**

(a) 20 (b) 9
(c) $\frac{5}{4}$ (d) $\frac{4}{5}$

63. If z_1 and z_2 are two non-zero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg\left(\frac{z_1}{z_2}\right)$ is **[Kerala CEE 2011]**

(a) 0 (b) $-\pi$ (c) $-\frac{\pi}{2}$
(d) $\frac{\pi}{2}$ (e) π

64. If $\omega \ne 1$ is a cube root of unity, then the sum of the series $S = 1 + 2\omega + 3\omega^2 + \ldots + 3n\omega^{3n-1}$ is **[WB JEE 2011]**

(a) $\frac{3n}{\omega - 1}$ (b) $3n(\omega - 1)$
(c) $\frac{\omega - 1}{3n}$ (d) 0

65. $\left[\dfrac{1+\cos\left(\frac{\theta}{2}\right)-i\sin\left(\frac{\theta}{2}\right)}{1+\cos\left(\frac{\theta}{2}\right)+i\sin\left(\frac{\theta}{2}\right)}\right]^{4n}$ is equal to **[UP SEE 2011]**

(a) $\cos n\theta - i\sin n\theta$ (b) $\cos n\theta + i\sin\theta$
(c) $\cos 2n\theta - i\sin 2n\theta$ (d) $\cos 2n\theta + i\sin 2n\theta$

66. If $x = \dfrac{-3+i\sqrt{3}}{2}$ is a complex number, then the value of $(x^2+3x)^2\,(x^2+3x+1)$ is **[UP SEE 2011]**

(a) $-\dfrac{9}{8}$ (b) 6
(c) -18 (d) 36

67. If $(x+iy)^{1/3} = 2+3i$, then $3x+2y$ is equal to **[Kerala CEE 2010]**

(a) -20 (b) -60 (c) -120
(d) 60 (e) 156

68. The modulus of the complex number z such that $|z+3-i| = 1$ and $\arg(z) = \pi$, is equal to **[Kerala CEE 2010]**

(a) 1 (b) 2 (c) 9
(d) 4 (e) 3

69. If $z_1, z_2, \ldots, z_n$ are complex numbers such that $|z_1| = |z_2| = \ldots = |z_n| = 1$, then $|z_2 + z_2 + \ldots + z_n|$ is equal to **[Kerala CEE 2010]**

(a) $|z_1 z_2 z_3 \ldots z_n|$ (b) $|z_1| + |z_2| + \ldots + |z_n|$
(c) $\left|\dfrac{1}{z_1}+\dfrac{1}{z_2}+\ldots+\dfrac{1}{z_n}\right|$ (d) n
(e) $\sqrt{n}$

70. If $z_1 = \sqrt{2}\left(\cos\dfrac{\pi}{4} + i\sin\dfrac{\pi}{4}\right)$ and $z_2 = \sqrt{3}\left(\cos\dfrac{\pi}{3} + i\sin\dfrac{\pi}{3}\right)$, then $|z_1 z_2|$ is **[Kerala CEE 2010]**

(a) 6 (b) $\sqrt{2}$
(c) $\sqrt{6}$ (d) $\sqrt{3}$
(e) $\sqrt{2}+\sqrt{3}$

71. If $z = r(\cos\theta + i\sin\theta)$, then the value of $\dfrac{z}{\bar{z}} + \dfrac{\bar{z}}{z}$ is **[Kerala CEE 2010]**

(a) $\cos 2\theta$ (b) $2\cos 2\theta$
(c) $2\cos\theta$ (d) $2\sin\theta$
(e) $2\sin 2\theta$

72. If $z = \dfrac{4}{1-i}$, then $\bar{z}$ is (where, $\bar{z}$ is complex conjugate of z) **[WB JEE 2010]**

(a) $2(1+i)$ (b) $(1+i)$
(c) $\dfrac{2}{1-i}$ (d) $\dfrac{4}{1-i}$

73. If $-\pi < \arg(z) < -\dfrac{\pi}{2}$, then $\arg(\bar{z}) - \arg(-\bar{z})$ is **[WB JEE 2010]**

(a) π
(b) $-\pi$
(c) $\pi/2$
(d) $-\pi/2$

74. The value of $\dfrac{\cos 30° + i\sin 30°}{\cos 60° - i\sin 60°}$ is equal to **[VITEEE 2010]**

(a) i (b) $-i$
(c) $\dfrac{1+\sqrt{3}i}{2}$ (d) $\dfrac{1-\sqrt{3}i}{2}$

Explanations

Target Exercises

1. $\dfrac{i^{584}(i^8+i^6+i^4+i^2+1)}{i^{574}(i^8+i^6+i^4+i^2+1)}-1=\dfrac{i^{584}}{i^{574}}-1$

$=i^{10}-1=-1-1$

$=-2$

2. $i^{57}+\dfrac{1}{i^{125}}=(i^4)^{14}i+\dfrac{1}{(i^4)^{31}i}=i+\dfrac{1}{i}=i-i=0$

3. We have, $i^n+i^{n+1}+i^{n+2}+i^{n+3}$

$=i^n(1+i+i^2+i^3)$

$=i^n(1+i-1-i)$ $\quad[\because i^3=i^2\cdot i=(-1)\cdot i=-i]$

$=i^n(0)=0$

4. Given expression $=1+i^2+i^4+i^6+\ldots+i^{2n}$

$=1-1+1-1+\ldots+(-1)^n$

which cannot be determined unless n is known.

5. We have, $\left[i^{19}+\left(\dfrac{1}{i}\right)^{25}\right]^2=\left[i^{16}\cdot i^3+\dfrac{1}{i^{24}\cdot i}\right]^2$

$=\left[i^2\cdot i+\dfrac{1}{i}\right]^2=(-i-i)^2$

$=(-2i)^2=4i^2=-4$

6. We have, $\dfrac{i^{4n+1}-i^{4n-1}}{2}$

$=\dfrac{i^{4n}\cdot i-i^{4n}\cdot i^{-1}}{2}=\dfrac{i-\frac{1}{i}}{2}$ $\quad[\because i^{4n}=(i^4)^n=(1)^n=1]$

$=\dfrac{i^2-1}{2i}=\dfrac{-1-1}{2i}=\dfrac{-2}{2i}=\dfrac{1}{-i}=i$

7. $(1-i)^n\left(1-\dfrac{1}{i}\right)^n=(1-i)^n(1+i)^n$

$=(1+1)^n=2^n$

8. $\dfrac{(1-i)^n}{(1+i)^{n-2}}=\dfrac{(1-i)^n}{(1+i)^{n-2}}\times\dfrac{(1-i)^{n-2}}{(1-i)^{n-2}}$

$=2(-i)^{n-1}=2(-1)^{\frac{n-1}{2}}$

This is positive and real, if $\dfrac{n-1}{2}$ is even.

Let $\dfrac{n-1}{2}=2\lambda$

$\therefore$ $n=4\lambda+1$

9. $\left(\dfrac{1+i}{1-i}\right)^n=\left(\dfrac{1+i}{1-i}\times\dfrac{1+i}{1+i}\right)^n=\left(\dfrac{1-1+2i}{1+1}\right)^n$

$=i^n=-1,$ if $n=2$

10. $(1+i)^{2n}=(1-i)^{2n}\Rightarrow 1=(-1)^n$

$\therefore$ The smallest value of n is 2.

11. $\dfrac{1+2i}{1-i}=\dfrac{1+2i}{1-i}\times\dfrac{1+i}{1+i}=\dfrac{1+3i-2}{2}=-\dfrac{1}{2}+\dfrac{3}{2}i$

$\therefore$ $\dfrac{1+2i}{1-i}$ lies in II quadrant

12. $\dfrac{(1-i)^3}{1-i^3}=\dfrac{1-3i+3i^2-i^3}{1+i}=\dfrac{-2-2i}{1+i}=-2$

13. We have, $\left(\dfrac{1+i}{1-i}\right)^2+\left(\dfrac{1-i}{1+i}\right)^2$

$=\dfrac{(1+i)^2}{(1-i)^2}+\dfrac{(1-i)^2}{(1+i)^2}=\dfrac{2i}{-2i}+\dfrac{-2i}{2i}$

$\left[\begin{array}{l}\because\ (1+i)^2=1+i^2+2i=2i\\ \text{and } (1-i)^2=1+i^2-2i=-2i\end{array}\right]$

$=-1-1=-2$

14. $\text{Re}\left[\dfrac{(1+i)^2}{3-i}\right]=\text{Re}\left[\left(\dfrac{2i}{3-i}\right)\left(\dfrac{3+i}{3+i}\right)\right]$

$=\text{Re}\left[\dfrac{6i-2}{9+1}\right]$

$=\text{Re}\left[-\dfrac{2}{10}+\dfrac{6}{10}i\right]=-\dfrac{1}{5}$

15. Given that, $a^2+b^2=1$

$\therefore$ $\dfrac{1+b+ia}{1+b-ia}=\dfrac{(1+b+ia)(1+b+ia)}{(1+b-ia)(1+b+ia)}$

$=\dfrac{(1+b)^2-a^2+2ia(1+b)}{1+b^2+2b+a^2}$

$=\dfrac{(1-a^2)+2b+b^2\ 2ia(1+b)}{2(1+b)}$

$=\dfrac{2b^2+2b+2ia(1+b)}{2(1+b)}$

$=b+ia$

16. We have, $b+ic=(1+a)z$

$\therefore$ $z=\dfrac{b+ic}{1+a}$ $\Rightarrow$ $iz=\dfrac{ib-c}{1+a}$

$\Rightarrow$ $\dfrac{1+iz}{1-iz}=\dfrac{1+a-c+ib}{1+a+c-ib}$

$=\dfrac{(1+a-c)+ib}{(1+a+c)-ib}\times\dfrac{(1+a+c)+ib}{(1+a+c)+ib}$

$=\dfrac{a^2+a+iab+ib}{1+a+ac+c}$

$=\dfrac{(a+1)(a+ib)}{(a+1)(1+c)}=\dfrac{a+ib}{1+c}$

17. $x+iy=6i(3i^2+3)+3i(4i+20)+1(12-60i)$

$=0-12+60i+12-60i=0+0i$

$\therefore$ $x=0,\ y=0$

18. $\sqrt{2i}=\sqrt{1+i^2+2i}=\sqrt{(1+i)^2}=1+i$

19. Let $z=x+iy$, where $x,y\in R$

$\therefore$ $x^2+y^2\neq 0$ and $x=0$

$\therefore$ $z=0+iy=iy,\ y\neq 0$

$\Rightarrow$ $z^2=-y^2$

$\Rightarrow$ $\text{Im}(z^2)=0$

20. We have, $(x+iy)^{1/3}=a+ib$

On cubing both sides, we get

$x+iy=(a+ib)^3$

$=a^3+3a^2(ib)+3a(ib)^2+(ib)^3$

$= a^3 + 3a^2 bi + 3ab^2 i^2 + i^3 b^3$
$= a^3 + 3a^2 bi - 3ab^2 - ib^3 \quad [\because i^3 = i^2 \cdot i = -i]$
$= a(a^2 - 3b^2) + ib(3a^2 - b^2)$

$\therefore \quad x = a(a^2 - 3b^2)$

and $\quad y = b(3a^2 - b^2)$

$\Rightarrow \quad \frac{x}{a} = a^2 - 3b^2 \quad$ and $\quad \frac{y}{b} = 3a^2 - b^2$

$\therefore \quad \frac{x}{a} + \frac{y}{b} = 4(a^2 - b^2)$

21. We have,

$8iz^3 + 12z^2 - 18z + 27i = 0$

$\Rightarrow 4z^2 (2iz + 3) + 9i (2iz + 3) = 0$

$\Rightarrow \quad (2iz + 3)(4z^2 + 9i) = 0$

$\Rightarrow \quad 2iz + 3 = 0 \quad$ or $\quad 4z^2 + 9i = 0$

$\therefore \quad |z| = \frac{3}{2}$

22. Multiplicative inverse of z^2

$$= \frac{1}{z^2} = \frac{1}{(1+i)^2} = \frac{1}{2i} = -\frac{i}{2}$$

23. Since, $\frac{1+i}{1-i} = i$ and $\frac{1-i}{1+i} = -i$

$\therefore \quad \left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy$

$\Rightarrow \quad i^3 - (-i)^3 = x + iy$

$\Rightarrow \quad -i + i^3 = x + iy$

$\Rightarrow \quad -i - i = x + iy$

$x + iy = 0 - 2i$

Hence, $(x, y) = (0, -2)$.

24. Let $z = (6 + 5i)^2 = 36 + 2(6)(5i) + 25i^2$

$= 36 + 60i - 25 = 11 + 60i$

Then, $\quad \bar{z} = 11 - 60i$

and $\quad |z| = \sqrt{(11)^2 + (60)^2}$

$= \sqrt{121 + 3600}$

$= \sqrt{3721} = 61$

Multiplicative inverse of

$$z = \frac{\bar{z}}{|z|^2} = \frac{11 - 60i}{(61)^2} = \frac{11}{(61)^2} - \frac{60}{(61)^2} i$$

25. Let $z = \frac{3+4i}{4-5i} = \frac{3+4i}{4-5i} \times \frac{4+5i}{4+5i}$

$= \frac{12 + 15i + 16i + 20i^2}{16 - 25i^2}$

$= \frac{12 + 31i - 20}{16 + 25}$

$= \frac{8}{41} + \frac{31}{41} i$

Then, $\quad \bar{z} = -\frac{8}{41} - \frac{31}{41} i$

and $\quad |z| = \sqrt{\left(-\frac{8}{41}\right)^2 + \left(-\frac{31}{41}\right)^2}$

$= \sqrt{\frac{64 + 961}{(41)^2}}$

$= \sqrt{\frac{1025}{(41)^2}} = \sqrt{\frac{25 \times 41}{(41)^2}} = \frac{5}{\sqrt{41}}$

$\therefore$ Multiplicative inverse of

$$z = \frac{\bar{z}}{|z|^2} = \frac{-\frac{8}{41} - \frac{31}{41} i}{\frac{25}{41}} = \frac{-8 - 31i}{25}$$

$$= -\frac{8}{25} - \frac{31}{25} i$$

26. Let $z = x + iy$, where $x < 0$, $y < 0$

$\therefore \quad \frac{\bar{z}}{z} = \frac{x - iy}{x + iy} = \frac{(x - iy)^2}{(x^2 + y^2)} = \frac{x^2 - y^2}{x^2 + y^2} - \left(\frac{2xy}{x^2 + y^2}\right) i$

$\frac{\bar{z}}{z}$ lies in III quadrant, if $x^2 - y^2 < 0$ and $-2xy < 0$

$x < 0, y < 0$

$\Rightarrow \quad -2xy < 0$

Also, $x^2 - y^2 < 0$, if $(x + y)(x - y) < 0$

If $\ x - y > 0$, if $x > y \quad [\because x, y < 0 \Rightarrow x + y < 0]$

$\therefore \ \frac{\bar{z}}{z}$ lies in III quadrant, if $y < x < 0$.

27. Let $z = \frac{2 - i}{(1 - 2i)^2}$

$\therefore \quad z = \frac{2 - i}{-3 - 4i} = \frac{-2 + i}{3 + 4i} \times \frac{3 - 4i}{3 - 4i}$

$= -\frac{2}{25} + \frac{11}{25} i$

$\therefore \quad \bar{z} = -\frac{2}{25} - \frac{11}{25} i$

28. $\left|(1 + i)\left(\frac{2 + i}{3 + i}\right)\right| = \frac{|1 + i| \times |2 + i|}{|3 + i|}$

$= \frac{\sqrt{2} \times \sqrt{5}}{\sqrt{10}} = 1$

29. $\sqrt{2i} - \sqrt{-2i} = \sqrt{(1 + i)^2} - \sqrt{(1 - i)^2}$

$= (1 + i) - (1 - i) = 2i$

$\therefore \ \left|\sqrt{2i} - \sqrt{-2i}\right| = |2i| = \sqrt{0 + 4} = 2$

30. $\frac{1 - ix}{1 + ix} = a - ib$

$\Rightarrow \quad \frac{(1 - ix)(1 - ix)}{(1 + ix)(1 - ix)} = a - ib$

$\Rightarrow \quad \frac{1 - x^2 - 2ix}{1 + x^2} = \frac{a - ib}{1}$

$\Rightarrow \quad \frac{1 - x^2}{1 + x^2} = a \quad$ and $\quad \frac{2x}{1 + x^2} = b$

Now, x can be written as

$$x = \frac{\frac{2x}{1 + x^2}}{\frac{2}{1 + x^2}} = \frac{\frac{2x}{1 + x^2}}{\frac{1 - x^2}{1 + x^2} + 1}$$

$$= \frac{b}{1 + a} = \frac{2b}{1 + 1 + 2a}$$

$$= \frac{2b}{1 + (a^2 + b^2) + 2a} = \frac{2b}{(1 + a)^2 + b^2}$$

31. $\left|\frac{(3 + 2i)^2}{(4 - 3i)}\right| = \frac{|3 + 2i|^2}{|4 - 3i|}$

$= \frac{(\sqrt{9 + 4})^2}{(\sqrt{16 + 9})} = \frac{13}{5}$

32. We have, $x + iy = \dfrac{u + iv}{u - iv}$ ...(i)

We know that, when two complex numbers are equal their conjugates are also equal.

$\therefore \qquad x - iy = \dfrac{u - iv}{u + iv}$ ...(ii)

On multiplying Eqs. (i) and (ii), we get

$$(x + iy)(x - iy) = \frac{u + iv}{u - iv} \times \frac{u - iv}{u + iv}$$

$$\Rightarrow \qquad x^2 + y^2 = \frac{u^2 - i^2v^2}{u^2 - i^2v^2}$$

$$\therefore \qquad x^2 + y^2 = \frac{u^2 + v^2}{u^2 + v^2} = 1$$

33. Taking modulus and squaring on both sides, we get

$$|1 + i|^2 \cdot |1 + 2i|^2 \cdot |1 + 3i|^2 \ldots |1 + ni|^2 = |\alpha + i\beta|^2$$

$$\Rightarrow \qquad (1 + 1)\cdot(1 + 4)\cdot(1 + 9)\ldots(1 + n^2) = \alpha^2 + \beta^2$$

$$\Rightarrow \qquad 2 \cdot 5 \cdot 10 \ldots (1 + n^2) = \alpha^2 + \beta^2$$

34. $\dfrac{(1 + i)^5 (1 + \sqrt{3}i)^2}{-2i(-\sqrt{3} + i)}$

$$= \frac{(\sqrt{2})^5 \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}\right)^5 2^2 \left(\frac{1}{2} + i\frac{\sqrt{3}}{2}\right)^2}{2i\, 2\left(\frac{\sqrt{3}}{2} - \frac{i}{2}\right)}$$

$\Rightarrow$ Argument $= \dfrac{5\pi}{4} + \dfrac{2\pi}{3} - \dfrac{\pi}{2} + \dfrac{\pi}{6} = \dfrac{9\pi}{12}$

Therefore, the principal argument is $-\dfrac{5\pi}{12}$.

35. $i + \sqrt{3} = 2\left(\dfrac{\sqrt{3}}{2} + \dfrac{i}{2}\right) = 2\left(\cos\dfrac{\pi}{6} + i\sin\dfrac{\pi}{6}\right)$

36. $|z^2| = |z\, z| = |z|\,|z| = |z|^2$

37. For every $a \in R$, $|a| = \sqrt{a^2}$

$$\therefore \qquad |a|^2 = a^2$$

Now, $\qquad (|x| - |y|)^2 \ge 0$

$$\Rightarrow \qquad |x|^2 + |y|^2 - 2|x||y| \ge 0$$

$$\Rightarrow \qquad 2|x||y| \le |x|^2 + |y|^2$$

$$\Rightarrow \qquad |x|^2 + |y|^2 + 2|x||y| \le 2|x|^2 + 2|y|^2$$

$$\Rightarrow \qquad (|x| + |y|)^2 \le 2(x^2 + y^2)$$

$$\Rightarrow \qquad (|x| + |y|)^2 \le 2|z|^2$$

$$\therefore \qquad |x| + |y| \le \sqrt{2}|z|$$

38. $|z + 1| = |(z + 4) - 3| \le |z + 4| + |-3| \le 3 + 3 = 6$

$\therefore$ Greatest value of $|z + 1| = 6$

Also, $\quad |z + 1| \ge |z + 4| - |-3| \ge 0$

$$\therefore \qquad 0 \le |z + 1| \le 6$$

39. $|z + 1| < |z - 2|$

$$\Rightarrow \qquad |3z + 3| < |3z - 6|$$

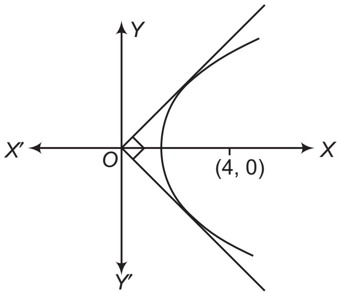
$$\Rightarrow \qquad |w + 1 - i| < |w - 8 - i|$$

$$\Rightarrow \qquad |w + 1| < |w - 8|$$

40. $|z| + |z - 1| \ge |z - z + 1| \ge 1$

41. Now, $\qquad |z - 4| = \text{Re}(z)$

$$\Rightarrow \qquad \sqrt{(x - 4)^2 + y^2} = x$$



$$\Rightarrow \qquad x^2 - 8x + 16 + y^2 = x^2$$

$$\Rightarrow \qquad y^2 = 8(x - 2)$$

The given relation represents the part of parabola with focus (4, 0) lying above X-axis and the imaginary axis as the directrix. The two tangents from directrix are at right angle. Hence, the greatest positive argument of z is $\dfrac{\pi}{4}$.

42. Let $a + bi$ be a square root of $-2 + 2\sqrt{3}i$.

$$\therefore \qquad (a + bi)^2 = -2 + 2\sqrt{3}i$$

$$\Rightarrow \qquad a^2 + 2abi + i^2b^2 = -2 + 2\sqrt{3}i$$

$$\Rightarrow \qquad (a^2 - b^2) + 2abi = -2 + 2\sqrt{3}i$$

$\therefore \qquad a^2 - b^2 = -2$ ...(i)

and $\qquad 2ab = 2\sqrt{3}$ ...(ii)

Now, $\qquad (a^2 + b^2)^2 = (a^2 - b^2)^2 + 4a^2b^2$

$$= (-2)^2 + (2\sqrt{3})^2$$

$$= 4 + 12 = 16$$

$\therefore \qquad a^2 + b^2 = \sqrt{16} = 4$ ...(iii)

On solving Eqs. (i) and (iii), we get

$$2a^2 = 2 \quad \text{or} \quad a^2 = 1$$

$$\therefore \qquad a = \pm 1$$

$$\Rightarrow \qquad 2b^2 = 6 \text{ or } b^2 = 3$$

$$\therefore \qquad b = \pm\sqrt{3}.$$

From Eq. (ii), $ab = \sqrt{3}$, which is positive.

Either $\quad a = 1, b = \sqrt{3} \quad$ or $\quad a = -1, b = -\sqrt{3}$

Hence, the two square roots are $1 + \sqrt{3}i$ and $-1 - \sqrt{3}i$ i.e. $\pm(1 + \sqrt{3}i)$.

Aliter

$$\sqrt{z} = \pm\left(\sqrt{\frac{|z| + a}{2}} + i\sqrt{\frac{|z| - a}{2}}\right)$$

$$= \pm\left(\sqrt{\frac{4 - 2}{2}} + i\sqrt{\frac{4 + 2}{2}}\right) = \pm(1 + i\sqrt{3})$$

43. As, $(a - b)^2 \ge 0, a^2 + b^2 \ge 2ab$ .... (i)

But $\qquad |z| = \sqrt{a^2 + b^2}$

From Eq. (i), we get $|z^2| \ge 2ab$

$$\therefore \qquad |z|^2 + a^2 + b^2 \ge a^2 + b^2 + 2ab$$

$$\Rightarrow \qquad |z|^2 + |z|^2 \ge (a + b)^2$$

$$\Rightarrow \qquad 2|z|^2 \ge (a + b)^2$$

$\Rightarrow \qquad \sqrt{2}|z| \ge a + b$, as $|z|$ is positive

$$\therefore \qquad |z| \ge \frac{1}{\sqrt{2}}(a + b)$$

44. We have, $|1-\bar{z}_1 z_2|^2 - |z_1 - z_2|^2$

$$= (1-\bar{z}_1 z_2)\overline{(1-\bar{z}_1 z_2)} - (z_1 - z_2)\overline{(z_1 - z_2)} \qquad [\because z\bar{z} = |z|^2]$$

$$= (1-\bar{z}_1 z_2)(1-\overline{\bar{z}_1 z_2}) - (z_1 - z_2)(\bar{z}_1 - \bar{z}_2)$$

$$[\because \overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2 \text{ and } \bar{1} = 1]$$

$$= (1-\bar{z}_1 z_2)(1 - z_1\bar{z}_2) - (z_1 - z_2)(\bar{z}_1 - \bar{z}_2) \qquad [\because \overline{(\bar{z}_1)} = z_1]$$

$$= 1 - z_1\bar{z}_2 - \bar{z}_1 z_2 + z_1\bar{z}_1 z_2\bar{z}_2 - z_1\bar{z}_1 + z_1\bar{z}_2 + \bar{z}_1 z_2 - z_2\bar{z}_2$$

$$= 1 + |z_1|^2|z_2|^2 - |z_1|^2 - |z_2|^2 = (1-|z_1|^2)(1-|z_2|^2)$$

$\therefore \qquad k = 1$

45. Let $z = x + iy$

We have, $\quad z + \alpha|z-1| + 2i = 0$

$\Rightarrow \quad x + i(y+2) + \alpha\sqrt{(x-1)^2 + y^2} = 0$

On equating real and imaginary parts

$y + 2 = 0 \quad \Rightarrow \quad y = -2$

and $\quad x + \alpha\sqrt{(x-1)^2 + 4} = 0$

$\therefore \quad x^2 = \alpha^2(x^2 - 2x + 5)$

or $(1-\alpha^2)x^2 + 2\alpha^2 x - 5\alpha^2 = 0$

Since, x is real.

$\therefore \quad D = B^2 - 4AC \ge 0$

$\Rightarrow \quad 4\alpha^4 + 20\alpha^2(1+\alpha^2) \ge 0$

$\Rightarrow \quad -4\alpha^4 + 5\alpha^2 \ge 0$

$\Rightarrow \quad 4\alpha^2\left(\alpha^2 - \frac{5}{4}\right) \le 0$

$\therefore \quad \frac{-\sqrt{5}}{2} \le \alpha \le \frac{\sqrt{5}}{2}$

46. Given, $|z| = 2$

Let $\quad \alpha = 5z - 1 \quad \Rightarrow \quad |\alpha + 1| = 5|z| = 5(2) = 10$

$\Rightarrow \quad |\alpha + 1| = 10$

$\therefore$ Locus of α, i.e. $5z - 1$ is the circle having centre at -1 and radius 10.

$\therefore \quad a = 10$

Again, $z_1^2 + z_2^2 - 2z_1 z_2 \cos\theta = 0$

$\Rightarrow \quad \left(\frac{z_1}{z_2}\right)^2 - 2\frac{z_1}{z_2}\cos\theta + 1 = 0$

$\Rightarrow \quad \frac{z_1}{z_2} = \frac{2\cos\theta \pm \sqrt{4\cos^2\theta - 4}}{2} = \cos\theta \pm i\sin\theta$

$\Rightarrow \quad \left|\frac{z_1}{z_2}\right| = |\cos\theta \pm i\sin\theta| = 1 = \frac{a}{10}$

$\therefore \quad |z_1| : |z_2| = a : 10$

47. We have, $|z| = \left|z + \frac{2}{z} - \frac{2}{z}\right| \le \left|z + \frac{2}{z}\right| + \frac{2}{|z|}$

$\Rightarrow \quad |z| \le 2 + \frac{2}{|z|} \quad \Rightarrow \quad |z|^2 \le 2|z| + 2$

$\Rightarrow \quad |z|^2 - 2|z| + 1 \le 1 + 2$

$\Rightarrow \quad (|z| - 1)^2 \le 3 \quad \Rightarrow \quad -\sqrt{3} \le |z| - 1 \le \sqrt{3}$

$\Rightarrow \quad 1 - \sqrt{3} \le |z| \le 1 + \sqrt{3}$

So, the maximum value of $|z|$ is $1 + \sqrt{3}$.

48. We have, $\; |z_1 + z_2| = \left|\frac{1}{z_1} + \frac{1}{z_2}\right| = \left|\frac{z_1 + z_2}{z_1 z_2}\right|$

$\Rightarrow \quad |z_1 + z_2|\left(1 - \frac{1}{|z_1 z_2|}\right) = 0$

$\Rightarrow \quad |z_1 z_2| = 1 \qquad [\because z_1 \ne -z_2]$

49. Since, $1, \omega, \omega^2, \ldots, \omega^{n-1}$ are the nth roots of unity.

$\therefore \quad \sum_{k=0}^{n-1} \omega^k = 0 \quad$ and $\quad \sum_{k=0}^{n-1} (\bar{\omega})^k = 0$

Now, $\quad \sum_{k=0}^{n-1} |z_1 + \omega^k z_2|^2 = \sum_{k=0}^{n-1} (z_1 + \omega^k z_2)\{\bar{z}_1 + (\bar{\omega})^k\,\bar{z}_2\}$

$$= \sum_{k=0}^{n-1} [z_1\bar{z}_1 + z_1\bar{z}_2(\bar{\omega})^k + \bar{z}_1 z_2\omega^k + z_2\bar{z}_2(\omega)^k(\bar{\omega})^k]$$

$$= \sum_{k=0}^{n-1} |z_1|^2 + \sum_{k=0}^{n-1} z_1\bar{z}_2(\bar{\omega})^k + \sum_{k=0}^{n-1} \bar{z}_1 z_2\omega^k + \sum_{k=0}^{n-1} |z_2|^2$$

$$= n|z_1|^2 + 0 + 0 + n|z_2|^2 = n(|z_1|^2 + |z_2|^2)$$

50. Let $z = x + iy$

$\therefore \quad |z| - z = 1 + 2i$

$\Rightarrow \quad \sqrt{x^2 + y^2} - (x + iy) = 1 + 2i$

$\Rightarrow (\sqrt{x^2 + y^2} - x) + i(-y) = 1 + 2i$

$\Rightarrow \quad \sqrt{x^2 + y^2} - x = 1$

and $\quad y = -2$

If $\quad y = -2, \sqrt{x^2 + 4} - x = 1$

$\Rightarrow \quad x^2 + 4 = (1 + x)^2$

$\Rightarrow \quad 2x = 3 \;$ or $\; x = \frac{3}{2}$

$\therefore \quad z = x + iy = \frac{3}{2} - 2i$

51. $(\sqrt{3} + i) = (a + ib)(c + id)$

On taking argument both sides, we get

$$\tan^{-1}\frac{1}{\sqrt{3}} = \tan^{-1}\frac{b}{a} + \tan^{-1}\frac{d}{c}$$

$\Rightarrow \tan^{-1}\frac{b}{a} + \tan^{-1}\frac{d}{c} = n\pi + \frac{\pi}{6}, n \in Z$

52. Let $z - 1 = e^{i\theta} \qquad [\because |z - 1| = 1]$

$\Rightarrow \quad z = 1 + \cos\theta + i\sin\theta$

$$= 2\cos^2\frac{\theta}{2} + 2i\sin\frac{\theta}{2}\cos\frac{\theta}{2}$$

$$= 2\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)$$

$\therefore \;$ arg $(z) = \frac{\theta}{2} = \frac{1}{2}$ arg $(z - 1)$ $\;$ or $\;$ arg $(z - 1) = 2$ arg (z)

53. arg $(z^{2/3}) = \frac{2}{3}$ arg (-1)

$$= \frac{2}{3}\pi, \frac{2}{3}\cdot 3\pi, \frac{2}{3}\cdot 5\pi = \frac{2\pi}{3}, 2\pi, \frac{10\pi}{3}$$

54. $\frac{z - z_1}{z - z_2} = \frac{(x + iy) - (8 + 4i)}{(x + iy) - (6 + 4i)} = \frac{(x - 8) + i(y - 4)}{(x - 6) + i(y - 4)}$

We have, arg $\left(\frac{z - z_1}{z - z_2}\right) = \frac{\pi}{4}$

$\Rightarrow \quad$ arg $(z - z_1) -$ arg $(z - z_2) = \frac{\pi}{4}$

$\Rightarrow \quad \tan^{-1}\frac{y - 4}{x - 8} - \tan^{-1}\frac{y - 4}{x - 6} = \frac{\pi}{4}$

$\Rightarrow \quad \frac{2(y - 4)}{x^2 + y^2 - 14x - 8y + 64} = 1$

$\Rightarrow \quad x^2 + y^2 - 14x - 10y + 72 = 0$

$\Rightarrow \quad (x - 7)^2 + (y - 5)^2 = (\sqrt{2})^2$

$\therefore \quad |z - (7 + 5i)| = \sqrt{2}$

55. $\arg(-z) = \pi - \theta = \pi + (-\theta) = \pi + \arg(z)$

$\therefore \quad \arg(-z) - \arg(z) = \pi$

56. Since, $|z-1| = 1$

Let $\quad z - 1 = \cos\theta + i\sin\theta$

Then, $\quad z - 2 = \cos\theta + i\sin\theta - 1$

$$= -2\sin^2\frac{\theta}{2} + 2i\sin\frac{\theta}{2}\cos\frac{\theta}{2}$$

$$= 2i\sin\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right) \quad \ldots\text{(i)}$$

and $\quad z = 1 + \cos\theta + i\sin\theta$

$$= 2\cos^2\frac{\theta}{2} + 2i\sin\frac{\theta}{2}\cos\frac{\theta}{2}$$

$$= 2\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right) \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{z-2}{z} = i\tan\frac{\theta}{2} = i\tan(\arg z)\left[\because \arg z = \frac{\theta}{2}, \text{ from Eq. (ii)}\right]$$

57. We have, $C^2 + S^2 = 1$

Let $C = \cos\theta, S = \sin\theta$

$$\therefore \quad \frac{1+C+iS}{1+C-iS} = \frac{1+\cos\theta + i\sin\theta}{1+\cos\theta - i\sin\theta}$$

$$= \frac{\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)}{\cos\frac{\theta}{2}\left(\cos\frac{\theta}{2} - i\sin\frac{\theta}{2}\right)}$$

$$= \frac{\left(\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right)^2}{1} = \cos\theta + i\sin\theta$$

$$= C + iS$$

58. Let $z - 1 = r(\cos\theta + i\sin\theta) = re^{i\theta}$

$$\therefore \text{ Given expression} = re^{i\theta}\cdot e^{-i\alpha} + \frac{1}{re^{i\theta}}e^{i\alpha}$$

$$= re^{i(\theta-\alpha)} + \frac{1}{r}e^{-i(\theta-\alpha)}$$

Since, imaginary part of given expression is zero, we have

$$r\sin(\theta-\alpha) - \frac{1}{r}\sin(\theta-\alpha) = 0$$

$$r^2 - 1 = 0 \Rightarrow r^2 = 1$$

$$\Rightarrow \quad r = 1 \Rightarrow |z-1| = 1$$

or $\quad \sin(\theta-\alpha) = 0 \Rightarrow (\theta-\alpha) = 0$

$$\Rightarrow \quad \theta = \alpha \Rightarrow \arg(z-1) = \alpha$$

59. $$\frac{\left(\sin\frac{\pi}{8} + i\cos\frac{\pi}{8}\right)^8}{\left(\sin\frac{\pi}{8} - i\cos\frac{\pi}{8}\right)^8} = \left(\cos\frac{\pi}{8} + i\sin\frac{\pi}{8}\right)^{-16}$$

$$= \cos 2\pi - i\sin 2\pi = 1$$

60. $$\frac{1+a}{2} = \frac{1}{2}\left(1 + \cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}\right)$$

$$= \frac{1}{2}.2\cos\frac{2\pi}{3}\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$$

$$= -\frac{1}{2}\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$$

$$\therefore \quad \left(\frac{1+a}{2}\right)^{3n} = \left(-\frac{1}{2}\right)^{3n}\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)^{3n} = \frac{(-1)^n}{2^{3n}}$$

61. We have, $\left(\frac{1+i}{\sqrt{2}}\right)^8 + \left(\frac{1-i}{\sqrt{2}}\right)^8$

$$= \left[\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right]^8 + \left[\cos\frac{\pi}{4} - i\sin\frac{\pi}{4}\right]^8$$

$$= \cos 2\pi + i\sin 2\pi + \cos 2\pi - i\sin 2\pi$$

$$= 2\cos 2\pi = 2(1) = 2 \quad \text{[using De-Moivre's theorem]}$$

62. We have, $\sum_{k=1}^{10}\left(\sin\frac{2\pi k}{11} - i\cos\frac{2\pi k}{11}\right)$

$$= \sum_{k=1}^{10}\left(-i^2\sin\frac{2\pi k}{11} - i\cos\frac{2\pi k}{11}\right)$$

$$= -i\sum_{k=1}^{10}\left(\cos\frac{2\pi k}{11} + i\sin\frac{2\pi k}{11}\right) = -i\sum_{k=1}^{10}e^{i\frac{2\pi k}{11}}$$

$$= -i\left[\sum_{k=1}^{10}e^{i\frac{2\pi k}{11}} - 1\right]$$

$$= -i\,(\text{Sum of 11th roots of unity} - 1)$$

$$= -i\,(0-1) = i$$

63. We have, $\dfrac{4(\cos 75° + i\sin 75°)}{0.4(\cos 30° + i\sin 30°)}$

$$= \frac{10\{\cos(75° - 30°) + i\sin(75° - 30°)\}}{\cos^2 30° + \sin^2 30°}$$

$$= 10(\cos 45° + i\sin 45°) = \frac{10}{\sqrt{2}}(1+i)$$

64. Using De-Moivre's theorem, the given expression

$$= \frac{(\cos\theta + i\sin\theta)^{-14}(\cos\theta + i\sin\theta)^{-15}}{(\cos\theta + i\sin\theta)^{48}(\cos\theta + i\sin\theta)^{-30}}$$

$$= (\cos\theta + i\sin\theta)^{-47} = \cos 47\theta - i\sin 47\theta$$

65. We have,

$$\sin\theta - i\cos\theta = -i^2\sin\theta - i\cos\theta$$

$$= -i(\cos\theta + i\sin\theta)$$

$\therefore$ The given expression, using De-Moivre's theorem

$$= (-i)^3[\cos(-25\theta) + i\sin(-25\theta)]$$

$$= i[\cos 25\theta - i\sin 25\theta]$$

$$= \sin 25\theta + i\cos 25\theta$$

66. We have, $z = \dfrac{(1+\cos\theta + i\sin\theta)^5}{(\cos\theta + i\sin\theta)^3}$

$$= \frac{\left\{1 + 2\cos^2\frac{\theta}{2} - 1 + 2i\sin\frac{\theta}{2}\cos\frac{\theta}{2}\right\}^5}{\cos 3\theta + i\sin 3\theta}$$

$$= \frac{32\cos^5\frac{\theta}{2}\left\{\cos\frac{\theta}{2} + i\sin\frac{\theta}{2}\right\}^5}{\cos 3\theta + i\sin 3\theta}$$

$$= 32\cos^5\frac{\theta}{2}\left\{\cos\frac{5\theta}{2} + i\sin\frac{5\theta}{2}\right\}\{\cos 3\theta - i\sin 3\theta\}$$

$$= 32\cos^5\frac{\theta}{2}\left[\cos\left\{\frac{5\theta}{2} - 3\theta\right\} + i\sin\left\{\frac{5\theta}{2} - 3\theta\right\}\right]$$

$$= 32\cos^5\frac{\theta}{2}\left[\cos\left(-\frac{\theta}{2}\right) + i\sin\left(-\frac{\theta}{2}\right)\right]$$

Hence, the modulus and argument of z are $32\left[\cos^5\frac{\theta}{2}\right]$ and $\left(-\frac{\theta}{2}\right)$, respectively.

67. We have,
$$\frac{1}{z}=\frac{1}{\cos\theta+i\sin\theta}=\cos\theta-i\sin\theta$$
$\therefore$ $$z^n=(\cos\theta+i\sin\theta)^n=\cos n\theta+i\sin n\theta\ ,$$
and $$\frac{1}{z^n}=(\cos\theta-i\sin\theta)^n=\cos n\theta-i\sin n\theta$$
Hence, $z^n+\dfrac{1}{z^n}=2\cos n\theta$ and $z^n-\dfrac{1}{z^n}=2i\sin n\theta$

68. We have,
$$\frac{z^{2n}-1}{z^{2n}+1}=\frac{(\cos\theta+i\sin\theta)^{2n}-1}{(\cos\theta+i\sin\theta)^{2n}+1}$$
$$=\frac{\cos 2n\theta+i\sin 2n\theta-1}{\cos 2n\theta+i\sin 2n\theta+1}$$
[using De-Moivre's theorem]
$$=\frac{(1-2\sin^2 n\theta)+2i\sin n\theta\cos n\theta-1}{(2\cos^2 n\theta-1)+2i\sin n\theta\cos n\theta+1}$$
$$=\frac{i\sin n\theta\cos n\theta+i^2\sin^2 n\theta}{\cos^2 n\theta+i\sin n\theta\cos n\theta}\qquad [\because i^2=-1]$$
$$=\frac{i\sin n\theta(\cos n\theta+i\sin n\theta)}{\cos n\theta(\cos n\theta+i\sin n\theta)}=i\tan n\theta$$

69. We have, $abcd=\cos(2\alpha+2\beta+2\gamma+2\delta)+i\sin(2\alpha+2\beta+2\gamma+2\delta)$
$\therefore$ $$\sqrt{abcd}=[\cos(2\alpha+2\beta+2\gamma+2\delta)+i\sin(2\alpha+2\beta+2\gamma+2\delta)]^{1/2}$$
or $$\sqrt{abcd}=\cos(\alpha+\beta+\gamma+\delta)+i\sin(\alpha+\beta+\gamma+\delta)\ \ldots\text{(i)}$$
[using De-Moivre's theorem]
$\therefore$ $$\frac{1}{\sqrt{abcd}}=\cos(\alpha+\beta+\gamma+\delta)-i\sin(\alpha+\beta+\gamma+\delta)\ \ldots\text{(ii)}$$
On adding Eqs. (i) and (ii), we get
$$\sqrt{abcd}+\frac{1}{\sqrt{abcd}}=2\cos(\alpha+\beta+\gamma+\delta)$$

70. Let $\cot^{-1}p=\theta$, then $p=\cot\theta$
$\therefore$ $$e^{2mi\cot^{-1}p}\cdot\left(\frac{pi+1}{pi-1}\right)^m=e^{2mi\theta}\cdot\left(\frac{i\cot\theta+1}{i\cot\theta-1}\right)^m$$
$$=e^{2mi\theta}\cdot\left(\frac{i(\cot\theta-i)}{i(\cot\theta+i)}\right)^m=e^{2mi\theta}\cdot\left(\frac{\cot\theta-i}{\cot\theta+i}\right)^m$$
$$=e^{2mi\theta}\cdot\left(\frac{\cos\theta-i\sin\theta}{\cos\theta+i\sin\theta}\right)^m=e^{2mi\theta}\cdot\left(\frac{e^{-i\theta}}{e^{i\theta}}\right)^m$$
$$=e^{2mi\theta}(e^{-2i\theta})^m=e^0=1$$

71. We have, $\alpha=\cos\left(\dfrac{8\pi}{11}\right)+i\sin\left(\dfrac{8\pi}{11}\right)=e^{\frac{8\pi}{11}i}$
$\text{Re}(\alpha+\alpha^2+\alpha^3+\alpha^4+\alpha^5)$
$$=\frac{\alpha+\alpha^2+\alpha^3+\alpha^4+\alpha^5+\bar{\alpha}+\bar{\alpha}^2+\bar{\alpha}^3+\bar{\alpha}^4+\bar{\alpha}^5}{2}$$
$$=\frac{\left[\begin{array}{l}-1+(1+\alpha+\alpha^2+\alpha^3+\alpha^4+\alpha^5\\ \qquad+\bar{\alpha}+\bar{\alpha}^2+\bar{\alpha}^3+\bar{\alpha}^4+\bar{\alpha}^5)\end{array}\right]}{2}$$
$$=\frac{-1+0}{2}\qquad\text{[sum of 11 and 11th roots of unity]}$$
$$=-\frac{1}{2}$$

72. We have, $\dfrac{1}{a+\omega}+\dfrac{1}{b+\omega}+\dfrac{1}{c+\omega}=2\omega^2=\dfrac{2}{\omega}$
and $$\frac{1}{a+\omega^2}+\frac{1}{b+\omega^2}+\frac{1}{c+\omega^2}=2\omega=\frac{2}{\omega}$$
$\therefore$ ω and ω^2 are roots of the equation
$$\frac{1}{a+x}+\frac{1}{b+x}+\frac{1}{c+x}=\frac{2}{x}.$$
When $x=1$,
$$\frac{1}{a+1}+\frac{1}{b+1}+\frac{1}{c+1}=\frac{2}{1}=2$$

73. $x^2-2x+4=0\ \Rightarrow\ x=1+\sqrt{3}i=2\left(\dfrac{1}{2}\pm\dfrac{\sqrt{3}}{2}i\right)$
$$=-2\omega-2\omega^2\ \Rightarrow\ \alpha^6+\beta^6=128$$

74. $z+\dfrac{1}{z}=1$
$\Rightarrow$ $$z=-\omega\quad\text{or}\quad-\omega^2$$
$\therefore$ $$z^{99}+\frac{1}{z^{99}}=(-1)+\frac{1}{(-1)}=-2$$

75. $(-1+\sqrt{-3})^{62}+(-1-\sqrt{-3})^{62}$
$$=2^{62}\omega^{62}+2^{62}(\omega^2)^{62}$$
$$=2^{62}[(\omega^3)^{20}\omega^2+(\omega^3)^{41}\omega]$$
$$=2^{62}[(\omega^2+\omega]=-2^{62}$$

76. Given expression
$$=\{3(1+\omega^2)+5\omega\}^2+\{3(1+\omega)+5\omega^2\}^2$$
$$=(-3\omega+5\omega)^2+(-3\omega^2+5\omega^2)^2$$
$$=4\omega^2+4\omega=-4$$

77. $\left(\dfrac{\omega^2}{\omega}\right)^6+\left(\dfrac{\omega}{\omega^2}\right)^6=2,$ using $\omega=\dfrac{-1+i\sqrt{3}}{2}$ and $\omega^2=\dfrac{-1-i\sqrt{3}}{2}$

78. Here, $\left(\dfrac{z_1}{z_2}\right)^2=\dfrac{-3i\omega}{2}$
$$\Rightarrow\ \left(\frac{z_1}{z_2}\right)^{50}=\left[\left(\frac{z_1}{z_2}\right)^2\right]^{25}=\left(\frac{-3i\omega}{2}\right)^{25}=-\left(\frac{3}{2}\right)^{25}i\omega$$
$$=\left(\frac{3}{2}\right)^{25}\left(\frac{\sqrt{3}}{2}+\frac{i}{2}\right)$$
$\therefore$ $\left(\dfrac{z_1}{z_2}\right)^{50}$ lies in I quadrant.

79. $\because xyz=(a+b)(a\omega+b\omega^2)(a\omega^2+b\omega)$
$$=(a+b)(a^2-ab+b^2)=a^3+b^3$$

80. $(1+\omega)^3-(1+\omega^2)^3=(-\omega^2)^3-(-\omega)^3$
$$=-\omega^6+\omega^3=-1+1=0$$

81. $p^{1/3}=(-p)^{1/3}(-1)^{1/3}$
$$=-(-p)^{1/3},-(-p)^{1/3}\omega,-(-p)^{1/3}\omega^2$$
$$=-q,-q\omega,-q\omega^2,\text{ where }q=(-p)^{1/3}$$
Let $\alpha=-q,\beta=-q\omega$ and $\gamma=-q\omega^2$
$\therefore$ $$\frac{x\alpha+y\beta+z\gamma}{x\beta+y\gamma+z\alpha}=\frac{-q(x+y\omega+z\omega^2)}{-q(x\omega+y\omega^2+z)}$$
$$=\frac{x\omega^3+y\omega^4+z\omega^2}{x\omega+y\omega^2+z}=\omega^2$$

82. Given expression

$$= \sum_{k=2}^{n} (k-1)(k-\omega)(k-\omega^2)$$
$$= \sum_{k=2}^{n} (k-1)(k^2+k+1) = \sum_{k=2}^{n} (k^3-1)$$
$$= (2^3+3^3+\ldots+n^3)-(n-1)$$
$$= (\Sigma n^3 - 1^3) - n + 1$$
$$= \left(\frac{n(n+1)}{2}\right)^2 - n$$

83. Let $\alpha = \omega$ and $\beta = \omega^2$

Now, $\alpha^3 + \beta^3 + \alpha^{-2}\beta^{-2} = \omega^3 + \omega^6 + \dfrac{1}{\omega^2}\cdot\dfrac{1}{\omega^4}$

$$= \omega^3 + (\omega^3)^2 + \frac{1}{(\omega^3)^2} = 1 + (1)^2 + \frac{1}{(1)^2} = 3 \quad [\because \omega^3 = 1]$$

84. We have,

$$(1-\omega+\omega^2)(1-\omega^2+\omega^4)(1-\omega^4+\omega^8)(1-\omega^8+\omega^{16})$$
$$= (1+\omega^2-\omega)(1-\omega^2+\omega)(1-\omega+\omega^2)(1-\omega^2+\omega)$$
$$[\because \omega^4 = \omega^3\cdot\omega = \omega; \omega^8 = (\omega^3)^2\cdot\omega^2;$$
$$\omega^{16} = (\omega^3)^5\cdot\omega = \omega \text{ and } \omega^3 = 1]$$
$$= (-\omega-\omega)(-\omega^2-\omega^2)(-\omega-\omega)(-\omega^2-\omega^2)$$
$$= (-2\omega)(-2\omega^2)(-2\omega)(-2\omega^2) = 16\cdot\omega^6$$
$$= 16(\omega^3)^2$$
$$= 16(1)^2 = 16$$

85. We have, $x = \omega - \omega^2 - 2$

or $x + 2 = \omega - \omega^2$

On squaring, $x^2 + 4x + 4 = \omega^2 + \omega^4 - 2\omega^3$

$$= \omega^2 + \omega^3\cdot\omega - 2\omega^3$$
$$= \omega^2 + \omega - 2 \quad [\because \omega^2 = 1]$$
$$= -1 - 2$$
$$= -3$$

$\Rightarrow \quad x^2 + 4x + 7 = 0$

On dividing $x^4 + 3x^3 + 2x^2 - 11x - 6$ by $x^2 + 4x + 7$, we get

$x^4 + 3x^3 + 2x^2 - 11x - 6$

$$= (x^2+4x+7)(x^2-x-1)+1$$
$$= (0)(x^2-x-1)+1$$
$$= 0 + 1 = 1$$

86. We have,

$$(1+\omega)(1+\omega)^2(1+\omega^4)(1+\omega^8)\ldots \text{ to } 2n \text{ factors}$$
$$= (1+\omega)(1+\omega^2)(1+\omega^3\cdot\omega)(1+\omega^6\cdot\omega^2)\ldots \text{ to } 2n \text{ factors}$$
$$= (1+\omega)(1+\omega^2)(1+\omega)(1+\omega^2)\ldots \text{ to } 2n \text{ factors}$$
$$[\because \omega^3 = \omega^6 = \ldots = 1]$$
$$= [(1+\omega)(1+\omega)\ldots \text{ to } n \text{ factors}]$$
$$[(1+\omega^2)(1+\omega^2)\ldots \text{ to } n \text{ factors}]$$
$$= (1+\omega)^n(1+\omega^2)^n = [(1+\omega)(1+\omega^2)]^n$$
$$= (1+\omega+\omega^2+\omega^3)^n = (0+1)^n = 1$$
$$[\because 1+\omega+\omega^2 = 0, \omega^3 = 1]$$

87. We have, $\alpha = \omega$ and $\beta = \omega^2$

Then, $xyz = (a+b+c)(a\omega+b\omega^2+c)(a\omega^2+b\omega+c)$

$$= (a+b+c)(a^2+b^2+c^2-ab-bc-ca)$$
$$= a^3+b^3+c^3-3abc$$

88. We have, $z^3 + 2z^2 + 2z + 1 = 0$

$\Rightarrow \quad (z+1)(z^2+z+1) = 0$

Its roots are $-1, \omega$ and ω^2. The root $z = -1$ does not satisfy the equation, $z^{1985} + z^{100} + 1 = 0$ but $z = \omega$ and $z = \omega^2$ satisfy it.

Hence, ω and ω^2 are the common roots.

89. We have, $(16)^{1/4} = (2^4)^{1/4} = 2(1)^{1/4}$

$$= 2(\cos 0 + i\sin 0)^{1/4}$$
$$= 2\left\{\cos\frac{1}{4}(2k\pi+0) + i\sin\frac{1}{4}(2k\pi+0)\right\}, k = 0, 1, 2, 3$$
$$= 2\times 1, 2\times i, 2\times -1, 2\times -i, = \pm 2, \pm 2i$$

90. We have, $f(\omega) = \omega^{3p} + \omega^{3q+1} + \omega^{3r+2}$

$$= \omega^{3p} + \omega^{3q}\cdot\omega + \omega^{3r}\cdot\omega^2$$
$$= (\omega^3)^p + (\omega^3)^q\cdot\omega + (\omega^3)^r\cdot\omega^2$$
$$= 1 + \omega + \omega^2 = 0 \quad [\because \omega^3 = 1]$$

91. Since $1, \alpha, \alpha^2, \ldots, \alpha^{n-1}$ are n and nth roots of unity.

$\therefore \quad x^n - 1 = (x-1)(x-\alpha)(x-\alpha^2)\ldots(x-\alpha^{n-1})$

$\Rightarrow \log(x^n-1) = \log(x-1) + \log(x-\alpha)$

$$+ \log(x-\alpha^2) + \ldots + \log(x-\alpha^{n-1})$$

On differentiating both sides w.r.t. x, we get

$$\frac{nx^{n-1}}{x^n-1} = \frac{1}{x-1} + \frac{1}{x-\alpha} + \frac{1}{x-\alpha^2} + \ldots + \frac{1}{x-\alpha^{n-1}}$$

Putting $x = 2$, we get

$$\frac{n2^{n-1}}{2^n-1} = \frac{1}{1} + \frac{1}{2-\alpha} + \frac{1}{2-\alpha^2} + \ldots + \frac{1}{2-\alpha^{n-1}}$$

$$\therefore \quad \frac{n\cdot 2^{n-1}}{2^n-1} - 1 = \sum_{i=1}^{n-1}\frac{1}{2-\alpha^i}$$

Hence, $\displaystyle\sum_{i=1}^{n-1}\frac{1}{2-\alpha^i} = \frac{n\cdot 2^{n-1} - 2^n + 1}{2^n - 1}$

$$= \frac{(n-2)2^{n-1}+1}{2^n-1}$$

92. The vertices of the triangle are $A(1, 0), B(1/\sqrt{2}, 1/\sqrt{2})$ and $C(0, 1)$.

$$\therefore \quad AB^2 = 2 - \sqrt{2}$$
$$BC^2 = 2 - \sqrt{2}$$
$$AC^2 = 1 + 1 = 2$$
$$\therefore \quad AB = BC$$

93. By definition,

$z_1 = x_1 + iy_1$, $z_2 = x_2 + iy_2$ and $z_3 = x_3 + iy_3$ are collinear, if

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} a & b & 1 \\ a' & b' & 1 \\ a-a' & b-b' & 1 \end{vmatrix} = 0$$

$\Rightarrow \quad ab' = a'b$

94. Let $z = x + iy$, where $x, y \in R$

$$\therefore \quad \alpha + i\beta = \tan^{-1}(x+iy)$$
$$\Rightarrow \quad \alpha - i\beta = \tan^{-1}(x-iy)$$
$$\Rightarrow \quad 2\alpha = \tan^{-1}(x+iy) + \tan^{-1}(x-iy)$$
$$= \tan^{-1}\frac{2x}{1-x^2-y^2}$$

$\therefore \quad x^2 + y^2 + 2x\cot 2\alpha = 1$

95. $|z - z_1| = |z - z_2|$ represents a perpendicular bisector.

96. We have, $(z-1)^n = i\,(z+1)^n$

$\therefore \quad |z-1|^n = |i|\,|z+1|^n$

$\Rightarrow \quad |z-1|^n = |z+1|^n$

$\Rightarrow \quad |z-1| = |z+1|$

$\Rightarrow \quad |z-1|^2 = |z+1|^2$

$\Rightarrow \quad (x-1)^2 + y^2 = (x+1)^2 + y^2$

$\Rightarrow \quad 4x = 0 \quad \Rightarrow \quad x = 0$

$\therefore$ The roots lies on the Y-axis.

97. Let $z = x + iy$, where $x, y \in R$

We have, $\quad |iz - 1| + |z - i| = 2$

$\Rightarrow \quad |ix - y - 1| + |x + iy - i| = 2$

$\Rightarrow \sqrt{(-y-1)^2 + x^2} + \sqrt{x^2 + (y-1)^2} = 2$

$\Rightarrow \quad x^2 = 0 \quad$ or $\quad x = 0$

$\therefore$ The locus of z is a straight line.

98. Clearly, $|z_1| < |z_3| < |z_2|$, as z_3 is mid-point of z_1 and z_2.

99. (a) $\text{Re}\left(\dfrac{1+z}{1-z}\right) = 0 \Rightarrow \arg\left(\dfrac{1+z}{1-z}\right) = \dfrac{\pi}{2}$

This represents a circle.

(b) $z\bar{z} + iz - i\bar{z} + 1 = 0$ represent a circle.

(c) $\arg\left(\dfrac{z-1}{z+1}\right) = \dfrac{\pi}{2}$

This represents a circle.

(d) $\left|\dfrac{z-1}{z+1}\right| = 1 \Rightarrow |\,z-1\,| = |\,z+1\,|$

This represents a straight line.

100. We have, $z_2 = \dfrac{z_1 + z_3}{2}$

The point representing z_2 divided the line segment joining points representing z_1 and z_3 in the ratio $1:1$.

$\therefore$ The points lies on a line.

101. Area of the triangle on the argand plane formed by complex numbers $-z, iz, z - iz$ is $\dfrac{3}{2}|z|^2$.

$\therefore \quad \dfrac{3}{2}|z|^2 = 600 \quad \Rightarrow \quad |z| = 20$

102. Let $z_1 = 1 - 3i$, $z_2 = 4 + 3i$ and $z_3 = 3 + i$. Then, z_3 divides the line segment joining z_1 and z_2 in the ratio $2:1$ internally. So, the points z_1, z_2 and z_3 are collinear.

103. Let $z = x + iy$

Then, $\dfrac{z+2i}{z+4} = \dfrac{x+iy+2i}{x+iy+4} = \dfrac{x+i\,(y+2)}{(x+4)+iy}$

$= \dfrac{[x+i(y+2)]\,[(x+4)-iy]}{(x+4)^2 + y^2}$

$= \dfrac{(x^2 + 4x + y^2 + 2y) + i\,(2x + 4y + 8)}{(x+4)^2 + y^2}$

Since, $\quad \text{Re}\left(\dfrac{z+2i}{z+4}\right) = 0 \quad \Rightarrow \quad x^2 + y^2 + 4x + 2y = 0$,

which represents a circle with centre $(-2, -1)$.

104. Let $z = x + iy$

Then, $\quad \dfrac{z+2i}{z+2} = \dfrac{x+iy+2i}{x+iy+2} = \dfrac{x+(y+2)i}{(x+2)+iy}$

$= \dfrac{[x+(y+2)i]\,[(x+2)-i\,y]}{(x+2)^2 + y^2}$

$= \dfrac{(x^2 + y^2 + 2x + 2y) + i\,(2x + 2y + 4)}{(x+2)^2 + y^2}$

Since, $\quad \text{Im}\left(\dfrac{z+2i}{z+2}\right) = 0 \quad \Rightarrow \quad x + y + 2 = 0$

which represents a straight line.

105. We have,

$|z - 4i| + |z + 4i| = 10$

$\Rightarrow \quad |z - (0 + 4i)| + |z - (0 - 4i)| = 10$

This represents an ellipse.

$|4i + 4i| < 10 \quad$ i.e. $10 > 8$

106. We have, $|z - ai| = |z + ai|$

$\Rightarrow \quad |x + i\,(y - a)|^2 = |x + i\,(y + a)|^2$

$\Rightarrow \quad x^2 + (y-a)^2 = x^2 + (y+a)^2$

$\Rightarrow 4ay = 0$; $y = 0$, which is X-axis.

107. We have, $|z-1|^2 + |z+1|^2 = 4$

$\Rightarrow \quad |(x-1) + iy|^2 + |(x+1) + iy|^2 = 4$

$\Rightarrow \quad (x-1)^2 + y^2 + (x+1)^2 + y^2 = 4$

$\Rightarrow \quad 2\,(x^2 + 1) + 2y^2 = 4$

$\therefore$ The locus of P is $x^2 + y^2 = 1$.

108. We have, $a_1z^3 + a_2z^2 + a_3z + a_4 = 3$

$\Rightarrow \quad |3| = |a_1z^3 + a_2z^2 + a_3z + a_4|$

$\Rightarrow \quad 3 \le |a_1z^3| + |a_2z^2| + |a_3z| + |a_4|$

$\Rightarrow \quad 3 \le |a_1|\,|z^3| + |a_2|\,|z^2| + |a_3|\,|z| + |a_4|$

$\Rightarrow \quad 3 \le |z|^3 + |z|^2 + |z| + 1 \qquad [\because\ |a_i| \le 1]$

$\Rightarrow \quad 3 \le 1 + |z| + |z|^2 + |z|^3 < 1 + |z| + |z|^2 + |z|^3 + \ldots \infty$

$\Rightarrow \quad 3 < 1 + |z| + |z|^2 + |z|^3 + \ldots \infty$

$\Rightarrow \quad 3 < \dfrac{1}{1 - |z|} \quad \Rightarrow \quad 1 - |z| < \dfrac{1}{3}$

$\Rightarrow \quad \dfrac{2}{3} - |z| < 0$

$\therefore \quad |z| > \dfrac{2}{3}$

109. We have, $|z-1| + |z+1| \le 4$

$\Rightarrow \quad \sqrt{(x-1)^2 + y^2} + \sqrt{(x+1)^2 + y^2} \le 4$

where, $\quad z = x + iy$

$\Rightarrow \quad = A + B \le 4 \qquad \ldots(\text{i})$

where, $\quad A = \sqrt{(x-1)^2 + y^2}$

and $\quad B = \sqrt{(x+1)^2 + y^2}$

But $\quad [(x-1)^2 + y^2] - [(x+1)^2 + y^2] = -4x$

i.e. $\quad A^2 - B^2 = -4x \qquad \ldots(\text{ii})$

On dividing Eq. (ii) by Eq. (i), we get

$\sqrt{(x-1)^2 + y^2} - \sqrt{(x+1)^2 + y^2} \le -x$

$\Rightarrow \quad 2\sqrt{(x-1)^2 + y^2} \le 4 - x$

$\Rightarrow \quad 3x^2 + 4y^2 \le 12$

[squaring and simplifying]

or $\quad \dfrac{x^2}{4} + \dfrac{y^2}{3} \le 1$

which represents the interior and boundary of an ellipse.

110. We have, $\log_{1/2}\left(\dfrac{|z-1|+4}{3|z-1|-2}\right) > 1 = \log_{1/2}\left(\dfrac{1}{2}\right)$

$$\Rightarrow \quad \frac{|z-1|+4}{3|z-1|-2} < \frac{1}{2} < 1$$

[$\because \log_a x$ is a decreasing function, if $a < 1$]

$$\Rightarrow \quad |z-1| + 4 < 3|z-1| - 2$$

$$\Rightarrow \quad 2|z-1| > 6 \Rightarrow |z-1| > 3$$

which is an exterior of a circle.

111. The closest distance = length of the perpendicular from the origin on the line $a\bar{z} + \bar{a}z + a\bar{a} = 0$

$$= \frac{a(0) + \bar{a}|0| + a\bar{a}}{2|a|} = \frac{|a|^2}{2|a|} = \frac{|a|}{2}$$

112. We have, $z_k = 1 + a + a^2 + \ldots + a^k = \dfrac{1 - a^{k+1}}{1-a}$

$$\Rightarrow \quad z_k - \frac{1}{1-a} - \frac{a^{k+1}}{1-a}$$

$$\Rightarrow \quad \left|z_k - \frac{1}{1-a}\right| = \frac{|a|^{k+1}}{|1-a|} < \frac{1}{|1-a|} \qquad [\because |a| < 1]$$

$\therefore$ Vertices of the polygon $z_1, z_2, \ldots, z_n$ lie within the circle

$$\left|z - \frac{1}{1-a}\right| = \frac{1}{|1-a|}$$

113. We have, $z_1 - z_4 = z_2 - z_3$ or $\dfrac{z_1 + z_3}{2} = \dfrac{z_2 + z_4}{2}$ i.e. the diagonals bisect each other.

$\therefore$ It is a parallelogram.

Also, $\quad \text{amp}\left(\dfrac{z_4 - z_1}{z_2 - z_1}\right) = \dfrac{\pi}{2}$

$\Rightarrow$ Angle at z_1 is a right angle.

$\therefore$ It is a rectangle and hence, a cyclic quadrilateral.

114. We have, $\text{Im}(z^2) = 4$

$\Rightarrow \quad \text{Im}[(x^2 - y^2) + 2ixy] = 4 \quad$ [putting $z = x + iy$]

$\Rightarrow 2xy = 4$ or $xy = 2$, which is a rectangular hyperbola.

115. We have, $\quad \text{Re}(z^2) = 4$

$\Rightarrow \text{Re}[(x^2 - y^2) + 2ixy] = 4 \quad$ [putting $z = x + iy$]

$$\Rightarrow \quad x^2 - y^2 = 4$$

which is a rectangular hyperbola.

116. $|z - z_1| = |z - z_2| = |z - z_3|$

$\therefore$ z must be the mid-point of z_1 and z_2 and since $|z - z_1| = |z - z_2|$ and z, z_1 and z_2 are collinear.

$\Rightarrow z$ is circumcentre of Δ formed by z_1, z_2 and z_3.

$\therefore \quad \arg\left(\dfrac{z_3 - z_1}{z_3 - z_2}\right) = \pm\dfrac{\pi}{2} \quad$ [neglecting –ve value]

117. $a_0 z^4 + a_1 z^3 + a_2 z^2 + a_3 z + a_4 = 0$

$$\Rightarrow \quad a_0\bar{z}^4 + a_1\bar{z}^3 + a_2\bar{z}^2 + a_3\bar{z} + a_4 = 0$$

[taking conjugate on both sides]

$$\Rightarrow a_0(\bar{z}^4) + a_1(\bar{z})^3 + a_2(\bar{z})^2 + a_3(\bar{z})^2 + a_3\bar{z} + a_4 = 0$$

$\therefore \bar{z}$ is a root of the equation if z is a root. So, option (a) is correct.

Also, if z_1 is real, $z_1 = \bar{z}_1$.

If z_1 is non-real complex, then $\bar{z}_1$ is also a root because imaginary root occurs in conjugate pairs. So, option (b) is also correct.

118. Let $z = \alpha$ be a real root. Then,

$$\alpha^3 + (3 + 2i)\alpha + (-1 + ia) = 0$$

$$\Rightarrow \quad (\alpha^3 + 3\alpha - 1) - i(a + 2\alpha) = 0$$

$$\Rightarrow \quad \alpha^3 + 3\alpha - 1 = 0$$

and $\alpha = -a/2$

$$\Rightarrow \quad -\frac{a^3}{8} - \frac{3a}{2} - 1 = 0$$

$$\Rightarrow \quad a^3 + 12a + 8 = 0$$

Let $f(a) = a^3 + 12a + 8$

$\therefore f(-1) < 0$, $f(0) > 0$, $f(-2) < 0$, $f(1) > 0$ and $f(3) = 0$

119. We have,

$$\frac{1 + i\cos\theta}{1 - 2i\cos\theta} = \frac{(1 + i\cos\theta)(1 + 2i\cos\theta)}{(1 - 2i\cos\theta)(1 + 2i\cos\theta)}$$

$$= \frac{(1 - 2\cos^2\theta) + i\,3\cos\theta}{1 + 4\cos^2\theta}$$

Thus, $\dfrac{(1 + i\cos\theta)}{(1 - 2i\cos\theta)}$ is a real number, if $\cos\theta = 0$

$$\Rightarrow \quad \theta = 2n\pi \pm \frac{\pi}{2}$$

where, n is an integer.

120. Let $z = c$ be a real root.

Then, $\quad \alpha c^2 + c + \bar{\alpha} = 0 \quad \ldots$(i)

Let $\quad \alpha = p + iq$

Then, $(p + iq)c^2 + c + p - iq = 0$

$$\Rightarrow \quad pc^2 + c + p = 0$$

and $\quad qc^2 - q = 0$

$\Rightarrow \quad c = \pm 1 \quad [\because q \neq 0]$

From Eq. (i), we get $\alpha \pm 1 + \bar{\alpha} = 0$

Also, $|c| = 1$

121. Let $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$

$$\Rightarrow \quad |z_2| = r_2$$

Also, $\arg(z_1) + \arg(z_2) = 0$

$$\Rightarrow \quad \arg(z_1) = -\arg(z_2) = -\theta_2$$

$$\therefore \quad z_1 = r_2[\cos(-\theta_2) + i\sin(-\theta_2)]$$

$$= r_2[\cos\theta_2 - i\sin\theta_2]$$

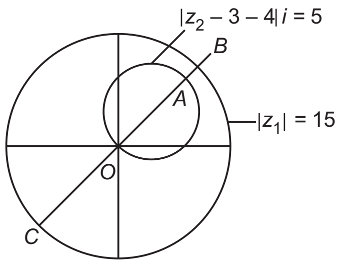
$$\Rightarrow \quad z_1 = \bar{z}_2$$

$$\Rightarrow \quad z_1 = \frac{1}{z_2}$$

$$\therefore \quad z_1 z_2 = 1$$

122. We have,

$|z_1| = 15$, $|z_2 - 3 - 4i| = 5$



Minimum value of $|z_1 - z_2|$,

$$AB = OB - OA = 15 - 10 = 5$$

Maximum value of $|z_1 - z_2|$,

$$CA = OA + OC$$

$$= 10 + 15$$

$$= 25$$

123. Given, $\left|z - \dfrac{1}{z}\right| = 1$

$\Rightarrow \quad 1 \geq \left||z| - \dfrac{1}{|z|}\right| \Rightarrow -1 \leq |z| - \dfrac{1}{|z|} \leq 1$

$\Rightarrow \quad -|z| \leq |z|^2 - 1 \leq |z|$

From $|z|^2 - 1 \geq |z|$, we get

$|z|^2 + |z| - 1 \geq 0$

$\Rightarrow \quad |z| \geq \dfrac{-1 + \sqrt{5}}{2}$ ...(i)

From $|z|^2 - 1 \leq |z|$, we get

$|z|^2 - |z| - 1 \leq 0$

$\Rightarrow \quad \dfrac{1 - \sqrt{5}}{2} \leq |z| \leq \dfrac{1 + \sqrt{5}}{2}$ ...(ii)

From Eqs. (i) and (ii), we get

$\Rightarrow \quad \dfrac{-1 + \sqrt{5}}{2} \leq |z| \leq \dfrac{1 + \sqrt{5}}{2}$

$\Rightarrow \quad |z|_{\min} = \dfrac{\sqrt{5} - 1}{2}, |z|_{\max} = \dfrac{1 + \sqrt{5}}{2}$

124. $|z_1^2 - z_2^2| = |\bar{z}_1^2 - \bar{z}_2^2 - 2\bar{z}_1\bar{z}_2|$

$\Rightarrow \quad |z_1 - z_2||z_1 + z_2| = |\bar{z}_1 - \bar{z}_2|^2$

$\Rightarrow \quad |z_1 + z_2| = |\bar{z}_1 + \bar{z}_2|$

$|z_1 + z_2| = |z_1 - z_2| \Rightarrow \left|\dfrac{z_1}{z_2} + 1\right| - \left|\dfrac{z_1}{z_2} - 1\right|$

$\Rightarrow \quad \dfrac{z_1}{z_2}$ lies on $\perp$ bisector of 1 and -1.

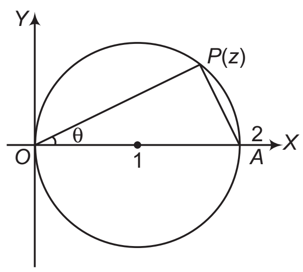
$\Rightarrow \quad \dfrac{z_1}{z_2}$ lies on imaginary axis.

$\Rightarrow \quad \dfrac{z_1}{z_2}$ is purely is imaginary.

$\Rightarrow \quad \arg\left(\dfrac{z_1}{z_2}\right) = \pm\dfrac{\pi}{2}$

$\therefore \quad |\arg(z_1) - \arg(z_2)| = \dfrac{\pi}{2}$

125. Since, $\arg((z - 1 - i)/z)$ is the angle subtended by the chord joining the points O and $1 + i$ at the circumference of the circle $|z - 1| = 1$, so it is equal to $-\pi/4$. The line joining the points $z = 0$ and $z = 2 + 0i$ is the diameter.



$\therefore \arg\dfrac{z - 2}{z} = \pm\dfrac{\pi}{2} \Rightarrow \dfrac{z - 2}{z - 0}$ is purely imaginary.

We have, $\angle POA = \dfrac{\pi}{2}$

$\Rightarrow \quad \arg\left(\dfrac{2 - z}{0 - z}\right) = \dfrac{\pi}{2} \Rightarrow \dfrac{z - 2}{2} = \dfrac{AP}{OP} i$

Now, in ΔOAP, $\tan\theta = \dfrac{AP}{OP}$ Thus, $z - 2 = 0$

126. Given, $z = x + iy$

Now, $\dfrac{3z - 6 - 3i}{2z - 8 - 6i} = \dfrac{3(x + iy) - 6 - 3i}{2(x + iy) - 8 - 6i}$

$= \dfrac{[3x - 6 + i(3y - 3)][(2x - 8) - i(2y - 6)]}{[(2x - 8) + i(2y - 6)][(2x - 8) - i(2y - 6)]}$

$= \dfrac{6x^2 - 36x + 48 + 6y^2 - 24y + 18 + i[6xy - 6x - 24y + 24 - 6xy + 12y + 18x - 36}{(2x - 8)^2 + (2y - 6)^2}$

$= \dfrac{6x^2 + 6y^2 - 36x - 24y + 66}{(2x - 8)^2 + (2y - 6)^2} + \dfrac{(12x - 12y - 12)}{(2x - 8)^2 + (2y - 6)^2} = a + ib$ [say]

Since, $\arg(a + ib) = \dfrac{\pi}{4}$

$\therefore \quad \tan\dfrac{\pi}{4} = \dfrac{b}{a} \Rightarrow a = b$

$\Rightarrow \quad 6x^2 + 6y^2 - 36x - 24y + 66 = 12x - 12y - 12$

$\Rightarrow \quad 6x^2 + 6y^2 - 48x - 12y + 78 = 8$

$\Rightarrow \quad x^2 + y^2 - 8x - 2y + 13 = 0$ ...(i)

Again, $|z - 3 - i| = 3 \Rightarrow |x + iy - 3 + i| = 3$

$\Rightarrow \quad (x - 3)^2 + (y + 1)^2 = 9$

$\Rightarrow x^2 + y^2 - 6x + 2y + 1 = 0$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), W get

$-2x - 4y + 12 = 0$

$\Rightarrow \quad x = -2y + 6$ ...(iii)

Putting the value of x in Eq. (ii), we get

$(-2y + 6)^2 + y^2 - 6(-2y + 6) + 2y + 1 = 0$

$\Rightarrow \quad 5y^2 - 10y + 1 = 0$

$\therefore \quad y = \dfrac{10 \pm 4\sqrt{5}}{10}$

$= 1 \pm \dfrac{2}{\sqrt{5}}$

$\therefore \quad x = -2y + 6 = 4 \mp \dfrac{4}{\sqrt{5}}$

$\therefore \quad z = x + iy = 4 \mp \dfrac{4}{\sqrt{5}} + i\left(1 \pm \dfrac{2}{\sqrt{5}}\right)$

Thus, the order pairs (x, y) satisfying the given equations such that $x = x + iy$ and $\left(4 - \dfrac{4}{\sqrt{5}}, 1 + \dfrac{2}{\sqrt{5}}\right)$ and $\left(4 + \dfrac{4}{\sqrt{5}}, 1 - \dfrac{2}{\sqrt{5}}\right)$.

127. Clearly, we have to find it for real z. Let $z = x$.

Then, $\quad |x - w| = |x - w^2| = |w - w^2|$

$\Rightarrow \quad \left(x + \dfrac{1}{2}\right)^2 + \dfrac{3}{4} = \left|\dfrac{-1 + \sqrt{3}i}{2} - \dfrac{-1 - \sqrt{3}i}{2}\right|^2 = 3$

$\Rightarrow \quad x + \dfrac{1}{2} = \pm\dfrac{3}{2}$

$\Rightarrow \quad x = 1, -2$

128. $\text{amp}(z_1 z_2) = 0 \Rightarrow \text{amp}(z_1) + \text{amp}(z_2) = 0$

$\therefore \quad \text{amp}(z_1) = -\text{amp}(z_2) = \text{amp}(\bar{z}_2)$

$\because \quad |z_1| = |z_2|$, we get $|z_1| = |\bar{z}_2|$.

So, $\quad z_1 = \bar{z}_2$

Also, $\quad z_1 z_2 = \bar{z}_2 z_2 = |z_2|^2 = 1$, because $|z_2| = 1$

129. $z + z^{-1} = 1 \Rightarrow z^2 - z + 1 = 0$

$\therefore \quad z = \dfrac{1 \pm \sqrt{3}i}{2} = -\omega, -\omega^2$

$\therefore z^n + z^{-n} = (-\omega)^n + (-\omega)^{-n}$ or $(-\omega^2)^n + (-\omega^2)^{-n}$

$= (-1)^n \omega^n + (-1)^{-n} \cdot \dfrac{1}{\omega^n}$

or $\quad = (-1)^n \omega^{2n} + (-1)^{-n} \cdot \dfrac{1}{\omega^{2n}}$

$= (-1)^n \left(\omega^n + \dfrac{1}{\omega^n}\right)$

or $\quad = (-1)^n \left(\omega^{2n} + \dfrac{1}{\omega^{2n}}\right)$

$= (-1)^n \left(\omega^n + \dfrac{1}{\omega^n}\right)$, because $\omega^{3n} = 1$

$= (-1)^n \cdot (\omega^n + \omega^{2n})$

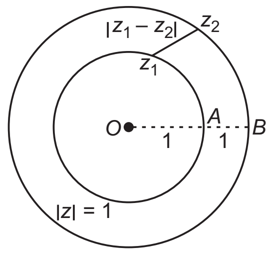
$= (-1)^n \cdot (1 + 1)$ or $(-1)^n \cdot (-1)$

Dependening on whether n is a multiple of 3 or not.

130. $|2z_1 + z_2| \le |2z_1| + |z_2|$

$= 2|z_1| + |z_2| = 2 \times 1 + 2 = 4$

From the figure, $|z_1 - z_2|$ is the least, when 0, z_1, z_2 are collinear.

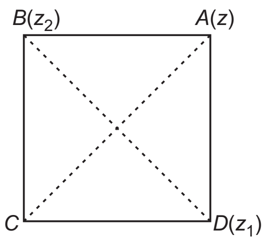


Then, $\quad |z_1 - z_2| = 1$

Again, $\quad \left|z_2 + \dfrac{1}{z_1}\right| \le |z_2| + \left|\dfrac{1}{z_1}\right|$

$= 2 + \left|\dfrac{1}{z_1}\right| = 2 + \dfrac{1}{1} = 3$

131. $OB = OD = OA = |z|$



If amp $(z) = \theta$, then amp $(z_1) = \theta - \dfrac{\pi}{2}$,

amp $\quad (z_2) = \theta + \dfrac{\pi}{2}$

and $\quad z = |z| \{\cos\theta + i\sin\theta\}$

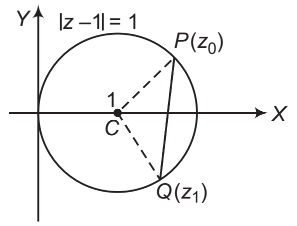
$\therefore \quad z_1 = |z| \left\{\cos\left(\theta - \dfrac{\pi}{2}\right) + i\sin\left(\theta - \dfrac{\pi}{2}\right)\right\}$

$= |z| \{\sin\theta - i\cos\theta\}$

$= |z|(-i)(\cos\theta + i\sin\theta) = -iz$

$z_2 = |z| \left\{\cos\left(\theta + \dfrac{\pi}{2}\right) + i\sin\left(\theta + \dfrac{\pi}{2}\right)\right\} = iz$

132. $\because |z_1 - 1| = 1, |z_0 - 1| = 1$



$\therefore \quad \left|\dfrac{z_1 - 1}{z_0 - 1}\right| = 1$

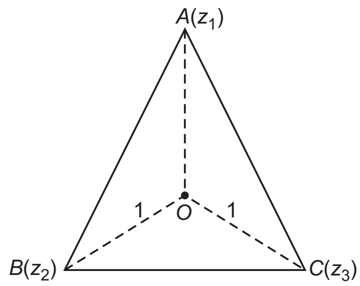
$\angle QCP = \dfrac{\pi}{2}$

$\Rightarrow$ amp $\left(\dfrac{z_1 - 1}{z_0 - 1}\right) = \dfrac{\pi}{2}, -\dfrac{\pi}{2}$

$\therefore \quad \dfrac{z_1 - 1}{z_0 - 1} = 1 \cdot \left(\cos\dfrac{\pm\pi}{2} + i\sin\dfrac{\pm\pi}{2}\right) = i, -i$

$\therefore \quad z_1 - 1 = (z_0 - 1)i,\ z_1 - 1 = -(z_0 - 1)i$

133. Given, $|z_1| = |z_2| = |z_3|$



$\Rightarrow$ The vertices are at equal distances from the origin $z = 0$.

$\therefore$ The origin is at the centroid of the equilateral triangle.

$\therefore \quad \dfrac{z_1 + z_2 + z_3}{3} = 0$

$\therefore \quad z_1 + z_2 + z_3 = 0$

with OA as real axis,

$z_1 = 1,\ z_2 = 1(\cos 120° + i\sin 120°)$,

$z_3 = 1(\cos 120° - i\sin 120°)$

$\therefore \quad z_1 z_2 z_3 = 1 \cdot \left(-\dfrac{1}{2} + i\dfrac{\sqrt{3}}{2}\right)\left(-\dfrac{1}{2} - i\dfrac{\sqrt{3}}{2}\right)$

$= \left(-\dfrac{1}{2}\right)^2 + \left(\dfrac{\sqrt{3}}{2}\right)^2$

$= 1$

134. $|z_2 z_3 + 8z_3 z_1 + 27z_1 z_2| = \left|z_1 z_2 z_3 \left(\dfrac{1}{z_1} + \dfrac{8}{z_2} + \dfrac{27}{z_3}\right)\right|$

$= |z_1||z_2||z_3| \left|\dfrac{1}{z_1} + \dfrac{8}{z_2} + \dfrac{27}{z_3}\right|$

$= |z_1||z_2||z_3| \left|\dfrac{\bar{z}_1}{|z_1|^2} + \dfrac{8\bar{z}_2}{|z_2|^2} + \dfrac{27\bar{z}_3}{|z_3|^2}\right|$

$= |z_1||z_2||z_3| \left|\dfrac{\bar{z}_1}{1} + \dfrac{8\bar{z}_2}{4} + \dfrac{27\bar{z}_3}{9}\right|$

$= |z_1||z_2||z_3| \left|\overline{z_1 + 2z_2 + 3z_3}\right|$

$= |z_1||z_2||z_3| |z_1 + 2z_2 + 3z_3|$

$= 1 \cdot 2 \cdot 3 \cdot 6 = 36$

135. Statement I is false, since there is no order relation in the set of complex numbers.
Cancellation laws, $a+c>b+c$
$\Rightarrow a>b$ does not hold true in complex numbers, therefore Statement II is true.

136. Given that, $\arg(z)=0$
$\Rightarrow z$ is purely real.
$\therefore$ Statement II is true.
Also, $|z_1|=|z_2|+|z_1-z_2|$
$\therefore \quad (|z_2-z_1|)^2=(|z_1|-|z_2|)^2$
$\Rightarrow \quad =|z_1|^2+|z_2|^2-2|z_1||z_2|\cos(\theta_1-\theta_2)$
$=|z_1|^2+|z_2|^2-2|z_1||z_2|$
$\Rightarrow \quad \cos(\theta_1-\theta_2)=1 \Rightarrow \theta_1-\theta_2=0$
$\Rightarrow \arg(z_1)-\arg(z_2)=0$
$\Rightarrow \quad \arg\left(\frac{z_1}{z_2}\right)=0 \Rightarrow \frac{z_1}{z_2}$ is purely real.
$\Rightarrow \quad \operatorname{Im}\left(\frac{z_1}{z_2}\right)=0$
Hence, Statement I and Statement II are true and Statement II is correct explanation of Statement I.

137. We will show that Statement I is true and follows from Statement II.
Indeed
$$|z|=\left|z+\frac{1}{z}-\frac{1}{z}\right|\le\left|z+\frac{1}{z}\right|+\frac{1}{|z|}\le 1+\frac{1}{|z|}$$
$\Rightarrow \quad |z|^2-|z|-1\le 0$
$\Rightarrow \quad |z|\in\left[\frac{1-\sqrt{5}}{2},\frac{1+\sqrt{5}}{2}\right]$
But as $|z|>0$, we have $|z|\in\left(0,\frac{1+\sqrt{5}}{2}\right)$
$\Rightarrow$ Maximum value of $|z|$ is $\frac{1+\sqrt{5}}{2}$.

138. Statement I is false, since $|z|=\frac{-a\pm\sqrt{a^2-4b}}{2}$, if $a^2>4b$
and $|z|$ is a positive number c, then $|z|=c$
$\Rightarrow z=c(\cos\theta+i\sin\theta)$
$\Rightarrow$ Infinite complex numbers satisfy the given equation.
Statement II is true.
A quadratic can have more than two roots, if all coefficients are zero.

139. $\because \quad e^{i\theta}=\cos\theta+i\sin\theta$
$\Rightarrow e^{-i\theta}=\cos\theta-i\sin\theta$
$\therefore \cos\theta=\frac{e^{i\theta}+e^{-i\theta}}{2}$
Now, $\cos(1-i)=\frac{e^{i(1-i)}+e^{-i(1-i)}}{2}=\frac{e^{(1+i)}+e^{-(1+i)}}{2}$
$=\frac{e(e^i)+e^{-1}(e^{-i})}{2}$
$=\frac{e(\cos 1+i\sin 1)+e^{-1}(\cos 1-i\sin 1)}{2}$
$=\frac{1}{2}\left(e+\frac{1}{e}\right)\cos 1+\frac{i}{2}\left(e-\frac{1}{e}\right)\sin 1$
$\therefore \quad a=\frac{1}{2}\left(e+\frac{1}{e}\right)\cos 1,\ b=\frac{1}{2}\left(e-\frac{1}{e}\right)\sin 1$

140. We have,
$(\cos\theta+i\sin\theta)^{3/5}=(\cos 3\theta+i\sin 3\theta)^{1/5}$
$=[\cos(2r\pi+3\theta)+i\sin(2r\pi+3\theta)]^{1/5}$
where, $r=0,1,2,3,4$
$=e^{i\left(\frac{2\pi r+3\theta}{5}\right)}$, $r=0,1,2,3,4$
Hence, product of all values of $(\cos\theta+i\sin\theta)^{3/5}$
$=e^{i\frac{3\theta}{4}}e^{i\left(\frac{2\pi+3\theta}{5}\right)}e^{i\left(\frac{6\pi+3\theta}{5}\right)}e^{i\left(\frac{8\pi+3\theta}{5}\right)}$
$=e^{i3\theta+4\pi i}=e^{4i\pi}e^{i3\theta}$
$=\cos 3\theta+i\sin 3\theta$
Also, product of roots of the equation $x^5-1=0$ is 1.
Hence, Statement II is true, but it is not a correct explanation of Statement I.

141. Let $A(z_1)$ and $B(z_1)$ be the centres of the given circles and P be the centre of the variable circle, which touches given circles externally, then
$$|AP|=a+r \text{ and } |BP|=b+r$$
where, r is the radius of the variable circle.
On subtraction, we get
$|AP|-|BP|=|a-b|$
$\Rightarrow \quad ||AP-BP||=|a-b|$ is a constant.
Hence, locus of P is
(i) a right bisector of AB, if $a=b$
(ii) a hyperbola if $|a-b|<|AB|=|z_2-z_1|$
(iii) an empty set, if $|a-b|>|AB|=|z_2-z_1|$
(iv) set of all points on line AB except those which lie between A and B, if $|a-b|=|AB|\ne 0$
Thus, Statement I is false and Statement II is true.

142. If $P(z)$ is any point on the ellipse, then equation of the ellipse is
$$|z-z_1|+|z-z_2|=\frac{|z_1-z_2|}{e} \quad \ldots(i)$$
For $P(z)$ to lie in ellipse, we have
$$|z-z_1|+|z-z_2|<\frac{|z_1-z_2|}{e}$$
It is given that origin is an interior point of the ellipse.
$\Rightarrow \quad |0-z_1|+|0-z_2|<\frac{|z_1-z_2|}{e}$
$\therefore \quad e\in\left(0,\frac{|z_1-z_2|}{|z_1|+|z_2|}\right)$
Hence, Statement I is false and Statement II is true.

143. As, we know $|z-z_1|+|z-z_2|=k$ represents an ellipse, if $|k|>|z_1-z_2|$. Thus, $|z-i|+|z+i|=k$ represents an ellipse, if $|k|>|i+i|$ or $|k|>2$.
$\therefore$ Statement I is false and Statement II is true.

144. The equation can be rewritten as
$z\bar{z}+\bar{a}z+a\bar{z}+a\bar{a}=a\bar{a}-\lambda$
$\Rightarrow \quad (z+a)(\bar{z}+a)=a\bar{a}-\lambda$
$\Rightarrow \quad |z+a|=\sqrt{a\bar{a}-\lambda}$
Since, $a\bar{a}$ is real, 1 should be real.
$\sqrt{a\bar{a}-\lambda}$ represents radius of the circle.
Hence, Statement I and Statement II both are true and Statement II is the correct explanation for Statement I.

Solutions (Q. Nos. 145-147)

Given that,

$$|z_1+z_2|^2=|z_1|^2+|z_2|^2$$

$$\Rightarrow |z_1|^2+|z_2|^2+z_1\bar{z}_2+\bar{z}_1z_2=|z_1|^2+|z_2|^2$$

$$\Rightarrow \quad z_1\bar{z}_2+\bar{z}_1z_2=0 \qquad \ldots(\text{i})$$

$$\Rightarrow \quad \frac{z_1}{z_2}+\frac{\bar{z}_1}{\bar{z}_2}=0 \qquad [\text{dividing by } z_2\bar{z}_2]$$

$$\Rightarrow \quad \frac{z_1}{z_2}+\overline{\left(\frac{z_1}{z_2}\right)}=0 \qquad \ldots(\text{ii})$$

145. From Eq. (i), $z_2\bar{z}_2$ is purely imaginary.

146. From Eq. (ii), z_1/z_2 is purely imaginary

147. Also, $i(z_1/z_2)$ is purely real. Hence, its possible arguments are 0 and π.

148. Clearly, according to the least possibility

$$\alpha^2-7\alpha+11\le 1 \;\Rightarrow\; \alpha\in[2,5]$$

149. $\left|(z-i)-(\alpha^2-7\alpha+11)\right|=1$

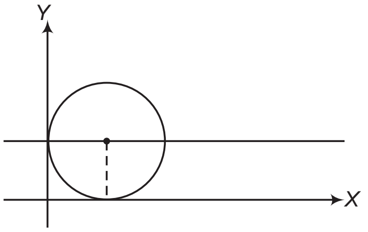
$$\therefore \left|(z-i)-(\alpha^2-7\alpha+11)\right|\ge|z-i|-\left|\alpha^2-7\alpha+11\right|$$

$$[\text{using } |z_1-z_2|\ge|z_1|-|z_2|]$$

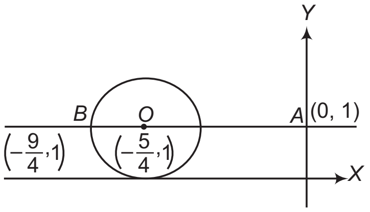
$$\Rightarrow \quad \left|\alpha^2-7\alpha+11\right|+1\ge|z-i|$$

$$[\text{since, } \alpha^2-7\alpha+11\ge-5/4]$$

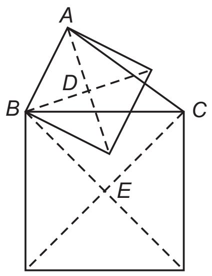
$$\therefore \quad |z-i|\le 1+5/4 \quad \text{or} \quad |z-i|\le 9/4$$



150. $AB=\dfrac{9}{4}$ and $\arg(z)=\pi-\tan^{-1}\dfrac{4}{9}$



151. $z_D=\dfrac{z_B-z_Ai}{1-i}$, $z_E=\dfrac{z_B-z_Ci}{1-i}$



$\therefore$ Angle between AC and DE

$$=\arg\left(\frac{z_C-z_A}{z_E-z_D}\right)-\arg\left(\frac{z_C-z_A}{z_A-z_C}\cdot\frac{1-i}{i}\right)=\frac{\pi}{4}$$

152. $DE=\dfrac{(z_A-z_C)i}{1-i}=\dfrac{\left|1-\omega^2\right|}{\sqrt{2}}=\dfrac{\sqrt{3}}{2}$

153. $z_E=\dfrac{z_B-z_C\,i}{1-i}=\dfrac{\omega-\omega^2 i}{1-i}$

$$=\frac{(\omega+\omega^2)+i(\omega-\omega^2)}{2}=\frac{-1-\sqrt{3}}{2}$$

$$\therefore \quad AE=1+\frac{1+\sqrt{3}}{2}=\frac{3+\sqrt{3}}{2}$$

154. A. $\arg\left(\dfrac{z^2-1}{z^2+1}\right)=0; z\ne\pm i$

$$=\frac{z^2-1}{z^2+1}=\frac{\bar{z}^2-1}{\bar{z}^2+1}$$

$\Rightarrow$ $z-\bar{z}=0$, $z+\bar{z}=0$, $y=0$, $x=0$

Locus of z is portion of pair of lines $xy=0$

$$\left[\because \left(\frac{z^2-1}{z^2+1}\right)>0\right]$$

B. Given,

$$\left|\left|z-\cos^{-1}\cos 12\right|-\left|z-\sin^{-1}\sin 12\right|\right|=8(\pi-3)$$

Since, $\left|\cos^{-1}\cos 12-\sin^{-1}\sin 12\right|=8(\pi-3)$

$\therefore$ Locus of z is portion of a line joining z_1 and z_2 except the segment between z_1 and z_2.

C. $z^2-i|z_1|^2=k_2-k_1$

$$\therefore \quad x^2-y^2+2ixy-i\lambda_1=\lambda_2$$

$$\Rightarrow \quad x^2-y^2=\lambda_2 \quad \text{and} \quad xy=\frac{\lambda_1}{2}$$

$\therefore$ Locus of z is point of intersection of hyperbola.

D. Given, $\left|z-1-\sin^{-1}\dfrac{1}{\sqrt{3}}\right|+\left|z+\cos^{-1}\dfrac{1}{\sqrt{3}}-\dfrac{\pi}{2}\right|=1$

since, $1+\sin^{-1}\dfrac{1}{\sqrt{3}}+\cos^{-1}\dfrac{1}{\sqrt{3}}-\dfrac{\pi}{2}=1$

$\therefore |z-z_1|+|z-z_2|=|z_1+z_2|$

$\Rightarrow$ Locus of z is the segment joining z_1 and z_2.

155. There are no real roots of the equation $z^6-6z+20=0$.

If $x+iy$ is a root, then $x-iy$ is also a root.

Let the roots be $x_1\pm iy_1$, $x_2\pm iy_2$, $x_3\pm iy_3$

Sum of the roots $=2(x_1+x_2+x_3)=0$

$$\Rightarrow \quad x_1+x_2+x_3=0$$

$\Rightarrow$ One of x_1, x_2, x_3 is negative and other two are positive or vice-versa.

$\Rightarrow$ The number of roots in each of the quadrant is either 1 or 2.

156. A. $z^4-1=0 \;\Rightarrow\; z^4=1=\cos 0+i\sin 0$

$$\Rightarrow \quad z=(\cos 0+i\sin 0)^{1/4}$$

$$=\cos 0+i\sin 0$$

B. $z^4+1=0 \;\Rightarrow\; z^4=-1=\cos\pi+i\sin\pi$

$$\Rightarrow \quad z=(\cos\pi+i\sin\pi)^{1/4}$$

$$=\cos\frac{\pi}{4}+i\sin\frac{\pi}{4}$$

C. $iz^4+1=0\Rightarrow z^4=i=\cos\dfrac{\pi}{2}+i\sin\dfrac{\pi}{2}$

$$\Rightarrow \quad z=\left(\cos\frac{\pi}{2}+i\sin\frac{\pi}{2}\right)^{1/4}$$

$$=\cos\frac{\pi}{8}+i\sin\frac{\pi}{8}$$

D. $iz^4 - 1 = 0$

$$\Rightarrow \quad z^4 = -i = \cos\frac{\pi}{2} - i\sin\pi/2$$

$$\Rightarrow \quad z = \left(\cos\frac{\pi}{2} - i\sin\pi/2\right)^{1/4}$$

$$= \cos\frac{\pi}{8} - i\sin\frac{\pi}{8}$$

157. A. Let $z = \sqrt{1-z} \Rightarrow z^2 + z + 1 = 0$

$$\Rightarrow \quad z = \omega, \omega^2$$

B. Here, $z_1 + z_2 + z_3 + \dots + z_6 = 0$ ... (i)

$z_2 = z_1 e^{(i2\pi)/n}$, if $e^{(i2\pi)/n} = \alpha \Rightarrow z_2 = z_1\alpha$

Similarly, $z_3 = z_1\alpha^2$, $z_4 = z_2\alpha^3$, $z_5 = z_2\alpha^4$, $z_6 = z_1\alpha^5$

On squaring and adding and then using Eq. (i), we get

$$z_1^2 + z_2^2 + z_3^2 + z_4^2 + z_5^2 + z_6^2 = 0$$

C. $\dfrac{1 + 2\omega + 3\omega^2 + 4\omega^3 + \dots + n\omega^{n-1}}{n} \geq \left\{n!\,\omega^{\frac{n(n+1)}{2}}\right\}^{1/n}$

[$\because$ AM $\geq$ GM]

Now,

$$E = 1 + 2\omega + 3\omega^2 + 4\omega^3 + \dots + n\omega^{n-1} + \dots$$

$$\omega E = \frac{\omega + 2\omega^2 + 3\omega^3 + \dots + (n-1)\omega^{n-1} + n\omega^n}{(1-\omega)E = 1 + \omega + \omega^2 + \dots + \omega^{n-1} - n\omega^n}$$

$$\Rightarrow \quad E = \frac{0 - n(1)}{1-\omega}$$

$$\therefore \quad E = \frac{n}{\omega - 1}$$

D. Let $x^2 + y^2 = 1$

where, $z_1 - i$, $z_2 = 1$, $z_3 = -1$

$$\therefore \quad z = -i$$

$$\Rightarrow \quad zz_1 + z_2z_3 = 1 - 1 = 0$$

158. Consider,

$$x = \frac{x^3}{x^2} = \frac{2 + 11i}{3 + 4i} \times \frac{3 - 4i}{3 - 4i} = \frac{50 + 25i}{25}$$

$$= 2 + i$$

$$\therefore \quad a + b = 2 + 1 = 3$$

159. Here, $\left|\dfrac{z-4}{z-8}\right| = 1 \Rightarrow \left|\dfrac{x - 4 + iy}{x - 8 + iy}\right| = 1$

$$\Rightarrow \quad (x-4)^2 + y^2 = (x-8)^2 + y^2$$

$$\Rightarrow \quad x = 6$$

With $x = 6$, $\left|\dfrac{z-12}{z-8i}\right| = \dfrac{5}{3}$

$\Rightarrow y^2 - 25y + 136 = 0$

$$\Rightarrow \quad 9(36 + y^2) = 25[36 + (y-8)^2]$$

$$\Rightarrow \quad y = 17, 8$$

Thus, the required numbers are $z = 6 + 17i$, $6 + 8i$.

Hence, the value of Re (z) is 6.

160. $\left|z + \dfrac{1}{z}\right| \geq \left||z| - \dfrac{1}{|-z|}\right| = \left||z| - \dfrac{1}{|z|}\right| = |z| - \dfrac{1}{|z|}$ as $|z| \geq 3$

Let $f(x) = x - \dfrac{1}{x}$ for $x \geq 3$, $f'(x) = 1 + \dfrac{1}{x^2} > 0$

$\Rightarrow f(x)$ is increasing function, so $f(x)_{\min}$ at $x = 3$ is

$$\left|z + \frac{1}{z}\right|_{\min} = \left||z| - \frac{1}{|z|}\right|_{|z|=3} = \frac{8}{3}$$

Hence, λ is equal to 8.

161. Consider

$$z^4 + z^3 + 2z^2 + z + 1 = 0$$

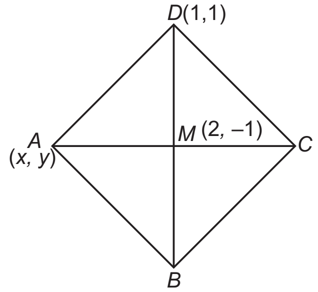
$$\Rightarrow \quad z^4 + z^3 + z^2 + z^2 + z + 1 = 0$$

$$\Rightarrow \quad z^2(z^2 + z + 1) + (z^2 + z + 1) = 0$$

$$\Rightarrow \quad (z^2 + z + 1)(z^2 + 1) = 0$$

$$\therefore \quad z = i, -i, \omega, \omega^2, \text{ for each } |z| = 1$$

162. Let A be (x, y).



It is given that, $BD = 2AC$

$$\Rightarrow \quad MD = 2AM$$

Also, DM is perpendicular to AM.

$$\Rightarrow \quad (1-2)^2 + (1+1)^2 = 4[(x-2)^2 + (y+1)^2] \quad \dots (i)$$

and $\quad \dfrac{y+1}{x-2} \cdot \dfrac{1+1}{1-2} = -1$

$$\Rightarrow \quad 2(y+1) = x - 2$$

With $x - 2 = 2(y+1)$, Eq. (i) can be written as

$$(y+1)^2 = \frac{1}{4}$$

$$\Rightarrow \quad y = -\frac{1}{2}, -\frac{3}{2}$$

$$\Rightarrow \quad x = 3, 1$$

$$\therefore \quad \lambda_1 + \lambda_2 = 4$$

4 Entrances Gallery

1. A. z_k is 10th root of unity $\Rightarrow \bar{z}_k$ will also be 10th root of unity. Take z_j as $\bar{z}_k$.

B. $z_1 \neq 0$, take $z = \dfrac{z_k}{z_1}$, we can always find z.

C. $z^{10} - 1 = (z-1)(z-z_1)\ldots(z-z_9)$

$\Rightarrow$ $(z-z_1)(z-z_2)\ldots(z-sz_9) = 1 + z + z^2 + \ldots + z^9, \forall\ z \in$ complex number

Put $z = 1$

$$(1-z_1)(1-z_2)\ldots(1-z_9) = 10$$

D. $1 + z_1 + z_2 + \ldots + z_9 = 0$

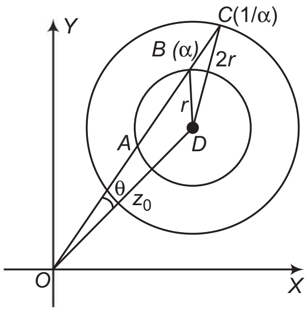
$\Rightarrow$ Re (1) $+$ Re $(z_1) + \ldots +$ Re $(z_9) = 0$

$\Rightarrow$ Re (z_1) + Re (z_2) $|+ \ldots +$ Re $(z_9) = -1$

$$\therefore \quad 1 - \sum_{k=1}^{9} \cos\frac{2k\pi}{10} = 2$$

2. $OB = |\alpha|$

$OC = \dfrac{1}{|\bar{\alpha}|} = \dfrac{1}{|\alpha|}$



In ΔOBD,

$$\cos\theta = \frac{|z_0|^2 + |\alpha|^2 - r^2}{2|z_0||\alpha|}$$

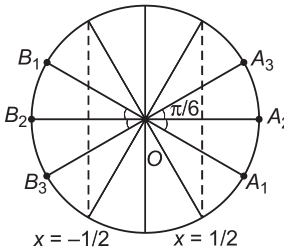
In ΔOCD,

$$\cos\theta = \frac{|z_0|^2 + \frac{1}{|\alpha|^2} - 4r^2}{2|z_0|\frac{1}{|\alpha|}}$$

$$\Rightarrow \quad \frac{|z_0|^2 + |\alpha|^2 - r^2}{2|z_0||\alpha|} = \frac{|z_0|^2 + \frac{1}{|\alpha|^2} - 4r^2}{2|z_0|\frac{1}{|\alpha|}}$$

$$\Rightarrow \quad |\alpha| = \frac{1}{\sqrt{7}}$$

3. $w = \dfrac{\sqrt{3} + i}{2} = e^{\frac{i\pi}{6}}$



So, $\quad w^n = e^{i\left(\frac{n\pi}{6}\right)}$

Now, for z_1, $\quad \cos\dfrac{n\pi}{6} > \dfrac{1}{2}$

and for z_2, $\quad \cos\dfrac{n\pi}{6} < -\dfrac{1}{2}$

Possible position of z_1 are A_1, A_2, A_3, whereas of z_2 are B_1, B_2, B_3 (as shown in the figure).

So, possible value of $\angle z_1Oz_2$ according to the given options is $\dfrac{2\pi}{3}$ or $\dfrac{5\pi}{6}$.

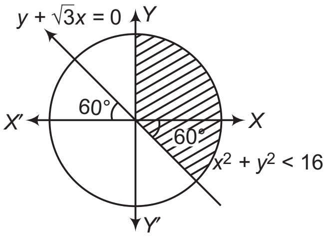
4. Area of

$S = S_1 \cap S_2 \cap S_3$

$= \dfrac{\pi \times 4^2}{4} + \dfrac{4^2 \times \pi}{6}$

$= 4^2\pi\left\{\dfrac{1}{4} + \dfrac{1}{6}\right\}$

$= \dfrac{20\pi}{3}$



5. Distance of (1, -3) from $y + \sqrt{3}x = 0$

$$> \left|\frac{-3 + \sqrt{3} \times 1}{2}\right| > \frac{3 - \sqrt{3}}{2}$$

6. Given, is $z^2 + z + 1 - a = 0$

Clearly, this equation do not have real roots, if

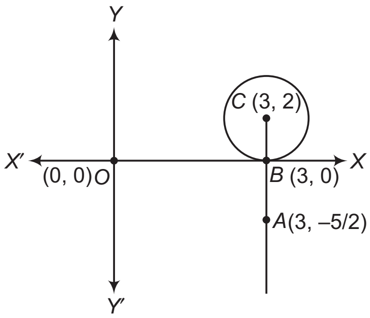
$$D < 0$$

$\Rightarrow \quad 1 - 4(1-a) < 0$

$\Rightarrow \quad 4a < 3$

$\therefore \quad a < \dfrac{3}{4}$

7. Length $AB = \dfrac{5}{2}$



$\therefore \quad$ Minimum value $= 5$

8. The expression may not attain integral value for all a, b, c. If we consider $a = b = c$, then

$$x = 3a$$
$$y = a(1 + \omega + \omega^2) = 0$$
$$z = a(1 + \omega^2 + \omega) = 0$$

$\therefore \ |x|^2 + |y|^2 + |z|^2 = 9|a|^2$

$\therefore \ \dfrac{|x|^2 + |y|^2 + |z|^2}{|a|^2 + |b|^2 + |c|^2} = \dfrac{9}{3} = 3$

As, $|x|^2 + |y|^2 + |z|^2$

$= (a + b + c)(\bar{a} + \bar{b} + \bar{c}) + (a + b\omega + c\omega^2)$

$(\bar{a} + \bar{b}\omega^2 + \bar{c}\omega) + (a + b\omega^2 + c\omega)(\bar{a} + \bar{b}\omega + \bar{c}\omega^2)$

$= 3(|a|^2 + |b|^2 + |c|^2) + a\bar{b}(1 + \omega + \omega^2) + \bar{a}b(1 + \omega + \omega^2)$

$+ b\bar{c}(1 + \omega + \omega^2) + \bar{b}c(1 + \omega + \omega^2) + a\bar{c}(1 + \omega + \omega^2)$

$+ \bar{a}c(1 + \omega + \omega^2)$

$= 3(|a|^2 + |b|^2 + |c|^2)$ $\quad$ [using $1 + \omega + \omega^2 = 0$]

$$\therefore \quad \frac{|x|^2 + |y|^2 + |z|^2}{|a|^2 + |b|^2 + |c|^2} = 3$$

Target Exercises

9. Given, $z = (1-t)z_1 + tz_2$

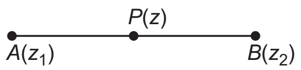
$\Rightarrow \quad \dfrac{z - z_1}{z_2 - z_1} = t$

$\Rightarrow \quad \arg\left(\dfrac{z - z_1}{z_2 - z_1}\right) = 0 \qquad \ldots(\text{i})$

$\Rightarrow \quad \arg(z - z_1) = \arg(z_2 - z_1)$

$\Rightarrow \quad \dfrac{z - z_1}{z_2 - z_1} = \dfrac{\bar{z} - \bar{z}_1}{\bar{z}_2 - \bar{z}_1}$

$\Rightarrow \quad \begin{vmatrix} z - z_1 & \bar{z} - \bar{z}_1 \\ z_2 - z_1 & \bar{z}_2 - \bar{z}_1 \end{vmatrix} = 0$



$AP + PB = AB$

$\Rightarrow \quad |z - z_1| + |z - z_2| = |z_1 - z_2|$

10. A. $\left|\dfrac{z}{|z|} - i\right| = \left|\dfrac{z}{|z|} + i\right|, z \neq 0$

$\dfrac{z}{|z|}$ is unimodular complex number

and lies on perpendicular bisector of i and $-i$

$\Rightarrow \dfrac{z}{|z|} = \pm 1 \Rightarrow z = \pm 1|z| \Rightarrow$ a is real number

$\Rightarrow \text{Im}(z) = 0$

B. $|z + 4| + |z - 4| = 10$

z lies on an ellipse, whose focus are (4, 0) and (– 4, 0) and length of major axis is 10.

$\Rightarrow \quad 2ae = 8$ and $2a = 10$

$\Rightarrow \quad e = 4/5$

$|\text{Re}(z)| \leq 5.$

C. $\therefore |\omega| = 2 \Rightarrow w = 2(\cos\theta + i\sin\theta)$

$x + iy = 2(\cos\theta + i\sin\theta) - \dfrac{1}{2}(\cos\theta - i\sin\theta)$

$= \dfrac{3}{2}\cos\theta + i\,\dfrac{5}{2}\sin\theta$

$\Rightarrow \dfrac{x^2}{(3/2)^2} + \dfrac{y^2}{(5/2)^2} = 1$

$e^2 = 1 - \dfrac{9/4}{25/4}$

$= 1 - \dfrac{9}{25} = \dfrac{16}{25}$

$\Rightarrow \quad e = \dfrac{4}{5}$

D. $|\omega| = 1$

$\Rightarrow \quad x + iy = \cos + i\sin\theta + \cos\theta - i\sin\theta$

$x + iy = 2\cos\theta$

$|\text{Re}(z)| \leq 1, |\text{Im}(z)| = 0$

11. Given, z_2 is not unimodular i.e. $|z_2| \neq 1$

and $\dfrac{z_1 - 2z_2}{2 - z_1\bar{z}_2}$ is unimodular.

$\Rightarrow \quad \left|\dfrac{z_1 - 2z_2}{2 - z_1\bar{z}_2}\right| = 1 \Rightarrow |z_1 - 2z_2|^2 = |2 - z_1\bar{z}_2|^2$

$\Rightarrow \quad (z_1 - 2z_2)(\bar{z}_1 - 2\bar{z}_2) = (2 - z_1\bar{z}_2)(2 - \bar{z}_1 z_2)$

$[\because z\bar{z} = |z|^2]$

$\Rightarrow |z_1|^2 + 4|z_2|^2 - 2\bar{z}_1 z_2 - 2z_1\bar{z}_2$

$= 4 + |z_1|^2|z_2|^2 - 2\bar{z}_1 z_2 - 2z_1\bar{z}_2$

$\Rightarrow \quad (|z_2|^2 - 1)(|z_1|^2 - 4) = 0$

$\because \quad |z_2| \neq 1$

$\therefore \quad |z_1| = 2$

Let $z_1 = x + iy \Rightarrow x^2 + y^2 = (2)^2$

$\therefore$ Point z_1 lies on a circle of radius 2.

12. $\because |z| \geq 2$

$\therefore \quad \left|z + \dfrac{1}{2}\right| \geq \left||z| - \left|\dfrac{1}{2}\right|\right| \geq \left|2 - \dfrac{1}{2}\right| \geq \dfrac{3}{2}$

Hence, minimum distance between z and $\left(-\dfrac{1}{2}, 0\right)$ is $\dfrac{3}{2}$.

13. Given, $|z| = 1$, $\arg z = \theta$

$\therefore \quad z = e^{ie}$

But $\quad \bar{z} = \dfrac{1}{z}$

$\therefore \quad \arg\left(\dfrac{1 + z}{1 + \dfrac{1}{z}}\right) = \arg(z) = \theta$

14. Given, a complex number $\dfrac{z^2}{z - 1}(z \neq 1)$ is purely real.

To find the locus of the complex number z.

Since, $\dfrac{z^2}{z - 1}(z \neq 1)$ is purely real.

$\therefore \quad \dfrac{z^2}{z - 1} = \dfrac{\bar{z}^2}{\bar{z} - 1}$

$\Rightarrow \quad z^2(\bar{z} - 1) = \bar{z}^2(z - 1)$

$\Rightarrow \quad z^2\bar{z} - z^2 = \bar{z}^2 z - \bar{z}^2$

$\Rightarrow \quad zz\bar{z} - z^2 = \overline{zz}z - \bar{z}^2$

$\Rightarrow \quad z|z|^2 - z^2 = \bar{z}|z|^2 - \bar{z}^2$

On rearranging the terms, we get

$z|z|^2 - \bar{z}|z|^2 = \bar{z}^2 - z^2$

$\Rightarrow \quad |z|^2(z - \bar{z}) = (\bar{z} - z)(\bar{z} + z)$

$\Rightarrow |z|^2(z - \bar{z}) - (z - \bar{z})(\bar{z} + z) = 0$

$\Rightarrow \quad (z - \bar{z})(|z|^2 - (\bar{z} + z)) = 0$

Either $(z - \bar{z}) = 0$

or $\quad [|z|^2 - (\bar{z} + z)] = 0$

Now, $z = \bar{z}$

$\Rightarrow$ Locus of z is real axis and

$(|z|^2 - (\bar{z} + z)) = 0 \Rightarrow z\bar{z} - (\bar{z} + z) = 0$

Locus of z is a circle passing through the origin.

Aliter

Put $z = x + iy$, then

$\dfrac{z^2}{z - 1} = \dfrac{(x + iy)^2}{(x + iy) - 1} = \dfrac{(x^2 - y^2) + i(2xy)}{(x - 1) + iy}$

$= \dfrac{(x^2 - y^2) + i(2xy)}{(x - 1) + iy} \times \dfrac{(x - 1) - iy}{(x - 1) - iy}$

Since, $\dfrac{z^2}{z - 1}(z \neq 1)$ is purely real, hence its imaginary part should be equal to zero.

$\Rightarrow \quad (x^2 - y^2)(-y) + (2xy)(x - 1) = 0$

$\Rightarrow \quad y(x^2 - y^2 + 2x - 2x^2) = 0$

$\Rightarrow \quad y(x^2 + y^2 - 2x) = 0$

Either $y = 0$ or $x^2 + y^2 - 2x = 0$

Now, $y = 0$, locus of z is real axis, and
$x^2 + y^2 - 2x = 0$, locus of z is a circle passing through the origin.
Locus of z is either real axis or a circle passing through the origin.

15. Let $z = x + iy$, given $\text{Re}(z) = 1$

$\therefore \quad x = 1 \Rightarrow z = 1 + iy$

Since, complex roots are conjugate of each other.
$\therefore z = 1 + iy$ and $1 - iy$ are two roots of

$$z^2 + \alpha z + \beta = 0$$

Product of roots $= \beta$

$\Rightarrow \quad (1 + iy)(1 - iy) = \beta$

$\therefore \quad \beta = 1 + y^2 \geq 1 \Rightarrow \beta \in (1, \infty)$

16. $\because (1 + \omega)^7 = A + B\omega$, we know $1 + \omega + \omega^2 = 0$

$\therefore \quad 1 + \omega = -\omega^2$

$\Rightarrow \quad (-\omega^2)^7 = A + B\omega$

$\Rightarrow \quad -\omega^{14} = A + B\omega \quad [\because \omega^{14} = \omega^{12} \cdot \omega^2 = \omega^2]$

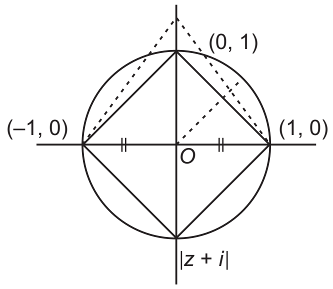
$\Rightarrow \quad -\omega^2 = A + B\omega$

$\Rightarrow \quad 1 + \omega = A + B\omega$

On comparing

$$A = 1, B = 1$$

17. We have, $|z - 1| = |z + 1| = |z - i|$



Clearly, z is the circumcentre of the triangle formed by the vertices (1, 0), (0, 1) and (– 1, 0), which is unique.
Hence, the number of complex number z is one.

18. Since, α and β are roots of the equation $x^2 - x + 1 = 0$.

$\Rightarrow \quad \alpha + \beta = 1, \alpha\beta = 1 \Rightarrow x = \dfrac{1 \pm \sqrt{3}i}{2}$

$\Rightarrow \quad x = \dfrac{1 + \sqrt{3}i}{2}$ or $\dfrac{1 - \sqrt{3}i}{2}$

$\Rightarrow \quad x = -\omega$ or $-\omega^2$

Thus, $\quad \alpha = -\omega^2$, then $\beta = -\omega$

or $\quad \alpha = -\omega$, then $\beta = -\omega^2$ [where, $\omega^3 = 1$]

Hence, $\quad \alpha^{2009} + \beta^{2009} = (-\omega)^{2009} + (-\omega^2)^{2009}$

$= -[(\omega^3)^{669} \cdot \omega^2 + (\omega^3)^{1337} \cdot \omega]$

$= -[\omega^2 + \omega] = -(-1) = 1$

19. $|z| = \left|\left(z - \dfrac{4}{z}\right) + \dfrac{4}{z}\right|$

$\Rightarrow \quad |z| \leq \left|z - \dfrac{4}{z}\right| + \dfrac{4}{|z|}$

$\Rightarrow \quad |z| \leq 2 + \dfrac{4}{|z|}$

$\Rightarrow \quad |z|^2 - 2|z| - 4 \leq 0$

$\Rightarrow \quad |z| \leq \sqrt{5} + 1$

$\therefore$ Maximum value of $|z|$ is $\sqrt{5} + 1$.

For minimum value of $|z|$, we take

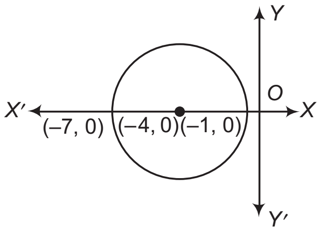
$$\left\|z - \frac{4}{z}\right| - \left|\frac{4}{z}\right\| \leq \left|\left(z - \frac{4}{z}\right) + \frac{4}{z}\right|$$

from which we get $|z| \geq \sqrt{5} - 1$

20. Let $z = \dfrac{1}{i - 1}$

$\therefore \quad \bar{z} = \overline{\left(\dfrac{1}{i - 1}\right)} = \dfrac{1}{-i - 1} = -\dfrac{1}{i + 1}$

21. From the argand diagram, maximum value of $|z + 1|$ is 6.



Aliter
$|z + 1| = |z + 4 - 3|$
$\leq |z + 4| + |-3| \leq 6$
Thus, maximum value of $|z + 1|$ is 6.

22. $\displaystyle\sum_{k=1}^{10} \left(\sin \frac{2k\pi}{11} + i \cos \frac{2k\pi}{11}\right)$

$$= i \sum_{k=1}^{10} \left(\cos \frac{2k\pi}{11} - i \sin \frac{2k\pi}{11}\right)$$

$$= i \sum_{k=1}^{10} \left(e^{\frac{2k\pi}{11}}\right)$$

$$= i \left\{\sum_{k=0}^{10} \left(e^{-\frac{2k\pi}{11}}\right) - 1\right\} = -i$$

23. Given, equation is $z^2 + z + 1 = 0$

$\Rightarrow \quad z = \omega, \omega^2$

Now, $\left(z + \dfrac{1}{z}\right)^2 + \left(z^2 + \dfrac{1}{z^2}\right)^2 + \left(z^3 + \dfrac{1}{z^3}\right)^2$

$+ \left(z^4 + \dfrac{1}{z^4}\right)^2 + \left(z^5 + \dfrac{1}{z^5}\right)^2 + \left(z^6 + \dfrac{1}{z^6}\right)^2$

$= (\omega + \omega^2)^2 + (\omega^2 + \omega)^2 + (\omega^3 + \omega^{-3})^2$
$+ (\omega + \omega^2)^2 + (\omega^2 + \omega)^2 + (\omega^6 + \omega^{-6})^2$

$= (-1)^2 + (-1)^2 + (1 + 1)^2 + (-1)^2 + (-1)^2 + (1 + 1)^2$

$= 1 + 1 + 4 + 1 + 1 + 4 = 12$

24. Given that, $(x - 1)^3 + 8 = 0$

$\Rightarrow \quad (x - 1)^3 = (-2)^3$

$\Rightarrow \quad \left(\dfrac{x - 1}{-2}\right)^3 = 1$

$\Rightarrow \quad \left(\dfrac{x - 1}{-2}\right) = (1)^{1/3}$

Cube roots of $\left(\dfrac{x - 1}{-2}\right)$ are $1, \omega, \omega^2$.

Cube roots of $(x - 1)$ are $-2, -2\omega$ and $-2\omega^2$.

$\therefore$ Cube roots of x are $-1, 1 - 2\omega$ and $1 - 2\omega^2$.

25. Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$

Given, $|z_1 + z_2| = |z_1| + |z_2|$

$\therefore \sqrt{(x_1 + x_2)^2 + (y_1 + y_2)^2}$

$$= \sqrt{x_1^2 + y_1^2} + \sqrt{x_2^2 + y_2^2}$$

On squaring both sides,

$$= x_1^2 + x_2^2 + 2x_1x_2 + y_1^2 + y_2^2 + 2y_1y_2$$
$$= x_1^2 + y_1^2 + x_2^2 + y_2^2 + 2\sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2)}$$
$$\Rightarrow \quad x_1x_2 + y_1y_2 = \sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2)}$$

Again, squaring both sides, we get

$$\Rightarrow \quad = x_1^2x_2^2 + y_1^2y_2^2 + 2x_1x_2y_1y_2$$
$$= x_1^2x_2^2 + y_1^2y_2^2 + x_1^2y_2^2 + y_1^2x_2^2$$
$$\Rightarrow \quad (x_1y_2 - y_1x_2)^2 = 0$$
$$\Rightarrow \quad \frac{y_1}{x_1} = \frac{y_2}{x_2}$$
$$\Rightarrow \quad \tan^{-1}\left(\frac{y_1}{x_1}\right) = \tan^{-1}\left(\frac{y_2}{x_2}\right)$$
$$\Rightarrow \quad \arg(z_1) = \arg(z_2)$$
$$\therefore \quad \arg(z_1) - \arg(z_2) = 0$$

Aliter

Given, $\quad |z_1 + z_2| = |z_1| + |z_2|$

$$= |z_1|^2 + |z_2|^2 + 2\,\text{Re}(z_1\bar{z}_2)$$

[squaring both sides]

$$= |z_1|^2 + |z_2|^2 + 2|z_1||z_2|$$
$$\Rightarrow \quad \text{Re}(z_1\bar{z}_2) = |z_1||z_2|$$
$$\Rightarrow \quad |z_1||z_2|\cos(\theta_1 - \theta_2) = |z_1||z_2|$$
$$\Rightarrow \quad \theta_1 - \theta_2 = 0$$
$$\therefore \quad \arg(z_1) - \arg(z_2) = 0$$

26. Given, $w = \dfrac{z}{z - \dfrac{i}{3}}$ and $|w| = 1$

$$\Rightarrow \quad \left|\frac{z}{z - \dfrac{i}{3}}\right| = 1 \Rightarrow |z| = \left|z - \frac{i}{3}\right|$$

$\Rightarrow z$ lies on perpendicular bisector of (0, 0) and $\left(0, \dfrac{1}{3}\right)$.

Hence, z lies on a straight line.

27. Given, $\bar{z} + i\,\bar{w} = 0$

$$\Rightarrow \quad \bar{z} = -i\bar{w}$$
$$\Rightarrow \quad z = iw$$
$$\Rightarrow \quad w = -iz$$

and $\quad \arg(zw) = \pi$

$$\Rightarrow \quad \arg(-iz^2) = \pi$$
$$\Rightarrow \quad \arg(-i) + 2\arg(z) = \pi$$
$$\Rightarrow \quad -\frac{\pi}{2} + 2\arg(z) = \pi \qquad \left[\because \arg(-i) = -\frac{\pi}{2}\right]$$
$$\therefore \quad \arg(z) = \frac{3\pi}{4}$$

28. Since, $z^{1/3} = p + iq$

$$\therefore \quad z = (p + iq)^3$$
$$= p^3 - iq^3 + 3ip^2q - 3pq^2$$

Given that, $\quad z = x - iy$

$$\therefore \quad x - iy = p^3 - 3pq^2 + i(3p^2q - q^3)$$
$$\Rightarrow \quad x = p^3 - 3pq^2$$

and $\quad -y = 3p^2q - q^3$

$$\Rightarrow \quad \frac{x}{p} = p^2 - 3q^2$$

and $\quad \dfrac{y}{q} = -3p^2 + q^2$

$$\therefore \quad \frac{x}{p} + \frac{y}{q} = -2p^2 - 2q^2$$
$$\Rightarrow \quad \frac{1}{(p^2 + q^2)}\left(\frac{x}{p} + \frac{y}{q}\right) = -2$$

29. Using the relation, if

$$|z_1 + z_2| = |z_1| + |z_2|$$

Then, $\quad \arg(z_1) = \arg(z_2)$

Since, $\quad |z^2 + (-1)| = |z^2| + |-1|$

Then, $\quad \arg(z^2) = \arg(-1)$

$$\Rightarrow \quad 2\arg(z) = \pi \qquad [\because \arg(-1) = \pi]$$
$$\Rightarrow \quad \arg(z) = \frac{\pi}{2}$$

$\Rightarrow z$ lies on Y-axis (imaginary axis).

30. Since, origin, z_1 and z_2 are the vertices of an equilateral triangle, then

$$z_1^2 + z_2^2 = z_1z_2$$
$$\Rightarrow \quad (z_1 + z_2)^2 = 3z_1z_2 \qquad \text{...(i)}$$

Again, z_1, z_2 are the roots of the equation

$$z^2 + az + b = 0$$

Then, $\quad z_1 + z_2 = -a \quad$ and $\quad z_1z_2 = b$

On putting these values in Eq. (i), we get

$$(-a)^2 = 3b \quad \Rightarrow \quad a^2 = 3b$$

31. Let $z = r_1e^{i\theta} \Rightarrow w = r_2e^{i\phi} \Rightarrow \bar{z} = r_1e^{i\theta}$

Given, $\quad |zw| = 1$

$$\Rightarrow \quad |r_1e^{i\theta} \cdot r_2e^{i\phi}| = 1$$
$$\Rightarrow \quad r_1r_2 = 1 \qquad \text{...(i)}$$

and $\quad \arg(z) - \arg(w) = \dfrac{\pi}{2}$

$$\Rightarrow \quad \theta - \phi = \frac{\pi}{2} \qquad \text{...(ii)}$$

Now, $\quad \bar{z}w = r_1e^{-i\theta} \cdot r_2e^{i\phi}$

$$= r_1r_2e^{-i(\theta - \phi)}$$
$$= 1 \cdot e^{i\pi/2} \quad \text{[from Eqs. (i) and (ii)]}$$
$$= \cos\frac{\pi}{2} - i\sin\frac{\pi}{2}$$
$$\therefore \quad \bar{z}w = -i$$

32. Now, $\left(\dfrac{1+i}{1-i}\right)^x = \left[\dfrac{(1+i)(1+i)}{(1-i)(1+i)}\right]^x$

$$= \left[\frac{(1+i)^2}{1-i^2}\right]^x = \left[\frac{1-1+2i}{2}\right]^x$$
$$\Rightarrow \quad \left(\frac{1+i}{1-i}\right)^x = (i)^x = 1 \qquad \text{[given]}$$
$$\Rightarrow \quad (i)^x = (i)^{4n}$$

where, n is any positive integer.

$$\therefore \quad x = 4n$$

33. Now, $(1 + \omega - \omega^2)^7 = (-\omega^2 - \omega^2)^7 \qquad [\because 1 + \omega + \omega^2 = 0]$

$$= (-2\omega^2)^7$$
$$= -2^7 \cdot \omega^{14}$$
$$= -128(\omega^3)^4\omega^2$$
$$= -128\omega^2 \qquad [\because \omega^3 = 1]$$

34. Given, $|\beta| = 1$

$$\therefore \quad \left|\frac{\beta - \alpha}{1 - \bar{\alpha}\beta}\right| = \left|\frac{\beta - \alpha}{\beta\bar{\beta} - \bar{\alpha}\beta}\right| \qquad [\because 1 = \beta\bar{\beta}]$$

$$= \frac{1}{|\beta|}\left|\frac{\beta - \alpha}{\bar{\beta} - \bar{\alpha}}\right| = \frac{1}{(1)} \times 1 = 1 \qquad [\because |\bar{z}| = |z|]$$

35. Given, $z = \dfrac{(\sqrt{3} + i)^3 (3i + 4)^2}{(8 + 6i)^2}$

$$\therefore \quad |z| = \left|\frac{(\sqrt{3} + i^3)(3i + 4)^2}{(8 + 6i)^2}\right|$$

$$= \frac{|(\sqrt{3} + i^3)||(3i + 4)^2|}{|8 + 6i|^2} \qquad \left[\because \left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}\right]$$

$$= \frac{|\sqrt{3} + i^3||3i + 4|^2}{|8 + 6i|^2} \qquad [\because |z^n| = |z|^n]$$

$$= \frac{(\sqrt{3 + 1^3})(\sqrt{9 + 16})^2}{(\sqrt{64 + 36})^2} = \frac{(2)^3 (5)^2}{(10)^2} = \frac{10^2 \cdot 2}{(10)^2} = 2$$

36. Given, $|w| = 1$ and $z = \dfrac{w - 1}{w + 1}$

$\Rightarrow \quad z(w + 1) = w - 1 \Rightarrow w(z - 1) = -1 - z$

$\Rightarrow \quad w = \dfrac{1 + z}{1 - z} \Rightarrow |w| = \left|\dfrac{1 + z}{1 - z}\right|$

$\Rightarrow \quad 1 = \dfrac{|1 + z|}{|1 - z|} \Rightarrow |1 - z| = |1 + z|$

On squaring both sides, we get

$$1^2 + |z|^2 - 2\,\text{Re}\,(z) = 1^2 + |z|^2 - 2\,\text{Re}\,(z)$$

$\Rightarrow \quad 4\,\text{Re}\,(z) = 0$

$\therefore \quad \text{Re}\,(z) = 0$

37. Let $z = x + iy$

$$\therefore \quad |z|^2 + |z - 3|^2 + |z - i|^2$$
$$= |x + iy|^2 + |(x - 3) + iy|^2 + |x + i(y - 1)|^2$$
$$= x^2 + y^2 + (x - 3)^2 + y^2 + x^2 + (y - 1)^2$$
$$= x^2 + y^2 + x^2 - 6x + 9 + y^2 + x^2 + y^2 + 1 - 2y$$
$$= 3x^2 + 3y^2 - 6x - 2y + 10$$
$$= 3(x^2 - 2x + 1) + 3\left(y^2 - \frac{2}{3}y + \frac{1}{9}\right) + 10 - 3 - \frac{1}{3}$$
$$= 3(x - 1)^2 + 3\left(y - \frac{1}{3}\right)^2 + \frac{20}{3}$$

It is minimum, when $x - 1 = 0$ and $y - \dfrac{1}{3} = 0$

$\therefore \quad x = 1$ and $y = \dfrac{1}{3}$

$\therefore \quad z = 1 + \dfrac{1}{3}i$

38. $$\frac{1 + i}{\left(\cos\frac{\pi}{4} - i\sin\frac{\pi}{4}\right)} = \frac{\sqrt{2}\left(\frac{1}{\sqrt{2}} + \frac{i}{\sqrt{2}}\right)}{e^{-i\pi/4}}$$

$$= \frac{\sqrt{2}\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right)}{e^{-i\pi/4}}$$

$$= \sqrt{2}e^{i\pi/4 + i\pi/4} = \sqrt{2}e^{2i\pi/4} = \sqrt{2}e^{i\pi/2}$$

$$= \sqrt{2}\left[\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right]$$

39. Let $z_1 = x + iy$ and $z_2 = p - iq$, where $x, q > 0$

Given, $|z_1| = |z_2|$

$$\Rightarrow \quad x^2 + y^2 = p^2 + q^2 \qquad \text{...(i)}$$

$$\therefore \quad \frac{z_1 + z_2}{z_1 - z_2} = \frac{(x + p) + i(y - q)}{(x - p) + i(y + q)}$$

$$= \frac{-2i(xq + yp)}{(x - p)^2 + (y + q)^2} \qquad \text{...(ii)}$$

If $xq + yp \neq 0$, then it is purely imaginary and if

$$xq + yp = 0 \quad \text{or} \quad \frac{x}{p} = -\frac{y}{q} = \lambda \qquad \text{[say]}$$

$\Rightarrow \quad x = p\lambda,\ y = -q\lambda$

From Eq. (i), we get

$$p^2 + q^2 = \lambda^2(p^2 + q^2)$$

$\Rightarrow \quad \lambda^2 = 1$

$\Rightarrow \quad \lambda = \pm 1$

For $\lambda = -1$ and $z_1 \neq z_2$, but $|z_1| = |z_2|$

In this case, Eq. (ii) is zero.

40. Given, $z = e^{2\pi/3}$

$$\therefore \quad 1 + z + 3z^2 + 2z^3 + 2z^4 + 2z^4 + 3z^5$$
$$= 1 + e^{2\pi/3} + 3(e^{2\pi/3})^2 + 2(e^{2\pi/3})^3 + 2(e^{2\pi/3})^4 + 3(e^{2\pi/3})^5$$
$$= 1 + \left[\cos\left(\frac{2\pi}{3}\right) + i\sin\left(\frac{4\pi}{3}\right)\right] + 3\left[\cos\left(\frac{4\pi}{3}\right) + i\sin\left(\frac{4\pi}{3}\right)\right]$$
$$+ 2[\cos 2\pi + i\sin 2\pi] + 2\left[\cos\frac{8\pi}{3} + i\sin\frac{8\pi}{3}\right] + 3\left[\cos\left(\frac{10\pi}{3}\right) + i\sin\left(\frac{10\pi}{3}\right)\right]$$
$$= 1 + [\cos 120° + i\sin 120°] + 3[\cos 240° + i\sin 240°] + 2[\cos 360° + i\sin 360°]$$
$$+ 2[\cos 480° + i\sin 480°] + 3[\cos 600° + i\sin 600°]$$
$$= 1 + \left[-\frac{1}{2} + \frac{\sqrt{3}}{2}i\right] + 3\left[-\frac{1}{2} - \frac{\sqrt{3}}{2}i\right] + 2[1 + 0] + 2[\cos 120° + i\sin 120°] + 3[\cos 120° - i\sin 120°]$$
$$= 3 - 2 - \sqrt{2} + 2\left[-\frac{1}{2} + \frac{\sqrt{3}}{2}i\right] + 3\left[-\frac{1}{2} - \frac{\sqrt{3}}{2}i\right]$$
$$= 1 - \sqrt{3}i + \left(\frac{-5}{2}\right) - \frac{\sqrt{3}}{2}i = -\frac{3}{2} - \frac{3\sqrt{3}}{2}i$$
$$= -3\left[\frac{1}{2} + \frac{\sqrt{3}}{2}i\right] = -3e^{\pi i/3}$$

41. Given, $(x - 1)^3 = -5$

$$(x - 1) = -5, -5\omega, -5\omega^2$$

$\Rightarrow \quad x = 1 - 5, 1 - 5\omega, 1 - 5\omega^2$

$\Rightarrow \quad x = -4, 1 - 5\omega, 1 - 5\omega^2$

42. Given, $\left|\dfrac{z - 3i}{z + 3i}\right| = 1$

$\Rightarrow \quad |z - 3i| = |z + 3i|$

[if $|z - z_1| = |z - z_2|$, then it is perpendicular bisector of z_1 and z_2]

Hence, perpendicular bisector of (0, 3) and (0, – 3) is X-axis.

43. $(z_3 - z_1) = (z_2 - z_1)(\cos 90^\circ + i \sin 90^\circ)$

$\Rightarrow \quad (z_3 - z_1) = i(z_2 - z_1)$

$\Rightarrow \quad (z_3 - z_1)^2 = -(z_2 - z_1)^2$

$\Rightarrow \quad (z_3 - z_1)^2 + (z_2 - z_1)^2 = 0$

Aliter

Let $z_1 = 0,\ z_2 = 1 - i$ and $z_3 = 1 + i$

Now, $(z_1 - z_2)^2 + (z_1 - z_3)^2 = [0 - (1 - i)]^2 + [0 - (1 + i)]^2$

$= (1 - i)^2 + (1 + i)^2$

$= 1^2 + i^2 - 2i + 1^2 + i^2 + 2i$

$= 1 - 1 + 1 - 1 = 0$

44. We know that,

$|z - z_1| + |z - z_2| = k$ will represent an ellipse, if $|z_1 - z_2| < k$.

Hence, the equation $|z - z_1| + |z - z_2| = 2|z_1 - z_2|$, represents an ellipse.

45. Given, $z_1 \neq \pm 1$

Since, z_2 and z_3 can be obtained by rotating vector representing through $\frac{2\pi}{3}$ and $\frac{4\pi}{3}$, respectively.

$\therefore \quad z_2 = z_1\omega$

and $\quad z_3 = z_1\omega^2$

$\therefore \quad z_1z_2z_3 = z_1 \times z_1\omega \times z_1\omega^2$

$= z_1^3\omega^3 = z_1^3 \qquad [\because \omega^3 = 1]$

46. Since, z_1, z_2 and z_3 are the vertices of an equilateral triangle, therefore

$|z_1 - z_2| = |z_2 - z_3|$

$= |z_3 - z_1| = k \qquad$ [say]

Also, $\quad \alpha = \frac{1}{2}(\sqrt{3} + i)$

$\Rightarrow \quad |\alpha| = \frac{1}{2}\sqrt{3+1} = \frac{1}{2} \times 2 = 1$

Let $\quad A = \alpha z_1 + \beta,\ B = \alpha z_2 + \beta$

and $\quad C = \alpha z_3 + \beta$

Now, $\quad |AB| = |\alpha z_2 + \beta - (\alpha z_1 + \beta)|$

$= |\alpha(z_2 - z_1)|$

$= |\alpha||z_2 - z_1|$

$= |1||z_2 - z_1| = 1|z_2 - z_1|$

$= |z_2 - z_1| = k$

Similarly, $BC = CA = k$

Hence, the points $\alpha z_1 + \beta, \alpha z_2 + \beta$ and $\alpha z_3 + \beta$ are the vertices of an equilateral triangle.

47. Given, equation is

$1 + z + z^3 + z^4 = 0.$

$\Rightarrow \quad (1 + z) + z^3(1 + z) = 0$

$\Rightarrow \quad (1 + z)(1 + z^3) = 1$

$\Rightarrow z = -1,\ z^3 = -1 \Rightarrow z = -1$

$\therefore \quad z = -1, -\omega, -\omega^2$

Hence, roots are in cubic roots of unity.

Hence, these roots are the vertices of an equilateral triangle.

48. Given, $z_1 = 2\sqrt{2}(1 + i)$

and $\ z_2 = 1 + i\sqrt{3}$

$\therefore \ z_1^2z_2^3 = [2\sqrt{2}(1 + i)]^2[1 + i\sqrt{3}]^3$

$= 8(1^2 + i^2 + 2i)[1^3 + (i\sqrt{3})^3] + 3\cdot 1\cdot i\sqrt{3}(1 + i\sqrt{3})$

$= 8(1 - 1 + 2i)[1 - 3\sqrt{3}\,i + 3\sqrt{3}\,i(1 + i\sqrt{3})]$

$= 8(2i)[1 - 9]$

$= 16i(-8) = -128i$

49. $1 + i^3 + 3i(1 + i) + 1 - i^3 - 3i(1 - i)$

$= 2 + 3i + 3i^2 - 3i + 3i^2$

$= 2 + 6i^2$

$= 2 - 6 = -4$

50. $z = \dfrac{i(\sqrt{3} + i)^4}{4(1 - \sqrt{3}\,i)^2} = \dfrac{i}{4} \cdot \dfrac{(2 + 2\sqrt{3}\,i)^2}{-2 - 2\sqrt{3}\,i} = \dfrac{i(-2 + 2\sqrt{3}\,i)}{2(-1 - 1\sqrt{3}\,i)}$

$= \dfrac{i(-2 + \sqrt{3}\,i)}{(-1 - \sqrt{3}\,i)} \times \dfrac{(-1 + i\sqrt{3})}{(-1 + i\sqrt{3})}$

$= \dfrac{i(-2 - 2i\sqrt{3})}{4} = \left(\dfrac{\sqrt{3}}{2} - i\dfrac{1}{2}\right)$

$\therefore \quad$ Amplitude $= -\dfrac{\pi}{6}$

51. $\because |z_1| = |z_2| = |z_3| = 1$

$\Rightarrow \quad |z_1|^2 = |z_2|^2 = |z_3|^2 = 1$

$\therefore \quad z_1\bar{z}_1 = z_2\bar{z}_2 = z_3\bar{z}_3 = 1$

$\Rightarrow \quad z_1 = \dfrac{1}{z_1},\ z_2 = \dfrac{1}{z_2}$

and $\quad z_3 = \dfrac{1}{z_3}$

$\therefore \quad |z_1 + z_2 + z_3| = \left|\dfrac{1}{z_1} + \dfrac{1}{z_2} + \dfrac{1}{z_3}\right|$

$= \overline{1} = 1$

52. Given, $(\sqrt{3}\,i + 1)^{100} = 2^{99}(a + ib)$

$\therefore \quad 2^{100}\left(\dfrac{\sqrt{3}}{2}i + \dfrac{1}{2}\right)^{100} = 2^{99}(a + ib) \qquad \left[\because \omega^2 = \dfrac{-1 - \sqrt{3}\,i}{2}\right]$

$\Rightarrow \quad 2(-\omega^2)^{100} = a + ib$

$\Rightarrow \quad 2 \times \omega^{200} = a + ib$

$\Rightarrow \quad 2 \times (\omega^3)^{66} \times \omega^2 = a + ib$

$\Rightarrow 2 \times (1)^{66} \times \left(\dfrac{-1 - \sqrt{3}\,i}{2}\right) = a + ib$

$\Rightarrow \quad -1 - \sqrt{3}i = a + ib$

$\therefore \quad a^2 + b^2 = 4$

53. $(1 + \sqrt{3}\,i)^4 + (1 - \sqrt{3}\,i)^4 = (-2\omega^2)^4 + (-2\omega)^4$

$\left[\because \omega = \dfrac{-1 + \sqrt{3i}}{2} \text{ and } \omega^2 = \dfrac{-1 - \sqrt{3i}}{2}\right]$

$= 16\omega^8 + 16\omega^4$

$= 16(\omega^3)^2\,\omega^2 + 16(\omega^3)\omega$

$= 16(\omega^2 + \omega) = 16(-1) = -16 \qquad [\because 1 + \omega + \omega^2 = 0]$

54. $\because 1^{1/4} = (\cos\theta + i\sin\theta)^{1/4}$

$= (\cos 2\pi r + i\sin 2\pi r)^{1/4}$

$= \cos\dfrac{\pi r}{2} + i\sin\dfrac{\pi r}{2}$

where, $\quad r = 0, 1, 2, 3$

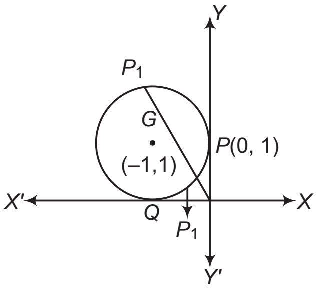
$\therefore \quad 1^{1/4} = 1, i, -1, -i$

$\therefore$ Required value $= 1^2 + i^2 + (-1)^2 + (-i)^2$

$= 1 - 1 + 1 - 1$

$= 0$

55. From figure, it is clear that argument $\geq 90°$.



The given equation $|z-(-1+i)\leq 1|$ represents the points inside and on the boundary of the circle, centred at $(-1, 1)$ and whose radius is 1. It lies in 2nd quadrant. The point $(0, 1)$, i.e. i lies on it such that, it has least argument.

$\therefore$ The required complex number is i.

56. $(|z_1|-|z_2|)^2=|z_1-z_2|^2$

$$\Rightarrow |z_1|^2+|z_2|^2-2|z_1||z_2|=|z_1|^2+|z_2|^2-2|z_1||z_2|\cos(\theta_1-\theta_2)$$

$\Rightarrow \quad \cos(\theta_1-\theta_2)=1$

$\Rightarrow \quad \theta_1=2n\pi+\theta_2$

Thus, if $\quad z_1=r_1(\cos\theta_1+i\sin\theta_1)$

and $\quad z_2=r_2(\cos\theta_1+i\sin\theta_2)$

$\Rightarrow \quad z_1=r_1(\cos\theta_2+i\sin\theta_2)$

and $\quad z_2=r_2(\cos\theta_2+i\sin\theta_2)$

$\Rightarrow \quad \dfrac{z_1}{z_2}=\dfrac{r_1}{r_2}$

$\Rightarrow \quad \operatorname{Im}\left(\dfrac{z_1}{z_2}\right)=0$

57. Gievn, $\overline{(x+iy)(1-2i)}=1+i$

$\Rightarrow \quad \overline{(x+iy)}\,\overline{(1-2i)}=1+i$

$\Rightarrow \quad (x-iy)(1+2i)=1+i \quad$ ...(i)

$\Rightarrow \quad x-iy=\dfrac{1+i}{1+2i}$

$\Rightarrow \quad \overline{x-iy}=\left(\dfrac{\overline{1+i}}{\overline{i+2i}}\right)=\dfrac{1-i}{1-2i} \quad$ ...(ii)

$\Rightarrow \quad x+iy=\dfrac{1-i}{1-2i}$

58. We have, $\left(\dfrac{3}{2}+i\dfrac{\sqrt{3}}{2}\right)^{50}=3^{25}(x+iy)$

$\Rightarrow \quad (\sqrt{3})^{50}\left(\dfrac{\sqrt{3}}{2}+i\dfrac{1}{2}\right)^{50}=3^{25}(x+iy)$

$\Rightarrow \quad 3^{25}\left(\cos\dfrac{\pi}{6}+i\sin\dfrac{\pi}{6}\right)^{50}=3^{25}(x+iy)$

$\Rightarrow \quad \cos 50\dfrac{\pi}{6}+i\sin 50\dfrac{\pi}{6}=x+iy$

$\Rightarrow \quad \cos 25\dfrac{\pi}{3}+i\sin 25\dfrac{\pi}{3}=x+iy$

$\Rightarrow \quad \cos\dfrac{\pi}{3}+i\sin\dfrac{\pi}{3}=x+iy$

$\Rightarrow \quad =\dfrac{1}{2}+i\dfrac{\sqrt{3}}{2}=x+iy$

$\therefore \quad (x, y)=\left(\dfrac{1}{2}, \dfrac{\sqrt{3}}{2}\right)$

59. Locus of z is a circle passing through origin.

60. Given, $2x=3+5i$

$\Rightarrow \quad 8x^3=27-125i+27+5i-25\times 9$

$\Rightarrow \quad 2x^3=\dfrac{-198+10i}{4} \quad$ ...(i)

Also, $\quad 4x^2=9-25+30i$

$\Rightarrow \quad 2x^2=\dfrac{-16+30i}{2}=-8+15i \quad$ ...(ii)

$\therefore \quad 2x^3+2x^2-7x+72$

$=\dfrac{-198+10i}{4}+(-8+15i)-x+172$ [form Eqs. (i) and (ii)]

$=\dfrac{58+70i-28x}{4}$

$=\dfrac{58+70i-14(3+5i)}{4}$

$=\dfrac{16}{4}=4$

61. We have, $|z_1+z_2|^2=|z_1|^2+|z_2|^2$

$\Rightarrow |z_1|^2+|z_2|^2+2\operatorname{Re}(z_1\bar{z}_2)=|z_1|^2+|z_2|^2$

$\Rightarrow \quad \operatorname{Re}(z_1\bar{z}_2)=0$

$\Rightarrow \quad z_1\bar{z}_2+z_2\bar{z}_1=0$

$\Rightarrow \quad \dfrac{z_1}{z_2}=-\dfrac{\bar{z}_1}{\bar{z}_2}$

$=-\overline{\left(\dfrac{z_1}{z_2}\right)}$

$\Rightarrow \dfrac{z_1}{z_2}$ is purely imaginary.

62. Let $z=\dfrac{1+i\sqrt{3}}{\left(\dfrac{i+2}{i+1}\right)^2}=\dfrac{(1+i\sqrt{3})(2i)}{3+4i}$

$=\dfrac{(1+i\sqrt{3})(2i)(3-4i)}{25}$

$\Rightarrow \quad |z|=\dfrac{|1+i\sqrt{3}||2i||3-4i|}{|25|}$

$=\dfrac{2\times 2\times 5}{25}=\dfrac{4}{5}$

63. We have,

$|z_1+z_2|^2=(|z_1|^2+|z_2|^2+2|z_1||z_2|)$

$\Rightarrow \quad =|z_1|^2+|z_2|^2+2|z_1||z_2|\cos(\theta_1-\theta_2)$

$=|z_1|^2+|z_2|^2+2|z_1||z_2|$

$\Rightarrow \quad \cos(\theta_1-\theta_2)=1$

$\Rightarrow \quad \theta_1=\theta_2$

$\Rightarrow \quad \arg(z_1)=\arg(z_2)$

$\therefore \quad \arg\left(\dfrac{z_1}{z_2}\right)=0$

64. Given,

$S=1+2\omega+3\omega^2+\ldots+3n\omega^{3n-1}$

$\therefore \quad S\omega=\omega+2\omega^2+2\omega^2+\ldots+(3n-1)\omega^{3n-1}+3n\omega^{2n}$

$\Rightarrow S(1-\omega)=1+\omega+\omega^2+\ldots+\omega^{3n-1}-3n\omega^{3n}=0-3n$

$\Rightarrow \quad S=-\dfrac{3n}{1-\omega}=\dfrac{3n}{\omega-1}$

65. Let $z = \left[\dfrac{2\cos^2\left(\frac{\theta}{4}\right) - i2\sin\left(\frac{\theta}{4}\right)\cos\left(\frac{\theta}{4}\right)}{2\cos^2\left(\frac{\theta}{4}\right) + 2i\sin\left(\frac{\theta}{4}\right)\cos\left(\frac{\theta}{4}\right)}\right]^{4n}$

$$= \left[\frac{\cos\left(\frac{\theta}{4}\right) - i\sin\left(\frac{\theta}{4}\right)}{\cos\left(\frac{\theta}{4}\right) + i\sin\left(\frac{\theta}{4}\right)}\right]^{4n}$$

$$= \frac{\cos n\theta - i\sin n\theta}{\cos n\theta + i\sin n\theta} = \frac{(\cos\theta + i\sin\theta)^{-n}}{(\cos\theta + i\sin\theta)^{n}}$$

$$= (\cos\theta + i\sin\theta)^{-2n} = \cos 2n\theta - i\sin 2n\theta$$

66. Given, $x = \dfrac{-3 + i\sqrt{3}}{2}$

$\Rightarrow \quad x = \dfrac{-1 + i\sqrt{3}}{2} - 1 = \omega - 1$

$\therefore \quad (x^2 + 3x)^2(x^2 + 3x + 1)$

$= [(\omega - 1)^2 + 3(\omega - 1)]^2[(\omega - 1)^2 + 3(\omega - 1) + 1]$

$= (\omega^2 + \omega - 2)^2(\omega^2 + \omega - 1)$

$= (-1 - 2)^2(-1 - 1) = -18 \qquad [\because 1 + \omega + \omega^2 = 0]$

67. Given, $(x + iy)^{1/3} = 2 + 3i$

$\Rightarrow \quad x + iy = (2 + 3i)^3$

$= 8 + 36i + 54i^2 + 27i^3$

$= -46 + 9i$

On equating real and imaginary parts from both sides, we get

$$x = -46, \ y = 9$$

$\therefore \quad 3x + 2y = -138 + 18 = -120$

68. Let $z = x + iy$

$\therefore \quad |z + 3 - i| = |(x + 3) + i(y - 1)| = 1$

$\Rightarrow \quad \sqrt{(x + 3)^2 + (y - 1)^2} = 1 \qquad \text{...(i)}$

$\because \quad \arg z = \pi \quad \Rightarrow \quad \tan^{-1}\dfrac{y}{x} = \pi$

$\Rightarrow \quad \dfrac{y}{x} = \tan\pi = 0 \Rightarrow y = 0 \qquad \text{...(ii)}$

From Eqs. (i) and (ii), we get

$$x = -3, \ y = 0$$

$\therefore \quad z = -3$

$\Rightarrow \quad |z| = |-3| = 3$

69. Given, $|z_1| = |z_2| = \ldots = |z_n| = 1$

$\Rightarrow \quad |z_1|^2 = |z_2|^2 = \ldots |z_n|^2 = 1$

$\Rightarrow \quad z_1\bar{z}_1 = z_2\bar{z}_2 = \ldots = z_n\bar{z}_n = 1$

$\Rightarrow \quad \bar{z}_1 = \dfrac{1}{z_1}, \bar{z}_2 = \dfrac{1}{z_2}, \ldots, \bar{z}_n = \dfrac{1}{z_n} \qquad \text{...(i)}$

Now, $= |z_1 + z_2 + \ldots + z_n|$

$= |\overline{z_1 + z_2 + \ldots + z_n}| = |\bar{z}_1 + \bar{z}_2 + \ldots + \bar{z}_n|$

$= \left|\dfrac{1}{z_1} + \dfrac{1}{z_2} + \ldots + \dfrac{1}{z_n}\right| \qquad$ [from Eq. (i)]

70. $\because |z_1| = \sqrt{2}$ and $|z_2| = \sqrt{3}$

$\therefore \quad |z_1z_2| = |z_1||z_2| = \sqrt{6}$

71. $\dfrac{z}{\bar{z}} + \dfrac{\bar{z}}{z} = \dfrac{re^{i\theta}}{re^{-i\theta}} + \dfrac{re^{-i\theta}}{re^{i\theta}} = e^{i2\theta} + e^{-i2\theta} = 2\cos 2\theta$

72. $z = \dfrac{4(1 + i)}{2} = 2(1 + i) = \dfrac{4}{1 + i}$

$\therefore \quad \bar{z} = \dfrac{4}{1 - i}$

73. If $\arg(z) = -\pi + \theta$

$\Rightarrow \quad \arg(\bar{z}) = \pi - \theta$

$\arg(-\bar{z}) = -\theta$

$\therefore \quad \arg(\bar{z}) - \arg(-\bar{z}) = \pi - \theta - (-\theta)$

$= \pi - \theta + \theta = \pi$

74. $\dfrac{\cos 30° + i\sin 30°}{\cos 60° - i\sin 60°}$

$= (\cos 30° + i\sin 30°)(\cos 60° + i\sin 60°)$

$= \cos 90° + i\sin 90° = i$

5

Inequalities and Quadratic Equation

Inequality

An equation having signs >, <, ≥ or ≤ at the place of sign of equality (=) is known as inequality or inequation.

or

Let a and b be two real numbers. If $a - b$ is negative, we say that a is less than b $(a < b)$ and if $a - b$ is positive, then a is greater than b $(a > b)$.

Properties of Inequalities

We shall learn about some elementary properties of inequalities which will be used in the subsequent discussion.

i. If $a > b$ and $b > c$, then $a > c$. Generally, if $a_1 > a_2, a_2 > a_3, \ldots, a_{n-1} > a_n$, then $a_1 > a_n$

ii. If $a > b$, then $a \pm c > b \pm c, \forall c \in R$

iii. If $a > b$, then for $m > 0$, $am > bm, \frac{a}{m} > \frac{b}{m}$ and for $m < 0$, $bm > am, \frac{b}{m} > \frac{a}{m}$

iv. If $a > b > 0$, then

(a) $a^2 > b^2$ (b) $|a| > |b|$ (c) $\frac{1}{a} < \frac{1}{b}$

and if $a < b < 0$, then

(a) $a^2 > b^2$ (b) $|a| > |b|$ (c) $\frac{1}{a} > \frac{1}{b}$

v. If $a < 0 < b$, then

(a) $a^2 > b^2$, if $|a| > |b|$ (b) $a^2 < b^2$, if $|a| < |b|$

vi. If $a < x < b$ and a, b are positive real numbers, then

$$a^2 < x^2 < b^2$$

vii. If $a < x < b$ and a is negative number and b is positive number, then

(a) $0 \le x^2 < b^2$, if $|b| > |a|$ (b) $0 \le x^2 \le a^2$, if $|a| > |b|$

viii. If $x \in [a, b] \Rightarrow \begin{cases} \frac{1}{x} \in \left[\frac{1}{b}, \frac{1}{a}\right], \\ \text{if } a \text{ and } b \text{ have same sign} \\ \frac{1}{x} \in \left(-\infty, \frac{1}{a}\right] \cup \left[\frac{1}{b}, \infty\right), \\ \text{if } a \text{ and } b \text{ have opposite signs} \end{cases}$

ix. If $\frac{a}{b} > 0$, then
(a) $a > 0$, if $b > 0$ (b) $a < 0$, if $b < 0$

x. If $a_i > b_i > 0$, where $i = 1, 2, 3, \ldots, n$, then $a_1 a_2 a_3 \ldots a_n > b_1 b_2 b_3 \ldots b_n$

xi. If $a_i > b_i$, where $i = 1, 2, 3, \ldots, n$, then $a_1 + a_2 + a_3 + \ldots + a_n > b_1 + b_2 + \ldots + b_n$

xii. If $0 < a < 1$ and n is a positive rational number, then
(a) $0 < a^n < 1$ (b) $a^{-n} > 1$

xiii. If a and b are positive real numbers such that $a < b$ and if n is any positive rational number, then
(a) $a^n < b^n$ (b) $a^{-n} > b^{-n}$
(c) $a^{1/n} < b^{1/n}$

xiv. If $a > 1$ and n is any positive rational number, then
(a) $a^n > 1$ (b) $0 < a^{-n} < 1$

xv. If $0 < a < 1$ and m, n are positive rational numbers, then
(a) $m > n \Rightarrow a^m < a^n$
(b) $m < n \Rightarrow a^m > a^n$

xvi. If $a > 1$ and m, n are positive rational numbers, then
(a) $m > n \Rightarrow a^m > a^n$
(b) $m < n \Rightarrow a^m < a^n$

Example 1. *If a, b and c are positive real numbers such that a < b < c, then show that*

$$\frac{a^2}{c} < \frac{a^2 + b^2 + c^2}{a + b + c} < \frac{c^2}{a}.$$

Sol. We have, $c > b > a > 0$

$\Rightarrow c^2 > b^2 > a^2 > 0$

Now, $a < b < c$

$\Rightarrow 3a < a + b + c < 3c$

$\Rightarrow \frac{1}{3c} < \frac{1}{a+b+c} < \frac{1}{3a}$ …(i)

and $a^2 < b^2 < c^2$

$\Rightarrow 3a^2 < a^2 + b^2 + c^2 < 3c^2$ …(ii)

From Eqs. (i) and (ii), we get

$$\frac{3a^2}{3c} < \frac{a^2 + b^2 + c^2}{a + b + c} < \frac{3c^2}{3a}$$

$$\Rightarrow \frac{a^2}{c} < \frac{a^2 + b^2 + c^2}{a + b + c} < \frac{c^2}{a}$$

Example 2. *The value of x for which $12x - 6 < 0$, $12 - 3x < 0$, is*
(a) ϕ *(b)* R
(c) $R - \{0\}$ *(d) None of these*

Sol. (a) $12x - 6 < 0$

$\Rightarrow 12x < 6 \Rightarrow x < \frac{1}{2}$

and $12 - 3x < 0$ …(i)

$\Rightarrow 12 < 3x$

$\Rightarrow 4 < x$

$\Rightarrow x > 4$ …(ii)

So, there is no real number x satisfying both the inequalities (i) and (ii).
Hence, the given system of inequalities has no solution.

Example 3. *The value of x for which* $\frac{x-3}{4} - x < \frac{x-1}{2} - \frac{x-2}{3}$, $2 - x > 2x - 8$
(a) $\left[-1, \frac{10}{3}\right]$ *(b)* $\left(-1, \frac{10}{3}\right)$
(c) R *(d) None of these*

Sol. (b) We have, $\frac{x-3}{4} - x < \frac{x-1}{2} - \frac{x-2}{3}$

$\Rightarrow 3x - 9 - 12x < 6x - 6 - 4x + 8$

$\Rightarrow -11x < 11 \Rightarrow -x < 1$

$\Rightarrow x > -1$ …(i)

and $2 - x > 2x - 8$

$\Rightarrow -3x > -10$

$\Rightarrow x < \frac{10}{3}$ …(ii)

From Eqs. (i) and (ii), the solution of the given system of inequalities is given by $x \in \left(-1, \frac{10}{3}\right)$.

Generalised Method of Intervals for Solving Inequalities by Wavy Curve Method
(Line Rule)

Let $F(x) = (x - a_1)^{k_1} (x - a_2)^{k_2} \ldots (x - a_{n-1})^{k_{n-1}} (x - a_n)^{k_n}$

where, $k_1, k_2, \ldots, k_n \in Z$ and $a_1, a_2, \ldots, a_n$ are fixed real numbers satisfying the condition

$$a_1 < a_2 < a_3 < \ldots < a_{n-1} < a_n$$

For solving $F(x) > 0$ or $F(x) < 0$, consider the following algorithm:

- We mark the numbers $a_1, a_2, \ldots, a_n$ on the number axis and put the plus sign in the interval on the right of the largest of these numbers, i.e. on the right of a_n.
- Then, we put the plus sign in the interval on the left of a_n, if k_n is an even number and the minus sign, if k_n is an odd number. In the next interval, we put a sign according to the following rule:
- When passing through the point a_{n-1} the polynomial $F(x)$ changes sign, if k_{n-1} is an odd number.Then, we consider the next interval and put a sign in it using the same rule.
- Thus, we consider all the intervals. The solution of the inequality $F(x) > 0$ is the union of all intervals in which we have put the plus sign and the solution of the inequality $F(x) < 0$ is the union of all intervals in which we have put the minus sign.

Solution of Rational Algebraic Inequation

If $P(x)$ and $Q(x)$ are polynomial in x, then the inequation

$$\frac{P(x)}{Q(x)} > 0, \frac{P(x)}{Q(x)} < 0, \frac{P(x)}{Q(x)} \geq 0$$

and $$\frac{P(x)}{Q(x)} \leq 0$$

are known as rational algebraic inequations.

To solve these inequations, we use the sign method as explained in the following algorithm :

Algorithm

***Step* I** Obtain $P(x)$ and $Q(x)$.

***Step* II** Factorise $P(x)$ and $Q(x)$ into linear factors.

***Step* III** Make the coefficient of x positive in all factors.

***Step* IV** Obtain critical points by equating all factors to zero.

***Step* V** Plot the critical points on the number line. If there are n critical points, then they divide the number line into $(n+1)$ regions.

***Step* VI** In the right most region the expression $\frac{P(x)}{Q(x)}$ bears positive sign and in other regions the expression bears positive and negative signs depending on the exponents of the factors.

Example 4. *Solve* $(x-1)(x-2)(1-2x) > 0$.

Sol. We have, $(x-1)(x-2)(1-2x) > 0$

$\Rightarrow \quad -(x-1)(x-2)(2x-1) > 0$

$\Rightarrow \quad (x-1)(x-2)(2x-1) < 0$

On number line mark $x = \frac{1}{2}, 1, 2$

When $x > 2$, all factors $(x-1)$, $(2x-1)$ and $(x-2)$ are positive.

Hence, $(x-1)(x-2)(2x-1) > 0$ for $x > 2$.

Now, put positive and negative sign alternatively as shown in figure.

Hence, solution set of $(x-1)(x-2)(1-2x) > 0$ or $(x-1)(x-2)(2x-1) < 0$ is $\left(-\infty, \frac{1}{2}\right) \cup (1, 2)$.

Example 5. *Solve* $\frac{2x-3}{3x-5} \geq 3$.

Sol. $\frac{2x-3}{3x-5} \geq 3$

$$\Rightarrow \quad \frac{2x-3}{3x-5} - 3 \geq 0$$

$$\Rightarrow \quad \frac{2x-3-9x+15}{3x-5} \geq 0$$

$$\Rightarrow \quad \frac{-7x+12}{3x-5} \geq 0$$

$$\Rightarrow \quad \frac{7x-12}{3x-5} \leq 0$$

$$\Rightarrow \quad (7x-12)(3x-5) \leq 0$$

Sign scheme of $(7x-12)(3x-5)$ is as follows :

$$\Rightarrow \quad x \in \left(\frac{5}{3}, \frac{12}{7}\right]$$

$x = \frac{5}{3}$ is not included in the solutions as at $x = \frac{5}{3}$ denominator becomes zero.

Example 6. *The value of x for which* $(x-2)^3(x-3) < 0$, *is*

(a) (2, 3) *(b)* [2, 3) *(c)* (0, 3) *(d)* (2, 3]

Sol. (a) $(x-2)^3(x-3) < 0$

$\Rightarrow \quad (x-2)(x-3) < 0$

[as $(x-2)^2$ is positive for all real values of $x \neq 2$]

Here, interval is open as $x = 2, 3$ do not satisfy inequality.

i.e. $\quad 2 < x < 3 \quad$ or $\quad x \in (2, 3)$

Work Book Exercise 5.1

1 The value of x satisfying the inequalities $x + \frac{1}{x} \geq 2$ hold

$(0, \infty)$ $\quad R \quad \phi \quad [0, \infty)$

2 $\frac{x^2}{x-1} \geq 0$

$(1, \infty)$ $\quad [1, \infty)$

$\{0\} \cup (1, \infty)$ $\quad$ None of these

3 $(x-2)^4(x-3)^3(x-4)^2(1-x) \leq 0$

$(1, 3)$

$(-\infty, 1) \cup (3, \infty)$

$(-\infty, 1] \cup [3, \infty)$

None of the above

4 If $c < d$, $x^2 + (c+d)x + cd < 0$

$(-d, -c]$

$(-d, -c)$

R

ϕ

5 $\frac{(2x-1)(x-1)^4(x-2)^4}{(x-2)(x-4)^4} \leq 0$

$\left[\frac{1}{2}, 2\right)$

R

ϕ

$\left(\frac{1}{2}, 2\right)$

Absolute Value of a Real Number

The absolute value of a real number 'x' is denoted by $|x|$ and defined by $|x| = \begin{cases} x, & \text{if } x \geq 0 \\ -x, & \text{if } x < 0 \end{cases}$

- (i) $|x|$ is also defined as $\sqrt{x^2}$

  (ii) If x is positive, then $\sqrt{x^2} = x$

  (iii) If x is negative, then $\sqrt{x^2} = -x$

  e.g. $\sqrt{9} = \sqrt{(-3)^2}$

  $= \sqrt{3^2} = 3$

  or $\sqrt{9} = \pm 3$

- (i) $a \leq |a|$

  (ii) $|ab| = |a||b|$

  (iii) $\left|\frac{a}{b}\right| = \frac{|a|}{|b|}$

  (iv) $|a+b| \leq |a| + |b|$ [triangle inequality]

  (v) $|a-b| \geq ||a| - |b||$ [triangle inequality]

  (vi) $|a+b| = |a| + |b|$, iff $ab \geq 0$

  (vii) $|a+b| = ||a| - |b||$, iff $ab \leq 0$

Inequations Containing Absolute Values

By definition,

$$|x| < a \Rightarrow -a < x < a \ (a > 0)$$
$$|x| \leq a \Rightarrow -a \leq x \leq a$$
$$|x| > a \Rightarrow x < -a \text{ and } x > a$$
$$|x| \geq a \Rightarrow x \leq -a \text{ and } x \geq a$$
$$a \leq |x| \leq b \Rightarrow x \in [-b, -a] \cup [a, b]$$

where, $a, b > 0$

Forms of the Inequations Containing Absolute Values

Form 1 The inequation of the form $f(|x|) < g(x)$ is equivalent to the collection of systems

$$\begin{cases} f(x) < g(x), & \text{if } x \geq 0 \\ f(-x) < g(x), & \text{if } x < 0 \end{cases}$$

Form 2 The inequation of the form $|f(x)| < g(x)$, is equivalent to the systems

$$\begin{cases} f(x) < g(x), & \text{if } g(x) > 0 \\ -f(x) < g(x), & \text{if } g(x) > 0 \end{cases}$$

Form 3 The inequation of the form $|f(x)| > g(x)$, is equivalent to the systems

$$\begin{cases} f(x) > g(x), & \text{if } g(x) < 0 \\ -f(x) > g(x), & \text{if } g(x) < 0 \end{cases}$$

Form 4 The inequation of the form $|f(|x|)| \geq g(x)$ is equivalent to the collection of systems

$$\begin{cases} |f(x)| \geq g(x), & \text{if } x \geq 0 \\ |f(-x)| \geq g(x), & \text{if } x < 0 \end{cases}$$

Form 5 The inequation of the form $|f(x)| \geq |g(x)|$ is equivalent to the collection of system

$$f^2(x) \geq g^2(x)$$

Form 6 The inequation of the form

$$h(x, |f(x)|) \geq g(x)$$

is equivalent to the collection of systems

$$\begin{cases} h\{x, f(x)\} \geq g(x), & \text{if } f(x) \geq 0 \\ h\{x, -f(x)\} \geq g(x), & \text{if } f(x) < 0 \end{cases}$$

Example 7. *The solution set of* $|3-4x| \geq 9$ *is*

(a) $\left(-\infty, \frac{3}{2}\right] \cup [3, \infty)$

(b) $\left(-\infty, -\frac{3}{2}\right] \cup [3, \infty)$

(c) $(-\infty, 2) \cup [2, \infty)$

(d) None of the above

Sol. (b) We have,

$$|3-4x| \geq 9$$

$\Rightarrow \quad 3-4x \leq -9 \quad$ or $\quad 3-4x \geq 9$

[since, $|x| \geq a \Rightarrow x \leq -a$ or $x \geq a$]

$\Rightarrow \quad -4x \leq -12 \quad$ or $\quad -4x \geq 6$

$\Rightarrow \quad x \geq 3 \quad$ or $\quad x \leq \frac{-3}{2}$ [dividing both sides by -4]

$\Rightarrow \quad x \in \left(-\infty, \frac{-3}{2}\right] \cup [3, \infty)$

Example 8. *The solution set of* $\frac{|x+3|+x}{x+2} > 1$ *is*

(a) $[-5, -2] \cup [-1, \infty)$ (b) $[-5, -2) \cup [-1, \infty)$

(c) $(-5, -2) \cup (-1, \infty)$ (d) None of these

Sol. (c) We have, $\frac{|x+3|+x}{x+2} > 1$

$\Rightarrow \quad \frac{|x+3|+x}{x+2} - 1 > 0$

$\Rightarrow \quad \frac{|x+3|-2}{x+2} > 0$

***Case* I** When $x+3 \geq 0$, i.e. $x \geq -3$

$\therefore \quad \frac{|x+3|-2}{x+2} > 0$

$\Rightarrow \quad \frac{x+3-2}{x+2} > 0$

$\Rightarrow \quad \frac{x+1}{x+2} > 0$

$\Rightarrow \{x+1 > 0$ and $x+2 > 0\}$ or $\{x+1 < 0$ and $x+2 < 0\}$

$\Rightarrow \quad \{x > -1$ and $x > -2\}$ or $\{x < -1$ and $x < -2\}$

$\Rightarrow \quad x > -1$ or $x < -2$

$\Rightarrow \quad x \in (-1, \infty)$ or $x \in (-\infty, -2)$

$\Rightarrow \quad x \in (-3, -2) \cup (-1, \infty) \quad [\because x \geq -3] \quad$ ...(i)

***Case* II** When $x+3 < 0$, i.e. $x < -3$

$\therefore \quad \frac{|x+3|-2}{x+2} > 0$

$\Rightarrow \quad \frac{-x-3-2}{x+2} > 0$

$\Rightarrow \quad \frac{-(x+5)}{x+2} > 0$

$\Rightarrow \quad \frac{(x+5)}{x+2} < 0$

$\Rightarrow \{x+5 < 0$ and $x+2 > 0\}$ or $\{x+5 > 0$ and $x+2 < 0\}$

$\Rightarrow (x < -5$ and $x > -2)$, which is not possible

or $\{x > -5$ and $x < -2\}$

$\Rightarrow \quad x \in (-5, -2) \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$$x \in (-5, -2) \cup (-1, \infty)$$

Example 9. *Solve the inequation*

$$\left|1 - \frac{|x|}{1+|x|}\right| \geq \frac{1}{2}.$$

Sol. The given inequation is equivalent to the collection of systems.

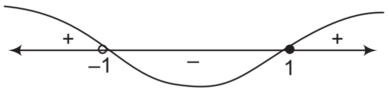
$$\Rightarrow \left[\begin{cases} \left|1 - \dfrac{x}{1+x}\right| \geq \dfrac{1}{2}, \text{ if } x \geq 0 \\ \left|1 + \dfrac{x}{1-x}\right| \geq \dfrac{1}{2}, \text{ if } x < 0 \end{cases}\right. \Rightarrow \left[\begin{cases} \dfrac{1}{|1+x|} \geq \dfrac{1}{2}, \text{ if } x \geq 0 \\ \dfrac{1}{|1-x|} \geq \dfrac{1}{2}, \text{ if } x < 0 \end{cases}\right.$$

$$\Rightarrow \left[\begin{cases} \dfrac{1}{1+x} \geq \dfrac{1}{2}, \text{ if } x \geq 0 \\ \dfrac{1}{1-x} \geq \dfrac{1}{2}, \text{ if } x < 0 \end{cases}\right.$$

$$\Rightarrow \left[\begin{cases} \dfrac{1-x}{1+x} \geq 0, \text{ if } x \geq 0 \\ \dfrac{1+x}{1-x} \geq 0, \text{ if } x < 0 \end{cases}\right. \Rightarrow \left[\begin{cases} \dfrac{x-1}{x+1} \leq 0, \text{ if } x \geq 0 \\ \dfrac{x+1}{x-1} \leq 0, \text{ if } x < 0 \end{cases}\right.$$

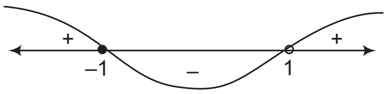
For $\frac{x-1}{x+1} \leq 0$, if $x \geq 0$, then

$$0 \leq x \leq 1 \quad \text{...(i)}$$



For $\quad \frac{x+1}{x-1} \leq 0$, if $x < 0$

$\therefore \quad -1 \leq x < 0 \quad$ ...(ii)



From Eqs. (i) and (ii), the solution of the given equation is $x \in [-1, 1]$.

Example 10. *The value of* x, $|x+3| > |2x-1|$ *is*

(a) $\left(\frac{-2}{3}, 4\right)$ (b) $\left(-\frac{2}{3}, \infty\right)$

(c) $(0, 1)$ (d) None of these

Sol. (a) Given, $|x+3| > |2x-1|$

On squaring both sides, we get

$$|x+3|^2 > |2x-1|^2$$

$\Rightarrow \quad \{(x+3)-(2x-1)\}\{(x+3)+(2x-1)\} > 0$

$\Rightarrow \quad \{(-x+4)(3x+2)\} > 0$

$\Rightarrow \quad x \in \left(\frac{-2}{3}, 4\right)$

Logarithms

Let there be a number $a > 0, \neq 1$. A number p is called the logarithm of a number x to the base a, if $a^p = x$ and is written as $p = \log_a x$. Obviously x must be positive.

- *If* $x < 0$, $\log_a x$ *is imaginary and if* $x = 0$, $\log_a x$ *does not exist.*
- $\log_a x$ *exists if and only if* $x, a > 0$ *and* $a \neq 1$.

Properties of Logarithms

i. $a^{\log_a x} = x;\ a \neq 0, \pm 1, x > 0$

ii. $a^{\log_b x} = x^{\log_b a};\ a > 0, b > 0, \neq 1, x > 0$

iii. $\log_a a = 1, \log_a 1 = 0;\ a > 0, \neq 1$

iv. $\log_a x = \dfrac{1}{\log_x a};\ x, a > 0, \neq 1$

v. $\log_a x = \log_b x \cdot \log_a b = \dfrac{\log_b x}{\log_b a};\ a, b > 0, \neq 1,$ $x > 0$

vi. For $m, n > 0, a > 0, \neq 1$
(a) $\log_a (m \cdot n) = \log_a m + \log_a n$
(b) $\log_a \left(\dfrac{m}{n}\right) = \log_a m - \log_a n$
(c) $\log_a (m^x) = x \log_a m$

vii. For $x > 0, a > 0, \neq 1$
(a) $\log_{a^n} (x) = \left(\dfrac{1}{n}\right) \log_a x$
(b) $\log_{a^n} (x^m) = \left(\dfrac{m}{n}\right) \log_a x$

viii. (a) $\log_a x > 0$, iff $x > 1, a > 1$ or $0 < x < 1, 0 < a < 1$
(b) $\log_a x < 0$, iff $x > 1, 0 < a < 1$ or $0 < x < 1, a > 1$

ix. For $x > y > 0$,
(a) $\log_a x > \log_a y$, if $a > 1$
(b) $\log_a x < \log_a y$, if $0 < a < 1$

x. If $a > 1$, then
(a) $\log_a x > p \Rightarrow x > a^p$
(b) $0 < \log_a x < p \Rightarrow 0 < x < a^p$

xi. If $0 < a < 1$, then
(a) $\log_a x > p \Rightarrow 0 < x < a^p$
(b) $0 < \log_a x < p \Rightarrow a^p < x < 1$

Example 11. *The value of x,* $\log_e (x - 3) < 1$ *is*

(a) $(0, 3)$ *(b)* $(0, e)$ (c) $(0, e + 3)$ *(d)* $(3, 3 + e)$

Sol. (d) From definition of logarithms

$$x - 3 > 0$$

$$\Rightarrow \quad x > 3 \quad \ldots\text{(i)}$$

Also, $e > 1$ given inequality may written as

$$x - 3 < (e)^1 \quad \Rightarrow \quad x < 3 + e$$

$$\Rightarrow \quad x \in (3, 3 + e)$$

Example 12. *The value of x,* $\log_{1/2} x \geq \log_{1/3} x$ *is*

(a) $(0, 1]$ *(b)* $(0, 1)$
(c) $[0, 1)$ *(d) None of these*

Sol. (a) ***Case* I** When $x \neq 1$ and $x > 0$

$$\log_{1/2} x \geq \log_{1/3} x$$

$$\Rightarrow \quad \log_x 2 \geq \log_x 3, \text{ when } x \neq 1$$

which is possible, only if $0 < x < 1$.

***Case* II** When $x = 1$

$$\log_{1/2} x = \log_{1/3} x, \text{ i.e. equality holds.}$$

Combining the above cases,

$$0 < x \leq 1 \quad \text{or} \quad x \in (0, 1]$$

Work Book Exercise 5.2

Solve for x,

5 Arithmetico-Geometric Mean Inequality

If $a_1, a_2, \ldots, a_n$ are n distinct positive real numbers, then

$$\frac{a_1 + a_2 + \ldots + a_n}{n} > (a_1 a_2 \ldots a_n)^{1/n}$$

i.e. $\quad AM > GM$

➘ *If $a_1 = a_2 = \ldots = a_n$, then AM = GM. Thus, equality occurs when all quantities are equal.*

Example 13. *If a, b and c are three distinct positive real numbers, then*

(a) $(a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > 9$

(b) $(a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) < 9$

(c) $(a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \geq 9$

(d) $(a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \leq 9$

Sol. (a) We have, AM > GM

$$\therefore \quad \frac{a+b+c}{3} > (abc)^{1/3} \text{ and } \frac{\frac{1}{a}+\frac{1}{b}+\frac{1}{c}}{3} > \left(\frac{1}{abc}\right)^{1/3}$$

$$\Rightarrow \quad a+b+c > 3(abc)^{1/3} \text{ and } \left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > \frac{3}{(abc)^{1/3}}$$

$$\Rightarrow \quad (a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > 9$$

Weighted AM and GM Inequalities

If $a_1, a_2, \ldots, a_n$ are n positive real numbers and $m_1, m_2, \ldots, m_n$ are n positive rational numbers, then

$$\frac{m_1 a_1 + m_2 a_2 + \ldots + m_n a_n}{m_1 + m_2 + \ldots + m_n} > (a_1^{m_1} \cdot a_2^{m_2} \ldots a_n^{m_n})^{\frac{1}{m_1 + m_2 + \ldots + m_n}}$$

i.e. weighted AM > weighted GM

Example 14. *If a, b and c are distinct positive integers, then $ax^{b-c} + bx^{c-a} + cx^{a-b}$ is*

(a) $> 2(a+b+c)$ $\quad$ (b) R

(c) $> (a+b+c)$ $\quad$ (d) $< (a+b+c)$

Sol. (c) We have,

$$\frac{a \cdot x^{b-c} + b \cdot x^{c-a} + c \cdot x^{a-b}}{a+b+c} > \{(x^{b-c})^a (x^{c-a})^b (x^{a-b})^c\}^{1/a+b+c}$$

$$\Rightarrow \quad \frac{ax^{b-c} + bx^{c-a} + cx^{a-b}}{a+b+c} > \{x^{a(b-c)+b(c-a)+c(a-b)}\}^{1/a+b+c}$$

$$\Rightarrow \quad ax^{b-c} + bx^{c-a} + cx^{a-b} > (a+b+c)$$

Example 15. *If the equation $x^4 - 4x^3 + ax^2 + bx + 1 = 0$ has four positive roots, then a, b are*

(a) $a = 4, b = 6$ $\quad$ (b) $a = -4, b = 6$

(c) $a = 2, b = 3$ $\quad$ (d) $a = 6, b = -4$

Sol. (d) Let α, β, γ and δ be four roots of the given equation.

Then, $\alpha + \beta + \gamma + \delta = 4$ and $\alpha\beta\gamma\delta = 1$

$\Rightarrow$ AM of $\alpha, \beta, \gamma, \delta$ = GM of $\alpha, \beta, \gamma, \delta \Rightarrow \alpha = \beta = \gamma = \delta$

$\Rightarrow \quad \alpha = \beta = \gamma = \delta = 1 \quad [\because \alpha + \beta + \gamma + \delta = 4$, also $\alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta = a$, $\alpha\beta\gamma + \alpha\beta\delta + \beta\gamma\delta + \alpha\gamma\delta = -b]$

$\therefore \quad x^4 - 4x^3 + ax^2 + bx + 1 = x^4 - 4x^3 + 6x^2 - 4x + 1$

$\Rightarrow \quad a = 6$ and $b = -4$

Two Important Inequalities

i. If $a_1, a_2, \ldots, a_n$ are n positive distinct real numbers, then

(a) $$\frac{a_1^m + a_2^m + a_n^m}{n} > \left(\frac{a_1 + a_2 + \ldots + a_n}{n}\right)^m,$$

if $m < 0$ or $m > 1$

(b) $$\frac{a_1^m + a_2^m + \ldots + a_n^m}{n} < \left(\frac{a_1 + a_2 + \ldots + a_n}{n}\right)^m$$

if $0 < m < 1$.

i.e. the arithmetic mean of the mth power of n positive quantities is greater than mth power of their arithmetic mean except when m is a positive proper fraction known as mth power mean.

(c) If $a_1, a_2, \ldots, a_n$ and $b_1, b_2, \ldots, b_n$ are rational numbers and m is a rational number, then

$$\frac{b_1 a_1^m + b_2 a_2^m + \ldots + b_n a_n^m}{b_1 + b_2 + \ldots + b_n} > \left(\frac{b_1 a_1 + b_2 a_2 + \ldots + b_n a_n}{b_1 + b_2 + \ldots + b_n}\right)^m,$$

if $m < 0$ or $m > 1$ and

$$\frac{b_1 a_1^m + b_2 a_2^m + \ldots + b_n a_n^m}{b_1 + b_2 + \ldots + b_n} < \left(\frac{b_1 a_1 + b_2 a_2 + \ldots + b_n a_n}{b_1 + b_2 + \ldots + b_n}\right)^m, \text{ if } 0 < m < 1$$

ii. If $a_1, a_2, a_3, \ldots, a_n$ are distinct positive real numbers and p, q, r are natural numbers, then

$$\frac{a_1^{p+q+r} + a_2^{p+q+r} + \ldots + a_n^{p+q+r}}{n} > \left(\frac{a_1^p + a_2^p + \ldots + a_n^p}{n}\right)\left(\frac{a_1^q + a_2^q + \ldots + a_n^q}{n}\right)\left(\frac{a_1^r + a_2^r + \ldots + a_n^r}{n}\right)$$

Example 16. *If $m > 1$ and $n \in N$, then*

(a) $\dfrac{1^m + 2^m + 3^m + \ldots + n^m}{n} > \left(\dfrac{n+1}{2}\right)^m$

(b) $\dfrac{1^m + 2^m + 3^m + \ldots + n^m}{n} < \left(\dfrac{n+1}{2}\right)^m$

(c) $\dfrac{1^m + 2^m + 3^m + \ldots + n^m}{n} \geq 1$

(d) $\dfrac{1^m + 2^m + 3^m + \ldots + n^m}{n} \leq 1$

Sol. (a) We know that for $m > 1$,
AM of mth power > mth power of AM

$$\therefore \quad \frac{1^m + 2^m + 3^m + \ldots + n^m}{n} > \left(\frac{1+2+3+\ldots+n}{n}\right)^m$$

$$\Rightarrow \quad \frac{1^m + 2^m + 3^m + \ldots + n^m}{n} > \left(\frac{n+1}{2}\right)^m$$

Some Other Standard Inequalities

i. **Weierstrass Inequality**

(a) If $a_1, a_2, \ldots, a_n$ are n positive real numbers, then for $n \geq 2$,
$$(1+a_1)(1+a_2)\ldots(1+a_n) > 1 + a_1 + a_2 + \cdots + a_n$$

(b) If $a_1, a_2, \ldots, a_n$ are positive numbers less than unity, then
$$(1-a_1)(1-a_2)\ldots(1-a_n) > 1 - a_1 - a_2 - \ldots - a_n$$

ii. **Cauchy-Schwartz Inequality**

If $a_1, a_2, \ldots, a_n$ and $b_1, b_2, \ldots, b_n$ are $2n$ real numbers, then
$$(a_1b_1 + a_2b_2 + \ldots + a_nb_n)^2 \leq (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^2 + b_2^2 + \ldots + b_n^2)$$
with the equality holding if and only if
$$\frac{a_1}{b_1} = \frac{a_2}{b_2} = \ldots = \frac{a_n}{b_n}$$

iii. **Tchebychef's Inequality**

If $a_1, a_2, \ldots, a_n$ and $b_1, b_2, \ldots, b_n$ are real numbers such that
$a_1 \leq a_2 \leq a_3 \leq \ldots \leq a_n$ and $b_1 \leq b_2 \leq \ldots \leq b_n$, then
$$n(a_1b_1 + a_2b_2 + \ldots + a_nb_n) \geq (a_1 + a_2 + \ldots + a_n)(b_1 + b_2 + \ldots + b_n)$$
or
$$\frac{a_1b_1 + a_2b_2 + \ldots + a_nb_n}{n} \geq \left(\frac{a_1 + a_2 + \ldots + a_n}{n}\right)\left(\frac{b_1 + b_2 + \ldots + b_n}{n}\right)$$

Example 17. *If none of $b_1, b_2, \ldots, b_n$ is zero, then $\left(\dfrac{a_1}{b_1} + \dfrac{a_2}{b_2} + \ldots + \dfrac{a_n}{b_n}\right)^2$ is*

(a) $\geq (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^{-2} + b_2^{-2} + \ldots + b_n^{-2})$

(b) $\leq (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^{-2} + b_2^{-2} + \ldots + b_n^{-2})$

(c) $> (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^{-2} + b_2^{-2} + \ldots + b_n^{-2})$

(d) $< (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^{-2} + b_2^{-2} + \ldots + b_n^{-2})$

Sol. (b) By Cauchy-Schwartz's inequality, we have

$$(a_1b_1^{-1} + a_2b_2^{-1} + \ldots + a_nb_n^{-1})^2 \leq (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^{-2} + b_2^{-2} + \ldots + b_n^{-2})$$

$$\Rightarrow \left(\frac{a_1}{b_1} + \frac{a_2}{b_2} + \ldots + \frac{a_n}{b_n}\right)^2 \leq (a_1^2 + a_2^2 + \ldots + a_n^2)\left(\frac{1}{b_1^2} + \frac{1}{b_2^2} + \ldots + \frac{1}{b_n^2}\right)$$

Applications of Inequalities to Find the Greatest and Least Values

i. If $x_1, x_2, \ldots, x_n$ are n positive variables such that $x_1 + x_2 + \ldots + x_n = c$ (constant), then the product $x_1x_2\ldots x_n$ is greatest when $x_1 = x_2 = \ldots = x_n = \dfrac{c}{n}$ and the greatest value is $\left(\dfrac{c}{n}\right)^n$.

ii. If $x_1, x_2, \ldots, x_n$ are positive variables such that $x_1x_2\ldots x_n = c$ (constant), then the sum $x_1 + x_2 + \ldots + x_n$ is least when $x_1 = x_2 = \ldots = x_n = c^{1/n}$ and the least value of the sum is $n(c^{1/n})$.

iii. If $x_1, x_2, \ldots, x_n$ are variables and $m_1, m_2, \ldots, m_n$ are positive real numbers such that $x_1 + x_2 + \ldots + x_n = c$ (constant), then $x_1^{m_1} \cdot x_2^{m_2} \ldots x_n^{m_n}$ is greatest, when
$$\frac{x_1}{m_1} = \frac{x_2}{m_2} = \ldots = \frac{x_n}{m_n} = \frac{x_1 + x_2 + \ldots + x_n}{m_1 + m_2 + \ldots + m_n}$$

Example 18. *The greatest value of x^2y^3 when $3x + 4y = 5$, is*

(a) $\dfrac{3}{8}$ (b) $\dfrac{3}{16}$ (c) $\dfrac{6}{5}$ (d) $\dfrac{8}{3}$

Sol. (b) Let $P = x^2y^3$. Clearly, P is the product of 5 factors such that two of them are equal to x and the remaining 3 are equal to y.

Now, $3x + 4y = 5$

$$\Rightarrow \quad 2\left(\frac{3x}{2}\right) + 3\left(\frac{4y}{3}\right) = 5$$

$$\Rightarrow \quad \frac{3x}{2} + \frac{3x}{2} + \frac{4y}{3} + \frac{4y}{3} + \frac{4y}{3} = 5$$

$$\Rightarrow \quad \left(\frac{16}{3}x^2y^3\right) \leq \left(\frac{5}{5}\right)^5 \quad \Rightarrow \quad x^2y^3 \leq \frac{3}{16}$$

or maximum of $x^2y^3 = 3/16$

Work Book Exercise 5.3

1 If a, b and c are all positive real numbers, which one of the following is true?

$(b+c)(c+a)(a+b) \geq 8abc$

$(b+c)(c+a)(a+b) < 8abc$

$\left(\frac{a}{e}+\frac{b}{f}+\frac{c}{g}\right)\left(\frac{e}{a}+\frac{f}{b}+\frac{g}{c}\right) < 9$

$(a+b)\left(\frac{1}{a}+\frac{1}{b}\right) < 4$

2 If $a_1, a_2, \ldots, a_n$ and $b_1, b_2, \ldots, b_n$ are any two sets of positive real numbers, then

$$\left(\frac{a_1^2}{b_1}+\frac{a_2^2}{b_2}+\ldots+\frac{a_n^2}{b_n}\right)^2$$

$\leq (a_1^4+a_2^4+\ldots+a_n^4)(b_1^{-2}+b_2^{-2}+\ldots+b_n^{-2})$

$\geq (a_1^4+a_2^4+\ldots+a_n^4)(b_1^{-2}+b_2^{-2}+\ldots+b_n^{-2})$

$< (a_1^4+a_2^4+\ldots+a_n^4)(b_1^{-2}+b_2^{-2}+\ldots+b_n^{-2})$

$> (a_1^4+a_2^4+\ldots+a_n^4)(b_1^{-2}+b_2^{-2}+\ldots+b_n^{-2})$

3 If a and b are two positive quantities whose sum is λ, then the minimum value of $\sqrt{\left(1+\frac{1}{a}\right)\left(1+\frac{1}{b}\right)}$ is

$\lambda-\frac{1}{\lambda}$ $\quad$ $\lambda-\frac{2}{\lambda}$ $\quad$ $1+\frac{2}{\lambda}$ $\quad$ $1+\frac{1}{\lambda}$

4 If $a^2x^4+b^2y^4=c^6$, then the greatest value of xy is

$\frac{c^3}{2ab}$ $\quad$ $\frac{c^3}{4ab}$ $\quad$ $\frac{c^3}{2\sqrt{ab}}$ $\quad$ $\frac{c^3}{\sqrt{2ab}}$

5 Which of the following is true, where $a, b, c > 0$?

$2(a^3+b^3+c^3) \geq bc(b+c)+ca(c+a)+ab(a+b)$

$\frac{a^3+b^3+c^3}{3} > \frac{(a+b+c)\cdot(a^2+b^2+c^2)}{9}$

$\frac{bc}{b+c}+\frac{ca}{c+a}+\frac{ab}{a+b} < \frac{1}{2}(a+b+c)$

$\frac{2}{b+c}+\frac{2}{c+a}+\frac{2}{a+b} < \frac{1}{a}+\frac{1}{b}+\frac{1}{c}$

Quadratic Equation with Real Coefficients

An equation of the form

$$ax^2+bx+c=0 \qquad \ldots\text{(i)}$$

where, $a \neq 0$, $a, b, c \in R$ is called a quadratic equation with real coefficients.

The quantity $D=b^2-4ac$ is known as the discriminant of the quadratic equation in (i) whose roots are given by

$$\alpha=\frac{-b+\sqrt{b^2-4ac}}{2a} \text{ and } \beta=\frac{-b-\sqrt{b^2-4ac}}{2a}$$

The nature of the roots is as given below:

(i) If a quadratic equation in x has more than two roots, then it is an identity in x that is $a=b=c=0$.

(ii) If $a=1$ and $b, c \in I$ and the roots are rational numbers, then these roots must be integers.

(iii) The roots are of the form $p \pm \sqrt{q}\,(p, q \in Q)$, iff a, b and c are rational and D is not a perfect square.

(iv) The roots are real and distinct, iff $D>0$.

(v) The roots are real and equal, iff $D=0$.

(vi) The roots are complex with non-zero imaginary part, iff $D<0$.

(vii) The roots are rational, iff a, b and c are rational and D is a perfect square.

- *If α is a root of the equation $f(x)=0$, then the polynomial $f(x)$ is exactly divisible by $(x-\alpha)$ or $(x-\alpha)$ is a factor of $f(x)$ and conversely.*
- *Every equation of nth degree $(n \geq 1)$ has exactly n roots and if the equation has more than n roots, it is an identity.*
- *If the coefficients of the equation $f(x)=0$ are all real and $\alpha+i\beta$ is its root, then $\alpha-i\beta$ is also a root, i.e. imaginary roots occur in conjugate pairs.*
- *If the coefficients in the equation are all rational and $\alpha+\sqrt{\beta}$ is one of its roots, then $\alpha-\sqrt{\beta}$ is also a root, where $\alpha, \beta \in Q$ and β is not a perfect square.*
- *If there is any two real numbers 'a' and 'b' such that $f(a)$ and $f(b)$ are of opposite signs, then $f(x)=0$ must have atleast one real root between 'a' and 'b'.*
- *Every equation $f(x)=0$ of odd degree has atleast one real root of a sign opposite to that of its last term.*

Example 19. *The number of values of a for which $(a^2-3a+2)x^2+(a^2-5a+6)x+a^2-4=0$ is an identity in x, is*

(a) 0 $\quad$ *(b)* 2

(c) 1 $\quad$ *(d)* 3

Sol. (b) It is an identity in x, if

$a^2-3a+2=0,\ a^2-5a+6=0,\ a^2-4=0$

$\Rightarrow a=1, 2$ and $a=2, 3$ and $a=2, -2$

$\therefore$ Equation is identity, if $a=2$

Example 20. *If* $\cos\theta$, $\sin\phi$ *and* $\sin\theta$ *are in GP, then roots of* $x^2+2\cot\phi\cdot x+1=0$ *are always*

(a) equal (b) real
(c) imaginary (d) greater than 1

Sol. (b) As $\cos\theta$, $\sin\phi$ and $\sin\theta$ are in GP.

$\Rightarrow \quad \sin^2\phi=\cos\theta\cdot\sin\theta$

$\Rightarrow \quad \cos 2\phi = 1-\sin 2\theta$ ...(i)

Also, discriminant, $D=4\cot^2\phi-4=\dfrac{4\cos 2\phi}{\sin^2\phi}$

$=\dfrac{4(1-\sin 2\theta)}{\sin^2\phi}>0$; as $\sin 2\theta<1$ and $\sin^2\phi>0$

$\Rightarrow$ Roots are real.

Also, when $\cos\theta=\sin\theta$

$\Rightarrow$ Three numbers are equal which is a special case i.e. the series forms both AP and GP.

Example 21. *If* l, m *and* n *are real,* $l\neq m$, *then the roots of the equation* $(l-m)x^2-5(l+m)x-2(l-m)=0$ *are*

(a) real and equal (b) complex
(c) real and unequal (d) None of these

Sol. (c) Discriminant of the given equation is

$$D=25(l+m)^2+8(l-m)^2$$

As, $l\neq m$, $(l-m)^2>0$.

Also, $\quad (l+m)^2\geq 0$

Thus, $\quad D>0$

Hence, roots are real and unequal.

Example 22. *The number of real solutions of the equation* $|x|^2-3|x|+2=0$ *is*

(a) 4 (b) 1 (c) 3 (d) 2

Sol. (a) Since, $|x|^2-3|x|+2=0$

$\Rightarrow \quad (|x|-1)(|x|-2)=0 \quad \Rightarrow \quad |x|=1, 2$

$\therefore \quad x=1, -1, 2, -2$

Hence, four real solutions exist.

Example 23. *Let* α *and* β *be the roots of the equation* $(x-a)(x-b)=c$, $c\neq 0$. *Then, the roots of the equation* $(x-\alpha)(x-\beta)+c=0$ *are*

(a) a, c (b) b, c
(c) a, b (d) $a+c$, $b+c$

Sol. (c) Given α and β are the roots of $(x-a)(x-b)-c=0$

$\Rightarrow \quad (x-a)(x-b)-c=(x-\alpha)(x-\beta)$

$\Rightarrow \quad (x-a)(x-b)=(x-\alpha)(x-\beta)+c$

$\Rightarrow$ a and b are the roots of equation

$$(x-\alpha)(x-\beta)+c=0$$

Example 24. *If the roots of the equation* $ax^2+x+b=0$ *are real, then the roots of the equation* $x^2-4\sqrt{ab}\,x+1=0$ *will be*

(a) rational (b) irrational
(c) real (d) imaginary

Sol. (d) Since, $ax^2+x+b=0$ has real roots

$\Rightarrow \quad (1)^2-4ab\geq 0$

$\Rightarrow \quad -4ab\geq -1$

or $\quad 4ab\leq 1$ ...(i)

Now, second equation is $x^2-4\sqrt{ab}\,x+1=0$

$\therefore \quad D=16ab-4$

From Eq. (i), $\quad D<0$

Hence, roots are imaginary.

Example 25. *Let* a, b *and* c *be real numbers,* $a\neq 0$. *If* α *is a root of* $a^2x^2+bx+c=0$, β *is the root of* $a^2x^2-bx-c=0$ *and* $0<\alpha<\beta$, *then the equation* $a^2x^2+2bx+2c=0$ *has a root* γ *that always satisfies*

(a) $\gamma=\dfrac{\alpha+\beta}{2}$ (b) $\gamma=\alpha+\dfrac{\beta}{2}$
(c) $\gamma=\alpha$ (d) $\alpha<\gamma<\beta$

Sol. (d) Since, α is a root of $a^2x^2+bx+c=0$

$\Rightarrow \quad a^2\alpha^2+b\alpha+c=0$ ...(i)

and β is a root of $\quad a^2x^2-bx-c=0$

$\Rightarrow \quad a^2\beta^2-b\beta-c=0$ ...(ii)

Let $\quad f(x)=a^2x^2+2bx+2c$

$\therefore \quad f(\alpha)=a^2\alpha^2+2b\alpha+2c$

$=a^2\alpha^2-2a^2\alpha^2=-a^2\alpha^2$ [from Eq. (i)]

and $\quad f(\beta)=a^2\beta^2+2b\beta+2c$

$=a^2\beta^2+2a^2\beta^2=3a^2\beta^2$ [from Eq. (ii)]

$\Rightarrow \quad f(\alpha)\,f(\beta)<0$

$\therefore$ $f(x)$ must have a root lying in the open interval (α, β).

$\therefore \quad \alpha<\gamma<\beta$

Example 26. *Find the values of* a *for which* $4^t-(a-4)2^t+\dfrac{9}{4}a<0$, $\forall\, t\in(1, 2)$.

Sol. Let $2^t=x$ and $f(x)=x^2-(a-4)x+\dfrac{9}{4}a$

We want $\quad f(x)<0$, $\forall\, x\in(2^1, 2^2)$

i.e. $\quad \forall\, x\in(2, 4)$

Since, we want $f(x)<0$, $\forall\, x\in(2, 4)$, one of the $f(x)$ should be less than 2 and the other must be greater than 4.

i.e. $f(2)<0$ and $f(4)<0$, $a<-48$ and $a>\dfrac{128}{7}$ which is not possible.

Hence, no such a exists.

Example 27. *The roots of* $ax^2+bx+c=0$, *were* $a\neq 0$ *and coefficients are real, are non-real complex and* $a+c<b$. *Then,*

(a) $4a+c>2b$ (b) $4a+c<2b$
(c) $4a+c=2b$ (d) None of these

Sol. (b) Since, $ax^2+bx+c=0$ has non-real.

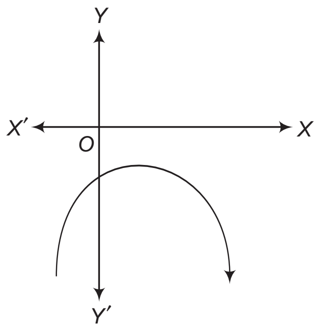
Thus, either $f(x)=ax^2+bx+c$

$\Rightarrow \quad f(x)>0$ or $f(x)<0$, for all x

As $\quad a+c<b \quad \Rightarrow \quad f(-1)<0$

$\Rightarrow \quad a - b + c < 0 \quad \text{or} \quad a + c < 0$

$\therefore \quad f(x) < 0$, for all x.



Thus, for all $x \in R$, $ax^2 + bx + c < 0$

or for $x = -2$, $4a - 2b + c < 0$

$\Rightarrow \quad 4a + c < 2b$

Formation of a Polynomial Equation from Given Roots

If $\alpha_1, \alpha_2, \alpha_3, \ldots, \alpha_n$ are the roots of an nth degree equation, then the equation is

$$x^n - S_1 x^{n-1} + S_2 x^{n-2} - S_3 x^{n-3} + \ldots + (-1)^n S_n = 0$$

where, S_k denotes the sum of the products of roots taking k roots at a time.

Particular Cases

i. **Quadratic equation** If α and β are the roots of a quadratic equation, then the equation is

$$x^2 - S_1 x + S_2 = 0$$

i.e. $\quad x^2 - (\alpha + \beta)x + \alpha\beta = 0$

ii. **Cubic equation** If α, β and γ are the roots of a cubic equation, then the equation is

$$x^3 - S_1 x^2 + S_2 x - S_3 = 0$$

i.e. $\quad x^3 - (\alpha + \beta + \gamma)x^2 + (\alpha\beta + \beta\gamma + \gamma\alpha)x - \alpha\beta\gamma = 0$

Example 28. *If a and b are rational and b is not a perfect square, then the quadratic equation with rational coefficients whose one root is* $\dfrac{1}{a + \sqrt{b}}$, *is*

(a) $x^2 - 2ax + (a^2 - b) = 0$

(b) $(a^2 - b)x^2 - 2ax + 1 = 0$

(c) $(a^2 - b)x^2 - 2bx + 1 = 0$

(d) None of the above

Sol. (b) As irrational roots alway occur in pairs,

i.e. the roots of given equation are $\dfrac{1}{a + \sqrt{b}}, \dfrac{1}{a - \sqrt{b}}$.

Thus, sum of roots $= \dfrac{2a}{a^2 - b}$

and product of roots $= \dfrac{1}{a^2 - b}$

Hence, the quadratic equation

$$x^2 - \left(\frac{2a}{a^2 - b}\right)x + \left(\frac{1}{a^2 - b}\right) = 0$$

$\Rightarrow \quad (a^2 - b)x^2 - 2ax + 1 = 0$

Example 29. *The quadratic equation whose roots are the AM and HM of the roots of the equation* $x^2 + 7x - 1 = 0$ *is*

(a) $14x^2 + 14x - 45 = 0$ (b) $14x^2 - 14x + 14 = 0$

(c) $14x^2 + 45x - 14 = 0$ (d) None of these

Sol. (c) Here, $x^2 + 7x - 1 = 0$ has $\alpha + \beta = -7$ and $\alpha\beta = -1$

$\because$ Quadratic equation's roots are AM and HM of the roots of the equation $x^2 + 7x - 1 = 0$

$\Rightarrow \quad \alpha' = \dfrac{\alpha + \beta}{2}$ and $\beta' = \dfrac{2\alpha\beta}{\alpha + \beta}$

or $\quad \alpha' = -\dfrac{7}{2}$ and $\beta' = \dfrac{-2}{-7} = \dfrac{2}{7}$

$\therefore$ Required equation is $x^2 - (\alpha' + \beta')x + \alpha'\beta' = 0$

$\Rightarrow \quad x^2 - \left(-\dfrac{45}{14}x\right) - 1 = 0$

or $\quad 14x^2 + 45x - 14 = 0$

Symmetric Function of the Roots

A function of α and β is said to be a symmetric function, if it remains unchanged when α and β are interchanged.

e.g. $\alpha^2 + \beta^2 + 2\alpha\beta$ is a symmetric function of α and β whereas $\alpha^2 - \beta^2 + 3\alpha\beta$ is not a symmetric function of α and β.

In order to find the value of a symmetric function of α and β, express the given function in terms of $\alpha + \beta$ and $\alpha\beta$. The following results may be useful:

i. $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

ii. $\alpha^3 + \beta^3 = (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)$

iii. $\alpha^4 + \beta^4 = (\alpha^3 + \beta^3)(\alpha + \beta) - \alpha\beta(\alpha^2 + \beta^2)$

iv. $\alpha^5 + \beta^5 = (\alpha^3 + \beta^3)(\alpha^2 + \beta^2) - \alpha^2\beta^2(\alpha + \beta)$

v. $|\alpha - \beta| = \sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$

vi. $\alpha^2 - \beta^2 = (\alpha + \beta)(\alpha - \beta)$

vii. $\alpha^3 - \beta^3 = (\alpha - \beta)[(\alpha + \beta)^2 - \alpha\beta] = (\alpha - \beta)^3 + 3\alpha\beta(\alpha - \beta)$

viii. $\alpha^4 - \beta^4 = (\alpha + \beta)(\alpha - \beta)(\alpha^2 + \beta^2)$

Example 30. *If α and β are the roots of $ax^2+2bx+c=0$, then $\frac{\alpha}{\beta}+\frac{\beta}{\alpha}$ is equal to*

(a) $\frac{4b^2-2ac}{ac}$ (b) $\frac{4b^2-4ac}{ac}$

(c) $\frac{2b^2-2ac}{ac}$ (d) $\frac{2b^2-4ac}{ac}$

Sol. (a) Since, α and β are the roots of equation

$$ax^2+2bx+c=0$$

$\therefore$ $\alpha+\beta=\frac{-2b}{a}$ and $\alpha\beta=\frac{c}{a}$

Now, $\frac{\alpha}{\beta}+\frac{\beta}{\alpha}=\frac{\alpha^2+\beta^2}{\alpha\beta}=\frac{(\alpha+\beta)^2-2\alpha\beta}{\alpha\beta}$

$\Rightarrow$ $\frac{\alpha}{\beta}+\frac{\beta}{\alpha}=\frac{(4b^2/a^2)-2c/a}{c/a}=\frac{4b^2-2ac}{ac}$

Example 31. *If α and β are the roots of the equation $px^2+qx+r=0$, then the value of $\alpha^3\beta+\beta^3\alpha$ is*

(a) $\frac{r}{p^3}$ (b) $\frac{r(q^2-2pr)}{p^3}$

(c) $\frac{r(q^2+2pr)}{p^3}$ (d) $\frac{(q^2-2pr)}{p^3}$

Sol. (b) Since, α and β are the roots of the equation $px^2+qx+r=0$, therefore $\alpha+\beta=-\frac{q}{p}$ and $\alpha\beta=\frac{r}{p}$.

$\therefore$ $\alpha^3\beta+\beta^3\alpha=\alpha\beta(\alpha^2+\beta^2)$

$=(\alpha\beta)[(\alpha+\beta)^2-2\alpha\beta]$

$=\left(\frac{r}{p}\right)\left(\frac{q^2}{p^2}-\frac{2r}{p}\right)=\frac{r(q^2-2pr)}{p^3}$

Transformation of Equations

Let α and β be the roots of the equation $ax^2+bx+c=0$, then the equation

i. Whose roots are $\alpha+k, \beta+k$ is obtained by replacing x by $x-k$ in the given equation.

ii. Whose roots are $\alpha-k, \beta-k$ is obtained by replacing x by $x+k$ in the given equation.

iii. Whose roots are $\alpha k, \beta k$ is obtained by multiplying the coefficients of x^2, x and constant term by k^0, k^1, k^2 respectively in the given equation.

iv. Whose roots are $\frac{\alpha}{k}, \frac{\beta}{k}$ is obtained by multiplying the coefficients of x^2, x and constant term by k^2, k^1, k^0 respectively in the given equation.

v. To obtain an equation whose roots are reciprocals of the roots of a given equation is obtained by replacing x by $1/x$ in the given equation.

vi. To transform an equation to another equation whose roots are negative of the roots of a given equation, replace x by $-x$.

vii. To transform an equation to another equation whose roots are square of the roots of a given equation, replace x by $\sqrt{x}$.

viii. To transform an equation to another equation whose roots are cubes of the roots of a given equation replace x by $x^{1/3}$.

Example 32. *Form an equation whose roots are cubes of the roots of equation $ax^3+bx^2+cx+d=0$.*

Sol. Replacing x by $x^{1/3}$ in the given equation, we get

$a(x^{1/3})^3+b(x^{1/3})^2+c(x^{1/3})+d=0$

$\Rightarrow$ $ax+d=-(bx^{2/3}+cx^{1/3})$

$\Rightarrow$ $(ax+d)^3=-(bx^{2/3}+cx^{1/3})^3$

$\Rightarrow$ $a^3x^3+3a^2dx^2+3ad^2x+d^3$
$=-\{b^3x^2+c^3x+3bcx(bx^{2/3}+cx^{1/3})\}$

$\Rightarrow a^3x^3+3a^2dx^2+3ad^2x+d^3$
$=-\{b^3x^2+c^3x-3bcx(ax+d)\}$

$\Rightarrow a^3x^3+x^2(3a^2d-3abc+b^3)$
$+x(3ad^2-3bcd+c^3)+d^3=0$

which is the required equation.

Example 33. *If the roots of $a_1x^2+b_1x+c_1=0$ are α_1, β_1 and that of $a_2x^2+b_2x+c_2=0$ are α_2, β_2 such that $\alpha_1\alpha_2=\beta_1\beta_2=1$, then*

(a) $\frac{a_1}{a_2}=\frac{b_1}{b_2}=\frac{c_1}{c_2}$

(b) $\frac{a_1}{c_2}=\frac{b_1}{b_2}=\frac{c_1}{a_2}$

(c) $a_1a_2=b_1b_2=c_1c_2$

(d) None of the above

Sol. (b) Roots of the second equation are reciprocal of the first.

As $\alpha_2=\frac{1}{\alpha_1}$

and $\beta_2=\frac{1}{\beta_1}$

$\therefore$ Replacing x by $\frac{1}{x}$ in $a_1x^2+b_1x+c_1=0$, we get

$c_1x^2+b_1x+a_1=0$ ...(i)

and $a_2x^2+b_2x+c_2=0$ [given]...(ii)

Eqs. (i) and (ii) are same equations.

$\therefore$ $\frac{c_1}{a_2}=\frac{b_1}{b_2}=\frac{a_1}{c_2}$

Example 34. *If α, β and γ are the roots of the equation $x(1+x^2)+x^2(6+x)+2=0$, then the value of $\alpha^{-1}+\beta^{-1}+\gamma^{-1}$ is*

(a) -3 (b) $\frac{1}{2}$

(c) $-\frac{1}{2}$ (d) None of these

Sol. (c) Since, $2x^3+6x^2+x+2=0$ has roots α, β and γ.

So, $2x^3+x^2+6x+2=0$ has roots α^{-1}, β^{-1} and γ^{-1}

[writing coefficients in reverse order, since roots are reciprocal]

Hence, sum of the roots $= -\dfrac{\text{Coefficient of } x^2}{\text{Coefficient of } x^3}$

$\therefore \quad \alpha^{-1}+\beta^{-1}+\gamma^{-1} = -\frac{1}{2}$

Descartes Rule of Signs for the Roots of a Polynomial

Rule 1 The maximum number of positive real roots of a polynomial equation

$$f(x) = a_0 x^n + a_1 x^{n-1} + a_2 x^{n-2} + \dots + a_{n-1} x + a_n = 0$$

is the number of changes of the signs of coefficients from positive to negative and negative to positive. For instance, in the equation $x^3+3x^2+7x-11=0$ the signs of coefficients are

$$+ \ + \ + \ -$$

As there is just one change of sign, the number of positive roots of $x^3+3x^2+7x-11=0$ is atmost 1.

Rule 2 The maximum number of negative roots of the polynomial equation $f(x)=0$ is the number of changes from positive to negative and negative to positive in the signs of coefficients of the equation $f(-x)=0$.

Common Roots

Let $a_1x^2+b_1x+c_1=0$ and $a_2x^2+b_2x+c_2=0$ be two quadratic equations such that $a_1, a_2 \neq 0$ and $a_1b_2 \neq a_2b_1$.

i. **When one common root** If α is the common root of these equations, then

$$(b_1c_2-b_2c_1)(a_1b_2-a_2b_1) = (c_1a_2-c_2a_1)^2$$

which is the condition for roots of two quadratic equations to be common.

ii. **When two common roots** The required condition is $\dfrac{a_1}{a_2} = \dfrac{b_1}{b_2} = \dfrac{c_1}{c_2}$

Example 35. *If $ax^2+bx+c=0$ and $bx^2+cx+a=0$ have a common root and a, b and c are non-zero real numbers, then find the value of $(a^3+b^3+c^3)/abc$.*

Sol. Given that, $ax^2+bx+c=0$

and $bx^2+cx+a=0$ have a common root. Hence,

$$(bc-a^2)^2 = (ab-c^2)(ac-b^2)$$

$\Rightarrow b^2c^2+a^4-2a^2bc = a^2bc-ab^3-ac^3+b^2c^2$

$\Rightarrow \quad a^4+ab^3+ac^3 = 3a^2bc$

$\Rightarrow \quad \dfrac{a^3+b^3+c^3}{abc} = 3$

Example 36. *If the equation $x^2+5x+8=0$ and $ax^2+bx+c=0$; $a, b, c \in R$ have a common root, then $a:b:c$ is*

(a) $1:5:6$ (b) $1:5:8$

(c) $8:5:1$ (d) None of these

Sol. (b) Since, the quadratic equation $x^2+5x+8=0$ has imaginary roots. So, equation $ax^2+bx+c=0$ will have both roots same as the equation x^2+5x+8 has.

Thus, $\frac{a}{1}=\frac{b}{5}=\frac{c}{8} \Rightarrow a=\lambda, \ b=5\lambda, c=8\lambda$

Hence, the required ratio is $1:5:8$.

Work Book Exercise 5.4

1 If α and β are the roots of the equation $2x^2-3x-6=0$, then equation whose roots are α^2+2, β^2+2 is

$4x^2+49x+118=0$ $4x^2-49x+118=0$
$4x^2-49x-118=0$ $x^2-49x+118=0$

2 If $2+i\sqrt{3}$ is a root of $x^2+px+q=0$, where p and q are real, then (p, q) is equal to

$(-4, 7)$ $(4, -7)$
$(-7\ 4)$ $(4, 7)$

3 The equations $ax^2+bx+a=0$, $x^3-2x^2+2x-1=0$ have two roots in common. Then, $a+b$ must be equal to

1 -1
0 None of these

4 If $|x^2|+|x|-2=0$, then the value of x is equal to

2
-2
± 1
None of the above

5 If $|x-2|+|x-9|=7$, then the set of values of x is

{2, 9} (2, 7) {2} **d** [2, 9]

6 If a, b and c are three distinct positive real numbers, then the number of real roots of $ax^2+2b|x|+c=0$ is

0 1 2 4

7 If $\sin\alpha, \sin\beta$ and $\cos\alpha$ are in GP, then roots of $x^2+2x\cot\beta+1=0$ are always

equal real
imaginary greater than 1

8 If x^2+ax+b is an integer for every integer x, then

d is always an integer but b need not be an integer
b is always an integer but d need not be an integer
Cannot be discussed
a and b are always integers

9 Let $a>0$, $b>0$ and $c>0$. Then, both the roots of the equation $ax^2+bx+c=0$

are real and negative have negative real part
are rational numbers None of these

10 If p, q and r are real and $p \neq q$, then the roots of the equation $(p-q)x^2+5(p+q)x-2(p-q)=0$ are

real and equal complex
real and unequal None of these

11 If α and β are the roots of $x^2+px+q=0$ and α^4, β^4 are the roots of $x^2-rx+s=0$, then the equation $x^2-4qx+2q^2-r=0$ has always

two real roots
two positive roots
two negative roots
one positive and one negative root

12 The real roots of the equation $|x|^3-3x^2+3|x|-2=0$ are

0, 2 ±1 ± 2 1, 2

13 If α and β are the roots of the quadratic equation $6x^2-6x+1=0$, then $\frac{1}{2}(a+b\alpha+c\alpha^2+d\alpha^3)$

$+\frac{1}{2}(a+b\beta+c\beta^2+d\beta^3)$ is equal to

$\frac{12d+6c+4b+a}{12}$
$12a+6b+4c+9d$
$\frac{1}{12}(12a+6b+4c+3d)$
None of these

14 Both the roots of the equation $(x-b)(x-c)+(x-a)(x-c)+(x-a)(x-b)=0$ are always

positive negative
real None of these

Quadratic Expression and its Graph

Let a, b and c be real numbers and $a \neq 0$. Then, $f(x)=ax^2+bx+c$ is known as a quadratic expression or a quadratic polynomial in x. In this section, we shall discuss the graph of the quadratic polynomial, i.e. the curve whose equation is $y=ax^2+bx+c$, $a\neq 0$.

Consider, $y=ax^2+bx+c$

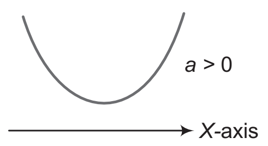
$$=a\left[\left(x+\frac{b}{2a}\right)^2+\frac{4ac-b^2}{4a^2}\right]$$

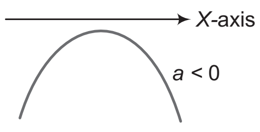
$$=a\left[\left(x+\frac{b}{2a}\right)^2-\frac{D}{4a^2}\right]$$

$$\Rightarrow \left(y+\frac{D}{4a}\right)=a\left(x+\frac{b}{2a}\right)^2$$

Thus, $y=f(x)$ represents a parabola.

The parabola opens upwards or downwards accordingly as $a>0$ or $a<0$





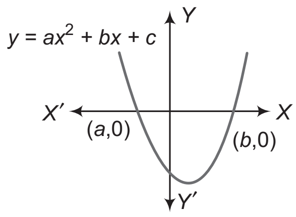
Thus, we may draw the following conclusions:

(i) **The parabola will intersect the X-axis in two distinct points iff $D>0$**

In this case, the parabola cuts X-axis at $(\alpha, 0)$ and $(\beta, 0)$, where $\alpha=\frac{-b-\sqrt{D}}{2a}$ and $\beta=\frac{-b+\sqrt{D}}{2a}$

For $a>0$, we have

$$y_{\min}=\frac{-D}{4a} \text{ at } x=\frac{-b}{2a},\ y_{\max}\to\infty$$

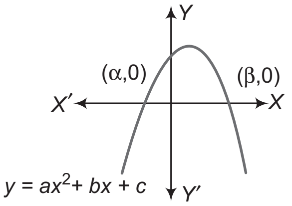


Also, $y=f(x)$ is $\begin{cases} <0, & \text{if } \alpha<x<\beta \\ =0, & \text{if } x=\alpha,\beta \\ >0, & \text{if } x<\alpha \text{ or } x>\beta \end{cases}$

For $a<0$, we have

$$y_{\max}=\frac{-D}{4a} \text{ at } x=\frac{-b}{2a},\ y_{\min}\to-\infty$$

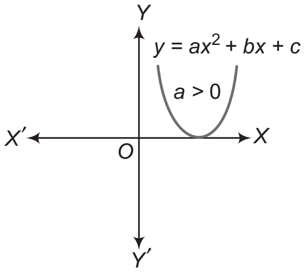
and $\quad y = f(x)$ is $\begin{cases} <0, & \text{if} \quad x < \alpha \text{ or } x > \beta \\ =0, & \text{if} \quad x = \alpha, \beta \\ >0, & \text{if} \quad \alpha < x < \beta \end{cases}$



(ii) **The parabola will just touch the X-axis at one point iff $D = 0$**

In this case, the parabola touches X-axis at $(\alpha, 0)$, when

$$\alpha = \beta = \frac{-b}{2a}$$



For $a > 0$, we have

$$y_{\min} = 0$$

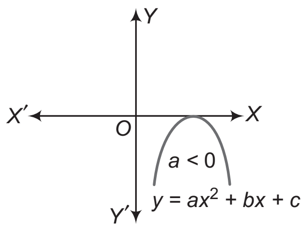
at $\quad x = \dfrac{-b}{2a}, \; y_{\max} \to \infty$

and $\quad y = f(x)$ is $\begin{cases} >0, \text{ if } x \neq \alpha \\ =0, \text{ if } x = \alpha \end{cases}$

For $a < 0$, we have

$$y_{\max} = 0 \text{ at } x = \frac{-b}{2a}, \; y_{\min} \to -\infty$$

and $\quad y = f(x) = \begin{cases} <0, \text{ if } x \neq \alpha \\ \;\;0, \;\text{ if } x = \alpha \end{cases}$



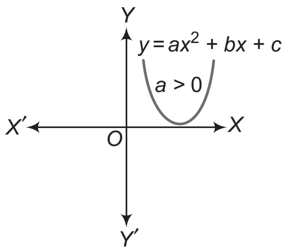
(iii) **The parabola will not intersect X-axis iff $D < 0$**

In this case, the parabola remains either completely above X-axis or completely below X-axis according as $a > 0$ or $a < 0$.

For $a > 0$, we have

$$y_{\min} = \frac{-D}{4a} \text{ at } x = \frac{-b}{2a}, \; y_{\max} \to \infty$$

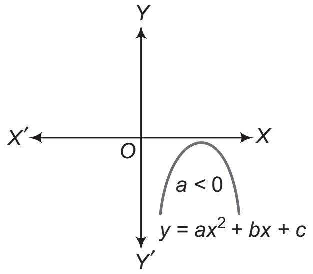
and $\quad y = f(x) > 0, \forall x$



For $a < 0$, we have

$$y_{\max} = \frac{-D}{4a} \text{ at } x = \frac{-b}{2a}, \; y_{\min} \to -\infty$$

and $\quad y = f(x) < 0, \forall x$



➘ $ax^2 + bx + c > 0, \; \forall x \in R$, *iff* $a > 0$ and $D < 0$ and

$ax^2 + bx + c < 0, \forall x \in R$, *iff* $a < 0$ and $D < 0$.

Example 37. *What is the minimum height of any point on the curve $y = x^2 - 4x + 6$ above the X-axis?*

Sol. Here, $a = 1 > 0$ and $D = 16 - 4(6) = -8 < 0$

Therefore, the parabola remains completely above X-axis and minimum value of any point on the curve is given by $\dfrac{-D}{4a}$.

i.e. $\quad y_{\min} = \dfrac{-D}{4a} = \dfrac{8}{4} = 2$

Hence, the minimum height is 2.

Example 38. *The roots of $ax^2 + bx + c = 0$, where $a \neq 0$ and coefficients are real, are non-real complex and $a + c < b$. Then,*

(a) $4a + c > 2b$

(b) $4a + c < 2b$

(c) $4a + c = 2b$

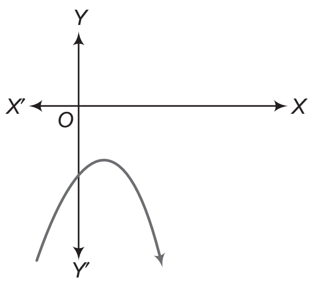
(d) None of the above

Sol. (b) Since, $f(x) = ax^2 + bx + c = 0$ has non-real roots.

Thus, either

$$f(x) > 0 \text{ or } f(x) < 0, \forall x$$

As $\quad a + c < b \Rightarrow f(-1) < 0$



i.e. $a - b + c < 0$ or $a + c < b$

$\therefore f(x) < 0, \forall x$

Thus, for all $x \in R$; $ax^2 + bx + c < 0$.

Now, for $x = -2$; $4a - 2b + c < 0$

$\Rightarrow \quad 4a + c < 2b$

Solution of Quadratic Inequations

Let $f(x) = ax^2 + bx + c$, where $a, b, c \in R$ and $a \neq 0$.

Then, $f(x) \geq 0$, $f(x) < 0$, $f(x) \leq 0$, $f(x) > 0$ are quadratic inequations. The set of all real values of x, which satisfy an inequation is called its solution set.

The following example will make it clear:

Example 39. *Solve the inequation* $-x^2 + 3x + 4 < 0$.

Sol. We have,

$$-x^2 + 3x + 4 < 0$$
$$\Rightarrow \quad x^2 - 3x - 4 > 0$$
$$\Rightarrow \quad (x-4)(x+1) > 0$$

$$\begin{array}{ccccc} + & & - & & + \\ & -1 & & 4 & \end{array}$$

$$\Rightarrow \quad x < -1$$
or
$$x > 4$$
$$\Rightarrow \quad x \in (-\infty, -1) \cup (4, \infty)$$

Frequently used inequalities

- $(x-a)(x-b) < 0 \Rightarrow x \in (a, b)$, *where* $a < b$
- $(x-a)(x-b) > 0 \Rightarrow x \in (-\infty, a) \cup (b, \infty)$, *where* $a < b$
- $x^2 \leq a^2 \Rightarrow x \in [-a, a]$
- $x^2 \geq a^2 \Rightarrow x \in (-\infty, -a] \cup [a, \infty)$
- *If* $ax^2 + bx + c < 0, (a > 0)$
  $\Rightarrow x \in (\alpha, \beta)$, *where* α and β $(\alpha < \beta)$ *are roots of the equation* $ax^2 + bx + c = 0$
- *If* $ax^2 + bx + c > 0, (a > 0)$
  $\Rightarrow x \in (-\infty, \alpha) \cup (\beta, \infty)$, *where* α and $\beta (\alpha < \beta)$ *are roots of the equation* $ax^2 + bx + c = 0$.

Maximum and Minimum Values of Rational Expression

Here, we shall find the values attained by a rational expression of the form $\dfrac{a_1x^2 + b_1x + c_1}{a_2x^2 + b_2x + c_2}$ for real values of x.

The following algorithm will explain the procedure:

Algorithm

***Step* I** Equate the given rational expression to y.

***Step* II** Obtain a quadratic equation in x by simplifying the expression in Step I.

***Step* III** Obtain the discriminant of the quadratic equation in Step II.

***Step* IV** Put discriminant ≥ 0 and solve the inequation for y. The values of y so obtained determines the set of values attained by the given rational expression.

Example 40. *If x is real, then prove that the values of* $\dfrac{x^2 - 3x + 4}{x^2 + 3x + 4}$ *lie between* $\dfrac{1}{7}$ *and* 7.

Sol. Let $y = \dfrac{x^2 - 3x + 4}{x^2 + 3x + 4}$. Then,

$$x^2(y-1) + 3x(y+1) + 4(y-1) = 0$$

Now, if $\quad D \geq 0$

$$\Rightarrow \quad 9(y+1)^2 - 16(y-1)^2 \geq 0$$
$$\Rightarrow \quad -7y^2 + 50y - 7 \geq 0$$
$$\Rightarrow \quad 7y^2 - 50y + 7 \leq 0$$
$$\Rightarrow \quad (7y-1)(y-7) \leq 0$$
$$\Rightarrow \quad \frac{1}{7} \leq y \leq 7$$

Hence, the given expression lies between $\dfrac{1}{7}$ and 7.

Example 41. *If* $f(x) = \dfrac{x^2 - 1}{x^2 + 1}$ *for every real number x, then the minimum value of f*

(a) does not exist because f is unbounded
(b) is not attained even though f is bounded
(c) is equal to 1
(d) is equal to -1

Sol. (d) Let $y = \dfrac{x^2 - 1}{x^2 + 1}$

$$\Rightarrow \quad yx^2 + y - x^2 + 1 = 0$$
$$\Rightarrow \quad x^2(y-1) + y + 1 = 0$$

Now, for real values of x consider $D \geq 0$

$$\Rightarrow \quad -4(y^2 - 1) \geq 0$$
$$\Rightarrow \quad y^2 - 1 \leq 0$$
$$\Rightarrow \quad -1 \leq y \leq 1$$

Thus, minimum value of $f(x)$ is -1.

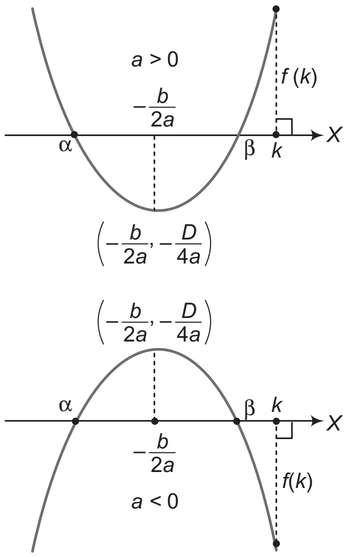
Location of the Roots of a Quadratic Equation

Here, we shall discuss various conditions satisfied by the coefficients of a quadratic equation when the location of its roots is given.

Let $f(x) = ax^2 + bx + c$, $a, b, c \in R$, $a \neq 0$ and α, β be the roots of $f(x) = 0$. Suppose $k, k_1, k_2 \in R$ and $k_1 < k_2$.

Then, the following hold good :

i. **Conditions for a number k** (If both the roots of $f(x)=0$ are less than k)

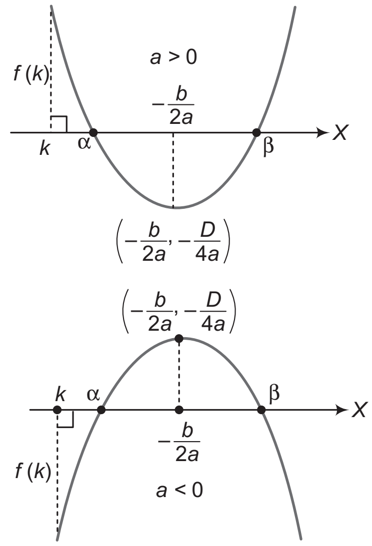


(a) $D \geq 0$ (roots may be equal)

(b) $af(k) > 0$

(c) $k > -\dfrac{b}{2a}$, where $\alpha \leq \beta$

ii. **Conditions for a number k** (If both the roots of $f(x)=0$ are greater than k)



(a) $D \geq 0$ (roots may be equal)

(b) $af(k) > 0$

(c) $k < -\dfrac{b}{2a}$, where $\alpha \leq \beta$

Example 42. *Find the values of m for which both roots of equation $x^2 - mx + 1 = 0$ are less than unity.*

Sol. Let $f(x) = x^2 - mx + 1$, as both roots of $f(x) = 0$ are less than 1, we can take $D \geq 0$, $af(1) > 0$

and $-\dfrac{b}{2a} < 1$.

***Case* I** Consider, $D \geq 0$

$$(-m)^2 - 4 \cdot 1 \cdot 1 \geq 0$$

$$\Rightarrow \quad (m+2)(m-2) \geq 0$$

$$\Rightarrow \quad m \in (-\infty, -2] \cup [2, \infty) \quad \ldots(\text{i})$$

***Case* II** Consider, $af(1) > 0$

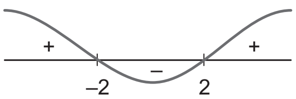
$$1 \cdot (1 - m + 1) > 0$$

$$\Rightarrow \quad m - 2 < 0$$

$$\Rightarrow \quad m < 2$$

$$\Rightarrow \quad m \in (-\infty, 2) \quad \ldots(\text{ii})$$

***Case* III** Consider, $-\dfrac{b}{2a} < 1$



$$\frac{m}{2} < 1$$

$$\Rightarrow \quad m < 2$$

$$\Rightarrow \quad m \in (-\infty, 2) \quad \ldots(\text{iii})$$

Hence, the values of m satisfying Eqs. (i), (ii) and (iii) at the same time are $m \in (-\infty, -2]$.

Example 43. *For what values of $m \in R$, both roots of the equation $x^2 - 6mx + 9m^2 - 2m + 2 = 0$ exceed 3?*

Sol. Let $f(x) = x^2 - 6mx + 9m^2 - 2m + 2$.

as both roots of $f(x) = 0$ are greater than 3, we can take $D \geq 0$, $af(3) > 0$ and $-\dfrac{b}{2a} > 3$.

***Case* I** Consider, $D \geq 0$

$$(-6m)^2 - 4 \cdot 1 \cdot (9m^2 - 2m + 2) \geq 0 \Rightarrow 8m - 8 \geq 0$$

$$\therefore \quad m \geq 1 \quad \text{or} \quad m \in [1, \infty) \quad \ldots(\text{i})$$

***Case* II** Consider, $af(3) > 0$

$$1 \cdot (9 - 18m + 9m^2 - 2m + 2) > 0$$

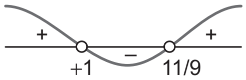
$$\Rightarrow \quad 9m^2 - 20m + 11 > 0$$

$$\Rightarrow \quad (9m - 11)(m - 1) > 0$$

$$\Rightarrow \quad \left(m - \frac{11}{9}\right)(m - 1) > 0$$

$$\Rightarrow \quad m \in (-\infty, 1) \cup \left(\frac{11}{9}, \infty\right) \quad \ldots(\text{ii})$$

***Case* III** Consider, $-\dfrac{b}{2a} > 3$

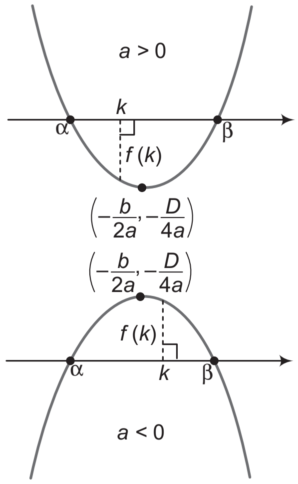


$$\frac{6m}{2} > 3 \Rightarrow m > 1$$

$$\Rightarrow \quad m \in (1, \infty) \quad \ldots(\text{iii})$$

Hence, the values of m satisfying Eqs. (i), (ii) and (iii) at the same time are $m \in \left(\dfrac{11}{9}, \infty\right)$.

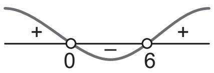
iii. **Conditions for a number k** (If k lies between the roots of $f(x) = 0$)



(a) $D > 0$ (b) $af(k) < 0$, where $\alpha < \beta$

Example 44. *Find all values of p, so that 6 lies between roots of the equation* $x^2 + 2(p-3)x + 9 = 0$.

Sol. Let $f(x) = x^2 + 2(p-3)x + 9$ as 6 lies between the roots of $f(x) = 0$, we can take $D > 0$ and $af(6) < 0$.



***Case* I** Consider, $D > 0$

$$\{2(p-3)\}^2 - 4 \cdot 1 \cdot 9 > 0$$

$\Rightarrow \quad (p-3)^2 - 9 > 0 \quad \Rightarrow \quad p(p-6) > 0$

$\Rightarrow \quad p \in (-\infty, 0) \cup (6, \infty)$ ...(i)

***Case* II** Consider, $af(6) < 0$

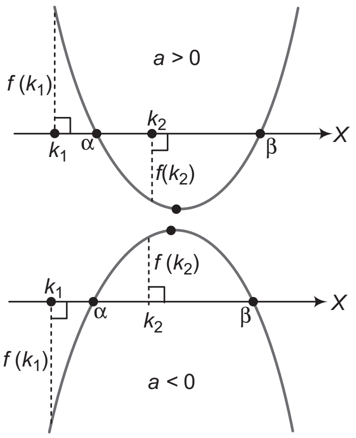
$$1 \cdot \{36 + 12(p-3) + 9\} < 0$$

$\Rightarrow \quad 12p + 9 < 0 \quad \Rightarrow \quad p + \frac{3}{4} < 0$

$\Rightarrow \quad p \in (-\infty, -3/4)$ ...(ii)

Hence, the values of p satisfying Eqs. (i) and (ii) at the same time are $p \in (-\infty, -3/4)$.

iv. **Conditions for numbers k_1 and k_2**
(If exactly one root of $f(x) = 0$ lies in the interval (k_1, k_2)).



(a) $D > 0$
(b) $f(k_1) f(k_2) < 0$, where $\alpha < \beta$

Example 45. *Find the values of m for which exactly one root of the equation* $x^2 - 2mx + m^2 - 1 = 0$ *lies in the interval* $(-2, 4)$.

Sol. Let $f(x) = x^2 - 2mx + m^2 - 1$ as exactly one root of $f(x) = 0$ lies in the interval, we can take $D > 0$ and $f(-2) f(4) < 0$.

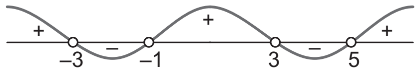
***Case* I** Consider, $D > 0$

$$(-2m)^2 - 4 \cdot 1 \cdot (m^2 - 1) > 0$$

$\Rightarrow \quad 4 > 0$

$\therefore \quad m \in R$ ...(i)

***Case* II** Consider, $f(-2) f(4) < 0$



$$(4 + 4m + m^2 - 1)(16 - 8m + m^2 - 1) < 0$$

$\Rightarrow \quad (m^2 + 4m + 3)(m^2 - 8m + 15) < 0$

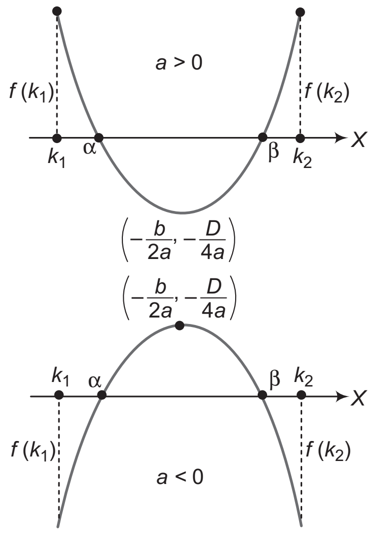
$\Rightarrow \quad (m+1)(m+3)(m-3)(m-5) < 0$

$\Rightarrow \quad (m+3)(m+1)(m-3)(m-5) < 0$

$\therefore \quad m \in (-3, -1) \cup (3, 5)$ ...(ii)

Hence, the values of m satisfying Eqs. (i) and (ii) at the same time are $m \in (-3, -1) \cup (3, 5)$.

v. **Conditions for numbers k_1 and k_2** (If both roots of $f(x) = 0$ are confined between k_1 and k_2)



(a) $D \geq 0$ (roots may be equal)
(b) $af(k_1) > 0$
(c) $af(k_2) > 0$
(d) $k_1 < -\frac{b}{2a} < k_2$, where $\alpha \leq \beta$ and $k_1 < k_2$

Example 46. *Find all values of a for which the equation* $4x^2 - 2x + a = 0$ *has two roots in the interval* $(-1, 1)$.

Sol. Let $f(x) = 4x^2 - 2x + a$ as both roots of the equation $f(x) = 0$ lie between $(-1, 1)$, we can take $D \geq 0$, $af(-1) > 0$, $af(1) > 0$ *and* $-1 < \frac{1}{4} < 1$.

***Case* I** Consider, $D \geq 0$

$$(-2)^2 - 4\cdot 4\cdot a \geq 0 \Rightarrow a \leq \frac{1}{4}$$

$$\Rightarrow \quad a \in \left(-\infty, \frac{1}{4}\right] \quad \dots\text{(i)}$$

***Case* II** Consider, $af(-1) > 0$

$$4(4 + 2 + a) > 0$$

$$\Rightarrow \quad a > -6 \Rightarrow a \in (-6, \infty) \quad \dots\text{(ii)}$$

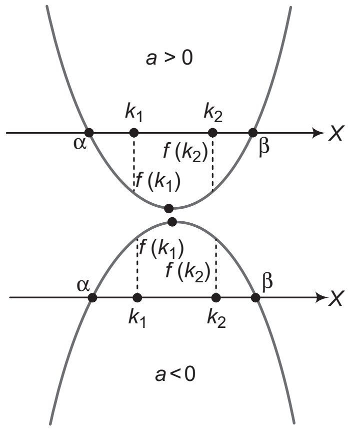
***Case* III** Consider, $af(1) > 0$

$$4(4 - 2 + a) > 0$$

$$\Rightarrow \quad a > -2 \Rightarrow a \in (-2, \infty) \quad \dots\text{(iii)}$$

Hence, the values of a satisfying Eqs. (i), (ii) and (iii) at the same time are $a \in \left(-2, \frac{1}{4}\right]$.

vi. **Conditions for numbers k_1 and k_2** (If k_1 and k_2 lie between the roots of $f(x) = 0$)



(a) $D > 0$

(b) $af(k_1) < 0$

(c) $af(k_2) < 0$, where $\alpha < \beta$

Example 47. *Find the values of a for which one root of equation $(a-5)x^2 - 2ax + a - 4 = 0$ is smaller than 1 and the other greater than 2.*

Sol. Let $f(x) = (a-5)x^2 - 2ax + a - 4 (a \neq 5)$ as 1 and 2 lie between the roots of $f(x) = 0$, we can take $D > 0$, $(a-5)f(1) < 0$ and $(a-5)f(2) < 0$.

***Case* I** Consider, $D > 0$

$$(-2a)^2 - 4\cdot(a-5)\cdot(a-4) > 0$$

$$\Rightarrow \quad 9a - 20 > 0 \Rightarrow a \in (20/9, \infty) \quad \dots\text{(i)}$$

***Case* II** Consider, $(a-5)f(1) < 0$

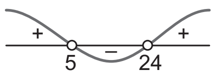
$$(a-5)(a - 5 - 2a + a - 4) < 0$$

$$\Rightarrow \quad (a-5)(-9) < 0$$

$$\Rightarrow \quad a - 5 > 0$$

$$\Rightarrow \quad a \in (5, \infty) \quad \dots\text{(ii)}$$

***Case* III** Consider, $(a-5)f(2) < 0$



$$(a-5)\{4(a-5) - 4a + a - 4\} < 0$$

$$\Rightarrow \quad (a-5)(a-24) < 0$$

$$\Rightarrow \quad a \in (5, 24) \quad \dots\text{(iii)}$$

Hence, the values of a satisfying Eqs. (i), (ii) and (iii) at the same time are $a \in (5, 24)$.

Example 48. *If the roots of the equation $x^2 - 2ax + a^2 + a - 3 = 0$ are real and less than 3, then*

(a) $a < 2$ *(b)* $2 \leq a \leq 3$

(c) $3a < a \leq 4$ *(d)* $a > 4$

Sol. (a) Let $f(x) = x^2 - 2ax + a^2 + a - 3$

Since, both roots are less than 3.

i.e. $\alpha < 3, \beta < 3$

$$\text{Sum } (S) = \alpha + \beta < 6$$

$$\Rightarrow \quad \frac{\alpha + \beta}{2} < 3 \Rightarrow \frac{2a}{2} < 3$$

$$\Rightarrow \quad a < 3 \quad \dots\text{(i)}$$

Again, product $(P) = \alpha\beta$

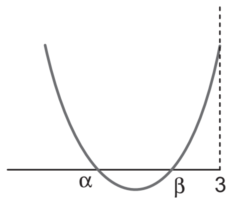
$$\Rightarrow \quad P < 9 \Rightarrow \alpha\beta < 9$$

$$\Rightarrow \quad a^2 + a - 3 < 9$$

$$\Rightarrow \quad a^2 + a - 12 < 0$$

$$\Rightarrow \quad (a-3)(a+4) < 0$$

$$\Rightarrow \quad -4 < a < 3 \quad \dots\text{(ii)}$$



Again, $D = B^2 - 4AC \geq 0$

$$\Rightarrow \quad (-2a)^2 - 4\cdot 1(a^2 + a - 3) \geq 0$$

$$\Rightarrow \quad 4a^2 - 4a^2 - 4a + 12 \geq 0$$

$$\Rightarrow \quad -4a + 12 \geq 0$$

$$\Rightarrow \quad a \leq 3 \quad \dots\text{(iii)}$$

Again, $\quad af(3) > 0$

$$\Rightarrow \quad 1[(3)^2 - 2a(3) + a^2 + a - 3] > 0$$

$$\Rightarrow \quad 9 - 6a + a^2 + a - 3 > 0$$

$$\Rightarrow \quad a^2 - 5a + 6 > 0$$

$$\Rightarrow \quad (a-2)(a-3) > 0$$

$$\therefore \quad a \in (-\infty, 2) \cup (3, \infty) \quad \dots\text{(iv)}$$

From Eqs. (i), (ii), (iii) and (iv), we get

$$a \in (-4, 2)$$

Algebraic Interpretation of Rolle's Theorem

Let $f(x)$ be a polynomial having α and β as its roots such that $\alpha < \beta$. Then, $f(\alpha) = f(\beta) = 0$. Also, a polynomial function is everywhere continuous and differentiable. Thus, $f(x)$ satisfies all the three conditions of Rolle's theorem. Consequently, there exists $\gamma \in (\alpha, \beta)$ such that $f'(\gamma) = 0$, i.e. $f'(x) = 0$ at $x = \gamma$. In other words, $x = \gamma$ is a root of $f'(x) = 0$. Thus, algebraically Rolle's theorem can be interpreted as follows:

Between any two roots of a polynomial $f(x)$, there is always a root of its derivative $f'(x)$.

Example 49. *If $a+b+c=0$, then the quadratic equation $3ax^2+2bx+c=0$ has*

(a) atleast one root in $(0, 1)$
(b) both imaginary roots
(c) one root in $(1, 2)$, other in $(-1, 0)$
(d) None of the above

Sol. (a) Consider the function $f(x) = ax^3 + bx^2 + cx$

$f(x)$ being a polynomial function is continuous and differentiable, $\forall x \in R$

$$f(0) = 0,\ f(1) = a + b + c = 0 \quad \text{[given]}$$

$$\Rightarrow \quad f(0) = f(1)$$

Thus, $f(x)$ satisfies all conditions of Rolle's theorem. So, there exists a point $k \in (0, 1)$ such that $f'(k) = 0$.

Condition for Resolution into Linear Factors

The quadratic function

$ax^2+2hxy+by^2+2gx+2fy+c$ is resolvable into linear rational factors iff

$$\Delta = abc+2fgh-af^2-bg^2-ch^2=0$$

i.e.
$$\begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix} = 0$$

Example 50. *For what values of m can the expression $2x^2+mxy+3y^2-5y-2$ be expressed as the product of two linear factors?*

Sol. Comparing the given equation with $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$, we have

$$a = 2,\ h = \frac{m}{2},\ b = 3,\ c = -2,\ f = -\frac{5}{2} \text{ and } g = 0$$

The given expression is resolvable into linear factors, if

$abc + 2hxy - af^2 - bg^2 - ch^2 = 0$

$$\Rightarrow \quad -12 - \frac{25}{2} + 2\left(\frac{m^2}{4}\right) = 0$$

$$\Rightarrow \quad m^2 = 49$$

$$\therefore \quad m = \pm 7$$

Some Application of Graphs to Find the Roots of Equations

Here, we shall discuss some examples to find the roots of equations with the help of graphs.

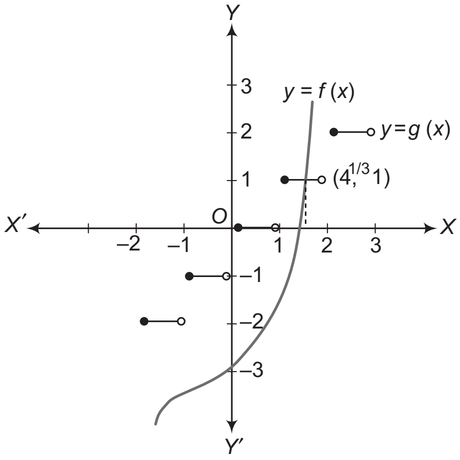
Example 51. *If $x^3-[x]=3$, where $[x]$ denotes the greatest integer less than or equal to x, then*

(a) $x \in \{4^{1/3}\}$
(b) $x \in R$
(c) Cannot be discussed
(d) None of the above

Sol. (a) We have,

$$x^3 - [x] = 3 \Rightarrow x^3 - 3 = [x]$$

Let $\quad f(x) = x^3 - 3$ and $g(x) = [x]$



Solving the given equations means finding the x-coordinates of the points of intersection of the curves $y = f(x)$ and $y = g(x)$.

If $1 < x < 2$, we have $g(x) = 1$ and $f(x) = x^3 - 3$

At the point of intersection of the two curves, we have

$$x^3 - 3 = 1 \Rightarrow x = 4^{1/3}$$

Hence, $x = 4^{1/3}$ is the solution of the equation

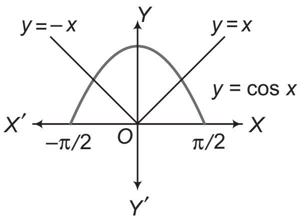
$$x^3 - [x] = 3$$

Example 52. *The number of solutions of the equation $|x| = \cos x$ are*

(a) one *(b) two* *(c) three* *(d) zero*

Sol. (b) Here, $|x| = \cos x$

Thus, to find value of x for which both curves have point of intersections.



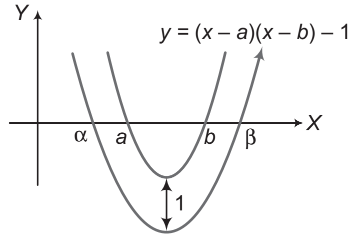
Clearly, there are two points of intersection of $y = |x|$ and $y = \cos x$.

Hence, there are two real solutions.

Example 53. *If $b > a$, then the equation $(x-a)(x-b)-1=0$ has*

(a) both roots in (a, b)
(b) both roots in $(-\infty, a)$
(c) both roots in $(b, +\infty)$
(d) one root in $(-\infty, a)$ and the other in (b, ∞)

Sol. (d)



From graph, it is clear that one of the roots of $(x - a)(x - b) - 1 = 0$ lies in $(-\infty, a)$ and other lies in (b, ∞).

Work Book Exercise 5.5

1 The number of values of k for which $\{x^2-(k-2)x+k^2\}\{x^2+kx+(2k-1)\}$ is a perfect square, is

a 1 **b** 2
c 0 **d** None of these

2 If $x^2-4x+\log_{1/2} a=0$ does not have two distinct real roots, then maximum value of a is

$\frac{1}{4}$ $\frac{1}{16}$
$-\frac{1}{4}$ None of these

3 If $c>0$ and $4a+c<2b$, then $ax^2-bx+c=0$ has a root in the interval

a (0, 2) **b** (2, 4)
c (0, 1) (–2, 0)

4 Conditions on a and b for which x^2-ax-b^2 is less than zero for atleast one positive x are

a $a-3>0, b<0$ **b** $a-3>0, b>0$
c $a, b \in R$ **d** Cannot be discussed

5 The set of possible values of λ for which $x^2-(\lambda^2-5\lambda+5)x+(2\lambda^2-3\lambda-4)=0$ has roots, whose sum and product are both less than 1, is

$\left(-1, \frac{5}{2}\right)$ (1, 4)
$\left[1, \frac{5}{2}\right]$ $\left(1, \frac{5}{2}\right)$

6 If $ax^2+bx+6=0$ does not have two distinct real roots, then the least value of $3a+b$ is

2 –2
1 –1

7 If x is real, then the least value of the expression $\frac{x^2-6x+5}{x^2+2x+1}$ is

–1 $-\frac{1}{2}$
$-\frac{1}{3}$ None of these

8 If the quadratic equation $\alpha x^2+\beta x+a^2+b^2+c^2-ab-bc-ca=0$ has imaginary roots, then

$2(\alpha-\beta)+(a-b)^2+(b-c)^2+(c-a)^2>0$
$2(\alpha-\beta)+(a-b)^2+(b-c)^2+(c-a)^2<0$
$2(\alpha-\beta)+(a-b)^2+(b-c)^2+(c-a)^2=0$
None of the above

9 Let S denotes the set of real values of d for which the roots of the equation $x^2-ax-a^2=0$ exceeds d, then S equals

a $(-\infty, 0)$
b $\left(-2, -\frac{1}{2}\right)$
c $\left(-\frac{1}{2}, \frac{1}{4}\right)$
d null set

10 $x^4-4x-1=0$ has

a exactly two positive real roots
b exactly two negative real roots
c exactly two real roots
d None of the above

11 The roots α and β of the quadratic equation are $ax^2+bx+c=0$ are real and of opposite sign. Then, the roots of the equation $\alpha(x-\beta)^2+\beta(x-\alpha)^2=0$ are

a positive
b negative
c real and of opposite sign
d imaginary

12 The graph of curve $x^2=3x-y-2$ is

a between the lines $x=1$ and $x=\frac{3}{2}$
b between the lines $x=1$ and $x=2$
c strictly below the line $4y=1$
d None of the above

13 If $0<a<5, 0<b<5$ and $\frac{x^2+5}{2}=x-2\cos(a+bx)$ is satisfied for atleast one real x, then the greatest value of $a+b$ is

a π
b $\frac{\pi}{2}$
c 3π
d 4π

14 If the roots of $ax^2-bx-c=0$ change by the same quantity, then the expression in a, b and c that does not change, is

a $\frac{b^2-4ac}{a^2}$
b $\frac{b-4c}{a}$
c $\frac{b^2+4ac}{a^2}$
d None of the above

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. If $0x^2 + x + |x| + 1 \leq 0$, then x lies in

(a) $(0, \infty)$ (b) $(-\infty, 0)$
(c) R (d) ϕ

Sol. $x^2 + x + |x| + 1 \leq 0$ gives two cases due to $|x|$.

***Case* I** When $x \geq 0$ …(i)

$$x^2 + 2x + 1 \leq 0 \quad \text{or} \quad (x+1)^2 \leq 0$$

$\Rightarrow$ $x + 1 = 0$

$\therefore$ $x = -1$ but $x \geq 0$ [from Eq. (i)]

$\therefore$ No value of $x \geq 0$.

***Case* II** When $x < 0$ …(ii)

$$x^2 + x - x + 1 \leq 0$$

$\Rightarrow$ $x^2 + 1 \leq 0$

which is not true for any value of $x < 0$

$\therefore$ No value of $x < 0$

From above two cases no value of x is possible i.e. $x \in \phi$.

Hence, (d) is the correct answer.

Ex 2. If $|x-1| + |x| + |x+1| \geq 6$, then x lies in

(a) $(-\infty, 2]$ (b) $(-\infty, -2] \cup [2, \infty)$
(c) R (d) ϕ

Sol. $|x-1| + |x| + |x+1| \geq 6$, gives four cases

***Case* I** When $x < -1$ …(i)

Then, $-(x+1) - x - (x-1) \geq 6$

$\Rightarrow$ $-x - 1 - x - x + 1 \geq 6$

$\Rightarrow$ $-3x \geq 6$ or $x \leq -2$ …(ii)

From Eqs. (i) and (ii), $x \leq -2$

***Case* II** When $-1 \leq x \leq 0$ …(iii)

$\Rightarrow$ $x + 1 - x - (x-1) \geq 6$

$\Rightarrow$ $1 - x + 1 \geq 6 \Rightarrow x \leq -4$ …(iv)

$\therefore$ No value of x. [from Eqs. (iii) and (iv)]

***Case* III** When $0 \leq x \leq 1$ …(v)

$\Rightarrow$ $x + 1 + x - (x-1) \geq 6$

$\Rightarrow$ $x \geq 4$ …(vi)

No solution, using Eqs. (v) and (vi).

***Case* IV** When $x > 1$ …(vii)

$\Rightarrow$ $x + 1 + x + x - 1 \geq 6$

$\Rightarrow$ $3x \geq 6$ or $x \geq 2$ …(viii)

From Eqs. (vii) and (viii), $x \geq 2$

Thus, from above four cases,

$$x \leq -2 \quad \text{or} \quad x \geq 2$$

$\Rightarrow$ $x \in (-\infty, -2] \cup [2, \infty)$

Aliter

As discussed above, solution exists only when all are positive or negative:

Thus, $|x+1| + |x| + |x-1| \geq 6$

$\Rightarrow$ $-(x+1) - (x) - (x-1) \geq 6$

or $(x+1) + x + (x-1) \geq 6$

$\Rightarrow$ $-3x \geq 6$

or $3x \geq 6$

$\Rightarrow$ $x \leq -2$

or $x \geq 2$

$\Rightarrow$ $x \in (-\infty, -2] \cup [2, \infty)$

Hence, (b) is the correct answer.

Ex 3. If $a_1, a_2, \ldots, a_n$ are positive real numbers whose product is a fixed real number c, then the minimum value of $a_1 + a_2 + \ldots + a_{n-1} + 2a_n$ is

(a) $n(2c)^{1/n}$

(b) $(n+1)c^{1/n}$

(c) $2nc^{1/n}$

(d) $(n+1)(2c)^{1/n}$

Sol. We have,

$$\frac{1}{n}(a_1 + a_2 + \ldots + a_{n-1} + 2a_n)$$

$$\geq [a_1 a_2 \ldots a_{n-1}(2a_n)]^{1/n} = (2c)^{1/n} \quad \text{[using AM} \geq \text{GM]}$$

$\Rightarrow$ $a_1 + a_2 + \ldots + a_{n-1} + 2a_n \geq n(2c)^{1/n}$

Thus, minimum value of $a_1 + a_2 + \ldots + a_{n-1} + 2a_n$ is $n(2c)^{1/n}$.

Hence, (a) is the correct answer.

Ex 4. Solution set of

$$\log_3(x^2 - 2) < \log_3\left(\frac{3}{2}|x| - 1\right) \text{ is}$$

(a) $(-\sqrt{2}, -1)$ (b) $(-2, -\sqrt{2})$
(c) $(-\sqrt{2}, 2)$ (d) None of these

Sol. We have,

$$x^2 - 2 > 0, \ \frac{3}{2}|x| - 1 > 0$$

and $$x^2 - 2 < \frac{3}{2}|x| - 1$$

$\Rightarrow$ $x^2 > 2, \ |x| > \frac{2}{3}$ and $|x|^2 - \frac{3}{2}|x| - 1 < 0$

$\Rightarrow$ $|x| > \sqrt{2}$ and $|x| < 2$

$\Rightarrow$ $x \in (-2, -\sqrt{2}) \cup (\sqrt{2}, 2)$

Hence, (d) is the correct answer.

Ex 5. Solution set of the inequality

$$\frac{1}{2^x - 1} > \frac{1}{1 - 2^{x-1}} \text{ is}$$

(a) $(1, \infty)$ (b) $\left[0, \log_2\left(\frac{4}{3}\right)\right]$

(c) $(-1, \infty)$ (d) $\left[0, \log_2\left(\frac{4}{3}\right)\right] \cup (1, \infty)$

Sol. Put $2^x = t$, then $t > 0$. The given inequality becomes

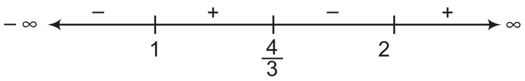
$$\frac{1}{t-1} > \frac{2}{2-t}$$

$$\Rightarrow \quad \frac{1}{t-1} - \frac{2}{2-t} > 0$$

$$\Rightarrow \quad \frac{2-t-2t+2}{(t-1)(2-t)} > 0$$

$$\Rightarrow \quad \frac{4-3t}{(t-1)(2-t)} > 0$$

$$\Rightarrow \quad \frac{(3t-4)}{(t-1)(t-2)} > 0$$



$$\Rightarrow \quad 1 < t < \frac{4}{3} \quad \text{or} \quad t > 2$$

$$\Rightarrow \quad 1 < 2^x < \frac{4}{3} \quad \text{or} \quad 2^x > 2$$

$$\Rightarrow \quad 0 < x < \log_2\left(\frac{4}{3}\right) \quad \text{or} \quad x > 1$$

Hence, (d) is the correct answer.

Ex 6. Given, $n^4 < 10^n$ for a fixed positive integer $n \ge 2$, then

(a) $(n+1)^4 < 10^{n+1}$ (b) $(n+1)^4 > 10^{n+1}$
(c) $(n-1)^4 < 10^{n+2}$ (d) None of these

Sol. We have,

$$\left(\frac{n+1}{n}\right)^4 = \left(1+\frac{1}{n}\right)^4 \le \left(1+\frac{1}{2}\right)^4 = \left(\frac{3}{2}\right)^4 < 10 \quad [\because n \ge 2]$$

$$\Rightarrow \quad (n+1)^4 \le n^4 \cdot 10 < 10^n \cdot 10 = 10^{n+1}$$

Hence, (a) is the correct answer.

Ex 7. If x_1, x_2, x_3 and x_4 are four positive real numbers such that $x_1 + \frac{1}{x_2} = 4, x_2 + \frac{1}{x_3} = 1$, $x_3 + \frac{1}{x_4} = 4$ and $x_4 + \frac{1}{x_1} = 1$, then

(a) $x_1 = x_3$ and $x_2 = x_4$ (b) $x_2 = x_4$ but $x_1 \ne x_3$
(c) $x_1 x_2 = 1, x_3 x_4 \ne 1$ (d) $x_3\ x_4 = 1, x_1 x_2 \ne 1$

Sol. Using AM $\ge$ GM,

$$x_1 + \frac{1}{x_2} \ge 2\sqrt{\frac{x_1}{x_2}}\ ; \ x_2 + \frac{1}{x_3} \ge 2\sqrt{\frac{x_2}{x_3}}$$

$$x_3 + \frac{1}{x_4} \ge 2\sqrt{\frac{x_3}{x_4}}\ ; \ x_4 + \frac{1}{x_1} \ge 2\sqrt{\frac{x_4}{x_1}}$$

$$\Rightarrow \quad \left(x_1 + \frac{1}{x_2}\right)\left(x_2 + \frac{1}{x_3}\right)\left(x_3 + \frac{1}{x_4}\right)\left(x_4 + \frac{1}{x_1}\right) \ge 2^4$$

$$\text{But} \left(x_1 + \frac{1}{x_2}\right)\left(x_2 + \frac{1}{x_3}\right)\left(x_3 + \frac{1}{x_4}\right)\left(x_4 + \frac{1}{x_1}\right) = 16$$

$$\therefore \quad x_1 = \frac{1}{x_2}, x_2 = \frac{1}{x_3}, x_3 = \frac{1}{x_4}, x_4 = \frac{1}{x_1}$$

$$\Rightarrow \quad x_1 = 2, x_2 = \frac{1}{2}, x_3 = 2, x_4 = \frac{1}{2}$$

Hence, (a) is the correct answer.

Ex 8. If roots of the equation

$$x^4 - 8x^3 + bx^2 + cx + 16 = 0$$

are positive, then

(a) $b = 8 = c$ (b) $c = -32, b = -24$
(c) $b = 24, c = -32$ (d) $c = 32, b = 24$

Sol. If x_1, x_2, x_3 and x_4 are four roots of given equation, then

$$x_1 + x_2 + x_3 + x_4 = 8 \text{ and } x_1\ x_2\ x_3\ x_4 = 16$$

As AM $\ge$ GM, we get

$$2 = \frac{1}{4}(x_1 + x_2 + x_3 + x_4) \ge (x_1x_2x_3x_4)^{1/4} = 2$$

i.e. AM = GM

Thus, $x_1 = x_2 = x_3 = x_4 = 2$

$$\therefore \quad x^4 - 8x^3 + bx^2 + cx + 16 = (x-2)^4$$

$$\Rightarrow \quad b = 24 \quad \text{and} \quad c = -32$$

Hence, (c) is the correct answer.

Ex 9. If a, b and c are three positive real numbers such that $a + b \ge c$, then

(a) $\frac{a}{1+a} + \frac{b}{1+b} \ge \frac{c}{1+c}$ (b) $\frac{a}{1+a} + \frac{b}{1+b} < \frac{c}{1+c}$
(c) $\frac{a}{1+a} + \frac{b}{1+b} > \frac{c}{1+c}$ (d) None of these

Sol. We have,

$$\frac{a}{1+a} + \frac{b}{1+b} \ge \frac{a}{1+a+b} + \frac{b}{1+a+b}$$

$$= \frac{a+b}{1+a+b} = \frac{1}{\frac{1}{a+b}+1}$$

Since, $a + b \ge c$, we get

$$\frac{1}{a+b} \le \frac{1}{c} \Rightarrow 1 + \frac{1}{a+b} \le 1 + \frac{1}{c} \Rightarrow \frac{1}{\frac{1}{a+b}+1} \ge \frac{1}{\frac{1}{c}+1}$$

$$\text{Thus, } \frac{a}{1+a} + \frac{b}{1+b} \ge \frac{1}{\frac{1}{c}+1} \ge \frac{1}{\frac{1}{c}+1} = \frac{c}{1+c}$$

Hence, (a) is the correct answer.

Ex 10. If $a_i > 0$ for $i = 1, 2, \ldots, n$ and $a_1 a_2 \ldots a_n = 1$, then minimum value of $(1+a_1)(1+a_2)\ldots(1+a_n)$ is

(a) $2^{n/2}$ (b) 2^n
(c) 2^{2n} (d) 1

Sol. We have,

$$\frac{1}{2}(1+a_1) \ge \sqrt{1 \cdot a_1} = \sqrt{a_1} \quad [\text{using A.M} \ge \text{G.M.}]$$

$$\frac{1}{2}(1+a_2) \ge \sqrt{1 \cdot a_2} = \sqrt{a_2}$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$\frac{1}{2}(1+a_n) \ge \sqrt{1 \cdot a_n} = \sqrt{a_n}$$

On multiplying above inequalities, we get

$$\frac{1}{2^n}(1+a_1)(1+a_2)\ldots(1+a_n) \ge \sqrt{a_1\ a_2 \ldots a_n} = 1$$

$$\Rightarrow \quad (1+a_1)(1+a_2)\ldots(1+a_n) \ge 2^n$$

Hence, (b) is the correct answer.

Ex 11. If a, b and c are the sides of a triangle, then

$$\frac{a}{b+c-a}+\frac{b}{c+a-b}+\frac{c}{a+b-c}$$

(a) ≤ 3 (b) ≥ 3
(c) ≥ 2 (d) ≤ 2

Sol. As a, b and c are sides of a triangle, $b+c-a$, $c+a-b, a+b-c>0$.

Let $x=b+c-a$, $y=c+a-b$ and $z=a+b-c$

$\Rightarrow$ $y+z=2a, z+x=2b$ and $x+y=2c$

Thus, LHS of the inequality

$$=\frac{y+z}{2x}+\frac{z+x}{2y}+\frac{x+y}{2z}$$

$$=\frac{1}{2}\left(\frac{y}{x}+\frac{x}{y}+\frac{x}{z}+\frac{z}{x}+\frac{y}{z}+\frac{z}{y}\right)$$

$$\geq \frac{6}{2}\left(\frac{y}{x}\cdot\frac{x}{y}\cdot\frac{x}{z}\cdot\frac{z}{x}\cdot\frac{y}{z}\cdot\frac{z}{y}\right)^{1/6}=3 \quad [\because \text{AM} \geq \text{GM}]$$

Hence, (b) is the correct answer.

Ex 12. If $a+b+c=6$, then

$$\sqrt{4a+1}+\sqrt{4b+1}+\sqrt{4c+1}$$

(a) ≤ 9 (b) ≥ 9 (c) >9 (d) <9

Sol. By the Cauchy-Schwartz's inequality,

$$(\sqrt{4a+1})+\sqrt{4b+1}+\sqrt{4c+1})^2$$
$$\leq (1+1+1)(4a+1+4b+1+4c+1)$$
$$=3[4(a+b+c)+3]=(3)(27)$$
$$\Rightarrow \quad \sqrt{4a+1}+\sqrt{4b+1}+\sqrt{4c+1}\leq 9$$

Hence, (a) is the correct answer.

Ex 13. If a, b and $c \in R$, then the square root of $a^2+b^2+c^2-bc-ca-ab$ is greater than or equal to

(a) $\frac{\sqrt{3}}{2}\max\{|b-c|, |c-a|, |a-b|\}$

(b) $\frac{3}{2}\max\{|b-c|, |c-a|, |a-b|\}$

(c) $\max\{|b-c|, |c-a|, |a-b|\}$

(d) $\frac{\sqrt{3}}{4}\max\{|b-c|, |c-a|, |a-b|\}$

Sol. We have, $a^2+b^2+c^2-bc-ca-ab$

$$=\frac{1}{2}[(b^2+c^2-2bc)+(c^2+a^2-2ca)+(a^2+b^2-2ab)]$$

$$=\frac{1}{2}[(b-c)^2+(c-a)^2+(a-b)^2]\geq 0$$

Also, $a^2+b^2+c^2-bc-ca-ab-\frac{3}{4}(b-c)^2$

$$=\frac{1}{4}[4a^2+4b^2+4c^2-4bc-4ca-4ab-3(b^2+c^2-2bc)]$$

$$=\frac{1}{4}[4a^2+b^2+c^2+2bc-4a(c+b)]$$

$$=\frac{1}{4}[4a^2+(b+c)^2-4a(b+c)]$$

$$=\frac{1}{4}[2a-(b+c)]^2\geq 0$$

Similarly, $a^2+b^2+c^2-bc-ca-ab\geq\frac{\sqrt{3}}{2}|c-a|$

and $a^2+b^2+c^2-bc-ca-ab\geq\frac{\sqrt{3}}{2}|a-b|$

$$\Rightarrow \quad a^2+b^2+c^2-ab-bc-ca \geq \frac{\sqrt{3}}{2}\max\{|b-c|, |c-a|, |a-b|\}$$

Hence, (a) is the correct answer.

Ex 14. If a, b and c are three distinct positive real numbers, then the number of real roots of $ax^2+2b|x|-c=0$ is

(a) 4
(b) 2
(c) 0
(d) None of the above

Sol. $a|x|^2+2b|x|-c=0$

$$\therefore \quad |x|=\frac{-2b\pm\sqrt{4b^2+4ac}}{2}$$
$$=-b\pm\sqrt{b^2+ac}$$

Since, a, b and c are positive. So, $|x|=-b+\sqrt{b^2+ac}$

$\therefore$ x has two real values, neglecting

$$|x|=-b-\sqrt{b^2+ac}, \text{ as } |x|\geq 0$$

Hence, (b) is the correct answer.

Ex 15. If the ratio of the roots of $\lambda x^2+\mu x+\nu=0$ is equal to the ratio of the roots of $x^2+x+1=0$, then λ, μ and ν are in

(a) AP
(b) GP
(c) HP
(d) None of the above

Sol. As ratio of roots for $\lambda x^2+\mu x+v=0$ and $x^2+x+1=0$ are equal.

$\therefore \frac{\alpha}{\beta}=\frac{\alpha'}{\beta'}$, where α and β are roots of $\lambda x^2+\mu x+v=0$

and α', β' are roots of $x^2+x+1=0$

Now, ω and ω^2 are the roots of $x^2+x+1=0$

$$\therefore \quad \frac{\alpha}{\beta}=\frac{\omega}{\omega^2}=\frac{1}{\omega} \Rightarrow \beta=\omega\alpha$$

and $$\alpha+\beta=-\frac{\mu}{\lambda}, \alpha\beta=\frac{\nu}{\lambda}$$

$$\Rightarrow \quad \alpha(1+\omega)=-\frac{\mu}{\lambda}, \alpha^2\omega=\frac{\nu}{\lambda}$$

$$\Rightarrow \quad -\alpha\omega^2=\frac{-\mu}{\lambda}, \alpha^2\omega=\frac{\nu}{\lambda}$$

$$\Rightarrow \quad \frac{\mu^2}{\lambda^2}=\frac{\nu}{\lambda} \text{ or } \mu^2=\lambda\nu$$

Hence, (b) is the correct answer.

Ex 16. If $x^2 - 2r \cdot p_r\, x + r = 0;\ r = 1, 2, 3$ are three quadratic equations of which each pair has exactly one root common, then the number of solutions of the triplet (p_1, p_2, p_3) is

(a) 2 (b) 1 (c) 9 (d) 27

Sol. $x^2 - 2p_1x + 1 = 0$ has roots α, β

$x^2 - 4p_2x + 2 = 0$ has roots α, γ

$x^2 - 6p_3x + 3 = 0$ has roots β, γ

$\Rightarrow \alpha + \beta = 2p_1, \alpha + \gamma = 4p_2, \beta + \gamma = 6p_3, \alpha\beta = 1,$
$\alpha\gamma = 2, \beta\gamma = 3$

$\therefore\ \gamma - \beta = 4p_2 - 2p_1$ and $\alpha(\gamma - \beta) = 1$

$$\Rightarrow \qquad \alpha = \frac{1}{4p_2 - 2p_1}$$

Also, $\dfrac{\beta}{\gamma} = \dfrac{1}{2} \Rightarrow 2\beta = \gamma$

$$\Rightarrow \qquad \beta \cdot 2\beta = 3$$

$$\Rightarrow \qquad \beta = \pm\sqrt{\frac{3}{2}}$$

$$\therefore \quad \frac{1}{4p_2 - 2p_1}\left(\pm\sqrt{\frac{3}{2}}\right) = 1 \qquad \ldots\text{(i)}$$

Again, $\dfrac{1}{\alpha} + \dfrac{1}{\beta} = 2p_1, \dfrac{1}{\alpha} + \dfrac{1}{\gamma} = 2p_2$

and $\dfrac{1}{\gamma} = -p_1 + p_2 + p_3$

$$\therefore \quad \frac{1}{\alpha} + \frac{1}{\beta} + \frac{1}{\gamma} = p_1 + p_2 + p_3$$

$$\Rightarrow \qquad \frac{1}{\alpha} = p_1 + p_2 - p_3$$

$$\frac{1}{\beta} = p_1 - p_2 + p_3$$

$$\frac{1}{\gamma} = -p_1 + p_2 + p_3$$

So, $\dfrac{\gamma}{\beta} = 2 = \dfrac{p_1 - p_2 + p_3}{-p_1 + p_2 + p_3}$

and $\dfrac{\alpha}{\gamma} = 3 = \dfrac{-p_1 + p_2 + p_3}{p_1 + p_2 - p_3}$

Thus, we get $\dfrac{p_1}{7} = \dfrac{p_2}{4} = \dfrac{P_3}{9} = t.$

Using this in Eq. (i), we get two values of x.

Hence, (a) is the correct answer.

Ex 17. If $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ are such that min $f(x) >$ max $g(x)$, then relation between b and c is

(a) no relation (b) $0 < c < \dfrac{b}{2}$

(c) $|c| < \sqrt{2}|b|$ (d) $|c| > \sqrt{2}|b|$

Sol. We have, $f(x) = (x + b)^2 + 2c^2 - b^2$

$$\Rightarrow \quad \min f(x) = 2c^2 - b^2$$

and $g(x) = b^2 + c^2 - (x + c)^2$

$$\Rightarrow \quad \max g(x) = b^2 + c^2$$

Thus, min $f(x) >$ max $g(x)$

$$\Rightarrow \qquad 2c^2 - b^2 > b^2 + c^2$$

$$\Rightarrow \qquad c^2 > 2b^2$$

$$|c| > \sqrt{2}\,|b|$$

Hence, (d) is the correct answer.

Ex 18. If $a \in R$ and the equation

$(a - 2)(x - [x])^2 + 2(x - [x]) + a^2 = 0$

(where, $[x]$ denotes the greatest integer $\le x$) has no integral solution and has exactly one solution in (2, 3), then a lies in the interval

(a) $(-1, 2)$ (b) $(0, 1)$

(c) $(-1, 0)$ (d) $(2, 3)$

Sol. Let $y = x - [x]$. Then, equation

$$(a - 2)(x - [x])^2 + 2(x - [x]) + a^2 = 0 \qquad \ldots\text{(i)}$$

can be written as

$$f(y) = (a - 2)y^2 + 2y + a^2 = 0 \qquad \ldots\text{(ii)}$$

As x cannot be an integer,

$$y = x - [x] \ne 0$$

When $2 < x < 3, [x] = 2$

$\Rightarrow \quad 0 < x - [x] < 1$ i.e. $0 < y < 1$

Since, Eq. (i) has exactly one solution in the interval (2, 3), Eq. (ii) has exactly one solution in the interval (0, 1). This is possible, if

$$f(0)\, f(1) < 0$$

For otherwise the Eq. (ii) has either no or two solutions in (0, 1).

$$\Rightarrow \qquad a^2\{a - 2 + 2 + a^2\} < 0$$

$$\Rightarrow \qquad a(a + 1) < 0 \qquad [\because a^2 > 0]$$

$$\Rightarrow \qquad -1 < a < 0 \quad \text{or} \quad a \in (-1, 0)$$

Hence, (c) is the correct answer.

Ex 19. If a, b and c are all distinct, then

$$a\frac{(x - b)(x - c)}{(a - b)(a - c)} + b\frac{(x - c)(x - a)}{(b - c)(b - a)} + c\frac{(x - a)(x - b)}{(c - a)(c - b)} - x \text{ is equal to}$$

(a) 0 (b) abc

(c) $a + b + c$ (d) None of these

Sol. Let

$$f(x) = a\frac{(x - b)(x - c)}{(a - b)(a - c)} + b\frac{(x - c)(x - a)}{(b - c)(b - a)} + c\frac{(x - a)(x - b)}{(c - a)(c - b)} - x$$

We have, $f(a) = 0$, $f(b) = 0$ and $f(c) = 0$, i.e. f is a trinomial which has three distinct zeroes but $f(x)$ is quadratic, so it could not have more than two zeroes.

$\Rightarrow f(x) \equiv 0$

Hence,

$$a\frac{(x - b)(x - c)}{(a - b)(a - c)} + b\frac{(x - a)(x - c)}{(b - a)(b - c)} + c\frac{(x - a)(x - b)}{(c - a)(c - b)} \equiv 0, \forall\, x \in R$$

Hence, (a) is the correct answer.

Ex 20. If x is real, then the maximum value of $y = 2(a-x)(x+\sqrt{x^2+b^2})$ is

(a) a^2+b^2 (b) a^2
(c) $\sqrt{a^2+b^2}$ (d) $a\sqrt{a^2+b^2}$

Sol. Let $t = x + \sqrt{x^2+b^2}$

$\Rightarrow \quad \frac{1}{t} = \frac{1}{x+\sqrt{x^2+b^2}} = \frac{\sqrt{x^2+b^2}-x}{b^2}$

$\therefore \quad t - \frac{b^2}{t} = 2x$ and $t + \frac{b^2}{t} = 2\sqrt{x^2+b^2}$

Thus, $2(a-x)(x+\sqrt{x^2+b^2}) = \left(2a - t + \frac{b^2}{t}\right)(t)$

$= 2at - t^2 + b^2$
$= a^2 + b^2 - (a^2 - 2at + t^2)$
$= a^2 + b^2 - (a-t)^2$

Therefore, $y = 2(a-x)\left(x+\sqrt{x^2+b^2}\right) \le a^2 + b^2$

So, the maximum value of y is a^2+b^2. This value is attained at $t = a$ or $x = \frac{a^2-b^2}{2a}$.

Hence, (a) is the correct answer.

Ex 21. If $a > 0$, $a \ne 1$, then the equation $2\log_x a + \log_{ax} a + 3\log_{a^2x} a = 0$ has

(a) exactly one real root
(b) two real roots
(c) no real root
(d) infinite number of real roots

Sol. The equation $2\log_x a + \log_{ax} a + 3\log_{a^2x} a = 0$ can be written as

$$\frac{2\log a}{\log x} + \frac{\log a}{\log(ax)} + \frac{3\log a}{\log(a^2x)} = 0 \qquad \ldots\text{(i)}$$

As $a > 0$ and $a \ne 1$, $\log a \ne 0$, Eq. (i) can be written as

$\frac{2}{y} + \frac{1}{b+y} + \frac{3}{2b+y} = 0$

where, $b = \log a$ and $y = \log x$

$\Rightarrow \quad 2(b+y)(2b+y) + y(2b+y) + 3y(b+y) = 0$

$\Rightarrow \quad 4b^2 + 11by + 6y^2 = 0$

$\Rightarrow y = \frac{-11b \pm \sqrt{121b^2 - 96b^2}}{12} = -\frac{4b}{3}, -\frac{b}{2}$

$\Rightarrow \quad \log x = -\frac{4}{3}\log a$ or $-\frac{1}{2}\log a$

$\Rightarrow \quad x = a^{-4/3}, a^{-1/2}$

Hence, (b) is the correct answer.

Ex 22. The set of values of p for which the roots of the equation $3x^2 + 2x + p(p-1) = 0$ are of opposite sign, is

(a) $(-\infty, 0)$ (b) $(0, 1)$
(c) $(1, \infty)$ (d) $(0, \infty)$

Sol. Since, the roots of the given equation are of opposite sign.

$\therefore$ Product of the roots < 0

$\Rightarrow \quad \frac{p(p-1)}{3} < 0 \Rightarrow p(p-1) < 0 \Rightarrow p \in (0, 1)$

Hence, (b) is the correct answer.

Ex 23. If $p, q \in \{1, 2, 3, 4\}$, then the number of equations of the form $px^2 + qx + 1 = 0$ having real roots is

(a) 15 (b) 9 (c) 7 (d) 8

Sol. For real roots, we have

$D \ge 0 \Rightarrow q^2 - 4p \ge 0 \Rightarrow q^2 \ge 4p$

If $p = 1$, then $q^2 \ge 4p \Rightarrow q^2 \ge 4 \Rightarrow q = 2, 3, 4$

If $p = 2$, then $q^2 \ge 4p \Rightarrow q^2 \ge 8 \Rightarrow q = 3, 4$

If $p = 3$, then $q^2 \ge 4p \Rightarrow q^2 \ge 12 \Rightarrow q = 4$

If $p = 4$, then $q^2 \ge 4p \Rightarrow q^2 \ge 16 \Rightarrow q = 4$

Thus, we see that there are 7 cases.

Hence, (c) is the correct answer.

Ex 24. If p and q are the roots of the equation $x^2 + px + q = 0$, then

(a) $p = 1, q = -2$
(b) $p = 0, q = 1$
(c) $p = -2, q = 0$
(d) $p = -2, q = 1$

Sol. Since, p and q are roots of the equation

$x^2 + px + q = 0 \Rightarrow p + q = -p$ and $pq = q$

$pq = q \Rightarrow q = 0$ or $p = 1$

If $q = 0$, then $p = 0$ and if $p = 1$, then $q = -2$

Hence, (a) is the correct answer.

Ex 25. If $x^2 + 6x - 27 > 0$ and $x^2 - 3x - 4 < 0$, then

(a) $x > 3$ (b) $x < 4$
(c) $3 < x < 4$ (d) $x = \frac{7}{2}$

Sol. $x^2 + 6x - 27 > 0$ and $x^2 - 3x - 4 < 0$

$\Rightarrow \quad (x+9)(x-3) > 0$ and $(x-4)(x+1) < 0$

$\Rightarrow \in (-\infty, -9) \cup (3, \infty)$ and $(-1 < x < 4)$

$\Rightarrow \quad 3 < x < 4$

Hence, (c) is the correct answer.

Ex 26. If $x^2 + ax + b$ is an integer for every integer x, then

(a) a is always an integer but b need not be an integer
(b) b is always an integer but a need not be an integer
(c) $a + b$ is always an integer
(d) Cannot be discussed

Sol. Let $f(x) = x^2 + ax + b$

Clearly, $f(0) = b \Rightarrow b$ is an integer.

Now, $f(1) = 1 + a + b$

$\Rightarrow \quad a + b$ is an integer.

Hence, (c) is the correct answer.

Ex 27. Sum of the real roots of the equation $x^2+5|x|+6=0$ is equal to

(a) 5 (b) 10
(c) -5 (d) Does not exist

Sol. Since, x^2, $5|x|$ and 6 are positive, so

$x^2+5|x|+6=0$ does not have any real root.

Therefore, sum does not exist.

Hence, (d) is the correct answer.

Ex 28. The number of real solutions of the equation $\dfrac{6-x}{x^2-4}=2+\dfrac{x}{(x+2)}$ is

(a) two (b) one
(c) zero (d) None of these

Sol. $\dfrac{6-x}{x^2-4}=2+\dfrac{x}{(x+2)}$

$\Rightarrow \quad \dfrac{6-x}{x^2-4}=\dfrac{2x+4+x}{(x+2)}$

$\Rightarrow \quad \dfrac{6-x}{x^2-4}=\dfrac{3x+4}{x+2}$

$\Rightarrow \quad 6-x=\dfrac{(3x+4)(x+2)(x-2)}{x+2}$

$\Rightarrow \quad 6-x=(3x+4)(x-2)$ [where, $x+2\neq 0$]

$\Rightarrow 3x^2-x-14=0,\ x\neq -2$

$\Rightarrow \quad x=-2,\dfrac{7}{3},\ x\neq -2$

$\therefore$ Only one solution

Hence, (b) is the correct answer.

Ex 29. For real θ, value of $\sin^2\theta+\cos^4\theta$ lies in the interval

(a) $[1, 2]$ (b) $\left[\dfrac{3}{4},1\right]$
(c) $\left[\dfrac{1}{4},\dfrac{5}{16}\right]$ (d) None of these

Sol. Since, $\quad 0\le\cos^2\theta\le 1$

$\Rightarrow \quad \cos^4\theta\le\cos^2\theta$

$\therefore \quad \sin^2\theta+\cos^4\theta\le\sin^2\theta+\cos^2\theta\le 1 \quad$ ...(i)

Also, $\sin^2\theta+\cos^4\theta=\sin^2\theta+(1-\sin^2\theta)^2$

$=\sin^4\theta-\sin^2\theta+1$

$=\left(\sin^2\theta-\dfrac{1}{2}\right)^2+\dfrac{3}{4}\ge\dfrac{3}{4} \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$\dfrac{3}{4}\le\sin^2\theta+\cos^4\theta\le 1$

Hence, (b) is the correct answer.

Ex 30. If $0<a<b<c$ and the roots α and β of the equation $ax^2+bx+c=0$ are imaginary, then

(a) $|\alpha|=|\beta|$ (b) $|\alpha|<1$
(c) $|b|<1$ (d) None of these

Sol. Since, roots are imaginary, therefore $b^2-4ac<0$.

The roots α and β are given by

$$\alpha=\frac{-b+i\sqrt{4ac-b^2}}{2a}$$

and $\quad \beta=\dfrac{-b-i\sqrt{4ac-b^2}}{2a}$

Therefore, $\quad |\alpha|=|\beta|$

Further, $\quad |\alpha|=\sqrt{\dfrac{b^2}{4a^2}+\dfrac{4ac-b^2}{4a^2}}=\sqrt{\dfrac{c}{a}}$

$\Rightarrow \quad |\alpha|>1 \quad [\because c>a]$

Hence, (a) is the correct answer.

Ex 31. The number of real solutions of the equation $\left(\dfrac{9}{10}\right)^x=-3+x-x^2$ is

(a) 0 (b) 1
(c) 2 (d) None of these

Sol. Let $f(x)=-3+x-x^2$. Then, $f(x)<0,\ \forall\ x$, because coefficient of $x^2<0$ and $D<0$.

Thus, LHS of the given equation is always positive whereas the RHS is always less than zero.

The given equation has no solution.

Hence, (a) is the correct answer.

Ex 32. Roots of the equation $ax^3+bx^2+cx+d=0$ remain unchanged by increasing each coefficient by one unit, then

(a) $a=b=c=d\neq 0$ (b) $a=b\neq c=d\neq 0$
(c) $a\neq b=c=d\neq 0$ (d) $a=b=c\neq d\neq 0$

Sol. ax^3+bx^2+cx+d

and $(a+1)x^3+(b+1)x^2+(c+1)x+(d+1)=0$ must be identical.

$\Rightarrow \quad \dfrac{a+1}{a}=\dfrac{b+1}{b}=\dfrac{c+1}{c}=\dfrac{d+1}{d}$

$\Rightarrow \quad a=b=c=d\neq 0$

Hence, (a) is the correct answer.

Ex 33. Complete set of values of a such that $\dfrac{x^2-x}{1-ax}$ attains all real values, is

(a) $[1,\infty)$ (b) $(0, 4]$
(c) $(0, 1]$ (d) None of these

Sol. $y=\dfrac{x^2-x}{1-ax}\Rightarrow x^2-x=y-axy$

$\Rightarrow \quad x^2+x(ay-1)-y=0$

Since, x is real $\Rightarrow (ay-1)^2+4y\ge 0$

$\Rightarrow \quad a^2y^2+2y(2-a)+1\ge 0,\ \forall\ y\in R$

$\Rightarrow \quad a^2>0,\ 4(2-a)^2-4a^2\le 0$

$\Rightarrow \quad 4+a^2-4a-a^2\le 0$

$\Rightarrow \quad a^2>0,\ 4a\ge 4$

$\Rightarrow \quad a\ge 1$

$\Rightarrow \quad a\in[1,\infty)$

Hence, (a) is the correct answer.

Ex 34. If the equations $ax^2 - 2bx + c = 0$, $bx^2 - 2cx + a = 0$ and $cx^2 - 2ax + b = 0$ all have only positive roots, then
(a) $a = b = c$ (b) $a \neq b \neq c$
(c) $a \neq b = c$ (d) $a = b \neq c$

Sol. Clearly, $\frac{b}{a} > 0, \frac{c}{a} > 0, \frac{c}{b} > 0, \frac{a}{b} > 0, \frac{a}{c} > 0, \frac{b}{c} > 0,$
Thus, a, b and c all have same signs.
Also, $b^2 \geq ac, c^2 \geq ab, a^2 \geq bc$
These last three inequalities can hold simultaneously if and only if $a = b = c$.
Hence, (a) is the correct answer.

Ex 35. If $a \in R^-$ and $a \neq -2$, then the equation
$$x^2 + a|x| + 1 = 0$$
(a) cannot have any real root
(b) must have exactly two real roots
(c) must have either exactly two real roots or no real root
(d) must have either four real roots or no real root

Sol. $x^2 + a|x| + 1 = 0$
$\Rightarrow \quad |x|^2 + a|x| + 1 = 0$
$$|x| = \frac{-a \pm \sqrt{a^2 - 4}}{2}$$
$\because \quad a < 0$ and not equal to -2.
$\Rightarrow \frac{-a + \sqrt{a^2 - 4}}{2}$ and $\frac{-a - \sqrt{a^2 - 4}}{2}$ both are positive.
Thus, there are four roots, if $a < -2$, else no real root.
Hence, (d) is the correct answer.

Ex 36. If $x^2 + ax + 1$ is a factor of $ax^3 + bx + c$, then
(a) $b + a + a^2 = 0, a = c$
(b) $b - a + a^2 = 0, a = c$
(c) $b + a - a^2 = 0, a = c$
(d) None of the above

Sol. $x^2 + ax + 1$ must divide $ax^3 + bx + c$.
Now, $\frac{ax^3 + bx + c}{x^2 + ax + 1}$
$$= a(x - a) + \frac{(b - a + a^3)x + c + a^2}{x^2 + ax + 1}$$
$\Rightarrow (b - a + a^3)x + (c + a^2) = 0, \forall x$
$\Rightarrow \quad b - a + a^3 = 0$ and $c + a^2 = 0$
Hence, (d) is the correct answer.

Ex 37. If $x^2 - (a - 3)x + a = 0$ has atleast one positive root, then
(a) $a \in (-\infty, 0) \cup [7, 9]$
(b) $a \in (-\infty, 0) \cup [7, \infty)$
(c) $a \in (-\infty, 0] \cup [9, \infty)$
(d) None of the above

Sol. $x^2 - (a - 3)x + a = 0,$
$$D = (a - 3)^2 - 4a = a^2 - 10a + 9$$
$$D \geq 0$$
$\Rightarrow \quad (a - 9)(a - 1) \geq 0$
$\Rightarrow \quad a \in (-\infty, 1] \cup [9, \infty)$

***Case* I** When both roots are positive.
$$D \geq 0$$
$\Rightarrow \quad (a - 9)(a - 1) \geq 0$
$\Rightarrow \quad D \geq 0, a > 0, a > 3$
$\Rightarrow \quad a \in [9, \infty) \quad \ldots(\text{i})$

***Case* II** When exactly one root is positive.
$\Rightarrow \quad a \leq 0 \quad \ldots(\text{ii})$
Thus, from Eqs. (i) and (ii),
$$a \in (-\infty, 0] \cup [9, \infty)$$
Hence, (c) is the correct answer.

Ex 38. If roots of $x^2 - (a - 3)x + a = 0$ are such that both of them is greater than 2, then
(a) $a \in [7, 9]$ (b) $a \in [7, \infty)$
(c) $a \in [9, 10)$ (d) $a \in [7, 9)$

Sol. $x^2 - (a - 3)x + a = 0$
$\Rightarrow \quad D = (a - 3)^2 - 4a$
$$= a^2 - 10a + 9 = (a - 1)(a - 9)$$
When both roots are greater than 2, then
$$D \geq 0, \ f(2) > 0, -\frac{B}{2A} > 2$$
$\Rightarrow (a - 1)(a - 9) \geq 0; 4 - (a - 3)2 + a > 0; \frac{a - 3}{2} > 2$
$\Rightarrow a \in (-\infty, 1] \cup [9, \infty); a < 10; a > 7$
$$a \in [9, 10)$$
Hence, (c) is the correct answer.

Ex 39. If the quadratic equation $ax^2 + bx + 6 = 0$ does not have real roots and $b \in R^+$, then
(a) $a > \max\left\{\frac{b^2}{24}, b - 6\right\}$
(b) $a < \max\left\{\frac{b^2}{24}, b - 6\right\}$
(c) $a > \min\left\{\frac{b^2}{24}, b - 6\right\}$
(d) $a < \min\left\{\frac{b^2}{24}, b - 6\right\}$

Sol. $ax^2 + bx + 6 = 0$, roots are not real.
$\Rightarrow \quad D < 0 \Rightarrow b^2 - 24a < 0 \Rightarrow a > \frac{b^2}{24}$
i.e. a is positive. $\quad \ldots(\text{i})$
Also, $\quad f(-1) > 0$
$\Rightarrow \quad a - b + 6 > 0$
$\Rightarrow \quad a > b - 6 \quad \ldots(\text{ii})$
$\Rightarrow \quad a > \max\left\{\frac{b^2}{24}, b - 6\right\}$ [from Eqs. (i) and (ii)]
Hence, (a) is the correct answer.

Ex 40. Consider the equation $x^2+2x-n=0$, where $n \in N$ and $n \in [5, 100]$. Total number of different values of n so that the given equation has integral roots, is

(a) 4 (b) 8 (c) 3 (d) 6

Sol. $x^2 + 2x - n = 0 \Rightarrow (x+1)^2 = n+1$

$$\Rightarrow \quad x = -1 \pm \sqrt{n+1}$$

Thus, $n+1$ should be a perfect square.

Since, $n \in [5, 100] \Rightarrow n+1 \in [6, 100]$

Number of perfect squares between 1 and 100 is 10.

Thus, n can take $10-2$, i.e. 8 different values.

Hence, (b) is the correct answer.

Ex 41. If $\log_2(ax^2+x+a) \geq 1, \forall x \in R$, then exhaustive set of values of a is

(a) $\left(0, 1+\frac{\sqrt{5}}{2}\right)$ (b) $\left(1-\frac{\sqrt{5}}{2}, 1+\frac{\sqrt{5}}{2}\right)$

(c) $\left(0, 1-\frac{\sqrt{5}}{2}\right)$ (d) $\left(1+\frac{\sqrt{5}}{2}, \infty\right)$

Sol. $\log_2(ax^2+x+a) \geq 1, \forall x \in R$

$$\Rightarrow \quad ax^2 + x + a \geq 2, \forall x \in R$$

$$\Rightarrow \quad ax^2 + x + (a-2) \geq 0, \forall x \in R$$

$$\Rightarrow \quad a > 0, 1 - 4a(a-2) \leq 0$$

$$\Rightarrow \quad 4a^2 - 8a - 1 \geq 0$$

$$\Rightarrow \quad a > 0, a \in \left(-\infty, 1-\frac{\sqrt{5}}{2}\right) \cup \left(1+\frac{\sqrt{5}}{2}, \infty\right)$$

$$\Rightarrow \quad a \in \left(1+\frac{\sqrt{5}}{2}, \infty\right)$$

Hence, (d) is the correct answer.

Ex 42. If $x^2-x+a-3<0$ for atleast one negative value of x, then complete set of values of 'a' is

(a) $(-\infty, 4)$

(b) $(-\infty, 2)$

(c) $(-\infty, 3)$

(d) $(-\infty, 1)$

Sol. The equation $x^2 - x + a - 3 = 0$ must have atleast one negative root.

For real roots, $D \geq 0 \quad \Rightarrow \quad 1 - 4(a-3) \geq 0$

$$\Rightarrow \quad a \leq \frac{13}{4} \quad \Rightarrow \quad a \in \left(-\infty, \frac{13}{4}\right] \quad \text{...(i)}$$

Both root will be non-negative, if

$$D \geq 0, a - 3 \geq 0$$

$$\Rightarrow \quad a \leq \frac{13}{4}, a \geq 3$$

$$\Rightarrow \quad a \in \left[3, \frac{13}{4}\right] \quad \text{...(ii)}$$

Thus, equation will have atleast one negative root, if

$$a \in \left(-\infty, \frac{13}{4}\right] \cup \left[3, \frac{13}{4}\right] \quad \text{[from Eqs. (i) and (ii)]}$$

$\Rightarrow \quad a \in (-\infty, 3)$

Hence, (c) is the correct answer.

Ex 43. If $16-x^2 > |x-a|$ is to be satisfied by atleast one negative value of x, then complete set of values of a is

(a) $\left(-16, \frac{65}{4}\right)$ (b) $\left(-8, \frac{65}{2}\right)$

(c) $(-16, 16)$ (d) $(-8, 8)$

Sol. $16 - x^2 > |x-a|$

$$\Rightarrow \quad x^2 - 16 < x - a < 16 - x^2$$

$$\Rightarrow \quad x^2 - 16 - x < -a < 16 - x^2 - x$$

$$\Rightarrow \quad x + 16 - x^2 > a > -16 + x^2 + x$$

$$\Rightarrow \quad \frac{65}{4} - \left(x - \frac{1}{2}\right)^2 > a > -16 + x^2 + x; x \leq 0$$

Since, $x \in R^- \Rightarrow a \in \left(-16, \frac{65}{4}\right)$

Hence, (a) is the correct answer.

Ex 44. If $x_1, x_2, x_3, \ldots, x_n$ are the roots of $x^n + ax + b = 0$, then the value of $(x_1-x_2)(x_1-x_3)(x_1-x_4)\ldots(x_1-x_n)$ is

(a) $nx_1 + b$ (b) $n(x_1)^{n-1}$

(c) $n(x_1)^{n-1} + a$ (d) $n(x_1)^{n-1} + b$

Sol. $x^n + x + b = (x-x_1)(x-x_2)\ldots(x-x_n)$

$$\Rightarrow \quad (x-x_2)(x-x_3)\ldots(x-x_n) = \frac{x^n+ax+b}{(x-x_1)}$$

$$\Rightarrow (x_1-x_2)(x_1-x_3)\ldots(x_1-x_n) = \lim_{x \to x_1} \frac{x^n+ax+b}{x-x_1}$$

$$= n(x_1)^{n-1} + a$$

Hence, (c) is the correct answer.

Ex 45. If $x^2+(a-b)x+(1-a-b)=0$, where $a, b \in R$, then the values of a for which equation has unequal roots for all values of b, is given by

(a) $a<1$ (b) $a>1$

(c) $a \in R$ (d) None of these

Sol. For unequal roots, $\quad D > 0$

$$\Rightarrow \quad (a-b)^2 - 4(1-a-b) > 0$$

$$\Rightarrow \quad b^2 + b(4-2a) + a^2 + 4a - 4 > 0$$

For the above quadratic inequation to be true, $\forall b \in R$, the discriminant of its corresponding equation should be less than zero.

i.e. $\quad (4-2a)^2 - 4(a^2+4a-4) < 0$

$$\Rightarrow \quad -32a + 32 < 0$$

$$\Rightarrow \quad a > 1$$

Hence, (b) is the correct answer.

Ex 46. Let a, b and c be real numbers with $a \neq 0$ and let α, β be the roots of the equation $ax^2+bx+c=0$. Then, $a^3x^2+abcx+c^3=0$ has roots

(a) $\alpha^2\beta, \beta^2\alpha$ (b) α, β^2

(c) $\alpha^2\beta, \beta\alpha$ (d) $\alpha^3\beta, \beta^3\alpha$

Sol. Dividing the equation, $a^3x^2 + abcx + c^3 = 0$ by c^2, we get $a\left(\frac{ax}{c}\right)^2 + b\left(\frac{ax}{c}\right) + c = 0$

$\Rightarrow \frac{ax}{c} = \alpha, \beta$ are roots

$\Rightarrow \quad x = \frac{c}{a}\alpha \quad$ and $\quad x = \frac{c}{a}\beta$

$\Rightarrow x = \alpha^2\beta$ and $\alpha\beta^2$ are roots of above equation.

Hence, (a) is the correct answer.

Ex 47. The values of 'a' for which $x^2 + ax + \sin^{-1}(x^2 - 4x + 5) + \cos^{-1}(x^2 - 4x + 5) = 0$ has atleast one solution, is

(a) -2 (b) $-2 + \pi$

(c) $-\frac{\pi}{4}$ (d) $-2 - \frac{\pi}{4}$

Sol. Since, $\sin^{-1}\theta$ is defined only when

$$-1 \le \theta \le 1$$

$\Rightarrow \quad -1 \le x^2 - 4x + 5 \le 1$

$\Rightarrow \quad x^2 - 4x + 4 \le 0 \quad$ and $\quad x^2 - 4x + 6 \ge 0$

$\Rightarrow \quad (x-2)^2 \le 0 \quad$ and $\quad (x-2)^2 + 2 \ge 0$

$\Rightarrow x = 2$ is only solution

Putting $x = 2$, we get

$$4 + 2a + \frac{\pi}{2} = 0$$

$\therefore \quad a = -2 - \frac{\pi}{4}$

Hence, (d) is the correct answer.

Ex 48. The set of values of x satisfying $\log_{|\sin x|}|\cos x| + \log_{|\cos x|}|\sin x| = 2$, when $x \in \left(0, \frac{\pi}{2}\right)$, is

(a) $\left\{\frac{\pi}{4}\right\}$ (b) $\left\{\frac{\pi}{3}\right\}$ (c) $\left(0, \frac{\pi}{4}\right)$ (d) $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$

Sol. Here, $\log_{|\sin x|}|\cos x| + \frac{1}{\log_{|\sin x|}|\cos x|} = 2$

$\Rightarrow \quad y + \frac{1}{y} = 2$, where $y = \log_{|\sin x|}|\cos x|$

$\Rightarrow \quad y^2 - 2y + 1 = 0$

$\Rightarrow \quad y = 1$

$\therefore \quad \log_{|\sin x|}|\cos x| = 1$

$\Rightarrow \quad |\cos x| = |\sin x|$

$\Rightarrow \quad |\tan x| = 1$

$\Rightarrow \quad x = \frac{\pi}{4}$

Hence, (a) is the correct answer.

Ex 49. If $a, b, c \in I$ and $ax^2 + bx + c = 0$ has irrational root and $\lambda \in Q = \frac{p}{q}$, where $f(x) = ax^2 + bx + c$, then $|f(\lambda)|$

(a) $\ge \frac{1}{q^2}$ (b) $< \frac{1}{q^2}$

(c) Cannot be discussed (d) None of these

Sol. Let $f(x) = ax^2 + bx + c$

Since, coefficients are integers and one root is irrational, then both the roots are irrational.

$\therefore$ For any $\lambda \in Q$, $f(\lambda) \ne 0$

$\Rightarrow f(\lambda) > 0$ or $f(\lambda) < 0$, but $f(\lambda) \ne 0$

$\therefore \quad |f(\lambda)| > 0$

or $\quad \left|a\frac{p^2}{q^2} + b\frac{p}{q} + c\right| > 0$

or $\quad \frac{1}{q^2}|ap^2 + bpq + cq^2| > 0 \quad$ ...(i)

As $a, b, c, p, q \in$ integers

$\therefore \quad |ap^2 + bpq + cq^2| \ge 1 \quad$ ...(ii)

$\Rightarrow |f(\lambda)| = \frac{1}{q^2}|ap^2 + bpq + cq^2| \ge \frac{1}{q^2}$

[from Eqs. (i) and (ii)]

Hence, (a) is the correct answer.

Ex 50. The equation $x^2 \cdot 2^{|x-3|+4} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{|x-3|+2}$ has

(a) no solution (b) two solutions

(c) $x = \pm\frac{1}{2}$ and $x \ge 3$ (d) $x \ge 3$

Sol. Here, $x^2 \cdot 2^{|x-3|+4} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{|x-3|+2}$

If $\quad x - 3 \ge 0$

$\Rightarrow \quad x^2 \cdot 2^{x-3+4} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{x-3+2}$

$\Rightarrow \quad x^2 \cdot 2^{x+1} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{x-1}$

which is always true for $x \ge 3$.

Again, if $x - 3 < 0$

$$x^2 \cdot 2^{-(x-3)+4} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{-(x-3)+2}$$

$\Rightarrow \quad x^2 \cdot 2^{7-x} + 2^{x-1} = x^2 \cdot 2^{x+1} + 2^{5-x}$

$\Rightarrow \quad x^2 \cdot 2^{7-x} - 2^{5-x} = x^2 \cdot 2^{x+1} - 2^{x-1}$

$\Rightarrow \quad 2^{5-x}(x^2 \cdot 2^2 - 1) = 2^{x-1}(x^2 \cdot 2^2 - 1)$

$\Rightarrow \quad (2^{5-x} - 2^{x-1})(4x^2 - 1) = 0$

$\Rightarrow \quad x^2 = \frac{1}{4} \quad$ and $\quad 5 - x = x - 1$

$\Rightarrow \quad x = \pm 1/2 \quad$ and $\quad x = 3$

$\therefore$ Solution set is $x = \pm\frac{1}{2} \quad$ and $\quad x \ge 3$

Hence, (c) is the correct answer.

Ex 51. For any real value of $\theta \ne \pi$, the value of the expression $y = \frac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$ is

(a) $-1 \le y \le 2$ (b) $y < 0$ and $y > 2$

(c) $-1 \le y \le 1$ (d) $y \ge 1$

Sol. Here, $y = \frac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$

$\Rightarrow (y-1)\cos^2\theta + y\cos\theta + 1 = 0$

$\Rightarrow \quad \cos\theta = -1 \quad$ and $\quad \cos\theta = \frac{1}{1-y}$

$\therefore \quad -1 < \frac{1}{1-y} < 1$

$\Rightarrow \quad \dfrac{1}{1-y}+1>0$ and $\dfrac{1}{1-y}-1<0$

$\Rightarrow \quad \dfrac{2-y}{1-y}>0$ and $\dfrac{y}{1-y}<0$

$\Rightarrow \quad y<0$ and $y>2$

Hence, (b) is the correct answer.

Ex 52. If the roots of the equation $x^2+ax+b=0$ are c and d, then one of the roots of the equation $x^2+(2c+a)x+(c^2+ac+b^2)=0$ is

(a) c (b) $d-c$ (c) $2d$ (d) $2c$

Sol. Here, $f(x)=x^2+ax+b$, then

$$f(x+c)=(x+c)^2+a(x+c)+b$$
$$=x^2+(2c+a)x+c^2+ac+b$$

which shows roots of $f(x)$ are transformed to $(x-c)$, i.e. roots of $f(x+c)=0$ are $c-c$ and $d-c$.

Thus, $x^2+(2c+a)x+c^2+ac+b^2=0$ has roots 0 and $(d-c)$.

Hence, (b) is the correct answer.

Ex 53. Number of integers, which satisfy the inequality $\dfrac{(16)^{1/x}}{(2^{x+3})}>1$, is equal to

(a) infinite (b) 0 (c) 1 (d) 4

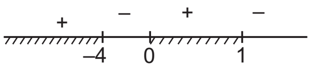
Sol. Here, $\dfrac{(16)^{1/x}}{2^{x+3}}>1$

$\Rightarrow \quad \dfrac{2^{4/x}}{2^{x+3}}>1$ or $2^{\frac{4}{x}-x-3}>1$

i.e. $\quad 2^{\frac{4}{x}-x-3}>2^0 \Rightarrow \dfrac{4}{x}-x-3>0$

$\Rightarrow -\dfrac{(x^2+3x-4)}{x}>0$ or $\dfrac{-(x+4)(x-1)}{x}>0$

Using number line rule,



$\Rightarrow \quad x\in(-\infty,-4)\cup(0,1)$

Hence, (a) is the correct answer.

Ex 54. Number of non-negative integral solution of equation $y^4+6xy^2-8x=0$ is equal to

(a) 1 (b) 2 (c) 3 (d) infinite

Sol. Here, $x=\dfrac{y^4}{8-6y^2}$ but x is non-negative.

So, $\quad \dfrac{y^4}{8-6y^2}\ge 0$

$\Rightarrow \quad 8-6y^2>0$ or $y^2<\dfrac{4}{3}$

i.e. $y=0,1$ [as y is non-negative integers]

For $y=0$, we get $x=0$

For $y=1$, we get $x=\dfrac{1}{2}\notin$ integer

$\therefore$ Only one non-negative integral solution.

Hence, (a) is the correct answer.

Ex 55. For what values of $K\in R$ the expression $2x^2+Kxy+3y^2-5y-2$ can be expressed as $(a_1x+b_1y+c_1)\cdot(a_2x+b_2y+c_2)$?

(a) $-3,-4$ (b) 2, 3
(c) 3, 4 (d) $7,-7$

Sol. As, $ax^2+2hxy+by^2+2gx+2fy+c$ can be expressed as product of two linear factors, if

$$abc+2fgh-af^2-bg^2-ch^2=0$$

$\Rightarrow 2x^2+Kxy+3y^2-5y-2$ can be expressed as $(a_1x+b_1y+c_1)(a_2x+b_2y+c_2)$, if

$$2(3)(-2)+2\left(-\frac{5}{2}\right)(0)\left(\frac{K}{2}\right)-2\left(-\frac{5}{2}\right)^2-3(0)^2-(-2)\left(\frac{K}{2}\right)^2=0$$

$\Rightarrow \quad K^2-49=0 \Rightarrow K=7,-7$

Hence, (d) is the correct answer.

Ex 56. The number of triangles formed by the lines represented by $x^3-x^2-x-2=0$ and $xy^2+2xy+4x-2y^2-4y-8=0$ is

(a) 1 (b) 2
(c) 3 (d) None of these

Sol. Here, $x^3-x^2-x-2=0$

$\Rightarrow \quad (x-2)(x^2+x+1)=0 \Rightarrow x=2$ ...(i)

and $xy^2+2xy+4x-2y^2-4y-8=0$

$\Rightarrow y^2(x-2)+2y(x-2)+4(x-2)=0$

$\Rightarrow \quad (x-2)(y^2+2y+4)=0$

$\Rightarrow \quad x=2$ ...(ii)

Both the equation represent same line. So, number of triangles is zero.

Hence, (d) is the correct answer.

Ex 57. If $x^2-(a+b+c)x+(ab+bc+ca)=0$ has imaginary roots, where $a,b,c\in R^+$, then $\sqrt{a},\sqrt{b}$ and $\sqrt{c}$

(a) can be sides of triangle
(b) cannot be side of triangle
(c) Nothing can be said
(d) None of the above

Sol. Here, $x^2-(a+b+c)x+(ab+bc+ca)=0$ has imaginary roots.

$\Rightarrow D<0$ or $(a+b+c)^2-4(ab+bc+ca)<0$

$\Rightarrow \quad (a^2+b^2+c^2-2ab-2bc+2ac)<4ac$

$\Rightarrow \quad (a-b+c)^2<4ac$

$\Rightarrow \quad -2\sqrt{ac}<a-b+c$

$\Rightarrow \quad (a+c+2\sqrt{ac})>b$

$\Rightarrow \quad (\sqrt{a}+\sqrt{c})^2>b$ or $\sqrt{a}+\sqrt{c}>\sqrt{b}$

Similarly, $\sqrt{b}+\sqrt{c}>\sqrt{a}$ and $\sqrt{a}+\sqrt{b}>\sqrt{c}$

$\Rightarrow \quad \sqrt{a},\sqrt{b}$ and $\sqrt{c}$ can be sides of triangle.

Hence, (a) is the correct answer.

Ex 58. The solution set for
$(\sqrt{2+\sqrt{2}})^x + (\sqrt{2-\sqrt{2}})^x = 2 \cdot 2^{x/4}$ is

(a) {2} (b) {0, 2} (c) {0} (d) [0, 2]

Sol. As we know, AM $\geq$ GM and equality holds only when values are equal,

$$\frac{(\sqrt{2+\sqrt{2}})^x + (\sqrt{2-\sqrt{2}})^x}{2} \geq (2^{x/2})^{1/2}$$

$$\Rightarrow \quad (\sqrt{2+\sqrt{2}})^x + (\sqrt{2-\sqrt{2}})^x \geq 2 \cdot 2^{x/4}$$

Here, equality holds only, if

$(\sqrt{2+\sqrt{2}})^x = (\sqrt{2-\sqrt{2}})^x$, i.e. $x = 0$

Hence, (c) is the correct answer.

Ex 59. If $c < a < b < d$, then roots of the equation $bx^2 + \{1 - b(c+d)\}x + bcd - a = 0$ are

(a) real and distinct in which one lie between c and a
(b) real and distinct in which one lie between c and d
(c) real and distinct in which one lie between a and b
(d) complex roots

Sol. Here, $f(x) = bx^2 + \{1 - b(c+d)\}x + bcd - a$

or $f(x) = b(x-c)(x-d) + (x-a)$

where, $f(c) = (c-a) = -$ ve

$f(d) = (d-a) = +$ ve

So, one root lies between c and d.

Hence, (b) is the correct answer.

Ex 60. If p and q are odd prime numbers, then which of the following statements about the roots of the equation $x^2 + 2px - 4q = 0$ is correct?

(a) Always integer
(b) Always irrational
(c) Always rational but never integer
(d) Nothing can be said

Sol. Here, $x^2 + 2px - 4q = 0$

$\Rightarrow \quad D = 4p^2 + 16q > 0$; as $p, q \in$ odd prime numbers

If D is perfect square, then

$$p^2 + 4q = d^2$$

$$\Rightarrow \quad 4q = d^2 - p^2 \quad \text{...(i)}$$

But $\quad d^2 - p^2 = 8k;\ k \in \text{integer} \quad \text{...(ii)}$

From Eqs. (i) and (ii), $q = 2k$ which is not possible as q is prime.

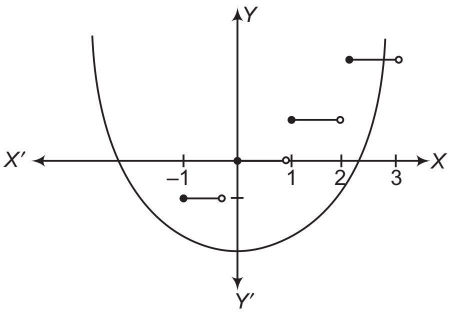
$\therefore \quad D$ is not a perfect square but positive.

Hence, (b) is the correct answer.

Ex 61. Number of solutions for $x^2 - 2 - 2[x] = 0$, (where, [ ] denotes the greatest integer function) is

(a) 0
(b) 1
(c) 2
(d) infinite

Sol. As $x^2 = 2 + 2[x]$, where LHS is always positive.



$\therefore \quad 2 + 2[x] \geq 0$

$\Rightarrow \quad [x] \geq -1$

If $[x] = -1$, then

$$x^2 - 2 = -2$$

$\Rightarrow \quad x = 0$, not possible

If $[x] = 0$, then

$\Rightarrow \quad x^2 = 4$

$\Rightarrow \quad x = \pm 2$, not possible

If $[x] = 2$, then

$$x^2 = 6$$

$\Rightarrow \quad x = \pm\sqrt{6}$, only one possible value

i.e. $\quad x = \sqrt{6}$

Hence, (b) is the correct answer.

Ex 62. The equations $x^3 + 5x^2 + px + q = 0$ and $x^3 + 7x^2 + px + r = 0$ have two roots in common. If their third roots are γ_1 and γ_2 respectively, then the ordered pair (γ_1, γ_2) is

(a) (5, 7) (b) (– 5, – 7)
(c) (– 5, 7) (d) (5, – 7)

Sol. Since, two common roots must satisfy

$(x^3 + 5x^2 + px + q) - (x^3 + 7x^2 + px + r) = 0$

i.e. $\quad -2x^2 + q - r = 0$

where, sum of common roots = 0

If $x^3 + 5x^2 + px + q = 0$ and $x^3 + 7x^2 + px + r = 0$ have roots α, β, γ_1 and α, β, γ_2, respectively.

$\therefore \quad \alpha + \beta + \gamma_1 = -5$ and $\alpha + \beta + \gamma_2 = -7$, where $\alpha + \beta = 0$

$\therefore \quad \gamma_1 = -5$ or $\gamma_2 = -7$

Hence, (b) is the correct answer.

Ex 63. Let $P(x) = 0$ be the polynomial equation of least possible degree with rational coefficients having $\sqrt[3]{7} + \sqrt[3]{49}$ as a root. Then, the product of all the roots of $P(x) = 0$ is

(a) 56 (b) 42 (c) 343 (d) 7

Sol. If $x = \sqrt[3]{7} + \sqrt[3]{49}$

$\Rightarrow \quad x^3 = 7 + 49 + 3 \cdot \sqrt[3]{7} \cdot \sqrt[3]{49} (\sqrt[3]{7} + \sqrt[3]{49})$

$\Rightarrow \quad x^3 = 56 + 21x$

$\Rightarrow \quad x^3 - 21x - 56 = 0$; where, $P(x)$ is least possible degree 3.

$\therefore \quad$ Product of all roots $= 56$

Hence, (a) is the correct answer.

Ex 64. If α and β are the roots of the equation $x^2 + px - \dfrac{1}{2p^2} = 0$, where $p \in R$, then the minimum value of $\alpha^4 + \beta^4$ is

(a) 2 (b) $2+\sqrt{2}$ (c) $2\sqrt{2}$ (d) $2-\sqrt{2}$

Sol. Here, $\alpha^4 + \beta^4 = (\alpha^2 + \beta^2)^2 - 2\alpha^2\beta^2$

$$= \{(\alpha+\beta)^2 - 2\alpha\beta\}^2 - 2(\alpha\beta)^2$$

$$= \left(p^2 + \frac{1}{p^2}\right)^2 - \frac{1}{2p^4}$$

$$= p^4 + \frac{1}{2p^4} + 2$$

$$= \left(p^2 - \frac{1}{\sqrt{2}p^2}\right)^2 + 2 + \sqrt{2} \geq 2 + \sqrt{2}$$

Thus, minimum value of $\alpha^4 + \beta^4$ is $2 + \sqrt{2}$.

Hence, (b) is the correct answer.

Ex 65. If α and β are roots of the equation $x^2 + ax + b = 0$, then maximum value of the expression $-(x^2 + ax + b) - \dfrac{(\alpha-\beta)^2}{4}$ will be

(a) $\dfrac{a^2 - 4b}{4}$ (b) $\dfrac{b^2 - 4a}{4}$

(c) 0 (d) None of these

Sol. Here, $y = -(x^2 + ax + b)$

y is maximum i.e. $y_{max} = -\dfrac{D}{4a} = -\dfrac{(a^2 - 4b)}{4}$

$\therefore \quad y_{max} = \dfrac{4b - a^2}{4} = -\dfrac{(\alpha-\beta)^2}{4}$

$\Rightarrow$ Maximum value of $-(x^2 + ax + b) - \dfrac{(\alpha-\beta)^2}{4} = 0$

Hence, (c) is the correct answer.

Ex 66. If $a, b, c > 0$ and $a(1-b) > \dfrac{1}{4}$, $b(1-c) > \dfrac{1}{4}$ and $c(1-a) > \dfrac{1}{4}$, then

(a) never possible (b) always true

(c) Cannot be discussed (d) None of these

Sol. If the given inequalities hold, then

$$a(1-b)\, b(1-c)\, c(1-a) > \frac{1}{64} \quad \text{... (i)}$$

For $x > 0$, we have

$x(1-x) = x - x^2$

$$= \frac{1}{4} - \left(\frac{1}{2} - x\right)^2 \leq \frac{1}{4} \quad \left[\because \left(\frac{1}{2} - x\right)^2 \geq 0\right]$$

$$\Rightarrow \quad a(1-a)\, b(1-b)\, c(1-c) \leq \frac{1}{64} \quad \text{... (ii)}$$

Eqs. (i) and (ii) cannot hold simultaneously.

Hence, (a) is the correct answer.

Ex 67. $x^4 - 4x - 1 = 0$

(a) all real roots (b) all imaginary roots

(c) exactly two real roots (d) None of these

Sol. Let $f(x) = x^4 - 4x - 1$

$f'(x) = 4x^3 - 4 = 4(x-1)(x^2 + x + 1)$

So, $f(x)$ decrease in $(-\infty, 1)$ and increases in $(1, \infty)$.

But $f(1) = -4$, so $f(x) = 0$ has only two real roots in which one will be positive and one will be negative. (as $f(0)$ is negative).

Hence, (c) is the correct answer.

Ex 68. If an unknown polynomial is divided by $(x-1)$ and $(x-2)$, we obtain the remainder 2 and 1 respectively, then the remainder resulting from the division of this polynomial by $(x-1)(x-2)$ is

(a) 3 (b) -3 (c) $3-x$ (d) $3-2x$

Sol. Let the polynomial be $P(x)$, when divided by $(x-1)$ leaves remainder 2 $\Rightarrow P(1) = 2$ and when $P(x)$ divided by $(x-2)$ leaves remainder 1 $\Rightarrow P(2) = 1$. When $P(x)$ is divided by $(x-1)(x-2)$, could be given by

$$P(x) = \{q(x)\}(x-1)(x-2) + r(x)$$

where, $q(x)$ is quotient and $r(x)$ is remainder.

i.e. $\quad r(x) = ax + b$

$\Rightarrow \quad P(x) = (x-1)(x-2)\,q(x) + (ax+b) \quad \text{... (i)}$

$\therefore \quad P(1) \Rightarrow 0 + a + b = 2$

and $\quad P(2) \Rightarrow 0 + 2a + b = 1$

On solving, we get $a = -1, b = 3$

$\therefore \quad$ Remainder $= -x + 3$

Hence, (c) is the correct answer.

Type 2. **More than One Correct Option**

Ex 69. If $3^{x+2} - 9^{-1/x} > 0$, then the interval of x can be

(a) $x \in (0, \infty)$ (b) $x \in (0, 250)$

(c) $x \in R$ (d) $x \in (-250, 250)$

Sol. $3^{x+2} > 9^{-1/x} \Rightarrow x + 2 > -\dfrac{2}{x} \Rightarrow \dfrac{x^2 + 2x + 2}{x} > 0$

$$\frac{(x+1)^2 + 1}{x} > 0$$

$$\Rightarrow \quad x > 0$$

Hence, (a) and (b) are the correct answers.

Ex 70. If $ax^2 - bx + c = 0$ has two distinct roots lying in the interval $(0, 1)$, $a, b, c \in N$. Then,

(a) $\log_5 abc = 1$

(b) $\log_6 abc = 2$

(c) $\log_5 abc = 3$

(d) $\log_6 abc = 4$

Sol. $\alpha + \beta = \dfrac{b}{a}, \alpha\beta = \dfrac{c}{a}, 0 < \alpha\beta < 1$

$\Rightarrow \quad 0 < (1-\alpha)\cdot(1-\beta) < 1$

$$\Rightarrow \quad 0 < \alpha(1-\alpha) \le \frac{1}{4}$$

and $$0 < \beta(1-\beta) \le \frac{1}{4}$$

$$0 < \alpha\beta(1-(\alpha+\beta)+\alpha\beta) \le \frac{1}{16}$$

$$0 < \frac{c}{a}\left(1 - \frac{b}{a} + \frac{c}{a}\right) \le \frac{1}{16}$$

$$0 < c(a-b+c) < \frac{a^2}{16}$$

$$\Rightarrow \quad a = b, c = 1$$

$$\Rightarrow \quad a^2 > 16$$

$$\Rightarrow \quad a > 4$$

$$\Rightarrow \quad a = 5$$

$$\Rightarrow \quad b = 5$$

$$\Rightarrow \quad \min(abc) = 25$$

Hence, (b), (c) and (d) are the correct answers.

Ex 71. If $ax^2 + bx + c = 0$ and $cx^2 + bx + a = 0$ $(a, b, c \in R)$ have a common non-real root, then

(a) $|b| < 2|a|$
(b) $|b| < 2|c|$
(c) $a = \pm c$
(d) $a = c$

Sol. $D_1 = b^2 - 4ac < 0$, $D_2 = b^2 - 4ac < 0$, as the root is non-real.

$\Rightarrow$ Both roots will be common.

$$\Rightarrow \quad \frac{a}{c} = \frac{b}{b} = \frac{c}{a} = 1$$

$$\Rightarrow \quad a = c$$

Now, $$b^2 - 4ac < 0$$

$$\Rightarrow \quad b^2 - 4a^2(4c^2) < 0$$

$$\Rightarrow \quad |b| < 2|a|(2|c|)$$

Hence, (a), (b) and (d) are the correct answers.

Ex 72. Consider the equation $x^2 + x - a = 0, a \in N$. If equation has integral roots, then

(a) $a = 2$
(b) $a = 6$
(c) $a = 12$
(d) $a = 20$

Sol. Discriminant, $D = \sqrt{1 + 4a}$

$\Rightarrow 1 + 4a$ should be a perfect square.

As $1 + 4a$ is always odd.

$$\Rightarrow \quad 1 + 4a = (2\lambda + 1)^2, \lambda \in I^+$$

$$\Rightarrow \quad a = \lambda(\lambda + 1)$$

Hence, (a), (b), (c) and (d) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 73-76) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

Ex 73. Statement I The quadratic equation $(a-b)x^2 + (b-c)x + (c-a) = 0$ has one root $x = 1$.

Statement II If sum of the coefficients in a quadratic equation vanishes, then its one root is $x = 1$.

Sol. **Statement I** $a - b + b - c + c - a = 0$

If quadratic equation $ax^2 + bx + c = 0$ has one root $x = 1$, then $a + b + c = 0$

Sum of coefficients = 0

Hence, (a) is the correct answer.

Ex 74. Statement I The equation $(x-p)(x-r) + \lambda(x-q)(x-s) = 0$, $p < q < r < s$ has non-real roots, if $\lambda > 0$.

Statement II The equation $ax^2 + bx + c = 0$, $a, b, c \in R$ has non-real roots, if $b^2 - 4ac < 0$.

Sol. **Statement I**

Let $f(x) = (x-p)(x-r) + \lambda(x-q)(x-s)$

If $\lambda > 0$, then $f(p) > 0$, $f(q) < 0$, $f(r) < 0$ and $f(s) > 0$

$f(x) = 0$ has one real root between p and q and other real root between r and s.

Statement II Obviously true.

Hence, (d) is the correct answer.

Ex 75. Statement I If roots of the equation $x^2 - bx + c = 0$ are two consecutive integers, then $b^2 - 4c < 1$.

Statement II If a, b and c are odd integers, then the roots of the equation $4abc\,x^2 + (b^2 - 4ac)x - b = 0$ are real and distinct.

Sol. **Statement I** Given equation $x^2 - bx + c = 0$

Let α and β be two roots such that $|\alpha - \beta| = 1$.

$$\Rightarrow \quad (\alpha+\beta)^2 - 4\alpha\beta = 1 \quad \Rightarrow \quad b^2 - 4c = 1$$

Statement II Given equation

$$4abc\,x^2 + (b^2 - 4a)x - b = 0$$

$$\therefore \quad D = (b^2 - 4ac)^2 + 16ab^2c$$

$$\Rightarrow \quad D = (b^2 + 4ac)^2 > 0$$

So, roots are real and unequal.

Hence, (d) is the correct answer.

Ex 76. **Statement I** If one root is $\sqrt{5}-\sqrt{2}$, then the equation of lowest degree with rational coefficient is $x^4 - 14x^2 + 9 = 0$.

Statement II For a polynomial equation with rational coefficient irrational roots occur in pairs.

Sol. Given a root of the equation is

$$x = \sqrt{5} - \sqrt{2}$$

On squaring both sides, we get

$$x^2 = 5 + 2 - 2\sqrt{10} \;\Rightarrow\; 7 - x^2 = 2\sqrt{10}$$

Again squaring both sides, we get

$$49 + x^4 - 14x^2 = 40 \;\Rightarrow\; x^4 - 14x^2 + 9 = 0$$

For polynomial equation with rational coefficients irrational roots occurs in pairs.

Hence, (a) is the correct answer.

Ex 77. **Statement I** The number of values of a for which $(a^2 - 3a + 2)x^2 + (a^2 - 5a + 6)x + a^2 - 4 = 0$ is an identity in x, is 2.

Statement II If $a = b = c = 0$, then equation $ax^2 + bx + c = 0$ is an identity in x.

Sol. **Statement I** $a^2 - 3a + 2 = 0$

$\Rightarrow \quad a = 1, 2$

$a^2 - 5a + 6 = 0$

$\Rightarrow \quad a = 2, 3$

$a^2 - 4 = 0$

$\Rightarrow \quad a = \pm 2$

$a = 2$ is the only solution. Hence, Statement I is false.

Statement II is true by definition.

Hence, (d) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 78-80) *Let $f(x) = x^2 + b_1x + c_1$, $g(x) = x^2 + b_2x + c_2$, real roots of $f(x) = 0$ be α, β and real roots of $g(x) = 0$ be $\alpha + \delta$, $\beta + \delta$. Least value of $f(x)$ be $-\frac{1}{4}$. Least value of $g(x)$ occurs at $x = \frac{7}{2}$.*

Ex 78. The least value of $g(x)$ is

(a) -1 (b) $-\frac{1}{2}$

(c) $-\frac{1}{4}$ (d) $-\frac{1}{3}$

Ex 79. The value of b_2 is

(a) 6 (b) -7

(c) 8 (d) 0

Ex 80. The roots of $g(x) = 0$ are

(a) 3, 4 (b) -3, 4

(c) 3, -4 (d) -3, -4

Sol. (Q. Nos. 78-80)

$(\beta - \alpha) = (\beta + \delta) - (\alpha + \delta)(\beta + \alpha)^2 - 4\alpha\beta$

$= [(\beta + \delta) + (\alpha + \delta)]^2 - 4(\beta + \delta)(\alpha + \delta)\,(-b_1)^2 - 4c_1$

$= (-b_2)^2 - 4c_2$

$$D_1 = D_2 \qquad \text{...(i)}$$

Least value of $f(x)$ is $-\frac{D_1}{4} = -\frac{1}{4} \Rightarrow D_1 = 1$

and $\quad D_2 = 1$

$\therefore \quad$ Least value of $g(x)$ is $-\frac{D_2}{4} = -\frac{1}{4}$

Least value of $g(x)$ occurs at $x = -\frac{b_2}{2} = \frac{7}{2} \Rightarrow b_2 = -7$

$$b_2^2 - 4c_2 = D_2 \;\Rightarrow\; 49 - 4c_2 = 1$$

$$\Rightarrow \quad \frac{48}{4} = c_2 \;\Rightarrow\; c_2 = 12$$

$$x^2 - 7x + 12 = 0 \;\Rightarrow\; x = 3, 4$$

78. (c) **79.** (b) **80.** (a)

Passage II (Ex. Nos. 81-83) *If roots of the equation $x^4 - 12x^3 + bx^2 + cx + 81 = 0$ are positive.*

Ex 81. Value of b is

(a) -54 (b) 54 (c) 27 (d) -27

Ex 82. Value of c is

(a) 108 (b) -108 (c) 54 (d) -54

Ex 83. Root of equation $2bx + c = 0$ is

(a) $-1/2$ (b) $1/2$ (c) 1 (d) -1

Sol. (Q. Nos. 81-83)

Let roots of $x^4 - 12x^3 + bx^2 + cx + 81 = 0$ be $\alpha, \beta, \gamma, \delta$.

$\Rightarrow \quad \alpha + \beta + \gamma + \delta = 12$ and $\alpha\beta\gamma\delta = 81$

$$\frac{\alpha + \beta + \gamma + \delta}{4} \geq (\alpha\beta\gamma\delta)^{1/4}$$

Since, $\frac{\alpha + \beta + \gamma + \delta}{4} = 3$ and $(\alpha\beta\gamma\delta)^{1/4} = 3$

$\therefore \quad \alpha = \beta = \gamma = \delta \;\Rightarrow\; \alpha = \beta = \gamma = \delta = 3$

Now, $\quad b = \sum \alpha\beta = 6 \times 9 = 54$

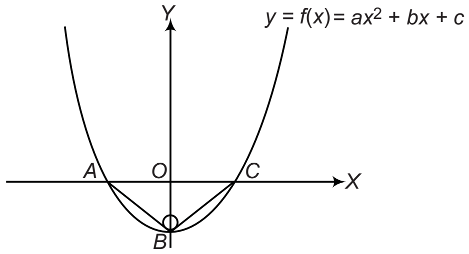
$c = -\sum \alpha\beta\gamma = -4 \times 27 = -108$

$\Rightarrow \quad 2b + c = 0$

$\therefore$ 1 is a root of equation $2bx + c = 0$.

81. (b) **82.** (b) **83.** (c)

Passage III (Ex. Nos. 84-86) *In the given figure vertices of ΔABC lie on $y = f(x) = ax^2 + bx + c$. The ΔABC is right angled isosceles triangle whose hypotaneous $AC = 4\sqrt{2}$ units, then*



Ex 84. $y = f(x)$ is given by

(a) $y = \dfrac{x^2}{2\sqrt{2}} - 2\sqrt{2}$ (b) $y = \dfrac{x^2}{2} - 2$

(c) $y = x^2 - 8$ (d) $y = x^2 - 2\sqrt{2}$

Sol. $\because \quad AC = 4\sqrt{2}$

$\therefore \quad AB = BC = \dfrac{4\sqrt{2}}{\sqrt{2}} = 4$ units

and $OB = \sqrt{4^2 - (2\sqrt{2})^2} = 2\sqrt{2}$

$\therefore \quad A(-2\sqrt{2}, 0), B(2\sqrt{2}, 0), C(0, -2\sqrt{2})$

$\because$ $y = ax^2 + bx + c$ passes through A, B and C, we get

$$y = \frac{x^2}{2\sqrt{2}} - 2\sqrt{2}$$

Hence, (a) is the correct answer.

Ex 85. Minimum value of $y = f(x)$ is

(a) $2\sqrt{2}$ (b) $-2\sqrt{2}$ (c) 2 (d) -2

Sol. Minimum value of $y = \dfrac{x^2}{2\sqrt{2}}$ at $x = 0$ is $-2\sqrt{2}$.

Hence, (b) is the correct answer.

Ex 86. Number of integral value of k for which $k/2$ lies between the roots of $f(x) = 0$, is

(a) 9 (b) 10 (c) 11 (d) 12

Sol. $\because$ Roots of $f(x) = 0$

i.e. $\dfrac{x^2}{2\sqrt{2}} - 2\sqrt{2} = 0 \Rightarrow x = \pm 2\sqrt{2}$

$\therefore$ Number of integral value, of k for which $k/2$ lies in $(-2\sqrt{2}, 2\sqrt{2})$ is 11.

Hence, (c) is the correct answer.

Type 5. **Match the Columns**

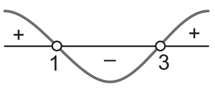
Ex 87. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	The equation $x^3 - 6x^2 + 9x + \lambda = 0$ has exactly one root in (1, 3), then $[\lambda + 1]$ is (where, [ ] denotes the greatest integer function)	p.	-3
B.	If $-3 < \dfrac{x^2 - \lambda x - 2}{x^2 + x + 1} < 2, \forall x \in R$, then $[\lambda]$ can be (where [ ] denotes the greatest integer function)	q.	-2
C.	If $x^2 + \lambda x + 1 = 0$ and $(b - c)x^2 + (c - a)x + (a - b) = 0$ have both the roots common, then $[\lambda - 1]$ is (where, [ ] denotes the greatest integer function)	r.	-1
D.	If N is the number of solutions of the equation $\lvert x - \lvert 4 - x \rvert \rvert - 2x = 4$, then the value of $-N$ is	s.	0

Sol. A. Let $f(x) = x^3 - 6x^2 + 9x + \lambda$

$\therefore \quad f'(x) = 3x^2 - 12x + 9 = 3(x - 1)(x - 3)$

$\therefore \quad f'(x) = 0$ in (1, 3)



But $f(1) = 4 + \lambda$ and $f(3) = \lambda$

For $f(x) = 0$ to have exactly one root in (1, 3)

$f(1)$ and $f(3)$ should have opposite signs

$\therefore \quad f(1)\, f(3) < 0$

$\Rightarrow \lambda(\lambda + 4) < 0 \Rightarrow -3 < \lambda + 1 < 0$

$\therefore \quad -3 < \lambda + 1 < 1$

$\Rightarrow \quad [\lambda + 1] = -3, -2, -1, 0$

B. $\because \quad -3 < \dfrac{x^2 - \lambda x - 2}{x^2 + x + 1} < 2$

$\Rightarrow -3x^2 - 3x - 3 < x^2 - \lambda x - 2 < 2x^2 + 2x + 2$

$[\because x^2 + x + 1 > 0, \forall x \in R]$

From inequality (i),

$$4x^2 - (\lambda - 3)x + 1 > 0$$

$\Rightarrow \quad (\lambda - 3)^2 - 4 \cdot 1 \cdot 4 \cdot 1 < 0$

$\Rightarrow \quad -4 < \lambda + 2 < 4$

$\Rightarrow \quad -1 < \lambda < 7 \quad \ldots(\text{i})$

From inequality (ii),

$$x^2 + (\lambda + 2)x + 4 > 0$$

$\therefore \quad (l + 2)^2 - 4 \cdot 1 \cdot 4 < 0$

$\Rightarrow \quad -4 < \lambda + 2 < 4$

$\Rightarrow \quad -6 < \lambda < 2 \quad \ldots(\text{ii})$

From Eqs. (i) and (ii), we get $-1 < \lambda < 2$

$\therefore \quad [\lambda] = -1, 0, 1$

C. $\because x = 1$ satisfies

$(b - c)x^2 + (c - a)x + (a - b) = 0$

$\therefore \quad x = 1$ satisfies $x^2 + \lambda x + 1 = 0$

Then, $\quad 1 + \lambda + 1 = 0$

$\Rightarrow \quad [\lambda - 1] = [-2 - 1]$

$= -3$

D. $\because |x^2 - x - 6| = x + 2$

$\Rightarrow \quad |(x - 3)(x + 2)| = x + 2$

$\Rightarrow \quad |x - 3||x + 2| = x + 2$

$$\Rightarrow \begin{cases} (x - 3)(x + 2) = (x + 2), & x < -2 \\ -(x - 3)(x + 2) = (x + 2), & -2 \le x < 3 \\ (x - 3)(x + 2) = x + 2, & x > 3 \end{cases}$$

$$\Rightarrow \begin{cases} x = 4, & x < -2 \\ x = -2, 2, & -2 \le x < 3 \\ x = 4, & x > 3 \end{cases}$$

Hence, $x = -2, 2, 4$

$\therefore \quad N = 3$

A $\to$ p, q, r, s; B $\to$ r, s; C $\to$ p; D $\to$ p

Ex 88. Match the statements of Column I with the values of Column II.

	Column I		Column II
A.	Number of real solutions of $\lvert x+1 \rvert = e^x$ is	p.	2
B.	The number of non-negative real roots of $2^x - x - 1 = 0$ is equal to	q.	3
C.	If p and q are the roots of the quadratic equation $x^2 - (\alpha - 2)x - \alpha - 1 = 0$, then minimum value of $p^2 + q^2$ is equal to	r.	6
D.	If α and β are the roots of $2x^2 + 7x + c = 0$ and $\lvert \alpha^2 - \beta^2 \rvert = \frac{7}{4}$, then c is equal to	s.	5

Sol.

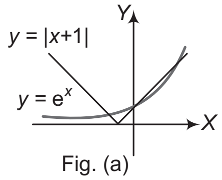


Fig. (a)

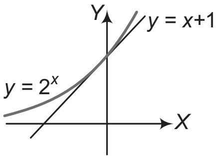

Fig. (b)

A. Number of solutions is 3. [fig. (a)]

B. $2^x - x - 1 = 0$

Consider $2^x = x + 1$

$\therefore$ There are two solutions.

$x = 0, 1$ [both are non-negative] [fig. (b)]

C. $p + q = \alpha - 2$

$\Rightarrow \quad pq = -\alpha - 1$

$$\therefore \quad p^2 + q^2 = (\alpha - 2)^2 - 2(-\alpha - 1)$$
$$= \alpha^2 - 4\alpha + 4 + 2\alpha + 2$$
$$= \alpha^2 - 2\alpha + 6 = (\alpha - 1)^2 + 5$$

$\therefore$ Least value of $p^2 + q^2 = 5$

D. $\alpha + \beta = -\frac{7}{2}, \alpha\beta = \frac{c}{2}$

$$\therefore \quad \frac{7}{4} = \lvert \alpha^2 - \beta^2 \rvert = \lvert (\alpha + \beta) \rvert \sqrt{(\alpha + \beta)^2 - 4\alpha\beta} = \frac{7}{2}$$
$$\sqrt{\frac{49}{4} - 2c} \Rightarrow \frac{7}{4} = \frac{7}{4}\sqrt{49 - 8c}$$

$\Rightarrow \quad 49 - 8c = 1 \quad \Rightarrow \quad c = 6$

A $\rightarrow$ q; B $\rightarrow$ p; C $\rightarrow$ s; D $\rightarrow$ r

Type 6. **Single Integer Answer Type Questions**

Ex 89. If the quadratic polynomial,

$$y = (\cot\alpha)x^2 + 2(\sqrt{\sin\alpha})x + \frac{1}{2}\tan\alpha,$$

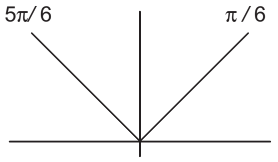
$\alpha \in [0, 2\pi]$, can take negative values for all $x \in R$ and the value of $\alpha \in \left(\frac{5\pi}{\lambda}, \pi\right)$, then the value of λ is ______ .

Sol. (6) $b^2 - 4ac < 0$ and $a < 0$

Hence, $\cot\alpha < 0$ i.e. $\alpha \in$ 2nd and 4th quadrants

and $\quad 4\sin\alpha - 2\tan\alpha\cot\alpha < 0$

$$2\sin\alpha < 1 \quad \Rightarrow \quad \sin\alpha < \frac{1}{2}$$



$\therefore$ $\alpha \in$ 2nd and 4th quadrant

$\sin\alpha \geq 0$ for $\sqrt{\sin\alpha}$ to exist.

$\therefore$ $\alpha \in$ 2nd quadrant

Hence, $\quad \alpha \in \left(\frac{5\pi}{6}, \pi\right)$

Ex 90. Number of quadratic equations with real roots which remain unchanged even after squaring their roots, is _____ .

Sol. (3) $\quad \alpha\beta = \alpha^2\beta^2 \quad$ ...(i)

and $\quad \alpha^2 + \beta^2 = \alpha + \beta \quad$ ...(ii)

So, $\alpha\beta(1 - \alpha\beta) = 0 \Rightarrow \alpha = 0$ or $\beta = 0$ or $\alpha\beta = 1$

If $\alpha = 0$, then from Eq. (ii), $\beta = 0$ or $\beta = 1$

$\Rightarrow$ Roots are (0, 0) or (0, 1)

If $\beta = 0$, then $\quad \alpha = 0 \quad$ or $\quad \beta = 1$

If $\beta = \frac{1}{\alpha}$, then $\alpha^2 + \frac{1}{\alpha^2} = \alpha + \frac{1}{\alpha}$

$$\Rightarrow \quad \left[\alpha + \frac{1}{\alpha}\right]^2 - 2 = \alpha + \frac{1}{\alpha}$$

$\therefore \quad t^2 - t - 2 = 0 \Rightarrow (t - 2)(t + 1) = 0$

$\Rightarrow \quad t = 2 \quad$ or $\quad t = -1$

If $t = 2$, then $\alpha = 1$ and $\beta = 1$. If $t = -1$, then roots are imaginary (ω or ω^2).

So, the number of quadratic equation is 3.

Ex 91. The number of non-zero solutions of the equation $x^2 - 5x - (\text{sgn } x)6 = 0$ is _______.

Sol. (1) If $x = 0$, we have $x^2 - 5x = 0 \Rightarrow x = 0$ or 5

$\Rightarrow$ No solution. If $x > 0$, we have $x^2 - 5x - 6 = 0$

$\Rightarrow \quad (x - 6)(x + 1) = 0 \quad \Rightarrow \quad x = 6$ is the solution.

If $x < 0$, we have $x^2 - 5x + 6 = 0$

$\Rightarrow \quad (x - 3)(x - 2) = 0 \quad \Rightarrow \quad$ No solution

$\therefore$ Only one solution.

Ex 92. The number of solutions for the equation $\log_4(2x^2 + x + 1) - \log_2(2x - 1) = 1$ is ______.

Sol. (1) $\log_4(2x^2 + x + 1) - \log_2(2x - 1) = 1$

$$\Rightarrow \frac{\log_e(2x^2 + x + 1)}{\log_e(4)} - \frac{\log_e(2x - 1)}{\log_e 2} = 1$$

$$\Rightarrow \log_e \frac{2x^2 + x + 1}{(2x - 1)^2} = \log_e 4 \quad \Rightarrow \quad (2x^2 + x + 1)$$
$$= 4(4x^2 - 4x + 1) \quad \Rightarrow \quad 14x^2 - 17x + 3 = 0$$

$$\Rightarrow \quad (14x - 3)(x - 1) = 0 \quad \Rightarrow \quad x = \frac{3}{14} \Rightarrow x = 1$$

But $x = \frac{3}{14}$ does not lie in the domain of function

Hence, $x = 1$ is the only solution.

Target Exercises

Type 1. **Only One Correct Option**

1. The least integer satisfying

$$49.4 - \left(\frac{27-x}{10}\right) < 47.4 - \left(\frac{27-9x}{10}\right) \text{ is}$$

(a) 2 (b) 3
(c) 4 (d) None of these

2. Let $f(x) = ax^2 + bx + c, a \neq 0$. Suppose, $f(-1) < 1$, $f(1) > -1$ and $f(3) < -4$. Then,

(a) Cannot be discussed (b) $b + 1 > 0$
(c) $b + 1 < 0$ (d) b is positive real

3. If a and b are positive and unequal, then

(a) $a^4 + b^4 > a^3b + ab^3$ (b) $a^4 + b^4 < a^3b + ab^3$
(c) $a^3 + b^3 < a^2b + ab^2$ (d) None of these

4. The inequality $\frac{2}{x} < 3$ is true, when x belongs to

(a) $[2/3, \infty)$ (b) $(-\infty, 2/3]$
(c) $(2/3, \infty) \cup (-\infty, 0)$ (d) None of these

5. $\frac{x+4}{x-3} < 2$ is satisfied when x satisfies

(a) $(-\infty, 3) \cup (10, \infty)$ (b) $(3, 10)$
(c) $(-\infty, 3) \cup [10, \infty)$ (d) None of these

6. Solution of $(x-1)^2(x+4) < 0$ is

(a) $(-\infty, 1)$ (b) $(-\infty, -4)$
(c) $(-1, 4)$ (d) $(1, 4)$

7. Solution of $(2x+1)(x-3)(x+7) < 0$ is

(a) $(-\infty, -7) \cup (-1/2, 3)$ (b) $(-\infty, -7) \cup (1/2, 3)$
(c) $(-\infty, 7) \cup (-1/2, 3)$ (d) $(-\infty, -7) \cup (3, \infty)$

8. The set of values of x which satisfy the inequations $5x + 2 < 3x + 8$ and $\frac{x+2}{x-1} < 4$ is

(a) $(-\infty, 1)$ (b) $(2, 3)$
(c) $(-\infty, 3)$ (d) $(-\infty, 1) \cup (2, 3)$

9. Solution of $|3x+2| < 1$ is

(a) $[-1, -1/3]$ (b) $\{-1/3, -1\}$
(c) $(-1, -1/3)$ (d) None of these

10. Solution of $|3-x| = x-3$ is

(a) $x < 3$ (b) $x > 3$ (c) $x \geq 3$ (d) $x \leq 3$

11. Solution of $|2x-3| < |x+2|$ is

(a) $(-\infty, 1/3)$ (b) $(1/3, 5)$
(c) $(5, \infty)$ (d) $(-\infty, 1/3) \cup (5, \infty)$

12. Solution of $0 < |3x+1| < \frac{1}{3}$ is

(a) $(-4/9, -2/9)$
(b) $[-4/9, -2/9]$
(c) $(-4/9, -2/9) - \{-1/3\}$
(d) $[-4/9, -2/9] - \{-1/3\}$

13. Solution of $|x-1| \geq |x-3|$ is

(a) $x \leq 2$ (b) $x \geq 2$
(c) $[1, 3]$ (d) None of these

14. Solution of $||x|-1| < |1-x|, x \in R$ is

(a) $(-1, 1)$ (b) $(0, \infty)$
(c) $(-1, \infty)$ (d) None of these

15. Solution of $\left|\frac{1}{x} - 2\right| < 4$ is

(a) $(-\infty, -1/2)$ (b) $(1/6, \infty)$
(c) $(-1/2, 1/6)$ (d) $(-\infty, -1/2) \cup (1/6, \infty)$

16. Solution of $\left|1 + \frac{3}{x}\right| > 2$ is

(a) $(0, 3]$ (b) $[-1, 0)$
(c) $(-1, 0) \cup (0, 3)$ (d) None of these

17. Solution of $|x^2 - 10| \leq 6$ is

(a) $(2, 4)$ (b) $(-4, -2)$
(c) $(-4, -2) \cup (2, 4)$ (d) $[-4, -2] \cup [2, 4]$

18. Solution of $\left|x + \frac{1}{x}\right| > 2$ is

(a) $R - \{0\}$ (b) $R - \{-1, 0, 1\}$
(c) $R - \{1\}$ (d) $R - \{-1, 1\}$

19. The solution set of $\left|\frac{x+1}{x}\right| + |x+1| = \frac{(x+1)^2}{|x|}$ is

(a) $\{x \mid x \geq 0\}$ (b) $\{x \mid x > 0\} \cup \{-1\}$
(c) $\{-1, 1\}$ (d) $\{x \mid x \geq 1 \text{ or } x \leq -1\}$

20. The set of real values of x satisfying $|x-1| \leq 3$ and $|x-1| \geq 1$ is

(a) $[2, 4]$ (b) $(-\infty, 2] \cup [4, \infty)$
(c) $[-2, 0] \cup [2, 4]$ (d) None of these

21. Solution of the inequality $x > \sqrt{(1-x)}$ is given by

(a) $]-\infty, (-1-\sqrt{5})/2[$
(b) $](\sqrt{5}-1)/2, \infty[$
(c) $]-\infty, (-1-\sqrt{5})/2[\cup](\sqrt{5}-1)/2, \infty[$
(d) $](\sqrt{5}-1)/2, 1[$

Target Exercises

22. The product of all the solutions of the equation $|(x-2)|^2 - 3|x-2| + 2 = 0$ is
(a) 2 (b) -4
(c) 0 (d) None of these

23. Which of the following statement(s) is/are correct?
(a) $a > b \Rightarrow ax > bx, x \neq 0, (a, b, x \in R)$
(b) $|x| > |y| \Rightarrow x > y\ (x, y \in R)$
(c) $a > b \Rightarrow \frac{1}{a} > \frac{1}{b}$
(d) $a > b \Rightarrow a + c > b + c$

24. Solution of $|x-1| + |x-2| + |x-3| \geq 6$ is
(a) $[0, 4]$ (b) $(-\infty, -2) \cup [4, \infty)$
(c) $(-\infty, 0] \cup [4, \infty)$ (d) None of these

25. If $\log_4 5 = a$ and $\log_5 6 = b$, then $\log_3 2$ is equal to
(a) $\frac{1}{2a+1}$ (b) $\frac{1}{2b+1}$
(c) $2ab + 1$ (d) $\frac{1}{2ab-1}$

26. If $\log_5 a \cdot \log_a x = 2$, then x is equal to
(a) 125 (b) a^2
(c) 25 (d) None of these

27. The number of solutions of $\log_2(x+5) = 6 - x$ is
(a) 2 (b) 0
(c) 3 (d) None of these

28. The solution set of $\log_2|4 - 5x| > 2$ is
(a) $\left(\frac{8}{5}, +\infty\right)$ (b) $\left(\frac{4}{5}, \frac{8}{5}\right)$
(c) $(-\infty, 0) \cup \left(\frac{8}{5}, +\infty\right)$ (d) None of these

29. The set of real values of x for which $\log_{0.2} \frac{x+2}{x} \leq 1$ is
(a) $\left(-\infty, -\frac{5}{2}\right] \cup (0, +\infty)$ (b) $\left[\frac{5}{2}, +\infty\right)$
(c) $(-\infty, -2) \cup (0, +\infty)$ (d) None of these

30. The number of real values of the parameter k for which $(\log_{16} x)^2 - \log_{16} x + \log_{16} k = 0$, with real coefficients will have exactly one solution, is
(a) 2 (b) 1
(c) 4 (d) None of these

31. $x^{\log_x a \times \log_a y \times \log_y z}$ is equal to
(a) x (b) y
(c) z (d) None of these

32. The number of zeroes coming immediately after the decimal point in the value of $(5)^{25}$ is (given, $\log_{10} 2 = 0.30103$)
(a) 16
(b) 17
(c) 18
(d) None of the above

33. If $\log x \log y \log z = (y-z)(z-x)(x-y)$, then
(a) $x^y \cdot y^z \cdot z^x = 1$
(b) $x^x \cdot y^y \cdot z^z = 1$
(c) $\sqrt[x]{x} \cdot \sqrt[y]{y} \cdot \sqrt[z]{z} = 1$
(d) None of the above

34. The solution set of the inequation $\log_{1/3}(x^2 + x + 1) + 1 > 0$ is
(a) $(-\infty, -2) \cup (1, +\infty)$ (b) $[-1, 2]$
(c) $(-2, 1)$ (d) $(-\infty, +\infty)$

35. Let $f(x) = \sqrt{\log_{10} x^2}$. The set of all values of x for which $f(x)$ is real, is
(a) $[-1, 1]$ (b) $[1, +\infty)$
(c) $(-\infty, -1]$ (d) $(-\infty, -1] \cup [1, +\infty)$

36. If $x_n > x_{n-1} > \ldots > x_2 > x_1 > 1$, then the value of $\log_{x_1} \log_{x_2} \log_{x_3} \ldots \log_{x_n} x_n^{x_{n-1}^{\cdot^{\cdot^{\cdot^{x_1}}}}}$ is
(a) 0 (b) 1
(c) 2 (d) None of these

37. $4^{\sin^2 x} + 4^{\cos^2 x}$ is equal to
(a) ≤ 4 (b) ≥ 4
(c) ≤ 2 (d) ≥ 2

38. If $y = 3^{x-1} + 3^{-x-1}$, then the least value of y is
(a) 2 (b) 6
(c) $\frac{2}{3}$ (d) $\frac{3}{2}$

39. Minimum value of $\frac{b+c}{a} + \frac{c+a}{b} + \frac{a+b}{c}$ (for real positive numbers a, b, c) is
(a) 1 (b) 2
(c) 4 (d) 6

40. If a, b and c are different positive real numbers such that $b+c-a$, $c+a-b$ and $a+b-c$ are positive, then $(b+c-a)(c+a-b)(a+b-c) - abc$ is
(a) positive (b) negative
(c) non-positive (d) non-negative

41. If the product of n positive numbers is unity, then their sum is
(a) a negative integer
(b) divisible by n
(c) never less than n
(d) equal to $n + \frac{1}{n}$

42. For positive numbers a, b and c, the least value of $(a^2 + b^2 + c^2)\left(\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}\right)$ is
(a) 3
(b) 9
(c) $\frac{27}{4}$
(d) None of the above

43. For positive real numbers a, b and c, which one of the following holds?

(a) $a^2 + b^2 + c^2 \geq bc + ca + ab$

(b) $(b + c)(c + a)(a + b) \leq 8abc$

(c) $\frac{a}{b} + \frac{b}{c} + \frac{c}{a} \leq 3$

(d) $a^3 + b^3 + c^3 \geq abc$

44. For positive real numbers a, b and c, which of the following holds?

(a) $a + b + c > 3 \Rightarrow a^2 + b^2 + c^2 > 3$

(b) $a^6 + b^6 \leq 12a^2b^2 - 64$

(c) $a + b + c = \alpha \Rightarrow \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \leq \frac{9}{\alpha}$

(d) None of the above

45. For positive real numbers a, b and c, such that $a + b + c = p$, which one holds?

(a) $(p - a)(p - b)(p - c) \geq \frac{8}{27}p^3$

(b) $(p - a)(p - b)(p - c) \geq 8abc$

(c) $\frac{bc}{a} + \frac{ca}{b} + \frac{ab}{c} \geq p$

(d) None of the above

46. The minimum value of $P = bcx + cay + abz$, when $xyz = abc$, is

(a) $3abc$ (b) $6abc$
(c) abc (d) $4abc$

47. The greatest value of $P = a^2b^3c^4$, when $a + b + c = 18$, is

(a) $P = 4^4 \cdot 6^4 \cdot 8^4$ (b) $P = 4^2 \cdot 6^3 \cdot 8^4$
(c) $P = 3^2 \cdot 6^3 \cdot 8^4$ (d) $P = 4^2 \cdot 6^2 \cdot 8^2$

48. If $x_1, x_2, \ldots, x_n$ are any real numbers and n is any positive integer, then

(a) $n\sum_{i=1}^{n} x_i^2 < \left(\sum_{i=1}^{n} x_i\right)^2$ (b) $n\sum_{i=1}^{n} x_i^2 \geq \left(\sum_{i=1}^{n} x_i\right)^2$

(c) $\sum_{i=1}^{n} x_i^2 \geq n\left(\sum_{i=1}^{n} x_i\right)^2$ (d) None of these

49. If x, y and z are positive real numbers such that $x + y + z = 2$, then

(a) $(2 - x)(2 - y)(2 - z) \geq 8xyz$

(b) $x^{-1} + y^{-1} + z^{-1} \geq 1/2$

(c) $(2 - x)(2 - y)(2 - z) < 8xyz$

(d) None of the above

50. For non-negative real numbers such that $a_1 + a_2 + \ldots + a_n = p$ and $q = \sum_{i<j} a_i a_j$, then

(a) $q \leq \frac{1}{2}p^2$ (b) $q > \frac{1}{4}p^2$

(c) $q < \frac{p}{2}$ (d) $q > \frac{p^2}{2}$

51. The polynomial $(ax^2 + bx + c)(ax^2 - dx - c), ac \neq 0$, has

(a) four real zeroes

(b) atleast two real zeroes

(c) atmost two real zeroes

(d) no real zeroes

52. If a, b and c are non-zero, unequal rational numbers, then the roots of the equation $abc^2x^2 + (3a^2 + b^2)cx - 6a^2 - ab + 2b^2 = 0$ are

(a) rational (b) imaginary
(c) irrational (d) None of these

53. The equation $(a + 2)x^2 + (a - 3)x = 2a - 1, a \neq -2$ has roots rational for

(a) all rational values of a except $a = -2$

(b) all real values of a except $a = -2$

(c) rational values of $a > \frac{1}{2}$

(d) None of the above

54. If the absolute value of the difference of roots of the equation $x^2 + px + 1 = 0$ exceeds $\sqrt{3p}$, then

(a) $p < -1$ or $p > 4$ (b) $p > 4$
(c) $-1 < p < 4$ (d) $0 \leq p < 4$

55. If $\frac{1}{4 - 3i}$ is a root of $ax^2 + bx + 1 = 0$, where a and b are real, then

(a) $a = 25, b = -8$ (b) $a = 25, b = 8$
(c) $a = 5, b = 4$ (d) None of these

56. If $a \in R, b \in R$, then the factors of the expression $a(x^2 - y^2) - bxy$ are

(a) real and different (b) real and identical
(c) complex (d) None of these

57. The number of positive integral values of k for which $(16x^2 + 12x + 39) + k(9x^2 - 2x + 11)$ is a perfect square, is

(a) two (b) zero
(c) one (d) None of these

58. For the equation $3x^2 + px + 3 = 0, p > 0$, if one of the roots is the square of the other, then p is equal to

(a) $\frac{1}{3}$ (b) 1

(c) 3 (d) $\frac{2}{3}$

59. Let α and β be the roots of the quadratic equation $x^2 + px + p^3 = 0\,(p \neq 0)$. If (α, β) is a point on the parabola $y^2 = x$, then the roots of the quadratic equation are

(a) $4, -2$

(b) $-4, -2$

(c) $4, 2$

(d) $-4, 2$

60. If a, b and c are positive real numbers, then the number of real roots of the equation $ax^2 + b|x| + c = 0$ is

(a) 2 (b) 4
(c) 0 (d) None of these

61. If α and β are the roots of $ax^2 + bx + c = 0$ and $\alpha + k, \beta + k$ are the roots of $px^2 + qx + r = 0$, then $\dfrac{b^2 - 4ac}{q^2 - 4pr}$ is equal to

(a) $\left(\dfrac{p}{a}\right)^2$ (b) 1 (c) $\left(\dfrac{a}{p}\right)^2$ (d) 0

62. If the roots of the equation $ax^2 + bx + c = 0$ are in the ratio $m : n$, then

(a) $mnb^2 = ac(m+n)^2$ (b) $b^2(m+n) = mn$
(c) $m + n = b^2 mn$ (d) $c^2(mn) = ab(m+n)^2$

63. If $x + \dfrac{1}{x} = 5$, then $\left(x^3 + \dfrac{1}{x^3}\right) - 5\left(x^2 + \dfrac{1}{x^2}\right) + \left(x + \dfrac{1}{x}\right)$ is equal to

(a) 0 (b) 5
(c) -5 (d) 10

64. The value of $\sqrt{6 + \sqrt{6 + \sqrt{6 + \dots \infty}}}$ is

(a) 3 (b) 6
(c) -2 (d) -4

65. The sum of the roots of the equation $x^2 + px + q = 0$ is equal to the sum of their squares, then

(a) $p^2 - q^2 = 0$ (b) $p^2 + q^2 = 2q$
(c) $p^2 + p = 2q$ (d) None of these

66. The roots of the equation $(q - r)x^2 + (r - p)x + (p - q) = 0$ are

(a) $\dfrac{r-p}{q-r}, 1$ (b) $\dfrac{p-q}{q-r}, 1$
(c) $\dfrac{q-r}{p-q}, 1$ (d) $\dfrac{r-p}{p-q}, 1$

67. A lad was asked his age by his friend. The lad said, 'The number you get when you subtract 25 times my age from twice the square of my age will be thrice your age.' If the friend's age is 14, then age of the lad is

(a) 21 (b) 28
(c) 14 (d) 25

68. If the roots of the equation $\dfrac{x^2 - bx}{ax - c} = \dfrac{\lambda - 1}{\lambda + 1}$ are such that $\alpha + \beta = 0$, then the value of λ is

(a) $\dfrac{a-b}{a+b}$ (b) c
(c) $\dfrac{1}{c}$ (d) $\dfrac{a+b}{a-b}$

69. If the roots of the equation $(a^2 + b^2)y^2 - 2(ac + bd)y + c^2 + d^2 = 0$ are equal, then

(a) $ab = dc$ (b) $ac = bd$
(c) $ad + bc = 0$ (d) $\dfrac{a}{b} = \dfrac{c}{d}$

70. If p, q and r are positive and are in AP, then the roots of the quadratic equation $px^2 + qx + r = 0$ are real for

(a) $\left|\dfrac{r}{p} - 7\right| \geq 4\sqrt{3}$ (b) $\left|\dfrac{p}{r} - 7\right| < 4\sqrt{3}$
(c) all p and r (d) no p and r

71. The roots of the equation $\dfrac{2x+1}{9} + \dfrac{x^2+7}{x^2-7} = \dfrac{2x+17}{9}$ are

(a) $3, -3$ (b) $5, -5$
(c) $\sqrt{3}, -\sqrt{3}$ (d) $\sqrt{5}, -\sqrt{5}$

72. If the roots of the equation $a(b-c)x^2 + b(c-a)x + c(a-b) = 0$ are equal, then a, b and c are in

(a) AP (b) GP
(c) HP (d) None of these

73. If α and β are the roots of the equation $x^2 + x\sqrt{\alpha} + \beta = 0$, then the values of α and β are

(a) $\alpha = 1$ and $\beta = -1$ (b) $\alpha = 1$ and $\beta = -2$
(c) $\alpha = 2$ and $\beta = 1$ (d) $\alpha = 2$ and $\beta = -2$

74. If α and β are the roots of the equation $8x^2 - 3x + 27 = 0$, then the value of $\left(\dfrac{\alpha^2}{\beta}\right)^{1/3} + \left(\dfrac{\beta^2}{\alpha}\right)^{1/3}$ is

(a) $\dfrac{1}{3}$ (b) $\dfrac{1}{4}$ (c) $\dfrac{7}{2}$ (d) 4

75. If the expression $a^2(b^2 - c^2)x^2 + b^2(c^2 - a^2)x + c^2(a^2 - b^2)$ is a perfect square, then

(a) a, b and c are in AP (b) a^2, b^2 and c^2 are in AP
(c) a^2, b^2 and c^2 are in HP (d) a^2, b^2 and c^2 are in GP

76. The values of m for which the equation $(1+m)x^2 - 2(1+3m)x + (1+8m) = 0$ has equal roots, are

(a) 0, 3 (b) 1 (c) 2 (d) 3

77. If α is a root of $4x^2 + 2x - 1 = 0$, then the other root are

(a) $3\alpha^3 - 4\alpha$ (b) $4\alpha^3 - 3\alpha$
(c) $3\alpha^3 + 4\alpha$ (d) $4\alpha^3 + 3\alpha$

78. If the roots of the equation $(b-c)x^2 + (c-a)x + (a-b) = 0$ are equal, then a, b and c are in

(a) AP (b) GP
(c) HP (d) None of these

79. If the ratio of the roots of $lx^2+nx+n=0$ is $p:q$, then

(a) $\sqrt{\frac{q}{p}}+\sqrt{\frac{p}{q}}+\sqrt{\frac{l}{n}}=0$

(b) $\sqrt{\frac{p}{q}}+\sqrt{\frac{q}{p}}+\sqrt{\frac{n}{l}}=0$

(c) $\sqrt{\frac{q}{p}}+\sqrt{\frac{p}{q}}+\sqrt{\frac{l}{n}}=1$

(d) $\sqrt{\frac{p}{q}}+\sqrt{\frac{q}{p}}+\sqrt{\frac{n}{l}}=1$

80. The roots of the equation $(x-a)(x-b)=abx^2$ are always

(a) real (b) imaginary
(c) Cannot be discussed (d) None of these

81. The equation $\sqrt{x+3-4\sqrt{x-1}}+\sqrt{x+8-6\sqrt{x-1}}=1$ has

(a) no solution (b) one solution
(c) two solutions (d) more than two solutions

82. If the sum of the roots of the equation $ax^2+bx+c=0$ is equal to the sum of the reciprocals of their squares, then bc^2, ca^2 and ab^2 are in

(a) AP (b) GP
(c) HP (d) None of these

83. If $\sin\theta$ and $\cos\theta$ are the roots of the equation ax^2+bx+c, then

(a) $(a-c)^2=b^2-c^2$ (b) $(a-c)^2=b^2+c^2$
(c) $(a+c)^2=b^2-c^2$ (d) $(a+c)^2=b^2+c^2$

84. A car travels 25 km an hour faster than a bus for a journey of 500 km. If the bus takes 10 h more than the car, then the speeds of the bus and the car are

(a) 25 km/h, 40 km/h (b) 25 km/h, 50 km/h
(c) 25 km/ h, 60 km/h (d) None of these

85. If $(ax^2+bx+c)\,y+a'x^2+b'x+c'=0$, then the condition that x may be rational function of y, is

(a) $(ac'-a'c)^2=(ab'-a'b)(bc'-b'c)$
(b) $(ab'-a'b)^2=(ac'-a'c)(bc'-b'c)$
(c) $(bc'-b'c)^2=(ab'-a'b)(ac'-a'c)$
(d) None of the above

86. If $a(b-c)x^2+b(c-a)xy+c(a-b)y^2$ is a perfect square, then a, b and c are in

(a) AP
(b) GP
(c) HP
(d) None of the above

87. If α and β are the roots of $ax^2+c=bx$, then the equation $(a+cy)^2=b^2y$ in y has the roots

(a) α^{-1},β^{-1} (b) α^2,β^2
(c) $\alpha\beta^{-1},\alpha^{-1}\beta$ (d) α^{-2},β^{-2}

88. If the sum of the roots of the quadratic equation $ax^2+bx+c=0$ is equal to the sum of squares of their reciprocals, then $\frac{a}{c},\frac{b}{a},\frac{c}{b}$ are in

(a) AP (b) GP
(c) HP (d) None of these

89. The harmonic mean of the roots of the equation $(5+\sqrt{2})x^2-(4+\sqrt{5})x+(8+2\sqrt{5})=0$ is

(a) 2 (b) 4
(c) 7 (d) 8

90. If x^2-3x+2 is a factor of x^4-px^2+q, then p and q are

(a) 2, 3 (b) 4, – 5
(c) 5, 4 (d) 0, 0

91. If $9^x-4\times 3^{x+2}+3^5=0$, then the solution set is

(a) $\{1, 2\}$ (b) $\{2, 3\}$ (c) $\{2, 4\}$ (d) $\{1, 3\}$

92. If the roots of the equation $\frac{1}{x+p}+\frac{1}{x+q}=\frac{1}{r}$ are equal in magnitude and opposite in sign, then

(a) $p+q=r$
(b) $p+q=2r$
(c) product of roots $=\frac{1}{2}(p^2+q^2)$
(d) None of the above

93. The solution set of $\left|\frac{x+1}{x}\right|+|x+1|=\frac{(x+1)^2}{|x|}$ is

(a) $\{x \mid x\ge 0\}$ (b) $\{x \mid x>0\}\cup\{-1\}$
(c) $\{-1, 1\}$ (d) $\{x \mid x\ge 1 \text{ or } x\le -1\}$

94. $\{x\in R: |x-2|=x^2\}$ is equal to

(a) $[-1, 2]$ (b) $[1, 2]$
(c) $[-1, -2]$ (d) $\{-2, 1\}$

95. Number of solutions of an equation $|x|^2-3|x|+2=0$ will be

(a) 4 (b) 1 (c) 3 (d) 2

96. In the equation $4^{x+2}=2^{x+3}+48$, the value of x will be

(a) $-\frac{3}{2}$ (b) – 2
(c) – 3 (d) 1

97. The real values of x which satisfy the equation $(5+2\sqrt{6})^{x^2-3}+(5-2\sqrt{6})^{x^2-3}=10$ are

(a) ± 2 (b) $\pm\sqrt{2}$
(c) $\pm 2, \pm\sqrt{2}$ (d) $2, \sqrt{2}$

98. The equation $125^x+45^x=2\cdot(27)^x$ has

(a) no solution
(b) one solution
(c) two solutions
(d) more than two solutions

99. If α and β are the roots of the equation $x^2 - px + q = 0$ and $\alpha > 0, \beta > 0$, then the value of $\alpha^{1/4} + \beta^{1/4}$ is $(p + 6\sqrt{q} + 4q^{1/4}\sqrt{p + 2\sqrt{q}})^k$, where k is equal to

(a) 1 (b) $\frac{1}{2}$ (c) $\frac{1}{3}$ (d) $\frac{1}{4}$

100. The solutions of the equation $(3|x| - 3)^2 = |x| + 7$ which belongs to the domain of definition of the function $y = \sqrt{x(x-3)}$, are given by

(a) $\frac{1}{9}, -2$ (b) $-\frac{1}{9}, 2$ (c) $\pm\frac{1}{9}, \pm 2$ (d) $-\frac{1}{9}, -2$

101. The roots of the equation $2^{x+2} \cdot 3^{\frac{3x}{x-1}} = 9$ are given by

(a) $\log_2\left(\frac{2}{3}\right), -2$ (b) $3, -3$
(c) $-2, 1 - \log_2 3$ (d) $1 - \log_2 3, 2$

102. If $f(x) = x - [x], x (\neq 0) \in R$, where $[x]$ is greatest integer less than or equal to x, then the number of solutions of $f(x) + f\left(\frac{1}{x}\right) = 1$ is

(a) 0 (b) 1 (c) 2 (d) infinite

103. The number of real solutions of the equation $27^{1/x} + 12^{1/x} = 2 \cdot 8^{1/x}$ is

(a) 1 (b) 2 (c) infinite (d) 0

104. If α and β $(\alpha < \beta)$ are the roots of the equation $x^2 + bx + c = 0$, where $c < 0 < b$, then

(a) $0 < \alpha < \beta$ (b) $\alpha < 0 < \beta < |\alpha|$
(c) $\alpha < \beta < 0$ (d) $\alpha < 0 < |\alpha| < \beta$

105. If $x^2 - 2x + \sin^2\alpha = 0$, then

(a) $x \in [-1, 1]$ (b) $x \in [0, 2]$
(c) $x \in [-2, 2]$ (d) $x \in [1, 2]$

106. The set of values of m for which the roots of the equation $x^2 - (m+1)x + m + 4 = 0$ are real and negative consists of all m such that

(a) $-3 < m \le -1$ (b) $-4 < m \le -3$
(c) $-3 \le m \le 5$ (d) $-3 \ge m$ or $m \ge 5$

107. If $a \le 0$, then the roots of the equation $x^2 - 2a|x - a| - 3a^2 = 0$ are

(a) $(1 - \sqrt{2})\, a, (\sqrt{6} - 1)\, a$
(b) $(-1 + \sqrt{6})\, a, (1 + \sqrt{2})\, a$
(c) $(1 + \sqrt{2})\, a, 0$
(d) $-(1 \pm \sqrt{6})\, a, (1 \pm \sqrt{2})\, a$

108. For $a \ge 0$, the roots of the equation $x^2 - 2a|x - a| - 3a^2 = 0$ are given by

(a) $-a(\sqrt{6} + 1)$ (b) $a(\sqrt{6} + 1)$
(c) $a(1 + \sqrt{2}), a(-1 - \sqrt{6})$ (d) $a(1 + \sqrt{2})$

109. The value of x for which $2^{x/2} + (\sqrt{2} + 1)^x = (5 + 2\sqrt{2})^{x/2}$, is

(a) 1 (b) 0
(c) 2 (d) None of these

110. If $[x]^2 = [x + 2]$, where $[x]$ is the greatest integer less than or equal to x, then x must be such that

(a) $x = 2, -1$ (b) $[-1, 0) \cup [2, 3)$
(c) $x \in [-1, 0)$ (d) None of these

111. Number of real roots of the equation $e^{\sin x} - e^{-\sin x} - 4 = 0$ is

(a) 1 (b) 0
(c) 2 (d) None of these

112. The roots of the equation $x^{\sqrt{x}} = \sqrt{x^x}$ are

(a) 0 and 4 (b) 0 and 1
(c) 0, 1 and 4 (d) 1 and 4

113. The quadratic equation $8\sec^2\theta - 6\sec\theta + 1 = 0$ has

(a) infinitely many roots (b) exactly two roots
(c) exactly four roots (d) no roots

114. If $\log_2 x + \log_x 2 = \frac{10}{3} = \log_2 y + \log_y 2$ and $x \neq y$, then $x + y^3$ is equal to

(a) 10 (b) $\frac{65}{8}$
(c) $\frac{37}{6}$ (d) None of these

115. The number of solutions of the equation $\sin(e^x) = 5^x + 5^{-x}$ is

(a) 0 (b) 1
(c) 2 (d) infinitely many

116. Let $D = a^2 + b^2 + c^2$, where a, b being consecutive integers and $c = ab$, then $\sqrt{D}$ is

(a) always an even integer
(b) always an odd integer
(c) always irrational
(d) Can't be discussed

117. The constant term of the quadratic expression $\sum_{k=2}^{n}\left(x - \frac{1}{k-1}\right)\left(x - \frac{1}{k}\right)$, as $n \to \infty$ is

(a) -1
(b) 0
(c) 1
(d) None of the above

118. The system $y^{(x^2+7x+12)} = 1$ and $x + y = 6, y > 0$ has

(a) no solution (b) one solution
(c) two solutions (d) more than two solutions

119. The curve $y = (\lambda + 1)x^2 + 2$ intersects the curve $y = \lambda x + 3$ in exactly one point, if λ equals

(a) $\{-2, 2\}$ (b) $\{1\}$ (c) $\{-2\}$ (d) $\{2\}$

120. If the expression $x^2 + 2(a+b+c)x + 3(bc+ca+ab)$ is a perfect square, then

(a) $a = b = c$ (b) $a = \pm b = \pm c$
(c) $a = b \neq c$ (d) None of these

121. Sum the non-real roots of $(x^2+x-2)(x^2+x-3)=12$ is

(a) -1 (b) 1 (c) -6 (d) 6

122. The number of irrational roots of the equation $4x/(x^2+x+3)+5x/(x^2-5x+3)=-3/2$ is

(a) 4 (b) 0 (c) 1 (d) 2

123. If α and β are the roots of the equation $x^2-2x+3=0$. Then, the equation whose roots are $P=\alpha^3-3\alpha^2+5\alpha-2$ and $Q=\beta^3-\beta^2+\beta+5$, is

(a) $x^2+3x+2=0$ (b) $x^2-3x-2=0$
(c) $x^2-3x+2=0$ (d) None of these

124. If α and β are the roots of the equation $2x^2-35x+2=0$, then the value of $(2\alpha-35)^3(2\beta-35)^3$ is

(a) 8 (b) 1
(c) 64 (d) None of these

125. The sum of values of x satisfying the equation $(31+8\sqrt{15})^{x^2-3}+1=(32+8\sqrt{15})^{x^2-3}$ is

(a) 3 (b) 0
(c) 2 (d) None of these

126. If α and β are the roots of the equation $ax^2+bx+c=0$, then the value of $(a\alpha^2+c)/(a\alpha+b)+(a\beta^2+c)/(a\beta+b)$ is

(a) $\dfrac{b(b^2-2ac)}{4a}$ (b) $\dfrac{b^2-4ac}{2a}$
(c) $\dfrac{b(b^2-2ac)}{a^2c}$ (d) None of these

127. If α and β are the roots of the equation $x^2+px+q=0$ and α^4, β^4 are the roots of $x^2-rx+q=0$, then the roots of $x^2-4qx+2q^2-r=0$ are always

(a) both non-real (b) both positive
(c) both negative (d) opposite in sign

128. Suppose A, B and C are defined as $A=a^2b+ab^2-a^2c-ac^2$, $B=b^2c+bc^2-a^2b-ab^2$ and $C=a^2c+ac^2-b^2c-bc^2$, where $a>b>c>0$ and the equation $Ax^2+Bx+C=0$ has equal roots, then a, b and c are in

(a) AP (b) GP (c) HP (d) AGP

129. If α and β are the roots of $ax^2+c=bx$, then the equation $(a+cy)^2=b^2y$ in y has the roots

(a) $\alpha\beta^{-1}, \alpha^{-1}\beta$ (b) α^{-2}, β^{-2}
(c) α^{-1}, β^{-1} (d) α^2, β^2

130. If α and β are the roots of the equation $x^2+px-1/(2p^2)=0$, where $p \in R$. Then, the minimum value of $\alpha^4+\beta^4$ is

(a) $2\sqrt{2}$ (b) $2-\sqrt{2}$
(c) 2 (d) $2+\sqrt{2}$

131. If x_1 and x_2 are the roots of $ax^2+bx+c=0$ and $x_1x_2<0$, then the roots of $x_1(x-x_2)^2+x_2(x-x_1)^2=0$ are

(a) real and of opposite sign (b) negative
(c) positive (d) non-real

132. The number of integral values of a for which the quadratic equation $(x+a)(x+1991)+1=0$ has integral roots, is

(a) 3 (b) 0
(c) 1 (d) 2

133. The number of real solutions of the equation $(9/10)^x=-3+x-x^2$ is

(a) 2 (b) 0
(c) 1 (d) None of these

134. If x, y, z and t are real numbers $x^2+y^2=9, z^2+t^2=4$ and $xt-yz=6$. Then, the greatest value of $P=xz$ is

(a) 2 (b) 3 (c) 4 (d) 6

135. If $x^2+ax-3x-(a+2)=0$ has real and distinct roots, then minimum value of $(a^2+1)/(a^2+2)$ is

(a) 1 (b) 0
(c) $\dfrac{1}{2}$ (d) $\dfrac{1}{4}$

136. The value of the expression $x^4-8x^3+18x^2-8x+2$, when $x=2+\sqrt{3}$, is

(a) 2 (b) 1 (c) 0 (d) 3

137. $x^{3^n}+y^{3^n}$ is divisible by $x+y$, if

(a) n is any integer ≥ 0
(b) n is an odd positive integer
(c) n is an even positive integer
(d) n is a rational number

138. If $z_0=\alpha+i\beta, i=\sqrt{-1}$, then the roots of the cubic equation $x^3-2(1+\alpha)x^2+(4\alpha+\alpha^2+\beta^2)x-2(\alpha^2+\beta^2)=0$ are

(a) $2, z_0, \bar{z}_0$ (b) $1, z_0, -z_0$
(c) $2, z_0, -\bar{z}_0$ (d) $2, -z_0, \bar{z}_0$

139. If α, β and γ are the roots of $x^3+64=0$, then the equation whose roots are $\left(\dfrac{\alpha}{\beta}\right)^2$ and $\left(\dfrac{\alpha}{\gamma}\right)^2$, is

(a) $x^2-4x+16=0$ (b) $x^2+x+1=0$
(c) $x^2+4x+16=0$ (d) $x^2-x+1=0$

140. If $(x-1)^3$ is a factor of $x^4+ax^3+bx^2+cx-1$, then the other factor is
(a) $x-3$ (b) $x+1$
(c) $x+2$ (d) None of these

141. Let $\alpha+i\beta, \alpha, \beta \in R$ be a root of the equation $x^3+qx+r=0$, $q, r \in R$. The cubic equation is independent of α and β whose one root is 2α, is
(a) $x^3+qx-r=0$ (b) $x^3+qx+2r=0$
(c) $x^3+qx+r=0$ (d) $x^3-qx+r=0$

142. If α, β are the roots of $x^2+px+q=0$ and $x^{2n}+p^nx^n+q^n=0$ and $\frac{\alpha}{\beta}, \frac{\beta}{\alpha}$ are the roots of $x^n+1+(x+1)^n=0$, then n must be
(a) even integer (b) odd integer
(c) rational but non-integer (d) None of these

143. The quadratic equation whose roots are cubes of the roots of $x^2+bx+c=0$, is
(a) $x^2+b(b^2-3c)x-c^3=0$
(b) $x^2+b(b^2-3c)x+c^3=0$
(c) $x^2-b(b^2-3c)x+c^3=0$
(d) None of the above

144. If α and β are the roots of the equation $ax^2+bx+c=0$, then the equation whose roots are $\frac{1}{a\alpha+b}$ and $\frac{1}{a\beta+b}$, is
(a) $cax^2-bx+1=0$ (b) $cax^2+bx+1=0$
(c) $cax^2+bx-1=0$ (d) None of these

145. If $x=2+2^{1/3}+2^{2/3}$, then the value of x^3-6x^2+6x is
(a) 3 (b) 2
(c) 1 (d) None of these

146. If roots of the equation $x^n-1=0$ are $1, a_1, a_2, a_3, \ldots, a_{n-1}$, then the value of $(1-a_1)(1-a_2)(1-a_3)\ldots(1-a_{n-1})$ will be
(a) n (b) n^2 (c) n^n (d) 0

147. If α and β are the roots of the quadratic $x^2-2\cos\theta x+1=0$, then equation whose roots are α^n, β^n, is
(a) $x^2-(2\cos n\theta)x+1=0$
(b) $2x^2-(2\cos n\theta)x-1=0$
(c) $x^2+(2\cos n\theta)x+1=0$
(d) $x^2+(2\cos n\theta)x-1=0$

148. If $1, \omega, \omega^2, \ldots, \omega^{n-1}$ are the nth roots of unity, then $(1+\omega)(1+\omega^2)\ldots(1+\omega^{n-1})$ equals
(a) 0, n is even (b) 1, n is even
(c) n, n is even (d) n^2, n is even

149. If $f(x)=x^4+9x^3+35x^2-x+4$, then $f(-5+2\sqrt{-4})$ is equal to
(a) -160 (b) 160
(c) 0 (d) None of these

150. If $p\in[-1,1]$, then the value of x for which $4x^3-3x-p=0$ has a root lies in
(a) $[0, 1]$ (b) $\left[\frac{1}{2}, 1\right]$ (c) $\left[0, \frac{1}{2}\right]$ (d) $[-1, 1]$

151. If α, β, γ and σ are the roots of the equation $x^4+4x^3-6x^2+7x-9=0$, then the value of $(1+\alpha^2)(1+\beta^2)(1+\gamma^2)(1+\sigma^2)$ is
(a) 6 (b) 11
(c) 13 (d) 5

152. If $\tan\theta_1, \tan\theta_2$ and $\tan\theta_3$ are the real roots of the $x^3-(a+1)x^2+(b-a)x-b=0$, where $\theta_1+\theta_2+\theta_3 \in (0, \pi)$, then $\theta_1+\theta_2+\theta_3$ is equal to
(a) $\pi/2$ (b) $\pi/4$ (c) $3\pi/4$ (d) π

153. If α, β and γ are the roots of $x^3-x^2-1=0$, then $(1+\alpha)/(1-\alpha)+(1+\beta)/(1-\beta)+(1+\gamma)/(1-\gamma)$ is equal to
(a) -5 (b) -6
(c) -7 (d) -2

154. The equation formed by decreasing each root of $ax^2+bx+c=0$ by 1 is $2x^2+8x+2=0$, then
(a) $a=-b$ (b) $b=-c$
(c) $c=-a$ (d) $b=a+c$

155. If the equations $ax^2+bx+c=0$ and $x^2+x+1=0$ have a common root, then
(a) $a+b+c=0$ (b) $a=b=c$
(c) $a=b$ or $b=c$ or $c=a$ (d) $a-b+c=0$

156. If $a, b, c \in R$ and the equations $ax^2+bx+c=0$ and $x^3+3x^2+3x+2=0$ have two roots in common, then
(a) $a=b\neq c$ (b) $a=b=-c$
(c) $a=b=c$ (d) None of these

157. If the equations $ax^2+bx+c=0$ and $cx^2+bx+a=0$, $a\neq c$ have a negative common root, then the value of $a-b+c$ is
(a) 0 (b) 2
(c) 1 (d) None of these

158. If the equations $x^2+ix+a=0$ and $x^2-2x+ia=0$, $a\neq 0$ have a common root, then
(a) a is real
(b) $a=\frac{1}{2}+i$
(c) $a=\frac{1}{2}-i$
(d) the other root is also common

159. If the equations $x^2+2x+3\lambda=0$ and $2x^2+3x+5\lambda=0$ have a non-zero common root, then λ is equal to
(a) 1 (b) – 1
(c) 3 (d) None of these

160. If the equations $ax^2+bx+c=0$ and $x^2+2x+3=0$ have a common root, then $a:b:c$ is equal to
(a) 2 : 4 : 5 (b) 1 : 3 : 4
(c) 1 : 2 : 3 (d) None of these

161. If the equations $x^2-px+q=0$ and $x^2-ax+b=0$ have a common root and the other root of the second equation is the reciprocal of the other root of the first, then $(q-b)^2$ is equal to
(a) $aq(p-b)^2$ (b) $bq(p-a)^2$
(c) $bq(p-b)^2$ (d) None of these

162. Let $f(x)=1+2x+3x^2+\ldots+(n+1)x^n$, where n is even. Then, the number of real roots of the equation $f(x)=0$ is
(a) 0 (b) 1
(c) n (d) None of these

163. The value of $x^2+2bx+c$ is positive, if
(a) $b^2-4ac>0$ (b) $b^2-4ac<0$
(c) $c^2<b$ (d) $b^2<c$

164. If $ax^2+bx+10=0$ does not have two distinct real roots, then the least value of $5a+b$ is
(a) – 3 (b) – 2
(c) 3 (d) None of these

165. If $-a^2x^2+2x+3a^2>0, \forall x\in(2,4)$, then the values of a lie in the interval
(a) $\left(-\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}\right)$ (b) $\left(-\frac{2}{\sqrt{7}},\frac{2}{\sqrt{7}}\right)$
(c) $\left(-\frac{4}{7},\frac{4}{7}\right)$ (d) $\left(-\frac{2\sqrt{2}}{\sqrt{13}},\frac{2\sqrt{2}}{\sqrt{13}}\right)$

166. The values of a which make the expression $x^2-ax+1-2a^2$ always positive for real values of x, are
(a) $-\frac{2}{3}<a<\frac{2}{3}$ (b) $-\frac{2}{3}\le a\le\frac{2}{3}$
(c) $-\frac{2}{3}<a<1$ (d) $0<a<\frac{2}{3}$

167. If x is integer satisfying $x^2-6x+5\le 0$ and $x^2-2x>0$, then the number of possible values of x is
(a) 3 (b) 4
(c) 2 (d) infinite

168. If $\frac{6x^2-5x-3}{x^2-2x+6}<4$, then the least and highest values of $4x^2$ are
(a) 0, 81 (b) 0, 36 (c) – 10, 3 (d) 10, – 3

169. The inequality $|2x-3|<1$ is valid when x lies in the interval
(a) (3, 4) (b) (1, 2)
(c) (– 1, 2) (d) (– 4, 3)

170. The set of real values of x satisfying $\big||x-1|-1\big|\le 1$ is
(a) [– 1, 3] (b) [0, 2]
(c) [– 1, 1] (d) None of these

171. If $5^x+(2\sqrt{3})^{2x}\ge 13^x$, then the solution set for x is
(a) $[2,+\infty]$ (b) $(2,+\infty)$
(c) $(4,+\infty)$ (d) None of these

172. If $\log_{10}x+\log_{10}y\ge 2$, then the smallest possible value of $x+y$ is
(a) 10 (b) 30
(c) 20 (d) None of these

173. If $x\in R$, then $\frac{x^2-x+1}{x^2+x+1}$ takes values in the interval
(a) $\left(\frac{1}{3},3\right)$ (b) $\left[\frac{1}{3},3\right]$
(c) (0, 3) (d) None of these

174. If $y=f(x)=\tan x\cot 3x$, then
(a) $\frac{1}{3}<y<1$
(b) $-\infty<y<\frac{1}{3}$ or $3<y<\infty$
(c) $\frac{1}{3}<y<\infty$
(d) $-\infty<y<1$

175. The real values of x for which $3^{72}\left(\frac{1}{3}\right)^x\left(\frac{1}{3}\right)^{\sqrt{x}}>1$, are
(a) $x\in[0,64]$ (b) $x\in(0,64)$
(c) $x\in[0,64)$ (d) None of these

176. If α and β are the roots of $4x^2-16x+\lambda=0$, $\lambda\in R$ such that $1<\alpha<2$ and $2<\beta<3$, then the number of integral solutions of λ is
(a) 5 (b) 6
(c) 2 (d) 3

177. The least integral value of k for which $(k-2)x^2+8x+k+4>0, \forall x\in R$, is
(a) 5 (b) 4
(c) 3 (d) None of these

178. The values of a for which exactly one root of the equation $e^ax^2-e^{2a}x+e^a-1=0$ lies between 1 and 2 are given by
(a) $\log\frac{(5-\sqrt{17})}{4}<a<\log\frac{5+\sqrt{17}}{4}$
(b) $0<a<100$
(c) $\log\frac{5}{4}<a<\log\frac{10}{3}$
(d) None of the above

179. If the roots of the equation $x^2 + 2ax + b = 0$ are real and distinct and they differ by atmost $2m$, then b lies in the interval

(a) $(a^2, a^2 + m^2)$ (b) $(a^2 - m^2, a^2)$
(c) $[a^2 - m^2, a^2]$ (d) None of these

180. If a, b, c and d are four consecutive terms of an increasing AP, then the roots of the equation $(x-a)(x-c) + 2(x-b)(x-d) = 0$ are

(a) non-real complex (b) real and equal
(c) integers (d) real and distinct

181. The interval of a for which the equation $\tan^2 x - (a-4)\tan x + 4 - 2a = 0$ has atleast one solution, $\forall\, x \in [0, \pi/4]$, is

(a) $a \in (2, 3)$
(b) $a \in [2, 3]$
(c) $a \in (1, 4)$
(d) $a \in [1, 4]$

182. If the expression $[mx - 1 + (1/x)]$ is non-negative for all positive real x, then the minimum value of m must be

(a) $-1/2$ (b) 0 (c) $1/4$ (d) $1/2$

183. If a, b and c are distinct positive numbers, then the nature of roots of the equation $1/(x-a) + 1/(x-b) + 1/(x-c) = 1/x$ is

(a) all real and distinct
(b) all real and atleast two are distinct
(c) atleast two real
(d) all non-real

184. If a, b, c and d are four consecutive terms of an increasing AP, then the roots of the equation $(x-a)(x-c) + 2(x-b)(x-d) = 0$ are

(a) real and distinct
(b) non-real complex
(c) real and equal
(d) integers

185. If $\cos^4 x + \sin^2 x - p = 0$, $p \in R$ has real solutions, then

(a) $p \le 1$ (b) $\frac{3}{4} \le p \le 1$
(c) $p \ge \frac{3}{4}$ (d) None of these

186. If the roots of $x^2 + x + a = 0$ exceed a, then

(a) $2 < a < 3$ (b) $a > 3$
(c) $-3 < a < -3$ (d) $a < -2$

187. The necessary and sufficient condition for the equation $(1 - a^2)x^2 + 2ax - 1 = 0$ to have roots lying in the interval $(0, 1)$ is

(a) $a \neq 0$
(b) $a > 0$
(c) $a < 2$ or $a > 2$
(d) None of the above

188. The values of a for which the equation $2x^2 - 2(2a+1)x + a(a-1) = 0$ has roots α and β satisfying the condition $\alpha < a < \beta$, are

(a) $(-3, 0)$ (b) $(0, \infty)$
(c) $(-\infty, -3) \cup (0, \infty)$ (d) None of these

189. Let a, b and c be real and $ax^2 + bx + c = 0$ has two real roots α and β, where $\alpha < -1$ and $\beta > 1$, then $1 + \frac{c}{a} + \left|\frac{b}{a}\right|$

(a) < 2 (b) < 1
(c) < 0 (d) None of these

190. If $2a + 3b + 6c = 0$, $a, b, c \in R$, then the quadratic equation $ax^2 + bx + c = 0$ has

(a) atleast one root in [0, 1] (b) atleast one root in [2, 3]
(c) atleast one root in (3, 4] (d) None of these

191. Let $f(x) = ax^2 + bx + c$ and $b, c \in R$, $a \neq 0$, satisfying $f(1) + f(2) = 0$. Then, the quadratic equation $f(x) = 0$ has

(a) no real root (b) 1 and 2 as real roots
(c) two equal roots (d) two distinct real roots

192. If $x + \lambda y - 2$ and $x - \mu y + 1$ are factors of the expression $6x^2 - xy - y^2 - 6x + 8y - 12$, then

(a) $\lambda = \frac{1}{3}, \mu = \frac{1}{2}$ (b) $\lambda = 2, \mu = 3$
(c) $\lambda = \frac{1}{3}, \mu = -\frac{1}{2}$ (d) None of these

193. If the expression $y^2 + 2xy + 2x + my - 3$ can be resolved into two rational factors, then m must be

(a) any positive real number
(b) any negative real number
(c) -2
(d) 3

194. If the expression $ax^2 + by^2 + cz^2 + 2ayz + 2bzx + 2cxy$ can resolved into rational factors, then

(a) $a + b + c = 0$
(b) $a^3 + b^3 + c^3 = 3abc$
(c) $ab + ac + bc = 0$
(d) None of the above

195. If the equation $x^2 + 9y^2 - 4x + 3 = 0$ is satisfied for real values of x and y, then

(a) $1 \le x \le 3$ (b) $2 \le x \le 3$
(c) $-\frac{1}{3} < y < 1$ (d) $0 < y < \frac{2}{3}$

196. If $(m_r, 1/m_r)$, $r = 1, 2, 3, 4$ are four pairs of values of x and y that satisfy the equation $x^2 + y^2 + 2gx + 2fy + c = 0$, then the value of $m_1 m_2 m_3 m_4$ is

(a) 0
(b) 1
(c) -1
(d) None of the above

197. The number of values of k for which the equation $x^2 - 3x + k = 0$ has two distinct roots lying in the interval (0, 1), is

(a) 3
(b) 2
(c) infinitely many
(d) no value of k satisfies the requirements

198. The number of real solutions of the equation $e^x = x$ is

(a) 1
(b) 2
(c) 0
(d) infinite

199. The number of real solutions of the equation $\log_{0.5} x = |x|$ is

(a) 1 (b) 2
(c) 0 (d) None of these

200. If $(\log_5 x)^2 + \log_5 x < 2$, then x belongs to the interval

(a) $\left(\frac{1}{25}, 5\right)$
(b) $\left(\frac{1}{5}, \frac{1}{\sqrt{5}}\right)$
(c) $(1, \infty)$
(d) None of the above

Type 2. **More than One Correct Option**

201. The roots of the equation $(a+\sqrt{b})^{x^2-15} + (a-\sqrt{b})^{x^2-15} = 2a$, where $a^2 - b = 1$, are

(a) ± 3 (b) ± 4 (c) $\pm\sqrt{14}$ (d) $\pm\sqrt{5}$

202. If $0 < a < b < c$ and the roots α, β of the equation $ax^2 + bx + c = 0$ are imaginary, then

(a) $|\alpha| = |\beta|$
(b) $|\alpha| = 1$
(c) $|\beta| < 1$
(d) None of the above

203. If $\tan\alpha$ and $\tan\beta$ are roots of the equation $x^2 + px + q = 0$ with $p \neq 0$, then

(a) $\sin^2(\alpha+\beta) + p\sin(\alpha+\beta)\cos(\alpha+\beta) + q\cos^2(\alpha+\beta) = q$
(b) $\tan(\alpha+\beta) = \dfrac{p}{q-1}$
(c) $\cos(\alpha+\beta) = -p$
(d) $\sin(\alpha+\beta) = 1-q$

204. If $(ax^2 + c)\,y + (a'x^2 + c') = 0$ and x is a rational function of y, then

(a) $\dfrac{a}{a'} = \dfrac{c}{c'}$ (b) $\dfrac{a}{c} = \dfrac{a'}{c'}$
(c) $ac' - a'c = 0$ (d) None of these

205. The equation $\left(\dfrac{x}{x+1}\right)^2 + \left(\dfrac{x}{x-1}\right)^2 = a(a-1)$ has

(a) four real roots, if $a > 2$
(b) two real roots, if $1 < a < 2$
(c) no real root, if $a < -1$
(d) four real roots, if $a < -1$

206. If α and β are the roots of the quadratic equation $ax^2 + bx + c = 0$, then which of the following expression will be the symmetric function of roots

(a) $\left|\log\dfrac{\alpha}{\beta}\right|$ (b) $\alpha^2\beta^5 + \beta^2\alpha^5$
(c) $\tan(\alpha - \beta)$ (d) $\left(\log\dfrac{1}{\alpha}\right)^2 + (\log\beta)^2$

207. If the quadratic equation $ax^2 + bx + c = 0\ (a > 0)$ has $\sec^2\theta$ and $\mathrm{cosec}^2\theta$ as its roots, then which of the following must hold good?

(a) $b + c = 0$ (b) $b^2 - 4ac \geq 0$
(c) $c \geq 4a$ (d) $4a + b \geq 0$

208. If the roots of the equation $x^3 + px^2 + qx - 1 = 0$ form an increasing GP, where p and q are real, then

(a) $p + q = 0$
(b) $p \in (-3, \infty)$
(c) one of the roots is unity
(d) one root is smaller than 1 and one root is greater than 1

209. Given that α, γ are roots of the equation $Ax^2 - 4x + 1 = 0$ and β, δ are the roots of the equation of $Bx^2 - 6x + 1 = 0$ such that α, β, γ and δ are in HP, then

(a) $A = 3$ (b) $A = 4$
(c) $B = 2$ (d) $B = 8$

210. If $(1+k)\tan^2 x - 4\tan x - 1 + k = 0$ has real roots $\tan x_1$ and $\tan x_2$, then

(a) $k^2 \leq 5$
(b) $\tan(x_1 + x_2) = 2$
(c) for $k = 2$, $x_1 = \pi/4$
(d) for $k = 1$, $x_1 = 0$

211. If the equation $x^2 + px + q = 0$ has roots u and v, where p and q are non-zero constants, then

(a) $qx^2 + px + 1 = 0$ has roots $1/u$ and $1/v$
(b) $(x+p)(x-q) = 0$ has roots $u+v$ and uv
(c) $x^2 + p^2x + q^2 = 0$ has roots u^2 and v^2
(d) $x^2 + px + p = 0$ has roots $\dfrac{u}{v}$ and $\dfrac{v}{u}$

212. For real x, the function $\dfrac{(x-a)(x-b)}{x-c}$ will assume all real values provided

(a) $a > b > c$

(b) $b \le c \le a$
(c) $a > c > b$
(d) $a \le c \le b$

213. Let $P(x) = x^2 + bx + c$, where b and c are integers. If $P(x)$ is a factor of both $x^4 + 6x^2 + 25$ and $3x^4 + 4x^2 + 28x + 5$, then

(a) $P(x) = 0$ has imaginary roots
(b) $P(x) = 0$ has roots of opposite sign
(c) $P(1) = 4$
(d) $P(1) = 6$

214. If the equations $4x^2 - x - 1 = 0$ and $3x^2 + (\lambda + \mu)x + \lambda - \mu = 0$ have a common root, then the rational values of λ and μ are

(a) $\lambda = \frac{-3}{4}$
(b) $\lambda = 0$
(c) $\mu = \frac{3}{4}$
(d) $\mu = 0$

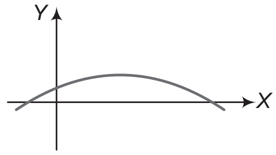
215. If $x, y \in R$ and $2x^2 + 6xy + 5y^2 = 1$, then

(a) $|x| \le \sqrt{5}$
(b) $|x| \ge \sqrt{5}$
(c) $y^2 \le 2$
(d) $y^2 \le 4$

216. If $\cos x - y^2 - \sqrt{y - x^2 - 1} \ge 0$, then

(a) $y \ge 1$
(b) $x \in R$
(c) $y = 1$
(d) $x = 0$

217. If the following figure shows the graph of $f(x) = ax^2 + bx + c$, then



(a) $ac < 0$
(b) $bc > 0$
(c) $ab > 0$
(d) $abc < 0$

Type 3. **Assertion and Reason**

Directions (Q. Nos. 218-219) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has four choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

218. **Statement I** If $\frac{a}{a_1}, \frac{b}{b_1}$ and $\frac{c}{c_1}$ are in AP, then a_1, b_1 and c_1 are in GP.

Statement II If $ax^2 + bx + c = 0$ and $a_1x^2 + b_1x + c_1 = 0$ have a common root and $\frac{a}{a_1}, \frac{b}{b_1}$ and $\frac{c}{c_1}$ are in AP, then a_1, b_1 and c_1 are in GP.

219. **Statement I** If roots of the equation $x^2 - bx + c = 0$ are two consecutive integers, then $b^2 - 4c = 1$.

Statement II If a, b and c are odd integers, then the roots of the equation $4abc\,x^2 + (b^2 - 4ac)x - b = 0$ are real and distinct.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 220-222) *Let the roots of $f(x) = x$ be α and β, where $f(x)$ is quadratic polynomial $ax^2 + bx + c$. α and β are also the roots of $f(f(x)) = x$. Let the other two roots of $f(f(x)) = x$ be λ and δ.*

220. The correct statements are

I. If α and β are real and unequal, then λ and δ are also real.

II. If α and β are imaginary, then λ and δ are also imaginary.

(a) Only I
(b) Only II
(c) both I and II
(d) neither I nor II

221. If $\alpha + \beta = \lambda + \delta$, then the correct statements are

I. α and β are real
II. λ and δ are real
III. α and β cannot be real
IV. λ and δ cannot be real

(a) I and II
(b) III and IV
(c) II and III
(d) I and IV

222. If α and β are real and equal, then

(a) λ and δ are imaginary
(b) λ and δ are real
(c) λ and δ may be real or imaginary
(d) Cannot say

Passage II (Q. Nos. 223-225) *If $f(x)$ is a differentiable function wherever it is continuous and $f'(c_1) = f'(c_2) = 0$. $f''(c_1) \cdot f''(c_2) < 0$, $f(c_1) = 5$, $f(c_2) = 0$ and $(c_1 < c_2)$.*

223. If $f(x)$ is continuous in $[c_1, c_2]$ and $f''(c_1) - f''(c_2) > 0$, then minimum number of roots of $f'(x) = 0$ in $[c_1 - 1, c_2 + 1]$ is

(a) 2
(b) 3
(c) 4
(d) 5

224. If $f(x)$ is continuous in $[c_1, c_2]$ and $f''(c_1) - f''(c_2) < 0$, then minimum number of roots of $f'(x) = 0$ in $[c_1 - 1, c_2 + 1]$ is

(a) 1 (b) 2 (c) 3 (d) 4

225. If $f(x)$ is continuous in $[c_1, c_2]$ and $f''(c_1) - f''(c_2) > 0$, then minimum number of roots of $f(x) = 0$ in $[c_1 - 1, c_2 + 1]$ is

(a) 2 (b) 3 (c) 4 (d) 5

Passage III (Q. Nos. 226-228) *Let $f(x) = x^2 + b_1x + c_1$ and $g(x) = x^2 + b_2x + c_2$. If real roots of $f(x) = 0$ are α, β and real roots of $g(x) = 0$ are $\alpha + \delta, \beta + \delta$ and least value of $f(x)$ is $-\frac{1}{4}$. Then, least value of $g(x)$ occurs at $x = \frac{7}{2}$.*

226. The least value of $g(x)$ is

(a) -1 (b) $-\frac{1}{2}$

(c) $-\frac{1}{4}$ (d) $-\frac{1}{3}$

227. The value of b_2 is

(a) 6 (b) -7

(c) 8 (d) 0

228. The roots of $g(x) = 0$ are

(a) 3, 4 (b) -3, 4

(c) 3, -4 (d) -3, -4

Passage IV (Q. Nos. 229-231) *Let x_1, x_2, x_3 and x_4 be the roots (real or complex) of the equation $x^4 + ax^3 + bx^2 + cx + d = 0$ and $x_1 + x_2 = x_3 + x_4$ and $a, b, c, d \in R$.*

229. If $a = 2$, then the value of $b - c$ is

(a) -1 (b) 1 (c) -2 (d) 2

230. If $b < 0$, then how many different values of a we may have?

(a) 3 (b) 2 (c) 1 (d) 0

231. If $b + c = 1$ and $a \neq -2$, then for real values of $a, c \in$

(a) $\left(-\infty, \frac{1}{4}\right)$ (b) $(-\infty, 3)$

(c) $(-\infty, 1)$ (d) $(-\infty, 4)$

Type 5. **Match the Columns**

232. Match the statements of Column I with the values of Column II.

Column I	Column II
A. The real values of a for which the quadratic equation $2x^2 - (a^3 + 8a - 1)x + a^2 - 4a = 0$ possesses roots of opposite signs are given by	p. $a \geq 6$
B. If the equation $x^2 + 2(a + 1)x + 9a - 5 = 0$ has only negative roots, then	q. $0 \leq a \leq 1$
C. The value of a for which the inequality $x^2 - 2(4a - 1)x + 15a^2 - 2a - 7 > 0$ is valid for all $x \in R$, is	r. $0 < a < 4$
D. If $x \in R$, then $\dfrac{x^2 + 2x + a}{x^2 + 4x + 3a}$ can take all real values, if	s. $2 < a < 4$

233. Match the statements of Column I with the values of Column II.

Column I	Column II
A. If the equation $x^2 + 2(k + 1)x + (9k - 5) = 0$ has only negative roots, then	p. $2 < k < 4$
B. If the inequality $x^2 - 2(4k - 1)x + 15k^2 - 2k - 7 > 0$ is valid for all x, then	q. $k \geq 6$
C. If $x^2 - 2(k - 1)x + (2k + 1) = 0$ has both roots positive, then	r. $k < -1$ or $k > 0$
D. If $2x^2 - 2(2k + 1)x + k(k + 1) = 0$ has one root less than k and other root greater than k, then	s. $k \geq 4$
E. The graph of the curve $x^2 = 3x - y - 2$ is strictly below the line y equal to	t. $\frac{1}{4}$

Type 6. **Single Integer Answer Type Questions**

234. Let x_1, x_2, x_3 satisfying the equation $x^3 - x^2 + \beta x + \gamma = 0$ are in GP, where $(x_1, x_2, x_3 > 0)$, then the maximum value of $[\beta] + [\gamma] + 2$ is ______, where [ ] denotes the greatest integer function.

235. Consider the equation $x^3 - ax^2 + bx - c = 0$, where $a, b, c \in Q$ $(a \neq 1)$. It is given that x_1, x_2 and x_1x_2 are the real roots of the equation. If $b + c = 2(a + 1)$, then x_1x_2 is equal to ______.

236. If α and β are the roots of $x^2 + px - q = 0$ and γ, δ are the roots of $x^2 + px + r = 0$, $q + r \neq 0$, then $\dfrac{(\alpha - \gamma)(\alpha - \delta)}{(\beta - \gamma)(\beta - \delta)}$ is equal to ______.

Entrances Gallery

JEE Advanced/IIT JEE

1. Let $a \in \mathrm{R}$ and let $f: R \to R$ be given by $f(x) = x^5 - 5x + a$, then **[2014]**

(a) $f(x)$ has three real roots, if $a > 4$
(b) $f(x)$ has only one real root, if $a > 4$
(c) $f(x)$ has three real roots, if $a < -4$
(d) $f(x)$ has three real roots, if $-4 < a < 4$

2. The quadratic equation $p(x) = 0$ with real coefficients has purely imaginary roots. Then, the equation $p(p(x)) = 0$ has **[2014]**

(a) only purely imaginary roots
(b) all real roots
(c) two real and two purely imaginary roots
(d) neither real nor purely imaginary roots

3. The number of points in $(-\infty, \infty)$, for which $x^2 - x\sin x - \cos x = 0$, is **[2013]**

(a) 6 (b) 4 (c) 2 (d) 0

4. If $3^x = 4^{x-1}$, then x is equal to **[2013]**

(a) $\dfrac{2\log_3 2}{2\log_3 2 - 1}$ (b) $\dfrac{2}{2 - \log_2 3}$

(c) $\dfrac{1}{1 - \log_4 3}$ (d) $\dfrac{2\log_2 3}{2\log_2 3 - 1}$

5. Let $\alpha(a)$ and $\beta(a)$ be the roots of the equation $(\sqrt[3]{1+a} - 1)x^2 + (\sqrt{1+a} - 1)x + (\sqrt[6]{1+a} - 1) = 0$, where $a > -1$. Then, $\lim\limits_{a \to 0^+} \alpha(a)$ and $\lim\limits_{a \to 0^+} \beta(a)$ are **[2012]**

(a) $-\dfrac{5}{2}$ and 1 (b) $-\dfrac{1}{2}$ and -1

(c) $-\dfrac{7}{2}$ and 2 (d) $-\dfrac{9}{2}$ and 3

6. The value of

$$6 + \log_{3/2}\left(\frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\dots}}}\right)$$

is **[2012]**

(a) 4 (b) 3 (c) 1 (d) 0

7. Let (x_0, y_0) be solution of the following equations

$$(2x)^{\ln 2} = (3y)^{\ln 3} \quad \text{and} \quad 3^{\ln x} = 2^{\ln y}.$$

Then, x_0 is equal to **[2011]**

(a) $\dfrac{1}{6}$ (b) $\dfrac{1}{3}$

(c) $\dfrac{1}{2}$ (d) 6

8. Let α and β be the roots of $x^2 - 6x - 2 = 0$ with $\alpha > \beta$. If $a_n = \alpha^n - \beta^n$ for $n \geq 1$, then the value of $\dfrac{a_{10} - 2a_8}{2a_9}$ is **[2011]**

(a) 1 (b) 2 (c) 3 (d) 4

9. A value of b for which the equations

$$x^2 + bx - 1 = 0$$

and $$x^2 + x + b = 0,$$

have one root in common, is **[2011]**

(a) $-\sqrt{2}$ (b) $-i\sqrt{3}$ (c) $i\sqrt{5}$ (d) $\sqrt{2}$

10. Consider the polynomial $f(x) = 1 + 2x + 3x^2 + 4x^3$. Let s be the sum of all distinct real roots of $f(x)$ and let $t = |s|$. The real number s lies in the interval **[2010]**

(a) $\left(-\dfrac{1}{4}, 0\right)$ (b) $\left(-11, -\dfrac{3}{4}\right)$

(c) $\left(-\dfrac{3}{4}, -\dfrac{1}{2}\right)$ (d) $\left(0, \dfrac{1}{4}\right)$

11. Let p and q be real numbers such that $p \neq 0$, $p^3 \neq q$ and $p^3 \neq -q$. If α and β are non-zero complex numbers satisfying $\alpha + \beta = -p$ and $\alpha^3 + \beta^3 = q$, then a quadratic equation having $\dfrac{\alpha}{\beta}$ and $\dfrac{\beta}{\alpha}$ as its roots, is **[2010]**

(a) $(p^3 + q)x^2 - (p^3 + 2q)x + (p^3 + q) = 0$
(b) $(p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$
(c) $(p^3 - q)x^2 - (5p^3 - 2q)x + (p^3 - q) = 0$
(d) $(p^3 - q)x^2 - (5p^3 + 2q)x + (p^3 - q) = 0$

JEE Main/AIEEE

12. Let α and β be the roots of equation $x^2 - 6x - 2 = 0$. If $a_n = \alpha^n - \beta^n$, for $n \geq 1$, then the value of $\dfrac{a_{10} - 2a_8}{2a_9}$ is equal to **[2015]**

(a) 6 (b) -6
(c) 3 (d) -3

13. If $a \in R$ and the equation $-3(x - [x])^2 + 2(x - [x]) + a^2 = 0$ (where, $[x]$ denotes the greatest integer $\leq x$) has no integral solution, then all possible values of a lie in the interval **[2014]**

(a) $(-1, 0) \cup (0, 1)$ (b) $(1, 2)$
(c) $(-2, -1)$ (d) $(-\infty, -2) \cup (2, \infty)$

Target Exercises

14. If the equations $x^2 + 2x + 3 = 0$ and $ax^2 + bx + c = 0$, $a, b, c \in R$, have a common root, then $a : b : c$ is **[2013]**

(a) 1 : 2 : 3 (b) 3 : 2 : 1 (c) 1 : 3 : 2 (d) 3 : 1 : 2

15. The equation $e^{\sin x} - e^{-\sin x} - 4 = 0$ has **[2012]**

(a) infinite number of real roots
(b) no real roots
(c) exactly one real root
(d) exactly four real roots

16. Let α, β be real and z be a complex number. If $z^2 + \alpha z + \beta = 0$ has two distinct roots on the line Re $z = 1$, then it is necessary that **[2011]**

(a) $\beta \in (-1, 0)$ (b) $|\beta| = 1$
(c) $\beta \in (1, \infty)$ (d) $\beta \in (0, 1)$

17. Sachin and Rahul attempted to solve a quadratic equation. Sachin made a mistake in writing down the constant term and ended up in roots (4, 3). Rahul made a mistake in writing down coefficient of x to get roots (3, 2). The correct roots of equation are **[2011]**

(a) – 4, – 3 (b) 6, 1 (c) 4, 3 (d) – 6, – 1

18. If α and β are the roots of the equation $x^2 - x + 1 = 0$, then $\alpha^{2009} + \beta^{2009}$ is equal to **[2010]**

(a) – 2 (b) – 1
(c) 1 (d) 2

19. If the roots of the equation $bx^2 + cx + a = 0$ are imaginary, then for all real values of x, the expression $3b^2x^2 + 6bcx + 2c^2$ is **[2009]**

(a) greater than $4ab$ (b) less than $4ab$
(c) greater than $-4ab$ (d) less than $-4ab$

20. The quadratic equations

$$x^2 - 6x + a = 0 \quad \text{and} \quad x^2 - cx + 6 = 0$$

have one root in common. The other roots of the first and second equations are integers in the ratio 4 : 3. Then, the common root is **[2008]**

(a) 2 (b) 1 (c) 4 (d) 3

21. If the difference between the roots of the equation $x^2 + ax + 1 = 0$ is less than $\sqrt{5}$, then the set of possible values of a is **[2007]**

(a) (– 3, 3) (b) (– 3, ∞)
(c) (3, ∞) (d) (– ∞, – 3)

22. If the roots of the quadratic equation $x^2 + px + q = 0$ are tan 30° and tan 15° respectively, then the value of $2 + q - p$ is **[2006]**

(a) 3 (b) 0 (c) 1 (d) 2

23. All the values of m for which both roots of the equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than – 2 but less than 4 lie in the interval **[2006]**

(a) $m > 3$ (b) $-1 < m < 3$
(c) $1 < m < 4$ (d) $-2 < m < 0$

24. The value of a for which the sum of the squares of the roots of the equation $x^2 - (a-2)x - a - 1 = 0$ assume the least value, is **[2005]**

(a) 2 (b) 3 (c) 0 (d) 1

25. If the roots of the equation $x^2 - bx + c = 0$ are two consecutive integers, then $b^2 - 4c$ is equal to **[2005]**

(a) 1 (b) 2 (c) 3 (d) – 2

26. If both the roots of the quadratic equation $x^2 - 2kx + k^2 + k - 5 = 0$ are less than 5, then k lies in the interval **[2005]**

(a) [4, 5] (b) (– ∞, 4) (c) (6, ∞) (d) (5, 6]

27. If the equation

$$a_n x^n + a_{n-1}x^{n-1} + \ldots + a_1 x = 0,$$

$a_1 \neq 0$, $n \geq 2$, has a positive root $x = \alpha$, then the equation
$na_n x^{n-1} + (n-1)a_{n-1}x^{n-2} + \ldots + a_1 = 0$ has a positive root, which **[2005]**

(a) is equal to α
(b) is greater than or equal to α
(c) belongs to $(0, \alpha)$
(d) is greater than α

28. If $(1-p)$ is a root of quadratic equation $x^2 + px + (1-p) = 0$, then its roots are **[2004]**

(a) 0, 1 (b) – 1, 1 (c) 0, – 1 (d) – 1, 2

29. If one root of the equation $x^2 + px + 12 = 0$ is 4, while the equation $x^2 + px + q = 0$ has equal roots, then the value of q is **[2004]**

(a) $\frac{49}{4}$ (b) 12
(c) 3 (d) 4

30. Let two numbers have arithmetic mean 9 and geometric mean 4. Then, these numbers are the roots of the quadratic equation **[2004]**

(a) $x^2 + 18x + 16 = 0$ (b) $x^2 - 18x + 16 = 0$
(c) $x^2 + 18x - 16 = 0$ (d) $x^2 - 18x - 16 = 0$

31. Let z_1 and z_2 be two roots of the equation $z^2 + az + b = 0$, z being complex. Further, assume that the origin, z_1 and z_2 form an equilateral triangle. Then, **[2003]**

(a) $a^2 = b$ (b) $a^2 = 2b$
(c) $a^2 = 3b$ (d) $a^2 = 4b$

32. If the sum of the roots of the quadratic equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, then $\frac{a}{c}, \frac{b}{a}$ and $\frac{c}{b}$ are in **[2003]**

(a) AP (b) GP (c) HP (d) AGP

33. The number of the real solutions of the equation $x^2 - 3|x| + 2 = 0$ is **[2003]**

(a) 2 (b) 4 (c) 1 (d) 3

34. The value of a for which one root of the quadratic equation $(a^2 - 5a + 3)x^2 + (3a - 1)x + 2 = 0$ is twice as large as the other, is **[2003]**

(a) 2/3 (b) –2/3 (c) 1/3 (d) –1/3

35. If $\alpha \neq \beta$ and $\alpha^2 = 5\alpha - 3$, $\beta^2 = 5\beta - 3$, then the equation having α/β and β/α as its roots, is **[2002]**

(a) $3x^2 + 19x + 3 = 0$ (b) $3x^2 - 19x + 3 = 0$

(c) $3x^2 - 19x - 3 = 0$ (d) $x^2 - 16x + 1 = 0$

36. The number of real roots of $3^{2x^2 - 7x + 7} = 9$ is **[2002]**

(a) 0 (b) 2 (c) 1 (d) 4

Other Engineering Entrances

37. The number of digits in 20^{301} (given, $\log_{10} 2 = 0.3010$) is **[WB JEE 2014]**

(a) 602

(b) 301

(c) 392

(d) 391

38. The number of solutions of the equation $\log_{101} \log_7 (\sqrt{x+7} + \sqrt{x}) = 0$ is **[WB JEE 2014]**

(a) 3 (b) 7

(c) 9 (d) 49

39. The value of a, so that the sum of squares of the roots of the equation $x^2 - (a-2)x - a + 1 = 0$ assume the least value, is **[BITSAT 2014]**

(a) 2 (b) 0

(c) 3 (d) 1

40. If the roots of $x^2 - ax + b = 0$ are two consecutive odd integers, then $a^2 - 4b$ is equal to **[Kerala CEE 2014]**

(a) 3 (b) 4 (c) 5

(d) 6 (e) 7

41. If α and β are the roots of $x^2 - ax + b^2 = 0$, then $\alpha^2 + \beta^2$ is equal to **[Kerala CEE 2014]**

(a) $a^2 + 2b^2$ (b) $a^2 - 2b^2$ (c) $a^2 - 2b$

(d) $a^2 + 2b$ (e) $a^2 - b^2$

42. If α and β are the roots of the equation $x^2 + 3x - 4 = 0$, then $\frac{1}{\alpha} + \frac{1}{\beta}$ is equal to **[Kerala CEE 2014]**

(a) $\frac{-3}{4}$ (b) $\frac{3}{4}$ (c) $\frac{-4}{3}$

(d) $\frac{4}{3}$ (e) $\frac{3}{2}$

43. If the roots of the equation $x^2 + 2bx + c = 0$ are α and β, then $b^2 - c$ is equal to **[Kerala CEE 2014]**

(a) $\frac{(\alpha - \beta)^2}{4}$

(b) $(\alpha + \beta)^2 - \alpha\beta$

(c) $(\alpha + \beta)^2 + \alpha\beta$

(d) $\frac{(\alpha - \beta)^2}{2} + \alpha\beta$

(e) $\frac{(\alpha + \beta)^2}{2} + \alpha\beta$

44. If a, b and c are positive numbers in a GP, then the roots of the quadratic equation $(\log_e a)x^2 - (2\log_e b)x + (\log_e c) = 0$ are **[WB JEE 2014]**

(a) -1 and $\frac{\log_e c}{\log_e a}$ (b) 1 and $-\frac{\log_e c}{\log_e a}$

(c) 1 and $\log_a c$ (d) -1 and $\log_c a$

45. If α, β are the roots of $ax^2 + bx + c = 0$ $(a \neq 0)$ and $\alpha + h, \beta + h$ are the roots of $px^2 + qx + r = 0$ $(p \neq 0)$, then the ratio of the squares of their discriminants is **[WB JEE 2014]**

(a) $a^2 : p^2$ (b) $a : p^2$ (c) $a^2 : p$ (d) $a : 2p$

46. Let $f(x) = 2x^2 + 5x + 1$. If we write $f(x)$ is

$$f(x) = [a(x+1)(x-2) + b(x-2)(x-1) + c(x-1)(x+1)]$$

for real numbers a, b and c, then **[WB JEE 2014]**

(a) there are infinite number of choices for a, b and c

(b) only one choice for a but infinite number of choices for b and c

(c) exactly one choice for each of a, b and c

(d) more than one but finite number of choices for a, b and c

47. If α and β are the roots of the equation

$$ax^2 + bx + c = 0 \quad \text{and} \quad S_n = \alpha^n + \beta^n,$$

then $aS_{n+1} + bS_n + cS_{n-1}$ is equal to **[AMU 2014]**

(a) 0

(b) abc

(c) $a + b + c$

(d) None of the above

48. If the roots of $ax^2 + bx + c = 0$ are $\sin\alpha$ and $\cos\alpha$ for some α, then which one of the following is correct? **[RPET 2014]**

(a) $a^2 + b^2 = 2ac$

(b) $b^2 - c^2 = 2ab$

(c) $b^2 - a^2 = 2ac$

(d) $b^2 + c^2 = 2ab$

49. The value of x such that $3^{2x} - 2(3^{x+2}) + 81 = 0$ is **[Kerala CEE 2014]**

(a) 1 (b) 2 (c) 3

(d) 4 (e) 5

50. The equation whose roots are the squares of the roots of the equation $2x^2 + 3x + 1 = 0$, is **[Kerala CEE 2014]**

(a) $4x^2 + 5x + 1 = 0$ (b) $4x^2 - x + 1 = 0$
(c) $4x^2 - 5x - 1 = 0$ (d) $4x^2 - 5x + 1 = 0$
(e) $4x^2 + 5x - 1 = 0$

51. In a ΔABC, $\tan A$ and $\tan B$ are the roots of $pq(x^2 + 1) = r^2 x$. Then, ΔABC is **[WB JEE 2014]**

(a) a right angled triangle (b) an acute angled triangle
(c) an obtuse angled triangle (d) an equilateral triangle

52. If α and β are the roots of the quadratic equation $x^2 + px + q = 0$, then the values of $\alpha^3 + \beta^3$ and $\alpha^4 + \alpha^2\beta^2 + \beta^4$ are respectively **[WB JEE 2014]**

(a) $3pq - p^3$ and $p^4 - 3p^2q + 3q^2$
(b) $-p(3q - p^2)$ and $(p^2 - q)(p^2 + 3q)$
(c) $pq - 4$ and $p^4 - q^4$
(d) $3pq - p^3$ and $(p^2 - q)(p^2 - 3q)$

53. The number of solution(s) of the equation $\sqrt{x+1} - \sqrt{x-1} = \sqrt{4x-1}$ is **[WB JEE 2014]**

(a) 2 (b) 0 (c) 3 (d) 1

54. If $9\sqrt{x} = \sqrt{12} + \sqrt{147}$, then the value of x is **[RPET 2014]**

(a) −2 (b) 2 (c) 3 (d) −3

55. Solve the equation $x^2 - \sqrt{3}x + 1 = 0$. **[J&K CET 2014]**

(a) $x = (-\sqrt{3} \pm 2i)/2$ (b) $x = (-\sqrt{3} \pm i)/2$
(c) $x = (-\sqrt{3} \pm i)$ (d) $x = (\sqrt{3} \pm i)/2$

56. If $a = \cos\frac{2\pi}{7} + i\sin\frac{2\pi}{7}$, then the quadratic equation whose roots are $\alpha = a + a^2 + a^4$ and $\beta = a^3 + a^5 + a^6$, is **[Manipal 2014]**

(a) $x^2 - x + 2 = 0$ (b) $x^2 + 2x + 2 = 0$
(c) $x^2 + x + 2 = 0$ (d) $x^2 + x - 2 = 0$

57. Let p and q be real numbers. If α is the root of $x^2 + 3p^2x + 5q^2 = 0$, β is the root of $x^2 + 9p^2x + 15q^2 = 0$ and $0 < \alpha < \beta$, then the equation $x^2 + 6p^2x + 10q^2 = 0$ has a root γ that always satisfies **[WB JEE 2014]**

(a) $\gamma = \frac{\alpha}{4} + \beta$ (b) $\beta < \gamma$
(c) $\gamma = \frac{\alpha}{2} + \beta$ (d) $\alpha < \gamma < \beta$

58. If the roots of the equation $\lambda^2 + 8\lambda + \mu^2 + 6\mu = 0$ are real, then μ lies between **[RPET 2014]**

(a) −2 and 8 (b) −3 and 6
(c) −8 and 2 (d) −6 and 3

59. The number of solutions of the inequation $|x-2| + |x+2| < 4$ is **[Kerala CEE 2014]**

(a) 1 (b) 2 (c) 4
(d) 0 (e) 5

60. Solve the inequality $2x - 5 \le (4x - 7)/3$. **[J&K CET 2014]**

(a) $x \in (-\infty, 4)$ (b) $x \in (-\infty, 4]$
(c) $x \in (-\infty, 8]$ (d) $x \in (-\infty, -4]$

61. Solve the inequality $3x + 2 > -16$ and $2x - 3 \le 11$. **[J&K CET 2014]**

(a) $(-6, 7]$ (b) $[-6, 7)$ (c) $(-6, 7)$ (d) $[-6, 7]$

62. The number of real solutions of the equation $\sin e^x = 5^x + 5^{-x}$ is **[Karnataka CET 2013]**

(a) 1 (b) 0
(c) 2 (d) None of these

63. Let a, b and c be real numbers, $a \ne 0$. If α is a root of $a^2x^2 + bx + c = 0$, β is a root of $a^2x^2 - bx - c = 0$ and $0 < \alpha < \beta$. Then, the equation $a^2x^2 + 2bx + 2c = 0$ has a root γ that always satisfies **[UP SEE 2013]**

(a) $\gamma = \alpha$ (b) $\alpha < \beta < \gamma$
(c) $\alpha < \gamma < \beta$ (d) $\gamma = \frac{\alpha + \beta}{2}$

64. If the arithmetic mean of the roots of a quadratic equation is 8 and the geometric mean is 5, then the equation is **[BITSAT 2013]**

(a) $x^2 - 16x - 25 = 0$ (b) $x^2 + 16x - 25 = 0$
(c) $x^2 - 16x + 25 = 0$ (d) $x^2 - 8x + 5 = 0$

65. If the roots of the equation $ax^2 + bx + c = 0$ are of the form $\frac{k+1}{k}$ and $\frac{k+2}{k+1}$, then $(a + b + c)^2$ is equal to **[Manipal 2013]**

(a) $b^2 - 4ac$ (b) $b^2 - 2ac$
(c) $2b^2 - ac$ (d) Σa^2

66. If the equations $2ax^2 - 3bx + 4c = 0$ and $3x^2 - 4x + 5 = 0$ have a common root, then $(a + b)/(b + c)$ is equal to $(a, b, c \in R)$ **[Kerala CEE 2013]**

(a) 1/2 (b) 3/35 (c) 34/31
(d) 29/23 (e) None of these

67. If $\log_2(9^{x-1} + 7) - \log_2(3^{x-1} + 1) = 2$, then the values of x are **[Karnataka CET 2012]**

(a) 0, 2 (b) 0, 1
(c) 1, 4 (d) 1, 2

68. If a, b and c are in arithmetic progression, then the roots of the equation $ax^2 - 2bx + c = 0$ are **[WB JEE 2012]**

(a) 1 and $\frac{c}{a}$ (b) $-\frac{1}{a}$ and $-c$
(c) -1 and $-\frac{c}{a}$ (d) -2 and $-\frac{c}{2a}$

69. The harmonic mean of the roots of the equation $(5+\sqrt{2})x^2 - (4+\sqrt{5})x + 8 + 2\sqrt{5} = 0$ is **[Manipal 2012]**

(a) 2 (b) 4 (c) 6 (d) 8

70. If α, β and γ are the roots of the equation $x^3 + 4x + 2 = 0$, then $\alpha^3 + \beta^3 + \gamma^3$ is equal to **[Karnataka CET 2012]**

(a) 2 (b) 6 (c) -2 (d) -6

71. If $(\alpha + \sqrt{\beta})$ and $(\alpha - \sqrt{\beta})$ are the roots of the equation $x^2 + px + q = 0$, where α, β, p and q are real, then the roots of the equation $(p^2 - 4q)(p^2x^2 + 4px) - 16q = 0$ are **[WB JEE 2012]**

(a) $\left(\frac{1}{\alpha} + \frac{1}{\sqrt{\beta}}\right)$ and $\left(\frac{1}{\alpha} - \frac{1}{\sqrt{\beta}}\right)$

(b) $\left(\frac{1}{\sqrt{\alpha}} + \frac{1}{\beta}\right)$ and $\left(\frac{1}{\sqrt{\alpha}} - \frac{1}{\beta}\right)$

(c) $\left(\frac{1}{\sqrt{\alpha}} + \frac{1}{\sqrt{\beta}}\right)$ and $\left(\frac{1}{\sqrt{\alpha}} - \frac{1}{\sqrt{\beta}}\right)$

(d) $(\sqrt{\alpha} + \sqrt{\beta})$ and $(\sqrt{\alpha} - \sqrt{\beta})$

72. If the product of the roots of the equation $x^2 - 2\sqrt{2}\,kx + 2e^{2\log k} - 1 = 0$ is 31, then the roots of the equation are real for k, is equal to **[AMU 2012]**

(a) -4 (b) 1
(c) 4 (d) 0

73. If α and β are the roots of the equation $x^2 - 2x + 4 = 0$, then the value of $\alpha^n + \beta^n$ will be **[BITSAT 2011]**

(a) $i2^{n+1}\sin(n\pi/3)$
(b) $2^{n+1}\cos(n\pi/3)$
(c) $i2^{n-1}\sin(n\pi/3)$
(d) $2^{n-1}\cos(n\pi/3)$

74. If α, β and γ are the roots of $x^3 - 2x + 1 = 0$, then the value of $\Sigma\left(\frac{1}{\alpha+\beta-\gamma}\right)$ is **[Karnataka CET 2011]**

(a) $-1/2$ (b) -1
(c) 0 (d) $1/2$

75. The number of integral values of b, for which the equation $x^2 + bx - 16$ has integral roots, is **[Kerala CEE 2011]**

(a) 2 (b) 3
(c) 4 (d) 5
(e) 6

76. If a, b and c are three real numbers such that $a + 2b + 4c = 0$. Then, the equation $ax^2 + bx + c = 0$ **[WB JEE 2011]**

(a) has both the roots complex
(b) has its roots lying within $-1 < x < 0$
(c) has one of roots equal to $\frac{1}{2}$
(d) has its roots lying within $2 < x < 6$

77. If one of the roots of $2x^2 - cx + 3 = 0$ is 3 and another equation $2x^2 - cx + d = 0$ has equal roots, where c and d are real numbers, then d is equal to **[UP SEE 2011]**

(a) 3 (b) 49/8 (c) 8/49 (d) -3

78. The value of $\dfrac{(\sqrt{\sqrt{3}+1} + \sqrt{\sqrt{3}-1})^2\,(\sqrt{3}-\sqrt{2})}{(\sqrt{\sqrt{3}+1})^2 - (\sqrt{\sqrt{3}-1})^2}$ is **[UP SEE 2011]**

(a) $\frac{\sqrt{3}+\sqrt{2}}{\sqrt{3}}$ (b) 1
(c) $\sqrt{3}$ (d) $\frac{1}{\sqrt{3}}$

79. If $|2x-3| < |x+5|$, then x lies in the interval **[Kerala CEE 2011]**

(a) $(-3, 5)$ (b) $(5, 9)$
(c) $\left(\frac{-2}{3}, 8\right)$ (d) $\left(-8, \frac{2}{3}\right)$
(e) $\left(-5, \frac{2}{3}\right)$

80. If α and β are the roots of the equation $ax^2 + bx + c = 0$, then the equation whose roots are $\frac{k}{\alpha}$ and $\frac{k}{\beta}$, is **[MP PET 2011]**

(a) $cx^2 + kbx + k^2a = 0$ (b) $cx^2 + k^2bx + ka = 0$
(c) $kcx^2 + bx + k^2a = 0$ (d) $k^2cx^2 + bx + ka = 0$

81. If $3 \le 3t - 18 \le 18$, then which one of the following is correct? **[Kerala CEE 2010]**

(a) $15 \le 2t + 1 \le 20$ (b) $8 \le t < 12$
(c) $8 \le t + 1 \le 13$ (d) $21 \le 3t \le 24$
(e) $t \le 7$ or $t \ge 12$

82. The solution set of the inequation $\frac{x+11}{x-3} > 0$ is **[Kerala CEE 2010]**

(a) $(-\infty, -11) \cup (3, \infty)$
(b) $(-\infty, -10) \cup (2, \infty)$
(c) $(-100, -11) \cup (1, \infty)$
(d) $(-5, 0) \cup (3, 7)$
(e) $(0, 5) \cup (-1, 0)$

83. In a right angled triangle, the sides are a, b and c, with c as hypotenuse and $c - b \ne 1$, $c + b \ne 1$. Then, the value of $(\log_{c+b} a + \log_{c-b} a)/(2\log_{c+b} a \times \log_{c-b} a)$ will be **[WB JEE 2010]**

(a) 2 (b) -1 (c) 1/2 (d) 1

84. If α and β are the roots of the equation $ax^2 + bx + c = 0$, $(c \ne 0)$, then the equation whose roots are $\frac{1}{a\alpha + b}$ and $\frac{1}{a\beta + b}$, is **[BITSAT 2010]**

(a) $acx^2 - bx + 1 = 0$ (b) $x^2 - acx + bc + 1 = 0$
(c) $acx^2 + bx - 1 = 0$ (d) $x^2 + acx - bc + 11 = 0$

85. If one root of the equation $x^2 + px + q = 0$ is $2+\sqrt{3}$, then the value of p and q are, respectively **[VITEEE 2010]**

(a) $-4, 1$ (b) $4, -1$ (c) $2, \sqrt{3}$ (d) $-2, -\sqrt{3}$

86. If $x^2 + px + q = 0$ has the roots α and β, then the value of $(\alpha - \beta)^2$ is **[VITEEE 2010]**

(a) $p^2 - 4q$ (b) $(p^2 - 4q)^2$
(c) $p^2 + 4q$ (d) $(p^2 + 4q)^2$

87. If a and b are the roots of the equation $x^2 + ax + b = 0, a \neq 0, b \neq 0$, then the values of a and b are, respectively **[Kerala CEE 2010]**

(a) 2 and -2 (b) 2 and -1 (c) 1 and -2
(d) 1 and 2 (e) -1 and 2

88. If the roots of the equation $x^2 - bx + c = 0$ are two consecutive integers, then $b^2 - 4c$ is equal to **[Kerala CEE 2010]**

(a) -1 (b) 0 (c) 1
(d) 2 (e) 3

89. If α and β are the roots of the quadratic equation $x^2 + x + 1 = 0$, then the equation whose roots are α^{19} and β^7, is **[WB JEE 2010]**

(a) $x^2 - x + 1 = 0$ (b) $x^2 - x - 1 = 0$
(c) $x^2 + x - 1 = 0$ (d) $x^2 + x + 1 = 0$

90. The quadratic equation $x^2 + 15|x| + 14 = 0$ has **[BITSAT 2010]**

(a) only positive solutions
(b) only negative solutions
(c) no solution
(d) both positive and negative solutions

91. The value of a for which the equation $2x^2 + 2\sqrt{6}x + a = 0$ has equal roots, is **[VITEEE 2010]**

(a) 3
(b) 4
(c) 2
(d) $\sqrt{3}$

92. If $\frac{3}{2} + \frac{7}{2}i$ is a solution of the equation $ax^2 - 6x + b = 0$, where a and b are real numbers, then the value of $a + b$ is **[Kerala CEE 2010]**

(a) 10 (b) 22 (c) 30
(d) 29 (e) 31

93. The roots of the quadratic equation $x^2 - 2\sqrt{3}x - 22 = 0$ are **[WB JEE 2010]**

(a) imaginary
(b) real, rational and equal
(c) real, irrational and unequal
(d) real, rational and unequal

Explanations

Target Exercises

1. The given inequation reduces to
$$2 < \frac{8x}{10} \quad \text{or} \quad x > \frac{5}{2}$$
$\therefore$ Least integer is 3.

2. $a - b + c < 1, a + b + c > -1, 9a + 3b + c < -4$
$$\begin{aligned} \Rightarrow \quad & \left.\begin{aligned} a - b + c &< 1 \\ \text{and} \quad -a - b - c &< 1 \end{aligned}\right\} \Rightarrow -2b < 2 \\ \text{or} \quad & 2b + 2 > 0 \\ \Rightarrow \quad & b + 1 > 0 \end{aligned}$$

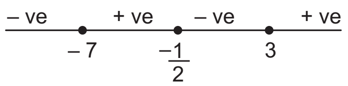
3. $$\begin{aligned}(a^4 + b^4) - (a^3b + ab^3) &= (a^4 - a^3b) - (ab^3 - b^4) \\ &= a^3(a - b) - b^3(a - b) \\ &= (a - b)(a^3 - b^3) \\ &= (a - b)^2(a^2 + ab + b^2)\end{aligned}$$
which is positive as both factors are positive.
Thus, $(a^4 + b^4) - (a^3b + ab^3) > 0$
$$\Rightarrow \quad a^4 + b^4 > a^3b + ab^3$$

4. Using number line rule,
$$x \in (-\infty, 0) \cup \left(\frac{2}{3}, \infty\right)$$

5. Using number line rule,
$$x \in (-\infty, 3) \cup (10, \infty)$$

6. Using number line rule,
$$x \in (-\infty, -4)$$

7. Using number line rule,



$$x \in (-\infty, -7) \cup \left(-\frac{1}{2}, 3\right)$$

8. $5x + 2 < 3x + 8$ and $\dfrac{x + 2}{x - 1} < 4$
$$\Rightarrow \quad x \in (-\infty, 1) \cup (2, 3)$$

9. $$\begin{aligned}|3x + 2| < 1 \quad \Leftrightarrow \quad & -1 < 3x + 2 < 1 \\ \Leftrightarrow \quad & -3 < 3x < -1 \\ \Leftrightarrow \quad & -1 < x < -\frac{1}{3}\end{aligned}$$

10. $|3 - x| = x - 3$ is true only when $x - 3 \geq 0$
i.e. $x \geq 3$

11. $|2x - 3| < |x + 2|$
Squaring on both sides, we get
$$(2x - 3)^2 - (x + 2)^2 < 0$$
$$(x - 5)(3x - 1) < 0$$

$$\Rightarrow \quad x \in \left(\frac{1}{3}, 5\right)$$

12. Let us first solve $|3x + 1| < \dfrac{1}{3}$
$$\begin{aligned}\Rightarrow \quad & -\frac{1}{3} < 3x + 1 < \frac{1}{3} \\ \Rightarrow \quad & -\frac{4}{3} < 3x < -\frac{2}{3} \\ \Rightarrow \quad & -\frac{4}{9} < x < -\frac{2}{9}\end{aligned}$$
Also, $0 < |3x + 1|$ is satisfied by each x except when
$$3x + 1 = 0$$
$$\Rightarrow \quad x = -\frac{1}{3}$$
$\therefore$ Solution is $\left(-\dfrac{4}{9}, -\dfrac{2}{9}\right) - \left\{-\dfrac{1}{3}\right\}$.

13. $|x - 1|$ is the distance of x from 1
$|x - 3|$ is the distance of x from 3
The points $x = 2$ is equidistant from 1 and 3.
Hence, the solution consists of all $x \geq 2$.

14. $||x| - 1| < |1 - x|$ $\quad \ldots$(i)

***Case* I** $x \geq 0$
$\therefore$ Eq. (i) becomes $|x - 1| < x - 1$ or $|1 - x| < 1 - x$
which is not satisfied by any x, because
$$|a| \geq a, \forall a \in R$$
***Case* II** $\quad -1 \leq x < 0$
$$\begin{aligned}\therefore \text{ Eq. (i) becomes } \quad & |-1 - x| < 1 - x \\ \text{or} \quad & |x + 1| < 1 - x \\ \Rightarrow \quad & x + 1 < 1 - x \text{ or } x < 0\end{aligned}$$
Thus, Eq. (i) is satisfied for $-1 \leq x < 0$

***Case* III** $\quad x < -1$
$$\begin{aligned}\text{Eq. (i) becomes } & |-1 - x| < 1 - x \\ \Rightarrow \quad & |1 + x| < 1 - x \\ \Rightarrow \quad & -(1 + x) < 1 - x \\ \Rightarrow \quad & -2 < 0, \text{ which is true}\end{aligned}$$
So, solution set is $(-\infty, 0)$.

15. $$\left|\frac{1}{x} - 2\right| < 4 \quad \Rightarrow \quad -4 < \frac{1}{x} - 2 < 4$$
$$\Rightarrow \quad -2 < \frac{1}{x} < 6$$
Hence, $x \in \left(-\infty, -\dfrac{1}{2}\right) \cup \left(\dfrac{1}{6}, \infty\right)$.

16. $$\left|1 + \frac{3}{x}\right| > 2$$

***Case* I** $\quad 1 + \dfrac{3}{x} > 2 \quad \Rightarrow \quad \dfrac{3}{x} > 1 \qquad$ [clearly $x > 0$]
$$\Rightarrow \quad 3 > x \quad \text{or} \quad x < 3$$
***Case* II** $\quad 1 + \dfrac{3}{x} < -2 \quad \Rightarrow \quad \dfrac{3}{x} < -3 \qquad$ [hence $x < 0$]
$$\begin{aligned}\Rightarrow \quad & 3 > -3x \\ \Rightarrow \quad & -1 < x \quad \text{or} \quad x > -1\end{aligned}$$
Hence, either $0 < x < 3$ or $-1 < x < 0$

17. $|x^2 - 10| \le 6$

$\Rightarrow \quad -6 < x^2 - 10 \le 6$

$\Rightarrow \quad 4 \le x^2 \le 16$

$\Rightarrow \quad 2 \le |x| \le 4$

$\therefore$ Either $2 \le x \le 4$

or $\quad -4 \le x \le -2$

$\therefore \quad x \in [-4, -2] \cup [2, 4]$

18. $\left|x + \frac{1}{x}\right| > 2 \qquad$ [clearly $x \ne 0$]

$\Rightarrow \quad \left|\frac{x^2+1}{x}\right| > 2 \Rightarrow \frac{x^2+1}{|x|} > 2 \qquad [\because x^2 + 1 > 0]$

$\Rightarrow \quad x^2 + 1 > 2|x|$

$\Rightarrow \quad |x|^2 - 2|x| + 1 > 0$

$\Rightarrow \quad (|x| - 1)^2 > 0$

$\Rightarrow \quad |x| \ne 1 \Rightarrow x \ne -1, 1$

$\therefore \quad x \in R - \{-1, 0, 1\}$

19. $\frac{|x+1|}{|x|} + |x+1| = \frac{|x+1|^2}{|x|}$

Since, $|a| + |b| = |a+b|$ iff $ab \ge 0$

$\therefore \quad \frac{(x+1)}{x} \cdot (x+1) \ge 0 \Rightarrow \frac{(x+1)^2}{x} \ge 0$

$\Rightarrow \quad x > 0$ or $\{-1\}$

20. $(-3 \le x - 1 \le 3)$ and $(x - 1 \le -1$ or $x - 1 \ge 1)$

$\Rightarrow (-2 \le x \le 4)$ and $(x \le 0$ or $x \ge 2)$

$\Rightarrow \quad -2 \le x \le 0$ or $2 \le x \le 4$

21. Here, $x > \sqrt{1-x}$ i.e. greater than zero

$\therefore \quad x^2 > 1 - x$ and $1 - x > 0, x > 0$

$\Rightarrow \quad x^2 + x - 1 > 0$ and $0 < x < 1$

$\Rightarrow \quad \left(x + \frac{1}{2}\right)^2 > \frac{5}{4}$ and $0 < x < 1$

$\Rightarrow \quad x > \frac{\sqrt{5}-1}{2}$ and $0 < x < 1$

$\Rightarrow \quad \frac{\sqrt{5}-1}{2} < x < 1$

22. $|x-2|^2 - 3|x-2| + 2 = 0$

$\Rightarrow \quad (|x-2| - 1)(|x-2| - 2) = 0 \Rightarrow x = 3, 1, 4, 0$

$\therefore$ Product of roots $= 0$

23. Here, $a > b \Rightarrow ax > bx$, only when $x > 0$

and $\quad a > b > 0$

Option (a) is false

$|x| > |y| \Rightarrow x > y > 0,$

Option (b) is false

$a > b > 0 \Rightarrow \frac{1}{a} < \frac{1}{b}$

Option (c) is false

$a > b \Rightarrow a + c > b + c$, for $c \in R$

$\therefore$ Option (d) is true.

24. For $x \le 1$, the given inequation gives $x \le 0$ and for $x \ge 3$, the given inequation gives $x \ge 4$.

For $1 < x \le 2$ or $2 < x < 3$, the given inequation gives no solution.

$\therefore$ Solution is $(-\infty, 0] \cup [4, \infty)$.

25. Here, $5 = 4^a$ and $6 = 5^b$

Let $\quad \log_3 2 = x$

Then, $\quad 2 = 3^x$

Now, $\quad 6 = 5^b = (4^a)^b = 4^{ab}$

or $\quad 3 = 2^{2ab-1}$

$\therefore \quad 2 = (2^{2ab-1})^x = 2^{x(2ab-1)}$

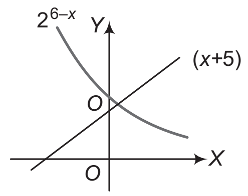
$\Rightarrow \quad x(2ab - 1) = 1$

26. $\frac{\log a}{\log 5} \cdot \frac{\log x}{\log a} = 2$

$\Rightarrow \quad \log_5 x = 2 \Rightarrow x = 5^2 = 25$

27. $x + 5 = 2^{6-x}$.

Its graph is as follows



Clearly, there cannot be more than one solution and by trial, the solution is $x = 3$.

28. $|4 - 5x| > 2^2 = 4$

$\Rightarrow \quad \frac{5x}{4} - 1 > 1$ or $\frac{5x}{4} - 1 < -1$

$\therefore \quad x > \frac{8}{5}$ or $x < 0$

So, the solution set $= (-\infty, 0) \cup \left(\frac{8}{5}, +\infty\right)$

29. $\frac{x+2}{x} \ge (0.2)^1$ or $\frac{x+2}{x} \ge \frac{1}{5}$

$5x(x+2) \ge x^2$ or $4x^2 + 10x \ge 0$

$\therefore \quad x \ge 0$ or $x \le -\frac{5}{2}$

Also, $\quad \frac{x+2}{x} > 0$

$\Rightarrow \quad x(x+2) > 0$

$\therefore \quad x < -2$ or $x > 0$

$\therefore$ The solution set is $\left(-\infty, -\frac{5}{2}\right] \cup (0, +\infty)$.

30. $\log_{16} x = \frac{1 \pm \sqrt{1 - 4\log_{16} k}}{2}$

For exactly one solution, $4\log_{16} k = 1$

$\therefore \quad k^4 = 16$

Hence, $\quad k = 2, -2, 2i, -2i$

But k is positive and real.

31. $x^{\log_x a \cdot \log_a y \cdot \log_y z}$

$\Rightarrow \quad x^{\frac{\log a}{\log x} \cdot \frac{\log y}{\log a} \cdot \frac{\log z}{\log y}} \Rightarrow x^{\log_x z} = z$

32. $\log_{10} x = 25\log_{10}(5) = 25\{1 - \log_{10} 2\}$

$= 25\{1 - 0.30103\}$

$= 25\{0.69897\}$

$= 17.469$

$\therefore$ Number of zeroes coming immediately after the decimal place is 17.

33. $\dfrac{\log x}{y-z}=\dfrac{\log y}{z-x}=\dfrac{\log z}{x-y}$

$$=\frac{x\log x+y\log y+z\log z}{0}$$

$\Rightarrow\ \log(x^x y^y z^z)=0\ \Rightarrow\ x^x y^y z^z=1$

34. $\log_{1/3}(x^2+x+1)<-1=\log_{1/3}\left(\dfrac{1}{3}\right)^{-1}$

$\Rightarrow\qquad x^2+x+1<\left(\dfrac{1}{3}\right)^{-1}$

$\Rightarrow\qquad x^2+x-2<0$

$\Rightarrow\qquad x\in(-2,1)$

35. $\log_{10}x^2\geq 0\ \Rightarrow\ \log_{10}x^2\geq\log_{10}1$

$\Rightarrow\quad x^2\geq 1\ \Rightarrow\ x\geq 1\ \Rightarrow\ x\leq -1$

36. Value $=\log_{x_1}\log_{x_2}\log_{x_3}\dots\log_{x_{n-1}}(x_{n-1}^{x_{n-2}^{\cdot^{\cdot^{x_1}}}}\log_{x_n}x_n)$

$=\log_{x_1}\log_{x_2}\log_{x_3}\dots\log_{n-1}x_{n-1}^{x_{n-2}^{\cdot^{\cdot^{x_1}}}}$

$=\dots=\log_{x_1}x_1=1$

37. $4^{\sin^2 x}+\dfrac{4}{4^{\sin^2 x}}\geq 2\sqrt{4^{\sin^2 x}\cdot\dfrac{4}{4^{\sin^2 x}}}$

$\Rightarrow\qquad 4^{\sin^2 x}+4^{\cos^2 x}\geq 4$

38. $y=\dfrac{3^x}{3}+\dfrac{1}{3^x\cdot 3}$, we know AM $\geq$ GM

$\Rightarrow\qquad \dfrac{\dfrac{3^x}{3}+\dfrac{1}{3^x\cdot 3}}{2}\geq\sqrt{\dfrac{3^x}{3}\cdot\dfrac{1}{3^x\cdot 3}}$

$\Rightarrow\qquad 3^{x-1}+3^{-x-1}\geq\dfrac{2}{3}$

39. Since, AM $\geq$ GM

$$\frac{a}{b}+\frac{b}{a}+\frac{b}{c}+\frac{c}{b}+\frac{c}{a}\geq 6$$

$\Rightarrow\qquad \dfrac{b+c}{a}+\dfrac{c+a}{b}+\dfrac{a+b}{c}\geq 6$

Hence, the least value is 6.

40. Since, AM > GM for different numbers.

$\therefore\qquad \dfrac{(b+c-a)+(c+a-b)}{2}>[(b+c-a)(c+a-b)]^{\frac{1}{2}}$

$\Rightarrow\qquad c>[(b+c-a)(c+a-b)]^{1/2}$

Similarly, $\quad b>[(b+c-a)(a+b-c)]^{1/2}$

and $\quad a>[(a+b-c)(c+a-b)]^{1/2}$

On multiplying, we get

$$abc>(b+c-a)(c+a-b)(a+b-c)$$

$\Rightarrow\qquad (b+c-a)(c+a-b)(a+b-c)-abc<0$

41. Here, $x_1\cdot x_2\dots x_n=1$

$\therefore\qquad \dfrac{x_1+x_2+\dots+x_n}{n}\geq(x_1\cdot x_2\dots x_n)^{\frac{1}{n}}$

$\Rightarrow\qquad x_1+x_2+\dots+x_n\geq n$

42. Since, AM $\geq$ GM

$\therefore\qquad \dfrac{a^2+b^2+c^2}{3}\geq(a^2b^2c^2)^{1/3}$

and $\quad \dfrac{1}{3}\left(\dfrac{1}{a^2}+\dfrac{1}{b^2}+\dfrac{1}{c^2}\right)\geq\left(\dfrac{1}{a^2b^2c^2}\right)^{1/3}$

On multiplying, we get

$$\frac{1}{3}(a^2+b^2+c^2)\cdot\frac{1}{3}\left(\frac{1}{a^2}+\frac{1}{b^2}+\frac{1}{c^2}\right)\geq(a^2b^2c^2)^{1/3}\left(\frac{1}{a^2b^2c^2}\right)^{1/3}$$

$\Rightarrow\quad (a^2+b^2+c^2)\left(\dfrac{1}{a^2}+\dfrac{1}{b^2}+\dfrac{1}{c^2}\right)\geq 9$

$\therefore$ Least value is 9.

43. Since, AM $\geq$ GM

$\therefore\qquad \dfrac{a^2+b^2}{2}\geq\sqrt{a^2b^2}=ab,\ \dfrac{b^2+c^2}{2}\geq bc$

and $\qquad \dfrac{c^2+a^2}{2}\geq ca$

On adding, we get $a^2+b^2+c^2\geq ab+bc+ca$

$\Rightarrow$ Option (a) holds.

Again, $\qquad \dfrac{a^3+b^3+c^3}{3}\geq(a^3b^3c^3)^{1/3}$

$\Rightarrow\qquad a^3+b^3+c^3\geq 3abc$

$\Rightarrow$ Option (d) does not hold.

Next, $\qquad \dfrac{b+c}{2}\geq\sqrt{bc},\ \dfrac{c+a}{2}\geq\sqrt{ca},\ \dfrac{a+b}{2}\geq\sqrt{ab}$

$\Rightarrow\qquad \left(\dfrac{b+c}{2}\right)\left(\dfrac{c+a}{2}\right)\left(\dfrac{a+b}{2}\right)\geq\sqrt{a^2b^2c^2}$

$\Rightarrow\qquad (b+c)(c+a)(a+b)\geq 8abc$

$\Rightarrow$ Option (b) does not hold.

Again, $\qquad \dfrac{1}{3}\left(\dfrac{a}{b}+\dfrac{b}{c}+\dfrac{c}{a}\right)\geq\left(\dfrac{a}{b}\cdot\dfrac{b}{c}\cdot\dfrac{c}{a}\right)^{1/3}$

$\Rightarrow\qquad \dfrac{a}{b}+\dfrac{b}{c}+\dfrac{c}{a}\geq 3$

$\Rightarrow$ Option (c) does not hold.

44. $3(a^2+b^2+c^2)-(a+b+c)^2$

$$=2(a^2+b^2+c^2-bc-ca-ab)$$
$$=(b-c)^2+(c-a)^2+(a-b)^2\geq 0$$

$\Rightarrow\qquad 3(a^2+b^2+c^2)\geq(a+b+c)^2>9$

$\Rightarrow\qquad a^2+b^2+c^2>3$

$\Rightarrow$ Option (a) holds.

Now, $\qquad a^6+b^6\geq 12a^2b^2-64$

If $\qquad a^6+b^6+64\geq 12a^2b^2$

i.e. if $\qquad a^6+b^6+2^6\geq 3\cdot 2^2\cdot a^2b^2$

i.e. if $\qquad \dfrac{a^6+b^6+2^6}{3}\geq(2^6a^6b^6)^{1/3}\qquad$ [$\because$ AM $\geq$ GM]

$\Rightarrow$ Option (b) does not hold.

Again, AM $\geq$ HM

$\therefore\qquad \dfrac{a+b+c}{3}\geq\dfrac{3}{\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}}$

$\Rightarrow\qquad \dfrac{\alpha}{3}\geq\dfrac{3}{\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}}\ \Rightarrow\ \dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}\geq\dfrac{9}{\alpha}$

$\Rightarrow$ Option (c) does not hold.

45. Using AM $\geq$ GM, one can show

$$(b+c)(c+a)(a+b)\geq 8abc$$

$\Rightarrow\qquad (p-a)(p-b)(p-c)\geq 8abc$

$\Rightarrow$ Option (b) holds.

Also, $\dfrac{(p-a)+(p-b)+(p-c)}{3}$
$$\ge [(p-a)(p-b)(p-c)]^{1/3}$$
$$\Rightarrow \quad \frac{3p-(a+b+c)}{3} \ge [(p-a)(p-b)(p-c)]^{1/3}$$
$$\Rightarrow \quad \frac{2p}{3} \ge [(p-a)(p-b)(p-c)]^{1/3}$$
$$\Rightarrow (p-a)(p-b)(p-c) \le \frac{8p^3}{27}$$
$\Rightarrow$ Option (a) does not hold.

Again, $\dfrac{1}{2}\left(\dfrac{bc}{a}+\dfrac{ca}{b}\right) \ge \sqrt{\left(\dfrac{bc}{a}\cdot\dfrac{ca}{b}\right)}$, etc.

On adding the inequalities, we get
$$\frac{bc}{a}+\frac{ca}{b}+\frac{ab}{c} \ge a+b+c = p$$
$\Rightarrow$ Option (c) does not hold.

46. AM $\ge$ GM
$$\Rightarrow \quad \frac{bcx+cay+abz}{3} \ge (a^2b^2c^2\cdot xyz)^{1/3}$$
$$bcx+cay+abz \ge 3xyz$$
or $\quad bcx+acy+abz \ge 3abc$

47. $$\frac{2\left(\frac{a}{2}\right)+3\left(\frac{b}{3}\right)+4\left(\frac{c}{4}\right)}{9} \ge \left(\left(\frac{a}{2}\right)^2\left(\frac{b}{3}\right)^3\left(\frac{c}{4}\right)^4\right)^{1/9}$$
$$\Rightarrow \quad 2^9 \ge \left(\frac{a^2b^3c^4}{2^2\cdot 3^3\cdot 4^4}\right)$$
or $\quad a^2b^3c^4 \le 2^9\cdot 2^2\cdot 3^3\cdot 4^4$

or $\quad a^2b^3c^4 \le 4^2\cdot 6^3\cdot 8^4$

$\Rightarrow$ Maximum value of P is $4^2\cdot 6^3\cdot 8^4$.

48. Here, $\dfrac{(x_1^2+x_2^2+\dots+x_n^2)}{n} \ge \left(\dfrac{x_1+x_2+\dots+x_n}{n}\right)^2$
$$\Rightarrow \quad n\sum_{i=1}^{n} x_i^2 \ge \left(\sum_{i=1}^{n} x_i\right)^2$$

49. $x+y+z=2$

Now, $(2-x)(2-y)(2-z)=(y+z)(z+x)(x+y)$

We know, $(y+z)\ge 2\sqrt{yz}, (x+z)\ge 2\sqrt{xz}, (x+y)\ge 2\sqrt{xy}$

$\therefore \quad (y+z)(z+x)(x+y) \ge 8xyz$

$\Rightarrow \quad (2-x)(2-y)(2-z) \ge 8xyz$

Also, $\left(\dfrac{x^{-1}+y^{-1}+z^{-1}}{3}\right) \ge \left(\dfrac{x+y+z}{3}\right)^{-1}$
$$\Rightarrow \quad x^{-1}+y^{-1}+z^{-1} \ge 3\cdot\left(\frac{2}{3}\right)^{-1}$$
$$\Rightarrow \quad x^{-1}+y^{-1}+z^{-1} \ge \frac{9}{2}$$

50. $p^2=(a_1+a_2+\dots+a_n)^2=\sum_{i=1}^{n} a_i^2+2\sum_{i<j}^{n} a_i a_j$
$$\Rightarrow p^2-2q=\sum_{i=1}^{n} a_i^2 \ge 0 \quad \Rightarrow \quad q \le \frac{1}{2}p^2$$

51. $D=b^2-4ac, D'=d^2+4ac$

$\Rightarrow \quad D+D'=b^2+d^2>0$

$\therefore$Atleast one of D, D' is positive.

52. $D=c^2(3a^2+b^2)^2-4abc^2(-6a^2-ab+2b^2)$
$$=c^2(3a^2-b^2+4ab)^2$$

53. The sum of the coefficients
$$=(a+2)+(a-3)-(2a-1)=0$$
So, $\quad x=1$ is a root.

$\therefore \quad$ Other root $=-\dfrac{2a-1}{a+2}=$ Rational, $\forall\, a, a\ne -2$

54. $|\alpha-\beta|>\sqrt{3p} \Rightarrow (\alpha+\beta)^2-4\alpha\beta>3p$

$\Rightarrow \quad p^2-3p-4>0$ and $p>0$

$\Rightarrow \quad (p-4)(p+1)>0$ and $p>0$

$\Rightarrow \quad p>4$

55. $\alpha=\dfrac{1}{4-3i}, \beta=\dfrac{1}{4+3i} \quad \Rightarrow \quad \alpha\beta=\dfrac{1}{a}$

or $\quad a=25$

Also, $\quad \alpha+\beta=\dfrac{-b}{a}$
$$\Rightarrow \quad \frac{8}{25}=-\frac{b}{25}$$
$\Rightarrow \quad b=-8$

56. For $ax^2-bxy-ay^2$, $D=b^2+4a^2>0$

57. $(16+9k)x^2+2(6-k)x+(39+11k)$

$\Rightarrow \quad D=0$

$\therefore$Only one possible integral solution for k.

58. $\alpha+\alpha^2=-\dfrac{p}{3}$

and $\quad \alpha\cdot\alpha^2=\dfrac{3}{3} \Rightarrow \alpha^3=1$

$\Rightarrow \quad \alpha=1, \omega, \omega^2$

If $\alpha=1$, then $p=-6$

If $\alpha=\omega$, then $p=3$

But $\quad p>0 \Rightarrow p\ne -6$

Hence, $\quad p=3$

59. $\alpha+\beta=-p, \alpha\beta=p^3$ and $\beta^2=\alpha$

Hence, the roots are 4 and -2.

60. Since, a, b and c are positive, therefore $ax^2+b|x|+c>0$

Hence, the equation $ax^2+b|x|+c=0$ has no real root.

61. $\alpha+\beta=-\dfrac{b}{a}, \alpha\beta=\dfrac{c}{a}$

$\Rightarrow [\{(\alpha+k)+(\beta+k)\}^2-4(\alpha+k)(\beta+k)]$
$$=(\alpha+\beta)^2-4\alpha\beta$$
$$\Rightarrow \quad \frac{q^2}{p^2}-4\frac{r}{p}=\frac{b^2}{a^2}-\frac{4c}{a}$$
$$\Rightarrow \quad \frac{q^2-4pr}{p^2}=\frac{b^2-4ac}{a^2}$$
$$\Rightarrow \quad \frac{b^2-4ac}{q^2-4pr}=\left(\frac{a}{p}\right)^2$$

62. Since, $\dfrac{\alpha}{\beta}=\dfrac{m}{n}$
$$\Rightarrow \quad \frac{\alpha+\beta}{\alpha-\beta}=\frac{m+n}{m-n}$$
$$\Rightarrow \quad \frac{(\alpha+\beta)^2}{(\alpha+\beta)^2-4\alpha\beta}=\frac{(m+n)^2}{(m+n)^2-4mn}$$

$\Rightarrow \quad \dfrac{4\alpha\beta}{(\alpha+\beta)^2} = \dfrac{4mn}{(m+n)^2}$

$\Rightarrow \quad \dfrac{c/a}{b^2/a^2} = \dfrac{mn}{(m+n)^2}$

$\Rightarrow \quad ac(m+n)^2 = mnb^2$

63. $\left(x^3 + \dfrac{1}{x^3}\right) - 5\left(x^2 + \dfrac{1}{x^2}\right) + \left(x + \dfrac{1}{x}\right)$

$= \left(x + \dfrac{1}{x}\right)^3 - 3\left(x + \dfrac{1}{x}\right) - 5\left[\left(x + \dfrac{1}{x}\right)^2 - 2\right] + \left(x + \dfrac{1}{x}\right)$

$= \left(x + \dfrac{1}{x}\right)^3 - 5\left(x + \dfrac{1}{x}\right)^2 - 2\left(x + \dfrac{1}{x}\right) + 10$

$= 125 - 125 - 2(5) + (10)$

$= 0$

64. Let $x = \sqrt{6 + \sqrt{6 + \sqrt{6 + \ldots \infty}}} = \sqrt{6+x}$

Squaring on both sides, we get

$x^2 = 6 + x$

$\Rightarrow \quad x = -2, 3$

But x cannot be negative.

Hence, $x = 3$

65. $\alpha + \beta = -p, \alpha\beta = q$

Given, $\quad \alpha + \beta = \alpha^2 + \beta^2$

$= (\alpha+\beta)^2 - 2\alpha\beta$

$\Rightarrow \quad -p = p^2 - 2q$

$\Rightarrow \quad p^2 + p = 2q$

66. Here, $q - r + r - p + p - q = 0$

$\therefore$ Its roots are 1, $\dfrac{p-q}{q-r}$.

67. $2x^2 - 25x = 3(14)$

$\Rightarrow \quad 2x^2 - 25x - 42 = 0$

$\Rightarrow \quad (2x+3)(x-14) = 0$

$\Rightarrow \quad x = -\dfrac{3}{2}, 14$

But x cannot be negative.

Hence, $\quad x = 14$

68. Given, $\dfrac{x^2 - bx}{ax - c} = \dfrac{\lambda - 1}{\lambda + 1}$

$\Rightarrow \quad (\lambda+1)(x^2 - bx) = (\lambda - 1)(ax - c)$

$\Rightarrow (\lambda+1)x^2 - [\lambda b + b + \lambda a - a]x + (\lambda - 1)c = 0$

Since, $\quad \alpha + \beta = 0$

$\Rightarrow \quad \dfrac{\lambda b + b + \lambda a - a}{\lambda + 1} = 0$

$\Rightarrow \quad \lambda(a+b) = a - b$

$\Rightarrow \quad \lambda = \dfrac{a-b}{a+b}$

69. Discriminant = 0

$\Rightarrow \quad 4(ac+bd)^2 - 4(a^2+b^2)(c^2+d^2) = 0$

$\Rightarrow \quad 2abcd - a^2d^2 - b^2c^2 = 0$

$\Rightarrow \quad (ad - bc)^2 = 0$

$\Rightarrow \quad ad = bc$

$\Rightarrow \quad \dfrac{a}{b} = \dfrac{c}{d}$

70. Given, p, q and r are in AP $\Rightarrow 2q = p + r$

The roots of $px^2 + qx + r = 0$ are real, if

$q^2 - 4pr \ge 0 \Rightarrow \left(\dfrac{p+r}{2}\right)^2 - 4pr \ge 0$

$\therefore \left(\dfrac{r}{p}\right)^2 - 14\left(\dfrac{r}{p}\right) + 1 \ge 0 \Rightarrow \left|\dfrac{r}{p} - 7\right| \ge 4\sqrt{3}$

71. Given, $\quad \dfrac{2x+1}{9} + \dfrac{x^2+7}{x^2-7} = \dfrac{2x+17}{9}$

$\Rightarrow \quad 7x^2 = 175$

$\Rightarrow \quad x^2 = 25$

$\Rightarrow \quad x = \pm 5$

72. $x = 1$, satisfy $a(b-c)x^2 + b(c-a)x + c(a-b) = 0$

$\therefore \quad \alpha = \beta = 1$

$\Rightarrow \quad c(a-b) = a(b-c) \Rightarrow b = \dfrac{2ac}{a+c}$

Hence, a, b and c are in HP.

73. Since, α and β are roots of equation $x^2 + x\sqrt{\alpha} + \beta = 0$.

$\therefore \quad \alpha + \beta = -\sqrt{\alpha}, \alpha\beta = \beta \Rightarrow \alpha = 1$

[$\because \beta = 0$ does not satisfy the equation]

$\therefore \quad 1 + \beta = -1$

$\Rightarrow \quad \beta = -2$

74. α and β are roots of $8x^2 - 3x + 27 = 0$.

$\Rightarrow \quad \alpha + \beta = \dfrac{3}{8}, \alpha\beta = \dfrac{27}{8}$

$\therefore \quad \left(\dfrac{\alpha^2}{\beta}\right)^{\frac{1}{3}} + \left(\dfrac{\beta^2}{\alpha}\right)^{\frac{1}{3}} = \dfrac{(\alpha^3)^{\frac{1}{3}} + (\beta^3)^{\frac{1}{3}}}{(\alpha\beta)^{1/3}}$

$= \dfrac{\alpha+\beta}{(\alpha\beta)^{1/3}} = \dfrac{3/8}{(27/8)^{1/3}}$

$= \dfrac{3/8}{3/2} = \dfrac{1}{4}$

75. Since, $f(1) = 0$ and $f(x)$ is perfect square.

$\therefore \quad \alpha = \beta = 1$

$\Rightarrow \quad \alpha\beta = 1$

or $\quad c^2(a^2 - b^2) = a^2(b^2 - c^2)$

$\Rightarrow \quad b^2(a^2 + c^2) = 2a^2c^2$

$\Rightarrow \quad b^2 = \dfrac{2a^2c^2}{a^2 + c^2}$

Hence, a^2, b^2 and c^2 are in HP.

76. We have, $(1+m)x^2 - 2(1+3m)x + (1+8m) = 0 \quad$ ...(i)

Let D be the discriminant of Eq. (i). Roots of Eq. (i) will be equal, if $D = 0$

$\Rightarrow \quad m^2 - 3m = 0 \Rightarrow m(m-3) = 0$

$\therefore \quad m = 0, 3$

77. Let the other root be β.

Then, $\quad \alpha + \beta = -\dfrac{2}{4} = -\dfrac{1}{2}$

$\Rightarrow \quad \beta = -\dfrac{1}{2} - \alpha \quad$ ...(i)

and $\quad 4\alpha^2 + 2\alpha - 1 = 0$

Now, $\quad 4\alpha^3 - 3\alpha = \alpha(4\alpha^2 - 3) = \alpha(1 - 2\alpha - 3)$

[$\because 4\alpha^2 + 2\alpha - 1 = 0$]

$$= -2\alpha^2 - 2\alpha = -\frac{1}{2}(4\alpha^2) - 2\alpha$$

$$= -\frac{1}{2}(1-2\alpha) - 2\alpha \qquad [\because 4\alpha^2 = 1-2\alpha]$$

$$= -\frac{1}{2} - \alpha = \beta \qquad \text{[from Eq. (i)]}$$

Hence, $4\alpha^3 - 3\alpha$ is the other root.

78. Since, the roots are equal.

$\therefore \quad B^2 - 4AC = 0$

$\Rightarrow \quad (c-a)^2 - 4(a-b)(b-c) = 0$

$\Rightarrow \quad c^2 + a^2 - 2ca - 4ab + 4ac + 4b^2 - 4bc = 0$

$\Rightarrow \quad c^2 + a^2 + 2ac + 4b^2 - 4b(c+a) = 0$

$\Rightarrow \quad (c+a)^2 + (2b)^2 - 2\cdot 2b(c+a) = 0$

$\Rightarrow \quad [(c+a) - (2b)]^2 = 0$

$\Rightarrow \quad c + a - 2b = 0$

$\Rightarrow \quad 2b = a + c$

Hence, a, b and c are in AP.

Aliter

As $x = 1$ satisfy given equation.

$\therefore \quad \alpha = 1$ is the root

$\Rightarrow \quad \alpha = \beta = 1$

$\therefore \quad \alpha\beta = 1 = \dfrac{a-b}{b-c}$

$\Rightarrow \quad 2b = a + c$

79. Let the roots be α and β.

Then, $\alpha + \beta = \dfrac{-n}{l}$, $\alpha\beta = \dfrac{n}{l}$ and $\dfrac{\alpha}{\beta} = \dfrac{p}{q}$

Now, $\sqrt{\dfrac{p}{q}} + \sqrt{\dfrac{q}{p}} + \sqrt{\dfrac{n}{l}} = \sqrt{\dfrac{\alpha}{\beta}} + \sqrt{\dfrac{\beta}{\alpha}} + \sqrt{\alpha\beta}$

$$= \frac{\alpha + \beta + \alpha\beta}{\sqrt{\alpha\beta}} = \frac{-\frac{n}{l} + \frac{n}{l}}{\sqrt{\frac{n}{l}}} = 0$$

80. The given equation can be written as

$(ab-1)x^2 + (a+b)x - ab = 0$

Here, $\quad D = (a+b)^2 + 4ab(ab-1)$

$= (a+b)^2 - 4ab + 4(ab)^2$

$= (a-b)^2 + (2ab)^2 \geq 0, \forall\, a, b$

$\therefore$ Roots are always real.

81. Put $\sqrt{x-1} = t \Rightarrow x - 1 = t^2 \Rightarrow x = t^2 + 1$

The given equation reduces to

$\sqrt{t^2 + 1 + 3 - 4t} + \sqrt{t^2 + 1 + 8 - 6t} = 1$, where $t \geq 0$

$\Rightarrow |t-2| + |t-3| = 1$, where $t \geq 0$.

This equation will be satisfied, if $2 \leq t \leq 3$

$\therefore \quad 2 \leq \sqrt{x-1} \leq 3 \quad$ or $\quad 5 \leq x \leq 10$

Hence, the given equation is satisfied for all values of lying in [5, 10].

82. Let α and β be the roots of the given equation.

Then, $\alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$

Given, $\alpha + \beta = \dfrac{1}{\alpha^2} + \dfrac{1}{\beta^2} = \dfrac{\alpha^2 + \beta^2}{(\alpha\beta)^2} = \dfrac{(\alpha+\beta)^2 - 2\alpha\beta}{(\alpha\beta)^2}$

$$\Rightarrow \quad -\frac{b}{a} = \frac{\frac{b^2}{a^2} - \frac{2c}{a}}{\frac{c^2}{a^2}} = \frac{b^2 - 2ca}{c^2}$$

$\Rightarrow \quad 2ca^2 = bc^2 + ab^2$

Hence, bc^2, ca^2 and ab^2 are in AP.

83. Since, $\sin\theta$ and $\cos\theta$ are the roots of the equation $ax^2 + bx + c = 0$.

$\therefore \quad \sin\theta + \cos\theta = -\dfrac{b}{a}$ and $\sin\theta\cos\theta = \dfrac{c}{a}$

Now, $(\sin\theta + \cos\theta)^2 = 1 + 2\sin\theta\cos\theta$

$\therefore \quad \dfrac{b^2}{a^2} = 1 + \dfrac{2c}{a} = \dfrac{a+2c}{a}$

$\Rightarrow \quad b^2 = a(a+2c) = a^2 + 2ac$

$\Rightarrow \quad b^2 + c^2 = a^2 + 2ac + c^2 = (a+c)^2$

Hence, $\quad (a+c)^2 = b^2 + c^2$

84. Let the speed of the bus $= x$ km/h, then the speed of the car $= (x + 25)$ km/h

Time taken by the bus to cover 500 km $= \dfrac{500}{x}$ h

and time taken by the car to cover 500 km $= \dfrac{500}{(x+25)}$ h

Given, $\dfrac{500}{x} = \dfrac{500}{(x+25)} + 10 \Rightarrow \dfrac{50}{x} = \dfrac{50}{(x+25)} + 1$

$\Rightarrow \quad \dfrac{50}{x} - \dfrac{50}{(x+25)} = 1$

$\Rightarrow \quad \dfrac{50(x + 25 - x)}{x(x+25)} = 1$

$\Rightarrow \quad 1250 = x^2 + 25x$

$\Rightarrow \quad x^2 + 25x - 1250 = 0$

$\Rightarrow \quad x^2 + 50x - 25x - 1250 = 0$

$\Rightarrow \quad (x+50)(x-25) = 0$

$\because \quad x \neq -50 \quad$ or $\quad x = 25$

Hence, the speed of the bus $= 25$ km/h and speed of the car $= (25 + 25) = 50$ km/h.

85. The given equation can be written as

$(ay + a')x^2 + (by + b')x + (cy + c') = 0$

The condition that x may be rational function of y is,

$(by + b')^2 - 4(ay + a')(cy + c')$ is a perfect square

i.e. $(b^2 - 4ac)y^2 + (2bb' - 4ac' - 4a'c)y + b'^2 - 4a'c'$ is a perfect square $\Rightarrow D = 0$

i.e. $4(bb' - 2ac' - 2a'c)^2 - 4(b^2 - 4ac)(b'^2 - 4a'c') = 0$

or $(ac' + a'c)^2 - 4aa'cc' = abb'c + a'bb'c - a'bb'c - a'c'b^2 - acb'^2$

$\Rightarrow \quad (ac' - a'c)^2 = (ab' - a'b)(bc' - b'c)$

86. The corresponding quadratic equation of the given expression is

$a(b-c)x^2 + b(c-a)xy + c(a-b)y^2 = 0$

$\Rightarrow \quad a(b-c)\left(\dfrac{x}{y}\right)^2 + b(c-a)\dfrac{x}{y} + c(a-b) = 0$

Let $\dfrac{x}{y} = X$

Then, $a(b-c)X^2 + b(c-a)X + c(a-b) = 0$

The given expression will be perfect square, if the discriminant of the corresponding equation of the given expression is zero.

$\therefore \quad b^2(c-a)^2 - 4a(b-c)\cdot c(a-b) = 0$

$\Rightarrow \quad (bc+ab-2ac)^2 = 0$

$\Rightarrow \quad b(a+c) = 2ac$

$\Rightarrow \quad b = \dfrac{2ac}{a+c}$

Hence, a, b and c are in HP.

87. $ax^2 - bx + c = 0$

$\Rightarrow \quad \alpha+\beta = \dfrac{b}{a}$

and $\quad \alpha\beta = \dfrac{c}{a}$

Clearly, $\quad y = \dfrac{1}{x^2}$

$\Rightarrow \quad a\cdot\dfrac{1}{y} - \dfrac{b}{\sqrt{y}} + c = 0$

$\Rightarrow \quad a - b\sqrt{y} + cy = 0$

$\Rightarrow \quad b^2y = (a+cy)^2$

$\Rightarrow (a+cy)^2 = b^2y$ has roots $\dfrac{1}{\alpha^2}, \dfrac{1}{\beta^2}$.

88. $\alpha+\beta = \dfrac{1}{\alpha^2} + \dfrac{1}{\beta^2}$

$\Rightarrow \quad -\dfrac{b}{a} = \dfrac{b^2-2ac}{c^2}$

$\Rightarrow \quad -bc^2 = ab^2 - 2a^2c$

$\Rightarrow \quad \dfrac{b}{c} + \dfrac{c}{a} = \dfrac{2a}{b}$

$\Rightarrow \quad \dfrac{c}{a}, \dfrac{a}{b}$ and $\dfrac{b}{c}$ are in AP.

i.e. $\quad \dfrac{a}{c}, \dfrac{b}{a}$ and $\dfrac{c}{b}$ are in HP.

89. $\alpha+\beta = \dfrac{4+\sqrt{5}}{5+\sqrt{2}}$ and $\alpha\beta = \dfrac{8+2\sqrt{5}}{5+\sqrt{2}}$

$$\text{HM} = \frac{2\alpha\beta}{\alpha+\beta} = \frac{16+4\sqrt{5}}{4+\sqrt{5}} = 4$$

90. Since, $x^2 - 3x + 2$

i.e. $(x-2)(x-1)$ is a factor of $x^4 - px^2 + q$.

$\therefore \quad x=2, x=1$ are roots of $x^4 - px^2 + q = 0$

$\Rightarrow \quad 16 - 4p + q = 0$ and $1 - p + q = 0$

On solving these equations, we get

$$p = 5, q = 4$$

91. $(3^x)^2 - 36\cdot 3^x + 243 = 0$

Put $3^x = y$, the equation becomes

$$y^2 - 36y + 243 = 0$$

$\Rightarrow \quad (y-9)(y-27) = 0$

$\Rightarrow \quad y = 9, 27$

$\Rightarrow \quad 3^x = 9$

or $\quad 3^x = 27$

$\Rightarrow \quad x = 2$

or $\quad x = 3$

$\therefore$ Solution pair is $\{2, 3\}$.

92. We have, $\dfrac{1}{x+p} + \dfrac{1}{x+q} = \dfrac{1}{r}$

$\Rightarrow \quad r(x+q+x+p) = (x+p)(x+q)$

or $\quad x^2 + x(p+q-2r) + pq - r(p+q) = 0$

Let its roots be α and $-\alpha$.

Then, $\quad \alpha + (-\alpha) = -(p+q-2r)$

$\Rightarrow \quad p+q = 2r$

Also, product $= \alpha(-\alpha) = pq - r(p+q)$

$$= pq - \frac{(p+q)^2}{2} = -\frac{1}{2}(p^2+q^2)$$

93. $\dfrac{|x+1|}{|x|} + |x+1| = \dfrac{|x+1|^2}{|x|}$

$\Rightarrow |x+1|\left\{\dfrac{1}{|x|} + 1 - \dfrac{(x+1)}{|x|}\right\} = 0$

$\therefore \quad |x+1| = 0 \Rightarrow 1 + |x| - |x+1| = 0$

$\quad |x+1| = 0 \Rightarrow x+1 > 0$ and $x \neq 0$

$\therefore \quad x = -1, x > 0$

Aliter

$$\frac{(x+1)^2}{x} > 0$$

$\Rightarrow \quad x > 0 \cup \{-1\}$

94. Given, $|x-2| = x^2$

On taking $x = 1$ and $x = -2$, the equation is satisfied.

Hence, its solution is $\{-2, 1\}$.

95. Given equation is $|x|^2 - 3|x| + 2 = 0$

$\Rightarrow \quad (|x|-1)(|x|-2) = 0$

Either $|x| = 1$ or $|x| = 2$

$\Rightarrow \quad x = \pm 1, x = \pm 2$

Hence, the given equation has four solutions.

96. Put $2^x = y$, the equation becomes $16y^2 = 8y + 48$

$\Rightarrow \quad 2y^2 - y - 6 = 0$

$\Rightarrow \quad (y-2)(2y+3) = 0$

$\Rightarrow y = 2, -\dfrac{3}{2}$

But 2^x cannot be negative.

Hence, $\quad 2^x = 2 \Rightarrow x = 1$

97. $5 - 2\sqrt{6} = \dfrac{1}{5+2\sqrt{6}}$

$\therefore$ Given equation

$$(5+2\sqrt{6})^{x^2-3} + (5-2\sqrt{6})^{x^2-3} = 10$$

Becomes $y + \dfrac{1}{y} = 10$, where $y = (5+2\sqrt{6})^{x^2-3}$

$\Rightarrow \quad y^2 - 10y + 1 = 0$

$\Rightarrow \quad y = 5 \pm 2\sqrt{6}$

$\Rightarrow \quad (5+2\sqrt{6})^{x^2-3} = (5+2\sqrt{6})^1$

$\Rightarrow \quad (5+2\sqrt{6})^{x^2-3} = (5+2\sqrt{6})^{-1}$

$\Rightarrow \quad x^2 - 3 = 1$

or $\quad x^2 - 3 = -1$

$\Rightarrow \quad x^2 = 4$ or $x^2 = 2$

Hence, $\quad x = \pm 2$

or $\quad x = \pm\sqrt{2}$

98. The given equation can be written as

$$\left(\frac{5}{3}\right)^{3x}+\left(\frac{5}{3}\right)^{x}=2$$

On putting $\left(\frac{5}{3}\right)^{x}=t$, the equation becomes

$$t^3+t-2=0$$
$$\Rightarrow \quad t^3-1+(t-1)=0$$
$$\Rightarrow \quad (t-1)(t^2+t+1)+(t-1)=0$$
$$\Rightarrow \quad (t-1)(t^2+t+2)=0$$
$$\Rightarrow \quad t=1 \quad \text{or} \quad t^2+t+2=0$$

But $t^2+t+2=0$ does not have real solutions.

Therefore, $t=1 \Rightarrow \left(\frac{5}{3}\right)^{x}=1 \Rightarrow x=0$

99. Since, α and β are the roots of the equation

$$x^2-px+q=0$$
$$\therefore \quad \alpha+\beta=p$$
$$\text{and} \quad \alpha\beta=q$$

Now, $(\alpha^{1/4}+\beta^{1/4})^4=[(\alpha^{1/4}+\beta^{1/4})^2]^2$

$$=[\alpha^{1/2}+\beta^{1/2}+2(\alpha\beta)^{1/4}]^2$$
$$=[\sqrt{\alpha+\beta+2\sqrt{\alpha\beta}}+2(\alpha\beta)^{1/4}]^2$$
$$=[\sqrt{p+2\sqrt{q}}+2(q)^{1/4}]^2$$
$$=p+6\sqrt{q}+4q^{1/4}\sqrt{p+2\sqrt{q}}$$
$$\therefore \quad \alpha^{1/4}+\beta^{1/4}=[p+6\sqrt{q}+4q^{1/4}\sqrt{p+2\sqrt{q}}]^{1/4}$$

100. The function $y=\sqrt{x(x-3)}$ is defined for $x(x-3)\ge 0$

i.e. $\quad x\le 0 \quad \text{or} \quad x\ge 3 \quad$ ...(i)

The given equation can be written as

$$9|x|^2-19|x|+2=0$$
$$\Rightarrow \quad (9|x|-1)(|x|-2)=0$$
$$\Rightarrow \quad |x|=2 \quad \text{or} \quad |x|=\frac{1}{9}$$

$\therefore$ Solutions of the given equation are $\pm 2, \pm \frac{1}{9}$.

In the domain (i), the required solutions are $-2, -\frac{1}{9}$.

101. We have, $2^{x+2}\cdot 3^{3x/(x-1)}=9=3^2$

$$\Rightarrow \quad (x+2)\log 2+\frac{3x}{x-1}\log 3=2\log 3$$
$$\Rightarrow \quad (x+2)\log 2+\left(\frac{3x}{x-1}-2\right)\log 3=0$$
$$\Rightarrow \quad (x+2)\left(\log 2+\frac{1}{x-1}\log 3\right)=0$$
$$\Rightarrow \quad x=-2 \quad \text{or} \quad x=1-\frac{\log 3}{\log 2}$$

102. We have, $f(x)+f\left(\frac{1}{x}\right)=1$

$$\Rightarrow \quad x-[x]+\frac{1}{x}-\left[\frac{1}{x}\right]=1$$
$$\Rightarrow \quad x+\frac{1}{x}-1=[x]+\left[\frac{1}{x}\right]$$
$$\Rightarrow \quad \frac{x^2+1-x}{x}=(\text{integer})\,k \qquad \text{[say]}$$
$$\Rightarrow \quad x^2-(k+1)x+1=0$$

Since, x is real, so $(k+1)^2-4\ge 0$

$$\Rightarrow k^2+2k-3\ge 0 \quad \Rightarrow \quad (k+3)(k-1)\ge 0$$
$$\Rightarrow \quad k\le -3 \quad \text{or} \quad k\ge 1$$

Therefore, number of solutions is infinite.

103. The given equation can be written as

$$\left(\frac{3}{2}\right)^{3/x}+\left(\frac{3}{2}\right)^{1/x}=2$$

Put $\left(\frac{3}{2}\right)^{1/x}=t$, the equation becomes $t^3+t-2=0$

$$\Rightarrow \quad (t-1)(t^2+t+2)=0$$

But $t^2+t+2=0$ has no real root. $\quad [\because t=1]$

$$\Rightarrow \quad \left(\frac{3}{2}\right)^{1/x}=1$$
$$\Rightarrow \quad \frac{1}{x}=0$$

which is not possible for any value of x.

104. Here, $\alpha+\beta=-b<0 \qquad [\because b>0]$

$$\alpha\beta=c<0 \qquad [\because c<0]$$

Since, $\alpha\beta<0$ and $\alpha<\beta \Rightarrow \alpha$ is a negative root.

$\alpha+\beta<0$ and $\alpha<0 \Rightarrow \beta<|\alpha|$

Hence, $\alpha<0<\beta<|\alpha|$

105. Given, $x^2-2x+\sin^2\alpha=0$

$$\Rightarrow \quad \sin^2\alpha=2x-x^2$$

Since, $\quad 0\le \sin^2\alpha\le 1$

$$\Rightarrow \quad 0\le 2x-x^2\le 1$$
$$\Rightarrow \quad x^2-2x\le 0 \quad \text{and} \quad x^2-2x+1\ge 0$$
$$\Rightarrow \quad x\in[0,2] \quad \text{and} \quad x\in R$$
$$\Rightarrow \quad x\in[0,2]$$

106. $(m+1)^2-4(m+4)\ge 0$

$$\Rightarrow \quad (m-1)^2\ge 4^2$$
$$\Rightarrow \quad |m-1|\ge 4$$
$$\Rightarrow \quad m-1\le -4 \quad \text{or} \quad m-1\ge 4$$
$$\Rightarrow \quad m\le -3 \quad \text{or} \quad m\ge 5$$

$\therefore$ Their product >0, i.e. $m+4>0$

$$\Rightarrow \quad m>-4$$

Hence, $\quad -4<m\le -3$

107. If $x-a<0, |x-a|=-(x-a)$

$\therefore$ Equation becomes $x^2+2a(x-a)-3a^2=0$

$$\Rightarrow \quad x^2+2ax-5a^2=0$$
$$\Rightarrow \quad x=-(1+\sqrt{6})a, (-1+\sqrt{6})a$$
$$\because \quad x<a\le 0$$
$$\therefore \quad x=(-1+\sqrt{6})a$$

If $\quad x-a\ge 0, |x-a|=x-a$

$\therefore$ The equation becomes $x^2-2a(x-a)-3a^2=0$

$$\Rightarrow \quad x^2-2ax-a^2=0$$
$$\Rightarrow \quad x=(1+\sqrt{2})a, (1-\sqrt{2})a$$
$$\Rightarrow \quad x=(1+\sqrt{2})a, (1-\sqrt{2})a$$
$$\because \quad x\ge a \quad \text{and} \quad a\le 0$$
$$\therefore \quad x=(1-\sqrt{2})a$$

108. For $x \geq a$, the given equation becomes

$$x^2 - 2a(x-a) - 3a^2 = 0$$
$$\Rightarrow \quad x^2 - 2ax - a^2 = 0$$
$$\Rightarrow \quad x = a(1 \pm \sqrt{2})$$

As $a \geq 0$ and $x \geq a$, the possible root is $a(1+\sqrt{2})$.

For $x < a$, the given equation becomes

$$x^2 + 2a(x-a) - 3a^2 = 0$$
$$\Rightarrow \quad x^2 + 2ax - 5a^2 = 0$$
$$\Rightarrow \quad x = a(-1 \pm \sqrt{6})$$

As $\quad a \geq 0$
and $\quad x < a$

$\therefore$ Possible root is $a(-1-\sqrt{6})$.

109. $\left(\dfrac{\sqrt{2}}{\sqrt{5+2\sqrt{2}}}\right)^x + \left(\dfrac{\sqrt{2}+1}{\sqrt{5+2\sqrt{2}}}\right)^x = 1$, which is of the form

$$\cos^x \alpha + \sin^x \alpha = 1$$
$$\therefore \quad x = 2$$

110. $[x]^2 - [x] - 2 = 0$

$$[x] = 2, -1$$
$$\Rightarrow \quad x \in [-1, 0) \cup [2, 3)$$

111. Let $e^{\sin x} = t$

$$t - \frac{1}{t} - 4 = 0$$
$$\Rightarrow \quad t = 2 \pm \sqrt{5}$$
$$\Rightarrow \quad e^{\sin x} = 2+\sqrt{5}, 2-\sqrt{5}$$

But $e^{\sin x}$ cannot be negative.

$$\therefore \quad e^{\sin x} = 2+\sqrt{5}$$
$$\Rightarrow \quad e^{\sin x} > e$$

$\Rightarrow \sin x > 1$, which is not possible.

So, the given equation has no real solution.

112. Given, $x^{\sqrt{x}} = \sqrt{x^x}$

$$\Rightarrow \quad x^{\sqrt{x}} = (x^x)^{1/2}, x > 0$$
$$\Rightarrow \quad x^{\sqrt{x}} = x^{x/2}, x > 0$$

$\Rightarrow$ Either $x = 1$

or $\quad \sqrt{x} = \dfrac{x}{2}, x > 0$

Hence, $x = 1$ and 4

113. $\sec\theta = \dfrac{6 \pm \sqrt{36-32}}{16} = \dfrac{6 \pm 2}{16} = \dfrac{1}{2}, \dfrac{1}{4}$

But $\sec\theta \leq -1$ or $\sec\theta \geq 1$

Hence, the given equation has no roots.

114. Given, $\log_2 x + \dfrac{1}{\log_2 x} = 3 + \dfrac{1}{3}$

$$= \log_2 y + \frac{1}{\log_2 y}$$

$\Rightarrow \quad \log_2 x = 3$ and $\log_2 y = \dfrac{1}{3} \qquad [\because x \neq y]$

$\Rightarrow \quad x = 2^3$ and $y = 2^{1/3}$

Hence, $\quad x + y^3 = 8 + 2 = 10$

115. $\sin(e^x) = 5^x + 5^{-x}$, let $5^x = t$, then

$$\sin(e^x) = t + \frac{1}{t} = \left(\sqrt{t} - \frac{1}{\sqrt{t}}\right)^2 + 2 \qquad [\because 5^x > 0]$$

$\Rightarrow \sin(e^x) \geq 2$, which is not possible for any real x.

116. $D = a^2 + b^2 + c^2 = a^2 + (a+1)^2 + a^2(a+1)^2$

$$= a^2\{1 + (a+1)^2\} + (a+1)^2$$
$$= a^2(a^2 + 2a + 2) + (a^2 + 2a + 1)$$
$$= a^4 + 2a^3 + 3a^2 + 2a + 1$$
$$= (a^2 + a + 1)^2$$

$\therefore \sqrt{D} = a(a+1) + 1 =$ an odd integer

117. $\displaystyle\sum_{k=2}^{n} \left(x^2 - \left(\frac{1}{k-1} + \frac{1}{k}\right)x + \frac{1}{k(k-1)}\right)$

where, constant term is given by $\dfrac{1}{k \cdot (k-1)}$

$$\therefore \quad \sum_{k=2}^{\infty} \frac{1}{k(k-1)} = \left(\frac{1}{1\cdot 2}\right) + \left(\frac{1}{2\cdot 3}\right) + \left(\frac{1}{3\cdot 4}\right) + \ldots$$
$$= \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \ldots \infty$$
$$= 1$$

118. $y^{x^2 + 7x + 12} = 1$

$$\Rightarrow \quad x^2 + 7x + 12 = 0$$
$$\Rightarrow \quad x = -3, -4$$
$$\Rightarrow \quad y = 9, 10 \qquad [\text{when } y \neq 1]$$

Again, when $y = 1$, $x = 5$

$\therefore$ Solutions are $(-3, 9)$ $(-4, 10)$ and $(5, 1)$.

119. As $(\lambda + 1)x^2 + 2 = \lambda x + 3$ has only one solution.

$$D = 0$$
$$\Rightarrow \quad \lambda^2 - 4(\lambda+1)(-1) = 0$$
$$\Rightarrow \quad \lambda^2 + 4\lambda + 4 = 0$$
$$\Rightarrow \quad (\lambda + 2)^2 = 0$$
$$\therefore \quad \lambda = -2$$

120. Given quadratic expression is

$x^2 + 2(a+b+c)x + 3(bc + ca + ab)$.

This quadratic expression will be a perfect square, if the discriminant of its corresponding equation is zero. Hence,

$$4(a+b+c)^2 - 4 \times 3(bc + ca + ab) = 0$$
$$\Rightarrow \quad (a+b+c)^2 - 3(bc + ca + ab) = 0$$
$$\Rightarrow \quad a^2 + b^2 + c^2 + 2ab + 2bc + 2ca - 3(bc + ca + ab) = 0$$
$$\Rightarrow \quad a^2 + b^2 + c^2 - ab - bc - ca = 0$$
$$\Rightarrow \frac{1}{2}[2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ca] = 0$$
$$\Rightarrow \frac{1}{2}[(a^2 + b^2 - 2ab) + (b^2 + c^2 - 2bc) + (c^2 + a^2 - 2ca)] = 0$$
$$\Rightarrow \quad \frac{1}{2}[(a-b)^2 + (b-c)^2 + (c-a)^2] = 0$$

which is possible only when $(a-b)^2 = 0$, $(b-c)^2 = 0$ and $(c-a)^2 = 0$ i.e. $a = b = c$

121. $(x^2 + x - 2)(x^2 + x - 3) = 12$ ...(i)

Put $x^2 + x = y$, so that Eq.(i) becomes

$$(y-2)(y-3) = 12$$
$$\Rightarrow \quad y^2 - 5y - 6 = 0$$
$$\Rightarrow \quad (y-6)(y+1) = 0 \Rightarrow y = 6, -1$$

When $y = 6$, we get

$$x^2 + x - 6 = 0$$
$$\Rightarrow \quad (x+3)(x-2) = 0 \Rightarrow x = -3, 2$$

When $y = -1$, we get

$$x^2 + x + 1 = 0$$

which has non-real roots and sum of roots is -1.

122. Here, $x = 0$ is not a root. Divide both the numerator and denominator by x and put $x + 3/x = y$ to obtain

$$\frac{4}{y+1} + \frac{5}{y-5} = \frac{3}{2} \Rightarrow y = -5, 3$$

$x + 3/x = -5$ has two irrational roots and $x + 3/x = 3$ has imaginary roots.

123. Given α and β are roots of equation

$$x^2 - 2x + 3 = 0$$
$$\Rightarrow \quad \alpha^2 - 2\alpha + 3 = 0 \quad \text{...(i)}$$
$$\text{and} \quad \beta^2 - 2\beta + 3 = 0 \quad \text{...(ii)}$$
$$\Rightarrow \quad \alpha^2 = 2\alpha - 3$$
$$\Rightarrow \quad \alpha^3 = 2\alpha^2 - 3\alpha$$
$$\Rightarrow \quad P = (2\alpha^2 - 3\alpha) - 3\alpha^2 + 5\alpha - 2$$
$$= -\alpha^2 + 2\alpha - 2 = 3 - 2 = 1$$

[using Eq. (i)]

Similarly, we have $Q = 2$

Now, sum of roots is 3 and product of roots is 2. Hence, the required equation is $x^2 - 3x + 2 = 0$.

124. Since, α and β are the roots of the equation

$2x^2 - 35x + 2 = 0$.

$$\therefore \quad 2\alpha^2 - 35\alpha = -2$$
$$\Rightarrow \quad 2\alpha - 35 = -\frac{2}{\alpha}$$
$$\text{and} \quad 2\beta^2 - 35\beta = -2$$
$$\Rightarrow \quad 2\beta - 35 = \frac{-2}{\beta}$$

Now, $(2\alpha - 35)^3(2\beta - 35)^3 = \left(\frac{-2}{\alpha}\right)^3\left(\frac{-2}{\beta}\right)^3$

$$= \frac{8 \times 8}{\alpha^3\beta^3} = \frac{64}{1} = 64 \quad [\because \alpha\beta = 1]$$

125. $(31 + 8\sqrt{15})^{x^2-3} + 1 = (32 + 8\sqrt{15})^{x^2-3}$

$\Rightarrow (31 + 8\sqrt{15})^{x^2-3} + 1^{x^2-3} = (32 + 8\sqrt{15})^{x^2-3}$

$\Rightarrow \quad x^2 - 3 = 1$ or $x = \pm 2$ $[\because a^n + b^n = (a+b)^n]$

126. $a\alpha^2 + c = -b\alpha, a\alpha + b = -\frac{c}{\alpha}$

Hence, the given expression is

$$\frac{b}{c}(\alpha^2 + \beta^2) = \frac{b(b^2 - 2ac)}{a^2c}$$

127. Since, α and β are roots of $x^2 + px + q = 0$.

$$\therefore \quad \alpha + \beta = -p \quad \text{and} \quad \alpha\beta = q$$

Now, α^4 and β^4 are roots of $x^2 - rx + q = 0$.

$$\therefore \quad \alpha^4 + \beta^4 = r \quad \text{and} \quad \alpha^4\beta^4 = q$$

Now, for equation $x^2 - 4qx + 2q^2 - r = 0$, product of roots is

$$2q^2 - r = 2(\alpha\beta)^2 - (\alpha^4 + \beta^4)$$
$$= -(\alpha^2 - \beta^2)^2 < 0$$

As product of roots is negative, so the roots must be real.

128. $A = a(b - c)(a + b + c)$

$B = b(c - a)(a + b + c)$

$C = c(a - b)(a + b + c)$

Now, $Ax^2 + Bx + C = 0$

$\Rightarrow (a + b + c)[a(b - c)x^2 + b(c - a)x + c(a - b)] = 0$

Given that roots are equal.

$$\therefore \quad D = 0$$
$$\Rightarrow \quad b^2(c-a)^2 - 4ac(b-c)(a-b) = 0$$
$$\Rightarrow \quad b^2c^2 - 2ab^2c + b^2a^2 - 4a^2bc + 4acb^2 + 4a^2c^2 - 4abc^2 = 0$$
$$\Rightarrow \quad b^2c^2 + b^2a^2 + 4a^2c^2 + 2ab^2c - 4a^2bc - 4abc^2 = 0$$
$$\Rightarrow \quad (bc + ab - 2ac)^2 = 0$$
$$\Rightarrow \quad bc + ab = 2ac$$
$$\Rightarrow \quad \frac{1}{a} + \frac{1}{c} = \frac{2}{b}$$

Hence, a, b and c are in HP.

129. $\because ax^2 - bx + c = 0$

$$\therefore \quad \alpha + \beta = \frac{b}{a}$$
$$\text{and} \quad \alpha\beta = \frac{c}{a}$$
$$\text{Also,} \quad (a + cy)^2 = b^2y$$
$$\Rightarrow \quad c^2y^2 - (b^2 - 2ac)y + a^2 = 0$$
$$\Rightarrow \quad \left(\frac{c}{a}\right)^2 y^2 - \left[\left(\frac{b}{a}\right)^2 - 2\left(\frac{c}{a}\right)\right]y + 1 = 0$$
$$\Rightarrow \quad (\alpha\beta)^2 y^2 - (\alpha^2 + \beta^2)y + 1 = 0$$
$$\Rightarrow \quad y^2 - (\alpha^{-2} + \beta^{-2})y + \alpha^{-2}\beta^{-2} = 0$$
$$\Rightarrow \quad (y - \alpha^{-2})(y - \beta^{-2}) = 0$$

Hence, the roots are α^{-2} and β^{-2}.

130. Here, $\alpha^4 + \beta^4 = (\alpha^2 + \beta^2)^2 - 2\alpha^2\beta^2$

$$= [(\alpha + \beta)^2 - 2\alpha\beta]^2 - 2(\alpha\beta)^2$$
$$= \left(p^2 + \frac{1}{p^2}\right)^2 - \frac{1}{2p^4}$$
$$= p^4 + \frac{1}{2p^4} + 2$$
$$= \left(p^2 - \frac{1}{\sqrt{2}p^2}\right)^2 + 2 + \sqrt{2} \geq 2 + \sqrt{2}$$

131. $x_1(x - x_2)^2 + x_2(x - x_1)^2 = 0$

$\Rightarrow x^2(x_1 + x_2) - 4x\, x_1x_2 + x_1x_2(x_1 + x_2) = 0$

$D = 16(x_1x_2)^2 - 4x_1x_2(x_1 + x_2)^2 > 0 \quad [\because x_1x_2 < 0]$

The product of roots is $x_1x_2 < 0$.

Thus, the roots are real and of opposite signs.

132. $(x+a)(x+1991)+1=0$

$\Rightarrow \quad (x+a)(x+1991)=-1$

$\Rightarrow \quad (x+a)=1$

and $\quad x+1991=-1$

$\Rightarrow \quad a=1993$

or $\quad x+a=-1$

and $\quad x+1991=1$

$\Rightarrow \quad a=1989$

133. Let $f(x)=-3+x-x^2$. Then, $f(x)<0$ for all x, because coefficient of x^2 is less than 0 and $D<0$. Thus, LHS of the given equation is always positive, whereas the RHS is always less than zero. Hence, there is no solution.

134. $x=3\cos\theta$ and $y=3\sin\theta$

$z=2\cos\phi, t=2\sin\phi$

$\therefore \quad 6\cos\theta\sin\phi-6\sin\theta\cos\phi=6$

$\Rightarrow \quad \sin(\phi-\theta)=1$

$\Rightarrow \quad \phi=90^\circ+\theta$

$\Rightarrow \quad P=xz=-6\sin\theta\cos\theta=-3\sin 2\theta$

$\Rightarrow \quad P_{\max}=3$

135. $D>0 \Rightarrow (a-3)^2+4(a+2)>0$

$\Rightarrow \quad a^2-6a+9+4a+8>0$

$\Rightarrow \quad a^2-2a+17>0$

$\Rightarrow \quad a\in R$

$\therefore \quad \dfrac{a^2+1}{a^2+2}=1-\dfrac{1}{a^2+2}\ge\dfrac{1}{2}$

136. $x=2+\sqrt{3}$

$\Rightarrow \quad (x-2)^2=3$

$\Rightarrow \quad x^2-4x+1=0 \quad \ldots(i)$

$\Rightarrow \quad (x-2)^4=9$

$\Rightarrow x^4-8x^3+24x^2-32x+16=9$

$\Rightarrow x^4-8x^3+18x^2-8x+2+6(x^2-4x+1)-1=0$

From Eq. (i), we get

$$x^4-8x^3+18x^2-8x+2=1$$

137. $x^{3^n}+(-x)^{3^n}=0$, if $n\ge 0$ and n is an integer.

138. At $x=2$,

$x^3-2(1+\alpha)x^2+(4\alpha+\alpha^2+\beta^2)x-2(\alpha^2+\beta^2)$

$=8-8(1+\alpha)+8\alpha+2\alpha^2+2\beta^2-2\alpha^2-2\beta^2=0$

$\therefore$ $x=2$, z_0 and $\bar{z}_0$ are three roots.

139. Let $\alpha=-4$, $\beta=-4\omega$ and $\gamma=-4\omega^2$

$\therefore \quad \left(\dfrac{\alpha}{\beta}\right)^2=\dfrac{1}{\omega^2}=\omega$ and $\left(\dfrac{\alpha}{\gamma}\right)^2=\dfrac{1}{\omega^4}=\omega^2$

$\therefore$ Required equation is

$$x^2-(\omega+\omega^2)x+\omega^3=0 \Rightarrow x^2+x+1=0$$

140. Let $f(x)=x^4+ax^3+bx^2+cx-1$

Since, $(x-1)^3$ is a factor.

$\therefore \quad f(1)=0, f'(1)=0, f''(1)=0$

$\Rightarrow \quad a+b+c=0, 3a+2b+c=-4$

and $\quad 3a+b=-6$

$\Rightarrow \quad a=-2, b=0, c=2$

So, other factor is $(x+1)$.

141. $\alpha\pm i\beta$ are complex roots of equation $x^3+qx+r=0$ and γ is its real root.

$\Rightarrow \quad (x-\gamma)(x^2-2\alpha x+\alpha^2+\beta^2)=x^3+qx+r$

On comparing coefficients, we get

$$-\gamma-2\alpha=0$$

$\Rightarrow \quad \gamma=-2\alpha$

Since, $\quad \gamma^3+q\gamma+r=0$

$\Rightarrow \quad (-2\alpha)^3+q(-2\alpha)+r=0$

i.e. 2α is root of cubic equation $x^3+qx-r=0$.

142. Since, α and β are the roots of $x^2+px+q=0$.

$\therefore \quad \alpha+\beta=-p,\ \alpha\beta=q \quad \ldots(i)$

$\alpha^{2n}+p^n\alpha^n+q^n=0$

$\beta^{2n}+p^n.\beta^n+q^n=0$

On subtraction,

$$\alpha^n+\beta^n=-p^n$$

Now, $\dfrac{\alpha}{\beta}$ is a root of $x^n+1+(x+1)^n=0$.

$\therefore \quad \dfrac{\alpha^n}{\beta^n}+1+\left(\dfrac{\alpha}{\beta}+1\right)^n=0$

$\Rightarrow \quad \dfrac{\alpha^n+\beta^n}{\beta^n}+\dfrac{(\alpha+\beta)^n}{\beta^n}=0$

$\Rightarrow \quad -p^n+(-p)^n=0$

This is true only, if n is an even integer.

143. Let α and β be the roots of $x^2+bx+c=0$.

Then, $\quad \alpha+\beta=-b, \alpha\beta=c$

Roots of the required equation are α^3 and β^3. So, the equation is $\quad x^2-(\alpha^3+\beta^3)x+\alpha^3\beta^3=0$

$\Rightarrow x^2-\{(\alpha+\beta)^3-3\alpha\beta(\alpha+\beta)\}x+(\alpha\beta)^3=0$

$\Rightarrow \quad x^2-(-b^3+3cb)x+c^3=0$

$\Rightarrow \quad x^2+b(b^2-3c)x+c^3=0$

144. Since, α and β are roots of the equation $ax^2+bx+c=0$.

$\therefore \quad \alpha+\beta=-\dfrac{b}{a}$

and $\quad \alpha\beta=\dfrac{c}{a}$

The required equation is

$x^2-\left(\dfrac{1}{a\alpha+b}+\dfrac{1}{a\beta+b}\right)x+\dfrac{1}{a\alpha+b}\cdot\dfrac{1}{a\beta+b}=0$

$\Rightarrow \{a^2\alpha\beta+ab(\alpha+\beta)+b^2\}x^2$

$$-\{a(\alpha+\beta)+2b\}x+1=0$$

$\Rightarrow \quad (ca-b^2+b^2)x^2-(2b-b)x+1=0$

$\Rightarrow \quad cax^2-bx+1=0$

145. $x=2+2^{1/3}+2^{2/3}$

$\Rightarrow \quad x-2=2^{1/3}+2^{2/3}$

$\Rightarrow \quad (x-2)^3=(2^{1/3}+2^{2/3})^3$

$\Rightarrow \quad x^3-8-6x(x-2)$

$$=(2^{1/3})^3+(2^{2/3})^3+3(2^{1/3})\cdot(2^{2/3})(2^{1/3}+2^{2/3})$$

On putting $2^{1/3}+2^{2/3}=x-2$ in above equation, we get

$$x^3-6x^2+12x-8=6+6(x-2)$$

$\Rightarrow \quad x^3-6x^2+6x=2$

146. $1, a_1, a_2, \ldots, a_{n-1}$ are roots of $x^n - 1 = 0$

$\Rightarrow \dfrac{x^n - 1}{x - 1} = (x - a_1)(x - a_2)\ldots(x - a_{n-1})$

$\Rightarrow x^{n-1} + x^{n-2} + x^{n-3} + \ldots + x + 1$
$= (x - a_1)(x - a_2)\ldots(x - a_{n-1})$

Put $x = 1$ on the both sides, we get

$1 + 1 + 1 + \ldots + 1 = (1 - a_1)(1 - a_2)\ldots(1 - a_{n-1})$

$\Rightarrow (1 - a_1)(1 - a_2)\ldots(1 - a_{n-1}) = n$

147. $x = \dfrac{2\cos\theta \pm \sqrt{4\cos^2\theta - 4}}{2} = \cos\theta \pm i\sin\theta$

Take $\alpha = \cos\theta + i\sin\theta$, then

$\beta = \cos\theta - i\sin\theta$

$\Rightarrow \alpha^n = (\cos\theta + i\sin\theta)^n$
$= \cos n\theta + i\sin n\theta$

Also, $\beta^n = (\cos\theta - i\sin\theta)^n$
$= \cos n\theta - i\sin n\theta$

Now, $\alpha^n + \beta^n = 2\cos n\theta$ and $\alpha^n\beta^n = 1$

$\therefore$ Required equation is $x^2 - (\alpha^n + \beta^n)x + \alpha^n\beta^n = 0$

$\Rightarrow x^2 - (2\cos n\theta)x + 1 = 0$

148. $\dfrac{x^n - 1}{x - 1} = (x - a_1)(x - a_2)\ldots(x - a_{n-1})$

$\Rightarrow x^{n-1} + x^{n-2} + \ldots + x + 1$
$= (x - a_1)(x - a_2)\ldots(x - a_{n-1})$

Put $x = -1$, we get

$(-1)^{n-1}(1 + a_1)(1 + a_2)\ldots(1 + a_{n-1})$
$= 1 - 1 + 1 - \ldots + 1$
$= \begin{cases} 0, \text{ if } n \text{ is even} \\ 1, \text{ if } n \text{ is odd} \end{cases}$

Thus, $(1 + \omega)(1 + \omega^2)\ldots(1 + \omega^{n-1}) = n$

149. Let $y = -5 + 4i \Rightarrow y^2 + 10y + 41 = 0$

$\therefore f(x) = x^4 + 9x^3 + 35x^2 - x + 4$
$= x^2(x^2 + 10x + 41) - x(x^2 + 10x + 41)$
$+ 4(x^2 + 10x + 41) - 160$
$= -160$

$\therefore f(-5 + 4i) = -160$

150. Let $x = \cos\theta$, we get $4\cos^3\theta - 3\cos\theta = p$

$\Rightarrow p = \cos 3\theta$

$\Rightarrow \theta = \dfrac{1}{3}\cos^{-1}(p)$ and $x = \cos\theta$

$\Rightarrow x = \cos\left(\dfrac{1}{3}\cos^{-1}(p)\right)$ ...(i)

Since, $-1 \le p \le 1 \Rightarrow 0 \le \cos^{-1} p \le \pi$

or $0 \le \dfrac{1}{3}\cos^{-1} p \le \dfrac{\pi}{3}$, as we know $\cos x$ is decreasing.

$\therefore \cos 0 \ge \cos\left(\dfrac{1}{3}\cos^{-1} p\right) \ge \cos\dfrac{\pi}{3}$ ...(ii)

From Eqs. (i) and (ii), we get

$\dfrac{1}{2} \le x \le 1 \Rightarrow x \in \left[\dfrac{1}{2}, 1\right]$

151. Since, α, β, γ and σ are the roots of the given equation, therefore

$x^4 + 4x^3 - 6x^2 + 7x - 9 = (x - \alpha)(x - \beta)(x - \gamma)(x - \sigma)$

On putting $x = i$ and then $x = -i$, we get

$1 - 4i + 6 + 7i - 9 = (i - \alpha)(i - \beta)(i - \gamma)(i - \sigma)$

and $1 + 4i + 6 - 7i - 9 = (-i - \alpha)(-i - \beta)(-i - \gamma)(-i - \sigma)$

On multiplying these two equations, we get

$(-2 + 3i)(-2 - 3i) = (1 + \alpha^2)(1 + \beta^2)(1 + \gamma^2)(1 + \sigma^2)$

$\Rightarrow 13 = (1 + \alpha^2)(1 + \beta^2)(1 + \gamma^2)(1 + \sigma^2)$

152. $\tan\theta_1 + \tan\theta_2 + \tan\theta_3 = (a + 1)$

$\Sigma\tan\theta_1\tan\theta_2 = (b - a)$

$\tan\theta_1\tan\theta_2\tan\theta_3 = b$

$\therefore \tan(\theta_1 + \theta_2 + \theta_3) = \dfrac{\Sigma\tan\theta_1 - \prod\tan\theta_1}{1 - \Sigma\tan\theta_1\tan\theta_2}$
$= \dfrac{(a + 1 - b)}{1 - (b - a)} = 1$

$\Rightarrow \theta_1 + \theta_2 + \theta_3 = \dfrac{\pi}{4}$

153. $\Sigma\alpha = 1, \Sigma\alpha\beta = 0, \alpha\beta\gamma = 1$

$\Sigma\dfrac{1 + \alpha}{1 - \alpha} = -\Sigma\dfrac{-\alpha + 1 - 2}{1 - \alpha} = \Sigma\left(\dfrac{2}{1 - \alpha} - 1\right)$
$= 2\Sigma\dfrac{1}{1 - \alpha} - 3$

Now, $\dfrac{1}{(x - \alpha)} + \dfrac{1}{(x - \beta)} + \dfrac{1}{(x - \gamma)} = \dfrac{3x^2 - 2x}{x^3 - x^2 - 1}$

$\Rightarrow \dfrac{1}{1 - \alpha} + \dfrac{1}{1 - \beta} + \dfrac{1}{1 - \gamma} = \dfrac{3 - 2}{1 - 1 - 1} = -1$

$\Rightarrow \dfrac{1 + \alpha}{1 - \alpha} = -5$

154. Here, $x \to x + 1$

$\Rightarrow ax^2 + (b + 2a)x + a + b + c = 0$

But equation given is $2x^2 + 8x + 2 = 0$

$\Rightarrow a = 2, b + 2a = 8, a + b + c = 2$

$\Rightarrow b = 4, c = -4$

$\Rightarrow b = -c$

155. $x^2 + x + 1 = 0$ has roots ω, ω^2.

$\therefore ax^2 + bx + c = 0$

$\therefore$ Both roots common.

$\Rightarrow \dfrac{a}{1} = \dfrac{b}{1} = \dfrac{c}{1}$

156. We have, $x^3 + 3x^2 + 3x + 2 = 0$

$\Rightarrow (x + 1)^3 + 1 = 0$

$\Rightarrow (x + 1 + 1)\{(x + 1)^2 - (x + 1) + 1\} = 0$

$\Rightarrow (x + 2)(x^2 + x + 1) = 0$

$\Rightarrow x = -2, \dfrac{-1 \pm \sqrt{3}i}{2}$

$\Rightarrow x = -2, \omega, \omega^2$

Since, $a, b, c \in R$, $ax^2 + bx + c = 0$ cannot have one real and one imaginary root. Therefore, two common roots of $ax^2 + bx + c = 0$ and $x^3 + 3x^2 + 3x + 2 = 0$ are ω and ω^2.

Thus, $-\dfrac{b}{a} = \omega + \omega^2 = -1$

$\Rightarrow a = b$ and $\dfrac{c}{a} = \omega \cdot \omega^2 = 1 \Rightarrow c = a$

$\Rightarrow a = b = c$

157. As the coefficients are in reverse order, the roots of $ax^2+bx+c=0$ are α and β, while the roots of

$cx^2+bx+a=0$ are $\frac{1}{\alpha}$ and $\frac{1}{\beta}$.

One negative root is common.

$\Rightarrow \quad \alpha = \frac{1}{\alpha} < 0$

So, $\alpha = -1 \Rightarrow a-b+c=0$

158. Let α be the common root.

Then, $\alpha^2+i\alpha+a=0$,

$\alpha^2-2\alpha+ia=0$

$\Rightarrow \quad \frac{\alpha^2}{a} = \frac{\alpha}{a(1-i)} = \frac{1}{-2-i}$

$\Rightarrow \quad a^2(1-i)^2 = a(-2-i)$

$\Rightarrow \quad a = \frac{1}{2} - i$

159. $\alpha^2+2\alpha+3\lambda=0$ and $2\alpha^2+3\alpha+5\lambda=0$

$\Rightarrow \quad \frac{\alpha^2}{\lambda} = \frac{\alpha}{\lambda} = \frac{1}{-1}$

$\Rightarrow \quad \alpha = 1$ and $\alpha = -\lambda$

$\Rightarrow \quad \lambda = -1$

160. For the equation $x^2+2x+3=0$,

Discriminant $= (2)^2 - 4\cdot 1\cdot 3 < 0$

$\therefore$ Roots of $x^2+2x+3=0$ are imaginary. Since, the equations $x^2+2x+3=0$ and $ax^2+bx+c=0$ are given to have a common root, therefore both roots will be common. Hence, both the equations are identical.

$\Rightarrow \quad a:b:c = 1:2:3$

161. Let α and β be the roots of $x^2-px+q=0$ and α and $\frac{1}{\beta}$ be the roots of $x^2-ax+b=0$.

Then, $\alpha+\beta=p$ and $\alpha\beta=q$

Also, $\alpha+\frac{1}{\beta}=a$ and $\frac{\alpha}{\beta}=b$

Now, $(q-b)^2 = \left(\alpha\beta - \frac{\alpha}{\beta}\right)^2 = \alpha^2\left(\beta-\frac{1}{\beta}\right)^2$

$= \frac{\alpha}{\beta}\cdot\beta\alpha\left[(\alpha+\beta)-\left(\alpha+\frac{1}{\beta}\right)\right]^2$

$= bq\,(p-a)^2$

162. For $x>0$, $f(x)>0$, so there is no positive real root of $f(x)=0$

Now, $f(0)=1\neq 0$, so $x=0$ is not a root

$f(x) = 1+2x+3x^2+\ldots+(n+1)x^n \quad \ldots$(i)

Multiplying Eq. (i) by x, we get

$xf(x) = x+2x^2+\ldots+nx^n+(n+1)x^{n+1}$

$\Rightarrow \quad (1-x)f(x) = (1+x+x^2+\ldots+x^n)-(n+1)x^{n+1}$

$= \frac{1-x^{n+1}}{1-x} - (n+1)x^{n+1}$

$\Rightarrow \quad f(x) = \frac{1-x^{n+1}}{(1-x)^2} - \frac{(n+1)x^{n+1}}{(1-x)}$

$= \frac{1-(n+2)x^{n+1}+(n+1)x^{n+2}}{(1-x)^2}$

So, the equation $f(x)>0$, $\forall x$.

Hence, no solution.

163. $x^2+2bx+c>0$

So, the given equation has no roots.

$\Rightarrow \quad D<0 \Rightarrow 4b^2-4c<0$

$\Rightarrow \quad b^2<c$

164. $f(0)=10>0$, as $f(x)=0$ does not have distinct real roots.

$\Rightarrow \quad f(5)\geq 0$

$\Rightarrow \quad 25a+5b+10\geq 0 \Rightarrow 5a+b\geq -2$

165. $f(2)>0$ and $f(4)>0$

$\Rightarrow \quad a^2<4$ and $13a^2<8$

$\Rightarrow \quad -2<a<2$ and $\frac{-2\sqrt{2}}{\sqrt{13}}<a<\frac{2\sqrt{2}}{\sqrt{13}}$

$\Rightarrow \quad -\frac{2\sqrt{2}}{\sqrt{13}}<a<\frac{2\sqrt{2}}{\sqrt{13}}$

166. Since, the coefficient of x^2 is 1 which is positive.

$\therefore$ The given expression is positive for all real values of x, if $D<0$.

$\Rightarrow \quad (-a)^2-4(1-2a^2)<0$

$\Rightarrow \quad 9a^2-4<0$

$\Rightarrow \quad (3a+2)(3a-2)<0$

$\Rightarrow \quad -\frac{2}{3}<a<\frac{2}{3}$

167. $x^2-6x+5\leq 0$ and $x^2-2x>0$

$\Rightarrow \quad 1\leq x\leq 5$

and $\quad x<0$ or $x>2$

$\Rightarrow \quad 2<x\leq 5$

$\Rightarrow \quad x\in\{3,4,5\}$

Hence, there are three solutions.

168. Denominator $=(x-1)^2+5>0$, $\forall x$

$\Rightarrow \quad 2x^2+3x-27=(2x+9)(x-3)\leq 0$

which gives $-\frac{9}{2}\leq x\leq 3$ leading to $0\leq 4x^2\leq 81$

169. Given, $|2x-3|<1 \Rightarrow -1<2x-3<1$

$\Rightarrow \quad 1<x<2$

$\Rightarrow \quad x\in(1,2)$

170. $||x-1|-1|\leq 1$

$\Rightarrow \quad 0\leq |x-1|\leq 2$

$\Rightarrow \quad |x-1|\leq 2$

$\Rightarrow \quad -1\leq x\leq 3$

171. $\left(\frac{5}{13}\right)^x+\left(\frac{12}{13}\right)^x\geq 1$

$\therefore \quad \cos^x\alpha+\sin^x\alpha\geq 1$

where, $\quad \cos\alpha=\frac{5}{13}$

and $\quad \sin\alpha=\frac{12}{13}$

Equality holds for $x=2$.

If $x<2$, both $\cos\alpha$ and $\sin\alpha$ increase (being positive fractions).

So, $\quad \cos^x\alpha+\sin^x\alpha>1$

If $x<2$. Thus, $x\leq 2$.

172. Here, $xy \geq 100$

$$\frac{x+y}{2} \geq \sqrt{xy}$$

$\Rightarrow \quad x + y \geq 2 \cdot 10$

$\Rightarrow \quad x + y \geq 20$

173. Let $\frac{x^2 - x + 1}{x^2 + x + 1} = m$

Discriminant ≥ 0

$\Rightarrow \quad (1+m)^2 - 4(1-m)^2 \geq 0$

$\Rightarrow \quad (m-3)\left(m - \frac{1}{3}\right) \leq 0$

$\Rightarrow \quad m \in \left[\frac{1}{3}, 3\right]$

174. $y = \frac{\tan x}{\tan 3x} = \frac{\tan x\,(1 - 3\tan^2 x)}{3\tan x - \tan^3 x}$

$\Rightarrow \quad y < \frac{1}{3}$ or $y > 3$

$\Rightarrow \quad -\infty < y < \frac{1}{3}$ or $3 < y < \infty$

175. The given inequation is valid only when

$x \geq 0$ ...(i)

The given inequation can be written in the form

$$3^{72 - x - \sqrt{x}} > 1$$

$\Rightarrow \quad 72 - x - \sqrt{x} > 0 \quad [\because 3 > 1]$

$\Rightarrow \quad x + \sqrt{x} - 72 < 0$

$\Rightarrow \quad (\sqrt{x} + 9)(\sqrt{x} - 8) < 0$

But $\quad \sqrt{x} + 9 > 0, \forall x \geq 0$

$\therefore \quad \sqrt{x} - 8 < 0 \Rightarrow \sqrt{x} < 8$

$\therefore \quad 0 \leq x < 64$

176. $f(1) > 0, f(2) < 0, f(3) > 0$ and $D > 0$

$\Rightarrow \quad -12 + \lambda > 0,$

$\lambda < 16,$

$\lambda > 12$ and $16(16 - \lambda) > 0$

$\Rightarrow \quad 12 < \lambda < 16$

$\therefore \quad \lambda \in \{13, 14, 15\}$

Hence, three integral solutions.

177. $k - 2 > 0$ and

$64 - 4(k-2)(k+4) < 0$

$k > 2$ and $16 - (k^2 + 2k - 8) < 0$

$k > 2$ and $k^2 + 2k - 24 > 0$

$k > 2$ and $(k < -6$ or $k > 4)$

$\Rightarrow \quad k > 4$

$\therefore$ Least integral value of $k = 5$

178. $(e^a - e^{2a} + e^a - 1)(4e^a - 2e^{2a} + e^a - 1) < 0$

$\Rightarrow \quad (e^{2a} - 2e^a + 1)(2e^{2a} - 5e^a + 1) < 0$

Let $\quad x = e^a$

$\Rightarrow \quad (x-1)^2(2x^2 - 5x + 1) < 0$

$\Rightarrow \quad (x-1)^2\left(x - \frac{5-\sqrt{17}}{4}\right)\left(x - \frac{5+\sqrt{17}}{4}\right) < 0$

$\Rightarrow \quad \frac{5-\sqrt{17}}{4} < x < \frac{5+\sqrt{17}}{4}$

$\Rightarrow \quad \log\left(\frac{5-\sqrt{17}}{4}\right) < a < \log\left(\frac{5+\sqrt{17}}{4}\right)$

179. Let the roots be α and β.

$\therefore \quad \alpha + \beta = -2a$ and $\alpha\beta = b$

Given, $\quad |\alpha - \beta| \leq 2m$

$\Rightarrow \quad |\alpha - \beta|^2 \leq (2m)^2$

$\Rightarrow \quad (\alpha + \beta)^2 - 4ab \leq 4m^2$

$\Rightarrow \quad 4a^2 - 4b \leq 4m^2$

$\Rightarrow \quad a^2 - m^2 \leq b$

and discriminant $\quad D > 0$ or $4a^2 - 4b > 0$

$\Rightarrow \quad a^2 - m^2 \leq b$ and $b < a^2$

Hence, $b \in [a^2 - m^2, a^2]$

180. Given, $a < b < c < d$. Let

$f(x) = (x-a)(x-c) + 2(x-b)(x-d)$

$\Rightarrow \quad f(b) = (b-a)(b-c) < 0$

and $\quad f(d) = (d-a)(d-c) > 0$

Hence, $f(x) = 0$ has one root in (b, d). Also, $f(a)f(c) < 0$. So, the other root lies in (a, c). Hence, roots of the equation are real and distinct.

181. $\tan x = \frac{(a-4) - \sqrt{(a-4)^2 - 4(4-2a)}}{2}$

$= \frac{a - 4 - a}{2} = a - 2, -2$

$\therefore \quad \tan x = a - 2 \quad [\because \tan x \neq -2]$

$\because \quad x \in \left[0, \frac{\pi}{4}\right]$

$\therefore \quad 0 \leq a - 2 \leq 1$

$\Rightarrow \quad 2 \leq a \leq 3$

182. We know that, $ax^2 + bx + c \geq 0, \forall x \in R$

If $a > 0$ and $b^2 - 4ac \leq 0$.

$\therefore \quad mx - 1 + \frac{1}{x} \geq 0$

$\Rightarrow \quad \frac{mx^2 - x + 1}{x} \geq 0$

$\Rightarrow \quad mx^2 - x + 1 \geq 0$ as $x > 0$

Now, $mx^2 - x + 1 \geq 0$, if $m > 0$ and $1 - 4m \leq 0$

$\Rightarrow \quad m > 0$ and $m \geq \frac{1}{4}$

Thus, the minimum value of m is $\frac{1}{4}$.

183. The equation on simplifying gives

$x(x-b)(x-c) + x(x-c)(x-a) + x(x-a)(x-b)$
$- (x-a)(x-b)(x-c) = 0$ ...(i)

Let $f(x) = x(x-b)(x-c) + x(x-c)(x-a)$
$+ x(x-a)(x-b) - (x-a)(x-b)(x-c)$

We can assume without loss of generality that $a < b < c$. Now,

$f(a) = a(a-b)(a-c) > 0$

$f(b) = b(b-c)(b-a) < 0$

$f(c) = c(c-a)(c-b) > 0$

So, one root of Eq. (i) lies in (a, b) and one root in (b, c). Obviously the third root must also be real.

184. As $a < b < c < d$ are in AP.

$\therefore f(x) = (x-a)(x-c) + 2(x-b)(x-d)$

$\Rightarrow f(a) = +$ve, $f(b) = -$ ve, $f(c) = -$ ve and $f(d) = +$ ve

$\Rightarrow$ One root lies in (a, b) and other in (c, d).

185. $\cos^4 x - \cos^2 x + 1 - p = 0;\ 0 \le \cos^2 x \le 1,$
The roots of $y^2 - y + 1 - p = 0$ lie between 0 and 1.

$\therefore \quad \alpha \ge 0, \beta \ge 0$
$\alpha - 1 \le 0$
$\beta - 1 \le 0$
and $\quad D \ge 0$
$\Rightarrow \quad \alpha + \beta \ge 0$
$\alpha\beta \ge 0, \alpha + \beta - 2 \le 0,$
$\alpha\beta - (\alpha + \beta) + 1 \ge 0$
and $\quad D \ge 0$
$\therefore \quad 1 \ge 0, 1 - p \ge 0,$
$1 - 2 \le 0, 1 - p - 1 + 1 \ge 0$
and $\quad 1 - 4(1 - p) \ge 0$
$\Rightarrow \quad \frac{3}{4} \le p \le 1$

186. Since, both roots of $f(x) = 0$ exceed a. Therefore,
Discriminant > 0 ...(i)
$f(a) > 0$ ...(ii)
$-\frac{1}{2} > a$ ...(iii)
On solving Eqs. (i), (ii) and (iii), we get
$a < -2$

187. $f(0) \cdot f(1) > 0$
$(-1)(1 - a^2 + 2a - 1) > 0$
$\Rightarrow \quad a^2 - 2a > 0$
$\Rightarrow \quad a(a - 2) > 0$
$\Rightarrow \quad a < 0$
or $\quad a > 2$

188. Since, a lies between the roots of the given equation.
$\therefore \quad 2f(a) < 0$
$\Rightarrow \quad f(a) < 0$
Here, $\quad f(x) = 2x^2 - 2(2a + 1)x + a(a - 1)$
$\therefore \quad f(a) = 2a^2 - 2(2a + 1)a + a(a - 1) < 0$
$\Rightarrow \quad -a^2 - 3a < 0$
$\Rightarrow \quad a(a + 3) > 0$
$\Rightarrow \quad a \in (-\infty, -3) \cup (0, \infty)$

189. Since, $\alpha < -1$ and $\beta > 1$
$\therefore\ \alpha + \lambda = -1$ and $\beta = 1 + \mu$, where $\lambda, \mu > 0$
Now, $1 + \frac{c}{a} + \left|\frac{b}{a}\right| = 1 + \alpha\beta + |\alpha + \beta|$
$= 1 + (-1 - \lambda)(1 + \mu) + |-1 - \lambda + 1 + \mu|$
$= 1 - 1 - \mu - \lambda - \lambda\mu + |\mu - \lambda|$
$= \begin{cases} -\mu - \lambda - \lambda\mu + \mu - \lambda, \text{if } \mu > \lambda \\ -\mu - \lambda - \lambda\mu + \lambda - \mu, \text{if } \lambda > \mu \end{cases}$
$\therefore \quad 1 + \frac{c}{a} + \left|\frac{b}{a}\right| = -2\lambda - \lambda\mu$ or $-2\mu - \lambda\mu$
In both cases, $1 + \frac{c}{a} + \left|\frac{b}{a}\right| < 0 \quad [\because \lambda, \mu > 0]$

190. Let $f(x) = \frac{ax^3}{3} + \frac{bx^2}{2} + cx + d$
where, $\quad f(0) = f(1) = d$
$\therefore f'(x)$ has atleast one root [0, 1]
or $ax^2 + bx + c$ has atleast one root [0, 1].

191. Since, $f(1) = -f(2),$
i.e. $f(1) \cdot f(2) < 0,$
Hence, the equation must have a root $x \in (1, 2)$.
$\therefore$ Two distinct real roots.

192. $6x^2 - xy - y^2 - 6x + 8y - 12 = 6(x + \lambda y - 2)(x - \mu y + 1)$
$\Rightarrow \quad \lambda = \frac{1}{3}, \mu = \frac{1}{2}$

193. The given equation can be written as
$y^2 + y(2x + m) + (2x - 3) = 0$
Here, $\quad D = (2x + m)^2 - 4(2x - 3)$
$= 4x^2 + 4xm - 8x + m^2 + 12$
$= 4x^2 + 4x(m - 2) + (m^2 + 12)$
$= [4x^2 + 4x(m - 2) + (m - 2)^2] + (m^2 + 12) - (m - 2)^2$
$= [2x + (m - 2)]^2 + [12 + 4m - 4]$
For rational factors, D should be a perfect square.
$\therefore \quad 8 + 4m = 0 \Rightarrow m = -2$

Aliter
Use $abc + 2fgh - af^2 - bg^2 - ch^2 = 0$
$\Rightarrow \quad m = -2$

194. The given expression
$= z^2\left[a\left(\frac{x}{z}\right)^2 + b\left(\frac{y}{z}\right)^2 + c + 2a\left(\frac{y}{z}\right) + 2b\left(\frac{x}{z}\right) + 2c\left(\frac{x}{z}\right)\left(\frac{y}{z}\right)\right]$
$= z^2[aX^2 + bY^2 + c + 2aY + 2bX + 2cXY]$ ...(i)
where, $\quad \frac{x}{z} = X$ and $\frac{y}{z} = Y$
The given expression can be resolved into rational factors when the expression under the brackets given in Eq. (i) can be resolved into rational factors.
The condition for this is
$abc + 2 \cdot a \cdot b \cdot c - a \cdot a^2 - b \cdot b^2 - c \cdot c^2 = 0$
$[\because$ here, $f = a, g = b, h = c]$
$\Rightarrow \quad a^3 + b^3 + c^3 = 3abc$

195. Given equation is
$x^2 + 9y^2 - 4x + 3 = 0$
or $\quad x^2 - 4x + 9y^2 + 3 = 0$ ...(i)
Since, x is real.
$\therefore \quad (-4)^2 - 4(9y^2 + 3) \ge 0$
$\Rightarrow \quad 16 - 4(9y^2 + 3) \ge 0$
$\Rightarrow \quad 4 - 9y^2 - 3 \ge 0$
$\Rightarrow \quad 9y^2 - 1 \le 0$
$\Rightarrow \quad (3y - 1)(3y + 1) \le 0$
$\Rightarrow \quad \frac{-1}{3} \le y \le \frac{1}{3}$
Eq. (i) can also be written as
$9y^2 + 0y + x^2 - 4x + 3 = 0$
Since, y is real.
$\therefore \quad 0^2 - 4 \times 9(x^2 - 4x + 3) \ge 0$
$\Rightarrow \quad x^2 - 4x + 3 \le 0$
$\Rightarrow \quad (x - 1)(x - 3) \le 0$
$\Rightarrow \quad 1 \le x \le 3$

196. If $\left[m_r, \left(\frac{1}{m_r}\right)\right]$ satisfy the given equation

$x^2 + y^2 + 2gx + 2fy + c = 0$, then

$$m_r^2 + \frac{1}{m_r^2} + 2gm_r + \frac{2f}{m_r} + c = 0$$

$\Rightarrow \quad m_r^4 + 2gm_r^3 + cm_r^2 + 2fm_r + 1 = 0$

Now, roots of given equation are m_1, m_2, m_3 and m_4.

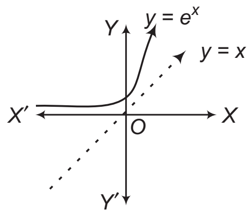
The product of roots,

$$m_1m_2m_3m_4 = \frac{\text{Constant term}}{\text{Coefficient of } m_r^4} = \frac{1}{1} = 1$$

197. Let $f(x) = 0$, where $f(x) = x^2 - 3x + k$ has two roots α and β in (0, 1) for some value of k, then by Rolle's theorem $f'(x) = 2x - 3 = 0$ has a root in (0, 1) $[\because \alpha, \beta \in (0, 1)]$ but $f'(x) = 0$ gives $x = \frac{3}{2} \notin (0, 1)$, which is contradiction.

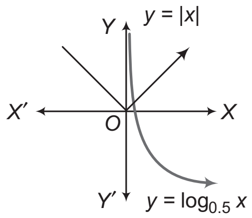
Hence, $f(x) = 0$ has no root in (0, 1) for any value of k.

198.



$\therefore$ No solution.

199.



$\therefore$ Only one solution.

200. We have, $(\log_5 x)^2 + \log_5 x < 2$

Put $\quad \log_5 x = a, \quad$ then $a^2 + a < 2$

$\Rightarrow \quad a^2 + a - 2 < 0$

$\Rightarrow \quad (a + 2)(a - 1) < 0$

$\Rightarrow \quad -2 < a < 1 \quad$ or $\quad -2 < \log_5 x < 1$

$\therefore \quad 5^{-2} < x < 5 \quad$ i.e. $\frac{1}{25} < x < 5$

201. $a - \sqrt{b} = \frac{(a - \sqrt{b})(a + \sqrt{b})}{a + \sqrt{b}} = \frac{a^2 - b}{a + \sqrt{b}} = \frac{1}{a + \sqrt{b}}$

$\therefore$ Given equation reduces to

$$(a + \sqrt{b})^{x^2 - 15} + \frac{1}{(a + \sqrt{b})^{x^2 - 15}} = 2a$$

$\Rightarrow \quad y + \frac{1}{y} = 2a$

where, $\quad y = (a + \sqrt{b})^{x^2 - 15}$

$\Rightarrow \quad y^2 - 2ay + 1 = 0$

$\Rightarrow \quad y = \frac{2a \pm \sqrt{4a^2 - 4}}{2} = a \pm \sqrt{a^2 - 1}$

$\Rightarrow \quad y = a \pm \sqrt{b} \quad [\because a^2 - b = 1]$

***Case* I** $\quad y = a + \sqrt{b} \Rightarrow (a + \sqrt{b})^{x^2 - 15} = a + \sqrt{b}$

$\Rightarrow \quad x^2 - 15 = 1 \Rightarrow x = \pm 4$

***Case* II** $\quad y = a - \sqrt{b} \Rightarrow y = \frac{1}{a + \sqrt{b}}$

$\Rightarrow \quad y = (a + \sqrt{b})^{-1}$

$\Rightarrow \quad (a + \sqrt{b})^{x^2 - 15} = (a + \sqrt{b})^{-1}$

$\Rightarrow \quad x^2 - 15 = -1$

$\Rightarrow \quad x = \pm\sqrt{14}$

202. The roots of $ax^2 + bx + c = 0$ are imaginary.

$\therefore \quad b^2 - 4ac < 0$

Roots are $\frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = -\frac{b}{2a} \pm \frac{\sqrt{4ac - b^2}}{2a} i$

Let $\quad \alpha = -\frac{b}{2a} + \frac{\sqrt{4ac - b^2}}{2a} i$

and $\quad \beta = -\frac{b}{2a} - \frac{\sqrt{4ac - b^2}}{2a} i$

$\therefore \quad |\alpha| = |\beta| \quad [\because \bar{\alpha} = \beta]$

Also, $\quad |\alpha| = \sqrt{\frac{b^2}{4a^2} + \frac{4ac - b^2}{4a^2}} = \sqrt{\frac{c}{a}} > 1$

$[\because 0 < a < b < c]$

$|\alpha| = |\beta| > 1$

$\therefore$ Option (c) is false.

203. We have, $\tan\alpha + \tan\beta = -p$ and $\tan\alpha \tan\beta = q$

$\therefore \tan(\alpha + \beta) = \frac{\tan\alpha + \tan\beta}{1 - \tan\alpha \tan\beta} = \frac{-p}{1 - q} = \frac{p}{q - 1}$

$\therefore$ Option (b) is true.

It can be easily checked that options (c) and (d) are false. LHS of expression in option (a)

$$= \cos^2(\alpha + \beta)[\tan^2(\alpha + \beta) + p\tan(\alpha + \beta) + q]$$

$$= \frac{1}{1 + \left(\frac{p}{q - 1}\right)^2}\left[\left(\frac{p}{q - 1}\right)^2 + p\left(\frac{p}{q - 1}\right) + q\right]$$

$$= \frac{1}{(q - 1)^2 + p^2}[p^2 + p^2(q - 1)^2 + q(q - 1)^2] = q$$

204. We have, $(ax^2 + c)y + (a'x^2 + c') = 0$

$\therefore \quad (ay + a')x^2 + (cy + c') = 0$

Since, x is a rational function, the discriminant must be a perfect square.

Discriminant $= 0 - 4(ay + a')(cy + c')$

$= -4[acy^2 + (ac' + a'c)y + a'c']$

$\therefore$ Roots of $acy^2 + (ac' + a'c)y + a'c' = 0$ must be equal.

$\therefore$ Discriminant $= 0$, i.e. $(ac' + a'c)^2 - 4ac \cdot a'c' = 0$

$\Rightarrow \quad (ac' - a'c)^2 = 0$

$\Rightarrow \quad ac' - a'c = 0$

$\Rightarrow \quad ac' = a'c$

$\Rightarrow \quad \frac{a}{a'} = \frac{c}{c'} \Rightarrow \frac{a}{c} = \frac{a'}{c'}$

205. We have, $\left(\frac{x}{x+1}\right)^2+\left(\frac{x}{x-1}\right)^2=a(a-1)$

$$\Rightarrow \left(\frac{x}{x+1}+\frac{x}{x-1}\right)^2-2\left(\frac{x}{x+1}\right)\left(\frac{x}{x-1}\right)=a(a-1)$$

$$\Rightarrow \left(\frac{2x^2}{x^2-1}\right)^2-\frac{2x^2}{x^2-1}=a(a-1)$$

$$\Rightarrow z^2-z-a(a-1)=0,\text{ where } z=\frac{2x^2}{x^2-1}$$

$$\Rightarrow z=a \quad\text{or}\quad a-1$$

$$z=a \Rightarrow \frac{2x^2}{x^2-1}=a$$

$$\Rightarrow 2x^2=ax^2-a$$

$$\Rightarrow x=\pm\sqrt{\frac{a}{a-2}}$$

$$z=1-a \Rightarrow \frac{2x^2}{x^2-1}=1-a$$

$$\Rightarrow 2x^2=(1-a)x^2-1+a$$

$$\Rightarrow x=\pm\sqrt{\frac{a-1}{a+1}}$$

$$\therefore x=\pm\sqrt{\frac{a}{a-2}},\pm\sqrt{\frac{a-1}{a+1}}$$

$\Rightarrow a<-1 \Rightarrow$ All roots are real

$1<a<2 \Rightarrow x=\pm\sqrt{\frac{a}{2-a}}i,\pm\sqrt{\frac{a-1}{a+1}}$

$\Rightarrow$ Only two roots are real.

$\Rightarrow a>2 \Rightarrow$ All roots are real.

206. Symmetric functions are those which do not change by interchanging α and β.

207. $\sec^2\theta+\operatorname{cosec}^2\theta=\sec^2\theta\cdot\operatorname{cosec}^2\theta$

Sum of the roots is equal to their product and the roots are real.

$$\therefore -\frac{b}{a}=\frac{c}{a} \Rightarrow b+c=0$$

Also, $b^2-4ac\ge 0$

$\Rightarrow c^2-4ac\ge 0$

$\Rightarrow c(c-4a)\ge 0$

$\Rightarrow c-4a\ge 0 \qquad [\because c>0]$

Further $b^2+4ab\ge 0$

$\Rightarrow b+4a\le 0 \qquad [\because b<0]$

208. Let the roots be a/r, a, ar, where $a>0$, $r>1$.

Now, $a/r+a+ar=-p \qquad$ ...(i)

$a(a/r)+a(ar)(ar)(a/r)=q \qquad$ ...(ii)

$(a/r)(a)(ar)=1 \qquad$ ...(iii)

$\Rightarrow a^3=1 \Rightarrow a=1$

Hence, option (c) is correct.

From Eq. (i), putting $a=1$, we get

$$-p-3>0 \qquad \left[\because r+\frac{1}{r}>2\right]$$

$\Rightarrow p<-3$

Hence, option (b) is not correct.

Also, $1/r+1+r=-p \qquad$ ...(iv)

From Eq. (ii), putting $a=1$, we get

$1/r+r+1=q \qquad$ ...(v)

From Eqs. (iv) and (v), we have

$-p=q \Rightarrow p+q=0$

Hence, option (a) is correct.

Now, as $r>1$

$a/r=1/r<1$

and $ar=r>1$

Hence, option (d) is correct.

209. Since α,β,γ and δ are in HP. So, $1/\alpha, 1/\beta, 1/\gamma$ and $1/\delta$ are in AP and they may be taken as $a-3d, a-d, a+d, a+3d$. Replacing x by $1/x$, we get the equation whose roots are $1/\alpha, 1/\beta, 1/\gamma, 1/\delta$.

Therefore, equation $x^2-4x+A=0$ has roots $a-3d, a+d$ and equation $x^2-6x+B=0$ has roots $a-d, a+3d$. Sum of the roots is

$$2(a-d)=4 \quad\text{and}\quad 2(a+d)=6$$

$$\therefore a=5/2, d=1/2$$

Product of the roots is

$$(a-3d)(a+d)=A=3$$

$$(a-d)(a+3d)=B=8$$

210. $(1+k)\tan^2 x-4\tan x-1+k=0 \qquad$ ...(i)

Since, roots are real, we have

$(-4)^2-4(1+k)(-1+k)\ge 0$

$\Rightarrow 16-4(k^2-1)\ge 0$

$\Rightarrow k^2\le 5$

We have, $\tan x_1+\tan x_2=-\left(\frac{-4}{1+k}\right)=\frac{4}{1+k}$

and $\tan x_1\cdot\tan x_2=\frac{-1+k}{1+k}$

$$\therefore \tan(x_1+x_2)=\frac{\frac{4}{1+k}}{1-\left(\frac{-1+k}{1+k}\right)}=\frac{4}{2}=2$$

For $k=2$, from Eq. (i),

$3\tan^2 x-4\tan x+1=0$

$\Rightarrow \tan x=1,\frac{1}{3}$

$\therefore x_1=\frac{\pi}{4}, x_2=\tan^{-1}\frac{1}{3}$

For $k=1$, from Eq. (i), $2\tan^2 x-4\tan x=0$

$\Rightarrow \tan x=0,2 \Rightarrow x_1=0, x_2=\tan^{-1}2$

211. We have, $u+v=-p$ and $uv=q$

(a) $\frac{1}{u}+\frac{1}{v}=\frac{u+v}{uv}=\frac{-p}{q}$ and $\frac{1}{u}\cdot\frac{1}{v}=\frac{1}{uv}=\frac{1}{q}$

$\therefore$ The required equation is

$$x^2-\left(-\frac{p}{q}\right)x+\frac{1}{q}=0$$

$\Rightarrow qx^2+px+1=0$

(b) $(u+v)+uv=-p+q$ and $(u+v)uv=-pq$

$\therefore$ The required equation is

$$x^2-(-p+q)x+(-pq)=0$$

$\Rightarrow x^2+(p-q)x-pq=0$

$\Rightarrow (x+p)(x-q)=0$

(c) $u^2 + v^2 = (u+v)^2 - 2uv = p^2 - 2q$

and $\quad u^2v^2 = (uv)^2 = q^2$

$\therefore$ The required equation is

$$x^2 - (p^2 - 2q)\,x + q^2 = 0$$

(d) $\dfrac{u}{v} + \dfrac{v}{u} = \dfrac{u^2 + v^2}{uv} = \dfrac{p^2 - 2q}{q}$ and $\dfrac{u}{v} \cdot \dfrac{v}{u} = 1$

$\therefore$ The required equation is

$$x^2 - \left(\frac{p^2 - 2q}{q}\right) x + 1 = 0$$

$\Rightarrow \quad qx^2 - (p^2 - 2q)\,x + q = 0$

212. $\dfrac{(x-a)(x-b)}{x-c} = k$

$\Rightarrow \quad (x-a)(x-b) - k\,(x-c) = 0$

$\Rightarrow \quad x^2 - (a+b+k)\,x + ab + kc = 0$

$\Rightarrow \{-(a+b+k)\}^2 - 4\cdot 1\cdot (ab+kc) \ge 0 \quad$ [$\because$ x is real]

$\Rightarrow \quad k^2 + 2\,(a+b-2c) + (a-b)^2 \ge 0$

This is true for all real k.

$\therefore$ Discriminant $= 4\,(a+b-2c)^2 - 4\cdot 1\,(a-b)^2 \le 0$

$\Rightarrow \quad (a+b-2c+a-b)\,(a+b-2c-a+b) \le 0$

$\Rightarrow \quad 2\,(a-c)\,2\,(b-c) \le 0$

$\Rightarrow \quad (a-c)\,(b-c) \le 0$

$\Rightarrow \quad (c-a)\,(c-b) \le 0$

$\Rightarrow \quad a \le c \le b \;$ or $\; b \le c \le a$

213. Since, $P(x)$ divides both of them. So, $P(x)$ also divides

$$(3x^4 + 4x^2 + 28x + 5) - 3\,(x^4 + 6x^2 + 25)$$
$$= -14x^2 + 28x - 70$$
$$= -14(x^2 - 2x + 5)$$

which is a quadratic.

Hence, $\quad P(x) = x^2 - 2x + 5$

$\Rightarrow \quad P(1) = 4$

214. Roots of $4x^2 - x - 1 = 0$ are irrational. So, one root common implies both roots are common.

$\therefore \quad \dfrac{4}{3} = \dfrac{-1}{\lambda + \mu} = \dfrac{-1}{\lambda - \mu} \quad \Rightarrow \quad \lambda = \dfrac{-3}{4}, \mu = 0$

215. $2x^2 + 6xy + 5y^2 = 1 \qquad$ ...(i)

Eq. (i) can be rewritten as

$$2x^2 + (6y)x + 5y^2 - 1 = 0$$

Since, x is real.

$$36y^2 - 8\,(5y^2 - 1) \ge 0$$

$\Rightarrow \quad y^2 \le 2$

$\Rightarrow \quad -\sqrt{2} \le y \le \sqrt{2}$

Eq. (i) can also be rewritten as

$$5y^2 + (6x)y + 2x^2 - 1 = 0$$

Since, y is real.

$\therefore \quad 36x^2 - 20\,(2x^2 - 1) \ge 0$

$\Rightarrow \quad 36x^2 - 40x^2 + 20 \ge 0$

$\Rightarrow \quad -4x^2 \ge -20$

$\Rightarrow \quad x^2 \le 5$

$\Rightarrow \quad -\sqrt{5} \le x \le \sqrt{5}$

216. $\cos x - y^2 - \sqrt{y - x^2 - 1} \ge 0 \qquad$ ...(i)

Now, $\sqrt{y - x^2 - 1}$ is defined when $y - x^2 - 1 \ge 0$ or $y \ge x^2 + 1$. So, minimum value of y is 1.

From Eq. (i),

$$\cos x - y^2 \ge \sqrt{y - x^2 - 1}$$

where, $\cos x - y^2 \le 0$ [as when $\cos x$ is maximum $(= 1)$ and y^2 is minimum $(= 1)$, so $\cos x - y^2$ is maximum].

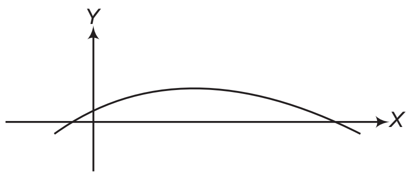
Also, $\quad \sqrt{y - x^2 - 1} \ge 0$

Hence, $\quad \cos x - y^2 = \sqrt{y - x^2 - 1} = 0$

$\Rightarrow \quad y = 1$ and $\cos x = 1, y = x^2 + 1$

$\Rightarrow \quad x = 0, y = 1$

217.



From the graph,

$$f(0) = c > 0 \qquad \text{...(i)}$$

Also, the graph is concave downward.

$\therefore \quad a < 0 \qquad$ ...(ii)

Further, abscissa of the vertex $= \dfrac{b}{2a} \qquad$ ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$ac < 0, ab < 0 \text{ and } bc > 0$$

218. For $ax^2 + bx + c = 0$ and $a_1x^2 + b_1x + c_1 = 0$ have a common root

$$(a_1c - ac_1)^2 = 4\,(ab_1 - ba_1)\,(bc_1 - b_1c) \qquad \text{...(i)}$$

If $\dfrac{a}{a_1}, \dfrac{b}{b_1}, \dfrac{c}{c_1}$ are in AP.

$$\frac{ba_1 - ab_1}{a_1b_1} = \frac{cb_1 - c_1b}{b_1c_1} = k$$

and $\quad \dfrac{cb_1 - ac_1}{a_1c_1} = 2k$

On putting these values in Eq. (i), we have

$$c_1a_1 = b_1^2$$

219. Statement I Given equation is $x^2 - bx + c = 0$

Let α and β be two roots such that

$$|\alpha - \beta| = 1$$

$\Rightarrow \quad (\alpha + \beta)^2 - 4\alpha\beta = 1$

$\Rightarrow \quad b^2 - 4c = 1$

Statement II Given equation is

$4abc\; x^2 + (b^2 - 4ac)\,x - b = 0.$

$\therefore \quad D = (b^2 - 4ac)^2 + 16ab^2c$

$\quad = (b^2 + 4ac)^2 > 0$

Hence, roots are real and unequal.

Solutions (Q.Nos. 220-222)

Let the other roots of $f\{f(x)\} = x$ be λ and δ.

$\Rightarrow \quad f\{f(\lambda)\} = \lambda$

Let $\quad f(\lambda) = \gamma$

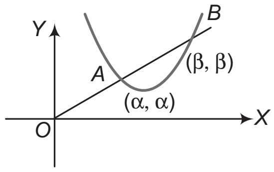
$\Rightarrow \quad f(\gamma) = \gamma$

Target Exercises

Other roots γ and δ lie on the line

$$y = -x + c$$

There must be two points C and D on the parabola $y = ax^2 + bx + c$ which are image of each other in the line $y = x$



$\Rightarrow$ If α and β are real so are λ and δ.

If $\alpha + \beta = \lambda + \delta \Rightarrow$ middle points of AB and CD become same.

This is not possible $\Rightarrow \alpha, \beta$ and λ, δ cannot be real.

Also, if α and β are equal to then λ, δ cannot be real.

223. $f''(c_2) f''(c_1) < 0$ and $f'(c_1) = f'(c_2) = 0$

$\Rightarrow \quad f''(c_1) - f''(c_2) > 0$

$\Rightarrow \quad f''(c_1) > 0$

and $\quad f''(c_2) > 0$

$\Rightarrow c_2$ is local maximum and c_1 is local minimum for $f(x)$

$\Rightarrow f'(x) = 0$ has atleast four times in $[c_1 - 1, c_2 + 1]$.

224. Here, c_1 is local maximum and c_2 is local minimum.

$\Rightarrow f'(x) = 0$ has atleast two roots in $[c_1 - 1, c_2 + 1]$.

225. As c_2 is local maximum and c_1 is local minimum.

$\Rightarrow f(x) = 0$ has atleast two solutions.

Solutions (Q. Nos. 226-228)

$$(\beta - \alpha) = ((\beta + \delta) - (\alpha + \delta))$$

$$(\beta + \alpha)^2 - 4\alpha\beta = [(\beta + \delta) + (\alpha + \delta)]^2 - 4(\beta + \delta)(\alpha + \delta)$$

$$(-b_1)^2 - 4c_1 = (-b_2)^2 - 4c_2$$

$$D_1 = D_2$$

Least value of $f(x)$ is

$$-\frac{D_1}{4} = -\frac{1}{4} \Rightarrow D_1 = 1 \Rightarrow D_2 = 1$$

$\therefore$ Least value of $g(x)$ is

$$-\frac{D_2}{4} = -\frac{1}{4}$$

Least value of $g(x)$ accurs at

$$x = -\frac{b_2}{2} = \frac{7}{2} \Rightarrow b_2 = -7$$

$$b_2^2 - 4c_2 = D_2 \Rightarrow 49 - 4c_2 = 1$$

$$\Rightarrow \quad \frac{48}{4} = c_2 \Rightarrow c_2 = 12$$

$$x^2 - 7x + 12 = 0 \Rightarrow x = 3, 4$$

Solutions (Q. Nos. 229-231)

Let $\quad x^4 + ax^3 + bx^2 + cx + d$

$$= (x - x_1)(x - x_2)(x - x_3)(x - x_4)$$

Let $(x - x_1)(x - x_2) = x^2 + px + q$

and $(x - x_3)(x - x_4) = x^2 + px + r$

$\therefore \quad q = x_1x_2$ and $r = x_3x_4$

$$x^4 + ax^3 + bx^2 + cx + d$$

$$= x^4 + 2px^3 + (p^2 + q + r)x^2 + p(q + r)x + qr$$

$\therefore \quad a = 2p; b = p^2 + q + r; \; c = p(q + r); \; d = qr$

Clearly, $\quad a^3 - 4ab + 8c = 0 \quad$ ...(i)

229. If $a = 2$, then

$$b - c = 1$$

230. Investigating the nature of the cubic equation of a

let $f(a) = a^3 - 4ab + 8c$

$$f'(a) = 3a^2 - 4b$$

If $b < 0$, then $f'(a) > 0$

$\therefore$ The equation $a^3 - 4ab + 8c = 0$ has only one real root.

231. On substituting $c = 1 - b$ in Eq. (i), we get

$$(a + 2)[(a - 1)^2 + 3 - 4b] = 0$$

$\Rightarrow \quad 4b - 3 > 0$

$\Rightarrow \quad b > \frac{3}{4}$

$\Rightarrow \quad c < \frac{1}{4}$

232. A. Roots of the given equation will be opposite sign, if $D \geq 0$ and product of roots < 0.

$$(a^3 + 8a - 1)^2 - 8(a^2 - 4a) \geq 0$$

and $\quad \frac{a^2 - 4a}{2} < 0$

$\Rightarrow \quad a^2 - 4a < 0$

$$\left[\begin{array}{l} \because \; a^2 - 4a < 0 \\ \Rightarrow (a^3 + 8a - 1)^2 - 8(a^2 - 4a) \geq 0 \end{array}\right]$$

$\Rightarrow \quad 0 < a < 4$

B. Equation has negative roots of discriminant ≥ 0,

$$\alpha < 0, \beta < 0$$

i.e. $\quad \alpha + \beta < 0$ and $f(0) > 0$

$\therefore \quad 4(a + 1)^2 - 36a + 20 > 0$

$\Rightarrow \quad a^2 - 7a + 6 \geq 0$

$\Rightarrow \quad a \leq 1$ or $a \geq 6 \quad$ ...(i)

$$\alpha + \beta < 0$$

$\Rightarrow \quad a + 1 > 0$

$\Rightarrow \quad a > -1 \quad$ ...(ii)

and $\quad f(0) > 0$

$$9a - 5 > 0$$

$\Rightarrow \quad a > \frac{5}{9} \quad$ ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$a \geq 6$$

C. Given, $x^2 - 2(4a - 1)x + 15a^2 - 2a - 7 > 0$

$\therefore$ Discriminant $< 0 \quad [\because$ coefficient of $x^2 > 0]$

$\Rightarrow \quad 4(4a - 1)^2 - 4(15a^2 - 2a - 7) < 0$

$\Rightarrow \quad a^2 - 6a + 8 < 0$

$\Rightarrow \quad 2 < a < 4$

D. Let $y = \dfrac{x^2 + 2x + a}{x^2 + 4x + 3a}$

$\Rightarrow x^2(y - 1) + 2(2y - 1)x + a(3y - 1) = 0$

As $\quad x \in R, D \geq 0$

$\therefore \quad 4(2y - 1)^2 - 4(y - 1)a(3y - 1) \geq 0$

$\Rightarrow (4 - 3a)y^2 - 4(1 - a)y + 1 - a \geq 0 \Rightarrow a < \frac{4}{3}$

and $\quad a(a - 1) \leq 0$

$\therefore \quad 0 \leq a \leq 1$

233. A. Since, $f(x) = x^2 + 2(k+1)x + (9k-5)$ has both negative roots.

(i) Discriminant ≥ 0 (ii) $\alpha < 0, \beta < 0$ (iii) $f(0) > 0$

i.e. $\alpha + \beta < 0$

$\therefore$ Discriminant ≥ 0

$\Rightarrow \quad 4(k+1)^2 - 36k + 20 > 0$

$\Rightarrow \quad k^2 - 7k + 6 \geq 0$

$\Rightarrow \quad (k-1)(k-6) \geq 0$

$\Rightarrow \quad k \leq 1 \text{ or } k \geq 6 \qquad \ldots(i)$

$\alpha + \beta < 0$

$\Rightarrow \quad -2(k+1) < 0$

$\Rightarrow \quad k + 1 > 0$

$\Rightarrow \quad k > -1 \qquad \ldots(ii)$

and $\quad f(0) > 0$

$\Rightarrow \quad 9k - 5 > 0$

$\Rightarrow \quad k > \frac{5}{9} \qquad \ldots(iii)$

From Eqs. (i), (ii) and (iii), we get

$k \geq 6$

B. $f(x) > 0$

$\Rightarrow$ Discriminant < 0

$\Rightarrow \quad 4(4k-1)^2 - 4(15k^2 - 2k - 7) < 0$

$\Rightarrow \quad k^2 - 6k + 8 < 0$

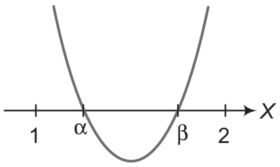
$\Rightarrow \quad 2 < k < 4$

C. $f(x) = x^2 - 2(k-1) + (2k+1)$ has both roots positive, if

(i) Discriminant > 0

(ii) Sum of the roots > 0

(iii) $f(0) > 0$



Now, discriminant ≥ 0

$\Rightarrow \quad 4(k-1)^2 - 4(2k+1) \geq 0$

$\Rightarrow \quad k^2 - 4k \geq 0$

$\Rightarrow \quad k \leq 0 \text{ and } k \geq 4 \qquad \ldots(i)$

Sum of roots > 0

$\Rightarrow \quad 2(k-1) > 0$

$\Rightarrow \quad k > 1 \qquad \ldots(ii)$

and $\quad f(0) > 0$

$\Rightarrow \quad (2k+1) > 0$

$\Rightarrow \quad k > -\frac{1}{2} \qquad \ldots(iii)$

From Eqs. (i), (ii) and (iii), we get

$k \geq 4$

D. Since, k lies between the roots of

$f(x) = 2x^2 - 2(2k+1)x + k(k+1)$

$\Rightarrow$ Discriminant > 0 and $f(k) < 0$

$\Rightarrow \quad 4(2k+1)^2 - 8k(k+1) > 0$

and $\quad 2k^2 - 2k(2k+1) + k(k+1) < 0$

$\Rightarrow \quad 8\left(k^2 + k + \frac{1}{2}\right) \geq 0$

and $\quad -k^2 - k < 0$

This is always true and $k > 0$ or $k < -1$.

E. $y = -x^2 + 3x - 2$

$= \frac{9}{4} - \left(x^2 - 3x + \frac{9}{4}\right) - 2$

$y = \frac{1}{4} - \left(\frac{x-3}{2}\right) \leq \frac{1}{4}$

234. Let $f(x) = x^3 - x^2 + \beta x + \gamma \qquad \ldots(i)$

$f(x) = 0$ has three positive real roots in GP.

$\Rightarrow f'(x) = 0$ will have two distinct real roots.

$\Rightarrow 3x^2 - 2x + \beta = 0$ has two distinct roots.

$\therefore \quad D > 0$

$4 - 12\beta > 0 \;\Rightarrow\; \beta < \frac{1}{3} \qquad \ldots(ii)$

Also, from Eq. (i),

$x_1x_2 + x_2x_3 + x_3x_1 = \beta$

$x_1 + x_2 + x_3 = 1$

$x_1x_2x_3 = -\gamma$

$\Rightarrow \quad x_2^3 = -r > 0 \qquad [\because x_2^2 = x_1x_3]$

$\Rightarrow \quad r > 0$

Also, $\quad x_2(x_1 + x_3) + x_2^2 = \beta$

$\Rightarrow \quad x_2(1 - x_2) + x_2^2 = \beta$

$\Rightarrow \quad x_2 = \beta > 0$

From Eqs. (ii) and (iv), we get $0 < \beta < \frac{1}{3}$ and $\gamma < 0$

$[\beta]_{max} = 0, [\gamma]_{max} = -1$

$\Rightarrow \quad [\beta] + [\gamma] + 2 = [0] + [-1] + 2 = 1$

235. $x_1 + x_2 + x_1x_2 = a \qquad \ldots(i)$

$x_1x_2 + x_1^2x_2 + x_1x_2^2 = b \qquad \ldots(ii)$

$x_1^2x_2^2 = c \qquad \ldots(iii)$

From Eq. (ii), we get

$x_1x_2(1 + x_1 + x_2) = b$

$x_1x_2(1 + a - x_1x_2) = b$

$x_1x_2(1 + a) - c = b$

$x_1x_2 = \frac{b+c}{a+1}$, which is clearly a rational number.

$\because \quad b + c = 2(a+1)$

$\therefore \quad x_1x_2 = 2$

236. Here, $\left.\begin{array}{l}\alpha + \beta = -p \\ \gamma + \delta = -p\end{array}\right\} \Rightarrow \alpha + \beta = \gamma + \delta$

Now, $(\alpha - \gamma)(\alpha - \delta) = \alpha^2 - \alpha(\gamma + \delta) + \gamma\delta$

$= \alpha^2 - \alpha(\alpha + \beta) + r$

$= -\alpha\beta + r$

$= -(-q) + r = q + r$

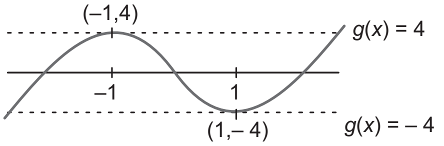
By symmetry of the results

$(\beta - \gamma)(\beta - \delta) = q + r$

Hence, the required ratio is 1.

Entrances Gallery

1. Let $y = x^5 - 5x$ and $g(x) = -a$. Then, it is clear from the graph that $f(x)$ has only real roots, if $a > 4$ or $a < -4$ and $f(x)$ has three real roots, if $-4 < a < 4$.



2. $P(x) = ax^2 + b$ with a, b of same sign.

$$P(P(x)) = a(ax^2 + b)^2 + b$$

If $x \in R$ or $ix \in R$

$$\Rightarrow \quad x^2 \in R$$

$$\Rightarrow \quad P(x) \in R$$

$$\Rightarrow \quad P\{P(x)\} \neq 0$$

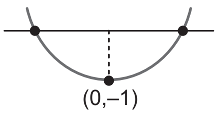
Hence, real or purely imaginary number cannot satisfy $P(P(x)) = 0$.

3. Let $f(x) = x^2 - x\sin x - \cos x \Rightarrow f'(x) = 2x - x\cos x$

$$\lim_{x \to \infty} f(x) \to \infty$$

$$\lim_{x \to -\infty} f(x) \to \infty$$

$$f(0) = -1$$



Hence, 2 solutions.

4. $\log_2 3^x = (x-1)\log_2 4 = 2(x-1)$

$$\Rightarrow \quad x\log_2 3 = 2x - 2$$

$$\Rightarrow \quad x = \frac{2}{2 - \log_2 3}$$

After rearranging, we get

$$x = \frac{2}{2 - \frac{1}{\log_3 2}} = \frac{2\log_3 2}{2\log_3 2 - 1}$$

Rearranging, again

$$x = \frac{\log_3 4}{\log_3 4 - 1} = \frac{\frac{1}{\log_4 3}}{\frac{1}{\log_4 3} - 1} = \frac{1}{1 - \log_4 3}$$

5. Let $1 + a = y$

$$\Rightarrow \quad (y^{1/3} - 1)x^2 + (y^{1/2} - 1)x + y^{1/6} - 1 = 0$$

$$\Rightarrow \quad \left(\frac{y^{1/3} - 1}{y - 1}\right)x^2 + \left(\frac{y^{1/2} - 1}{y - 1}\right)x + \frac{y^{1/6} - 1}{y - 1} = 0$$

Taking $\lim_{y \to 1}$ on both the sides, we get

$$\frac{1}{3}x^2 + \frac{1}{2}x + \frac{1}{6} = 0$$

$$\Rightarrow \quad 2x^2 + 3x + 1 = 0$$

$$\therefore \quad x = -1, -\frac{1}{2}$$

6. Let $\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\ldots}}} = y$

So, $$4 - \frac{1}{3\sqrt{2}}y = y^2 \qquad [\because y > 0]$$

$$\Rightarrow \quad y^2 + \frac{1}{3\sqrt{2}}y - 4 = 0 \Rightarrow y = \frac{8}{3\sqrt{2}}$$

So, the required value is $6 + \log_{3/2}\left(\frac{1}{3\sqrt{2}} \times \frac{8}{3\sqrt{2}}\right)$

$$= 6 + \log_{3/2}\frac{4}{9} = 6 - 2 = 4$$

7. $(2x)^{\ln 2} = (3y)^{\ln 3}$ $\quad \ldots$(i)

$$3^{\ln x} = 2^{\ln y} \qquad \ldots\text{(ii)}$$

$$\Rightarrow \quad (\log x)(\log 3) = (\log y)\log 2$$

$$\Rightarrow \quad \log y = \frac{(\log x)(\log 3)}{\log 2} \qquad \ldots\text{(iii)}$$

In Eq. (i), taking log on both sides, we get

$$(\log 2)\{\log 2 + \log x\} = \log 3\{\log 3 + \log y\}$$

$$\Rightarrow (\log 2)^2 + (\log 2)(\log x) = (\log 3)^2 + \frac{(\log 3)^2(\log x)}{\log 2}$$

[from Eq. (iii)]

$$\Rightarrow \quad (\log 2)^2 - (\log 3)^2 = \frac{(\log 3)^2 - (\log 2)^2}{\log 2}(\log x)$$

$$\Rightarrow \quad -\log 2 = \log x$$

$$\Rightarrow \quad x = \frac{1}{2} \Rightarrow x_0 = \frac{1}{2}$$

8. $a_n = \alpha^n - \beta^n$

$$\alpha^2 - 6\alpha - 2 = 0$$

Multiply with α^8 on both sides, we get

$$\alpha^{10} - 6\alpha^9 - 2\alpha^8 = 0 \qquad \ldots\text{(i)}$$

Similarly, $$\beta^{10} - 6\beta^9 - 2\beta^8 = 0 \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\alpha^{10} - \beta^{10} - 6(\alpha^9 - \beta^9) = 2(\alpha^8 - \beta^8)$$

$$\Rightarrow \quad a_{10} - 6a_9 = 2a_8 \Rightarrow \frac{a_{10} - 2a_8}{2a_9} = 3$$

9. $x^2 + bx - 1 = 0$

and $$x^2 + x + b = 0 \qquad \ldots\text{(i)}$$

Common root is

$$(b-1)x - 1 - b = 0 \Rightarrow x = \frac{b+1}{b-1}$$

This value of x satisfies Eq. (i).

$$\therefore \quad \frac{(b+1)^2}{(b-1)^2} + \frac{b+1}{b-1} + b = 0$$

$$\Rightarrow \quad b = \sqrt{3}i, -\sqrt{3}i, 0$$

10. Since, $f\left(-\frac{1}{2}\right) \cdot f\left(-\frac{3}{4}\right) < 0$, so lies in $\left(-\frac{3}{4}, -\frac{1}{2}\right)$.

11. $\alpha^3 + \beta^3 = q$

$$\Rightarrow \quad (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta) = q$$

$$\Rightarrow \quad -p^3 + 3p\alpha\beta = q$$

$$\Rightarrow \quad \alpha\beta = \frac{q + p^3}{3p}$$

$$\Rightarrow \quad x^2 - \left(\frac{\alpha}{\beta} + \frac{\beta}{\alpha}\right) x + \frac{\alpha}{\beta} \cdot \frac{\beta}{\alpha} = 0$$

$$\Rightarrow \quad x^2 - \frac{(\alpha^2 + \beta^2)}{\alpha\beta} x + 1 = 0$$

$$\Rightarrow \quad x^2 - \left(\frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta}\right) x + 1 = 0$$

$$\Rightarrow \quad x^2 - \left[\frac{p^2 - 2\left(\frac{p^3 + q}{3p}\right)}{\frac{p^3 + q}{3p}}\right] x + 1 = 0$$

$$\Rightarrow (p^3 + q) x^2 - (3p^3 - 2p^3 - 2q) x + (p^3 + q) = 0$$

$$\Rightarrow \quad (p^3 + q) x^2 - (p^3 - 2q)x + (p^3 + q) = 0$$

12. Given, α and β are the roots of the equation $x^2 - 6x - 2 = 0$.

$\because \quad a_n = \alpha^n - \beta^n$ for $n \geq 1$

$\therefore \quad a_{10} = \alpha^{10} - \beta^{10}$

$a_8 = \alpha^8 - \beta^8 \Rightarrow a_9 = \alpha^9 - \beta^9$

Now, consider

$$\frac{a_{10} - 2a_8}{2a_9} = \frac{\alpha^{10} - \beta^{10} - 2(\alpha^8 - \beta^8)}{2(\alpha^9 - \beta^9)}$$

$$= \frac{\alpha^8(\alpha^2 - 2) - \beta^8(\beta^2 - 2)}{2(\alpha^9 - \beta^9)}$$

$$= \frac{\alpha^8 \cdot 6\alpha - \beta^8 \cdot 6\beta}{2(\alpha^9 - \beta^9)} \quad \left[\begin{array}{l} \because \alpha \text{ and } \beta \text{ are the roots of} \\ x^2 - 6x - 2 = 0 \\ \text{So,} \quad x^2 = 6x + 2 \\ \Rightarrow \quad \alpha^2 = 6\alpha + 2 \\ \Rightarrow \quad \alpha^2 - 2 = 6\alpha \\ \text{and} \quad \beta^2 = 6\beta = 2 \\ \Rightarrow \quad \beta^2 - 2 = 6\beta \end{array}\right]$$

$$= \frac{6\alpha^9 - 6\beta^9}{2(\alpha^9 - \beta^9)} = \frac{6}{2} = 3$$

Aliter

Since, α and β are the roots of the equation

$$x^2 - 6x - 2 = 0$$

$$\Rightarrow \quad x^2 = 6x + 2 \quad \Rightarrow \quad \alpha^2 = 6\alpha + 2$$

$$\Rightarrow \quad \alpha^{10} = 6\alpha^9 + 2\alpha^8 \qquad \ldots\text{(i)}$$

Similarly, $\quad \beta^{10} = 6\beta^9 + 2\beta^8 \qquad \ldots$(ii)

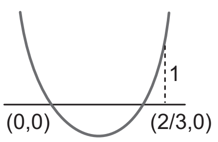
On subtracting Eq. (ii) from Eq. (i), we get

$$\alpha^{10} - \beta^{10} = 6(\alpha^9 - \beta^9) + 2(\alpha^8 - \beta^8)$$

$$\Rightarrow \quad a_{10} = 6a_9 + 2a_8 \qquad [\because a_n = \alpha^n - \beta^n]$$

$$\Rightarrow \quad a_{10} - 2a_8 = 6a_9 \quad \Rightarrow \quad \frac{a_{10} - 2a_8}{2a_9} = 3$$

13. $\because a^2 = 3t^2 - 2t$



For non-integral solution,

$$0 < a^2 < 1 \quad \Rightarrow \quad a \in (-1, 0) \cup (0, 1)$$

It is assumed that a real solution of given equation exists.

14. Given equations are

$$x^2 + 2x + 3 = 0 \qquad \ldots\text{(i)}$$

and $\quad ax^2 + bx + c = 0 \qquad \ldots$(ii)

Since, Eq. (i) has imaginary roots.

So, Eq. (ii) will also have both roots same as Eq. (i).

Thus, $\quad \dfrac{a}{1} = \dfrac{b}{2} = \dfrac{c}{3}$

Hence, $a : b : c$ is $1 : 2 : 3$

15. Given equation is

$$e^{\sin x} - e^{-\sin x} = 4$$

$$\Rightarrow \quad e^{\sin x} - \frac{1}{e^{\sin x}} = 4$$

Now, let $\quad y = e^{\sin x}$

$$\therefore \quad y - \frac{1}{y} = 4$$

$$\Rightarrow \quad y^2 - 4y - 1 = 0$$

$$\Rightarrow \quad y = \frac{4 \pm \sqrt{16 + 4}}{2}$$

$$\Rightarrow \quad y = 2 \pm \sqrt{5}$$

On substituting the value of y, we get

$$e^{\sin x} = 2 \pm \sqrt{5}$$

Now, sine is a bounded function,

i.e. $-1 \leq \sin x \leq 1$.

$$\therefore \quad e^{-1} \leq e^{\sin x} \leq e$$

$$\Rightarrow \quad e^{\sin x} \in \left[\frac{1}{e}, e\right]$$

16. Let $z = x + iy$, given $\text{Re}(z) = 1$

$$\therefore \quad x = 1$$

$$\Rightarrow \quad z = 1 + iy$$

Since, the complex roots are conjugate of each other.

$\therefore$ $z = 1 + iy$ and $1 - iy$ are two roots of $z^2 + \alpha z + \beta = 0$

Product of roots $= \beta$

$$\Rightarrow \quad (1 + iy)(1 - iy) = \beta$$

$$\therefore \quad \beta = 1 + y^2 \geq 1$$

$$\Rightarrow \quad \beta \in (1, \infty)$$

17. Let the quadratic equation be

$$ax^2 + bx + c = 0$$

Sachin made a mistake in writing down constant terms.

$\therefore$ Sum of roots is correct.

i.e. $\quad \alpha + \beta = 7$

Rahul made mistake in writing down coefficient of x.

$\therefore$ Product of roots is correct.

i.e. $\quad \alpha\beta = 6$

$\Rightarrow$ Correct quadratic equation is

$$x^2 - (\alpha + \beta) x + \alpha\beta = 0$$

$\Rightarrow x^2 - 7x + 6 = 0$ having roots 1 and 6.

18. Since, α and β are roots of the equation $x^2 - x + 1 = 0$.

$$\Rightarrow \quad \alpha + \beta = 1, \alpha\beta = 1$$

$$\Rightarrow \quad x = \frac{1 \pm \sqrt{3}i}{2}$$

$$\Rightarrow \quad x = \frac{1 + \sqrt{3}i}{2} \quad \text{or} \quad \frac{1 - \sqrt{3}i}{2}$$

$$\Rightarrow \quad x = -\omega \quad \text{or} \quad -\omega^2$$

Thus, $\alpha = -\omega^2$, then $\beta = -\omega$

or $\alpha = -\omega$, then $\beta = -\omega^2$ [where, $\omega^3 = 1$]

Hence, $\alpha^{2009} + \beta^{2009} = (-\omega)^{2009} + (-\omega^2)^{2009}$

$= -[(\omega^3)^{669} \cdot \omega^2 + (\omega^3)^{1339} \cdot \omega]$

$= -[\omega^2 + \omega] = -(-1) = 1$

19. Given $bx^2 + cx + a = 0$ has imaginary roots

$\Rightarrow c^2 - 4ab < 0 \Rightarrow c^2 < 4ab$

$\Rightarrow -c^2 > -4ab$ ...(i)

Let $f(x) = 3b^2x^2 + 6bcx + 2c^2$

Here, $3b^2 > 0$

So, the given expression has a minimum value.

$\therefore$ Minimum value $= \frac{-D}{4a}$

$= \frac{4ac - b^2}{4a} = \frac{4(3b^2)(2c^2) - 36b^2c^2}{4(3b^2)}$

$= -\frac{12b^2c^2}{12b^2} = -c^2 > -4ab$ [from Eq. (i)]

20. Let the roots of $x^2 - 6x + a = 0$ be $\alpha, 4\beta$ and that of $x^2 - cx + 6 = 0$ be $\alpha, 3\beta$.

$\therefore \alpha + 4\beta = 6$ and $4\alpha\beta = a$

and $\alpha + 3\beta = c$ and $3\alpha\beta = 6$

$\Rightarrow \frac{a}{6} = \frac{4}{3} \Rightarrow a = 8$

$\therefore x^2 - 6x + 8 = 0$

$\Rightarrow (x-4)(x-2) = 0$

$\Rightarrow x = 2, 4$

and $x^2 - cx + 6 = 0$

If $x = 2$, then $2^2 - 2c + 6 = 0 \Rightarrow c = 5$

$\therefore x^2 - 5x + 6 = 0$

$\Rightarrow x = 2, 3$

Hence, the common root is 2.

21. Let α and β be the roots of equation $x^2 + ax + 1 = 0$, then $\alpha + \beta = -a$ and $\alpha\beta = 1$.

Now, $|\alpha - \beta| = \sqrt{(\alpha+\beta)^2 - 4\alpha\beta}$

$\Rightarrow |\alpha - \beta| = \sqrt{a^2 - 4}$

According to given condition,

$\sqrt{a^2 - 4} < \sqrt{5}$

$\Rightarrow a^2 - 4 < 5$

$\Rightarrow a^2 < 9$

$\Rightarrow |a| < 3$

$\Rightarrow a \in (-3, 3)$

22. Since, $\tan 30°$ and $\tan 15°$ are the roots of equation $x^2 + px + q = 0$.

$\therefore \tan 30° + \tan 15° = -p$

and $\tan 30° \tan 15° = q$

Now, $2 + q - p = 2 + \tan 30° \tan 15° + (\tan 30° + \tan 15°)$

$= 2 + \tan 30° \tan 15° + 1 - \tan 30° \tan 15°$

$\left[\because \tan 45° = \frac{\tan 30° + \tan 15°}{1 - \tan 30° \tan 15°}\right]$

$\Rightarrow 2 + q - p = 3$

23. Since, both roots of equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than -2 but less than 4.

$\therefore D \ge 0, -2 < -\frac{b}{2a} < 4,$

$f(4) > 0$ and $f(-2) > 0$

Now, $D \ge 0$; $4m^2 - 4m^2 + 4 \ge 0$

$\Rightarrow 4 > 0, \forall m \in R$ ...(i)

$-2 < -\frac{b}{2a} < 4$

$\Rightarrow -2 < \left(\frac{2m}{2\cdot 1}\right) < 4$

$\Rightarrow -2 < m < 4$ ...(ii)

$f(4) > 0$

$\Rightarrow 16 - 8m + m^2 - 1 > 0$

$\Rightarrow m^2 - 8m + 15 > 0$

$\Rightarrow (m-3)(m-5) > 0$

$\Rightarrow -\infty < m < 3$ and $5 < m < \infty$ ...(iii)

and $f(-2) > 0$

$\Rightarrow 4 + 4m + m^2 - 1 > 0$

$\Rightarrow m^2 + 4m + 3 > 0$

$\Rightarrow (m+3)(m+1) > 0$

$\Rightarrow -\infty < m < -3$ and $-1 < m < \infty$ ...(iv)

From Eqs. (i), (ii), (iii) and (iv), we get m lies between -1 and 3.

24. Let α and β be the roots of equation

$x^2 - (a-2)x - a - 1 = 0$

Then, $\alpha + \beta = a - 2$ and $\alpha\beta = -a - 1$

Now, $\alpha^2 + \beta^2 = (\alpha+\beta)^2 - 2\alpha\beta$

$\Rightarrow \alpha^2 + \beta^2 = (a-2)^2 + 2(a+1)$

$\Rightarrow \alpha^2 + \beta^2 = a^2 - 2a + 6$

$\Rightarrow \alpha^2 + \beta^2 = (a-1)^2 + 5$

The value of $\alpha^2 + \beta^2$ will be least, if $a - 1 = 0$

$\Rightarrow a = 1$

Aliter

Since, $\alpha + \beta = (a-2)$ and $\alpha\beta = -a - 1$

Let $f(a) = \alpha^2 + \beta^2$

$= (\alpha+\beta)^2 - 2\alpha\beta$

$= (a-2)^2 + 2(a+1)$

$= a^2 - 2a + 6$

$\Rightarrow f'(a) = 2a - 2$

For maxima or minima, put $f'(a) = 0$.

$\therefore 2a - 2 = 0 \Rightarrow a = 1$

Now, $f''(a) = 2 \Rightarrow f''(1) = 2 > 0$

$\therefore f(a)$ is minimum at $a = 1$.

25. Let n and $(n+1)$ be the two consecutive roots of $x^2 - bx + c = 0$. Then, $n + (n+1) = b$ and $n(n+1) = c$

$\therefore b^2 - 4c = (2n+1)^2 - 4n(n+1)$

$= 4n^2 + 4n + 1 - 4n^2 - 4n = 1$

26. Let $f(x) = x^2 - 2kx + k^2 + k - 5$

Since, both roots are less than 5.

Then, $D \ge 0, -\frac{b}{2a} < 5$

and $f(5) > 0$

Now, $D = 4k^2 - 4(k^2 + k - 5)$

$= -4k + 20 \geq 0$

$\Rightarrow \quad k \leq 5 \quad \ldots(i)$

$-\dfrac{b}{2a} < 5 \Rightarrow k < 5 \quad \ldots(ii)$

and $f(5) > 0$

$\Rightarrow 25 - 10k + k^2 + k - 5 > 0$

$\Rightarrow k^2 - 9k + 20 > 0$

$\Rightarrow (k-5)(k-4) > 0$

$\Rightarrow k < 4$ and $k > 5 \quad \ldots(iii)$

From Eqs. (i), (ii) and (iii), we get

$k < 4$

27. Let $f(x) = a_n x^n + a_{n-1}x^{n-1} + \ldots + a_1 x = 0 \quad \ldots(i)$

$f(0) = 0$

and $f(\alpha) = 0$

According to the Rolle's theorem,

$f'(x) = 0$

has atleast one root between $(0, \alpha)$.

$\Rightarrow f'(x) = 0$ has a positive root less than α.

28. Since, $(1-p)$ is a root of quadratic equation

$x^2 + px + (1-p) = 0 \quad \ldots(i)$

So, $(1-p)$ satisfied the above equation.

$\therefore \quad (1-p)^2 + p(1-p) + (1-p) = 0$

$\Rightarrow (1-p)(1-p+p+1) = 0$

$\Rightarrow (1-p)2 = 0$

$\Rightarrow p = 1$

On putting the value of p in Eq. (i), we get $x^2 + x = 0$

$\Rightarrow x = 0, -1$

29. Since, one of the roots of equation $x^2 + px + 12 = 0$ is 4.

$\therefore \quad 16 + 4p + 12 = 0$

$\Rightarrow 4p = -28$

$\Rightarrow p = -7$

So, the other equation is $x^2 - px + q = 0$ whose roots are equal. Let the roots be α and α.

$\therefore$ Sum of roots $= \alpha + \alpha = \dfrac{7}{1}$

$\Rightarrow \alpha = \dfrac{7}{2}$

and product of roots $= \alpha \cdot \alpha = q$

$\Rightarrow \left(\dfrac{7}{2}\right)^2 = q \Rightarrow q = \dfrac{49}{4}$

30. Let α and β be two numbers whose arithmetic mean is 9 and geometric mean is 4.

$\therefore \quad \alpha + \beta = 18$ and $\alpha\beta = 16$

$\therefore$ Required equation is

$x^2 - (\alpha + \beta)x + (\alpha\beta) = 0$

$\Rightarrow x^2 - 18x + 16 = 0$

31. Since, origin z_1 and z_2 are the vertices of an equilateral triangle, then

$z_1^2 + z_2^2 = z_1 z_2$

$\Rightarrow (z_1 + z_2)^2 = 3z_1 z_2 \quad \ldots(i)$

Again, z_1 and z_2 are the roots of the equation

$z^2 + az + b = 0$

Then, $z_1 + z_2 = -a$

and $z_1 z_2 = b$

On putting these values in Eq. (i), we get

$(-a)^2 = 3b$

$\Rightarrow a^2 = 3b$

32. Given equation is $ax^2 + bx + c = 0$

Let α and β be the roots of the equation.

Then, $\alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$

Also given, $\alpha + \beta = \dfrac{1}{\alpha^2} + \dfrac{1}{\beta^2} = \dfrac{\alpha^2 + \beta^2}{\alpha^2\beta^2}$

$\Rightarrow \alpha + \beta = \left(\dfrac{\alpha + \beta}{\alpha\beta}\right)^2 - \dfrac{2}{\alpha\beta}$

$\Rightarrow \left(-\dfrac{b}{a}\right) = \left(\dfrac{-b/a}{c/a}\right)^2 - \dfrac{2}{c/a}$

$\Rightarrow -\dfrac{b}{a} = \left(\dfrac{b}{c}\right)^2 - \dfrac{2a}{c}$

$\Rightarrow \dfrac{2a}{c} = \dfrac{b}{c}\left(\dfrac{b}{c} + \dfrac{c}{a}\right)$

$\Rightarrow \dfrac{2a}{b} = \dfrac{b}{c} + \dfrac{c}{a}$

$\Rightarrow \dfrac{c}{a}, \dfrac{a}{b}$ and $\dfrac{b}{c}$ are in AP.

$\Rightarrow \dfrac{a}{c}, \dfrac{b}{a}$ and $\dfrac{c}{b}$ are in HP.

33. Given equation is $x^2 - 3|x| + 2 = 0$

***Case* I** When $x > 0$, then $|x| = x$

$\therefore \quad x^2 - 3x + 2 = 0$

$\Rightarrow (x-1)(x-2) = 0$

$\Rightarrow x = 1, 2$

***Case* II** When $x < 0$, then $|x| = -x$

$\therefore \quad x^2 + 3x + 2 = 0$

$\Rightarrow (x+1)(x+2) = 0$

$\Rightarrow x = -1, -2$

Hence, four solutions are possible.

34. Since, one root of the quadratic equation $(a^2 - 5a + 3)x^2 + (3a-1)x + 2 = 0$ is twice as large as the other, then let their roots be α and 2α.

$\therefore \quad \alpha + 2\alpha = -\dfrac{(3a-1)}{(a^2 - 5a + 3)}$

$\Rightarrow 3\alpha = -\dfrac{(3a-1)}{(a^2 - 5a + 3)}$

and $\alpha \cdot 2\alpha = \dfrac{2}{(a^2 - 5a + 3)}$

$\Rightarrow 2\alpha^2 = \dfrac{2}{(a^2 - 5a + 3)}$

$\Rightarrow \dfrac{(3a-1)^2}{9(a^2 - 5a + 3)^2} = \dfrac{1}{(a^2 - 5a + 3)}$

$\Rightarrow (3a-1)^2 = 9(a^2 - 5a + 3)$

$\Rightarrow 9a^2 - 6a + 1 = 9a^2 - 45a + 27$

$\Rightarrow 45a - 6a = 27 - 1$

$\Rightarrow a = \dfrac{26}{39} = \dfrac{2}{3}$

35. Since, $\alpha^2 = 5\alpha - 3$

$\Rightarrow \quad \alpha^2 - 5\alpha + 3 = 0$ and $\beta^2 = 5\beta - 3$

$\Rightarrow \quad \beta^2 - 5\beta + 3 = 0$

These two equations show that α and β are the roots of the equation

$$x^2 - 5x + 3 = 0$$

$\therefore \quad \alpha + \beta = 5$ and $\alpha\beta = 3$

Now, $\dfrac{\alpha}{\beta} + \dfrac{\beta}{\alpha} = \dfrac{\alpha^2 + \beta^2}{\alpha\beta}$

$= \dfrac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta}$

$= \dfrac{25 - 6}{3} = \dfrac{19}{3}$

and $\dfrac{\alpha}{\beta} \cdot \dfrac{\beta}{\alpha} = 1$

Thus, the equation having roots $\dfrac{\alpha}{\beta}$ and $\dfrac{\beta}{\alpha}$ is given by

$$x^2 - \left(\frac{\alpha}{\beta} + \frac{\beta}{\alpha}\right)x + \frac{\alpha}{\beta} \cdot \frac{\beta}{\alpha} = 0$$

$\Rightarrow \quad x^2 - \dfrac{19}{3}x + 1 = 0$

$\Rightarrow \quad 3x^2 - 19x + 3 = 0$

36. Given, $3^{2x^2 - 7x + 7} = 3^2$

$\Rightarrow \quad 2x^2 - 7x + 7 = 2$

$\Rightarrow \quad 2x^2 - 7x + 5 = 0$

Now, $D = b^2 - 4ac$

$= (-7)^2 - 4 \times 2 \times 5$

$= 49 - 40 = 9 > 0$

Hence, it has two real roots.

37. Let $y = 20^{301}$

Number of digits = Integral part of $(301 \log_{10} 20) + 1$

= Integral part of $[301(\log_{10} 10 + \log_{10} 2)] + 1$

= Integral part of $[301(1 + 0.3010)] + 1$

= Integral part of $[301 \times 1.3010] + 1$

= Integral part of $[391.601] + 1$

$= 391 + 1 = 392$

38. Given, $\log_{101} \log_7 (\sqrt{x+7} + \sqrt{x}) = 0$

$\therefore \quad \log_7 (\sqrt{x+7} + \sqrt{x}) = (101)^0$

$\Rightarrow \quad \log_7 (\sqrt{x+7} + \sqrt{x}) = 1$

$\Rightarrow \quad (\sqrt{x+7} + \sqrt{x}) = 7^1$

$\Rightarrow \quad \sqrt{x+7} + \sqrt{x} = 7$

On squaring both sides, we get

$$(x+7) + x + 2\sqrt{x^2 + 7x} = 49$$

$\Rightarrow \quad 2x - 42 = -2\sqrt{x^2 + 7x}$

$\Rightarrow \quad x - 21 = -\sqrt{x^2 + 7x}$

Again, squaring on both sides, we get

$$x^2 + 441 - 42x = x^2 + 7x$$

$\Rightarrow \quad 49x = 441$

$\Rightarrow \quad x = \dfrac{441}{49}$

$\therefore \quad x = 9$

39. Let α and β be the roots of the equation

$$x^2 - (a-2)x - a + 1 = 0$$

$\therefore \quad \alpha + \beta = a - 2$

and $\quad \alpha\beta = -(a-1)$

$\Rightarrow \quad s = \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$= (a-2)^2 + 2(a-1)$

$= a^2 - 4a + 4 + 2a - 2$

$= a^2 - 2a + 2$

Now, $\dfrac{ds}{da} = 2a - 2$

For maximum and minimum, put $ds/da = 0$

$\Rightarrow \quad 2a - 2 = 0 \Rightarrow a = 1$

Also, $\dfrac{d^2s}{da^2} = 2 > 0$

Hence, at $a = 1$, s will have minimum value.

40. Let two consecutive odd integers be $(\alpha + 1)$ and $(\alpha + 3)$.

$\therefore$ Sum of roots, $\alpha + 1 + \alpha + 3 = +a$

$\Rightarrow \quad 2\alpha = a - 4 \Rightarrow \alpha = \dfrac{a-4}{2}$

and product of roots, $(\alpha + 1)(\alpha + 3) = b$

$\Rightarrow \quad \alpha^2 + 4\alpha + 3 = b$

$\Rightarrow \quad \left(\dfrac{a-4}{2}\right)^2 + 4\left(\dfrac{a-4}{2}\right) + 3 = b$

$\Rightarrow \quad \dfrac{a^2 + 16 - 8a}{4} + \dfrac{4a - 16}{2} + 3 = b$

$\Rightarrow \quad a^2 + 16 - 8a + 8a - 32 + 12 = 4b$

$\therefore \quad a^2 - 4b = 4$

41. Since, α and β are the roots of $x^2 - ax + b^2 = 0$.

Then, $\alpha + \beta = a$

and $\alpha\beta = b^2$

Now, $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$= (a)^2 - 2(b)^2 = a^2 - 2b^2$

42. Since, α and β are the roots of the equation

$$x^2 + 3x - 4 = 0.$$

Then, $\alpha + \beta = -3$ and $\alpha\beta = -4$

Now, $\dfrac{1}{\alpha} + \dfrac{1}{\beta} = \dfrac{\beta + \alpha}{\alpha\beta} = \dfrac{-3}{-4} = \dfrac{3}{4}$

43. Since, α and β are the roots of $x^2 + 2bx + c = 0$.

Then, $\alpha + \beta = -2b$

and $\alpha\beta = c$

Now, $b^2 - c = \left(\dfrac{\alpha + \beta}{-2}\right)^2 - \alpha\beta$

$= \dfrac{\alpha^2 + \beta^2 + 2\alpha\beta - 4\alpha\beta}{4}$

$= \dfrac{\alpha^2 + \beta^2 - 2\alpha\beta}{4} = \dfrac{(\alpha - \beta)^2}{4}$

44. Since, a, b and c are in GP.

$\therefore \quad b^2 = ac$

Given equation is

$$(\log_e a)x^2 - (2\log_e b)x + (\log_e c) = 0$$

Put $x = 1$, we get

$\log_e a - 2\log_e b + \log_e c = 0$

$\Rightarrow \quad 2\log_e b = \log_e a + \log_e c$

$\Rightarrow \quad \log_e b^2 = \log_e ac$

$\Rightarrow b^2 = ac$, which is true.

Hence, one of the root of given equation is 1.

Let another root be α.

$\therefore$ Sum of roots, $1+\alpha = \dfrac{2\log_e b}{\log_e a} = \dfrac{\log_e b^2}{\log_e a}$

$$\Rightarrow \quad \alpha = \frac{\log_e ac}{\log_e a} - 1 = \frac{(\log_e a + \log_e c)}{\log_e a} - 1 = \frac{\log_e c}{\log_e a} = \log_a c$$

Hence, roots are 1 and $\log_a c$.

45. Given α, β are the roots of $ax^2 + bx + c = 0$ and $\alpha + h, \beta + h$ are the roots of $px^2 + qx + r = 0$.

$$\therefore \quad \alpha + \beta = -\frac{b}{a}, \alpha\beta = \frac{c}{a}$$

and $\quad \alpha + h + \beta + h = -\dfrac{q}{p}, (\alpha + h)(\beta + h) = \dfrac{r}{p}$

Now, $(\alpha + h) - (\beta + h) = \alpha - \beta$

$\Rightarrow [(\alpha + h) - (\beta + h)]^2 = (\alpha - \beta)^2$

$\Rightarrow [(\alpha + h) + (\beta + h)]^2 - 4(\alpha + h)(\beta + h)$

$= (\alpha + \beta)^2 - 4\alpha\beta$

$$\Rightarrow \quad \frac{q^2}{p^2} - \frac{4r}{p} = \frac{b^2}{a^2} - \frac{4c}{a}$$

$$\Rightarrow \quad \frac{q^2 - 4pr}{p^2} = \frac{p^2 - 4ac}{a^2}$$

$$\therefore \quad \frac{b^2 - 4ac}{q^2 - 4pr} = \frac{a^2}{p^2}$$

Hence, the ratio of the square of their discriminants is $a^2 : p^2$.

46. Given, $f(x) = 2x^2 + 5x + 1$ ...(i)

Also, $f(x) = a(x+1)(x-2) + b(x-2)(x-1) + c(x-1)(x+1)$

$= a(x^2 - x - 2) + b(x^2 - 3x + 2) + c(x^2 - 1)$

$\Rightarrow \quad f(x) = (a + b + c)x^2 + (-a - 3b)x + (-2a + 2b - c)$ ...(ii)

On equating the coefficients of x^2, x and constant terms in Eqs. (i) and (ii), we get

$a + b + c = 2, -a - 3b = 5$ and $-2a + 2b - c = 1$

On solving above equations, we get

$a = -4, b = -1/3$ and $c = 19/3$

Hence, exactly one choice for each of a, b and c.

47. Given, α and β are the roots of equation

$$ax^2 + bx + c = 0.$$

$$\therefore \quad \alpha + \beta = -\frac{b}{a} \quad \text{and} \quad \alpha\beta = \frac{c}{a}$$

Now, $S_{n+1} = \alpha^{n+1} + \beta^{n+1}$

$= \alpha^{n+1} + \beta^{n+1} + \alpha^n\beta + \beta^n\alpha - \alpha^n\beta - \beta^n\alpha$

$= \alpha^n(\alpha + \beta) + \beta^n(\alpha + \beta) - \alpha\beta(\alpha^{n-1} + \beta^{n-1})$

$= (\alpha + \beta)(\alpha^n + \beta^n) - \alpha\beta(\alpha^{n-1} + \beta^{n-1})$

$= -\dfrac{b}{a}S_n - \dfrac{c}{a}S_{n-1}$

$$\Rightarrow \quad S_{n+1} = \frac{-bS_n - cS_{n-1}}{a}$$

$\therefore \quad aS_{n+1} + bS_n + cS_{n-1} = 0$

48. Since, $\sin\alpha$ and $\cos\alpha$ are the roots of $ax^2 + bx + c = 0$.

$\therefore \sin\alpha + \cos\alpha = -\dfrac{b}{a}$ and $\sin\alpha\cos\alpha = \dfrac{c}{a}$

$$\Rightarrow \quad (\sin\alpha + \cos\alpha)^2 = \left(-\frac{b}{a}\right)^2$$

$$\Rightarrow \sin^2\alpha + \cos^2\alpha + 2\sin\alpha\cos\alpha = \frac{b^2}{a^2}$$

$$\Rightarrow \quad 1 + 2\cdot\frac{c}{a} = \frac{b^2}{a^2}$$

$\Rightarrow \quad a(a + 2c) = b^2$

$\Rightarrow \quad b^2 - a^2 = 2ac$

49. Given, $3^{2x} - 2(3^{x+2}) + 81 = 0$

$\therefore \quad (3^x)^2 - 2(3^x)3^2 + 81 = 0$

Let $\quad 3^x = y$

$\therefore \quad y^2 - 18y + 81 = 0$

$\Rightarrow \quad (y - 9)^2 = 0$

$\Rightarrow \quad y = 9 \Rightarrow 3^x = 3^2 \quad [\because 3^x = y]$

$\therefore \quad x = 2$

50. Let the roots of the equation $2x^2 + 3x + 1 = 0$ be α and β.

Then, $\quad \alpha + \beta = \dfrac{-3}{2}$ ...(i)

and $\quad \alpha\beta = \dfrac{1}{2}$ ...(ii)

$\therefore \quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$$= \left(\frac{-3}{2}\right)^2 - 2\left(\frac{1}{2}\right) = \frac{9}{4} - 1 = \frac{5}{4}$$

and $\quad \alpha^2\beta^2 = \left(\dfrac{1}{2}\right)^2 = \dfrac{1}{4}$

$\therefore$ Required equation is

$$x^2 - (\alpha^2 + \beta^2)x + \alpha^2\beta^2 = 0$$

$$\Rightarrow \quad x^2 - \frac{5}{4}x + \frac{1}{4} = 0$$

$\Rightarrow \quad 4x^2 - 5x + 1 = 0$

51. Given equation can be rewritten as

$$x^2 - \frac{r^2}{pq}x + 1 = 0$$

$\therefore \tan A + \tan B = \dfrac{r^2}{pq}$ and $\tan A \tan B = 1$

We know that, $A + B + C = 180°$

$\Rightarrow \quad (A + B) = 180° - C$

$\Rightarrow \quad \tan(A + B) = \tan(180° - C)$

$$\Rightarrow \quad \frac{\tan A + \tan B}{1 - \tan A \tan B} = -\tan C$$

$$\Rightarrow \quad \frac{r^2/pq}{1 - 1} = -\tan C$$

$\Rightarrow \quad \infty = -\tan C$

$\therefore \quad C = 90°$

Hence, ΔABC is a right angled triangle.

52. $\because$ Sum of roots, $\alpha + \beta = -p$ and $\alpha\beta = q$

$\therefore \quad (\alpha^3 + \beta^3) = (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)$

$= (-p)^3 - 3q(-p) = -p^3 + 3pq$

and $\quad \alpha^4 + \alpha^2\beta^2 + \beta^4 = (\alpha^4 + \beta^4) + (\alpha\beta)^4$

$= (\alpha^2 + \beta^2)^2 - (\alpha\beta)^2$

$= [(\alpha + \beta)^2 - 2\alpha\beta]^2 - (\alpha\beta)^2$

$= [(-p)^2 - 2q]^2 - 3(q)^2$

$= [p^2 - 2q]^2 - 3q^2$

$= p^4 - 4p^2q + 4q^2 - q^2$

$= p^4 - 4p^2q + 3q^2$

$= p^4 - 3p^2q - p^2q + 3q^2$

$= p^2(p^2 - 3q) - q(p^2 - 3q)$

$= (p^2 - q)(p^2 - 3q)$

53. Given equation is $\sqrt{x+1} - \sqrt{x-1} = \sqrt{4x-1}$ ...(i)

On squaring both sides, we get

$(x+1) + (x-1) - 2\sqrt{x^2-1} = 4x - 1$

$\Rightarrow \quad 2x - 2\sqrt{x^2-1} = 4x - 1$

$\Rightarrow \quad -2\sqrt{x^2-1} = 2x - 1$

Again, squaring on both sides, we get

$4(x^2 - 1) = 4x^2 + 1 - 4x$

$\Rightarrow \quad -4 = +1 - 4x$

$\Rightarrow \quad 4x = 5 \Rightarrow x = 5/4$

But when we put $x = \frac{5}{4}$ in Eq. (i), we get

$\sqrt{\frac{5}{4} + 1} - \sqrt{\frac{5}{4} - 1} = \sqrt{4 \times \frac{5}{4} - 1}$

$\Rightarrow \quad \sqrt{\frac{9}{4}} - \sqrt{\frac{1}{4}} = \sqrt{5-1}$

$\Rightarrow \frac{3}{2} - \frac{1}{2} = 2 \Rightarrow 1 = 2$, which is not true.

Hence, no value of x satisfy the given equation.

54. Given, $9\sqrt{x} = \sqrt{12} + \sqrt{147}$

On squaring both sides, we get

$81x = 12 + 147 + 2\sqrt{12}\sqrt{147}$

$\Rightarrow \quad 81x = 159 + 84$

$\Rightarrow \quad 81x = 243$

$\therefore \quad x = 3$

Aliter

$9\sqrt{x} = \sqrt{12} + \sqrt{147}$

$\Rightarrow \quad 9\sqrt{x} = 2\sqrt{3} + 7\sqrt{3}$

$\Rightarrow \quad 9\sqrt{x} = 9\sqrt{3}$

$\Rightarrow \quad \sqrt{x} = \sqrt{3}$

$\therefore \quad x = 3$

55. $x^2 - \sqrt{3}x + 1 = 0$

$\Rightarrow \quad x = \frac{\sqrt{3} \pm \sqrt{3-4}}{2} = \frac{\sqrt{3} \pm i}{2}$

56. Given, $a = \cos\frac{2\pi}{7} + i\sin\frac{2\pi}{7}$

$\therefore \quad a^7 = \cos 2\pi + i\sin 2\pi \quad [\because e^{i\theta} = \cos\theta + i\sin\theta]$

$= 1$

Also, $\alpha = a + a^2 + a^4$ and $\beta = a^3 + a^5 + a^6$

Then, sum of the roots,

$S = \alpha + \beta = a + a^2 + a^3 + a^4 + a^5 + a^6$

$\Rightarrow \quad S = \frac{a(1-a^6)}{1-a} = \frac{a - a^7}{1-a} = \frac{a-1}{1-a} = -1 \quad [\because a^7 = 1]$

Product of the roots,

$P = \alpha\beta = (a + a^2 + a^4)(a^3 + a^5 + a^6)$

$= a^4 + a^5 + 1 + a^6 + 1 + a^2 + 1 + a + a^3 \quad [\because a^7 = 1]$

$= 3 + (a + a^2 + a^3 + a^4 + a^5 + a^6) = 3 - 1 = 2$

Hence, the required quadratic equation is

$x^2 + x + 2 = 0.$

57. Since, α is a root of $x^2 + 3p^2x + 5q^2 = 0$, then

$\alpha^2 + 3p^2\alpha + 5q^2 = 0$ ...(i)

and β is a root of $x^2 + 9p^2x + 15q^2 = 0$, then

$\therefore \quad \beta^2 + 9p^2\beta + 15q^2 = 0$ ...(ii)

Let $\quad f(x) = x^2 + 6p^2x + 10q^2$

Then, $\quad f(\alpha) = \alpha^2 + 6p^2\alpha + 10q^2$

$= (\alpha^2 + 3p^2\alpha + 5q^2) + 3p^2\alpha + 5q^2$

$= 0 + 3p^2\alpha + 5q^2$ [from Eq. (i)]

$\Rightarrow \quad f(\alpha) > 0$ and $f(\beta) = \beta^2 + 6p^2\beta + 10q^2$

$= (\beta^2 + 9p^2\beta + 15q^2) - (3p^2\beta + 5q^2)$

$= 0 - (3p^2\beta + 5q^2)$

$\Rightarrow \quad f(\beta) < 0$

Thus, $f(x)$ is a polynomial such that $f(\alpha) > 0$ and $f(\beta) < 0$.

Therefore, there exists γ satisfying $\alpha < \gamma < \beta$ such that $f(\gamma) = 0$.

58. Given equation is $\lambda^2 + 8\lambda + \mu^2 + 6\mu = 0$.

Since, roots are real.

$\therefore \quad b^2 - 4ac \ge 0$

$\Rightarrow \quad (8)^2 - 4(\mu^2 + 6\mu) \ge 0$

$\Rightarrow \quad 64 - 4(\mu^2 + 6\mu) \ge 0$

$\Rightarrow \quad 16 - (\mu^2 + 6\mu) \ge 0$

$\Rightarrow \quad \mu^2 + 6\mu - 16 \le 0$

$\Rightarrow \quad \mu^2 + 8\mu - 2\mu - 16 \le 0$

$\Rightarrow \quad \mu(\mu + 8) - 2(\mu + 8) \le 0$

$\Rightarrow \quad (\mu + 8)(\mu - 2) \le 0$

$\therefore \quad -8 \le \mu \le 2$

59. Given, $|x - 2| + |x + 2| < 4$

***Case* I** When $x < -2$

$\Rightarrow \quad -(x-2) - (x+2) < 4$

$\Rightarrow \quad -2x < 4$

$\Rightarrow -x < 2 \Rightarrow x > -2$, which is not true.

Hence, no value of x exist.

***Case* II** When $-2 < x < 2$

$\Rightarrow -(x-2) + x + 2 < 4$

$\Rightarrow 4 < 4$, which is not true.

Hence, no value of x exist.

***Case* III** When $x > 2$

$\Rightarrow x - 2 + x + 2 < 4$

$\Rightarrow 2x < 4 \Rightarrow x < 2$, which is not true.

So, no value of x exist.

Hence, the number of solutions of the inequation is 0.

60. $2x - 5 \le \dfrac{4x-7}{3}$

$\Rightarrow \quad 6x - 15 \le 4x - 7$

$\Rightarrow \quad 2x \le 8 \Rightarrow x \le 4$

61. $3x + 2 > -16$

$\Rightarrow \quad x > -6$

and $\quad 2x - 3 \le 11$

$\Rightarrow \quad x \le 7$

$\therefore \quad x \in (-6, 7]$

62. We can write, $5^x + 5^{-x} = 5^x + \dfrac{1}{5^x}$

$$= 5^x + \frac{1}{5^x} - 2 + 2$$

$$= \left(5^x - \frac{1}{5^x}\right)^2 + 2$$

This means $5^x + 5^{-x} > 1$

Thus, $\sin(e^x) > 1$, which is not possible.

63. By hypothesis, $a^2\alpha^2 + b\alpha + c = 0$ ...(i)

and $\quad a^2\beta^2 - b\beta - c = 0$ ...(ii)

where, $\quad 0 < \alpha < \beta$

and $\quad \alpha \ne 0$

Let $\quad f(x) = a^2x^2 + 2bx + 2c$

Clearly, it is continuous on $[\alpha, \beta]$.

$\therefore \quad f(\alpha) = a^2\alpha^2 + 2b\alpha + 2c = -\alpha^2a^2 < 0$

and $\quad f(\beta) = a^2\beta^2 + 2b\beta + 2c = 3a^2\beta^2 > 0$

Therefore, by the intermediate value theorem of continuous function, $f(x) = 0$ has a root γ between α and β.

64. Let α and β be the roots, then

$\alpha + \beta = 16$

and $\quad \alpha\beta = 25$

$\therefore \quad x^2 - x(\alpha + \beta) + \alpha\beta = 0$

$\Rightarrow \quad x^2 - 16x + 25 = 0$

65. We have,

$$\frac{k+1}{k} + \frac{k+2}{k+1} = -\frac{b}{a} \quad \text{...(i)}$$

and $$\frac{k+1}{k} \cdot \frac{k+2}{k+1} = \frac{c}{a} \quad \text{...(ii)}$$

From Eq. (i), we have

$$1 + \frac{1}{k} + 1 + \frac{1}{k+1} = -\frac{b}{a}$$

$$\Rightarrow \quad 2 + \frac{1}{k} + \frac{1}{k+1} = -\frac{b}{a} \quad \text{...(iii)}$$

From Eq. (ii), we have

$$\frac{k+2}{k} = \frac{c}{a}$$

$$\Rightarrow \quad 1 + \frac{2}{k} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{2}{k} = \frac{c}{a} - 1$$

$$\therefore \quad k = \frac{2a}{c-a}$$

Now, on substituting the value of k in Eq. (iii), we get

$$2 + \frac{c-a}{2a} + \frac{1}{\dfrac{2a}{c-a} + 1} = -\frac{b}{a}$$

$$\Rightarrow \quad 2 + \frac{c-a}{2a} + \frac{c-a}{a+c} = -\frac{b}{a}$$

$$\Rightarrow \quad \frac{2(2a)(a+c) + (c-a)(c+a) + 2a(c-a)}{2a(a+c)} = -\frac{b}{a}$$

$$\Rightarrow \quad a^2 + c^2 + 6ac = -2ab - 2bc$$

$$\Rightarrow \quad a^2 + b^2 + c^2 + 2ab + 2bc + 2ca = b^2 - 4ac$$

$$\therefore \quad (a+b+c)^2 = b^2 - 4ac$$

66. Since, the second equation has imaginary roots.

$$\therefore \quad \frac{2a}{3} = \frac{-3b}{-4} = \frac{4c}{5} = k$$

$$\Rightarrow \quad a = \frac{3k}{2}, b = \frac{4k}{3}, c = \frac{5k}{4}$$

$$\therefore \quad \frac{a+b}{b+c} = \frac{\dfrac{3k}{2} + \dfrac{4k}{3}}{\dfrac{4k}{3} + \dfrac{5k}{4}} = \frac{34}{31}$$

67. $\log_2\left(\dfrac{9^{x-1}+7}{3^{x-1}+1}\right) = 2\log_2 2$

$$\Rightarrow \quad \frac{(3^2)^{x-1}+7}{(3^{x-1}+1)} = 4 \quad \Rightarrow \quad \frac{(3^{x-1})^2+7}{3^{x-1}+1} = 4$$

Let $\quad 3^{x-1} = y$

$$\therefore \quad \frac{y^2+7}{y+1} = 4$$

$\Rightarrow \quad y^2 + 7 = 4y + 4$

$\Rightarrow \quad y^2 - 4y + 3 = 0$

$\Rightarrow \quad y = 1, 3$

$\therefore \quad 3^{x-1} = 3^0 \quad$ and $\quad 3^{x-1} = 3^1$

$\Rightarrow \quad x = 1, 2$

68. Since, a, b and c are in AP.

$\therefore \quad 2b = a + c$

Let α and β be the roots of the given equation.

$$\therefore \quad \alpha + \beta = \frac{2b}{a}$$

$$= \frac{a+c}{a} = 1 + \frac{c}{a} \quad \text{...(i)}$$

and $$\alpha\beta = \frac{c}{a}$$

Now, $$(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$$

$$= \left(1 + \frac{c}{a}\right)^2 - 4\cdot\frac{c}{a} = \left(1 - \frac{c}{a}\right)^2$$

$$\Rightarrow \quad \alpha - \beta = 1 - \frac{c}{a} \quad \text{...(ii)}$$

On adding Eqs. (i) and (ii), we get

$2\alpha = 2 \quad \Rightarrow \quad \alpha = 1$

On subtracting Eq. (ii) from Eq. (i), we get

$$2\beta = \frac{2c}{a}$$

$$\therefore \quad \beta = \frac{c}{a}$$

69. Let α and β be the roots of the given equation.

$\therefore \quad \alpha + \beta = \dfrac{4+\sqrt{5}}{5+\sqrt{2}}$

and $\quad \alpha\beta = \dfrac{8+2\sqrt{5}}{5+\sqrt{2}}$

Now, harmonic mean of α and $\beta = \dfrac{2\alpha\beta}{\alpha+\beta}$

$$= \frac{\dfrac{16+4\sqrt{5}}{5+\sqrt{2}}}{\dfrac{4+\sqrt{5}}{5+\sqrt{2}}}$$

$$= \frac{16+4\sqrt{5}}{4+\sqrt{5}} \times \frac{(4-\sqrt{5})}{(4-\sqrt{5})}$$

$$= \frac{64-16\sqrt{5}+16\sqrt{5}-4\times 5}{16-5}$$

$$= \frac{44}{11} = 4$$

70. $\alpha^3 + \beta^3 + \gamma^3 - 3\alpha\beta\gamma$

$= (\alpha+\beta+\gamma)(\alpha^2+\beta^2+\gamma^2-\alpha\beta-\beta\gamma-\gamma\alpha)$

$\Rightarrow \quad \alpha^3+\beta^3+\gamma^3-3\alpha\beta\gamma = 0$

$\Rightarrow \quad \alpha^3+\beta^3+\gamma^3 = 3\alpha\beta\gamma$

$= 3\times(-2) = -6$

71. $(\alpha+\sqrt{\beta})+(\alpha-\sqrt{\beta}) = -p$ [given]

$\Rightarrow \quad 2\alpha = -p$

$\Rightarrow \quad \alpha = -\dfrac{p}{2}$

and $\quad [(\alpha+\sqrt{\beta})(\alpha-\sqrt{\beta})] = q$ [given]

$\Rightarrow \quad \alpha^2 - \beta = q$

$\Rightarrow \quad \beta = \alpha^2 - q$

$= \left(-\dfrac{p}{2}\right)^2 - q$

$= \dfrac{p^2}{4} - q$

$\Rightarrow \quad p^2 - 4q = 4\beta$

The given equation is

$(p^2-4q)(p^2x^2+4px) - 16q = 0$

$\Rightarrow \quad 4\beta(p^2x^2+4px) - 16(\alpha^2-\beta) = 0 \quad [\because \alpha^2-\beta = q]$

$\Rightarrow \quad \beta(4\alpha^2x^2 - 8\alpha x) - 4(\alpha^2-\beta) = 0 \quad [\because p = -2\alpha]$

$\Rightarrow \quad \alpha^2\beta x^2 - 2\alpha\beta x + \beta = \alpha^2$

$\Rightarrow \quad (\alpha x\sqrt{\beta} - \sqrt{\beta})^2 = \alpha^2$

$\Rightarrow \quad \alpha x\sqrt{\beta} - \sqrt{\beta} = \pm\alpha$

$\therefore \quad x = \dfrac{1}{\alpha} \pm \dfrac{1}{\sqrt{\beta}}$

72. Given, $x^2 - 2\sqrt{2}kx + 2e^{2\log k} - 1 = 0$

$\therefore$ Product of roots $= 2e^{2\log k} - 1 = 31$ [given]

$\Rightarrow \quad 2e^{2\log k} = 32$

$\Rightarrow \quad e^{\log k^2} = 16$

$\Rightarrow \quad k^2 = 16$

$\therefore \quad k = \pm 4$

But $k = -4$, $\log k$ is not defined.

Hence, required value of k is 4.

73. Here, $\alpha+\beta = 2$ and $\alpha\beta = 4$

Now, $\quad (\alpha-\beta) = \sqrt{(\alpha+\beta)^2 - 4\alpha\beta}$

$= \sqrt{4-16} = 2\sqrt{3}i$

$\therefore \quad \alpha = 2\left(\dfrac{1}{2} + \dfrac{\sqrt{3}}{2}i\right)$

$= 2\left(\cos\dfrac{\pi}{3} + i\sin\dfrac{\pi}{3}\right)$

and $\quad \beta = \dfrac{2-2\sqrt{3}i}{2}$

$= 2\left(\cos\dfrac{\pi}{3} - i\sin\dfrac{\pi}{3}\right)$

$\therefore \quad \alpha^n + \beta^n = \left[2\left(\cos\dfrac{\pi}{3} + i\sin\dfrac{\pi}{3}\right)\right]^n$

$+ \left[2\left(\cos\dfrac{\pi}{3} - i\sin\dfrac{\pi}{3}\right)\right]^n$

$= 2^n\left[2\cos\dfrac{n\pi}{3}\right]$

$= 2^{n+1}\cos\dfrac{n\pi}{3}$

74. Since, α, β and γ are the roots of $x^3 - 2x + 1 = 0$.

We have, $\quad \Sigma\alpha = 0 \quad$ ...(i)

$\Sigma\alpha\beta = -2 \quad$ ...(ii)

$\alpha\beta\gamma = -1 \quad$ ...(iii)

Now, $\Sigma\left(\dfrac{1}{\alpha+\beta-\gamma}\right) = \Sigma\left(\dfrac{1}{-\gamma-\gamma}\right)$

$= \Sigma\left(\dfrac{-1}{2\gamma}\right) = \dfrac{-1}{2}\Sigma\dfrac{1}{\gamma}$

$= \dfrac{-1}{2}\left[\dfrac{1}{\alpha} + \dfrac{1}{\beta} + \dfrac{1}{\gamma}\right]$

$= \dfrac{-1}{2}\left[\dfrac{\Sigma\alpha\beta}{\alpha\beta\gamma}\right] = \dfrac{-1}{2}\left[\dfrac{-2}{-1}\right] = -1$

75. (i) b must be even integer.

(ii) Its discriminant is a perfect square of an even number.

So, $\quad D = b^2 + 4\cdot 16$

$= b^2 + 64$

Here, 0 and 6 only the even integers value of b, on which the discriminant of given quadratic equation have perfect square of an even number.

So, the number of integral values of b is 2.

76. On taking option (c), it is clear that,

$$a\left(\frac{1}{2}\right)^2 + b\left(\frac{1}{2}\right) + c = 0$$

$\Rightarrow \quad a + 2b + 4c = 0$

77. $2(3)^2 - c(3) + 3 = 0$

$\Rightarrow \quad c = 7$

and $\quad 2x^2 - 7x + d = 0$

Also, $\quad B^2 = 4AC$

$\Rightarrow \quad 49 = 4\times 2\times d$

$\therefore \quad d = \dfrac{49}{8}$

78. $\dfrac{(\sqrt{\sqrt{3}+1}+\sqrt{\sqrt{3}-1})^2\,(\sqrt{3}-\sqrt{2})}{(\sqrt{\sqrt{3}+1})^2-(\sqrt{\sqrt{3}-1})^2}$

$$=\frac{(\sqrt{3}+1+\sqrt{3}-1+2\sqrt{2})\,(\sqrt{3}-\sqrt{2})}{(\sqrt{3}+1)-(\sqrt{3}-1)}$$

$$=\frac{2(\sqrt{3}+\sqrt{2})\,(\sqrt{3}-\sqrt{2})}{2}=1$$

79. We have, $|2x-3|<|x+5|$

Case I If $-\infty<x<-5$

$\Rightarrow \quad -2x+3<-x-5$

$\Rightarrow \quad -x<-8$

$\therefore \quad x>8 \qquad \ldots$(i)

So, no solution exist.

Case II If $-5<x<3/2$

$-2x+3<x+5$

$\Rightarrow \quad -3x<2 \;\Rightarrow\; x>\dfrac{-2}{3}$

$\therefore \quad -\dfrac{2}{3}<x<\dfrac{3}{2} \qquad \ldots$(ii)

Case III If $\dfrac{3}{2}<x<\infty$

$\Rightarrow \quad 2x-3<x+5$

$\Rightarrow \quad x<8$

$\therefore \quad \dfrac{3}{2}<x<8 \qquad \ldots$(iii)

From Eqs. (i), (ii) and (iii), we get

$$x\in\left(\frac{-2}{3},8\right)$$

80. We have, $\dfrac{k}{\alpha}+\dfrac{k}{\beta}=k\left(\dfrac{\alpha+\beta}{\alpha\beta}\right)=k\left(\dfrac{-b/a}{c/a}\right)$

$=\dfrac{-kb}{c}$ and $\dfrac{k}{\alpha}\cdot\dfrac{k}{\beta}=\dfrac{k^2}{\alpha\beta}=\dfrac{k^2a}{c}$

$\therefore \quad x^2-\left(\dfrac{-kb}{c}\right)x+\dfrac{k^2a}{c}=0$

$\Rightarrow \quad cx^2+kbx+k^2a=0$

81. $3\le 3t-18\le 18 \;\Rightarrow\; 21\le 3t\le 36$

$\Rightarrow \quad 7\le t\le 12 \;\Rightarrow\; 8\le t+1\le 13$

82. $\dfrac{x+11}{x-3}>0$

$\Rightarrow \quad (x-3)\,(x+11)>0$

$\Rightarrow \quad x<-11,\ x>3$

$\Rightarrow \quad x\in(-\infty,-11)\cup(3,\infty)$

83. $\dfrac{\log_{c+b}a+\log_{c-b}a}{2\log_{c+b}a\cdot\log_{c-b}a}$

$$=\frac{\dfrac{\log a}{\log(c+b)}+\dfrac{\log a}{\log(c-b)}}{2\cdot\dfrac{\log a}{\log(c+b)}\cdot\dfrac{\log a}{\log(c-b)}}$$

$$=\frac{\log a\{\log(c-b)+\log(c+b)\}}{2(\log a)^2}$$

$$=\frac{\log(c^2-b^2)}{2\log a}=\frac{\log a^2}{\log a^2} \qquad [\because a^2+b^2=c^2]$$

$=1$

84. $ax^2+bx+c=0 \qquad [\because c\neq 0]$

Replacing x by $\dfrac{1-bx}{ax}$, we get the required equation

$$a\left(\frac{1-bx}{ax}\right)^2+b\left(\frac{1-bx}{ax}\right)+c=0$$

$\Rightarrow \quad a(1+b^2x^2-2bx)+ax(b-b^2x)+ca^2x^2=0$

$\Rightarrow a+ab^2x^2-2abx+abx-ab^2x^2+a^2cx^2=0$

$\Rightarrow \quad acx^2-bx+1=0$

85. Since, one root of the equation $x^2+px+q=0$ is $2+\sqrt{3}$, then the other root will be $2-\sqrt{3}$.

$\therefore$ Sum of roots, $2+\sqrt{3}+2-\sqrt{3}=-p$

$\Rightarrow \quad p=-4$

and product of roots, $(2+\sqrt{3})\,(2-\sqrt{3})=q$

$\therefore \quad q=1$

86. $\alpha+\beta=-p,\ \alpha\beta=q$

$\therefore \quad \alpha^2+\beta^2=(\alpha+\beta)^2-2\alpha\beta$

$=p^2-2q$

$\Rightarrow \quad (\alpha-\beta)^2=\alpha^2+\beta^2-2\alpha\beta$

$=(p^2-2q)-2q=p^2-4q$

87. $a+b=-a \qquad \ldots$(i)

$ab=b \qquad \ldots$(ii)

From Eq. (ii), $\quad a=1 \qquad [\because b\neq 0]$

From Eq. (i), $\quad b=-2$

88. Let α and β be the roots, then

$\alpha+\beta=b,\ \alpha\beta=c$

Given, $\quad |\alpha-\beta|=1$

$\Rightarrow \quad (\alpha+\beta)^2-4\alpha\beta=1$

$\Rightarrow \quad b^2-4c=1$

89. $\because \alpha=\omega,\ \beta=\omega^2$ will satisfy the given equation.

Now, $\alpha^{19}=\omega^{19}=\omega,\ \beta^7=\omega^{14}=\omega^2$

$\therefore$ Required equation is

$x^2-(\omega+\omega^2)x+\omega^3=0$

$\Rightarrow \quad x^2+x+1=0$

90. $\because \quad x^2+15|x|+14=|x|^2+15|x|+14>0$

for all real x.

So, given equation has no solution.

91. Since, roots are equal.

$\therefore \quad (2\sqrt{6})^2=4\cdot 2\cdot a$

$\Rightarrow \quad 24=8a \;\Rightarrow\; a=3$

92. Let $\alpha=\dfrac{3}{2}+\dfrac{7}{2}i$ and $\beta=\dfrac{3}{2}-\dfrac{7}{2}i$

$\therefore \quad \alpha+\beta=3,\ \alpha\beta=\dfrac{9}{4}+\dfrac{49}{4}=\dfrac{29}{2}$

$\Rightarrow \quad \dfrac{6}{a}=3,\ \dfrac{b}{a}=\dfrac{29}{2}$

$\Rightarrow \quad a=2,\ b=29$

$\therefore \quad a+b=31$

93. Discriminant $(D)=(-2\sqrt{3})^2+88$

$=100=10^2$

So, roots are real, irrational and unequal.

6

Permutation and Combination

Fundamental Principles of Counting (FPC)

Fundamental Principle of Multiplication

If there are two jobs such that one of them can be completed in m ways and when it has been completed in anyone of these m ways, second job can be completed in n ways, then the two jobs in succession can be completed in $m \times n$ ways.

Example 1. *In a class, there are 15 boys and 10 girls. The teacher wants to select a boy and a girl to represent the class in a function, then the total number of selection by teacher is*

(a) 15 (b) 10 (c) 25 (d) 150

Sol. (d) Here, the teacher is to perform two jobs:

(i) Selecting a boy among 15 boys.

(ii) Selecting a girl among 10 girls.

The first job can be performed in 15 ways and the second in 10 ways. Therefore, by fundamental principle of multiplication, the total number of selection $= 15 \times 10 = 150$ ways.

Fundamental Principle of Addition

If there are two jobs such that they can be performed independently in m and n ways respectively, then either of the two jobs can be performed in $(m + n)$ ways.

Example 2. *There are 20 students in a class, in which 12 boys and 8 girls. The class teacher select either a boy or a girl for monitor of the class. In how many ways, the teacher can make this selection?*

(a) 120 (b) 12 (c) 96 (d) 20

Sol. (d) By fundamental principle of addition, the number of ways in which either a boy or a girl can be chosen as a monitor $= 12 + 8 = 20$ ways.

Example 3. *Three dices are rolled. The number of possible outcomes in which atleast one dice shows 5, is*

(a) 36 (b) 18 (c) 90 (d) 91

Chapter Snapshot

- Fundamental Principles of Counting (FPC)
- Factorial
- Exponent of Prime p in Factorial n
- Representation of Symbols ${}^nP_r$ and ${}^nC_r$
- Some Basic Arrangements and Selections
- Summation of Numbers (3 different ways)
- Permutations under Certain Conditions
- Circular Permutations
- Geometrical Applications of ${}^nC_r$
- Selection of One or More Objects
- Number of Divisors and the Sum of the Divisors of a Given Natural Number
- Division of Objects into Groups
- Dearrangements
- Number of Integral Solutions of Linear Equations and Inequations

Sol. (d) When a die is rolled, there are six possible outcomes. So, by FPC, the total number of outcomes when three dice is rolled $= 6 \times 6 \times 6 = 216$.

Now, the number of possible outcomes in which atleast one dice shows 5 = Total number of possible outcomes – Number of possible outcomes in which 5 does not appear on any dice

$$= 6^3 - 5^3 = 216 - 125 = 91$$

Example 4. *How many four-digit numbers can be formed using the digits 0, 1, 2, 3, 4, 5, if repetition of digits is not allowed?*

(a) 120 *(b)* 1080 *(c)* 300 *(d)* 600

Sol. (c) In a four-digit numbers, 0 cannot appear in the thousand's place. So, thousand's place can be filled in 5 ways (i.e. 1, 2, 3, 4, 5). Since, repetition of digits is not allowed and 0 can be used at hundred's place. So, hundred's place can be filled in 5 ways. Now, anyone of the remaining 4 digits can be used to fill up ten's place. So, ten's place can be filled in 4 ways. One's place can be filled from the remaining 3 digits in 3 ways. Hence, by fundamental principle of multiplication, the required number of numbers $= 5 \times 5 \times 4 \times 3 = 300$.

Example 5. *The total number of n-digit numbers $(n > 1)$ having the property that no two consecutive digits are same, is*

(a) 9^n *(b)* 10^n

(c) $10^n - 9^n$ *(d)* None of these

Sol. (a)

x_1	x_2	x_3	...	x_n
↑	↑	↑		↑
9	9	9		9

The digit x_1 can be selected in 9 ways as '0' cannot be selected. The digit x_2 can be selected in 9 ways as 0 can be selected but digit in position x_1 cannot be selected. Similarly, each of the remaining digit can also be selected in 9 ways. Thus, the total number of such numbers is 9^n.

Example 6. *The number of polynomials of the form $x^3 + ax^2 + bx + c$ that are divisible by $x^2 + 1$ where $a, b, c \in \{1, 2, 3, \ldots, 9, 10\}$, are*

(a) 7 *(b)* 8

(c) 9 *(d)* 10

Sol. (d)

$$\begin{array}{r|l} & x + a \\ \hline x^2 + 1 & x^3 + ax^2 + bx + c \\ & \underline{\overset{-}{x^3} \qquad \overset{-}{+ x}} \\ & ax^2 + (b-1)x + c \\ & \underline{\overset{-}{ax^2} \qquad \overset{-}{+ a}} \\ & (b-1)x + c - a \end{array}$$

Now, remainder $(b-1)x + c - a$ must be zero for any x, then

$$b - 1 = 0 \quad \text{and} \quad c - a = 0$$

$$\Rightarrow \quad b = 1 \quad \text{and} \quad c = a$$

Now, c or a can be selected in 10 ways. Hence, number of polynomials are 10.

Work Book Exercise 6.1

1 Twenty buses run between New Delhi to Meerut. If a man goes from Meerut to New Delhi by a bus and comes back to Meerut by another bus. The total possible ways is

20 40 39 380

2 Ten different letters of an alphabet are given. Words with five letters are formed from these given letters. Then, the total number of words which have atleast one letter repeated, is

30240 69760
99748 None of these

3 An examination paper contains 8 questions of which 4 have 3 possible answers, 3 have 2 possible answers and the remaining one question has 5 possible answers. The total number of possible answers to all the question is

2880 178
94 3240

4 There are stalls for 10 animals in a ship. The number of ways in which ship load can be made, if there are cows, calves and horses to be transported, animals of each kind being not less than 10, is

4^{10}
13^{10}
130
None of the above

5 A letter lock consists of three rings, each marked with 10 different letters, the number of ways in which it is possible to make an unsuccessful attempt to open the lock is

999 899
479 None of these

6 How many two-digit even numbers can be formed from the digits 1, 2, 3, 4, 5, if the digits can be repeated?

120 20 25 10

7 A five-digit numbers divisible by 3 is to be formed using the digits 0, 1, 2, 3, 4 and 5 without repetition. The total number of ways in which this can be done, is

216 600 240 3125

8 If $p, q \in (1, 2, 3, 4)$, then the number of equations of the form $px^2 + qx + 1 = 0$ having real roots, is

4 5 6 7

9 Find the number ordered pairs (x, y), if $x, y \in \{0, 1, 2, 3, \ldots, 10\}$ and if $|x - y| > 5$.

30 20
15 None of these

10 Find the total number of ways in which two small squares can be selected on the normal chessboard, if they are not in same row or same column.

64 1296
1568 None of these

Factorial

For any natural number n, we define factorial of n ($n!$ or $\underline{|n}$) as follows:

$$n! = n(n-1)(n-2)\ldots 5\cdot 4\cdot 3\cdot 2\cdot 1$$

$\therefore\quad 1! = 1,\ 2! = 2\times 1 = 2,\ 3! = 3\times 2\times 1 = 6$ and so on.

We can extend the definition of the factorial to zero and negative integers as follows:

(i) $0! = 1$

(ii) *Factorial of negative integers and fractions are not defined.*

(iii) $n! = n(n-1)! = n(n-1)(n-2)!$

(iv) $\dfrac{n!}{r!} = n(n-1)(n-2)\ldots,\ n > r$

Example 7. *If $(n+1)! = 12\times(n-1)!$, then n is equal to*

(a) 4 (b) 5
(c) 3 (d) 6

Sol. (c) We have, $(n+1)! = 12\times(n-1)!$

$\Rightarrow\quad (n+1)(n)(n-1)! = 12\times(n-1)!$

$\Rightarrow\quad n^2 + n = 12$

$\Rightarrow\quad n^2 + n - 12 = 0$

$\Rightarrow\quad (n+4)(n-3) = 0$

$\therefore\quad n = 3,\ n = -4$

Example 8. *If $\dfrac{1}{8!} + \dfrac{1}{9!} = \dfrac{x}{10!}$, then x is equal to*

(a) 100 (b) 10
(c) 90 (d) None of these

Sol. (a) We have,

$$\frac{1}{8!} + \frac{1}{9\times 8!} = \frac{x}{10\times 9\times 8!}$$

$$\Rightarrow\quad 1 + \frac{1}{9} = \frac{x}{10\times 9} \quad\Rightarrow\quad \frac{10}{9} = \frac{x}{10\times 9}$$

$$\therefore\quad x = 100$$

Example 9. *Find the remainder when $1!+2!+3!+\ldots+n!$ is divided by 15, if $n \ge 5$.*

(a) 13 (b) 12 (c) 3 (d) 5

Sol. (c) Let $N = 1! + 2! + 3! + \ldots + n!$

$$\Rightarrow\quad \frac{N}{15} = \frac{1!+2!+3!+4!+5!+6!+\ldots+n!}{15}$$

$$\Rightarrow\quad \frac{N}{15} = \frac{1!+2!+3!+4!}{15} + \frac{5!+6!+7!+\cdots+n!}{15}$$

$$\Rightarrow\quad \frac{N}{15} = \frac{1+2+6+24}{15} + 8k$$

$$\Rightarrow\quad \frac{N}{15} = \frac{33}{15} \quad \text{[as 5!, 6!, 7!, 8! are divisible by 15]}$$

Hence, remainder is 3.

Example 10. *The value of $\dfrac{(2n)!}{n!}$ is*

(a) $\{1\cdot 3\cdot 5\ldots(2n-1)\}2^n$ (b) $\{1\cdot 3\cdot 5\ldots(n-1)\}2^n$
(c) $\{1\cdot 3\cdot 5\ldots(2n+1)\}2^n$ (d) None of these

Sol. (a) We have,

$$\frac{(2n)!}{n!} = \frac{1\cdot 2\cdot 3\cdot 4\cdot 5\cdot 6\cdot 7\cdot 8\ldots(2n-2)(2n-1)(2n)}{n!}$$

$$= \frac{\{1\cdot 3\cdot 5\cdot 7\ldots(2n-1)\}\cdot\{2\cdot 4\cdot 6\cdot 8\ldots(2n-2)(2n)\}}{n!}$$

$$= \frac{\{1\cdot 3\cdot 5\cdot 7\ldots(2n-1)\}\cdot 2^n\cdot n!}{n!}$$

$$= \{1\cdot 3\cdot 5\cdot 7\ldots(2n-1)\}\cdot 2^n$$

Example 11. *The one's and ten's digits in $1!+2!+3!+\ldots+49!$ are respectively*

(a) 4 and 1 (b) 3 and 1 (c) 4 and 2 (d) 5 and 1

Sol. (b) We know that $n!$ is divisible by 100 for $n \ge 10$ and $1!+2!+3!+4!+5!+6!+7!+8!+9! = 409113$.

Therefore,

$1!+2!+3!+\ldots+49! = 409113$ + a multiple of 100

Hence, one's and ten's digits in $1!+2!+\ldots+49!$ are 3 and 1, respectively.

Example 12. *If $S = (1)(1!) + (2)(2!) + (3)(3!) + \ldots + n(n!)$, then*

(a) $\dfrac{S+1}{n!} \in$ *integer*

(b) $\dfrac{S+1}{n!} \notin$ *integer*

(c) $\dfrac{S+1}{n!}$ *cannot be discussed*

(d) *None of the above*

Sol. (a) We have,

$$S = \sum_{k=1}^{n} k(k!) = \sum_{k=1}^{n}\{(k+1)-1\}(k!)$$

$$= \sum_{k=1}^{n}\{(k+1)! - k!\}$$

$$= (n+1)! - 1$$

$$\Rightarrow\quad S + 1 = (n+1)!$$

Thus, $\dfrac{S+1}{n!} \in$ Integer

Example 13. *$S_n = 1!+2!+3!+4!+\ldots+n!$ cannot be the square of natural number except for n, is*

(a) 1, 4 (b) 2, 3 (c) 1, 3 (d) 2, 4

Sol. (c) For $n = 1$, we have

$S_1 = 1! = 1$, which is a perfect square.

For $n = 2$, we have

$S_2 = 1! + 2! + = 1 + 2 = 3$, which is not a perfect square.

For $n = 3$, we have

$$S_3 = 1! + 2! + 3! = 1 + 2 + 6 = 9$$

which is a perfect square.

For $n = 4$, we have

$$S_4 = 1! + 2! + 4! = 1 + 2 + 6 + 24 = 33$$

which is not a perfect square.

For $n \geq 5$, we find that the digits at unit's place in $n!$ is 0 and $S_4 = 1! + 2! + 3! + 4!$ has 3 as the digit at unit's place. Therefore, for $n \geq 5$, S_n has 3 at unit's place. But the square of any natural number does not have 3 at unit's place.

Therefore, S_n is not a perfect square for $n \geq 5$.

Hence, $S_n = 1! + 2! + 3! + \ldots + n!$ is not a perfect square of a natural number except for $n = 1, 3$.

Example 14. *Let p be a prime number such that $p \geq 11$. Let $n = p! + 1$. The number of primes in the list $n+1, n+2, n+3, \ldots n+p-1$, is*

(a) $p - 1$ (b) 2
(c) 1 (d) None of these

Sol. (d) For $1 \leq i \leq p-1$, $p!$ is divisible by $(i+1)$.

Thus, $n + i = p! + (i+1)$ is divisible by $(i+1)$

for $1 \leq i \leq p-1$

$\therefore$ None of $n+1, n+2, \ldots, n+p-1$ is prime.

Exponent of Prime *p* in Factorial *n*

Let p be a prime number and n be a positive integer.

Let $E_p n!$ denotes the exponent of the prime p in the positive integer n. Then,

$$E_p(n!) = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + \left[\frac{n}{p^3}\right] + \ldots + \left[\frac{n}{p^s}\right]$$

where, s is the largest positive integer such that $p^s \leq n < p^{s+1}$.

Example 15. *The exponent of 3 in 100! is*

(a) 33 (b) 48 (c) 45 (d) 50

Sol. (b) We have, $n = 100!$

$$E_3(100!) = \left[\frac{100}{3}\right] + \left[\frac{100}{3^2}\right] + \left[\frac{100}{3^3}\right] + \left[\frac{100}{3^4}\right]$$

$$= 33 + 11 + 3 + 1 = 48$$

Hence, the exponent of 3 in 100! = 48.

Example 16. *The exponent of 12 in 50! is*

(a) 22 (b) 23 (c) 45 (d) 48

Sol. (a) We have,

$$12 = 2^2 \times 3 = 2 \times 2 \times 3 \text{ and } 50! = 2^a \times 3^b \times 5^c \times \ldots$$

Now, $a = E_2(50!) = \left[\frac{50}{2}\right] + \left[\frac{50}{2^2}\right] + \left[\frac{50}{2^3}\right] + \left[\frac{50}{2^4}\right] + \left[\frac{50}{2^5}\right]$

$= 25 + 12 + 6 + 3 + 1 = 47$

and $b = E_3(50!) = \left[\frac{50}{3}\right] + \left[\frac{50}{3^2}\right] + \left[\frac{50}{3^3}\right]$

$= 16 + 5 + 1 = 22$

$\therefore$ $50! = 2^{47} \times 3^{22} \times 5^c \times \ldots$

$\Rightarrow$ $50! = (2^2 \times 3)^{22} \times 2^3 \times 5^c \times \ldots$

$\Rightarrow$ $50! = (12)^{22} \times 2^3 \times 5^c \times \ldots$

Hence, $E_{12}(50!) = 22$

Example 17. *Let*

$$E = \left[\frac{1}{3} + \frac{1}{50}\right] + \left[\frac{1}{3} + \frac{2}{50}\right] + \left[\frac{1}{3} + \frac{3}{50}\right] + \ldots + 50 \text{ terms},$$

then the exponent of 2 in $E!$ is

(a) 17 (b) 25 (c) 15 (d) 20

Sol. (c) Let $E = \sum_{x=1}^{50} \left[\frac{1}{3} + \frac{x}{50}\right]$

For $1 \leq x \leq 33$, $\frac{1}{3} < \frac{1}{3} + \frac{x}{50} < 1$

$\therefore$ $\left[\frac{1}{3} + \frac{x}{50}\right] = 0$, for $1 \leq x \leq 33$

For $34 \leq x \leq 50$, $1 < \frac{1}{3} + \frac{x}{50} < \frac{4}{3}$

$\Rightarrow$ $\left[\frac{1}{3} + \frac{x}{50}\right] = 1$, for $34 \leq x \leq 50$

Thus, $E = 17$ and $p = 2$

$\because$ $2^4 < 17 < 2^5$

$\therefore$ $a = 4$

Exponent of 2 in $17! = \left[\frac{17}{2}\right] + \left[\frac{17}{4}\right] + \left[\frac{17}{8}\right] + \left[\frac{17}{16}\right]$

$= 8 + 4 + 2 + 1 = 15$

Work Book Exercise 6.2

x.	$\dfrac{{}^nC_r}{{}^nC_{r-1}} = \dfrac{n-(r-1)}{r}$
xi.	${}^nC_r$ is greatest $= \begin{cases} r = \dfrac{n}{2}, & \text{if } n \text{ is even} \\ r = \dfrac{n\pm 1}{2}, & \text{if } n \text{ is odd} \end{cases}$
xii.	${}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n = 2^n$
xiii.	${}^nC_0 + {}^nC_2 + \dots = {}^nC_1 + {}^nC_3 + \dots = 2^{n-1}$
xiv.	${}^{2n+1}C_0 + {}^{2n+1}C_1 + \dots + {}^{2n+1}C_n = 2^{2n}$
xv.	${}^rC_r + {}^{r+1}C_r + {}^{r+2}C_r + \dots + {}^nC_r = {}^{n+1}C_{r+1}$
xvi.	The number of combinations of n distinct objects taken $r\,(\le n)$ at a time, when $k\ (0 \le k \le r)$ particular objects always occur, is ${}^{n-k}C_{r-k}$.
xvii.	The number of combinations of n distinct objects taken r at a time, when $k\ (1 \le k \le r)$ objects never occur, is ${}^{n-k}C_r$.
xviii.	The total number of selections of one or more objects from n different objects $= 2^n - 1 = ({}^nC_1 + {}^nC_2 + {}^nC_3 + \dots + {}^nC_n)$

Example 18. *If ${}^{56}P_{r+6} : {}^{54}P_{r+3} = 30800 : 1$, then r is equal to*

(a) 39 *(b)* 40
(c) 41 *(d) None of these*

Sol. (c) We have, $\dfrac{56!}{(50-r)!}\cdot\dfrac{(51-r)!}{54!} = 30800$

$\Rightarrow \quad 56\times 55\,(51-r) = 30800$

$\Rightarrow \quad 51 - r = \dfrac{30800}{280\times 11} = \dfrac{30800}{3080} = 10$

$\therefore \quad r = 51 - 10 = 41$

Example 19. ${}^{4n}C_{2n} : {}^{2n}C_n$ *is equal to*

(a) $\dfrac{\{1\cdot 3\cdot 5\dots(4n-1)\}}{\{1\cdot 3\cdot 5\dots(2n-1)\}^2}$ *(b)* $\dfrac{\{1\cdot 3\cdot 5\dots(4n-1)\}^2}{\{1\cdot 3\cdot 5\dots(2n-1)\}}$

(c) $\dfrac{\{1\cdot 3\cdot 5\dots(2n-1)\}^2}{\{1\cdot 3\cdot 5\dots(4n-1)\}}$ *(d) None of these*

Sol. (a) We have, $\dfrac{{}^{4n}C_{2n}}{{}^{2n}C_n} = \dfrac{4n!}{2n!\,2n!} \times \dfrac{n!\,n!}{2n!}$

$$= \frac{\{1\cdot 2\cdot 3\cdot 4\cdot 5\cdot 6 \ldots (4n-1)\,4n!\}\,n!n!}{(1\cdot 2\cdot 3\cdot 4\cdot 5\cdot 6 \ldots 2n)^2\,2n!}$$

$$= \frac{\{1\cdot 3\cdot 5 \ldots (4n-1)\}\ \{2\cdot 4\cdot 6 \ldots 4n\}\,n!\,n!}{\{1\cdot 3\cdot 5 \ldots (2n-1)\}^2\ \{2\cdot 4\cdot 6 \ldots 2n\}^2\,2n!}$$

$$= \frac{\{1\cdot 3\cdot 5 \ldots (4n-1)\}\,2^{2n}\,2n!\,n!\,n!}{\{1\cdot 3\cdot 5 \ldots (2n-1)\}^2\,2^{2n}\,\{1\cdot 2\cdot 3 \ldots n\}^2\,2n!}$$

$$= \frac{\{1\cdot 3\cdot 5 \ldots (4n-1)\}\,2^{2n}\,2n!\,n!\,n!}{\{1\cdot 3\cdot 5 \ldots (2n-1)\}^2\,2^{2n}\,(n!)^2\,2n!}$$

$$= \frac{\{1\cdot 3\cdot 5 \ldots (4n-1)\}}{\{1\cdot 3\cdot 5 \ldots (2n-1)\}^2}$$

Example 20. *The number of positive terms in the sequence* $x_n = \dfrac{195}{4\cdot {}^nP_n} - \dfrac{{}^{n+3}P_3}{{}^{n+1}P_{n+1}}$, $n \in N$ *are*

(a) 2 *(b)* 3

(c) 4 *(d) None of these*

Sol. (c) We have, $x_n = \dfrac{195}{4\cdot {}^nP_n} - \dfrac{{}^{n+3}P_3}{{}^{n+1}P_{n+1}}$

$$= \frac{195}{4\cdot n!} - \frac{(n+3)(n+2)(n+1)}{(n+1)!} = \frac{195}{4\cdot n!} - \frac{(n+3)(n+2)}{n!}$$

$$= \frac{195 - 4n^2 - 20n - 24}{4\cdot n!} = \frac{171 - 4n^2 - 20n}{4\cdot n!}$$

$\because$ x_n is positive.

$\therefore$ $\dfrac{171 - 4n^2 - 20n}{4\cdot n!} > 0 \Rightarrow 4n^2 + 20n - 171 < 0$

which is true for $n = 1, 2, 3, 4$.

Hence, the given sequence has 4 positive terms.

Example 21. *The value of* $({}^7C_0 + {}^7C_1) + ({}^7C_1 + {}^7C_2) + \ldots + ({}^7C_6 + {}^7C_7)$ *is*

(a) $2^8 - 2$ *(b)* $2^8 - 1$ *(c)* $2^8 + 1$ *(d)* 2^8

Sol. (a) $({}^7C_0 + {}^7C_1) + ({}^7C_1 + {}^7C_2) + \ldots + ({}^7C_6 + {}^7C_7)$

$$= {}^8C_1 + {}^8C_2 + \ldots + {}^8C_7$$

$$= {}^8C_0 + {}^8C_1 + {}^8C_2 + \ldots + {}^8C_7 + {}^8C_8 - ({}^8C_0 + {}^8C_8)$$

$$= 2^8 - (1+1) = 2^8 - 2$$

Example 22. *The value of n for which* ${}^{n-1}C_4 - {}^{n-1}C_3 - \dfrac{5}{4}\cdot {}^{n-2}P_2 < 0$, *where* $n \in N$, *is*

(a) $\{5, 6, 7, 8, 9, 10\}$ *(b)* $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$

(c) $(0, 2) \cup (3, 11)$ *(d)* $(-\infty, 2) \cup (3, 11)$

Sol. (a) We have, ${}^{n-1}C_4 - {}^{n-1}C_3 - \dfrac{5}{4}\cdot {}^{n-2}P_2 < 0$

$$\Rightarrow \frac{(n-1)(n-2))(n-3)(n-4)}{4!} - \frac{(n-1)(n-2)(n-3)}{3!} - 5/4\,(n-2)(n-3) < 0$$

$$\Rightarrow \frac{(n-2)(n-3)}{24}\{(n-1)(n-4) - 4(n-1) - 30\} < 0$$

$$\Rightarrow (n-2)(n-3)(n^2 - 9n - 22) < 0$$

$$\Rightarrow (n-2)(n-3)(n-11)(n+2) < 0$$

$$\Rightarrow (n-2)(n-3)(n-11) < 0 \quad [\because\ n+2 > 0 \text{ for } n \in N]$$

$$\Rightarrow n \in (-\infty, 2) \cup (3, 11)$$

$\Rightarrow$ $n \in (0, 2) \cup (3, 11)$ $\Rightarrow$ $n = 1, 4, 5, 6, 7, 8, 9, 10$

But ${}^{n-1}C_4$ and ${}^{n-2}P_2$ both are meaningful for $n \geq 5$.

Hence, $n = 5, 6, 7, 8, 9, 10$.

Example 23. *The value of* $\dfrac{{}^{20}C_n}{{}^{25}C_m}$ *when both numerator and denominator have their greatest values, is*

(a) $\dfrac{140}{403}$ *(b)* $\dfrac{140}{4025}$ *(c)* $\dfrac{143}{4025}$ *(d)* $\dfrac{140}{2045}$

Sol. (c) We know that,

Greatest value of ${}^nC_r = \begin{cases} {}^nC_{n/2}, & \text{if } n \text{ is even} \\ {}^nC_{(n+1)/2}, & \text{if } n \text{ is odd} \end{cases}$

$\therefore$ ${}^{20}C_n$ is greatest for $n = \dfrac{20}{2} = 10$

and ${}^{25}C_m$ is greatest for $m = \dfrac{25+1}{2} = 13$

For $n = 10$ and $m = 13$, we have

$$\frac{{}^{20}C_n}{{}^{25}C_m} = \frac{{}^{20}C_{10}}{{}^{25}C_{13}} = \frac{20!}{10! \times 10!} \times \frac{12! \times 13!}{25!} = \frac{143}{4025}$$

Example 24. $(n!)!$ *is divisible by*

(a) $28(2n-1)^{n-1}$ *(b)* $(3n)!$

(c) $(n!)^{n!}$ *(d)* $(n!)^{(n-1)!}$

Sol. (d) Clearly, $(n!)!$ is the product of natural numbers from 1 to $n!$.

$\therefore$ $(n!)! = \{1 \times 2 \times 3 \times \ldots \times n\} \times \{(n+1)(n+2)\ldots(2n)\}$
$\times \{(2n+1)(2n+2)\ldots(3n)\}$
$\vdots \quad \vdots \quad \vdots$
$\times \{(n! - n + 1)(n! - n + 2)(n! - n + 3)\ldots n!\}$ …(i)

We observe that,

Last term of first bracket on RHS of Eq. (i) is n.

Last term of second bracket on RHS of Eq. (i) is $2\cdot n$.

Last term of third bracket on RHS of Eq. (i) is $3\cdot n$ and so on.

Last term of the last bracket on RHS of Eq. (i) is $n!$ i.e. $n(n-1)!$. It is clear from above pattern that there are $(n-1)!$ brackets on the RHS of Eq.(i) and in each bracket, there is product of n consecutive natural numbers.

From Eq. (i), we have

$$(n!)! = \prod_{r=1}^{(n-1)} [\{r-1\}n + 1]\{(r-1)n + 2\}$$
$$\{(r-1)n + 3\}\ldots[(r-1)n + n]$$

We know that, the product of n consecutive natural numbers is divisible by $n!$.

So, let

$\{(r-1)n + 1\}\{(r-1)n + 2\}\ldots\{(r-1)n + n\} = n!I_r$

where, $r = 1, 2, \ldots, (n-1)!$

$$\therefore \quad (n!)! = \prod_{r=1}^{(n-1)!} n!\,I_r = (n!)^{n-1!} \prod_{r=1}^{(n-1)!} I_r$$

$$= (n!)^{(n-1)!} \times \text{A natural number}$$

Thus, $(n!)!$ is divisible by $(n!)^{(n-1)!}$.

Work Book Exercise 6.3

1 If ${}^{15}P_r = {}^{14}P_8 + 8 \cdot {}^{14}P_7$, then r is equal to

a 5 b 6 c 7 d 8

2 Which of the following is incorrect?

a ${}^nC_r = {}^nC_{n-r}$ b ${}^nC_r = {}^{n+1}C_r + {}^nC_{n-r}$
c ${}^nC_r = {}^{n-1}C_r + {}^{n-1}C_{r-1}$ d $r!\,{}^nC_r = {}^nP_r$

3 If ${}^{n+2}C_8 : {}^{n-2}P_4 = 57 : 16$, then the value of n is

a 20 b 19 c 18 d 17

4 The exponent of 7 in ${}^{100}C_{50}$ is

a 0 b 2
c 4 d None of these

5 If ${}^{n-1}C_r = (k^2 - 3)\,{}^nC_{r+1}$, then k belongs to

a $[-\sqrt{3}, \sqrt{3}]$ b $(-\infty, -2)$
c $(2, \infty)$ d $(\sqrt{3}, 2)$

6 If n is even and ${}^nC_0 < {}^nC_1 < {}^nC_2 < \ldots < {}^nC_r > {}^nC_{r+1} > {}^nC_{r+2} > \ldots > {}^nC_n$, then r is equal to

a $\frac{n}{2}$ b $\frac{n-1}{2}$ c $\frac{n-2}{2}$ d $\frac{n+2}{2}$

7 The number of positive integers satisfying the inequality ${}^{n+1}C_{n-2} - {}^{n+1}C_{n-1} \le 100$, are

a 9 b 8
c 5 d None of these

Some Basic Arrangements and Selections

Combinations

Each of the different selections made by taking some or all of a number of distinct objects or items, irrespective of their arrangements or order in which they are placed is called a combination.

Permutations

Each of the different arrangements which can be made by taking some or all of a number of distinct objects is called a permutation.

1. Let r and n be positive integers such that $1 \le r \le n$. Then, the number of all permutations of n distinct items or objects taken r at a time is

$$n\,(n-1)\,(n-2)\,(n-3)\ldots(n-\overline{r-1})$$

e.g. We have, $n\,(n-1)\,(n-2)\ldots(n-\overline{r-1})$

$$= \frac{n\,(n-1)\,(n-2)\ldots(n-\overline{r-1})\,(n-r)!}{(n-r)!}$$

$$= \frac{n!}{(n-r)!} = {}^nP_r$$

So, the total number of arrangements (permutations) of n distinct items, taking r at time is ${}^nP_r$ or $P\,(n, r)$.

2. The number of all permutations (arrangements) of n distinct objects taken all at a time is $n!$.
3. The number of ways of selecting r items or objects from a group of n distinct items or objects is $\frac{n!}{(n-r)!\,r!} = {}^nC_r$

e.g. Let there be n distinct objects which are to be arranged in a row by taking r at a time. The job of arranging n items by taking r at a time can be divided into two ordered sub-jobs J_1 and J_2 given by

J_1 : Selecting r items from n distinct items.
J_2 : Arranging r selected items.

We find that the sub-job J_1 can be completed in ${}^nC_r$ ways and sub-job J_2 can be completed in $r!$ ways. Therefore, number of ways of arranging n distinct items, taking r at a time

$$= {}^nC_r \times r!$$

Clearly, it is consistent with the result stated in point (1), because

$${}^nC_r \times r! = n\,(n-1)\,(n-2)\ldots(n-\overline{r-1}) = {}^nP_r$$

Example 25. *Seven atheletes are participating in a race. In how many ways can the first three prizes be won?*

(a) 420 *(b)* 210
(c) 35 *(d)* 105

Sol. (b) The total number of ways in which first three prizes can be won is equivalent to the number of arrangements of seven different things taken 3 at a time

$$= {}^7P_3 = \frac{7!}{(7-3)!} = \frac{7!}{4!} = 210$$

Example 26. *How many numbers between* 400 *and* 1000 *can be made with the digits* 2, 3, 4, 5, 6 *and* 0*?*

(a) 120
(b) 720
(c) 60
(d) None of the above

Sol. (c) Any number between 400 and 1000 will be three digits.

Since, the number should be greater than 400, therefore hundred's place can be filled up by any one of the three digits 4, 5 and 6 in 3 ways. Remaining two places can be filled up by remaining five digits in ${}^5P_2$ ways.

$\therefore$ Required number $= 3 \times {}^5P_2$

$$= 3 \times \frac{5!}{3!} = 60$$

Example 27. *The number of numbers lying between* 40000 *and* 70000 *that can be made from the digits* 0, 1, 2, 4, 5, 7, *if digits can be repeated in the same number, is*

(a) 2591 (b) 932
(c) 766 (d) None of these

Sol. (a) The numbers are of five digits having 4 or 5 in ten thousand's place and the remaining digits are any of the given six digits.

$\therefore$ Number of ways to fill ten thousand's place $= {}^2P_1 = 2$

Number of ways to fill other four places $= 6^4$

$\therefore$ Required number of numbers $= 2 \times 6^4 - 1 = 2591$

Example 28. *In a network of railways, a small island has* 15 *stations. The number of different types of tickets to be printed for each class, if every station must have tickets for other station, are*

(a) 230
(b) 210
(c) 340
(d) None of the above

Sol. (b) For each pair of stations, two different types of tickets are required. Now, the number of selections of 2 stations from 15 stations $= {}^{15}C_2$.

$\therefore$ Required number of types of tickets

$$= 2 \cdot {}^{15}C_2 = 2 \cdot \frac{15!}{2!13!} = 15 \times 14 = 210$$

Example 29. *In a certain test, a_i students gave wrong answers to atleast i questions, where $i = 1, 2, 3, \ldots, k$. No student gave more than k wrong answers. The total number of wrong answers given is*

(a) $a_1 + a_2 + \ldots + a_k$
(b) $a_1 + a_2 + \ldots + a_{k-1}$
(c) $a_1 + a_2 + \ldots + a_{k+1}$
(d) None of the above

Sol. (a) Total number of wrong answers

$$= 1 \cdot (a_1 - a_2) + 2 \cdot (a_2 - a_3) + \ldots + (k-1)(a_{k-1} - a_k) + ka_k$$
$$= a_1 + a_2 + a_3 + \ldots + a_k$$

Example 30. *In a class tournament, the participants were to play one game with another, two class players fell ill, having played* 3 *games each. If the total number of games played is* 84, *then the number of participants at the beginning, was*

(a) 22 (b) 15
(c) 17 (d) None of these

Sol. (b) Suppose, the two players did not play at all, so that the remaining $(n-2)$ players played ${}^{n-2}C_2$ matches.

Since, these two players played 3 matches each, hence the total number of matches

$$= {}^{n-2}C_2 + 3 + 3 = 84 \qquad \text{[given]}$$

$$\Rightarrow \frac{(n-2)(n-3)}{1 \cdot 2} = 78$$
$$\Rightarrow n^2 - 5n + 6 = 156$$
$$\Rightarrow n^2 - 5n - 150 = 0$$
$$\Rightarrow (n-15)(n+10) = 0$$
$$\therefore n = 15 \qquad [\because n \neq -10]$$

Example 31. *The maximum number of points of intersection of* 8 *circles are*

(a) 56 (b) 28
(c) 24 (d) 16

Sol. (a) Maximum number of points

$$= {}^8P_2 = 8 \times 7 = 56$$

Example 32. *On a railway route, there are* 15 *stations. The number of tickets required in order that it may be possible to book a passenger from every station to every other, is*

(a) $\frac{15!}{13!2!}$ (b) $\frac{15!}{13!}$
(c) $15!$ (d) $\frac{15!}{2!}$

Sol. (a) Required number of tickets $= {}^{15}C_2 = \frac{15!}{2!13!}$

Example 33. *If a denotes the number of permutations of $(x+2)$ things taken all at a time, b denotes the number of permutations of x things taken* 11 *at a time and c denotes the number of permutations of $(x-11)$ things taken all at a time such that $a = 182\,bc$, then the value of x is*

(a) 15 (b) 12
(c) 10 (d) 19

Sol. (b) We have, ${}^{x+2}P_{x+2} = a \Rightarrow a = (x+2)!$

Also, ${}^xP_{11} = b$

$$\Rightarrow b = \frac{x!}{(x-11)!}$$

and ${}^{x-11}P_{x-11} = c$

$$\Rightarrow c = (x-11)!$$
$$\because a = 182\,bc$$
$$\therefore (x+2)! = 182 \cdot \frac{x!}{(x-11)!} \cdot (x-11)!$$
$$\Rightarrow (x+2)(x+1) = 182 = 14 \times 13$$
$$\Rightarrow x + 1 = 13$$
$$\text{and } x + 2 = 14$$
$$\therefore x = 12$$

Example 34. *In a certain test, there are n questions. In this test, 2^{n-i} students gave wrong answers to atleast i questions, where $i = 1, 2, 3, \ldots, n$. If the total number of wrong answers given is* 2047, *then n is equal to*

(a) 10 (b) 11
(c) 12 (d) 13

Sol. (b) The number of students answering exactly $i\,(1 \le i \le n-1)$ questions wrongly is $2^{n-i} - 2^{n-i-1}$. The number of students answering all n questions wrongly is 2^0. Hence, the total number of wrong answer is

$$\sum_{i=1}^{n-1} i\,(2^{n-i} - 2^{n-i-1}) + n(2^0) = 2047$$

$$\Rightarrow 2^{n-1} + 2^{n-2} + 2^{n-3} + \ldots + 2^0 = 2047$$

$$\Rightarrow \quad 2^n - 1 = 2047$$

$$\Rightarrow \quad 2^n = 2048 \quad \Rightarrow \quad 2^n = 2^{11}$$

$$\therefore \quad n = 11$$

Example 35. *The number of numbers of* 9 *different non-zero digits such that all the digits in the first four places are less than the digit in the middle and all the digits in the last four places are greater than that in the middle, is*

(a) 2 (4!) *(b)* $(4!)^2$

(c) 8! *(d) None of these*

Sol. (b) The required number of numbers $= {}^4P_4 \times {}^4P_4 = (4!)^2$

Summation of Numbers (3 different ways)

Sum of all the numbers greater than 10000 formed by the digits 1, 3, 5, 7, 9, no digit being repeated.

Method 1

All possible numbers $= 5! = 120$

If one occupies the unit's place, then total number $= 24$

Hence, 1 enjoys unit's place 24 times.

				1

Similarly, 1 enjoys each place 24 times.

Sum due to $1 = 1 \times 24\,(1 + 10 + 10^2 + 10^3 + 10^4)$

Similarly, sum due to the digit

$$3 = 3 \times 24\,(1 + 10 + 10^2 + 10^3 + 10^4)$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots$$

Required total sum $= 24\,(1 + 10 + 10^2 + 10^3 + 10^4)$
$(1 + 3 + 5 + 7 + 9)$

Method 2

In 1st column, there are twenty four 1's, twenty four 3's and so on and their sum $= 24 \times 25 = 600$

Hence, add in vertical column normally, we get

Sum $= 6666600$

	5th			2nd	1st
120 Number	X	X	X	X	X
	X	X	X	X	X
	⋮	⋮	⋮	⋮	⋮
	X	X	X	X	X
	666	6	6	0	0 = 6666600

Method 3

Applicable only if the digits used are such that they have the same common difference. (Valid even, if the digits are repeating)

Writing all the numbers in ascending order of magnitude,

$$S = (13579 + 13597) + \ldots + 97513 + 97531$$

$$S = (13579 + 99531) + (13597 + 97513) + \ldots$$

$$= (111110)\ 60 \text{ times} = 6666600$$

$$S = \frac{n}{2}(l + L), \text{ where } n = \text{Number of numbers},$$

$$l = \text{Smallest}, L = \text{Largest}$$

Example 36. *The sum of all the numbers that can be formed with the digits* 2, 3, 4, 5 *taken all at a time, is equal to*

(a) 93324

(b) 93328

(c) 92324

(d) None of the above

Sol. (a) The total number of numbers formed with the digits 2, 3, 4, 5 taken all at a time = Number of arrangements of 4 digits taken all at a time $= {}^4P_4 = 4! = 24$

To find the sum of these 24 numbers, we will find the sum of digits at unit's, ten's, hundred's and thousand's places in all these numbers.

Consider the digits in the unit's place in all these numbers. Each of the digits 2, 3, 4, 5 occur in 3! i.e. 6 times in the unit's place.

So, total for the digits in the unit's place in all the numbers $= (2 + 3 + 4 + 5) \times 3! = 84$.

Since, each of the digits 2, 3, 4, 5 occurs 3! times in anyone of the remaining places. So, the sum of the digits in the ten's, hundred's and thousand's places in all the numbers $= (2 + 3 + 4 + 5) \times 3! = 84$

Hence, the sum of all the numbers

$$= 84\,(10^0 + 10^1 + 10^2 + 10^3) = 93324$$

Sum of all the numbers that can be formed with n (non-zero) digits, when repetition is not allowed and each digit being used once $= (n-1)!\dfrac{(10^n - 1)}{(10-1)}$ *(sum of digits)*

$= n - 1!$ *(sum of digits)* $\times$ *(111 … n times)*

Example 37. *The sum of all the numbers greater than* 10000 *formed by using digits* 0, 2, 4, 6, 8, *no digit repeated in any number, is equal to*

(a) 5199960

(b) 5209960

(c) 5199980

(d) 5299960

Sol. (a) The total number of numbers formed by arranging the digits 0, 2, 4, 6, 8 taken all at a time is 5! = 120. Some of these numbers are less than 10000 and some are greater than 10000. Infact all those numbers having 0 at ten thousand's place are four-digit numbers.

$\therefore$ Required sum = Sum of the numbers formed by using digits 0, 2, 4, 6, 8 – Sum of the numbers formed by using digits 2, 4, 6, 8

$$= (0 + 2 + 4 + 6 + 8)(5 - 1)!\left(\frac{10^5 - 1}{10 - 1}\right) - (2 + 4 + 6 + 8)(4 - 1)!\left(\frac{10^4 - 1}{10 - 1}\right)$$

$$= 480\left(\frac{10^5 - 1}{10 - 1}\right) - 120\left(\frac{10^4 - 1}{10 - 1}\right)$$

$$= 5333280 - 133320 = 5199960$$

Permutations under Certain Conditions

The number of all permutations (arrangements) of n different objects taken r at a time,

1. when a particular object is to be always included in each arrangement, is ${}^{n-1}C_{r-1} \times r!$.
2. when a particular object is never taken in each arrangement, is ${}^{n-1}C_r \times r!$.
3. when two specified objects always occur together is ${}^{n-2}C_{r-2} \times (r-1)! \times 2!$.

Proof

1. In order to arrange n distinct items by taking r at a time when a particular object is to be always included in each arrangement,

   ☐ M ☐ M ☐ M ☐ … ☐ M ☐

   1st 2nd 3rd nth

   Let us first put aside the specified item and select $(r-1)$ items from the remaining $(n-1)$ items. This can be done in ${}^{n-1}C_{r-1}$ ways. Now, we have r items, namely, one specified item and $(r-1)$ selected items. These r items can be arranged in $r!$ ways. Hence, the required number of arrangements is ${}^{n-1}C_{r-1} \times r!$.
2. If a particular objects is never taken in each arrangement, then we first select r objects from the remaining $(n-1)$ objects and then they are arranged. So, required number of arrangements is ${}^{n-1}C_r \times r!$.
3. In order to arrange n distinct items by taking r at a time when two specified objects always occur together, we first select $(r-2)$ objects from the remaining $(n-2)$ objects. This can be done in ${}^{n-2}C_{r-2}$ ways. Now, we consider two specified objects temporarily as a single object and mix it with $(r-2)$ selected objects. Now, these $(r-1)$ objects can be arranged in $(r-1)!$ ways. But two specified objects can be put together in 2! ways. Hence, required number of arrangements is

   $${}^{n-2}C_{r-2} \times (r-1)! \times 2!$$

Example 38. *There are 5 boys and 3 girls. In how many ways can they be seated in a row, so that all the three girls do not sit together?*

(a) 8! *(b)* 8!5!
(c) $8! - 5!$ *(d)* $50 \cdot 6!$

Sol. (d) Total number of persons = 5 + 3 = 8

When there is no restriction, then they can be seated in a row in 8! ways.

But when all the three girls sit together, consider the three girls as one person, we have only (5 + 1) = 6 persons. These 6 persons can be arranged in a row in 6! ways. But the three girls can be arranged among themselves in 3! ways.

$\therefore$ Number of ways when three girls are together = 6! 3!

$\therefore$ Required number of ways in which all the three girls do not sit together

$$= 8! - 6!\,3! = 6!\,(56 - 6) = 6! \cdot 50 = 50 \cdot 6!$$

Example 39. *In how many ways can 10 examination paper be arranged, so that the best and the worst papers never come together?*

(a) $9 \cdot 8!$ *(b)* $8 \cdot 9!$
(c) $10 \cdot 9!$ *(d)* $9 \cdot 10!$

Sol. (b) The number of permutation of 10 papers when there is no restriction = 10!

When the best and the worst papers come together, consider the two as one paper, we have only 9 papers. These 9 papers can be arranged in 9! ways.

But these two papers can be arranged among themselves in 2! ways.

$\therefore$ Number of arrangement when the best and the worst paper do not come together = $10! - 9!\,2! = 8 \cdot 9!$

Example 40. *The number of ways in which a committee of 5 can be chosen from 10 candidates so as to exclude the youngest, if it includes the oldest, is*

(a) 196
(b) 178
(c) 202
(d) None of the above

Sol. (a) There are two different ways of forming the committee:

(i) oldest may be included
(ii) oldest may be excluded

(i) If oldest is included, then youngest has to be excluded and we are to select 4 candidates out of 8.

This can be done in

$${}^8C_4 = \frac{8!}{4!\,4!} = \frac{8 \times 7 \times 6 \times 5}{4 \times 3 \times 2} = 70 \text{ ways}$$

(ii) If oldest is excluded, then we are to select 5 candidates from 9 which can be done in

$${}^9C_5 = \frac{9!}{5!\,4!} = \frac{9 \times 8 \times 7 \times 6}{4 \times 3 \times 2 \times 1} = 126 \text{ ways}$$

Hence, the total number of ways in which committee can be formed

$$= 126 + 70 = 196$$

Example 41. *The number of ways in which the letters of the word VOWEL can be arranged so that the letters O, E occupy only even places, is*

(a) 12 (b) 18

(c) 24 (d) None of these

Sol. (a)

V	O	W	E	L
1	2	3	4	5
	×		×	

$\because$ O, E occupy only even places.

$\therefore$ O and E can be arranged in two × marked places in ${}^2P_2$ ways $= 2! = 2$.

Also, the remaining 3 letters can be arranged in themselves in 3! ways $= 3 \times 2 \times 1 = 6$

$\therefore$ Required number of words $= 3! = 2 \times 6 = 12$

Example 42. *The number of ways in which the letters of word FRACTION be arranged so that no two vowels are together, is*

(a) 17330 (b) 14400

(c) 16440 (d) None of these

Sol. (b) The word 'FRACTION' consists of 8 different letters out of which A, I, O are 3 vowels and F, R, C, T, N are 5 consonants.

First of all, we arrange the consonants among themselves.

This can be done in $P(5, 5) = 5! = 120$ ways.

Let one such way be × F × R × C × T × N ×

Now, no two vowels are together, if they are put at places marked (×). The 3 vowels can fill up these 6 places in $P(6, 3)$ ways.

Hence, the total number of words

$= 120 \times P(6, 3) = 120 \times 6 \times 5 \times 4 = 120 \times 120 = 14400$

Example 43. *A boat is to be managed by eight men of whom 2 can only row on bow side and 3 can only row on stroke side, the number of ways in which the crew can be arranged, is*

(a) 4360 (b) 5760

(c) 5930 (d) None of these

Sol. (b) First, we have to select 2 men for bow side and 3 for stroke side.

$\therefore$ The number of selections of the crew for two sides

$$= {}^5C_2 \times {}^3C_3$$

For each selection, there are 4 persons, each on both sides who can be arranged in $4! \times 4!$ ways.

$\therefore$ Required number of arrangements

$$= {}^5C_2 \times {}^3C_3 \times 4! \times 4! = \frac{5 \times 4}{2} \times 1 \times 24 \times 24 = 5760$$

Example 44. *A teaparty is arranged for 16 people along two sides of a large table with 8 chairs on each side. Four men want to sit on one particular side and two on the other side. The number of ways in which they can be seated, is*

(a) $\frac{6!8!10!}{4!6!}$ (b) $\frac{8!8!10!}{4!6!}$

(c) $\frac{8!8!6!}{6!4!}$ (d) None of these

Sol. (b) There are 8 chairs on each side of the table. Let the sides be represented by A and B. Let four persons sit on side A, then number of ways of arranging 4 persons on 8 chairs on side $A = {}^8P_4$ and then two persons sit on side B. The number of ways of arranging 2 persons on 8 chairs on side $B = {}^8P_2$ and the remaining 10 persons can be arranged in remaining 10 chairs in 10! ways.

Hence, the total number of ways in which the person can be arranged

$$= {}^8P_4 \times {}^8P_2 \times 10! = \frac{8!8!10!}{4!6!}$$

Example 45. *The number of permutations of n different things taken r at a time, in which $p\ (r \le n - p)$ particular things will never occur, is*

(a) $P(n-p, r)$

(b) $P(n, r) - P(n, p)$

(c) $P(n, r) \times P(n, p)$

(d) $P(n-p, r) \times P(n, n-p)$

Sol. (a) As, p things are excluded.

$\therefore$ Number of things left $= (n - p)$, out of which r are to be arranged.

Now, the number of permutations $= P(n - p, r)$

Example 46. *The number of permutations of n different objects taken $r\ (\ge 3)$ at a time which include 3 particular objects, is*

(a) ${}^nP_r \cdot 3!$ (b) ${}^nP_{r-3} \cdot 3!$

(c) ${}^{n-3}P_{r-3} \cdot 3!$ (d) ${}^rP_3 \cdot {}^{n-3}P_{r-3}$

Sol. (d) First, we arrange 3 particular things in r places. This can be done in ${}^rP_3$ ways. Then, remaining $n - 3$ things can be arranged taken $r - 3$ at a time in ${}^{n-3}P_{r-3}$ ways.

$\therefore$ Total number of ways $= {}^rP_3 \cdot {}^{n-3}P_{r-3}$

Example 47. *We are required to form different words with the help of the letters of the word INTEGER. Let m_1 be the number of words in which I and N are never together and m_2 be the number of words which begin with I and end with R, then $\frac{m_1}{m_2}$ is given by*

(a) 42 (b) 30 (c) 6 (d) $\frac{1}{30}$

Sol. (b) The number of words in which I and N are together

$$= \frac{6!}{2!} \times 2! = 6! = 720$$

$\therefore$ The number of words in which I and N are never together,

$$m_1 = \frac{7!}{2!} - 720 = 1800$$

The number of words which begin with I and end with R,

$$m_2 = \frac{5!}{2!} = 60$$

$$\therefore \quad \frac{m_1}{m_2} = \frac{1800}{60} = 30$$

Example 48. *The number of six-digit numbers that can be formed from the digits* 1, 2, 3, 4, 5, 6 *and* 7, *so that digits do not repeat and the terminal digits are even, is*

(a) 144 *(b)* 72 *(c)* 288 *(d)* 720

Sol. (d) Terminal digits are the first and last digits.

Since, terminal digits are even.

$\therefore$ 1st place can be filled in 3 ways and last place can be filled in 2 ways and remaining places can be filled in $^5P_4 = 120$ ways.

Hence, the number of six digit numbers, so that the terminal digits are even $= 3 \times 120 \times 2 = 720$.

Permutations of Objects not all Distinct

1. The number of mutually distinguishable permutations of n things taken all at a time, of which p are alike of one kind, q alike of second kind such that $p + q = n$, is $\dfrac{n!}{p!\,q!}$.
2. The number of permutations of n things, of which p_1 are alike of one kind, p_2 are alike of second kind, p_3 are alike of third kind,..., p_r are alike of rth kind such that
$p_1 + p_2 + \dots + p_r = n$, is $\dfrac{n!}{p_1!\,p_2!\,p_3!\dots p_r!}$.
3. The number of permutations of n things, of which p are alike of one kind, q are alike of second kind and remaining all are distinct, is $\dfrac{n!}{p!\,q!}$.
4. Suppose there are r things to be arranged, allowing repetitions. Let further $p_1, p_2, \dots, p_r$ be the integers such that the first object occurs exactly p_1 times, the second occurs exactly p_2 times, etc. Then, the total number of permutations of these r objects to the above condition is
$$\frac{(p_1 + p_2 + \dots + p_r)!}{p_1!\,p_2!\,p_3!\dots p_r!}$$

Example 49. *The number of arrangements which can be made out of the letters of the word ALGEBRA, without changing the relative order (positions) of vowels and consonants, is*

(a) 72 *(b)* 54

(c) 36 *(d)* 62

Sol. (a) We have to arrange the 3 vowels in their places, i.e. in the 1st, 4th, 7th places and the 4 consonants in their places. The number of ways to arrange 3 vowels in 1st, 4th and 7th places $= \dfrac{3!}{2!}$ [$\because$ there are 2A's]

The number of ways to arrange 4 consonants in their places = 4!

$\therefore$ Required number of arrangements

$$= \frac{3!}{2!} \times 4! = 3 \times 24 = 72$$

Example 50. *The number of ways in which two* 10 *paise, two* 20 *paise, three* 25 *paise and one* 50 *paise coins can be distributed among* 8 *children, so that each child gets only one coin, is*

(a) 1720 *(b)* 1680

(c) 1570 *(d)* None of these

Sol. (b) Total number of coins $= 2 + 2 + 3 + 1 = 8$

$\because$ 2 coins are of 10 paise, 2 coins are of 20 paise, 3 coins are of 25 paise and 1 coin is of 50 paise.

$\therefore$ Required number of ways

$$= \frac{8!}{2! \times 2! \times 3! \times 1!} = \frac{8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{2 \times 1 \times 2 \times 1 \times 3 \times 2 \times 1 \times 1}$$

$$= 8 \times 7 \times 6 \times 5 = 1680$$

Example 51. *A boy has* 3 *library tickets and* 9 *books of his interest in the library. Out of these* 8, *he does not want to borrow Chemistry part II, unless Chemistry part I is also borrowed. The number of ways in which he can choose the three books to be borrowed, is*

(a) 41 *(b)* 32

(c) 51 *(d)* None of these

Sol. (a) The following are the different possibilities in which three books can be borrowed.

(i) When Chemistry part II is selected, then Chemistry part I is also borrowed and the third book is selected from the remaining 6 books $= C(6, 1) = 6$.

(ii) When Chemistry part II is not selected, in this case, he has to select the three books from the remaining 7 books. First choice can be made in

$$C(7, 3) = \frac{7 \times 6 \times 5}{1 \times 2 \times 3} = 35 \text{ ways.}$$

$\therefore$ Total number of ways in which he can choose the three books to be borrowed $= 6 + 35 = 41$.

Example 52. *There are three copies, each of* 4 *different books. The number of ways in which they can be arranged on a shelf, is*

(a) $\dfrac{12!}{(3!)^4}$ *(b)* $\dfrac{11!}{(3!)^2}$

(c) $\dfrac{9!}{(3!)^2}$ *(d)* None of these

Sol. (a) Total number of books $= 3 \times 4 = 12$ in which each of 4 different books is repeated 3 times.

Hence, the required number of arrangements

$$= \frac{12!}{3! \times 3! \times 3! \times 3!} = \frac{12!}{(3!)^4}$$

Example 53. *A library has a copies of one book, b copies of two books, c copies of each of three books and single copy of d books. The total number of ways in which these books can be distributed, is*

(a) $\dfrac{(a+2b+3c+d)!}{a!\,b!\,c!}$ *(b)* $\dfrac{(a+b+c+d)!}{a!\,b!\,c!}$

(c) $\dfrac{(a+2b+3c+d)!}{a!\,(b!)^2\,(c!)^3}$ *(d)* None of these

Sol. (c) Total number of books $= a + 2b + 3c + d$
Since, there are b copies each of two books, c copies each of three books and single copy of d books.

$\therefore$ Total number of arrangements

$$= \frac{(a + 2b + 3c + d)!}{a!\,(b!)^2\,(c!)^3}$$

Example 54. *How many different arrangements can be made out of the letters in the expansion $A^2B^3C^4$, when written in full?*

(a) $\frac{9!}{2!+3!+4!}$ *(b)* $\frac{9!}{2!3!4!}$

(c) $2!+3!+4!(2!3!4!)$ *(d)* $2!3!-4$

Sol. (b) $A^2B^3C^4$ written in full is *AA BBB CCCC.*

$\therefore$ Required number of ways $= \frac{9!}{2!3!4!}$

Example 55. *The number of ways in which the six faces of a cube is painted with six different colours, is*

(a) 6
(b) 6!
(c) ${}^6C_2$
(d) None of the above

Sol. (d) Number of ways $= \frac{6!}{6!} = 1$ [all faces are alike]

Example 56. *The number of numbers greater than a million that can be formed with the digits* 2, 3, 0, 3, 4, 2 *and* 3*, is*

(a) 360 *(b)* 340
(c) 370 *(d)* None of these

Sol. (a) Any number greater than a million must be of 7 or more than 7 digits. Here, number of given digits is seven, therefore we have to form numbers of seven digits only. Now, there are seven digits of which 3 occurs thrice and two occurs twice.

$\therefore$ Number of numbers formed $= \frac{7!}{2!3!} = 420$

But this also includes those numbers of seven digits, whose first digit is zero and so infact, they are only six digit numbers.

Number of numbers of seven digits having zero in the first place $= 1 \times \frac{6!}{3!2!} = 60$

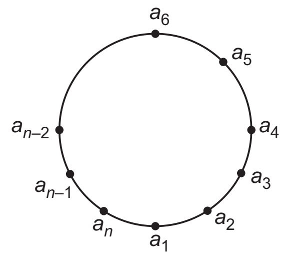
Hence, required number $= 420 - 60 = 360$

Circular Permutations

The number of circular permutations of n distinct objects is $(n-1)!$.

Proof Let $a_1, a_2, a_3, \ldots, a_{n-1}, a_n$ be n distinct objects.

Let the total number of circular permutations be x. Consider one of these x permutations as shown in figure.



Clearly, this circular permutation provides n linear permutations as given below:

$$\begin{array}{c} a_1, a_2, a_3, \ldots, a_{n-1}, a_n \\ a_2, a_3, a_4, \ldots, a_n, a_1 \\ a_3, a_4, a_5, \ldots, a_n, a_1, a_2 \\ a_4, a_5, a_6, \ldots, a_n, a_1, a_2, a_3 \\ \ldots \quad \ldots \quad \ldots \quad \ldots \\ \ldots \quad \ldots \quad \ldots \quad \ldots \\ a_n, a_1, a_2, a_3, \ldots, a_{n-1} \end{array}$$

Thus, each circular permutation gives n linear permutations. But there are x circular permutations, so that number of linear permutations is xn. But the number of linear permutations of n distinct objects is $n!$.

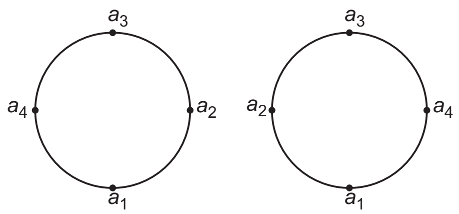
$$\therefore \qquad xn = n! \quad \Rightarrow \quad x = \frac{n!}{n} = (n-1)!$$

In the above theorem, anti-clockwise and clockwise orders of arrangements are considered as distinct permutations.

Difference between Clockwise and Anti-clockwise Arrangements

Consider the following circular permutations:

We observe that in both the order of the circular arrangements is $a_1, a_2, a_3\ a_4$. In Fig. (i), the order is anti-clockwise whereas in Fig. (ii), the order is clockwise.



(i) (ii)

Thus, the number of circular permutation of n things in which clockwise and anti-clockwise arrangements give rise to different permutations is $(n-1)!$. e.g. The number of permutations of 5 persons seated around a table is $(5-1)! = 4!$, because with respect to the table, the clockwise and anti-clockwise arrangements are distinct.

If anti-clockwise and clockwise orders of arrangements are not distincts, then the number of circular permutations of n distinct items is $\frac{1}{2}\{(n-1)!\}$.

e.g. Arrangements of beads in a necklace, arrangements of flowers in a garland.

Example 57. *The Chief Minister of* 11 *states of India meet to discuss the language problem. The number of ways they can seat themselves at a round table so that Punjab and Chennai Chief Ministers sit together, is*

(a) $9! \times 2!$
(b) $9!$
(c) $10!$
(d) None of the above

Sol. (a) Treat the Punjab and Chennai Chief Ministers as one (P, C) + 9 others.

So, we have to arrange 10 persons around round table. This can be done in $(10-1)! = 9!$ ways. Corresponding to each of these 9! ways, Punjab and Chennai Chief Ministers can interchange their places in 2! ways.

$\therefore$ Associating the two operations, total number of ways $= 9! \times 2!$.

Example 58. *The number of ways in which n things of which r are alike, can be arranged in a circular order, is*

(a) $\dfrac{(n-1)!}{r!}$
(b) $\dfrac{n!}{r!}$
(c) $\dfrac{n!}{(r-1)!}$
(d) None of the above

Sol. (a) Let the required number of arrangements $= x$

Consider anyone of these x arrangements.

If in this arrangements, r alike things are replaced by r different things, then these r things can be arranged among themselves in $r!$ ways.

Since, one arrangement gives rise to $r!$ arrangements.

$\therefore x$ arrangements will give rise to $xr!$ arrangements.

But if all the n things are different, then the number of circular arrangements

$$= (n-1)!$$

Thus, $x \cdot r! = (n-1)!$

Hence, $x = \dfrac{(n-1)!}{r!}$

Example 59. *The number of ways in which 7 people can be arranged at a round table, so that 2 particular persons may be together, is*

(a) 132
(b) 148
(c) 240
(d) None of the above

Sol. (c) The two particular persons can be arranged among themselves in ${}^2P_2$ ways i.e. 2! ways.

Taking them as one person and keeping him fixed, we can arrange the remaining 5 persons among themselves in 5! ways.

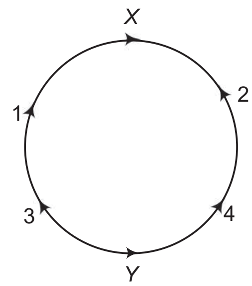
Hence, the required number of ways of which 2 particular persons come together

$$= 5! \times 2! = 120 \times 2 = 240$$

Example 60. *Three boys and three girls are to be seated around a table, in a circle. Among them, the boy X does not want any girl neighbour and the girl Y does not want any boy neighbour. The number of such arrangements possible is*

(a) 4
(b) 6
(c) 8
(d) None of the above

Sol. (a) As shown in figure, 1, 2 and X are the three boys and 3, 4 and Y are three girls. Boy X will have neighbours as boys 1 and 2 and the girl Y will have neighbours as girls 3 and 4.



1 and 2 can be arranged in

$$P(2, 2) = 2! = 2 \times 1 = 2 \text{ ways}$$

Also, 3 and 4 can be arranged in

$$P(2, 2) = 2! = 2 \times 1 = 2 \text{ ways}$$

Hence, required number of permutations

$$= 2 \times 2 = 4$$

Example 61. *There are n seats round a table numbered* 1, 2, 3,..., *n. The number of ways in which m* $(\le n)$ *persons can take seats, is*

(a) ${}^nP_m$
(b) ${}^nC_m \cdot (m-1)!$
(c) $\dfrac{1}{2} \cdot {}^nP_m$
(d) ${}^{n-1}P_m$

Sol. (a) Since, the seats are numbered.

So, the arrangement is not circular.

Hence, the required number of ways = The number of arrangements of n things taken m at a time $= {}^nP_m$

Work Book Exercise 6.4

1 If the letters of the word 'VARUN' are written in all possible ways and then are arranged as in a dictionary, then the rank of the word 'VARUN' is

98 99 100 101

2 5 Indian and 5 American couples meet at a party and shake hands. If no wife shakes hands with her own husband and no Indian wife shakes hands with a male, then the number of hand shakes that takes place in the party, is

95 110 135 150

3 If m denotes the number of 5-digit numbers, if each successive digits are in their descending order of magnitude and n is the corresponding figure, when the digits are in their ascending order of magnitude, then $(m-n)$ has the value

${}^{10}C_4$ ${}^{9}C_5$ ${}^{10}C_3$ ${}^{9}C_3$

4 The number of ways in which 9 different prizes be given to 5 students, if one particular boy receives 4 prizes and the rest of the students can get any numbers of prizes, is

${}^{9}C_4 \cdot 2^{10}$
${}^{9}C_5 \cdot 5^4$
$4 \cdot 4^5$
None of these

5 The number of ways in which 8 non-identical apples can be distributed among 3 boys such that every boy should get atleast 1 apple and atmost 4 apples is $k \cdot {}^{7}P_3$, where k has the value equal to

88 66 44 22

6 A rack has 5 different pairs of shoes. The number of ways in which 4 shoes can be chosen from it so that there will be no complete pair, is

1920
200
110
80

7 The number of ways in which 7 people can occupy six seats, 3 seats on each side in a first class railway compartment, if two specified persons are to be always included and occupy adjacent seats on the same side, is $(5!) \cdot k$, then k has the value equal to

2
4
8
None of these

8 The number of different ways in which five 'dashes' and eight 'dots' can be arranged, using only seven of these 13 'dashes' and 'dots', is

1287
119
120
1235520

9 There are n identical red balls and m identical green balls. The number of different linear arrangements consisting of n red balls but not necessarily all the green balls is ${}^{x}C_y$, then

$x = m + n$, $y = m$
$x = m + n + 1$, $y = m$
$x = m + n + 1$, $y = m + 1$
$x = m + n$, $y = n$

10 In a unique hockey series between India and Pakistan, they decide to play on till a team wins 5 matches. The number of ways in which the series can be won by India, if no match ends in a draw, is

126
252
225
None of these

11 The number of ways in which n things of which r alike and the rest different can be arranged in a circle distinguishing between clockwise and anti-clockwise arrangement, is

$\dfrac{(n+r-1)!}{r!}$
$\dfrac{(n-1)!}{r}$
$\dfrac{(n-1)!}{(r-1)!}$
$\dfrac{(n-1)!}{r!}$

12 A gentleman invites a party of $m + n$ $(m \neq n)$ friends to dinner and places m at one table T_1 and n at another table T_2, the table being round. If not all people shall have the same neighbour in any two arrangement, then the number of ways in which he can arrange the guests, is

$\dfrac{(m+n)!}{4mn}$
$\dfrac{1}{2} \cdot \dfrac{(m+n)!}{mn}$
$2 \cdot \dfrac{(m+n)!}{mn}$
None of these

13 There are 12 guests at a dinner party. Supposing that the master and mistress of the house have fixed seats opposite one another and that there are two specified guests who must always, be placed next to one another, the number of ways in which the company can be placed, is

$20 \cdot 10!$
$22 \cdot 10!$
$44 \cdot 10!$
None of the above

14 The number of signals that can be generated by using 6 differently coloured flags, when any number of them may be hoisted at a time, is

1956
1957
1958
1959

15 The sum of all five-digit numbers that can be formed using the digits 1, 2, 3, 4, 5 when repetition of digits is not allowed, is

366000
660000
360000
3999960

16 By using the digits 0, 1, 2, 3, 4 and 5 (repetitions not allowed), any number of digits being used, the number of non-zero numbers that can be formed, is

1030 1630 1200 1530

17 The total number of numbers of not more than 20 digits that are formed by using the digits 0, 1, 2, 3 and 4, is

5^{20}
$5^{20} - 1$
$5^{20} + 1$
None of the above

18 Six boys and six girls sit along a line alternately in x ways and along a circle (again alternatively in y ways), then

$x = y$ | $y = 12x$ | $x = 10y$ | $x = 12y$

19 The number of times the digit 3 will be written when listing the integers from 1 to 1000, is

269 | 300 | 271 | 302

20 The number of ways in which a mixed double game can be arranged from amongst 9 married couples, if no husband and wife play in the same game, is

756 | 1512 | 3024 | None of these

21 The number of different seven digit-numbers that can be written using only the three digits 1, 2 and 3 with the condition that the digit 2 occurs twice in each number, is

${}^2P_2 \cdot 2^5$ | ${}^7C_2 \cdot 2^5$ | ${}^7C_2 \cdot 5^2$ | None of these

22 The number of ways one can put 5 different balls in 5 different boxes such that atmost three boxes is empty, is

3000 | 3010 | 2990 | 3120

23 Given that n is odd, the number of ways in which three numbers in AP can be selected from 1, 2, 3, …, n, is

$\frac{(n-1)^2}{2}$ | $\frac{(n+1)^2}{4}$ | $\frac{(n+1)^2}{2}$ | $\frac{(n-1)^2}{4}$

24 The number of ways in which we can select four numbers from 1 to 30, so as to exclude every selection of four consecutive numbers, is

27378 | 27405 | 27399 | None of these

25 The number of ways in which 10 candidates $A_1, A_2, \ldots, A_{10}$ can be ranked, so that A_1 is always above A_2, is

$10!$ | $\frac{10!}{2}$ | $9!$ | None of the above

26 There are n white and n black balls marked 1, 2, 3, …, n. The number of ways in which we can arrange these balls in a row, so that neighbouring balls are of different colours, is

$n!$ | $(2n)!$ | $2(n!)^2$ | $\frac{(2n)!}{(n!)^2}$

27 A man invites in a party of $(m+n)$ friends to dinner and places m at one round table and n at another. The number of ways of arranging the guests is

$\frac{(m+n)!}{m!\,n!}$ | $\frac{(m+n)!}{(m-1)!(n-1)!}$ | $(m-n)!(n-1)!$ | None of the above

Geometrical Applications of ${}^nC_r$

Some basic Geometrical Applications on ${}^nC_r$ are as follow:

1. Out of n non-concurrent and non-parallel straight lines, points of intersection are ${}^nC_2$.
2. Out of n points, the number of straight lines (when three points are not collinear) are ${}^nC_2$.
3. If out of n points, m are collinear, then
   Number of straight lines $= {}^nC_2 - {}^mC_2 + 1$
4. In a polygon, total number of diagonals out of n points (when three points are not collinear)
   $$= \frac{n(n-3)}{2}$$
5. Number of triangles formed from n points (when three points are not collinear) are ${}^nC_3$.
6. Number of triangles out of n points in which m are collinear, are ${}^nC_3 - {}^mC_3$.
7. Number of triangles that can be formed out of n points (when none of the side is common to the sides of polygon) are ${}^nC_3 - {}^nC_1 - {}^nC_1 \cdot {}^{n-4}C_1$.
8. Number of parallelogram formed by two system of parallel lines (when 1st set contains m parallel lines and 2nd set contains n parallel lines)
   $$= {}^nC_2 \times {}^mC_2$$
9. Number of squares formed by two system of parallel lines in which 1st set is perpendicular 2nd sets of lines (when 1st set contains m parallel lines and 2nd set contains n parallel lines)
   $$= \sum_{r=1}^{m-1} (m-r)(n-r);\ m < n$$

Example 62. *The number of parallelograms that can be formed from a set of four parallel lines intersecting another set of three parallel lines, is*

(a) 6 | *(b)* 18 | *(c)* 12 | *(d)* 9

Sol. (b) Required number of parallelograms

$$= {}^4C_2 \times {}^3C_2 = \frac{4!}{2!\,2!} \times \frac{3!}{2!\,1!}$$
$$= \frac{4 \times 3}{2 \times 1} \times \frac{3}{1} = 18$$

Example 63. *The number of diagonals that can be drawn by joining the vertices of an octagon, is*

(a) 28 (b) 48
(c) 20 (d) None of these

Sol. (c) The total number of lines obtained by joining 8 vertices of octagon

$$= {}^8C_2 = 28 \text{ ways}$$

Out of these 28 lines, 8 are sides and remaining diagonals.
Hence, the number of diagonals

$$= 28 - 8 = 20$$

Example 64. *There are n concurrent lines and another line parallel to one of them. The number of different triangles that will be formed by the* $(n+1)$ *lines, is*

(a) $\frac{(n-1)n}{2}$ (b) $\frac{(n-1)(n-2)}{2}$
(c) $\frac{n(n+1)}{2}$ (d) $\frac{(n+1)(n+2)}{2}$

Sol. (b) The number of triangles = Number of selections of 2 lines from the $(n-1)$ concurrent lines which are cut by the another line

$$= {}^{n-1}C_2 = \frac{(n-1)!}{2!\,(n-3)!}$$

$$= \frac{(n-1)(n-2)}{2}$$

Example 65. *In a plane, there are two sets of parallel lines, one of m lines and the other of n lines. If the lines of one set cut those of the other, then the number of different parallelograms that can be formed is*

(a) $\frac{mn\,(m-1)\,(n-1)}{2}$
(b) $\frac{m\,(m-1)(n-1)}{6}$
(c) $\frac{nm\,(m-1)\,(n-1)}{4}$
(d) None of the above

Sol. (c) The number of parallelograms = Number of selections of 4 lines, two from each set

$\left[\because \text{parallelogram has two sets of parallel sides}\right]$

$$= {}^nC_2 \times {}^mC_2 = \frac{n\,(n-1)}{2} \times \frac{m\,(m-1)}{2}$$

$$= \frac{mn\,(m-1)(n-1)}{4}$$

Example 66. *The maximum number of points into which 4 circles and 4 straight lines intersect, is*

(a) 26 (b) 50 (c) 56 (d) 72

Sol. (b) 4 lines intersect each other in ${}^4C_2 = 6$ points and 4 circles intersect in ${}^4P_2 = 12$ points.
Each line cuts 4 circles into 8 points.
$\therefore$ 4 lines cut 4 circles into 32 points.
$\therefore$ Required number $= 6 + 12 + 32$
$= 50$

Example 67. *The straight lines* I_1, I_2, I_3 *are parallel and lie in the same plane. A total number of m points are taken on* I_1*, n points on* I_2*, k points on* I_3*. The maximum number of triangles formed with vertices at these points, are*

(a) ${}^{m+n+k}C_3$
(b) ${}^{m+n+k}C_3 - {}^mC_3 - {}^nC_3 - {}^kC_3$
(c) ${}^mC_3 + {}^nC_3 + {}^kC_3$
(d) None of the above

Sol. (b) Total number of points are $m + n + k$. The triangles formed by these points $= {}^{m+n+k}C_3$.
Joining 3 points on the same line gives no triangle, such triangles are ${}^mC_3 + {}^nC_3 + {}^kC_3$.
$\therefore$ Required number of triangles

$$= {}^{m+n+k}C_3 - {}^mC_3 - {}^nC_3 - {}^kC_3$$

Example 68. *Two straight lines intersect at a point O. Points* $A_1, A_2, \ldots, A_n$ *are taken on one line and points* $B_1, B_2, \ldots, B_n$ *on the other. If the point O is not to be used, then the number of triangles that can be drawn using these points as vertices, is*

(a) $n\,(n-1)$
(b) $n\,(n-1)^2$
(c) $n^2\,(n-1)$
(d) $n^2\,(n-1)^2$

Sol. (c) Number of triangles $= {}^{2n}C_3 - {}^nC_3 - {}^nC_3$

$$= \frac{2n(2n-1)(2n-2)}{6} - \frac{2n(n-1)(n-2)}{6}$$

$$= \frac{1}{3}n(n-1)(3n) = n^2(n-1)$$

Example 69. *There are* 10 *points in a plane, of which no* 3 *points are collinear and* 4 *points are concyclic. The number of different circles that can be drawn through atleast* 3 *of these points, is*

(a) 116
(b) 120
(c) 117
(d) None of the above

Sol. (c) The required number of circles

$$= ({}^{10}C_3 - {}^4C_3) + 1$$

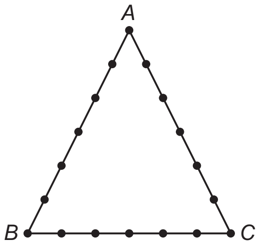
$$= 117$$

Work Book Exercise 6.5

1 The interior angles of a regular polygon measure 150° each. The number of diagonals of the polygon is

35 44
54 78

2 18 points are indicated on the perimeter of a ΔABC (see figure). How many triangles are there with vertices at these points?



331 408 710 711

3 There are m points on a straight line AB and n points on the line AC, none of them being the point A. Triangles are formed with these points as vertices, when

(i) A is excluded.
(ii) A is included.

Then, the ratio of number of triangles in the two cases is

$\frac{m+n-2}{m+n}$ $\frac{m+n-2}{m+n-1}$
$\frac{m+n-2}{m+n+2}$ $\frac{m(n-1)}{(m+1)(n+1)}$

4 Let there be 9 fixed points on the circumference of a circle. Each of these points is joined to every one of the remaining 8 points by a straight line and the points are so positioned on the circumference that atmost 2 straight lines meet in any interior point of the circle. The number of such interior intersection points is

126
351
756
None of the above

5 The greatest possible number of points of intersection of 9 different straight lines and 9 different circles in a plane, is

117
153
270
None of the above

6 The number of triangles whose vertices are at the vertices of an octagon but none of whose sides happen to come from the sides of the octagon, is

24 52
48 16

Selection of One or More Objects

Selection from Different Items

The number of ways of selecting one or more items from a group of n distinct items is $2^n - 1$.

Out of n items, 1 item can be selected in ${}^nC_1$ ways, 2 items can be selected in ${}^nC_2$ ways, 3 items can be selected in ${}^nC_3$ ways and so on.

Hence, the required number of ways

$$= {}^nC_1 + {}^nC_2 + {}^nC_3 + \dots + {}^nC_n$$
$$= ({}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n) - {}^nC_0 = 2^n - 1$$

Example 70. *Nishi has 5 coins, each of the different denomination. The number of different sums of money, she can form, is*

(a) 32
(b) 25
(c) 31
(d) None of the above

Sol. (c) Required number of ways

$$= {}^5C_1 + {}^5C_2 + {}^5C_3 + {}^5C_4 + {}^5C_5$$
$$= 2^5 - 1 = 31$$

Example 71. *A man has 6 friends. In how many ways he can invite one or more of them at dinner?*

(a) 64 *(b)* 65 *(c)* 63 *(d)* 61

Sol. (c) The man has to select some or all of his 6 friends.
So, required number of ways $= 2^6 - 1 = 63$

- *The number of ways of selecting r items out of n identical items is 1.*
- *The total number of ways of selecting zero or more i.e. items from a group of n identical items is $(n+1)$.*
- *The total number of selections of one or more out of $p+q+r$ items, where p are alike of one kind, q are alike of second kind and rest are alike of third kind is*

$$[(p+1)(q+1)(r+1)] - 1.$$

Selection from Identical and Distinct Objects

The total number of ways of selecting one or more items from p identical items of one kind, q identical items of second kind, r identical items of third kind and n different items is

$$(p+1)(q+1)(r+1)2^n - 1$$

Number of Divisors and the Sum of the Divisors of a Given Natural Number

Let $$n = p_1^{n_1} \cdot p_2^{n_2} \cdot p_3^{n_3} \ldots p_k^{n_k} \quad \ldots(i)$$

where, $p_1, p_2, \ldots, p_k$ are distinct prime numbers and $n_1, n_2, \ldots, n_k$ are positive integers.

Clearly, any divisor of n is of the form

$$d = p_1^{m_1} \cdot p_2^{m_2} \cdot p_3^{m_3} \ldots p_k^{m_k} \quad \ldots(ii)$$

where, $m_1, m_2, \ldots, m_k$ are natural numbers such that

$$0 \le m_i \le n_i, i = 1, 2, 3, \ldots, k$$

Therefore, the total number of divisors of Eq. (i) will be equal to the number of ways of selecting atleast one from n_1 identical primes p_1, n_2 identical primes p_2 and so on, finally n_k identical primes p_k. The number of such ways is

$$(n_1 + 1)(n_2 + 1)\ldots(n_k + 1)$$

Hence, the total number of divisors of

$$n = p_1^{n_1} \cdot p_2^{n_2} \cdot p_3^{n_3} \ldots p_k^{n_k} \text{ is}$$

$$(n_1 + 1)(n_2 + 1)(n_3 + 1)\ldots(n_k + 1)$$

This includes 1 and n as divisors. Therefore, number of divisors other than 1 and n is

$$(n_1 + 1)(n_2 + 1)(n_3 + 1)\ldots(n_k + 1) - 2$$

The sum of all divisors of Eq.(i) is given by

$$\sum_{r_1=0}^{n_1} \sum_{r_2=0}^{n_2} \sum_{r_3=0}^{n_3} \ldots \sum_{r_k=0}^{n_k} p_1^{r_1} \cdot p_2^{r_2} \cdot p_3^{r_3} \ldots p_k^{r_k}$$

$$= \left\{\frac{p_1^{n_1+1} - 1}{p_1 - 1}\right\}\left\{\frac{p_2^{n_2+1} - 1}{p_2 - 1}\right\}\left\{\frac{p_3^{n_3+1} - 1}{p_3 - 1}\right\} \ldots \left\{\frac{p_k^{n_k+1} - 1}{p_k - 1}\right\}$$

The number of ways of expressing n as a product of two natural numbers

$$= \begin{cases} \frac{1}{2}(n_1 + 1)(n_2 + 1)\ldots(n_k + 1), & \text{if } n \text{ is not perfect square} \\ \frac{1}{2}[(n_1 + 1)(n_2 + 1)\ldots(n_k + 1) + 1], & \text{if } n \text{ is perfect square} \end{cases}$$

e.g. To find number of ways in which the number 94864 can be resolved as a product of two factors.

$$94864 = 2^4 \times 7^2 \times 11^2$$

So, 94864 is a perfect square.

Hence, the number of ways $= \frac{1}{2}[(4+1)(2+1)(2+1)+1] = 23$

Example 72. *The total number of factors (excluding 1) of 2160 is*

(a) 40 (b) 39 (c) 41 (d) 38

Sol. (b) We have,

$$2160 = 2^4 \times 3^3 \times 5^1$$

The total number of divisors is same as the number of ways selecting same or all out of four 2's, three 3's and one 5's.

The number of ways

$$= (4 + 1)(3 + 1)(1 + 1) - 1 = 39$$

Example 73. *The total number of proper factors of 7875 is*

(a) 23
(b) 24
(c) 22
(d) 21

Sol. (c) We have,

$$7875 = 3^2 \times 5^3 \times 7^1$$

The total number of factor

$$= (2 + 1)(3 + 1)(1 + 1) - 1 = 23$$

But this includes the given number itself.

∴ Number of proper factors = 23 − 1 = 22

Example 74. *The number of factors (excluding 1 and the expression itself) of the product $a^7b^4c^3$ def, where a, b, c, d, e and f are all prime numbers, is*

(a) 1279
(b) 1278
(c) 1280
(d) 1277

Sol. (a) The total number of factors of the product $a^7b^4c^3def$ is equal to number of ways of selecting atleast one from seven a's, four b's, three c's, d, e, f are different.

∴ The number of ways

$$= (7 + 1)(4 + 1)(3 + 1)2^3 - 1 = 1279$$

Example 75. *The number of even divisors of 10800 is*

(a) 12 (b) 24 (c) 36 (d) 48

Sol. (d) We have,

$$10800 = 2^4 \times 3^3 \times 5^2$$

For a divisor to be even, we must have atleast one 2 out of four 2's any number of 3's and 5's.

∴ Total number of even divisors

$$= 4(3 + 1)(2 + 1) = 48$$

Example 76. *The sum of divisors of 2520 is*

(a) 9360 (b) 5040
(c) 9600 (d) None of these

Sol. (a) We have,

$$2520 = 2^3 \times 3^2 \times 5 \times 7$$

The sum of divisors of 2520

$$= (1 + 2 + 2^2 + 2^3)(1 + 3 + 3^2)(1 + 5)(1 + 7)$$
$$= 15 \times 13 \times 6 \times 8$$
$$= 9360$$

6 Division of Objects into Groups

Division of Items into Groups of Unequal Size

Number of ways in which $(m+n)$ distinct items can be divided into two unequal groups containing m and n items is $\dfrac{(m+n)!}{m!\,n!}$.

Proof

The number of ways in which $(m+n)$ items are divided into two groups containing m and n items is same as the number of combinations of $(m+n)$ things taken m at a time. Thus, the required number

$$= {}^{m+n}C_m = \frac{(m+n)!}{m!\,n!}.$$

- *The number of ways in which $(m+n+p)$ items can be divided into unequal groups containing m, n, p items, is*

$${}^{m+n+p}C_m \cdot {}^{n+p}C_n = \frac{(m+n+p)!}{m!\,n!\,p!}$$

- *The number of ways to distribute $(m+n+p)$ items among 3 persons in the groups containing m, n and p items*

= (Number of ways to divide) × (Number of groups)!

$$= \frac{(m+n+p)!}{m!\,n!\,p!} \times 3!$$

Example 77. *The number of ways to 16 different things to three persons A, B, C so that B gets one more than A and C gets two more than B, is*

(a) $\dfrac{16!}{4!5!7!}$ (b) $\dfrac{16!}{3!5!8!}$

(c) $4!5!7!$ (d) None of these

Sol. (a) Suppose, A gets x things, then B gets $(x+1)$ and C gets $(x+3)$ things.

$\therefore \quad x + x + 1 + x + 3 = 16$

$\Rightarrow \quad x = 4$

Thus, we have to distribute 16 things to A, B and C in such that A gets 4, B gets 5 and C gets 7 things.

$\therefore$ Required number of ways $= \dfrac{(4+5+7)!}{4!\,5!\,7!}$

$$= \frac{16!}{4!\,5!\,7!}$$

Division of Objects into Groups of Equal Size

The number of ways in which mn different objects can be divided equally into m groups, each containing n objects and the order of groups is not important, is

$$\left(\frac{(mn)!}{(n!)^m}\right)\frac{1}{m!}$$

The number of ways in which mn different items can be divided equally into m groups, each containing n objects and the order of groups is important, is

$$\left(\frac{(mn)!}{(n!)^m} \times \frac{1}{m!}\right)m! = \frac{(mn)!}{(n!)^m}$$

Example 78. *The number of ways in which a pack of 52 cards can be divided equally into four groups, is*

(a) $\dfrac{52!}{(13!)^4}$ (b) $\dfrac{52!}{(13!)^4 \times 4!}$

(c) $\dfrac{52!}{(13!) \times 4!}$ (d) None of these

Sol. (b) Here, 52 cards are to be divided in four equal groups and order of the group is not important.

So, required number of ways $= \dfrac{52!}{(13!)^4 \times 4!}$

Example 79. *The number of ways 12 different books can be distributed equally among 4 persons, is*

(a) $\dfrac{12!}{(4!)^3}$ (b) $\dfrac{12!}{(3!)^4 \times 3}$ (c) $\dfrac{12!}{(3!)^4}$ (d) $\dfrac{12!}{(4!)^4}$

Sol. (c) Here, 12 different books can be divided equally among 4 persons that each person will get 3 books. Hence, required number of distribution

$$= {}^{12}C_3 \cdot {}^{9}C_3 \cdot {}^{6}C_3 \cdot {}^{3}C_3 = \frac{12!}{(3!)^4}$$

Division of Identical Objects into Groups

i. The total number of ways of dividing n identical items among r persons, each one of whom, can receive 0, 1, 2 or more items $(\le n)$ is ${}^{n+r-1}C_{r-1}$.

Or

The total number of ways of dividing n identical objects into r groups, if blank groups are allowed, is ${}^{n+r-1}C_{r-1}$.

Example 80. *The total number of ways can 15 identical Mathematics books be distributed among six students, is*

(a) $\dfrac{15!}{6!9!}$ (b) $\dfrac{20!}{5!15!}$

(c) ${}^{15}P_6$ (d) None of these

Sol. (b) We know that the total number of ways in which n things all alike can be distributed into r different boxes is ${}^{n+r-1}C_{r-1}$, when blank box is allowed. Hence, number of ways in which 15 identical books be distributed among six students

$$= {}^{15+6-1}C_{6-1} = {}^{20}C_5 = \frac{20!}{5!15!}$$

ii. The total number of ways of dividing n identical items among r persons, each one of whom, receives atleast one item is ${}^{n-1}C_{r-1}$.

Or

The number of ways in which n identical items can be divided into r groups such that blank groups are not allowed is ${}^{n-1}C_{r-1}$.

Example 81. *The number of ways in which 10 identical balls can be distributed in 4 distinct boxes, so that none of the boxes remain empty, is*

(a) ${}^{10}C_4$ *(b)* ${}^{10}P_4$

(c) ${}^{9}P_3$ *(d) None of these*

Sol. (d) The required number of ways of distributing 10 identical items to three persons such that each person receives atleast one item.

So, required number of ways

$$= {}^{10-1}C_{4-1} = {}^9C_3 = \frac{9!}{3!6!} = 84$$

iii. The number of ways in which n identical items can be divided into r groups so that no group contains less than m items and more than $k\,(m<k)$ items is coefficient of x^n in the expansion of $(x^m + x^{m+1} + \ldots + x^k)^r$.

Example 82. *Five distinct letters are to be transmitted through a communication channel. A total number of 15 blanks is to be inserted between the letters with atleast three between every two. The number of ways in which this can be done, is*

(a) 1200 *(b)* 1800

(c) 2400 *(d)* 3000

Sol. (c) For $1 \le i \le 4$, let $x_i (\ge 3)$ be the number of blanks between ith and $(i+1)$th letters. Then,

$$x_1 + x_2 + x_3 + x_4 = 15 \quad \ldots\text{(i)}$$

The number of solutions of Eq. (i)

= Coefficient of t^{15} in $(t^3 + t^4 + \ldots)^4$

= Coefficient of t^3 in $(1-t)^{-4}$

= Coefficient of t^3 in $(1 + {}^4C_1 + {}^5C_2 t^2 + {}^6C_3 t^3 + \ldots)$

But 5 letters can be permuted in $5! = 120$ ways.

Thus, the required number of arrangements

$$= (120)(20) = 2400$$

Dearrangements

If n distinct objects are arranged in a row, then the number of ways in which they can be dearranged, so that none of them occupies its original place is

$$n!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \ldots + (-1)^n \frac{1}{n!}\right\}$$

and it is denoted by $D(n)$.

If $r\,(0 \le r \le n)$ objects occupy the places assigned to them i.e. their original places and none of the remaining $(n-r)$ objects occupies its original places, then the number of such ways is $D(n-r) = {}^nC_r \cdot D(n-r)$

$$= {}^nC_r \cdot (n-r)!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^{n-r}\frac{1}{(n-r)!}\right\}$$

Example 83. *There are four balls of different colours and four boxes of colours, same as those of the balls. The number of ways in which the balls, one each in a box, could be placed such that a ball does not go to a box of its own colour is*

(a) 9

(b) 13

(c) 8

(d) None of the above

Sol. (a) The required number of ways

$$= 4!\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!}\right]$$

$$= 12 - 4 + 1 = 9$$

Example 84. *The number of ways can 10 letters be placed in 10 marked envelopes, so that no letter is in the right envelope, are*

(a) $10!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{1}{10!}\right\}$

(b) $10!\left\{1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right\}$

(c) $\left\{1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right\}$

(d) $9!\left\{1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right\}$

Sol. (a) The required number of ways is equal to the number of dearrangements of 10 objects.

Hence, required number of ways

$$= 10!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{1}{10!}\right\}$$

Example 85. *Ajay writes letters to his five friends and addresses the corresponding. The number of ways can the letters be placed in the envelopes, so that atleast two of them are in the wrong envelopes, are*

(a) 120

(b) 125

(c) 119

(d) None of the above

Sol. (c) Required number of ways

$$= \sum_{r=2}^{5} {}^5C_{5-r}\, D(r)$$

$$= \sum_{r=2}^{5} \frac{5!}{r!(5-r)!} r!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{(-1)^r}{r!}\right\}$$

$$= \sum_{r=2}^{5} \frac{5!}{(5-r)!}\left\{\frac{1}{2!} - \frac{1}{3!} + \dots + \frac{(-1)^r}{r!}\right\}$$

$$= \frac{5!}{3!}\left(\frac{1}{2!}\right) + \frac{5!}{2!}\left(\frac{1}{2!} - \frac{1}{3!}\right) + \frac{5!}{1!}\left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!}\right) + \frac{5!}{0!}\left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right)$$

$$= 10 + 20 + (60 - 20 + 5) + (60 - 20 + 5 - 1)$$

$$= 10 + 20 + 45 + 44 = 119$$

Number of Integral Solutions of Linear Equations and Inequations

Consider the equation

$$x_1 + x_2 + x_3 + x_4 + \dots + x_r = n \qquad \dots\text{(i)}$$

where, $x_1, x_2, x_3, x_4, \dots, x_r$ and n are non-negative integers.

This equation may be interpreted as that n identical objects are to be divided into r groups, where a group may contain any number of objects. Therefore,

Total number of solutions of Eq. (i)

$$= \text{Coefficient of } x^n \text{ in } (x^0 + x^1 + \dots + x^n)^r$$

$$= {}^{n+r-1}C_n \text{ or } {}^{n+r-1}C_{r-1}$$

- *The total number of non-negative integral solutions of the equation $x_1 + x_2 + \dots + x_r = n$ is ${}^{n+r-1}C_{r-1}$ and the total number of solutions of the same equation in the set N of natural numbers is ${}^{n-1}C_{r-1}$.*
- *If the upper limit of a variable in solving an equation of the form $x_1 + x_2 + \dots + x_m = n$ subject to the conditions $a_i \le x \le b_i$; $i = 1, 2, \dots, m$ is more than or equal to the sum required and lower limit of all the variables are non-negative, then upper limit of that variable can be taken as infinite.*
- *In order to solve inequations of the form*

  $$x_1 + x_2 + \dots + x_m \le n$$

  We introduce a dummy (artificial) variable x_{m+1} such that

  $$x_1 + x_2 + \dots + x_m + x_{m+1} = n, \text{ where } x_{m+1} \ge 0.$$

  The number of solutions of this equation are same as the number of solutions of Eq. (i).

Example 86. *In an examination, the maximum marks for each of three papers is n and that for fourth paper is 2n. Then, the number of ways in which a candidate can get 3n marks, is*

(a) $\frac{1}{6}(n-1)(5n^2 + 10n + 6)$

(b) $\frac{1}{6}(n+1)(5n^2 + 10n + 6)$

(c) $\frac{1}{6}(n+1)(5n^2 + n + 6)$

(d) None of the above

Sol. (b) The total number of ways of getting $3n$ marks

$= \text{Coefficient of } x^{3n}$ in $(x^0 + x^1 + x^2 + \dots + x^n)^3 \times (x^0 + x^1 + \dots + x^{2n})$

$$= \text{Coefficient of } x^{3n} \text{ in } \left(\frac{1 - x^{n+1}}{1 - x}\right)^3 \left(\frac{1 - x^{2n+1}}{1 - x}\right)$$

$$= \text{Coefficient of } x^{3n} \text{ in } (1 - x^{n+1})^3 (1 - x^{2n+1})(1 - x)^{-4}$$

$$= \text{Coefficient of } x^{3n} \text{ in } [(1 - 3x^{n+1} + 3x^{2n+2} - x^{3n+3})(1 - x^{2n+1})(1 - x)^{-4}]$$

$$= \text{Coefficient of } x^{3n} \text{ in } [(1 - 3x^{n+1} - x^{2n+1} + 3x^{2n+2} + \dots)(1 - x)^{-4}]$$

$$= \text{Coefficient of } x^{3n} \text{ in } (1 - x)^{-4} - 3 \text{ Coefficient of } x^{2n-1} \text{ in } (1 - x)^{-4} - \text{Coefficient of } x^{n-1} \text{ in } (1 - x)^{-4} + 3 \text{ Coefficient of } x^{n-2} \text{ in } (1 - x)^{-4}$$

$$= {}^{3n+4-1}C_{4-1} - 3 \times {}^{2n-1+4-1}C_{4-1} - {}^{n-1+4-1}C_{4-1} + 3 \times {}^{n-2+4-1}C_{4-1}$$

$$= {}^{3n+3}C_3 - 3 \times {}^{2n+2}C_3 - {}^{n+2}C_3 + 3 \times {}^{n+1}C_3$$

$$= \frac{(3n+3)(3n+2)(3n+1)}{6} - 3 \cdot \frac{(2n+2)(2n+1)(2n)}{6} - \frac{(n+2)(n+1)(n)}{6} + 3 \cdot \frac{(n+1)(n)(n-1)}{6}$$

$$= \frac{1}{6}(n+1)(5n^2 + 10n + 6)$$

Example 87. *The number of ways of selecting n objects out of 3n objects, of which n are alike and rest are different, is*

(a) $2^{2n-1} + \frac{(2n-1)!}{n!(n-1)!}$ (b) $2^{2n-1} - \frac{(2n-1)!}{n!(n-1)!}$

(c) $2^{2n+1} + \frac{(2n+1)!}{n!(n+1)!}$ (d) None of these

Sol. (a) The required number of ways

$$= \text{Coefficient of } x^n \text{ in } (x^0 + x^1 + x^2 + \dots + x^n)(x^0 + x)^{2n}$$

$$= \text{Coefficient of } x^n \text{ in } \left(\frac{1 - x^{n+1}}{1 - x}\right)(1 + x)^{2n}$$

$$= \text{Coefficient of } x^n \text{ in } (1 - x)^{-1}(1 + x)^{2n}$$

$$= \text{Coefficient of } x^n \text{ in } \left(\sum_{r=0}^{\infty} x^r\right)(1 + x)^{2n}$$

$$= \text{Coefficient of } x^n \text{ in } \left(\sum_{r=0}^{n} x^r\right)(1 + x)^{2n}$$

$$= \text{Coefficient of } x^n \text{ in } \sum_{r=0}^{n} x^r (1 + x)^{2n}$$

$$= \sum_{r=0}^{n} \text{Coefficient of } x^{n-r} \text{ in } (1 + x)^{2n}$$

$$= \sum_{r=0}^{n} {}^{2n}C_{n-r}$$

$$= {}^{2n}C_n + {}^{2n}C_{n+1} + \dots + {}^{2n}C_1 + {}^{2n}C_0$$

$$= \frac{1}{2}[{}^{2n}C_n + \{{}^{2n}C_0 + {}^{2n}C_1 + \dots + {}^{2n}C_n + {}^{2n+1}C_{n+1} + \dots + {}^{2n}C_{2n}\}] \quad [\because {}^nC_r = {}^nC_{n-r}]$$

$$= \frac{1}{2}[{}^{2n}C_n + 2^{2n}] = \frac{1}{2}\left[\frac{2n!}{n!\,n!} + 2^{2n}\right] = 2^{2n-1} + \frac{(2n-1)!}{n!\,(n-1)!}$$

Example 88. *The number of ways of selecting 4 letters from the word EXAMINATION, is*

(a) 136 (b) 140 (c) 126 (d) 102

Sol. (a) There are 11 letters in the word EXAMINATION *viz.* 2 A's, 2 I's, 2 N's, E, X, M, T, O.

Therefore,

Number of ways of selecting 4 letters from these letters

$= \text{Coefficient of } x^4 \text{ in } (x^0 + x^1 + x^2)^3 (1+x)^5$

$= \text{Coefficient of } x^4 \text{ in } \left(\frac{1-x^3}{1-x}\right)^3 (1+x)^5$

$= \text{Coefficient of } x^4 \text{ in } (1-x^3)^3 (1-x)^{-3} (1+x)^5$

$= \text{Coefficient of } x^4 \text{ in } (1-3x^3+3x^6-x^9)(1+x)^5(1-x)^{-3}$

$= \text{Coefficient of } x^4 \text{ in } (1-3x^3)(1+{}^5C_1x+{}^5C_2x^2 + {}^5C_3x^3+{}^5C_4x^4)(1-x)^{-3}$

$= \text{Coefficient of } x^4 \text{ in } (1+5x+10x^2+7x^3-10x^4)(1-x)^{-3}$

$= {}^{4+3-1}C_{3-1} + 5\times {}^{3+3-1}C_{3-1} + 10\times {}^{2+3-1}C_{3-1} + 7\times {}^{1+3-1}C_{3-1} - 10$

$= {}^6C_2 + 5\times {}^5C_2 + 10\times {}^4C_2 + 7\times {}^3C_2 - 10$

$= 15+50+60+21-10 = 136$

Example 89. *The number of ways in which 16 identical things can be distributed among 4 persons, if each person gets atleast 3 things, is*

(a) 33 (b) 35

(c) 38 (d) None of these

Sol. (b) Required number

$= \text{Coefficient of } x^{16} \text{ in } (x^3+x^4+\ldots+x^7)^4$

$= \text{Coefficient of } x^4 \text{ in } (1+x+\ldots+x^4)^4$

$= \text{Coefficient of } x^4 \text{ in } \left(\frac{1-x^5}{1-x}\right)^4$

$= \text{Coefficient of } x^4 \text{ in } [(1-x^5)^4(1-x)^{-4}]$

$= \text{Coefficient of } x^4 \text{ in } (1-x)^{-4} = {}^7C_3 = \frac{4\cdot5\cdot6\cdot7}{4!} = 35$

Aliter

$x_1+x_2+x_3+x_4 = 16$, where $x_1, x_2, x_3, x_4 \geq 3$

or $x_1-3=a_1,\ x_2-3=a_2,\ x_3-3=a_3,\ x_4-3=a_4$

$\therefore\ a_1, a_2, a_3, a_4 \geq 0$ or $a_1+a_2+a_3+a_4 = 8$

$\Rightarrow$ Number of solutions $= {}^{4+4-1}C_{4-1} = {}^7C_3$

$$= \frac{7\times6\times5}{3\times2} = 35$$

Example 90. *If N is the number of positive integral solution of $x_1x_2x_3x_4 = 770$. Then,*

(a) N is 250 *(b) N is 252*

(c) N is 254 *(d) N is 256*

Sol. (d) We have, $770 = 2\cdot5\cdot7\cdot11$

We can assign 2 to x_1 or x_2 or x_3 or x_4 i.e. 2 can be assigned in 4 ways.

Similarly, each of 5, 7 or 11 can be assigned in 4 ways.

Thus, the number of positive integral solution of

$$x_1x_2x_3x_4 = 770 \text{ is } 4^4 = 2^8 = 256$$

Aliter

$$x_1x_2x_3x_4 = 2^1\cdot5^1\cdot7^1\cdot11^1$$

$\therefore\ a_1+a_2+a_3+a_4 = 1$

i.e. 2^1 can be assigned to a_1, a_2, a_3, a_4.

$\Rightarrow\ {}^{1+4-1}C_{4-1} = {}^4C_3 = 4$

Similarly, for $5^1, 7^1, 11^1$

$\therefore$ Total number of ways $= 4\cdot4\cdot4\cdot4 = 256$

Work Book Exercise 6.6

1 The total number of ways of dividing 15 different things into groups of 8, 4 and 3 respectively, is

$\frac{15!}{7!3!2!}$ $\frac{15!}{9!5!4!}$

$\frac{15!}{8!4!3!}$ None of these

2 The number of ways of distributing 50 identical things among 8 persons in such a way that three of them get 8 things each, two of them get 7 things each and remaining 3 get 4 things each, is

$\frac{8!}{(3!)^2(2!)}$ $\frac{8!}{(2!)^2\,3!}$

$\frac{8!}{(4!)^2\,3!}$ None of these

3 In how many ways can we put 12 different balls in three different boxes such that the first box contains exactly 5 balls?

${}^{12}C_3\cdot5^7$ ${}^{12}C_5\cdot2^7$

c ${}^{12}C_5\cdot5^2$ None of these

4 The number of ways, 3 persons *A*, *B* and *C* having 6 one rupee coins, 7 one rupee coins and 8 one rupee coins respectively can donate 10 one rupee coins collectively, is

a ${}^7C_3$ ${}^8C_3$

c ${}^{10}C_3$ None of these

5 In an examination, the maximum marks for each of the three papers are 50. Maximum marks for the fourth paper is 100. The number of ways in which a candidate can score 60% marks on the whole, is

a 100550 101551

c 110551 d None of these

6 The number of ways of dividing 20 persons into 10 couples, is

a $\frac{20!}{2^{10}}$ ${}^{20}C_{10}$

c $\frac{20!}{(2!)^9}$ None of these

7 The number of integer solutions for the equation $x+y+z+t=20$, where $x, y, z, t \geq -1$, is

a $^{20}C_4$ $^{23}C_3$
c $^{27}C_4$ $^{27}C_3$

8 The number of ways in which mn students can be distributed equally among m sections, is

a $\frac{(mn)!}{n!}$ $\frac{(mn)!}{(n!)^m}$
c $\frac{(mn)!}{m!n!}$ $(mn)^m$

9 The number of integers which lie between 1 and 10^6 and which have the sum of the digits equal to 12, is

a 8550 5382 c 6062 8055

10 The number of integral solutions of $x+y+z=10$, with $x \geq -5$, $y \geq -5$, $z \geq -5$, is

a 135 136 c 455 105

11 The number of ways in which a score of 11 can be made from a throw by three persons, each throwing a single die once, is

a 45 b 18
c 27 d None of these

12 If $x, y, z, \dots$ are $(m+1)$ distinct prime numbers, then then number of factors of $x^n y z \dots$ is

a $m(n+1)$ b $2^n m$
c $(n+1)2^m$ d $n \cdot 2^m$

13 There are m copies of each of n different books in a university library. The number of ways in which one or more than one book can be selected, is

a m^n+1 b $(m+1)^n-1$
c $(n+1)^n-m$ d m

14 The number of ways in which one or more balls can be selected out of 10 white, 9 green and 7 blue balls, is

a 892 b 881
c 891 d 879

15 The number of all three element subsets of the set $\{a_1, a_2, a_3, \dots, a_n\}$ which contain a_3, is

a $^nC_3$ b $^{n-1}C_3$
c $^{n-1}C_2$ d None of these

16 If one quarter of all three element subsets of the set $A=\{a_1, a_2, a_3, \dots, a_n\}$ contains the element a_3, then n is equal to

a 10
b 12
c 14
d None of the above

17 The number of positive integral solutions of $abc=30$ is

a 30 b 27
c 8 None of these

18 The number of non-negative integral solutions of $x+y+z \leq n$, where $n \in N$ is

a $^{n+3}C_3$ b $^{n+4}C_4$
c $^{n+5}C_5$ d None of these

19 If n objects are arranged in a row, then the number of ways of selecting three of these objects, so that no two of them are next to each other, is

a $^{n-2}C_3$ b $^{n-3}C_2$
c $^{n-3}C_3$ d None of these

20 There are three piles of identical red, blue and green balls and each pile contains atleast 10 balls. The number of ways of selecting 10 balls, if twice as many red balls as green balls are to be selected, is

a 3 b 4
c 6 d 8

21 Two classrooms A and B having capacity of 25 and $(n-25)$ seats, respectively. Let A_n denotes the number of possible sitting arrangements of room A, when n students are to be seated in these rooms, starting from room A which is to be filled up full to its capacity. If $A_n - A_{n-1} = 25!(^{49}C_{25})$, then n equals

a 49 b 48 c 50 d 51

22 Between two junction stations A and B, there are 12 intermediate stations. The number of ways in which a train can be made to stop at 4 of these stations, so that no two of these halting stations are consecutive, is

a $^8C_4$ b $^9C_4$
c $^{12}C_4-4$ d None of these

23 The sum of the divisors of $2^5 \cdot 3^4 \cdot 5^2$ is

a $3^2 \cdot 7^1 \cdot 11^2$
b $63 \cdot 121 \cdot 31$
c $3 \cdot 7 \cdot 11 \cdot 31$
d None of the above

24 The number of ways arranging m positive and $n < m+1$ negative signs in a row, so that no two negative signs are together, is

a $^{m+1}P_n$
b $^{n+1}P_m$
c $^{m+1}C_n$
d $^{n+1}C_m$

25 If a_i, $i=1, 2, 3, 4$ is four real numbers of the same sign, then the minimum value of $\Sigma \frac{a_i}{a_j}$, $i, j \in \{1, 2, 3, 4\}$, $i \neq j$, is

a 8
b 6
c 12
d None of the above

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. Number of positive integer n less than 17, for which $n!+(n+1)!+(n+2)!$ is an integral multiple of 49, is

(a) 0 (b) 3

(c) 5 (d) 2

Sol. Here, $n! + (n+1)! + (n+2)!$

$= n![1 + (n+1) + (n+2)(n+1)] = n!(n+2)^2$

Either 7 divides $(n+2)$ or 49 divides $n!$.

i.e. $n = 5, 12, 14, 15, 16$ $[\because n < 17]$

Thus, number of solutions is five.

Hence, (c) is the correct answer.

Ex 2. If $\dfrac{2}{9!}+\dfrac{2}{3!\,7!}+\dfrac{1}{5!\,5!}=\dfrac{2^a}{b!}$, where $a, b \in N$, then the ordered pair (a, b) is

(a) (9, 10)

(b) (10, 9)

(c) (7, 10)

(d) (10, 7)

Sol. Here, $\dfrac{2}{9!}+\dfrac{2}{3!7!}+\dfrac{1}{5!5!}$

$$=\frac{1}{1!9!}+\frac{1}{3!7!}+\frac{1}{5!5!}+\frac{1}{3!7!}+\frac{1}{9!1!}$$

$$=\frac{1}{10!}\left\{\frac{10!}{9!1!}+\frac{10!}{7!3!}+\frac{10!}{5!5!}+\frac{10!}{3!7!}+\frac{10!}{9!1!}\right\}$$

$$=\frac{1}{10!}\{{}^{10}C_1+{}^{10}C_3+{}^{10}C_5+{}^{10}C_7+{}^{10}C_9\}$$

$$=\frac{1}{(10)!}\cdot(2^{10-1})=\frac{2^9}{10!}, \text{ but it is } \frac{2^a}{b!}.$$

$\Rightarrow$ $a = 9$ and $b = 10$

Hence, (a) is the correct answer.

Ex 3. Number of ordered triplets (x, y, z) such that x, y, z are primes and $x^y + 1 = z$, is

(a) 0

(b) 1

(c) 3

(d) None of the above

Sol. Here, $x^y + 1 = z$, where x, y, z are prime.

Thus, y cannot be odd, if y is prime.

$\Rightarrow$ $x^y + 1$ is divisible by $(x+1)$.

Now, z must be odd.

$\Rightarrow x$ must be even. $[\because x^y = z - 1]$

Thus, only even value (i.e. prime) is $x = 2$.

$\Rightarrow$ $x = 2,\ y = 2,\ z = 5$

So, there is only one such triplet (2, 2, 5).

Hence, (b) is the correct answer.

Ex 4. $\displaystyle\sum_{0\le i<j<k<l\le n}\sum\sum\sum$ is equal to

(a) ${}^{n+1}C_4$ (b) $n\,{}^{n+1}C_4$

(c) ${}^{n+1}C_3$ (d) $n(n+1)$

Sol. As $\displaystyle\sum_{0\le i<j<k<l\le n}\sum\sum\sum n = n\sum_{0\le i<j<k<l\le n}\sum\sum\sum$ represents selection of four terms from $\{0, 1, 2, ..., n\}$ i.e. $(n+1)$ terms.

Thus, $\displaystyle\sum_{0\le i<j<k<l\le n}\sum\sum\sum n = n\cdot{}^{n+1}C_4$

Hence, (b) is the correct answer.

Ex 5. Let A denotes the property that two elements of $A = \{1, 5, 9, 13, \ldots, 1093\}$ add upto 1094. Then, maximum number of elements in A can be

(a) 273 (b) 136

(c) 137 (d) 138

Sol. Since, $A = \{1, 5, 9, 13, ..., 1093\}$ is an arithmetic progression.

$\therefore$ Number of terms $=\dfrac{1093-1}{4}+1$

$= 274$

Since, sum of equidistant terms in AP is equal to sum of first and last terms $= 1 + 1093 = 1094$.

$\therefore$ Maximum number of elements in A that add upto 1094

$$=\frac{274}{2}=137$$

Hence, (c) is the correct answer.

Ex 6. Let $n_1 = x_1x_2x_3$ and $n_2 = y_1y_2y_3$ be two 3-digit numbers, then the pairs of n_1 and n_2 can be formed, so that n_1 can be subtracted from n_2 without borrowing, is

(a) $55\cdot 54$ (b) $45\cdot 55$

(c) $45\cdot(55)^2$ (d) $55\cdot(45)^2$

Sol. Here, $n_1 = x_1x_2x_3$ and $n_2 = y_1y_2y_3$

$\Rightarrow$ n_1 can be subtracted from n_2 without borrowing, if $y_i \ge x_i$ for $i = 1, 2, 3$.

$$\therefore \text{ Let } x_i = r \Rightarrow \begin{cases} r = 0, 1, 2, \ldots, 9, \text{ for } x_2 \text{ and } x_3 \\ r = 1, 2, 3, \ldots, 9, \text{ for } x_1 \end{cases}$$

$\therefore$ $y_i = r, r+1, \ldots, 9$

Thus, for y_1, y_2 and y_3, we have $(10 - r)$ choices each.

Now, total number of ways for choosing y_i and x_i

$$=\left\{\sum_{r=1}^{9}(10-r)\right\}\left\{\sum_{r=0}^{9}(10-r)\right\}\left\{\sum_{r=0}^{9}(10-r)\right\}$$

$$= 45\cdot 55\cdot 55 = 45\cdot(55)^2$$

Hence, (c) is the correct answer.

Ex 7. Let
$E=(2n+1)(2n+3)(2n+5)\dots(4n-3)(4n-1)$;
$n>1$, then $2^n E$ is divisible by
(a) ${}^{n}C_{n/2}$ (b) ${}^{2n}C_n$ (c) ${}^{3n}C_n$ (d) ${}^{4n}C_{2n}$

Sol. Here, $E=(2n+1)(2n+3)(2n+5)\dots(4n-3)(4n-1)$

or $E=\dfrac{(2n+1)(2n+2)(2n+3)(2n+4)\dots(4n-1)(4n)}{(2n+2)(2n+4)\dots(4n)}\cdot\dfrac{(2n)!}{(2n)!}$

$$=\frac{(4n)!}{(2n)!\cdot 2^n\cdot(n+1)(n+2)\dots(2n)}$$

$$E=\frac{(4n)!\cdot n!}{(2n)!2^n\cdot(2n)!}$$

$$\Rightarrow\quad 2^nE=\frac{(4n)!}{(2n)!(2n)!}\cdot n!={}^{4n}C_{2n}\cdot n!$$

$\therefore 2^nE$ is divisible by ${}^{4n}C_{2n}$.

Hence, (d) is the correct answer.

Ex 8. $\displaystyle\sum_{0\le i\le j\le 10}\sum {}^{10}C_j\,{}^{j}C_i$ is equal to
(a) $2^{10}-1$ (b) 2^{10}
(c) $3^{10}-1$ (d) None of these

Sol. We have, $\displaystyle\sum_{0\le i\le j\le 10}\sum {}^{10}C_j\,{}^{j}C_i$

$$={}^{10}C_0\cdot{}^{0}C_0+{}^{10}C_1({}^{1}C_0+{}^{1}C_1)+{}^{10}C_2({}^{2}C_0+{}^{2}C_1+{}^{2}C_2)+{}^{10}C_3({}^{3}C_0+{}^{3}C_1+{}^{3}C_2+{}^{3}C_3)+\dots+{}^{10}C_{10}({}^{10}C_0+{}^{10}C_1+{}^{10}C_2+\dots+{}^{10}C_{10})$$

$$={}^{10}C_0\cdot 2^0+{}^{10}C_1\cdot 2^1+{}^{10}C_2\cdot 2^2+{}^{10}C_3\cdot 2^3+\dots+{}^{10}C_{10}\cdot 2^{10}$$

$$=(1+2)^{10}=3^{10}$$

Hence, (d) is the correct answer.

Ex 9. $\displaystyle\lim_{n\to\infty}\frac{\sum\sum_{1\le i\le j\le n}(i+1)(j+1)}{n^4}$ is equal to
(a) $\frac{1}{4}$ (b) $\frac{1}{6}$
(c) $\frac{1}{8}$ (d) None of these

Sol. Here, $\displaystyle\lim_{n\to\infty}\frac{\sum\sum_{1\le i\le j\le n}(i+1)(j+1)}{n^4}$

$$=\lim_{n\to\infty}\frac{\left(\sum_{i=1}^{n}(i+1)\right)^2-\sum_{i=1}^{n}(i+1)^2}{2n^4}$$

$$=\lim_{n\to\infty}\frac{\left\{\frac{(n+2)(n+1)}{2}-1\right\}^2-\left\{\frac{(n+1)(n+2)(2n+3)}{6}-1\right\}}{2n^4}$$

$$=\lim_{n\to\infty}\frac{n^4\left(\frac{1}{4}\right)+n^3\dots\text{ and decreasing powers of } n}{2n^4}=\frac{1}{8}$$

Hence, (c) is the correct answer.

Ex 10. A seven-digit numbers divisible by 9 is to be formed by using 7 out of numbers {1, 2, 3, 4, 5, 6, 7, 8, 9}. The number of ways in which this can be done, is
(a) 7! (b) $2\cdot(7)!$
(c) $3\cdot(7)!$ (d) $4\cdot 7!$

Sol. Sum of 7 digits = a multiple of 9
We know, sum of numbers 1, 2, 3, 4, 5, 6, 7, 8, 9 is 45.
So, two left numbers should also have sum as 9. The pairs to be left are (1, 8), (2, 7), (3, 6), (4, 5) with each pair left number of 7 digit numbers is 7!.
So, with all 4 pairs $=4\times 7!$
Hence, (d) is the correct answer.

Ex 11. Among 9! permutations of the digits 1, 2, 3,..., 9. Consider those arrangements which have the property that if we take any five consecutive positions, the product of the digits in those positions is divisible by 7, the number of such arrangements is
(a) 7! (b) $3\cdot 7!$ (c) 8! (d) $4\cdot 7!$

Sol. Since, amongst 9! arrangements of digits 1, 2, 3, 4, 5, 6, 7, 8, 9 i.e. the number formed is of the form $x_1\,x_2\,x_3\,x_4\,x_5\,x_6\,x_7\,x_8\,x_9$. Taking any five consecutive positions product is divisible by 7 only, if $x_5=7$.
So, the required arrangements = 8!
Hence, (c) is the correct answer.

Ex 12. Let $S_n=\displaystyle\sum_{r=1}^{n}r!$; $(n>6)$, then $S_n-7\left[\dfrac{S_n}{7}\right]$ (where, [ ] denotes the greatest integer function) is equal to
(a) $\left[\frac{n}{7}\right]$ (b) $n!-7\left[\frac{n}{7}\right]$
(c) 5 (d) 3

Sol. All the number $r!$ 1; $(r\ge 7)$ will be multiple of 7.
So, for remainder, consider
$S_6=1+2+6+24+120+720=873$
which leaves the remainder 5, when divided by 7.
Hence, (c) is the correct answer.

Ex 13. The number of ways of arranging m numbers out of 1, 2, 3, ..., n, so that maximum is $(n-2)$ and minimum is 2 (repetitions of numbers is allowed) such that maximum and minimum both occur exactly once $(n>5,\ m>3)$, is
(a) ${}^{n-3}C_{m-2}$ (b) ${}^{m}C_2\,(n-3)^{m-2}$
(c) $m(m-1)(n-5)^{m-2}$ (d) ${}^{n}C_2\cdot{}^{n}C_m$

Sol. First, we take one number as 2 and one as $(n-2)$ and put them in $m(m-1)$ ways. Now, remaining $(m-2)$, numbers can be anyone from, 3, 4, ..., $(n-4)$, $(n-3)$. Which we can do in $(n-5)^{(m-2)}$.
$\therefore$ Total number of ways $=m(m-1)(n-5)^{m-2}$
Hence, (c) is the correct answer.

Ex 14. Total number of integer n such that $2 \le n \le 2000$ and HCF of n and 36 is one, is equal to

(a) 666
(b) 667
(c) 665
(d) None of the above

Sol. $\because 36 = 2^2 \cdot 3^2$

Total number of integers $\in [2, 2000]$ that are divisible by 2 is

$$\left[\frac{2000}{2}\right] = 1000$$

The integer $\in [2, 2000]$ that are divisible by 3 is

$$\left[\frac{2000}{3}\right] = 666$$

Integers that are divisible by 2 and 3 and contained in

$$[2, 2000] = \left[\frac{2000}{6}\right] = 333$$

Thus, total number of integers that are neither divisible by 2 nor by 3

$$= 1999 - (1000 + 666 - 333) = 666$$

Hence, (a) is the correct answer.

Ex 15. If $E = \frac{1}{4} \cdot \frac{2}{6} \cdot \frac{3}{8} \cdot \frac{4}{10} \ldots \frac{30}{62} \cdot \frac{31}{64} = 8^x$, then value of x is

(a) -7 (b) -9
(c) -10 (d) -12

Sol. We have,

$$E = \frac{31!}{2^{31}(32)!} = \frac{1}{2^{31}(32)} = \frac{1}{2^{36}}$$

$$= 2^{-36} = (2^3)^{-12} = 8^{-12}, \text{ but it is } 8^x.$$

Thus, $x = -12$

Hence, (d) is the correct answer.

Ex 16. The number of rational numbers lying in the interval (2002, 2003) all whose digits after the decimal points are non-zero and are in decreasing order, is

(a) $\sum_{i=1}^{9} {}^9P_i$ (b) $\sum_{i=1}^{10} {}^9P_i$
(c) $2^9 - 1$ (d) $2^{10} - 1$

Sol. A rational number of the desired category is of the form 2002. $x_1x_2\ldots x_k$, where $1 \le k \le 9$ and $9 \ge x_1 > x_2 > \ldots > x_k \ge 1$. We can choose k digits out 9 in ${}^9C_k$ ways and arrange them in decreasing order in just one way. Thus, the desired number of rational numbers is

$${}^9C_1 + {}^9C_2 + \ldots + {}^9C_9 = 2^9 - 1$$

Hence, (c) is the correct answer.

Ex 17. The number of ways of dividing 15 men and 15 women into 15 couples, each consisting of a man and a woman, is

(a) 1240 (b) 1840 (c) 1820 (d) 2005

Sol. The number of ways of choosing first couple is $({}^{15}C_1)({}^{15}C_1) = 15^2$, the number of ways of choosing 2nd couple is $({}^{14}C_1)({}^{14}C_1) = 14^2$ and so on. Thus, the number of ways of choosing the couple is

$$15^2 + 14^2 + 13^2 + \ldots + 2^2 + 1^2$$

$$= \frac{15 \times (15+1)[2(15)+1]}{6} = 1240$$

Hence, (a) is the correct answer.

Ex 18. The number of ordered pairs (m, n), $m, n \in \{1, 2, \ldots, 50\}$ such that $6^n + 9^m$ is a multiple of 5, is

(a) 2500 (b) 1250 (c) 625 (d) 500

Sol. All the numbers of the form 6^n will end with 6 and 9^m will end with 9, if m is odd and will end with 1, if m is even, so $6^n + 9^m$ will end with 5, if n is any number and m is odd.

So, ordered pairs will be $50 \times 25 = 1250$.

Hence, (b) is the correct answer.

Ex 19. n is selected from the set $\{1, 2, 3, \ldots, 100\}$ and the number $2^n + 3^n + 5^n$ is formed. Total number of ways of selecting n, so that the formed number is divisible by 4, is equal to

(a) 50 (b) 49
(c) 48 (d) None of these

Sol. If n is odd, $3^n = 4\lambda_1 - 1$, $5^n = 4\lambda_2 + 1$

$\Rightarrow 2^n + 3^n + 5^n$ is not divisible by 4, as $2^n + 3^n + 5^n$ will be in the form of $4\lambda + 2$.

Thus, total number of ways of selecting n is 49.

Hence, (b) is the correct answer.

Ex 20. The number of ordered pairs (m, n), $m, n \in \{1, 2, \ldots, 100\}$ such that $7^m + 7^n$ is divisible by 5, is

(a) 1250 (b) 2000 (c) 2500 (d) 5000

Sol. Note that 7^r $(r \in N)$ ends in 7, 9, 3 or 1 (corresponding to $r = 1, 2, 3$ and 4, respectively).

Thus, $7^m + 7^n$ cannot end in 5 for any values of $m, n \in N$.

In other words, for $7^m + 7^n$ to be divisible by 5, it should end in 0.

For $7^m + 7^n$ to end in 0, the forms of m and n should be as follows:

S.No.	m	n
1.	$4r$	$4s + 2$
2.	$4r + 1$	$4s + 3$
3.	$4r + 2$	$4s$
4.	$4r + 3$	$4s + 1$

Thus, for a given value of m, there are just 25 values of n for which $7^m + 7^n$ ends in 0.

[for instance, if $m = 4r$, then $n = 2, 6, 10, \ldots, 98$]

$\therefore$ There are $100 \times 25 = 2500$ ordered pairs (m, n) for which $7^m + 7^n$ is divisible by 5.

Hence, (c) is the correct answer.

Ex 21. If the number of ways of selecting K coupons out of an unlimited number of coupons bearing the letters A, T, M, so that they cannot be used to spell the word MAT is 93, then K is equal to

(a) 3 (b) 5
(c) 7 (d) None of these

Sol. Here, A, T, M bears unlimited number of coupons.

Thus, selecting K in which word MAT is not spelled.

If atleast one letter is not selected. i.e. ${}^3C_1$. ...(i)

From the remaining two we have to select K i.e. for each selection of K coupons we have 2 ways.

For K coupons, we have 2^K ways but to select atleast one, we have

$\Rightarrow \quad 2^K - 1 \quad$ ...(ii)

Words cannot be used to spell MAT

$\Rightarrow \quad 3(2^K - 1) = 93 \quad \Rightarrow \quad K = 5$

Hence, (b) is the correct answer.

Ex 22. In a shooting competition, a man can score 5, 4, 3, 2 or 0 points for each shot. Then, the number of different ways in which he can score 30 in seven shots, is

(a) 419 (b) 418 (c) 420 (d) 421

Sol. Number of ways of making 30 in 7 shots

$= \text{Coefficient of } x^{30} \text{ in } (x^0 + x^2 + x^3 + x^4 + x^5)^7$

$= \text{Coefficient of } x^{30} \text{ in } \{(x^0 + x^2 + x^3) + x^4(x+1)\}^7$

$= \text{Coefficient of } x^{30}$ in

$\{x^{28}(x+1)^7 + {}^7C_1 x^{24}(x+1)^6(1 + x^2 + x^3) + {}^7C_2 x^{20}(x+1)^5(x^3 + x + 1)^2 + \dots\}$

$= {}^7C_5 + {}^7C_1({}^6C_3 + {}^6C_2 + {}^6C_0) + {}^7C_2({}^5C_1 + 2)$

$= 21 + 252 + 147 = 420$

Hence, (c) is the correct answer.

Ex 23. The number of ways in which the sum of upper faces of four distinct dices can be six, is

(a) 10 (b) 4
(c) 6 (d) 7

Sol. The number of required ways will be equal to the number of solutions of

$$x_1 + x_2 + x_3 + x_4 = 6$$

where, $x_1, x_2, x_3, x_4 \geq 1$

Let, $x_1 - 1 = a_1, x_2 - 1 = a_2, x_3 - 1 = a_3, x_4 - 1 = a_4 \geq 0$

$\Rightarrow (a_1 + 1) + (a_2 + 1) + (a_3 + 1) + (a_4 + 1) = 6$

where, $\quad a_1, a_2, a_3, a_4 \geq 0$

$\Rightarrow \quad a_1 + a_2 + a_3 + a_4 = 2$

$\therefore$ Number of solutions $= {}^{2+4-1}C_{4-1} = {}^5C_3 = 10$

Hence, (a) is the correct answer.

Ex 24. The number of ways can 14 identical toys be distributed among three boys, so that each one gets atleast one toy and no two boys get equal number of toys, is

(a) 45 (b) 48
(c) 60 (d) None of these

Sol. Let the boys gets a, b and c toys, respectively.

$\Rightarrow \quad a + b + c = 14, a, b, c \geq 1$ and a, b and c are distinct.

Let $a < b < c$ and $x_1 = a, x_2 = b - a, x_3 = c - b$

So, $3x_1 + 2x_2 + x_3 = 14; x_1, x_2, x_3 \geq 1$

$\therefore$ The number of solutions

$= \text{Coefficient of } t^{14} \text{ in } \{(t^3 + t^6 + t^9 + \dots)(t^2 + t^4 + \dots)(t + t^2 + \dots)\}$

$= \text{Coefficient of } t^8 \text{ in } \{(1 + t^3 + t^6 + \dots)(1 + t^2 + t^4 + \dots)(1 + t + t^2 + \dots)\}$

$= \text{Coefficient of } t^8 \text{ in } \{(1 + t^2 + t^3 + t^4 + t^5 + 2t^6 + t^7 + 2t^8)(1 + t + t^2 + \dots + t^8)\}$

$= 1 + 1 + 1 + 1 + 1 + 2 + 1 + 2 = 10$

Since, three distinct numbers can be assigned to three boys in 3! ways.

So, total number of ways $= 10 \times 3! = 60$

Hence, (c) is the correct answer.

Ex 25. Total number of positive integral solutions of $15 < x_1 + x_2 + x_3 \leq 20$ is equal to

(a) 1125 (b) 1150
(c) 1245 (d) 685

Sol. $15 < x_1 + x_2 + x_3 \leq 20$

$\Rightarrow \quad x_1 + x_2 + x_3 = 16 + r;\ r = 0, 1, 2, 3, 4$

Now, number of positive integral solutions of $x_1 + x_2 + x_3 = 16 + r$ is ${}^{13+r+3-1}C_{13+r}$

i.e. ${}^{15+r}C_{13+r} = {}^{15+r}C_2$

Thus, total solutions

$= \sum_{r=0}^{4} {}^{15+r}C_2 = {}^{15}C_2 + {}^{16}C_2 + {}^{17}C_2 + {}^{18}C_2 + {}^{19}C_2$

$= {}^{20}C_3 - {}^{15}C_3 = 685$

Hence, (d) is the correct answer.

Ex 26. Ten persons numbered 1, 2, ..., 10 play a chess tournament, each player playing against every other player exactly one game. It is known that no game ends in a draw. Let $w_1, w_2, \dots, w_{10}$ be the number of games won by players 1, 2, 3, ..., 10 respectively and $l_1, l_2, \dots, l_{10}$ be the number of games lost by the players 1, 2, ..., 10, respectively. Then,

(a) $\Sigma w_i^2 = 81 - \Sigma l_i^2$ (b) $\Sigma w_i^2 = 81 + \Sigma l_i^2$
(c) $\Sigma w_i^2 = \Sigma l_i^2$ (d) None of these

Sol. Clearly, each player will play 9 games and total number of games $= {}^{10}C_2 = 45$

Clearly, $\quad w_i + l_i = 9$

and $\quad \Sigma w_i = \Sigma l_i = 45$

$\Rightarrow \quad w_i = 9 - l_i$

$\Rightarrow \quad w_i^2 = 81 + l_i^2 - 18 l_i$

$\Rightarrow \quad \Sigma w_i^2 = 81 \cdot 10 + \Sigma l_i^2 - 18 \Sigma l_i$

$= 810 + \Sigma l_i^2 - 18 \cdot 45 = \Sigma l_i^2$

Hence, (c) is the correct answer.

Ex 27. The number of subsets of the set $A = \{a_1, a_2, \ldots, a_n\}$ which contain even number of elements, is

(a) 2^{n-1} (b) $2^n - 1$ (c) 2^{n-2} (d) 2^n

Sol. For each of the first $(n-1)$ elements $a_1, a_2, \ldots, a_{n-1}$, we have two choices : either $a_i (1 \le i \le n-1)$ lies in the subset or a_i does not lie in the subset. For the last element we have just one choice. If even number elements have already been taken, we do not include a_n, in the subset, otherwise (when odd number of elements have been added), we include it in the subset.

Thus, the number of subsets of $A = \{a_1, a_2, \ldots, a_n\}$ which contain even number of elements is equal to 2^{n-1}.

Hence, (a) is the correct answer.

Ex 28. A is a set containing n elements. A subset P of A is chosen. The set A is reconstructed by replacing the elements of P. A subset Q of A is again chosen. The number of ways of choosing P and Q, so that $P \cap Q = \phi$, is

(a) $2^{2n} - {}^{2n}C_n$ (b) 2^n

(c) $2^n - 1$ (d) 3^n

Sol. Let $A = \{a_1, a_2, \ldots, a_n\}$. For $a_i \in A$, we have the following choices:

(i) $a_i \in P$ and $a_i \in Q$

(ii) $a_i \in P$ and $a_i \notin Q$

(iii) $a_i \notin P$ and $a_i \in Q$

(iv) $a_i \notin P$ and $a_i \notin Q$

Out of these, only (ii), (iii) and (iv), $a_i \notin P \cap Q$.

Therefore, the number of required subsets is 3^n.

Hence, (d) is the correct answer.

Ex 29. The number of integral points that lie exactly in the interior of the triangle with vertices $(0, 0), (0, 21), (21, 0)$, is

(a) 133 (b) 190

(c) 233 (d) 105

Sol. The integral points lying on the line $x = 1$ which also lie in the interior of ΔOAB are

$$(1, 1), (1, 2), \ldots, (1, 19).$$

$\therefore$ There are 19 points lying on the line $x = 1$.

Similarly, the number of integral points $x = 2$ is 18 and on $x = 3$ is 17 and so on. The number of integral points on $x = 19$ is just 1.

Thus, number of integral points lying in the interior of the triangle is

$$19 + 18 + \ldots + 1 = \frac{1}{2}(19)(19+1) = 190$$

Hence, (b) is the correct answer.

Ex 30. Let $S = \{1, 2, 3, \ldots, n\}$. If X denotes the set of all subsets of S containing exactly two elements, then the value of $\sum_{A \in X} (\min A)$ is

(a) ${}^{n+1}C_3$ (b) ${}^{n}C_3$

(c) ${}^{n}C_2$ (d) None of these

Sol. There are exactly $(n-1)$ subsets of S containing two elements having 1 as least element, exactly $(n-2)$ subsets of S having 2 as least element and so on.

Thus,

$$\sum_{A \in X} \min(A) = 1(n-1) + 2(n-2) + \ldots + (n-1)(1)$$

$$= \sum_{r=1}^{n-1} r(n-r) = n\sum_{r=1}^{n-1} r - \sum_{r=1}^{n-1} r^2$$

$$= n\left\{\frac{1}{2}n(n-1)\right\} - \frac{1}{6}n(n-1)(2n-1)$$

$$= \frac{1}{6}n(n-1)\{3n - 2n + 1\}$$

$$= \frac{1}{6}(n+1)n(n-1) = {}^{n+1}C_3$$

Hence, (a) is the correct answer.

Ex 31. The sum of factors of 8! which are odd and are of the form $3m+2$, where m is a natural number, is

(a) 40

(b) 8

(c) 45

(d) 35

Sol. Here, $8! = 2^7 \cdot 3^2 \cdot 5^1 \cdot 7^1$

Obviously, the factors are not multiple of either 2 or 3. So, the factors may be 1, 5, 7, 35 of which 5 and 35 are of the form $3m + 2$.

So, the sum = 40

Hence, (a) is the correct answer.

Ex 32. The number of positive integral solutions of the equation $x_1 x_2 x_3 x_4 x_5 = 420$ is

(a) 1875

(b) 1600

(c) 1250

(d) None of the above

Sol. Since, $x_1 x_2 x_3 x_4 x_5 = 420$

$$\therefore \quad x_1 x_2 x_3 x_4 x_5 = 2^2 \times 3 \times 5 \times 7$$

Each of 3, 5 or 7 can take 5 places and 2^2 can be disposed in 15 ways.

So, required number of solutions

$$= 5^3({}^5C_1 + {}^5C_2) = 5^3 \times 15 = 1875$$

Hence, (a) is the correct answer.

Aliter

$$x_1 x_2 x_3 x_4 x_5 = 2^2 \times 3 \times 5 \times 7$$

Here, 2^2 can be assigned to a_1, a_2, a_3, a_4, a_5

$$\Rightarrow \quad a_1 + a_2 + a_3 + a_4 + a_5 = 2.$$

$$\Rightarrow \quad {}^{2+5-1}C_{5-1} = {}^6C_4 = 15.$$

Also, 3^1 can be assigned to b_1, b_2, b_3, b_4, b_5

$$\Rightarrow \quad b_1 + b_2 + b_3 + b_4 + b_5 = 1$$

$$\Rightarrow \quad {}^{1+5-1}C_{5-1} = {}^5C_4 = 5$$

Similarly, for 5 and 7.

$\therefore$ Total number of positive integral solutions

$$= 15 \times 5 \times 5 \times 5 = 1875$$

Ex 33. The number of numbers lying in (2, 3), where all the digits after decimal are non-zero and in increasing order, is

(a) $\sum_{i=1}^{9} {}^9P_i$ (b) 511 (c) $\sum_{i=1}^{10} {}^{10}P_i$ (d) 1023

Sol. Since, the digits required is non-zero.

$\therefore$ To select amongst {1, 2, 3, 4, 5, 6, 7, 8, 9}

Thus, any number is of the form

$2x_1\, x_2 \dots x_k\, 3$, where $1 \le x_1 < x_2 < x_3 < \dots < x_9 \le 9$

i.e. number of numbers lying between (2, 3)

$$= {}^9C_1 + {}^9C_2 + {}^9C_3 + \dots + {}^9C_9$$

$$= 2^9 - 1 = 1023$$

Hence, (d) is the correct answer.

Ex 34. The number of divisors of $n = 2^7 \cdot 3^5 \cdot 5^3$, which are of the form $4t + 1 (t \in N)$, is

(a) 12 (b) 10

(c) 11 (d) 14

Sol. Any number will be of the form $4t + 1$, if it does not contain any power of 2 but contain even number of odds of the form $4k + 3$ and any number of odds of the form $4k + 1$, so total factors $= 1 \times 3 \times 4 = 12$

But one will be 1, also so required number $= 12 - 1 = 11$

Hence, (c) is the correct answer.

Aliter

Odd numbers of the type $4t + 1$ or $4t + 3$ and they are symmetrical.

Number of odd numbers $= (1 + 5)(1 + 3) = 24$

[any number of 5's and 3's and no 2's]

Required number = 12 but 1 is included.

$\therefore$Required number of numbers $= 12 - 1 = 11$

Ex 35. Total number of divisors of $n = 2^5 \cdot 3^4 \cdot 5^{10} \cdot 7^6$ that are of the form $4\lambda + 2, \lambda \ge 1$, is equal to

(a) 385 (b) 55 (c) 384 (d) 54

Sol. $\because 4\lambda + 2 = 2(2\lambda + 1)$ = odd multiple of 2

Thus, total divisors $= 1 \cdot 5 \cdot 11 \cdot 7 - 1 = 384$

[one is subtracted because there will be case when selected powers of three, five and seven are zero each and this will make $\lambda = 0$]

Hence, (c) is the correct answer.

Ex 36. Total number of divisors of $n = 3^5 \cdot 5^7 \cdot 7^9$ that are of the form $4\lambda + 1, \lambda \ge 0$, is equal to

(a) 240 (b) 30 (c) 120 (d) 15

Sol. $\because 3^{n_1} = (4 - 1)^{n_1} = 4\lambda_1 + (-1)^{n_1}$,

$$5^{n_2} = (4 + 1)^{n_2} = 4\lambda_2 + 1$$

and $\quad 7^{n_3} = (8 - 1)^{n_3} = 4\lambda_3 + (-1)^{n_3}$

Hence, any positive integer power of 5 will be in the form of $4\lambda_2 + 1$. Even powers of 3 and 7 will be in the form of $4\lambda + 1$ and odd powers of 3 and 7 will be in the form of $4\lambda - 1$. Thus, required number of divisors

$$= 8 \cdot (3 \cdot 5 + 3 \cdot 5) = 240$$

Hence, (a) is the correct answer.

Ex 37. Total number of positive integral solutions of $x_1 \cdot x_2 \cdot x_3 = 60$ is equal to

(a) 27 (b) 54

(c) 64 (d) None of these

Sol. $\because x_1 \cdot x_2 \cdot x_3 = 2^2 \cdot 3 \cdot 5$

Total number of positive integral solutions

$$= 3 \cdot 3 \cdot ({}^3C_1 + {}^3C_2) = 54$$

Hence, (b) is the correct answer.

Aliter

$$x_1 \cdot x_2 \cdot x_3 = 2^2 \cdot 3 \cdot 5$$

Here, 2^2 can be assigned to a_1, a_2, a_3.

$\Rightarrow \quad a_1 + a_2 + a_3 = 2$

$\Rightarrow \quad {}^{2+3-1}C_{3-1} = {}^4C_2 = 6$

and 3^1 can be assigned to b_1, b_2, b_3.

$\Rightarrow \quad b_1 + b_2 + b_3 = 1 \Rightarrow {}^{1+3-1}C_{3-1} = 3$

$\therefore \quad x_1 \cdot x_2 \cdot x_3 = 2^2 \cdot 3^1 \cdot 5^1$

Total number of positive integral solutions

$$= 6 \times 3 \times 3 = 54$$

Ex 38. The number of positive integral solutions of the equation $x_1 x_2 x_3 x_4 x_5 = 1050$, is

(a) 1800 (b) 1600

(c) 1400 (d) None of these

Sol. Using prime factorisation of 1050, we can write the given equation as

$x_1 x_2 x_3 x_4 x_5 = 2 \times 3 \times 5^2 \times 7$

We can assign 2, 3 or 7 to any of variables. We can assign entire 5^2 to just one variable in 5 ways or can assign $5^2 = 5 \times 5$ to two variables in ${}^5C_2$ ways. Thus, 5^2 can be assigned in

$${}^5C_1 + {}^5C_2 = 5 + 10 = 15 \text{ ways}$$

Hence, required number of solutions

$$= 5 \times 5 \times 5 \times 15 = 1875$$

Hence, (d) is the correct answer.

Aliter

$$x_1 \cdot x_2 \cdot x_3 \cdot x_4 \cdot x_5 = 2 \times 3 \times 5^2 \times 7$$

For 5^2, the number of ways $= {}^{5+2-1}C_{5-1} = {}^6C_4 = 15$

For 2^1, the number of ways $= {}^{1+5-1}C_{5-1} = {}^5C_4 = 5$

$\therefore$Positive integral solutions for $x_1 \cdot x_2 \cdot x_3 \cdot x_4 \cdot x_5$

$= 2 \times 3 \times 5^2 \times 7$ is $15 \times 5 \times 5 \times 5 = 1875$

Ex 39. Let a be a factor of 120, then the number of positive integral solutions of $x_1 x_2 x_3 = a$ is

(a) 160 (b) 320 (c) 480 (d) 960

Sol. Let x_4 be such that $x_4 = \dfrac{120}{a}$, then the number of positive integral solutions of $x_1 x_2 x_3 = a$ is same as that of number of positive integral solutions of $x_1 x_2 x_3 x_4$

$$= 120 = 2^3 \times 3 \times 5$$

We can assign 3 and 5 to unknown quantities in 4×4 ways.

We can assign all 2 to one unknown in ${}^4C_1$ ways, to two unknown in ${}^4C_2$ and to three unknown in ${}^4C_3$ ways.

Hence, the number of required solutions

$= 4\times4\times[{}^4C_1 + ({}^4C_2)(2) + {}^4C_3] = 4\times4\times20 = 320$

Hence, (b) is the correct answer.

Aliter

$$x_1\cdot x_2\cdot x_3\cdot x_4 = 120$$

$$\Rightarrow \quad x_1\cdot x_2\cdot x_3\cdot x_4 = 2^3\times3\times5$$

For 2^3, the number of ways $= {}^{3+4-1}C_{4-1} = {}^6C_3 = 20$

For 3^1, the number of ways $= {}^{1+4-1}C_{4-1} = {}^4C_3 = 4$

$\therefore$ Total number of integral solutions $= 20\times4\times4 = 320$

Ex 40. The number of ways of choosing triplets (x, y, z) such that $z \geq \max\{x, y\}$ and $x, y, z \in \{1, 2, \ldots, n, n+1\}$, is

(a) ${}^{n+1}C_3 + {}^{n+2}C_3$ (b) $n(n+1)(2n+1)$

(c) $1^1 + 2^2 + \ldots + (n-1)^2$ (d) None of these

Sol. Triplets with $x = y < z, x < y < z, y < z < x$ can be chosen in ${}^{n+1}C_2, {}^{n+1}C_3, {}^{n+1}C_3$ ways.

$\therefore$ There ${}^{n+1}C_2 + 2({}^{n+1}C_3) = {}^{n+2}C_3 + {}^{n+1}C_3$ ways

Hence, (a) is the correct answer.

Ex 41. The number of maps (functions) from the set $A = \{1, 2, 3\}$ into the set $B = \{1, 2, 3, 4, 5, 6, 7\}$ such that $f(i) \leq f(j)$ whenever $i < j$, is

(a) 84 (b) 90

(c) 88 (d) None of these

Sol. If the function is one-one, then select any three from the set B in ${}^7C_3$ ways i.e. 35 ways .

If the function is many-one, then there are two possibilities.

All three corresponds to same element number of such functions $= {}^7C_1 = 7$ ways.

Two corresponds to same element. Select any two from the set B. The larger one corresponds to the larger and the smaller one corresponds to the smaller the third may corresponds to any two.

Number of such functions $= {}^7C_2\times2 = 42$

So, the required number of maps $= 35 + 7 + 42 = 84$

Hence, (a) is the correct answer.

Ex 42. If $f:\{1, 2, 3, 4, 5\}\to\{x, y, z, t\}$, then the total number of onto functions is equal to

(a) 242 (b) 245 (c) 102 (d) 240

Sol. Total functions $= 4^5$

Total functions when any one element is the left out

$= {}^4C_1\cdot3^5$

Total functions when any two elements are left out

$= {}^4C_2\cdot2^5$

$\therefore$ Total number of onto functions

$= 4^5 - ({}^4C_1\cdot3^5 - {}^4C_2\cdot2^5 + {}^4C_3) = 240$

Hence, (d) is the correct answer.

Ex 43. The function $f:\{1, 2, 3, 4, 5\}\to\{1, 2, 3, 4, 5\}$ that are onto and $f(i)\neq i$, is equal to

(a) 9

(b) 44

(c) 16

(d) None of the above

Sol. Total number of required functions

= Number of dearrangement of 5 objects

$$= 5!\left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right) = 44$$

Hence, (b) is the correct answer.

Ex 44. The total number of functions f from the set $\{1, 2, 3\}$ into the set $\{1, 2, 3, 4, 5\}$ such that $f(i) \leq f(j), \forall\, i < j$, is equal to

(a) 35 (b) 30

(c) 50 (d) 60

Sol. Let 1 is associated with $r, r\in\{1, 2, 3, 4, 5\}$, then 2 can be associated with $r, r+1, \ldots, 5$.

Let 2 is associated with j, then 3 can be associated with $j, j+1, \ldots, 5$. Thus, required number of functions

$$= \sum_{r=1}^{5}\left(\sum_{j=r}^{5}(6-j)\right) = \sum_{r=1}^{5}\frac{(6-r)(7-r)}{2}$$

$$= \frac{1}{2}\left(\sum_{r=1}^{5}(42 - 13r + r^2)\right)$$

$$= \frac{1}{2}\left(42\cdot5 - 13\cdot\frac{6\cdot5}{2} + \frac{5\cdot6\cdot11}{6}\right)$$

$= 35$

Hence, (a) is the correct answer.

Ex 45. The number of functions f from the set $A = \{0, 1, 2\}$ into the set $B = \{0, 1, 2, 3, 4, 5, 6, 7\}$ such that $f(i) \leq f(j)$ for $i < j$ and $i, j \in A$, is

(a) ${}^8C_3$

(b) ${}^8C_3 + 2({}^8C_2)$

(c) ${}^{10}C_3$

(d) None of the above

Sol. A function $f: A\to B$ such that $f(0)\leq f(1)\leq f(2)$ falls in one of the following four categories.

***Case* I** $f(0) < f(1) < f(2)$

There are ${}^8C_3$ functions in this category.

***Case* II** $f(0) = f(1) < f(2)$

There are ${}^8C_2$ functions in this category.

***Case* III** $f(0) < f(1) = f(2)$

There are again ${}^8C_2$ functions in this category.

***Case* IV** $f(0) = f(1) = f(2)$

There are ${}^8C_1$ functions in this category.

Thus, the number of desired functions is

${}^8C_3 + {}^8C_2 + {}^8C_2 + {}^8C_1 = {}^9C_3 + {}^9C_2 = {}^{10}C_3$

Hence, (c) is the correct answer.

Ex 46. The integers from 1 to 1000 are written in order around a circle. Starting at 1, every fifteenth number is marked (i.e. 1, 16, 31 etc.) This process is continued until a number is reached which has already been marked, then unmarked numbers are

(a) 200 (b) 400 (c) 600 (d) 800

Sol. In first round all the integers, which leaves the remainder 1 when divided by 15, will be marked.

Last number of this category is 991.

Next number to be marked is $(991 + 15 - 1000) = 6$

Again, second round of integers which leaves the remainder 6 when divided by 15, will be marked.

Last number of this category is 996.

Next number to be marked is $(996 + 15 - 1000) = 11$

Thus, third round of integers which leaves the remainder 11 when divided by 15, will be marked last number of this category is 986.

Next number to be marked is $986 + 15 - 1000 = 1$, which is already been marked.

Hence, the numbers of the form $15\lambda + 1, 15\lambda + 6, 15\lambda + 11$ are marked. All these numbers can also be put in the form of $5\lambda_1 + 1 (\lambda_1 \geq 0)$.

Hence, total number of marked numbers

$$= 1 + \left[\frac{999}{5}\right] = 200$$

$\therefore$ Unmarked numbers = 800

Hence, (d) is the correct answer.

Ex 47. Let $f(n)$ denotes the number of different ways the positive integer n can be expressed as the sum of 1's and 2's. For example $f(4) = 5$, since $4 = 1+1+1+1, 1+1+2, 1+2+1, 2+1+1, 2+2$ (**Note** Order of 1's and 2's is important). Then, $f\{f(6)\}$ is

(a) $f(6)$ (b) $f(12)$

(c) $f(13)$ (d) None of these

Sol. As $f(4) = 5$ [given]

$\therefore f(6)$ can be written using 1's and 2's as

Number of 1's	Number of 2's	Number of arrangements
0	3	$\frac{3!}{3!} = 1$
2	2	$\frac{4!}{2!2!} = 6$
4	1	$\frac{5!}{4!} = 5$
6	0	$\frac{6!}{6!} = 1$
Total		13

$\therefore \quad f(6) = 13$

$\therefore \quad f\{f(6)\} = f(13)$

Hence, (c) is the correct answer.

Ex 48. The number of ways in which we can choose 3 squares on a chessboard such that one of the squares has its two sides common to other two squares, is

(a) 290 (b) 292

(c) 294 (d) 296

Sol. Either we have to choose  or 

(i) Every square of (2 by 2)  will contribute four  shaped figures by removing anyone square out of it.

Number of ways to choose these squares $= 7 \times 7 = 49$

So, total  shaped figures $= 49 \times 4 = 196$

(ii) In every line it is possible to have 6  shaped figures.

So, total number of such figures $= 6 \times 8 \times 2 = 96$

$\therefore$ Total number of cases $= 196 + 96 = 292$

Hence, (b) is the correct answer.

Ex 49. A man on the verge of dying. He has unlimited amount of money and intends to distributed some of it among his n relatives, so that total money that is to be distributed is a positive multiple of four and no relative gets more than ₹ $(4n - 1)$, then the number of ways in which the rich man can write his will, is

(a) $4^{n-1} - 1$

(b) $n^n - 1$

(c) $4^{n-1} \cdot n^n$

(d) $4^{n-1} \cdot n^n - 1$

Sol. Let us assume the total money that is to be distributed is $4K$; ($K \in$ Natural numbers) and the relative x_i receives ₹p_i.

$$\Rightarrow \quad \sum_{i=1}^{n} p_i = 4K \quad \text{and} \quad 0 \leq p_i \leq 4n - 1$$

Thus, to obtain the number of integral solutions of $p_1 + p_2 + p_3 + \dots + p_n = 4K$, $K = 1, 2, \dots$ is

Coefficient of x^{4K} in $(1 + x + x^2 + \dots + x^{4n-1})^n$ ...(i)

$$\text{Let } (1 + x + x^2 + \dots + x^{4n-1})^n = \sum_{r=0}^{4n^2 - n} a_r x^r \quad \text{...(ii)}$$

Now, required coefficients $= a_4 + a_8 + a_{12} + \dots$

Putting $x = 1, -1, i$ and $-i$ in Eq. (ii) and adding, we get

$4(a_0 + a_4 + a_8 + \dots) = (4n)^n + 0 + 0 + 0$

$$\Rightarrow \quad a_0 + a_4 + a_8 + \dots = 4^{n-1} \cdot n^n \quad \text{...(iii)}$$

From Eqs. (i) and (iii), we get

Coefficient of x^{4K} in $(1 + x + x^2 + \dots + x^{4n-1})^n$ is $(4^{n-1} \cdot n^n - 1)$.

Hence, (d) is the correct answer.

Ex 50. A seven-digit number made up of all distinct digits 8, 7, 6, 4, 2, x and y is divisible by 3. Then, possible number of order pair (x, y) is

(a) 4
(b) 8
(c) 2
(d) None of the above

Sol. We have, 8, 7, 6, 4, 2, x and y

Any number is divisible by 3, if sum of digits is divisible by 3.

i.e. $x + y + 27$ is divisible by 3.

x and y can take values from 0, 1, 3, 5, 9.

$\therefore$ Possible pairs are (5, 1), (3, 0), (9, 0), (9, 3), (1, 5), (0, 3), (0, 9) and (3, 9).

Hence, (b) is the correct answer.

Ex 51. 10 different toys are to be distributed among 10 children. Total number of ways of distributing these toys so that exactly 2 children do not get any toy, is equal to

(a) $(10!)^2 \left(\dfrac{1}{3!2!7!} + \dfrac{1}{(2!)^5\, 6!}\right)$

(b) $(10!)^2 \left(\dfrac{1}{3!2!7!} + \dfrac{1}{(2!)^4\, 6!}\right)$

(c) $(10!)^2 \left(\dfrac{1}{3!7!} + \dfrac{1}{(2!)^5\, 6!}\right)$

(d) $(10!)^2 \left(\dfrac{1}{3!7!} + \dfrac{1}{(2!)^4\, 6!}\right)$

Sol. It is possible in two mutually exclusive cases.

***Case* I** 2 children get none, one child gets three and all remaining children get one each.

***Case* II** 2 children get none, 2 children get 2 each and all remaining children get one each.

In first case, number of ways $= \dfrac{10!}{3!2!\,7!} \cdot 10!$

In second case, number of ways $= \dfrac{10!}{(2!)^4 \cdot 6!} \cdot 10!$

Thus, total number of ways

$$= (10!)^2 \left(\frac{1}{3!2!\,7!} + \frac{1}{(2!)^4 6!}\right)$$

Hence, (b) is the correct answer.

Ex 52. A delegation of five students is to be formed from a group of 10 students. If three particular students want to remain together whereas two particular students do not want to remain together, then the number of selection is

(a) 10 (b) 20
(c) 30 (d) None of these

Sol. Let A, B and C want to remain together and D, E do not want to remain together.

In	Out	Number of selections
A, B, C, D	E	${}^5C_1 = 5$
A, B, C, E	D	${}^5C_1 = 5$
D	A, B, C, E	${}^5C_4 = 5$
E	A, B, C, D	${}^5C_4 = 5$

$\therefore$ Required number of selections

$$= {}^5C_1 + {}^5C_1 + {}^5C_4 + {}^5C_4 = 20$$

Hence, (b) is the correct answer.

Type 2. **More than One Correct Option**

Ex 53. If m and n are positive integers more than or equal to 2, $m > n$, then $(mn)!$ is divisible by

(a) $(m!)^n$
(b) $(n!)^m$
(c) $(m+n)!$
(d) $(m-n)!$

Sol. $\dfrac{(mn)!}{(m!)^n}$ is the number of ways of distribution mn distinct objects in n persons equally.

Hence, $\dfrac{(mn)!}{(m!)^n}$ is an integer $\Rightarrow (m!)^n/(mn)!$

Similarly, $(n!)^m/(mn)!$

Further $m + n < 2m \le mn$

$\Rightarrow \quad (m+n)!/(mn)!$

and $\quad m - n < m < mn$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 54. Let n be a positive integer with $f(n) = 1! + 2! + 3! + \dots + n!$ and $P(x), Q(x)$ be polynomials in x such that $f(n+2) = P(n)\, f(n+1) + Q(n) f(n)$ for all $n \ge 1$. Then,

(a) $P(x) = x + 3$
(b) $Q(x) = -x - 2$
(c) $P(x) = -x - 2$
(d) $Q(x) = x + 3$

Sol. $\because f(n) = 1! + 2! + 3! + \dots + n!$

$f(n+1) = 1! + 2! + 3! + \dots + (n+1)!$

$f(n+2) = 1! + 2! + 3! + \dots + (n+2)!$

$\therefore f(n+2) - f(n+1) = (n+2)! = (n+2)(n+1)!$

$= (n+2)[f(n+1) - f(n)]$

$\Rightarrow f(n+2) = (n+3) f(n+1) - (n+2) f(n)$

$\Rightarrow \quad P(x) = x + 3,\ Q(x) = -x - 2$

Hence, (a) and (b) are the correct answers.

Ex 55. The number of ways in which we can choose 2 distinct integers from 1 to 100, such that the difference between them is atmost 10, is

(a) ${}^{100}C_2 - {}^{90}C_2$

(b) ${}^{100}C_{98} - {}^{90}C_{88}$

(c) ${}^{100}C_2 - {}^{90}C_{88}$

(d) None of the above

Sol. Let the chosen integers be x_1 and x_2.

Let a be an integer before x_1, b be integer between x_1 and x_2 and c be integer after x_2.

$\therefore \quad a + b + c = 98$, where $a \ge 0, b \ge 10, c \ge 0$.

Now, if we consider the choices, where difference is atleast 11, then the number of solutions is ${}^{88+3-1}C_{3-1} = {}^{90}C_2$

$\therefore$ The number of ways in which b is less than 10 is ${}^{100}C_2 - {}^{90}C_2$ which is equal to options (a), (b) and (c).

Hence, (a), (b) and (c) are the correct answers.

Ex 56. n locks and n corresponding keys are available. But the actual combination is not known. The maximum numbers of trials that are needed to assign the keys to their corresponding locks, are

(a) ${}^nC_2$

(b) $\sum_{k=2}^{n} (k-1)$

(c) $n!$

(d) ${}^{n+1}C_2$

Sol. First key will be tried for atmost $(n-1)$ locks. Second key will be tried for atmost $(n-2)$ locks and so on. Thus, the maximum number of trials needed

$$= (n-1) + (n-2) + \dots + 1$$
$$= \frac{n(n-1)}{2} = {}^nC_2$$

Hence, (a) and (b) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 57-61) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 57. Statement I The maximum number of points of intersection of 8 circles of unequal radii is 56.

Statement II The maximum number of points into which 4 circles of unequal radii and 4 non-coincident straight lines intersect is 50.

Sol. **Statement I** Two circles intersect in 2 points.

$\therefore$ Maximum number of points of intersection

= 2 × Number of selection of two circles from 8 circles

$= 2 \times {}^8C_2 = 2 \times 28 = 56$

Statement II 4 lines intersect each other in ${}^4C_2 = 6$ points and 4 circles intersect each other in $2 \times {}^4C_2 = 12$ points.

Further, one line and one circle intersect in two points. So, 4 lines will intersect four circles in 32 points.

$\therefore$ Maximum number of points $= 6 + 12 + 32 = 50$

Hence, (b) is the correct answer.

Ex 58. Statement I If there are six letters, $L_1, L_2, L_3, L_4, L_5, L_6$ and their corresponding six envelopes are $E_1, E_2, E_3, E_4, E_5, E_6$. Letters having odd value can be put into odd value envelopes and even value letters can be put into even value envelopes, so that no letter go into the right envelopes, the number of arrangements will be equal to 4.

Statement II If P_n is the number of ways in which n letter can be put in n corresponding envelopes, such that no letters goes to correct envelopes, then

$$P_n = n!\left(1 - \frac{1}{1!} + \frac{1}{2!} - \dots + \frac{(-1)^n}{n!}\right)$$

Sol. $L_1 \ L_3 \ L_5 \ L_2 \ L_4 \ L_6$

$E_1 \ E_3 \ E_5 \ E_2 \ E_4 \ E_6$

$\therefore$ Number of ways

$$= 3!\left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!}\right) \cdot 3!\left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!}\right) = 4$$

Hence, (a) is the correct answer.

Ex 59. Statement I The maximum value of k, such that $(50)^k$ divides $100!$ is 2.

Statement II If p is any prime number, then power of p in $n!$ is equal to $\left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + \left[\frac{n}{p^3}\right] + \dots$, where [ ] represents the greatest integer function.

Sol. If power of p is l in $n!$, then $l = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + ...$

Power of 2 in 100!

$= \left[\frac{100}{2}\right] + \left[\frac{100}{2^2}\right] + \left[\frac{100}{2^3}\right] + \left[\frac{100}{2^4}\right] + \left[\frac{100}{2^5}\right] + \left[\frac{100}{2^6}\right]$

$= 50 + 25 + 12 + 6 + 3 + 1 = 97$

So, power of 5 in 100! is 24.

$\therefore$ Exponent of 25 in $(100)! = 12$

$\Rightarrow$ Maximum value of k is 12.

Hence, (d) is the correct answer.

Ex 60. **Statement I** A five-digit number divisible by 3 is to be formed using the digits 0, 1, 2, 3, 4 and 5 with repetition. The total number formed are 216.

Statement II If sum of digits of any number is divisible by 3, then the number must be divisible by 3.

Sol. Number of numbers form by using $1, 2, 3, 4, 5 = 5! = 120$

Number of numbers formed by using 0, 1, 2, 4, 5

$\boxed{4}\boxed{4}\boxed{3}\boxed{2}\boxed{1} = 4 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 96$

Statement I is incorrect and Statement II is correct.

Hence, (d) is the correct answer.

Ex 61. **Statement I** The number of ordered pairs (m, n); $m, n \in \{1, 2, 3, ..., 20\}$, such that $3^m + 7^n$ is a multiple of 10, is equal to 100.

Statement II $3^m + 7^n$ has last digit zero, when m is of $4k - 2$ type and n is of $4l$ type where $k, l \in W$.

Sol. 3^m gives 1 at unit place, if $m = 4k$

and these are 5 in numbers.

7^n gives 9 at unit place, if $n = 4l + 2$

and these are 5 in numbers.

$\therefore$ Number of ways = 25

3^m gives 3 at unit place, if $m = 4k + 1$

and these are 5 in numbers.

7^n gives 7 at unit place, if $n = 4l + 1$

and these are 5 in numbers.

$\therefore$ Number of ways = 25

3^m gives 7 at unit place, if $m = 4k + 3$

and these are 5 in numbers.

7^n gives 3 at unit place, if $n = 4l + 3$

and these are 5 in numbers.

$\therefore$ Number of ways = 25

3^m gives 9 at unit place, if $m = 3k + 2$

and these are 5 in numbers.

7^n gives 1 at unit place, if $n = 4l$

and these are 5 in numbers.

Hence, (c) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 62-64) *One of the most important techniques of counting is the principle of exclusion and inclusion. Let $A_1, A_2, ..., A_n$ be m sets and $n(A_i)$ represents the cardinality of the set A_i (the number of elements in the set A_i), then according to the principle of exclusion and inclusion*

$$n(A_1 \cup A_2 \cup ... \cup A_n) = \sum_{i=1}^{m} n(A_i) - \sum_{i \neq j} n(A_i \cap A_j) + \sum_{i<j<k} n(A_i \cap A_j \cap A_k) - ... + (-1)^{m+1} n(A_1 \cap A_2 \cap ... \cap A_m)$$

In particular, if A, B, C are three sets, then

$$n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(C \cap A) + n(A \cap B \cap C)$$

Principle of exclusion and inclusion must be applied whenever there is a chance of repeated counting of some of the samples.

Ex 62. The number of numbers from 1 to 100, which are neither divisible by 3 nor by 5 nor by 7, is

(a) 67 (b) 55 (c) 45 (d) 33

Sol. A : Set of numbers, which are divisible by 3.

B : Set of numbers, which are divisible by 5.

C : Set of numbers, which are divisible by 7.

Number of numbers, which are divisible by atleast one of 3 or 5 or 7

$= n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(C \cap A) + n(A \cap B \cap C)$

$= \left[\frac{100}{3}\right] + \left[\frac{100}{5}\right] + \left[\frac{100}{7}\right] - \left[\frac{100}{15}\right] - \left[\frac{100}{21}\right] - \left[\frac{100}{35}\right] + \left[\frac{100}{105}\right] = 55$

$\therefore$ Desired number $= 100 - 55 = 45$

Hence, (c) is the correct answer.

Ex 63. A six letters word is formed using the letters of the word 'ALMIGHTY' with or without repetition. The number of words that contain exactly three different letters, is

(a) 15600

(b) 30240

(c) ${}^8P_6 - {}^8P_3$

(d) None of the above

Sol. We can select three different letters in ${}^8C_3$ ways.

Suppose we select A, L, M.

Let X = Set of words in which A is absent,

Y = Set of words in which L is absent and

Z = Set of words in which M is absent.

Then, $n(X \cup Y \cup Z) = (2^6 + 2^6 + 2^6) - (1^6 + 1^6 + 1^6) + 0$

$= 189$

So, the number of six letter words formed by using A, L and M $= 3^6 - 189 = 540$

$\therefore$ The desired number of words $= {}^8C_3 \times 540$

$= 30240$

Hence, (b) is the correct answer.

Ex 64. The number of natural numbers less than or equal to 2985984, which are neither perfect squares nor perfect cubes, is

(a) 2984124
(b) 2984244
(c) 2959595
(d) None of the above

Sol. Desired number

$= 2985984 - \{\sqrt{2985984} + \sqrt[3]{2985984} - \sqrt[6]{2985984}\}$

$= 2985984 - 1860 = 2984124$

$[\because 2985984 = 2^{12} \cdot 3^6]$

Hence, (a) is the correct answer.

Passage II (Ex. Nos. 65-67) *Consider the letters of the word 'MATHEMATICS'. There are eleven letters some of them are identical. Letters are classified as repeating and non-repeating letters. Set of repeating letters $=\{M, A, T\}$ and set of non-repeating letters $=\{H, E, I, C, S\}$.*

Ex 65. Possible number of words taking all letters at a time such that atleast one repeating letter is at odd position in each word, is

(a) $\frac{9!}{2!2!2!}$ (b) $\frac{11!}{2!2!2!}$

(c) $\frac{11!}{2!2!2!} - \frac{9!}{2!2!}$ (d) $\frac{9!}{2!2!}$

Sol. Since, there are 5 even places and 3 pairs of repeated letters, therefore atleast one of these must be at an odd place.

$\therefore$ The number of ways $= \frac{11!}{2!2!2!}$

Hence, (b) is the correct answer.

Ex 66. Possible number of words taking all letters at a time such that in each word both M's are together and both T's are together but both A's are not together, is

(a) $7! \cdot {}^8C_2$ (b) $\frac{11!}{2!2!2!} - \frac{10!}{2!2!}$

(c) $\frac{6!4!}{2!2!}$ (d) $\frac{9!}{2!2!2!}$

Sol. Make a bundle of both M's and another boundle of T's. Then, except A's we have 5 letters remaining, so M's, T's and the letters except A's can be arranged in 7! ways.

$\therefore$ Total number of arrangements $= 7! \times {}^8C_2$

Hence, (a) is the correct answer.

Ex 67. Possible number of words in which no two vowels are together, is

(a) $\frac{7!}{2!2!} \cdot {}^8C_4 \cdot \frac{4!}{2!}$

(b) $\frac{7!}{2!} \cdot {}^8C_4 \cdot \frac{4!}{2!}$

(c) $7! \cdot {}^8C_4 \cdot \frac{4!}{2!}$

(d) $\frac{7!}{2!2!2!} \cdot {}^8C_4 \cdot \frac{4!}{2!}$

Sol. Consonants can be placed in $\frac{7!}{2!2!}$ ways.

Then, there are 8 places and 4 vowels.

$\therefore$ Number of ways $= \frac{7!}{2!2!} \cdot {}^8C_4 \cdot \frac{4!}{2!}$

Hence, (a) is the correct answer.

Passage III (Ex. Nos. 68-70) *Let set $S = \{1, 2, 3, \ldots, n\}$ be a set of first n natural and $A \subseteq S$. Suppose, $n(A)$ represents cardinal number and min (A) represents least number among the elements of set A.*

Ex 68. The greatest value of min (A), where $A \subseteq S$ and $n(A) = r, 1 \le r \le n$, is

(a) r
(b) $(n - r)$
(c) $n - r + 1$
(d) $r + 1$

Sol. Consider, $A = \{n - r + 1, n - r + 2, \ldots, n\} \subset S$

Clearly, $n(A) = r$ and min $(A) = n - r + 1$

$\therefore$ Greatest value of min $(A) = n - r + 1$

Hence, (c) is the correct answer.

Ex 69. The number of subsets A of S for which $n(A) = r$ and min $(A) = k$, is

(a) ${}^{n-k}C_{r-1}$

(b) ${}^{n}C_{r-1}$

(c) ${}^{n-k+1}C_{r-1}$

(d) ${}^{n-k-1}C_{r-1}$

Sol. k is the least member of A and rest of the $r - 1$ members of A are among the numbers $k + 1, k + 2, k + 3, \ldots, n$.

$\therefore$ Number of ways $= {}^{n-k}C_{r-1}$

Hence, (a) is the correct answer.

Ex 70. The value of $\sum_{n(A)=r} \{\min(A)\} = k$ is

(a) $n \cdot {}^{n-k}C_{r-1}$

(b) $(n+1) \cdot {}^{n-k}C_{r-1} - r \cdot {}^{n-k+1}C_r$

(c) $k \cdot {}^{n-k}C_{r-1} + n \cdot {}^{n-k+1}C_r$

(d) ${}^{n}C_r$

Sol. Now, $\sum_{\substack{A \subseteq S \\ |A| = r}} [\min(A)] = \sum_{k=1}^{n-r+1} (k \cdot {}^{n-k}C_{r-1})$

Now, $k \, {}^{n-k}C_{r-1} = [(n+1) - (n-k+1)] \cdot {}^{n-k}C_{r-1}$

$= (n+1) \cdot {}^{n-k}C_{r-1} - (n-k+1) \cdot {}^{n-k}C_{r-1}$

Also, $(n-k+1) \cdot {}^{n-k}C_{r-1} = \frac{(n-k+1) \cdot (n-k)!}{(r-1)![n-k-r+1]!}$

$= \frac{r \cdot (n-k+1)!}{r!(n-k+1-r)!} = r \cdot {}^{n-k+1}C_r$

$\therefore \; k \cdot {}^{n-k}C_{r-1} = (n+1) \cdot {}^{n-k}C_{r-1} - r \cdot {}^{n-k+1}C_r$

Hence, (b) is the correct answer.

Type 5. **Match the Columns**

Ex 71. Match the statements of Column I with values of Column II.

Column I	Column II
A. The number of five-digit numbers having the product of digits 20 is	p. 77
B. A man took 5 space plays out of an engine to clean them. The number of ways in which he can place atleast two plays in the engine from where they came out, is	q. 31
C. The number of integers between 1 and 1000 inclusive in which atleast two consecutive digits are equal, is	r. 50
D. The value of $\frac{1}{15}\sum_{1 \le i} \sum_{\le j \le 9} i \cdot j$ is	s. 181

Sol. A. There are two cases:

***Case* I** $5, 4, 1, 1, 1, \frac{5!}{3!} = 20$

***Case* II** $5, 2, 2, 1, 1 \ \frac{5!}{2!2!} = 30$

$\therefore$ Total $= 20 + 30 = 50$

B. $5! - D_5 - 5 \cdot D_4$

[D_5 stands for dearrangements of 5 things]

$= 120 - 44 - 5 \times 9 = 31$

C. $1000 - 9^3 - 9^2 - 9 = 181$

D. $$\frac{1}{15}\sum_{1 \le i \le j \le 9} \sum i \cdot j = \frac{1}{15}\left\{\sum_{1 \le i \le j \le 9} \sum i \cdot j + (1^2 + 2^2 + \dots + 9^2)\right\}$$

$$= \frac{1}{15}\left\{\frac{(1 + 2 + \dots + 9)^2 - (1^2 + 2^2 + .. + 9^2) + (1^2 + 2^2 + \dots + 9^2)}{2}\right\}$$

$$= \frac{1}{30}\left\{\left(\frac{9 \times 10}{2}\right)^2 + \frac{9 \times 10 \times 19}{6}\right\} = 77$$

$\therefore$ A $\to$ r; B $\to$ q; C $\to$ s, D $\to$ p

Ex 72. Match the statements of Column I with values of Column II.

Column I	Column II
A. The total number of selections of fruits which can be made from, 3 bananas, 4 apples and 2 oranges, is	p. greater than 50
B. If 7 points out of 12 are in the the same straight line, then the number of triangles formed is	q. greater than 100
C. The number of ways of selecting 10 balls from unlimited number of red, black, white and green balls, is	r. greater than 150
D. The total number of proper divisors of 38808 is	s. greater than 200

Sol. A. Required number of ways

$= (2 + 1)(3 + 1)(4 + 1) - 1$

$= 59$

B. The number of ways of selecting 3 points out of 12 points is ${}^7C_3$ ways.

Hence, the number of triangles formed is

$${}^{12}C_3 - {}^7C_3 = 185$$

C. Required number of ways

$=$ Coefficient of x^{10} in $(1 + x + x^2 + \dots)^4$

$=$ Coefficient of x^{10} in $(1 - x)^{-4}$

$= {}^{10+4-1}C_{4-1}$

$= {}^{13}C_3 = 286$

D. Factorising the given number, we have

$$38808 = 2^3 \cdot 3^2 \cdot 7^2 \cdot 11$$

The total number of divisors of this number is same as the number of ways of selecting some or all of two 2's, two 3's, two 7's and one 11. Therefore, the total number of divisors

$= (3 + 1)(2 + 1)(2 + 1)(1 + 1)$

$= 72$

Hence, the required number of divisors

$= 72 - 2$

$= 70$

A $\to$ p; B $\to$ p, q, r; C $\to$ p, q, r, s; D $\to$ p

Ex 73. Match the statements of Column I with values of Column II. Consider the word 'HONOLULU'.

Column I	Column II
A. Number of words that can be formed using the letters of given word in which consonants and vowels are alternate, is	p. 26
B. Number of words that can be formed without changing the order of vowels, is	q. 144
C. Number of ways in which 4 letters can be selected from the letters of the given word, is	r. 840
D. Number of words in which two O's are together but U's are separated, is	s. 900

Sol. A. Required number of ways $= 2! \cdot \frac{4!}{2!} \cdot \frac{4!}{2!2!} = 144$

B. Required number of words $= {}^8C_4 \cdot \frac{4!}{2!} = 840$

C. Required number of ways of

***Case* I** 2 alike + 2 alike $= {}^3C_2$

***Case* II** 2 alike + 2 different $= {}^3C_1{}^4C_2$

***Case* III** All different $= {}^5C_4 = 3 + 18 + 5$

$= 26$

D. Required number of words $= \frac{5!}{2!} \cdot {}^6C_2 = 900$

A $\to$ q; B $\to$ r; C $\to$ p; D $\to$ s

Type 6. **Single Integer Answer Type Questions**

Ex 74. The possible number of ordered triads (m, n, p), where $m, n, p \in N$ is (6250) k, such that $1 \le m \le 100$, $1 \le n \le 50$, $1 \le p \le 25$ and $2^m + 2^n + 2^p$ is divisible by 3, then k is _____.

Sol. (5) Here, $2^m + 2^n + 2^p = (3-1)^m + (3-1)^n + (3-1)^p$

$$= 3k + (-1)^m + (-1)^n + (-1)^p \; (k \in I)$$

So that $2^m + 2^n + 2^p$ is divisible by 3, if m, n, p all are odd or all are even.

$\therefore$ Number of possible ordered triads

$= 50 \times 25 \times 12 + 50 \times 25 \times 13 = 31250 = 6250 \times 5$

But it is $6250k$.

$\therefore \quad k = 5$

Ex 75. If the total number of garlands that can be formed using 3 flowers of 1st kind and 12 flowers of the 2nd kind is 19λ, then λ is _______.

Sol. (1) This is a case equivalent to distributing 12 identical flowers into 3 identical boxes is same as $x + y + z = 12$ taking only different combinations of x, y and z.

***Case* I** $\quad x = y = z = 4$ only 1 way

***Case* II** $\quad x = y \ne z$

$$2x + z = 12$$

(a) $x > z, \quad x - z = a, \quad a \ge 1$

$\Rightarrow \quad x = z + a$

So, $\quad 2x + z = 12$

$\Rightarrow \quad 3z + 2a = 12, \; a \ge 1, z \ge 0$

i.e. coefficient of x^{12} in

$$(1 + x^3 + x^6 + \dots)(x^2 + x^4 + \dots) = 2$$

(b) $x < z, \quad z - x = a$

$\Rightarrow \quad z = x + a$

So, $\quad 3x + a = 12, a \ge 1, x \ge 0$

i.e. coefficient of x^{12} in

$$(1 + x^3 + x^6 + x^9 + \dots)(x + x^2 + \dots) = 4$$

***Case* III** $\quad x + y + z = 12, \; x \ne y \ne z$

Taking only different combinations of x, y and z.

Let $x > y > z$

$\Rightarrow \quad y - z = a$

$\Rightarrow \quad y = z + a, a \ge 1$

$\quad x - y = b$

$\Rightarrow \quad x = z + a + b, b \ge 1$

$\quad x + y + z = 12$

$\Rightarrow \quad 3z + 2a + b = 12; \; a, b \ge 1, z > 0$

Coefficient of x^{12} in

$$(1 + x^3 + x^6 + \dots)(x^2 + x^4 + x^6 + \dots)(x + x^2 + x^3 + \dots)$$
$$= 12$$

So, total ways $= 1 + 2 + 4 + 12 = 19$

Hence, $\lambda = 1$

Ex 76. If the number of ordered triplet (a, b, c), such that LCM $(a, b) = 1000$, LCM $(b, c) = 2000$ and LCM $(c, a) = 2000$ is $10\,k$, then k is ________.

Sol. (7) $\because \; 1000 = 2^3 \cdot 5^3$, $2000 = 2^4 \cdot 5^3$

So, $\quad a = 2^A \cdot 5^R$, $b = 2^B \cdot 5^S$, $c = 2^C \cdot 5^T$

$\max(A, B) = 3$, $\max(A, C) = \max(B, C) = 4$

$\max(R, S) = \max(R, T) = \max(S, T) = 3$

There are 10 ways of choosing R, S, T.

1 with all 3, 3 with one 2, 3 with one 1, 3 with one 0.

C must be 4. There are 7 ways of choosing A, B.

1 with both 3, 3 with $A = 3$, B not, 3 with $B = 3$ and A not thus, 7 ways of choosing A, B, C, hence $7 \cdot 10 = 70$ ways

$\Rightarrow \quad k = 7$

Ex 77. N is the number of ways in which a person can walk up a stairway which has 7 steps. If he can take 1 or 2 steps up the stairs at a time, then the value of $N/3$ is _________ .

Sol. (7) If x denotes the number of times, he can take unit step and y denotes the number of times, he can take 2 steps, then $x + 2y = 7$.

We must have $x = 1, 3, 5$.

If $x = 1$, then steps will be 1, 2, 2, 2.

$\Rightarrow \quad$ Number of ways $= \dfrac{4!}{3!} = 4$

If $x = 3$, then steps will be 1, 1, 1, 2, 2.

$\Rightarrow \quad$ Number of ways $= \dfrac{5!}{3!\,2!} = 10$

If $x = 5$, then steps will be 1, 1, 1, 1, 1, 2.

$\Rightarrow \quad$ Number of ways $= {}^6C_1 = 6$

If $x = 7$, then steps will be 1, 1, 1, 1, 1, 1, 1.

$\Rightarrow \quad$ Number of ways $= {}^7C_0 = 1$

Hence, total number of ways $(N) = 4 + 10 + 6 + 1 = 21$

$$\Rightarrow \quad \frac{N}{3} = \frac{21}{3} = 7$$

Target Exercises

Type 1. **Only One Correct Option**

1. If $\alpha = {}^mC_2$, then ${}^\alpha C_2$ is equal to

(a) ${}^{m+1}C_4$ (b) ${}^{m-1}C_4$ (c) $3\,{}^{m+2}C_4$ (d) $3\,{}^{m+1}C_4$

2. If ${}^nC_3 + {}^nC_4 > {}^{n+1}C_3$, then

(a) $n > 6$ (b) $n > 7$
(c) $n < 6$ (d) None of these

3. The value of $\sum_{r=0}^{n-1} {}^nC_r / ({}^nC_r + {}^nC_{r+1})$ equals

(a) $n + 1$ (b) $n/2$
(c) $n + 2$ (d) None of these

4. The value of $\sum_{r=1}^{n} \frac{{}^nP_r}{r!}$ is

(a) 2^n (b) $2^n - 1$ (c) 2^{n-1} (d) $2^n + 1$

5. If ${}^{2n+1}P_{n-1} : {}^{2n-1}P_n = 3:5$, then n is equal to

(a) 4 (b) 6 (c) 3 (d) 8

6. The number less than 1000 that can be formed using the digits 0, 1, 2, 3, 4, 5 when repetition is not allowed is equal to

(a) 130 (b) 131
(c) 156 (d) 155

7. The numbers greater than 1000 but not greater than 4000, which can be formed with the digits 0, 1, 2, 3, 4 (repetition of digits is allowed), are

(a) 350 (b) 375
(c) 450 (d) 576

8. A variable name in certain computer language must be either an alphabet or an alphabet followed by a decimal digit. The total number of different variable names that can exist in that language is equal to

(a) 280 (b) 290
(c) 286 (d) 296

9. The number of five-digit numbers that contain 7 exactly once is

(a) $(41)(9^3)$ (b) $(37)(9^3)$
(c) $(7)(9^4)$ (d) $(41)(9^4)$

10. The total number of flags with three horizontal strips in order, which can be formed by using 2 identical red, 2 identical green and 2 identical white strips, is equal to

(a) $4!$
(b) $3 \times (4!)$
(c) $2 \times (4!)$
(d) None of these

11. Let A be a set of $n\,(\geq 3)$ distinct elements. The number of triplets (x, y, z) of the elements of A in which atleast two coordinates same, is

(a) ${}^nP_3$ (b) $n^3 - {}^nP_3$ (c) $3n^2 - 2n$ (d) $3n^2(n-1)$

12. The total number of six-digit numbers that can be formed, having the property that every succeeding digit is greater than the preceding digit, is

(a) ${}^9C_3$ (b) ${}^{10}C_3$ (c) ${}^9P_3$ (d) ${}^{10}P_3$

13. The number of four-digit numbers that can be made with the digits 1, 2, 3, 4 and 5 in which atleast two digits are identical, is

(a) $4^5 - 5!$ (b) 505
(c) 600 (d) None of these

14. The total number of five-digit numbers of different digits in which the digit in the middle is the largest, is

(a) $\sum_{n=4}^{9} {}^nP_4$ (b) $33(3!)$
(c) $30(3!)$ (d) None of these

15. The number of nine non-zero digit numbers such that all the digits in the first four places are less than the digit in the middle and all the digits in the last four places are greater than that in the middle, is

(a) $2(4!)$ (b) $3(7!)/2$ (c) $2(7!)$ (d) ${}^4P_4 \times {}^4P_4$

16. The total number of three-digit numbers, the sum of whose digits is even, is equal to

(a) 450 (b) 350 (c) 250 (d) 325

17. The permutations of n objects taken
(i) atleast r objects at a time
(ii) atmost r objects at a time
(if repetition of the objects is allowed)
are respectively

(a) $\frac{n^{n-r+1}}{n-1}$ and $\frac{n^{r+1}-1}{n-1}$
(b) $\frac{n^{n-r+1}}{n-1}$ and $\frac{n^r(n^{r+1}-1)}{n-1}$
(c) $\frac{n^r(n^{n-r}-1)}{n-1}$ and $\frac{n^{r+1}-1}{n-1}$
(d) None of these

18. How many ten-digit numbers can be written by using the digits 1 and 2?

(a) ${}^{10}C_1 + {}^9C_2$ (b) 2^{10}
(c) ${}^{10}C_2$ (d) $10!$

19. A five-digit number divisible by 3 is to be formed using the numerals 0, 1, 2, 3, 4 and 5 without repetition. The total number of ways this can be done is
(a) 216 (b) 240 (c) 600 (d) 3125

20. The total number of 9-digit numbers which have all different digits is
(a) 10! (b) 9! (c) $9 \cdot 9!$ (d) $10 \cdot 10!$

21. Eight chairs are numbered 1 to 8. Two women and three men wish to occupy one chair each. First the women choose the chairs from amongst the chairs marked 1 to 4 and then the men select the chairs from amongst the remaining. The number of possible arrangements is
(a) ${}^4C_3 \times {}^4C_2$ (b) ${}^4C_2 \times {}^4P_3$
(c) ${}^4P_2 \times {}^4P_3$ (d) None of these

22. From 4 Officers and 8 Jawans, a committee of 6 is to be chosen to include exactly one officer. The number of such committee is
(a) 160 (b) 200 (c) 224 (d) 300

23. Seven different lecturers are to deliver lectures in seven periods of a class on a particular day. A, B and C are three of the lecturers. The number of ways in which a routine for the day can be made such that A delivers his lecture before B and B before C, is
(a) 420 (b) 120
(c) 210 (d) None of these

24. The number of arrangements of letters of the word 'BANANA' in which the two N's do not appear together is
(a) 40 (b) 60 (c) 80 (d) 100

25. How many different nine-digit numbers can be formed from the number 223355888 by rearranging its digits, so that odd digits occupy even positions?
(a) 16 (b) 36 (c) 60 (d) 180

26. Let $A = \{x \mid x$ is a prime number and $x < 30\}$. The number of different rational numbers whose numerator and denominator belong to A, is
(a) 90 (b) 180
(c) 91 (d) None of these

27. Let S be the set of all functions from the set A to the set A. If $n(A) = k$, then $n(S)$ is
(a) $k!$ (b) k^k (c) $2^k - 1$ (d) 2^k

28. Let A be the set of 4-digit numbers $a_1 a_2 a_3 a_4$, where $a_1 > a_2 > a_3 > a_4$, then $n(A)$ is equal to
(a) 126 (b) 84
(c) 210 (d) None of these

29. An n-digit number is a positive number with exactly n-digits. Nine hundred distinct n-digit numbers are to be formed using only the three digits 2, 5 and 7. The smallest value of n for which this is possible is
(a) 6 (b) 7 (c) 8 (d) 9

30. The number of 5-digit telephone numbers having atleast one of their digits repeated is
(a) 90000 (b) 100000 (c) 30240 (d) 69760

31. If letters of the word 'KUBER' are written in all possible orders and arranged as in a dictionary, then rank of the word 'KUBER' will be
(a) 67 (b) 68 (c) 65 (d) 69

32. The total number of 4-digit numbers that are greater than 3000, that can be formed using the digits 1, 2, 3, 4, 5, 6 (no digit is being repeated in any number) is equal to
(a) 120 (b) 240 (c) 480 (d) 80

33. In a country, no two persons have identical set of teeth and there is no person without a tooth, also no person has more than 32 teeth. If shape and size of tooth is disregarded and only the position of tooth is considered, then maximum population of that country can be
(a) 2^{32} (b) $2^{32} - 1$
(c) Cannot be determined (d) None of these

34. n different toys have to be distributed among n children. Total number of ways in which these toys can be distributed, so that exactly one child gets no toy, is equal to
(a) $n!$ (b) $n! \cdot {}^nC_2$
(c) $(n-1)! \cdot {}^nC_2$ (d) $n! \cdot {}^{n-1}C_2$

35. The total number of permutations of k different things, in a row, taken not more than r at a time (each thing may be repeated any number of times) is equal to
(a) $k^r - 1$ (b) k^r (c) $\dfrac{k^r - 1}{k - 1}$ (d) $\dfrac{k(k^r - 1)}{(k-1)}$

36. A person predicts the outcome of 20 cricket matches of his home team. Each match can result either in a win, loss or tie for the home team. Total number of ways in which he can make the predictions, so that exactly 10 predictions are correct, is equal to
(a) ${}^{20}C_{10} \cdot 2^{10}$ (b) ${}^{20}C_{10} \cdot 3^{20}$
(c) ${}^{20}C_{10} \cdot 3^{10}$ (d) ${}^{20}C_{10} \cdot 2^{20}$

37. A team of four students is to be selected from a total of 12 students. Total number of ways in which team can be selected such that two particular students refuse to be together and other two particular students wish to be together only, is equal to
(a) 220 (b) 182
(c) 226 (d) None of these

38. The total number of numbers that are less than $3 \cdot 10^8$ and can be formed using the digits 1, 2, 3, is equal to
(a) $\dfrac{1}{2}(3^9 + 4 \cdot 3^8)$ (b) $\dfrac{1}{2}(3^9 - 3)$
(c) $\dfrac{1}{2}(7 \cdot 3^8 - 3)$ (d) $\dfrac{1}{2}(3^9 - 3 + 3^8)$

39. Four couples (husband and wife) decide to form a committee of four members. The number of different committees that can be formed in which no couple finds a place, is

(a) 10 (b) 12 (c) 14 (d) 16

40. In an examination of 9 papers, a candidate has to pass in more papers than the number of papers in which he fails in order to be successful. The number of ways in which he can be unsuccessful, is

(a) 255 (b) 256 (c) 193 (d) 319

41. The number of 5-digit numbers that can be made using the digits 1 and 2 and in which atleast one digit is different, is

(a) 30 (b) 31
(c) 32 (d) None of these

42. In a club election, the number of contestants is one more than the number of maximum candidates for which a voter can vote. If the total number of ways in which a voter can vote be 62, then the number of candidates is

(a) 7 (b) 5
(c) 6 (d) None of these

43. Two players P_1 and P_2 play a series of '$2n$' games. Each game can result in either a win or loss for P_1. Total number of ways in which P_1 can win the series of these games, is equal to

(a) $\frac{1}{2}(2^{2n} - {}^{2n}C_n)$ (b) $\frac{1}{2}(2^{2n} - 2\cdot {}^{2n}C_n)$
(c) $\frac{1}{2}(2^{n} - {}^{2n}C_n)$ (d) $\frac{1}{2}(2^{n} - 2\cdot {}^{2n}C_n)$

44. In the decimal system of numeration, the number of 6-digit numbers in which the sum of digits is divisible by 5, is

(a) 180000 (b) 540000
(c) 5×10^5 (d) None of these

45. The number of possible outcomes in a throw of n ordinary dice in which atleast one of the dice shows an odd number, is

(a) $6^n - 1$ (b) $3^n - 1$
(c) $6^n - 3^n$ (d) None of these

46. The number of different matrices that can be formed with elements 0, 1, 2 or 3, each matrix having 4 elements, is

(a) 3×2^4 (b) 2×4^4
(c) 3×4^4 (d) None of these

47. There are 20 questions in a question paper. If no two students solve the same combination of questions but solve equal number of questions, then the maximum number of students who appeared in the examination, is

(a) ${}^{20}C_9$ (b) ${}^{20}C_{11}$
(c) ${}^{20}C_{10}$ (d) None of these

48. The number of different pairs of words (□□□□, □□□) that can be made with the letters of the word 'STATICS' is

(a) 828 (b) 1260
(c) 396 (d) None of these

49. A shopkeeper sells three varieties of perfumes and he has a large number of bottles of the same size of each variety in his stock. There are 5 places in a row in his showcase. The number of different ways of displaying the three varieties of perfumes in the showcase is

(a) 6 (b) 50
(c) 150 (d) None of these

50. The number of ways in which 3 boys and 3 girls (all are of different heights) can be arranged in a line, so that boys as well as girls among themselves are in decreasing order of height from left to right, is

(a) 1 (b) 6!
(c) 20 (d) None of these

51. The number of words of four letters containing equal number of vowels and consonants, repetition allowed, is

(a) 105^2 (b) 210×243
(c) 105×243 (d) None of these

52. There are three teams each of a chairman, a supervisor and a worker three different companies. There are nine bonus of different denominations to be paid to these nine persons in all. In how many ways can this be done with due respect to superiority is given in every team?

(a) 865 (b) 129
(c) 1680 (d) None of these

53. If two numbers are selected from numbers 1 to 25, then the number of ways that their difference does not exceed 10 is

(a) 105 (b) 195
(c) ${}^{15}C_2$ (d) None of these

54. The number of ways in which a mixed double game can be arranged amongst 9 married couples, if no husband and wife play in the same game, is

(a) 756 (b) 1512
(c) 3024 (d) None of these

55. In a certain test, there are n questions. In this test 2^{n-i} students gave wrong answers to atleast i question, where $i = 1, 2, \ldots, n$. If the total number of wrong answers given is 2047, then n is equal to

(a) 10 (b) 11 (c) 12 (d) 13

56. The number of natural numbers which are less than $2 \cdot 10^8$ and which can be written by means of the digit 1 and 2, is

(a) 772 (b) 870 (c) 900 (d) 766

57. The number of times digit 3 will be written when listing the integer from 1 to 1000, is

(a) 269 (b) 300 (c) 271 (d) 302

58. Five balls of different colours are to be placed in three boxes of different sizes. Each box can hold all five balls. The number of ways in which we can place the balls in the boxes (order is not considered in the box) so that no box remains empty is

(a) 150 (b) 300
(c) 200 (d) None of these

59. The number of permutations of the letters of the word 'HINDUSTAN' such that neither the pattern 'HIN' nor 'DUS' nor 'TAN' appear, are

(a) 166674 (b) 168474 (c) 166680 (d) 181434

60. Two teams are to play a series of 5 matches between them. A match ends in a win or loss or draw for a team. A number of people forecast the result of each match and no two people make the same forecast for the series of matches. The smallest group of people in which one person forecasts correctly for all the matches will contain n people, where n is

(a) 81 (b) 243
(c) 486 (d) None of these

61. In a class of 20 students, every student had a hand shake with every other student. The total number of hand shakes were

(a) 180 (b) 190 (c) 200 (d) 210

62. There are 10 persons among whom two are brother. The total number of ways in which these persons can be seated around a round table so that exactly one person sit between the brothers, is equal to

(a) (2!) (7!) (b) (2!) (8!)
(c) (3!) (7!) (d) (3!) (8!)

63. The number of ways in which a couple can sit around a table with 6 guests, if the couple take consecutive seats, is

(a) 1440 (b) 720
(c) 5040 (d) None of these

64. The number of different garlands, that can be formed using 3 flowers of one kind and 3 flowers of other kind, is

(a) 60 (b) 20
(c) 4 (d) 5

65. In the next world cup of cricket, there will be 12 teams, divided equally in two groups. Teams of each group will play a match against each other. From each group, 3 top teams will qualify for the next round. In this round each team will play against others once. Four top teams of this round will qualify for the semifinal round, where each team will play against the other three. Two top teams of this round will go to the final round, where they will play the best of three matches. The minimum number of matches in the next world cup will be

(a) 54 (b) 53
(c) 38 (d) None of these

66. The value of ${}^{10}C_5 / {}^{11}C_6$, when numerator and denominator takes their greatest value, is

(a) $\frac{6}{11}$ (b) $\frac{5}{11}$ (c) $\frac{10}{6}$ (d) $\frac{10}{5}$

67. The number of subsets $\{1, 2, 3, ..., n\}$ having least element m and greatest element k, $1 \le m < k \le n$, is

(a) $2^{n-(k-m)}$ (b) 2^{k-m-2} (c) 2^{k-m-1} (d) 2^{k-m+1}

68. A class has 21 students. The class teacher has been asked to make n groups of r students each and go to zoo taking one group at a time. The size of group zoo i.e. the value of r) for which the teacher goes to the maximum number of times is (no group can go to the zoo twice)

(a) 9 or 10 (b) 10 or 11 (c) 11 or 12 (d) 12 or 13

69. A class has n students. We have to form a team of the students including atleast two students and also excluding atleast two students. The number of ways of forming the team is

(a) $2^n - 2n$ (b) $2^n - 2n - 2$
(c) $2^n - 2n - 4$ (d) None of these

70. From 4 gentlemen and 6 ladies, a committee of five is to be selected. The number of ways, in which the committee can be formed so that gentlemen are in majority, is

(a) 66 (b) 156
(c) 60 (d) None of these

71. If the total number of m elements subsets of the set $A = \{a_1, a_2, a_3, \dots, a_n\}$ is k times the number of m elements subsets containing a_4, then n is

(a) $(m-1)k$ (b) mk
(c) $(m+1)k$ (d) None of these

72. An urn contains 3 red pens, 4 green pens and 6 yellow pens. The number of ways of drawing 4 pens from the urn, if atleast one red pen is to be included in the draw, is (all the pens are different from each other)

(a) 500 (b) 505
(c) 510 (d) None of these

73. Two numbers are chosen from 1, 3, 5, 7, ... , 147, 149 and 151 and multiplied together in all possible ways. The number of ways which will give us the product a multiple of 5, is

(a) 1710 (b) 2900
(c) 1700 (d) None of these

74. Let T_n denotes the number of triangles which can be formed using the vertices of a regular polygon of n sides. If $T_{n+1} - T_n = 21$, then n equals

(a) 5 (b) 7 (c) 6 (d) 4

75. If a polygon has 44 diagonals, then the number of its sides are

(a) 11 (b) 7
(c) 8 (d) None of these

76. The sides AB, BC, CA of a ΔABC have 3, 4, 5 interior points, respectively on them. Total number of triangles that can be formed using these points as vertices, is equal to
(a) 135 (b) 145 (c) 178 (d) 205

77. $ABCD$ is a convex quadrilateral 3, 4, 5 and 6 points are marked on the sides AB, BC, CD and DA, respectively. The number of triangles with vertices on different sides is
(a) 270 (b) 220
(c) 282 (d) None of these

78. In a polygon, no three diagonals are concurrent. If the total number of points of intersection of diagonals interior to the polygon is 70, then the number of diagonals of the polygon is
(a) 20 (b) 28
(c) 8 (d) None of these

79. n lines are drawn in a plane such that no two of them are parallel and no three of them are concurrent. The number of different points at which these lines will cut, is
(a) $\sum_{k=1}^{n} k$ (b) $n(n-1)$
(c) n^2 (d) None of these

80. If n objects are arranged in a row, then the number of ways of selecting three objects, so that no two of them are next to each other, is
(a) $\frac{(n-2)(n-3)(n-4)}{3}$ (b) ${}^{n-2}C_3$
(c) ${}^{n-2}C_3 + {}^{n-3}C_2$ (d) None of these

81. There are three coplanar parallel lines. If any p points are taken on each of the lines, the maximum number of triangles with vertices at these points is
(a) $3p^2(p-1)+1$ (b) $3p^2(p-1)$
(c) $p^2(4p-3)$ (d) None of these

82. In a plane, there are two families of lines $y = x + r$, $y = -x + r$, where $r \in \{0, 1, 2, 3, 4\}$. The number of squares of diagonals of length 2 formed by the lines, is
(a) 9 (b) 16
(c) 25 (d) None of these

83. Line L_1 contains l_1 point and line L_2 contains l_2 point. If the points on L_1 are joined to the points on L_2, then number of points of intersection of new lines, is
(a) ${}^{l_1}C_2 \times {}^{l_2}C_2$
(b) $4 \cdot {}^{l_1}C_2 \times {}^{l_2}C_2$
(c) $2 \cdot {}^{l_1}C_2 \times {}^{l_2}C_2$
(d) None of the above

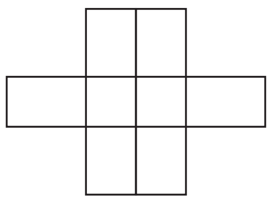
84. The number of triangles whose vertices are at the vertices of an octagon but none of whose sides happen to come from the octagon, is
(a) 16 (b) 28 (c) 56 (d) 70

85. The sides AB, BC and CA of a ΔABC have a, b and c interior points on them respectively, then the number of triangles that can be constructed using these interior points as vertices, is
(a) $\frac{ab+bc+ca}{2}$ (b) $\Sigma\, ab\,(a+b-2)$
(c) $\Sigma\, ab\,(a+b)$ (d) None of these

86. The number of points in the cartesian plane with integral coordinates satisfying the inequalities $|x| \le k, |y| \le k, |x-y| \le k$, is
(a) $(k+1)^3 - k^3$ (b) $(k+2)^3 - (k+1)^3$
(c) (k^2+1) (d) None of these

87. Given 5 different green dyes, 4 different blue dyes and 3 different red dyes. The number of combinations of dyes, which can be chosen taking atleast one green and one blue dye, is
(a) 3600 (b) 3720
(c) 3800 (d) None of these

88. Six X's have to be placed in the squares of the figure given below such that each row contains atleast one X'. The number of ways in which this can be done is



(a) 26 (b) 27
(c) 22 (d) None of these

89. The total number of six-digit numbers $x_1x_2x_3x_4x_5x_6$ having the property $x_1 < x_2 \le x_3 < x_4 < x_5 \le x_6$, is
(a) ${}^{10}C_6$ (b) ${}^{12}C_6$
(c) ${}^{11}C_6$ (d) None of these

90. A class contains three girls and four boys. Every Saturday five students go on a picnic, a different group of students is being sent each week. During the picnic, each girl in the group is given doll by the accompanying teacher. All possible groups of five have gone once, the total number of dolls the girls have got, is
(a) 21 (b) 45 (c) 27 (d) 24

91. The total number of ways of selecting two numbers from the set $\{1, 2, 3, 4, ..., 3n\}$, so that their sum of divisible by 3, is
(a) $\frac{2n^2-n}{2}$ (b) $\frac{3n^2-n}{2}$ (c) $2n^2-n$ (d) $3n^2-n$

92. If $r > p > q$, the number of different selections of $p+q$ things taking r at a time, where p things are identical and q other things are identical, is
(a) $p+q-r$ (b) $p+q-r+1$
(c) $r-p-q+1$ (d) None of these

93. The number of proper divisors of $2^p \cdot 6^q \cdot 15^r$ is

(a) $(p+q+1)(q+r+1)(r+1)$
(b) $(p+q+1)(q+r+1)(r+1)-2$
(c) $(p+q)(q+r)r-2$
(d) None of the above

94. The number of even proper divisors of 1008 is

(a) 23 (b) 24
(c) 22 (d) None of these

95. The number of ways to fill each of the four cells of the table with a distinct natural number such that the sum of the numbers is 10 and the sum of the numbers places diagonally are equal, is

(a) $2! \times 2!$ (b) $4!$
(c) $2(4!)$ (d) None of these

96. In the figure, two 4-digit numbers are to be formed by filling the places with digits. The number of different ways in which the places can be filled by digits so that the sum of the numbers formed is also a 4-digit number and in no place the addition is with carrying, is

	Th	H	T	U
+				

(a) 55^4 (b) $36 \cdot (55)^3$
(c) 45^4 (d) None of these

97. A bag contains 2 apples, 3 oranges and 4 bananas. The number of ways in which 3 fruits can be selected, if atleast one banana is always in the combination (assume fruit of same species to be alike) is

(a) 6 (b) 10 (c) 29 (d) 7

98. The number of divisors of the number 38808 (excluding 1 and the number itself), is

(a) 70 (b) 72
(c) 71 (d) None of these

99. The number of integral solutions of $x_1 + x_2 + x_3 = 0$, with $x_i \geq -5$, is

(a) ${}^{15}C_2$ (b) ${}^{16}C_2$ (c) ${}^{17}C_2$ (d) ${}^{18}C_2$

100. If 33! is divisible by 2^n, then the maximum value of n is equal to

(a) 30 (b) 31 (c) 32 (d) 33

101. Let p be a prime number such that $p \geq 3$. Let $n = p! + 1$. The number of primes in the list $n+1, n+2, n+3, \ldots, n+p-1$ is

(a) $p-1$ (b) 2
(c) 1 (d) None of these

102. A person writes letters to 6 friends and addresses the corresponding envelopes. The number of ways in which all 5 letters can be placed in wrong envelopes, is

(a) 264 (b) 210
(c) 206 (d) None of these

103. The number of ways in which $m+n$ $(n \leq m+1)$ different things can be arranged in a row such that no two of the n things may be together, is

(a) $\dfrac{(m+n)!}{m!\,n!}$ (b) $\dfrac{m!\,(m+1)!}{(m+n)!}$
(c) $\dfrac{m!\,n!}{(m-n+1)!}$ (d) None of these

104. Number of divisors of the form $4n+2$ $(n \geq 0)$ of the integer 240, is

(a) 4 (b) 8
(c) 10 (d) 3

105. Total number of non-negative integral solutions of $x_1 + x_2 + x_3 = 10$ is equal to

(a) ${}^{12}C_3$ (b) ${}^{10}C_3$
(c) ${}^{12}C_2$ (d) ${}^{10}C_2$

106. Total number of positive integral solutions of $x_1 + x_3 + 2x_3 = 15$ is equal to

(a) 42 (b) 70
(c) 32 (d) None of these

107. Total number of ways in which 15 identical blankets can be distributed among 4 persons, so that each of them gets atleast two blankets, is

(a) ${}^{10}C_3$ (b) ${}^{9}C_3$
(c) ${}^{11}C_3$ (d) None of these

108. Total number of 3 letter words that can be formed from the letter of the word 'AAAHNPRRS' is equal to

(a) 210 (b) 237 (c) 247 (d) 227

109. 15 identical balls have to be put in 5 different boxes. Each box can contain any number of balls. Total number of ways of putting the balls into box, so that each box contains atleast 2 balls, is equal to

(a) ${}^{9}C_5$ (b) ${}^{10}C_5$
(c) ${}^{6}C_5$ (d) ${}^{10}C_6$

110. The minimum marks required for clearing a certain screening paper is 210 out of 300. The screening paper consists of 3 sections each of Physics, Chemistry and Mathematics. Each section has 100 as maximum marks. Assuming, there is no negative marking and marks obtained in each section are integers, the number of ways in which a student can qualify the examination, assuming no cut-off limit, is

(a) ${}^{210}C_3 - {}^{90}C_3$
(b) ${}^{93}C_3$
(c) ${}^{213}C_3$
(d) $(210)^3$

111. Number of ways of distributing 10 identical objects among 8 persons (one or many persons may not be getting any object), is

(a) 8^{10} (b) 10^8 (c) ${}^{17}C_7$ (d) ${}^{10}C_8$

112. A bag contains 3 black, 4 white and 2 red balls, all the balls being different. The number of selections of atmost 6 balls containing balls of all the colours, is

(a) 42 (4!)
(b) $2^6 \times 4!$
(c) $(2^6 - 1)(4!)$
(d) None of the above

113. The number of ways to give 16 different things to three persons, so that B gets 1 more than A and C gets 2 more than B, is

(a) $\dfrac{16!}{4!\,5!\,7!}$
(b) $4!\,5!\,7!$
(c) $\dfrac{16!}{3!\,5!\,8!}$
(d) None of the above

114. The number of positive integral solutions of $x + y + z = n, n \in N, n \geq 3$, is

(a) ${}^{n-1}C_2$
(b) ${}^{n-1}P_2$
(c) $n(n-1)$
(d) None of the above

115. The number of non-negative integral solutions of $a + b + c + d = n, n \in N$, is

(a) ${}^{n-1}P_2$
(b) $\dfrac{(n+1)(n+2)(n+3)}{6}$
(c) ${}^{n-1}C_{n-4}$
(d) None of these

116. The number of points (x, y, z) in space, whose each coordinate is a negative integer such that $x + y + z + 12 = 0$, is

(a) 385 (b) 55
(c) 110 (d) None of these

117. If a, b, c are three natural numbers in AP and $a + b + c = 21$, then the possible number of values of the ordered triplet (a, b, c) is

(a) 15
(b) 14
(c) 13
(d) None of the above

118. If a, b, c, d are odd natural numbers such that $a + b + c + d = 20$, then the number of values of the ordered 4-tuple (a, b, c, d) is

(a) 165
(b) 455
(c) 310
(d) None of the above

Type 2. **More than One Correct Option**

119. Number of ways in which three numbers in AP can be selected from 1, 2, 3,..., n, is

(a) $\left(\dfrac{n-1}{2}\right)^2$, if n is even0
(b) $\dfrac{n(n-2)}{4}$, if n is even
(c) $\dfrac{(n-1)^2}{4}$, if n is odd
(d) None of the above

120. Kanchan has 10 friends among whom two are married to each other. She wishes to invite five of them for a party. If the married couples refuse to attend separately, then the number of different ways in which she can invite five friends, is

(a) ${}^8C_5$ (b) $2 \times {}^8C_3$
(c) ${}^{10}C_5 - 2 \times {}^8C_4$ (d) None of these

121. A forecast is to be made of the results of five cricket matches, each of which can be a win or a draw or a loss for Indian team. Let

p = number of forecasts with exactly 1 error
q = number of forecasts with exactly 3 errors and
r = number of forecasts with all five errors
Then, the correct statement(s) is/are

(a) $2q = 5r$ (b) $8p = q$
(c) $8p = 5r$ (d) $2(p + r) > q$

122. If x is the number of 5-digit numbers sum of whose digits is even and y is the number of 5-digit numbers sum of whose digits is odd, then

(a) $x = y$
(b) $x + y = 90000$
(c) $x = 45000$
(d) $x < y$

123. If ${}^nC_\alpha = {}^nC_\beta$, then it may be true that

(a) $\alpha = \beta$
(b) $\alpha + \beta = 2n$
(c) $\alpha + \beta = n$
(d) All of the above

124. There are n married couples at a party. Each person shakes hand with every person other than her or his spouse. The total number of hand shakes must be

(a) ${}^{2n}C_2 - n$
(b) ${}^{2n}C_2 - (n-1)$
(c) $2n(n-1)$
(d) ${}^{2n}C_2$

125. There are n lines in a plane, no two of which are parallel and no three of which are concurrent. If plane is divided in u_n parts, then

(a) $u_4 = 11$
(b) $u_3 = 7$
(c) $u_2 = 3$
(d) $u_n = u_{n-1} + 4$

Type 3. **Assertion and Reason**

Directions (Q. Nos. 126-133) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

126. **Statement I** The number of positive integral solutions of $abc = 30$ is 27.

Statement II Number of ways in which three prizes can be distributed among three persons is 3^3.

127. **Statement I** Number of ways in which 10 identical toys can be distributed among three students, if each receives at least two toys, is ${}^9C_2$.

Statement II Number of positive integral solutions of $x + y + z + w = 7$ is ${}^6C_3$.

128. **Statement I** $(n^2)!/(n!)^n$ is a natural number, $\forall\, n \in N$.

Statement II Number of ways in which n^2 objects can be distributed among n persons equally is $(n^2)!/(n!)^n$.

129. **Statement I** The number of ways of writing 1400 as a product of two positive integers is 12.

Statement II 1400 is divisible by exactly three prime factors.

130. **Statement I** Let $E = \{1, 2, 3, 4\}$ and $F = \{a, b\}$. Then, the number of onto functions from E to F is 14.

Statement II Number of ways in which four distinct objects can be distributed into two different boxes, if no box remains empty is 14.

131. **Statement I** Number of ways in which India can win the series of 11 matches, if no match is drawn is 2^{10}.

Statement II For each match, there are two possibilities, either India wins or loses.

132. **Statement I** Number of ways in which Indian team (11 players) can bat, if Yuvraj wants to bat before Dhoni and Pathan wants to bat after Dhoni is 11!/3!.

Statement II Yuvraj, Dhoni and Pathan can be arranged in batting order in 3! ways.

133. **Statement I** When number of ways of arranging 21 objects of which r objects are identical of one type and remaining are identical of second type is maximum, then maximum value of ${}^{13}C_r$ is 78.

Statement II ${}^{2n+1}C_r$ is maximum, when $r = n$.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 134-136) *We have to choose* 11 *players for cricket team from eight batsmen, six bowlers, four all rounders and two wicket keepers in the following questions.*

134. The number of selections, when atmost one all rounder and one wicket keeper will play, is

(a) ${}^4C_1 \times {}^{14}C_{10} + {}^2C_1 \times {}^{14}C_{10} + {}^4C_1 \times {}^2C_1 \times {}^{14}C_9 + {}^{14}C_{11}$

(b) ${}^4C_1 \times {}^{15}C_{11} + {}^{15}C_{11}$

(c) ${}^4C_1 \times {}^{15}C_{10} + {}^{15}C_{11}$

(d) None of the above

135. Number of selections when two particular batsmen do not want to play when a particular bowler will play, is

(a) ${}^{17}C_{10} + {}^{19}C_{11}$ (b) ${}^{17}C_{10} + {}^{19}C_{11} + {}^{17}C_{11}$

(c) ${}^{17}C_{10} + {}^{20}C_{11}$ (d) ${}^{19}C_{10} + {}^{19}C_{11}$

136. Number of selections when a particular batsman and a particular wicket keeper do not want to play together, is

(a) $2\,{}^{18}C_{10}$ (b) ${}^{19}C_{11} + {}^{18}C_{10}$

(c) ${}^{19}C_{10} + {}^{19}C_{11}$ (d) None of these

Passage II (Q. Nos. 137-139) 12 *persons are to be arranged around two round tables such that one table can accommodate seven persons and another five persons only.*

137. Number of ways in which these 12 persons can be arranged is

(a) ${}^{12}C_5\, 6!\, 2!$ (b) $6!4!$

(c) ${}^{12}C_5\, 6!\, 4!$ (d) None of these

138. Number of ways of arrangements, if two particular persons A and B do not want to be on the same table, is

(a) ${}^{10}C_4\, 6!\, 4!$ (b) $2\,{}^{10}C_6\, 6!\, 4!$

(c) ${}^{11}C_6\, 6!\, 4!$ (d) None of these

139. Number of ways of arrangement, if two particular persons A and B want to be together and consecutive, is

(a) ${}^{10}C_7\, 6!\, 3!2! + {}^{10}C_5\, 4!\, 5!\, 2!$

(b) ${}^{10}C_5\, 6!\, 3! + {}^{10}C_7\, 4!\, 5!$

(c) ${}^{10}C_7\, 6!\, 2! + {}^{10}C_5\, 5!\, 2!$

(d) None of the above

Passage III (Q. Nos. 140-142) *Number of ways of distributing n different things into r different groups is r^n when blank groups are taken into account and is $r^n - {}^rC_1 (r-1)^n + {}^rC_2 (r-2)^2 - .. + (-1)^{r-1}\, {}^rC_{r-1}$ when blank groups are not permitted.*

140. 4 candidates are competing for two managerial posts. In how many ways can the candidates be selected?
(a) 4^2 (b) ${}^4C_2$
(c) 2^4 (d) None of these

141. 8 different balls can be distributed among 3 children so that every child receives atleast 1 ball, is
(a) 3^8 (b) ${}^8C_3$
(c) 8^3 (d) None of these

142. 5 letters can be posted into 3 letter boxes in
(a) 3^5 ways
(b) 5^3 ways
(c) ${}^5C_3$ ways
(d) None of the above

Type 5. **Match the Columns**

143. Match the following.

Column I		Column II
A. Number of straight lines joining any two of 20 points of which four points are collinear, is	p.	56
B. Maximum number of points of intersection of 20 straight lines in the plane, is	q.	60
C. Maximum number of points of intersection of 8 circles in the plane, is	r.	185
D. Maximum number of points of intersection of six parabolas, is	s.	190

144. A function is defined as
$f : \{a_1, a_2, a_3, a_4, a_5, a_6\} \to \{b_1, b_2, b_3\}$.
Then, match the following.

Column I	Column II
A. Number of surjective functions is	p. divisible by 6
B. Number of functions in which $f(a_i) \neq b_i$, is	q. divisible by 2
C. Number of invertible functions is	r. divisible by 4
D. Number of many-one functions is	s. divisible by 3
	t. not possible

145. Match the statements of Column I with values of Column II.

Column I	Column II
A. The value of $1 \cdot 1! + 2 \cdot 2! + 3 \cdot 3! + \dots + n \cdot n!$ is	p. $(n+2)\,2^{n-1} - (n+1)$
B. The value of $n \cdot {}^nC_1 + (n-1) \cdot {}^nC_2 + (n-1) \cdot {}^nC_3 + \dots + 1 \cdot {}^nC_n$ is	q. ${}^{2n}C_n$
C. The value of ${}^2C_2 + {}^3C_2 + {}^4C_2 + \dots + {}^nC_2$ is	r. $(n+1)! - 1$
D. The value of $\sum_{r=0}^{n} ({}^nC_r)^2$ is	s. ${}^{n+1}C_3$
	t. ${}^{2n}C_{n-1} - 1$

Type 6. **Single Integer Answer Type Questions**

146. A class has three teachers, Mr. P, Ms. Q and Mrs. R and six students A, B, C, D, E, F. Number of ways in which they can be seated in a line of 9 chairs, if between any two teachers, there are exactly two students, is $k!(18)$, then the value of k is ____________ .

147. Consider, the five points comprising the vertices of a square and the intersection point of its diagonals. How many triangles can be formed using these points?

148. If number of selections of 6 different letters that can be made from the words 'SUMAN' and 'DIVYA', so that each selection contains 3 letters from each word is N^2, then the value of N is _________ .

149. There are n distinct white and n distinct black balls. If the number of ways of arranging them in a row, so that neighbouring balls are of different colours, is 1152, then the value of n is _________ .

150. There are 4 oranges, 5 apples and 6 mangoes in a fruit basket. If $(21k + 20)$ ways can a person make a selection of fruits from among the fruits in the basket, when all fruits of the same type, are identical, then k refers to _________ .

151. The number of ways of filling three boxes (named A, B and C) by 12 or less number of identical balls, if no box is empty, box B has atleast 3 balls and box C has atmost 5 balls, is $55\,\lambda$, where λ_r refers to _______ .

152. The number of non-negative integral solutions $2x + y + z = 21$ is $22(k)$, where k refers to _______ .

Entrances Gallery

JEE Advanced/IIT JEE

1. Let $n_1 < n_2 < n_3 < n_4 < n_5$ be positive integers such that $n_1 + n_2 + n_3 + n_4 + n_5 = 20$. Then, the number of such distinct arrangements $(n_1, n_2, n_3, n_4, n_5)$ is _________ . **[2014]**

2. Let $n \geq 2$ be an integer. Take n distinct points on a circle and join each pair of points by a line segment. Colour the line segment joining every pair of adjacent points by blue and the rest by red. If the number of red and blue line segments are equal, then the value of n is _________ . **[2014]**

3. Six cards and six envelopes are numbered 1, 2, 3, 4, 5, 6 and cards are to be placed in envelopes so that each envelope contains exactly one card and no card is placed in the envelope bearing the same number and moreover the card numbered 1 is always placed in envelope numbered 2. Then, the number of ways it can be done is **[2014]**

(a) 264 (b) 265 (c) 53 (d) 67

4. Consider the set of eight vectors $V = \{a\hat{\mathbf{i}} + b\hat{\mathbf{j}} + c\hat{\mathbf{k}} ; a, b, c \in \{-1, 1\}\}$. Three non-coplanar vectors can be chosen from V in 2^p ways. Then, p is _________ . **[2013]**

JEE Main/AIEEE

5. The number of integers greater than 6000 that can be formed, using the digits 3, 5, 6, 7 and 8 without repetition, is **[2015]**

(a) 216 (b) 192
(c) 120 (d) 72

6. Let A and B be two sets containing 2 elements and 4 elements, respectively. The number of subsets of $A \times B$ having 3 or more elements, is **[2013]**

(a) 256 (b) 220
(c) 219 (d) 211

7. The total number of ways in which 5 balls of different colours can be distributed among 3 persons so that each person gets atleast one ball, is **[2012]**

(a) 75 (b) 150 (c) 210 (d) 243

Directions (Q. Nos. 8-9) *Let a_n denotes the number of all n-digit positive integers formed by the digits 0, 1 or both, such that no consecutive digits in them are 0. Let b_n be the number of such n digit integers ending with digit 1 and c_n be the number of such n digit integers ending with digit 0.* **[2012]**

8. Which of the following is correct?

(a) $a_{17} = a_{16} + a_{15}$
(b) $c_{17} \neq c_{16} + c_{15}$
(c) $b_{17} \neq b_{16} + c_{16}$
(d) $a_{17} = c_{17} + b_{16}$

9. The value of b_6 is

(a) 7 (b) 8 (c) 9 (d) 11

10. **Statement I** The number of ways distributing 10 identical balls in 4 distinct boxes such that no box is empty is ${}^9C_3$.

Statement II The number of ways of choosing any 3 places from 9 different places is ${}^9C_3$. **[2011]**

(a) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(b) Statement I is true, Statement II is false
(c) Statement I is false, Statement I is true
(d) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

11. There are 10 points in a plane, out of these 6 are collinear. If N is the number of triangles formed by joining these points, then **[2011]**

(a) $N > 190$ (b) $N \leq 100$
(c) $100 < N \leq 140$ (d) $140 < N \leq 190$

12. There are two urns. Urn A has 3 distinct red balls and urn B has 9 distinct blue balls. From each urn, two balls are taken out at random and then transferred to the other. The number of ways in which this can be done is **[2010]**

(a) 3 (b) 36
(c) 66 (d) 108

13. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on the shelf so that the dictionary is always in the middle. Then, the number of such arrangements is **[2009]**

(a) atleast 500 but less than 750
(b) atleast 750 but less than 1000
(c) atleast 1000
(d) less than 500

14. In a shop, there are five types of ice-creams available. A child buys six ice-creams.

Statement I The number of different ways the child can buy the six ice-creams is ${}^{10}C_5$.

Statement II The number of different ways the child can buy the six ice-creams is equal to the number of different ways of arranging 6A's and 4B's in a row. **[2008]**

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

15. How many different words can be formed by jumbling the letters in the word 'MISSISSIPPI' in which no two S are adjacent? **[2008]**

(a) $8 \cdot {}^6C_4 \cdot {}^7C_4$
(b) $6 \cdot 7 \cdot {}^8C_4$
(c) $6 \cdot 8 \cdot {}^7C_4$
(d) $7 \cdot {}^6C_4 \cdot {}^8C_4$

16. The set $S : \{1, 2, 3, \dots, 12\}$ is to be partitioned into three sets A, B, C of equal size.
Thus, $A \cup B \cup C = S$, $A \cap B = B \cap C = A \cap C = \phi$.
The number of ways to partition S is **[2007]**

(a) $12!/3!(4!)^3$ (b) $12!/3!(3!)^4$
(c) $12!/(4!)^3$ (d) $12!/(3!)^4$

17. At an election, a voter may vote for any number of candidates not greater than the number to be elected. There are 10 candidates and 4 are to be elected. If a voter votes for atleast one candidate, then the number of ways in which he can vote, is **[2006]**

(a) 6210 (b) 385 (c) 1110 (d) 5040

18. If the letters of the word 'SACHIN' are arranged in all possible ways and these words are written out as in dictionary, then the word 'SACHIN' appears at serial number is **[2005]**

(a) 602 (b) 603 (c) 600 (d) 601

19. The range of the function $f(x) = {}^{7-x}P_{x-3}$ is **[2004]**

(a) $\{1, 2, 3\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{1, 2, 3, 4\}$ (d) $\{1, 2, 3, 4, 5\}$

20. How many ways are there to arrange the letters in the word 'GARDEN' with the vowels in alphabetical order? **[2004]**

(a) 120 (b) 240 (c) 360 (d) 480

21. The number of ways of distributing 8 identical balls in 3 distinct boxes, so that none of the boxes is empty, is **[2004]**

(a) 5 (b) 21 (c) 3^8 (d) ${}^8C_3$

22. The number of ways in which 6 men and 5 women can dine at a round table, if no two women are to sit together, is given by **[2003]**

(a) $6! \times 5!$ (b) 30 (c) $5! \times 4!$ (d) $7! \times 5!$

23. If ${}^nC_r$ denotes the number of combinations of n things taken r at a time, then the expression ${}^nC_{r+1} + {}^nC_{r-1} + 2 \times {}^nC_r$ equals **[2003]**

(a) ${}^{n+2}C_r$ (b) ${}^{n+2}C_{r+1}$ (c) ${}^{n+1}C_r$ (d) ${}^{n+1}C_{r+1}$

Other Engineering Entrances

24. How many 5-digit telephone numbers can be constructed using the digits 0 to 9, if each number starts with 67 and no digit appears more than once? **[Karnataka CET 2014]**

(a) 335 (b) 336 (c) 338 (d) 337

25. A student is allowed to select atmost n books from a collection of $(2n+1)$ books. If the number of ways in which he can do this, is 64, then the value of n is **[BITSAT 2014]**

(a) 6 (b) n
(c) 3 (d) None of these

26. $S = \{1, 2, 3, \dots, 20\}$ is to be partitioned into four sets A, B, C and D of equal size. The number of ways it can be done, is **[Manipal 2014]**

(a) $\frac{20!}{4! \times 5!}$ (b) $\frac{20!}{4^5}$
(c) $\frac{20!}{(5!)^4}$ (d) $\frac{20!}{(4!)^5}$

27. In how many ways can a student choose a program of 5 courses, if 9 courses are available and 2 specific courses are compulsory for every student? **[Manipal 2014]**

(a) 34 (b) 36
(c) 35 (d) 37

28. 10 different toys are to be distributed among 10 children. Total number of ways of distributing these toys, so that exactly two children do not get any toy, is **[Manipal 2014]**

(a) $\frac{10!}{2!\,3!\,7!}$ (b) $\frac{10!}{(2!)^4 \times 6!}$
(c) $(10!)^2\left[\frac{1}{(2!)^4 \times 6!} + \frac{1}{2! \times 3!}\right]$ (d) $\frac{10! \times 10!}{(2!)^2 \times 6!}\left[\frac{25}{84}\right]$

29. Out of 7 consonants and 4 vowels, the number of words (not necessarily meaningful) that can be made, each consisting of 3 consonants and 2 vowels, is **[WB JEE 2014]**

(a) 24800 (b) 25100 (c) 25200 (d) 25400

30. ${}^mC_{r+1} + \sum_{k=m}^{n} {}^kC_r$ is equal to **[AMU 2014]**

(a) ${}^nC_{r+1}$ (b) ${}^{n+1}C_{r+1}$
(c) ${}^nC_r$ (d) None of these

31. $\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \dots + n\frac{C_n}{C_{n-1}}$ is equal to **[AMU 2014]**

(a) $\frac{n(n-1)}{2}$ (b) $\frac{n(n+1)}{2}$
(c) $\frac{(n+1)(n+2)}{2}$ (d) None of these

32. If n is an integer with $0 \le n \le 11$, then the minimum value of $n!(11-n)!$ is attained, when a value of n is **[EAMCET 2014]**
(a) 11 (b) 5
(c) 7 (d) 9

33. Find ${}^nC_{21}$, if ${}^nC_{10} = {}^nC_{11}$. **[J&K CET 2014]**
(a) 1 (b) 0
(c) 11 (d) 10

34. Determine n, if ${}^{2n}C_2 : {}^nC_2 = 9:2$. **[J&K CET 2014]**
(a) 5 (b) 4

Explanations

Target Exercises

1. We have, $\alpha = {}^mC_2 \Rightarrow \alpha = \frac{m(m-1)}{2}$

$$\therefore \quad {}^{\alpha}C_2 = \frac{\alpha(\alpha-1)}{2} = \frac{1}{2}\cdot\frac{m(m-1)}{2}\left\{\frac{m(m-1)}{2}-1\right\}$$
$$= \frac{1}{8}m(m-1)(m-2)(m+1)$$
$$= \frac{1}{8}(m+1)\,m\,(m-1)(m-2) = 3\,{}^{m+1}C_4$$

2. Given, ${}^nC_3 + {}^nC_4 > {}^{n+1}C_3$

$$\Rightarrow \quad {}^{n+1}C_4 > {}^{n+1}C_3 \qquad [\because {}^nC_r + {}^nC_{r+1} = {}^{n+1}C_{r+1}]$$
$$\Rightarrow \quad \frac{{}^{n+1}C_4}{{}^{n+1}C_3} > 1 \;\Rightarrow\; \frac{n-2}{4} > 1 \;\Rightarrow\; n > 6$$

3. We have, $\sum_{r=0}^{n-1}\frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}} = \sum_{r=0}^{n-1}\frac{1}{1+\frac{{}^nC_{r+1}}{{}^nC_r}}$

$$= \sum_{r=0}^{n-1}\frac{1}{1+\frac{n-r}{r+1}}$$
$$= \sum_{r=0}^{n-1}\frac{r+1}{n+1} = \frac{1}{n+1}\sum_{r=0}^{n-1}(r+1)$$
$$= \frac{1}{(n+1)}[1+2+\ldots+n] = \frac{n}{2}$$

4. We know that, $\frac{{}^nP_r}{r!} = {}^nC_r$

$$\therefore \quad \sum_{r=1}^{n}{}^nC_r = 2^n - 1 \qquad [1 \text{ corresponding to } {}^nC_0]$$

5. Given, $\frac{(2n+1)!\,(n-1)!}{(n+2)!\,(2n-1)!} = \frac{3}{5}$

$$\frac{(2n+1)(2n)}{(n+2)(n+1)n} = \frac{3}{5}$$
$$\Rightarrow \quad 10(2n+1) = 3(n^2+3n+2)$$
$$\Rightarrow \quad 3n^2 - 11n - 4 = 0$$
$$\Rightarrow \quad (n-4)(3n+1) = 0$$
$$\therefore \quad n = 4$$

6. The number of one-digit numbers = 0
The number of two-digit numbers = $5\times5=25$.
The number of three-digit numbers = $5\times5\times4=100$.
Hence, the total numbers are 131.

7. Numbers greater than 1000 and less than or equal to 4000 will be of 4-digits and will have either 1 or 2 or 3 in the 1st place. After fixing 1 at first place, then 2nd place can be filled by any of the 5-digits. Similarly, the 3rd place can be filled up in 5 ways and 4th place can be filled up in 5 ways. Thus, there will be $5\times5\times5=125$ ways in which 1 will be in first place but this also includes 1000. Hence, there will be 124 numbers having 1 in the first place. Similarly, 125 for each 2 or 3. One number will be there in which 4 will be in the first place i.e. 4000. Hence, the required number of numbers

$$= 124 + 125 + 125 + 1$$
$$= 375$$

8. Total number of variables, if only alphabet is used is 26. Total number of variables, if alphabets and digits both are used is 26×10. Hence, the total number of variables is $26\,(1+10)=286$.

9. If 7 is used at first place, the number of numbers is 9^4 and for any other four places, it is 8×9^3.

Now, required number of numbers = $9^4 + 4\times8\times9^3$
$$= 9^3(9+32) = 41\,(9^3)$$

10. If all strips are of different colours, then number of flags is $3! = 6$. When two strips are of same colour, then number of flags is ${}^3C_1\times(3!/2)\times{}^2C_1 = 18$.

$\therefore$ Total number of flags $= 6 + 18 = 24 = 4!$

11. Total number of triplets without restriction is $n\times n\times n$. The number of triplets with all different coordinates is ${}^nP_3$.
Therefore, the required number of triplets is $n^3 - {}^nP_3$.

12. $x_1 < x_2 < x_3 < x_4 < x_5 < x_6$, when the number is $x_1x_2x_3x_4x_5x_6$. Clearly, no digit can be zero. Also, all the digits are distinct. So, let us first select six digits from the list of digits 1, 2, 3, 4, 5, 6, 7, 8, 9 which can be done in ${}^9C_6$ ways.
After selecting these digits, they can be put only in one order.
Thus, total number of such numbers $= {}^9C_6\times1 = {}^9C_3$

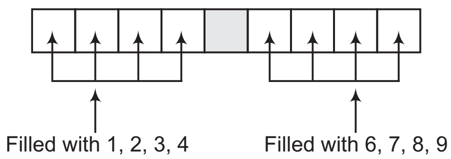
13. The number of numbers when repetition is allowed is 5^4. The number of numbers when digits cannot be repeated is ${}^5P_4$.
Therefore, the required number of numbers is $5^4 - 5! = 505$.

14.

Middle digit	Digits available for remaining four places	Pattern	Number of ways of filling remaining four places
4	0, 1, 2, 3		$3\times{}^3P_3$
5	0, 1,...,4		$4\times{}^4P_3$
6	0, 1,...,5	...	$5\times{}^5P_3$
7	0, 1,...,6	...	$6\times{}^6P_3$
8	0, 1,...,7	...	$7\times{}^7P_3$
9	0, 1,...,8	...	$8\times{}^8P_3$

Thus, number of required numbers = 5292

15. According to the given conditions, numbers can be formed by the following format:



$\therefore$ Number of required numbers $= {}^4P_4\times{}^4P_4$

Target Exercises

16. Total number of digits (sum of digits is even) = 450

17. (i) Required number of permutations = Number of permutations of n objects (taken r at a time + taken $(r+1)$ at a time + taken $(r+2)$ at a time + ... + taken n at a time]

$$= n^r + n^{r+1} + n^{r+2} + \ldots + n^n$$

$$= \frac{n^r\,(n^{n-r+1}-1)}{n-1}$$

(ii) Required number of permutations = Number of permutations of n objects (taken 0 at a time + taken 1 at a time + ... + taken r at a time)

$$= n^0 + n^1 + n^2 + \ldots + n^r = \frac{1\times(n^{r+1}-1)}{n-1}$$

18. Total number of required numbers

$$= 2\times 2\times \ldots 10 \text{ times} = 2^{10}$$

19. Number of numbers using 1, 2, 3, 4, 5 = $5! = 120$

Number of numbers using 0, 1, 2, 4, 5

$$= 5! - 4! = 120 - 24 = 96$$

[$\because$ there are 4! numbers beginning with '0']

$\therefore$ Total number of required numbers $= 120 + 96 = 216$

20. Number of ways of filling first place = 9

Number of ways of filling remaining 8 places

$$= 9\times 8\times 7\times 6\times 5\times 4\times 3\times 2 = 9!$$

$\therefore$ Total number of numbers $= 9\times 9!$

21. Number of ways for women $= {}^4P_2$

Number of ways for men $= {}^6P_3$

$\therefore$ Total number of ways $= {}^4P_2 \times {}^6P_3$

22. Number of committees $= {}^4C_1 \times {}^8C_5 = 4\times 56 = 224$

23. As the order of A, B and C is not to change, therefore number of ways of assigning three periods to them is ${}^7C_3$. Now, we left with 4 periods for 4 lecturers that can assign in 4! ways.

$\therefore$ Required number of ways $= {}^7C_3 \times 4!$

$$= \frac{7!}{3!\times 4!}\times 4! = \frac{7!}{3!} = 840$$

24. Total number of arrangements of the letters of the given word

$$= \frac{6!}{3!\,2!} = 60$$

Number of arrangements in which two N's are together

$$= \frac{5!}{3!} = 20$$

$\therefore$ Number of arrangements in which two N's are not together

$$= 60 - 20 = 40$$

25. There are 5 odd places and that can be filled by using 2, 2, 8, 8, 8 in $\frac{5!}{2!\,3!} = 10$ ways and remaining 4 even places can be filled by using 3, 3, 5, 5 in $\frac{4!}{2!\times 2!} = 6$ ways

$\therefore$ Total number of numbers $= 10\times 6 = 60$

26. $A = \{2, 3, 5, 7, 11, 13, 17, 19, 23, 29\}$. A rational number is made by taking any two in any order.

So, the required number of rational numbers

$$= {}^{10}P_2 + 1 = 9 \qquad \text{[including 1]}$$

27. Each element of the set A (domain) can be give the image in the set A (codomain) in k ways. So, the required number of functions.

i.e. $n(S) = k\times k\times \ldots (k \text{ times}) = k^k$

28. Any selection of four digits from the ten digits 0, 1, 2, 3, ...,9 gives one such number. So, the required number of numbers $= {}^{10}C_4 = 210$

29. Number of distinct n digit numbers using $2, 5, 7 = 3^n$.

Now consider, $3^n > 900 \Rightarrow n = 7$ [for minimum]

30. Number of numbers with repetition

$$= 10\times 10\times 10\times 10\times 10 = 100000$$

Number of numbers without repetition

$$= 10\times 9\times 8\times 7\times 6 = 30240$$

$\therefore$ Number of numbers with atleast one digit repeated

$$= 100000 - 30240 = 69760$$

31. Total words starting with B $= 4! = 24$

Total words starting with E $= 4! = 24$

Total words starting with KB $= 3! = 6$

Total words starting with KE $= 3! = 6$

Total words starting with KR $= 3! = 6$

The first word starting with KU will be KUBER.

So, rank of the word KUBER

$$= 24 + 24 + 18 + 1 = 67$$

32. Total number of such numbers

$$= 4\cdot 5\cdot 4\cdot 3 = 240$$

33. Maximum population $= 2^{32} - 1$ [as each position of tooth has two options]

34. Total number of ways

$$= {}^nC_2 \times {}^nC_1 \times (n-1)!\cdot \frac{n!}{2!\,(n-2)!}\cdot n! = n!\cdot {}^nC_2$$

35. Total number of permutations $= 0 + k + k^2 + k^3 + \ldots + k^r$

$$= \frac{k\,(k^r - 1)}{(k-1)}$$

36. Matches whose predictions are correct can be selected in ${}^{20}C_{10}$ ways. Now, each wrong prediction can be made in 2 ways. Thus, total number of ways $= {}^{20}C_{10}\cdot 2^{10}$.

37. Let S_1 and S_2 refuse to be together and S_3 and S_4 want to be together only. Total number of ways, when S_3 and S_4 are selected

$$= ({}^8C_2 + {}^2C_1\cdot {}^8C_1) = 44$$

Total number of ways when S_3 and S_4 are not selected

$$= ({}^8C_2 + {}^2C_1\cdot {}^8C_3) = 182$$

Thus, total number of ways $= 44 + 182 = 226$

38. Formed number can be atmost of nine digits.

Total number of such numbers

$$= 3 + 3^2 + 3^3 + \ldots + 3^8 + 2\cdot 3^8$$

$$= \frac{3(3^8-1)}{3-1} + 2\cdot 3^8 = \frac{3^9 - 3 + 4\cdot 3^8}{2} = \frac{7\cdot 3^8 - 3}{2}$$

39. The number of committees of 4 gentlemen $= {}^4C_4 = 1$
The number of committees of 3 gentlemen, 1 wife
$$= {}^4C_3 \times {}^1C_1 \quad \left[\begin{array}{l}\text{after selecting 3 gentlemen, only 1}\\ \text{wife is left, which can be included}\end{array}\right]$$
The number of committees of 2 gentlemen, 2 wives
$$= {}^4C_2 \times {}^2C_2$$
The number of committees of 1 gentleman, 3 wives
$$= {}^4C_1 \times {}^3C_3$$
The number of committees of 4 wives = 1
$\therefore$ The required number of committees
$$= 1 + 4 + 6 + 4 + 1 = 16$$

40. The candidate is unsuccessful, if he fails in 9 or 8 or 7 or 6 or 5 papers.
$\therefore$ The number of ways to be unsuccessful
$$= {}^9C_9 + {}^9C_8 + {}^9C_7 + {}^9C_6 + {}^9C_5$$
$$= 1 + 9 + 36 + 84 + 126 = 256$$

41. Total number of numbers of without restriction $= 2^5$
Two numbers have all the digits equal. So, the required number of numbers $= 2^5 - 2$
$$= 32 - 2 = 30$$

42. $62 = {}^nC_1 + {}^nC_2 + {}^nC_3 + \dots + {}^nC_{n-1}$
$$= 2^n - {}^nC_0 - {}^nC_n = 2^n - 2$$
$$\Rightarrow \quad 62 + 2 = 2^n$$
$$\therefore \quad 2^n = 64 = 2^6 \quad \Rightarrow \quad n = 6$$

43. Total number of ways
$$= \sum_{r=1}^{n} {}^{2n}C_{n+r} = {}^{2n}C_{n+1} + \dots + {}^{2n}C_{2n}$$
$$= \frac{1}{2}(2^{2n} - {}^{2n}C_n)$$

44. Ways $9 \times 10 \times 10 \times 10 \times 10 \times 2$
0 cannot be placed in the first place. In the other four places, any digit can go. After filling the first five places, the last place can be filled by 0 or 5.
$\therefore$ Required number of numbers $= 9 \times 10^4 \times 2 = 18000$

45. Total number of outcomes $= 6 \times 6 \times \dots$ to n times $= 6^n$
Total number of outcomes which show only even numbers
$$= 3 \times 3 \times 3 \dots \text{to } n \text{ times} = 3^n$$

46. The matrix will be of the order 4×1 or 1×4 or 2×2.
For each order, the number of different matrices
= The number of ways to fill four places by 0, 1, 2, 3
$$= 4 \times 4 \times 4 \times 4$$

47. If r questions are solved by each student, then the number of possible selections of questions is ${}^{20}C_r$.
$\therefore$ The number of students $= {}^{20}C_r$
$$\left[\begin{array}{l}\because \text{ each student has solved different}\\ \text{combinations of questions}\end{array}\right]$$
$\therefore$ The maximum number of students
= Maximum value of ${}^{20}C_r = {}^{20}C_{10}$
because ${}^{20}C_{10}$ is the largest among ${}^{20}C_0, {}^{20}C_1, \dots, {}^{20}C_{20}$ being the middle one.

48. From every arrangement of 7 letters, we get a pair by putting a sign (,).
$\therefore$ The required number of pairs $= \dfrac{7!}{2!2!} = 1260$

49.

Possibilities	Selections	Arrangements
One triplet, two different	${}^3C_1 \times {}^2C_2$	${}^3C_1 \times {}^2C_2 \times \dfrac{5!}{3!} = 60$
Two pairs, one different	${}^3C_2 \times {}^1C_1$	${}^3C_2 \times {}^1C_1 \times \dfrac{5!}{2!2!} = 90$

$\therefore$ Required number of ways = 150

50. Total number of ways $= \dfrac{6!}{3! \times 3!} = 20$

51. The number of selections of 1 pair of vowels and 1 pair of consonants $= {}^5C_1 \times {}^{21}C_1$
$\therefore$ Required number of words
$$= {}^5C_1 \times {}^{21}C_1 \times \frac{4!}{2!2!} + {}^5C_2 \times {}^{21}C_2 \times 4!$$

52. Required number of ways $= 3! \cdot 3! \cdot 3! = 216$

53. If $x = 1, y \in \{1, 2, \dots, 11\}$
$x = 2, y \in \{1, 2, \dots, 12\}$
... ...
$x = 11, y \in \{1, 2, \dots, 21\}$
$\therefore$ Number of ways $= 11 + 12 + \dots + 21$

54. We can choose two men out of 9 in ${}^9C_2$ ways. Since, no husband and wife are to play in the same game, two women out of the remaining 7 can be chosen in ${}^7C_2$ ways. If M_1, M_2, W_1 and W_2 are chosen, then a team may consist of M_1 and W_1 or M_1 and W_2. Thus, the number of ways of arranging the game is
$${}^9C_2 \cdot {}^7C_2 = \frac{9 \times 8}{2} \times \frac{7 \times 6}{2} \times 2 = 1512$$

55. The number of students answering exactly i $(1 \le i \le n-1)$ questions wrongly is $2^{n-i} - 2^{n-i-1}$. The number of students answering all n questions wrongly is 2^0.
Thus, the total number of wrong answers is
$$1(2^{n-1} - 2^{n-2}) + 2(2^{n-2} - 2^{n-3}) + \dots + (n-1)(2^1 - 2^0) + n(2^0)$$
$$= 2^{n-1} + 2^{n-2} + 2^{n-3} + \dots + 2^0 = 2^n - 1$$
Now, $2^n - 1 = 2047$
$$\Rightarrow \quad 2^n = 2048 = 2^{11}$$
$$\therefore \quad n = 11$$

56. The required numbers are
1, 2, 11, 12, 21, 22, ...,122222222
Let us calculate how many numbers are these.
There are 2 one-digit such numbers. There are 2^2 two-digit such numbers and so on.
There are 2^8 eight-digit such numbers. Also, the 9-digit numbers beginning with 1 and written by means of 1 and 2 are smaller than $2 \cdot 10^8$. Thus, there are 2^8 such nine-digit numbers.
Hence, the required number of numbers
$$= 2 + 2^2 + 2^3 + \dots + 2^8 + 2^8$$
$$= \frac{2(2^8 - 1)}{2 - 1} + 2^8$$
$$= 2^9 - 2 + 2^8$$
$$= 766$$

57. Since, 3 does not occur in 1000, we have to count the number of times 3 occurs when we list the integers from 1 to 999. Any number between 1 and 999 is of the form xyz, where $0 \le x, y, z \le 9$. Let us first count the numbers in which 3 occurs exactly once. Since, 3 can occur at one place in ${}^3C_1$ ways, there are ${}^3C_1\,(9\times 9) = 3\times 9^2$ such numbers. Next, 3 can occur exactly two places in $({}^3C_2)\,(9) = 3\times 9$ such numbers.

Lastly, 3 can occur in all three-digits in one number only. Hence, the number of times 3 occurs is

$$1\times(3\times 9^2) + 2\times(3\times 9) + 3\times 1 = 300$$

58. One possible arrangements is

$$2 \quad 2 \quad 3$$

Three such arrangements are possible. Therefore, the number of ways is $({}^5C_2)\,({}^3C_2)\,({}^1C_1)\,(3) = 90$

The other possible arrangements is

$$1 \quad 1 \quad 3$$

Three such arrangement are possible. In this case, the number of ways is $({}^5C_1)\,({}^4C_1)\,({}^3C_3)\,(3) = 60$

Hence, the total number of ways $= 90 + 60 = 150$

59. Total number of permutations $= \dfrac{9!}{2!}$

Number of permutation of those containing 'HIN' $= 7!$

Number of permutation of those containing 'DUS' $= \dfrac{7!}{2!}$

Number of permutation of those containing 'TAN' $= 7!$

Number of permutation of those containing 'HIN' and 'DUS' $= 5!$

Number of permutation of those containing 'HIN' and 'TAN' $= 5!$

Number of permutation of those containing 'TAN' and 'DUS' $= 5!$

Number of permutation of those containing 'HIN', 'DUS' and 'TAN' $= 3!$

$\therefore$ Required number $= \dfrac{9!}{2!} - \left(7! + 7! + \dfrac{7!}{2}\right) - 3\times 5! - 3!$

$= 168474$

60. The smallest number of people

= Total number of possible forecast

= Total number of possible results

$= 3\times 3\times 3\times 3\times 3 = 243$

61. Since, every pair of the students gives us a hand shake

$\therefore$ Total number of hand shakes

= Total number of pairs of students

= Number of ways of choosing two students out of

$= {}^{20}C_2 = \dfrac{20!}{2!\,18!}$

$= \dfrac{20\times 19\times 18!}{2\times 18!} = 190$

62. Total number of ways $= 8!\,2!$

63. A couple and 6 guests can be arranged in $(7-1)!$ ways. But the two people forming the couple can be arranged among themselves in $2!$ ways.

$\therefore$ Required number of ways $= 6!\times 2! = 1440$

64. Required number of garlands $= \dfrac{5!}{2\cdot 2!\cdot 3!} = 5$

65. The number of matches in the first round $= {}^6C_2 + {}^6C_2$

The number of matches in the next round $= {}^6C_2$

The number of matches in the semifinal round $= {}^4C_2$

So, the required number of matches

$= {}^6C_2 + {}^6C_2 + {}^6C_2 + {}^4C_2 + 2$

$= 53$

66. $\dfrac{{}^{10}C_5}{{}^{11}C_6} = \dfrac{6}{11}$

67. Required set is $\{m, m+1, \ldots, k\}$

$\Rightarrow$ Number of subsets $= 2^{k-(m-1)}$

68. Number of groups each having r students $= {}^{21}C_r$

Let G = Number of times the teacher can go to the zoo

Z = Number of groups she can form $= {}^{21}C_r$

$\therefore$ G is maximum, when Z is maximum.

i.e. $\quad r = \dfrac{21-1}{2}$ or $\dfrac{21+1}{2}$

i.e.] $\quad r = 10$ or 11

69. Required number of ways

$= {}^nC_2 + {}^nC_3 + \ldots + {}^nC_{n-3} + {}^nC_{n-2}$

$= 2^n - ({}^nC_0 + {}^nC_1 + {}^nC_{n-1} + {}^nC_n)$

$= 2^n - (1 + n + n + 1)$

$= 2^n - 2(n+1)$

70. In a committee of 5 persons, the gentlemen will be in majority, if the number of gentlemen ≥ 3.

Total number of ways of forming committee

$= {}^4C_3\times {}^6C_2 + {}^4C_4\times {}^6C_1$

$= 4\times 15 + 1\times 6$

$= 66$

71. Total number of m elements subsets of $A = {}^nC_m$

Number of m elements subsets of A each containing the element a_4 = Number of ways of choosing remaining $(m-1)$ elements of the subset, out of remaining $(n-1)$ elements of A

$= {}^{n-1}C_{m-1}$

Given that, $\quad {}^nC_m = k\times {}^{n-1}C_{m-1}$

$$\frac{n!}{m!\,(n-m)!} = k\cdot\frac{(n-1)!}{(m-1)!\,(n-m)!}$$

$\Rightarrow \quad n = km$

72. Required number of ways

= Total number of ways of choosing 4 pens

$-$ Number of ways of choosing 4 non-red pens

$= {}^{3+4+6}C_4 - {}^{4+6}C_4 = {}^{13}C_4 - {}^{10}C_4$

$= \dfrac{13\cdot 12\cdot 11\cdot 10}{4\cdot 3\cdot 2\cdot 1} - \dfrac{10\cdot 9\cdot 8\cdot 7}{4\cdot 3\cdot 2\cdot 1}$

$= 715 - 210 = 505$

73. Out of the given numbers, the numbers which are multiple of 5, are 5, 10, 15, 20,...,145.

This is an AP whose first term $a = 5$,

Common difference $= 5$

nth term, $t_n = 145$

$\therefore \quad 145 = 5 + (n-1)\times 5$

$\Rightarrow \quad n = 29$

Now, if total number of numbers is m, then

$$151 = 1 + (m-1) \times 2$$

$$\Rightarrow \quad m - 1 = \frac{151-1}{2} \quad \Rightarrow \quad m = 76$$

So, number of ways in which product is a multiple of 5

= Both two numbers from 5, 10, 15, 25,...,145

+ One number from 5, 10, 15, 25,...,145 and one from remaining numbers

$$= {}^{29}C_2 + {}^{29}C_1 \times {}^{76}C_1$$

$$= 29 \times 14 + 29 \times 76 = 29 \times 90 = 2610$$

74. $\because \ {}^{n+1}C_3 - {}^{n}C_3 = 21$

$$\therefore \quad \frac{(n+1)(n-1)n}{6} - \frac{n(n-1)(n-2)}{6} = 21$$

$$\Rightarrow \quad \frac{n(n-1)}{6}[(n+1)-(n-2)] = 21$$

$$\Rightarrow \quad n(n-1) = 42$$

$$\Rightarrow \quad n^2 - n - 42 = 0$$

$$\Rightarrow \quad n = -6, 7$$

$$\therefore \quad n = 7$$

75. $\because \ {}^{n}C_2 - n = 44 \quad \Rightarrow \quad \frac{n(n-1)}{2} - n = 44$

$$\therefore \quad n^2 - 3n - 88 = 0$$

$$\Rightarrow \quad n = -8, 11$$

$$\therefore \quad n = 11$$

76. Total number of triangles $= {}^{12}C_3 - {}^{3}C_3 - {}^{4}C_3 - {}^{5}C_3 = 205$

77. The number of triangles with vertices on sides

$$AB, BC, CD = {}^{3}C_1 \times {}^{4}C_1 \times {}^{5}C_1$$

Similarly, for other cases, the total number of triangles

$$= {}^{3}C_1 \times {}^{4}C_1 \times {}^{5}C_1 + {}^{3}C_1 \times {}^{4}C_1 \times {}^{6}C_1 + {}^{3}C_1 \times {}^{5}C_1 \times {}^{6}C_1 + {}^{4}C_1 \times {}^{5}C_1 \times {}^{6}C_1$$

$= 342$

78. A selection of four vertices of the polygon gives an interior intersection.

$\therefore$ The number of sides $= n$

$$\Rightarrow \quad {}^{n}C_4 = 70$$

$$\Rightarrow \quad n(n-1)(n-2)(n-3) = 24 \times 70$$

$$= 8 \times 7 \times 6 \times 5$$

$$\therefore \quad n = 8$$

$\therefore$ The number of diagonals $= {}^{8}C_2 - 8 = 20$

79. ${}^{n}C_2$ is point of intersection.

80. Let x_0 be the number of objects to left of the first object chosen, x_1 be the number of objects between the first and the second, x_2 be the number of objects between the second and the third and x_3 be the number of objects to the right of the third object. We have,

$$x_0, x_3 \geq 0, x_1, x_2 \geq 1$$

and $\quad x_0 + x_1 + x_2 + x_3 = n - 3 \quad$ ...(i)

The number of solutions of Eq. (i)

= Coefficient of y^{n-3} in $(1 + y + y^2 + \ldots)(1 + y + y^2 + \ldots)(y + y^2 + y^3 + \ldots)(y + y^2 + y^3 + \ldots)$

= Coefficient of y^{n-3} in $y^2(1 + y + y^2 + y^3 + \ldots)^4$

= Coefficient of y^{n-5} in $(1-y)^{-4}$

= Coefficient of y^{n-5} in $(1 + {}^{4}C_1 y + {}^{5}C_2 y^2 + {}^{6}C_3 y^3 + \ldots)$

$$= {}^{n-5+3}C_{n-5} = {}^{n-2}C_3 = \frac{(n-2)(n-3)(n-4)}{6}$$

81. The number of triangles with vertices on different lines

$$= {}^{p}C_1 \times {}^{p}C_1 \times {}^{p}C_1 = p^3$$

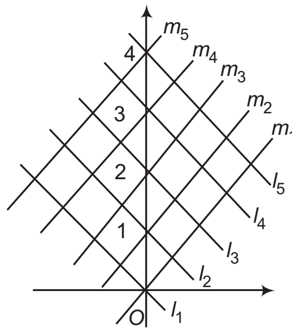
The number of triangles with two vertices on one line and the third vertex on any one of the other two lines

$$= {}^{3}C_1 \{{}^{p}C_2 \times {}^{2p}C_1\} = 6p \cdot \frac{p(p-1)}{2}$$

So, the required number of triangles

$$= p^3 + 3p^2(p-1) = p^2(4p-3)$$

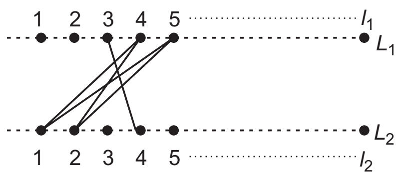
82. There are two sets of five parallel lines at equal distances.



Clearly, lines like l_1, l_3, m_1, m_3 form a squares whose diagonals length is 2. So, the number of required squares $= 3 \times 3 = 9$.

Since, choices are $(l_1, l_3), (l_2, l_4), (l_3, l_5)$ for one set.

83.



Required number of points on intersection of new lines

= 2 × Number of choosing 1 point on L_1 and 2 point on L_2

$$= 2 \cdot {}^{l_1}C_1 \times {}^{l_2}C_2$$

84. Required number of triangles

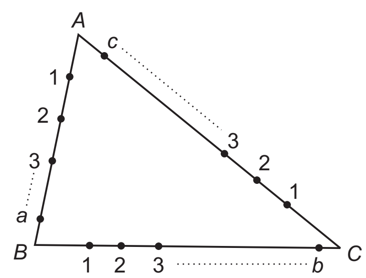
= Total number of triangles

– Number of triangles having two sides common

– Number of triangles having one side common

$$= {}^{8}C_3 - 8 - 8 \times 4 = 16$$

85.



Required number of triangles

= Total number of ways of choosing 3 points

– Number of ways of choosing all the 3 points from AB or BC or CA

$$= {}^{a+b+c}C_3 - ({}^{a}C_3 + {}^{b}C_3 + {}^{c}C_3)$$

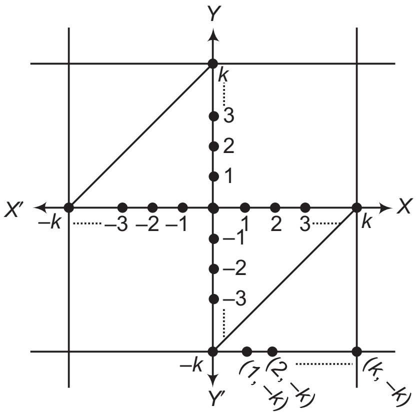
86. $|x| \le k \;\Rightarrow\; -k \le x \le k$ ...(i)

and $|y| \le k \;\Rightarrow\; -k \le y \le k$ ...(ii)

and $|x - y| \le k \;\Rightarrow\; |y - x| \le k$

$\Rightarrow\quad -k \le y - x \le k$

$\Rightarrow\quad x - k \le y \le x + k$ ...(iii)



$\therefore$ Number of points having integral coordinates

$$= (2k+1)^2 - 2[k + (k-1) + \ldots + 2 + 1]$$
$$= (3k^2 + 3k + 1)$$

87. Total number of ways $= 31 \times 15 \times 8 = 3720$

88. Total number of squares $= 8$. We are to choose 6 squares for six X's and this can be done is ${}^8C_6 = 28$ ways. This also include the possibility that either the top horizontal row does not have any X or the bottom horizontal row have no X. These possibilities are not required.

$\therefore$ Total number of ways $= 28 - 2 = 26$

89. Total number of such numbers

$= {}^9C_6 + {}^9C_5 + {}^9C_5 + {}^9C_4 = {}^{10}C_6 + {}^{10}C_5 = {}^{11}C_6$

90. The number of times, a particular girl goes on picnic $= {}^6C_4$

$\therefore$ Total number of dolls given to the girls

$$= {}^6C_4 \cdot 3 = \frac{6!}{4!\,2!} \cdot 3 = 45$$

91. ***Case* I** $1\ 4\ 7 \ldots 3n - 2$

***Case* II** $2\ 5\ 8 \ldots 3n - 1$

***Case* III** $3\ 6\ 9 \ldots 3n$

That means we must take 2 numbers from last row or one number each from first and second rows.

Total number of ways $= {}^nC_2 + {}^nC_1 \cdot {}^nC_1 z$

$$= \frac{n(n-1)}{2} + n^2 = \frac{3n^2 - n}{2}$$

92. The number of selections of p things from q identical things are $(r - p)$ things from q identical things $= 1 \times 1$

$p \to p \qquad p - 1 \ldots r - q$

$q \to r - p \qquad r - p + 1 \ldots q$

Similarly, in all other cases, total number of ways

$= p - (r - q) + 1$ or $q - (r - p) + 1 = p + q - r + 1$

93. $2^p \cdot 6^q \cdot 15^r = 2^{p+q} \cdot 3^{q+r} \cdot 5^r$

$\therefore$ The number of proper divisors

= {Total number of selections from $(p + q)$ twos, $(q + r)$ threes and r fives} $- 2$

$= (p + q + 1)(q + r + 1)(r + 1) - 2$

94. $1008 = 2^4 \times 3^2 \times 7$

$\therefore$ The required number of even proper divisors

= Total number of selections of atleast one 2 and any number of 3's or 7's

$= 4 \times (2 + 1) \times (1 + 1) - 1 = 23$

95. The natural numbers are 1, 2, 3 and 4.

Clearly, in one diagonal we have to place 1, 4 and in the other 2, 3.

The number of ways $= 2! \times 2! = 4$

96. If 0 is placed in the unit's place of the upper number, then the unit's place of the lower number can be filled in 10 ways (filling by any one of 0, 1, 2, ..., 9).

If 1 is placed in the units place of the upper number, then the unit's place of the lower number can be filled in 9 ways (filling by any one of 0, 1, 2, ..., 8) etc.

$\therefore$ The unit's column can be filled in $10 + 9 + 8 + \ldots + 1$, i.e. 55 ways. Similarly, for the second and the third columns. The number of ways for the fourth column

$$= 8 + 7 + \ldots + 1 = 36$$

$\therefore$ The required number of ways

$$= 55 \times 55 \times 55 \times 36$$

97. Coefficient of x^3 in

$(x^0 + x^1 + x^2)(x^0 + x^1 + x^2 + x^3)(x^1 + x^2 + x^3 + x^4)$

$= 6$

98. $38808 = 2^3 \times 3^2 \times 7^2 \times 11^1$

$\therefore$ Divisors $= 4 \times 3 \times 3 \times 2 - 2 = 70$

99. ${}^{15+3-1}C_{3-1} = {}^{17}C_2$

100. $\left[\frac{33}{2}\right] + \left[\frac{33}{4}\right] + \left[\frac{33}{8}\right] + \left[\frac{33}{16}\right] + \left[\frac{33}{32}\right]$

$$= 16 + 8 + 4 + 2 + 1 = 31$$

101. For $1 \le k \le p - 1$, $n + k = p! + k + 1$, is clearly divisible by $k + 1$. Therefore, there is no prime number in the given list.

102. The number of ways in which all 5 letters be placed in wrong envelopes

$$= {}^6C_5 \,.\, 5!\left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right)$$
$$= 720\left(\frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120}\right) = 264$$

103. There is $(m + 1)$ space between them (including the beginning and the end) and n things can be placed in all possible spaces in ${}^{m+1}P_n$ ways.

$\therefore$ Required number of ways

$$= m! \cdot {}^{m+1}P_n = \frac{m! \cdot (m+1)!}{(m + 1 - n)!}$$

104. We have, $240 = 2^4 \times 3^1 \times 5^1$

$\therefore$ There are 4 divisors of 240 which of the form $4n + 2, n \ge 0$.

105. Number of non-negative integral solutions

$$= {}^{12}C_{10} = {}^{12}C_2$$

106. $\because x_1 + x_2 + 2x_3 = 15 \Rightarrow x_1 + x_2 = 15 - 2x_3$

where, x_3 can be 1, 2, ..., 7.

Let $x_3 = r$

$\Rightarrow\quad x_1 + x_2 = 15 - 2r$

Number of positive integral solutions of this equation $=(14-2r)$

$\therefore$ Total number of solutions

$$=\sum_{r=1}^{7}(14-2r)=14\cdot 7-2\cdot\left(\frac{7\cdot 8}{2}\right)=42$$

107. $x_1+x_2+x_3+x_4=15$ and $x_i\ge 2$

$\Rightarrow (x_1-2)+(x_2-2)+(x_3-2)+(x_4-2)=7$

$\Rightarrow y_1+y_2+y_3+y_4=7$, where $y_i=x_i-2\ge 0$

$\Rightarrow {}^{10}C_7={}^{10}C_3$ are number of non-negative.

108. Coefficient of x^3 in

$\{(x^0+x^1+x^2+x^3)(x^0+x^1+x^2)\cdot(x^0+x^1)^4\}$

$=247$

109. Let the balls put in the box be x_1, x_2, x_3, x_4 and x_5.

We have,

$x_1+x_2+x_3+x_4+x_5=15,\ x_i\ge 2$

$\Rightarrow\ (x_1-2)+(x_2-2)+(x_3-2)+(x_4-2)+(x_5-2)=5$

$\Rightarrow\ y_1+y_2+y_3+y_4+y_5=5,\ y_i=x_i-2\ge 0$

$= {}^{5+5-1}C_{5-1}={}^9C_4$

110. Coefficient of x^{210} in $\{(x^0+x^1+x^2+x^3+\ldots+x^{100})^3\}$

$={}^{93}C_3$

111. Required number of ways = Number of non-negative integral solution of $x_1+x_2+x_3+x_4+\ldots+x_8=10$

$={}^{10+8-1}C_{8-1}={}^{17}C_7$

112. The required number of selections

$={}^3C_1\times{}^4C_1\times{}^2C_1\,({}^6C_3+{}^6C_2+{}^6C_1+{}^6C_0)$

113. $x+y+z=16,\ y=x+1$ and $z=y+2$

$\therefore\qquad x=4,\ y=5,\ z=7$

Now, number of ways to give 16 different things

$={}^{16}C_4\times{}^{12}C_5\times{}^7C_7$

114. $x+y+z=n$

$x, y, z\ge 1$ or $x-1=a,\ y-1=b,\ z-1=c\ge 0$

$\Rightarrow\qquad a+b+c=n-3$

The required number of solutions

$={}^{n-3+3-1}C_{3-1}={}^{n-1}C_2$

115. The number of non-negative integral solutions of $a+b+c+d=n$

$$\Rightarrow\quad {}^{n+3}C_n=\frac{(n+3)!}{n!\,3!}=\frac{(n+3)(n+2)(n+1)}{6}$$

116. The required number of solutions

= The number of positive integral solution of $(a+b+c=12)$

$$=\frac{(12-1)(12-2)}{2}=55$$

117. $a+a+d+a+2d=21$ or $a+d=7$

$\therefore\qquad a+c=14$

and $\qquad b=7$

The number of positive integral solutions of $(a+c=14)$ is 13.

118. Let $a=2p+1,\ b=2q+1,\ c=2r+1,\ d=2s+1$, where p q, r and s are non-negative integers.

$\therefore\qquad 2p+1+2q+1+2r+1+2s+1=20$

or $\qquad p+q+r+s=8$

The required number of solutions

= The number of non-negative integral solutions of $(p+q+r+s=8)$

$$=\frac{(8+3)(8+2)(8+1)}{6}=165$$

119. If a, b and c are in AP, then a and c both are odd or both are even.

***Case* I** When n is even.

The number of ways of selection of two even numbers, a and c is ${}^{n/2}C_2$. Number of ways of selection of two odd numbers is ${}^{n/2}C_2$.

Hence, the number of AP's

$$2\cdot{}^{n/2}C_2=2\cdot\frac{\frac{n}{2}\left(\frac{n}{2}-1\right)}{2}=\frac{n(n-2)}{4}$$

***Case* II** When n is odd.

The number of ways of selection of two odd numbers a and c is ${}^{(n+1)/2}C_2$. The number of ways of selection of two even numbers a and c is ${}^{(n-1)/2}C_2$.

Hence, the number of AP's $={}^{(n+1)/2}C_2+{}^{(n-1)/2}C_2$

$$=\frac{\left(\frac{n+1}{2}\right)\left(\frac{n+1}{2}-1\right)}{2}+\frac{\left(\frac{n-1}{2}\right)\left(\frac{n-1}{2}-1\right)}{2}$$

$$=\frac{1}{8}(n-1)[(n+1)+(n-3)]=\frac{(n-1)^2}{4}$$

120. The number of ways of inviting, when the couple not included is ${}^8C_5$. The number of ways of inviting with the couple included is ${}^8C_3$. Therefore, the required number of ways $={}^8C_5+{}^8C_3={}^8C_3+{}^8C_3\qquad[\because\ {}^8C_5={}^8C_3]$

Also, $\ {}^{10}C_5-2\times{}^8C_4=\dfrac{10!}{5!5!}-2\times\dfrac{8!}{4!4!}$

$$=\frac{10\times9\times8\times7\times6}{120}-2\times\frac{8\times7\times6\times5}{24}$$

$$=9\times4\times7-140=112=2\times\frac{8!}{3!5!}$$

121. $\because\ p={}^5C_4\times{}^2C_1=10$

$q={}^5C_2\,({}^2C_1)^3=80$

and $\qquad r={}^5C_0({}^2C_1)^5=32$

$\therefore\qquad 2q=5r,\ 8p=q$

and $\qquad 2(p+r)>q$

122. By principle of homogenuity, $x=y$ is evident and since sum of digits is either or odd.

$\Rightarrow\qquad x+y=$ Total 5-digit numbers

$=9\times10\times10\times10\times10$

$\Rightarrow\qquad 2x=90000$

$\therefore\qquad x=45000$

123. Since, ${}^nC_r={}^nC_{n-r}$, hence options (a) and (c) follow.

124. Total hand shakes possible $={}^{2n}C_2$. This will include n hand shakes in which a person shakes hand with her or his spouse.

$\therefore$ Required number of hand shakes

$={}^{2n}C_2-n=2n(n-1)$

125. The nth line will rise to n additional parts, when u_{n-1} parts are already there.

$\Rightarrow \qquad u_n = u_{n-1} + n$

$\Rightarrow$ Option (d) is incorrect.

Again, $\quad u_0 = 1, u_1 = 2$

We easily get $\quad u_2 = 4, u_3 = 7, u_4 = 11$

Hence, options (a) and (b) are correct and option (c) is false.

126. We have, $30 = 2 \times 3 \times 5$. So, 2 can be assigned to either a or b or c i.e. 2 can be assigned in 3 ways. Similarly, each of 3 and 5 can be assigned in 3 ways. Thus, the number of solutions is $3 \times 3 \times 3 = 27$.

Also, the number of ways in which three prizes can be distributed among three persons

$$= 3 \times 3 \times 3 = 3^3$$

127. As each student receives atleast two toys. So, let us first give each student one toy. Now, we are left with 7 toys, which can be distributed among three students such that each receives atleast one toy, which is equivalent to number of positive integral solutions of the equation $x + y + z + w = 7$, which is given by ${}^{7-1}C_{4-1} = {}^6C_3$.

Hence, Statement I is false and Statement II is correct.

128. Number of ways of dividing n^2 objects into n groups of same size is $\frac{(n^2)!}{(n!)^n n!}$.

Now, number of ways of distributing these n groups among n persons is

$\left[\frac{(n^2)!}{(n!)^n \, n!}\right] n! = \frac{(n^2)!}{(n!)^n}$, which is always an integer.

Also, we know that product of r is divisible by $r!$.

Now, $(n^2)! = 1 \times 2 \times 3 \times 4 \times \ldots \times n^2$

$$= 1 \times 2 \times \times 3 \ldots n \times (n+1)(n+2) \ldots 2n \times (2n+1)(2n+2) \ldots 3n \times \{n^2 - (n^2 - 1)\} \{n^2 - (n^2 - 1)\} \ldots n^2$$

Thus, in $n^2!$, there are n rows each consisting product of n integers. Each row is divisible by $n!$.

Hence, $(n^2)!$ is divisible by $(n!)^n$ or $\frac{(n^2)!}{(n!)^n}$ is a natural number.

Hence, both statements are correct and Statement II is the correct explanation of Statement I.

129. $\because 1400 = 2^3 5^2 7$

The number of ways in which 1400 can be expressed as a product of two positive integers is

$$\frac{(3+1)(2+1)(1+1)}{2} = 12$$

Statement II is correct but does not explain Statement I as it just gives the information of prime factor about which 1400 is divisible.

130. In onto functions, each image must be assigned to atleast one pre-image. Now, if we consider the images a and b as two different boxes, then four distinct objects 1, 2, 3 and 4 (pre-images) can be distributed, such that no box remains empty, in $2^4 - {}^2C_1 (2-1)^4 = 14$ ways.

Hence, both statements are correct and Statement II is the correct explanation of Statement I.

131. India must win atleast 6 matches out of 11 matches. Then, number of ways in which India can win the series

$$= {}^{11}C_6 + {}^{11}C_7 + \ldots + {}^{11}C_{11} = 2^{10}$$

Thus, both the statements are true, but Statement II is not a correct explanation of Statement I.

132. The batting order of 11 players can be decided in 11! ways. Now, Yuvraj, Dhoni and Pathan can be arranged in 3! ways. But the order of these three players is fixed i.e. Yuvraj-Dhoni-Pathan. Now, 11! answer is 3! times more, hence the required answer is 11!/3!.

133. Number of ways of arranging 21 identical objects, when r is identical of one type and remaining are identical of second type, is $\frac{21!}{r!(21-r)!} = {}^{21}C_r$, which is maximum when $r = 10$ or 11.

Therefore, ${}^{13}C_r = {}^{13}C_{10}$ or ${}^{13}C_{11}$, hence maximum value of ${}^{13}C_r$ is ${}^{13}C_{10} = 286$.

Hence, Statement I is false. Obviously, Statement II is true.

134. When one all rounder and ten players from bowlers and batsman play, number of ways is ${}^4C_1 \, {}^{14}C_{10}$.

When one wicketkeeper and 10 players from bowlers and batsman play, number of ways is ${}^2C_1 {}^{14}C_{10}$.

When one all rounder, one wicketkeeper and nine from batsman and bowlers play, number of ways is ${}^4C_1 \, {}^2C_1 \, {}^{14}C_9$.

When all eleven players play from bowlers and batsmen then number of ways is ${}^{14}C_{11}$.

Total number of selections

$= {}^4C_1 \, {}^{14}C_{10} + {}^2C_1 \, {}^{14}C_{10} + {}^4C_1 \, {}^2C_1 \, {}^{14}C_9 + {}^{14}C_{11}$

135. If the particular bowler plays, then two batsmen will not play. So, rest of 10 players can be selected from 17 other players. Number of such selections is ${}^{17}C_{10}$.

If the particular bowler does not play, then number of selections $= {}^{19}C_{11}$

If all the three players do not play, then number of selections $= {}^{17}C_{11}$

$\therefore$ Total number of selections $= {}^{17}C_{10} + {}^{19}C_{11} + {}^{17}C_{11}$

136. If the particular batsman is selected, then rest of 10 players can be selected in ${}^{18}C_{10}$ ways.

If particular wicketkeeper is selected, then rest of 10 players can be selected in ${}^{18}C_{10}$ ways.

If both are not selected, then number of ways is ${}^{18}C_{11}$.

Hence, total number of ways

$$= 2 \cdot {}^{18}C_{10} + {}^{18}C_{11} = {}^{19}C_{11} + {}^{18}C_{10}$$

137. Seven persons can be selected for first table in ${}^{12}C_7$ ways. Now, these seven persons can be arranged in 6! ways. The remaining five persons can be arranged on the second table in 4! ways.

Hence, total number of ways $= {}^{12}C_5 \; 6! \, 4!$

138. Here, A can sit on first table and B on the second or A on second table and B on the first table.

If A is on the first table, then remaining six for first table can be selected in ${}^{10}C_6$ ways. Now, these seven persons can be arranged in 6! ways. Remaining five can be arranged on the other table in 4! ways.

Hence, total number of ways is $2\ {}^{10}C_6\ 6!\,4!$.

139. If A, B are on the first table, then remaining five can be selected in ${}^{10}C_5$ ways.

Now, seven persons including A and B can be arranged on the first table in which A and B are together in $2!5!$ ways. Remaining five can be arranged on the second table in 4! ways. Total number of ways is ${}^{10}C_5\ 4!5!2!$.

If A and B are on the second table, then remaining three can be selected in ${}^{10}C_3$ ways.

Now, five persons including A and B can be arranged on the second table in which A and B are together in 2!3! ways. Remaining seven can be arranged on the first table in 6! ways. Total number of ways for first table is ${}^{10}C_7\ 6!3!2!$.

$\therefore$ Total number of ways $= {}^{10}C_7\ 6!\,3!\,2! + {}^{10}C_5\ 4!\,5!\,2!$

140. 2 candidates can be selected out of 4 in ${}^4C_2$ ways.

141. Required number of ways $= 3^8 - {}^3C_1 \cdot 2^8 + {}^3C_2$

142. Each letter has 3 choices of letter boxes in 3^5 ways.

143. A. ${}^{20}C_2 - {}^4C_2 + 1 = 190 - 6 + 1 = 185$

B. $1 \times {}^{20}C_2 = 190$

C. $2 \times {}^8C_2 = 56$

D. ${}^6C_2 \times 4 = 60$

144. A. Number of surjective functions is

$$3^6 - {}^3C_1 (3-1)^6 + {}^3C_2 (3-2)^6 = 729 - 192 + 3 = 540$$

B. If $f(a_i) \neq b_i$, then pre-image a_1, a_2, a_3 cannot be assigned to images b_1, b_2, b_3, respectively.

Hence, each of a_1, a_2, a_3 can be assigned to images in 2 ways. a_4, a_5, a_6 can be assigned to images in 3 ways each.

Hence, number of functions is $2^3 3^3 = 216$

C. One-one functions are not possible, as pre-images are more than images.

D. Number of many one functions
$=$ Total number of functions
$-$ Number of one-one functions
$= 3^6 - 0 = 729$

145. A. For $k \geq 1$, we have

$$k \cdot k! = [(k+1) - 1]k! = (k+1)! - k!$$

Thus, $1 \cdot 1! + 2 \cdot 2! + 3 \cdot 3! + \ldots + n \cdot n!$
$= (2! - 1) + (3! - 2!) + (4! - 3!) + \ldots + \{(n+1)! - n!\}$
$= (n+1)! - 1$

B. Let $S = n \cdot {}^nC_1 + (n-1) \cdot {}^nC_2 + (n-2) \cdot {}^nC_3 + \ldots + 1 \cdot {}^nC_n$

$$= (n-1) \cdot {}^nC_1 + (n-2) \cdot {}^nC_2 + \ldots + 1 \cdot {}^nC_{n-1} + ({}^nC_1 + {}^nC_2 + \ldots + {}^nC_n)$$

Let $C = (n-1) \cdot {}^nC_1 + (n-2) \cdot {}^nC_2 + \ldots + 1 \cdot {}^nC_{n-1}$ ...(i)

We use ${}^nC_r = {}^nC_{n-r}$ and rewrite the terms in the reverse order, to obtain

$$C = 1 \cdot {}^nC_1 + 2 \cdot {}^nC_2 + \ldots + (n-1) \cdot {}^nC_{n-1} \quad \text{...(ii)}$$

On adding Eqs. (i) and (ii), we get

$$2C = n({}^nC_1 + {}^nC_2 + \ldots + {}^nC_{n-1})$$
$$= n(2^n - {}^nC_0 - {}^nC_n) = n(2^n - 2)$$
$$\Rightarrow \quad C = n(2^{n-1} - 1)$$

Thus, $S = n(2^{n-1} - 1) + (2^n - 1) = (n+2)\,2^{n-1} - (n+1)$

C. We have,

$${}^2C_2 + {}^3C_2 + {}^4C_2 + \ldots + {}^nC_2 = {}^{n+1}C_3$$

D. We have, $\sum_{r=0}^{n} ({}^nC_r)^2 = \sum_{r=0}^{n} ({}^nC_r)({}^nC_{n-r})$

$\therefore$ The number of ways of selecting n persons out on n men and n women $= {}^{2n}C_n$

146. Let T and S denote teacher and student, respectively. Then, we have following possible patterns according to questions

(i) T S S T S S T S S
(ii) S T S S T S S T S
(iii) S S T S S T S S T

Hence, total number of arrangements are

$$3 \cdot (3!)6! = 18 \times 6! \Rightarrow k = 6$$

147. To form a triangle, 3 points out of 5 can be chosen in ${}^5C_3 = 10$ ways.

But of these, the three points lying on the 2 diagonals will be collinear.

So, $10 - 2 = 8$ triangles can be formed.

148. Here, A is common letter in words SUMAN and DIVYA. Now, for selecting six different letters, we must select A either from word SUMAN or from word DIVYA.
Hence, for possible selections, we have

A excluded from SUMAN + A included in SUMAN
$= {}^4C_3 \cdot {}^5C_3 + {}^4C_2 \cdot {}^4C_3$
$= 40 + 24 = 64$

Hence, $N^2 = 64 \Rightarrow N = 8$

149. Number of arrangements are $2\,n!\,n!$.

Given that, $2\,n!\,n! = 1152$
$\Rightarrow \quad (n!)^2 = 576$
$\therefore \quad n! = 24 \Rightarrow n = 4$

150. Zero or more oranges can be selected out of 4 identical oranges in $4 + 1 = 5$ ways.

Zero or more apples can be selected out of 5 identical apples in $5 + 1 = 6$ ways.

Zero or more mangoes can be selected out of 6 identical mangoes in $6 + 1 = 7$ ways.

$\therefore$ Total number of selections when all the three types of fruits are selected $= 5 \times 6 \times 7 = 210$

But in one of these selections number of each type of fruit is zero and hence this selection must be excluded.

$\therefore$ Required number of ways $= 210 - 1 = 209$

151. Suppose box A has x_1 balls, box B has x_2 balls and box C has x_3 balls. Then,

$x_1 + x_2 + x_3 \le 12,\ x_1 \ge 1,\ x_2 \ge 3,\ 1 \le x_3 \le 5$

Let $\quad x_4 = 12 - (x_1 + x_2 + x_3)$.

Then, $\quad x_1 + x_2 + x_3 + x_4 = 12$

$[1 \le x_1 \le 8,\ 3 \le x_2 \le 10,\ 1 \le x_3 \le 5 \text{ and } 0 \le x_4 \le 7]$

$\therefore$ Required number of ways = Coefficient of x^{12} in

$$(x^1 + x^2 + \ldots + x^8)(x^3 + x^4 + \ldots + x^{10})$$
$$(x^1 + x^2 + \ldots + x^5)(x^0 + x^1 + \ldots + x^7)$$

$= $ Coefficient of x^7 in $(1 + x + x^2 + \ldots + x^7)$

$$(1 + x + x^2 + \ldots + x^7)(1 + x + x^2 + x^3 + x^4)$$
$$(1 + x + x^2 + \ldots + x^7)$$

$= $ Coefficient of x^7 in $(1 - x)^{-4}(1 - x^5)(1 - x^8)$

$= $ Coefficient of x^7 in $(1 - x)^{-4}(1 - x^5)$

$= $ Coefficient of x^7 in

$$(1 - x^5)(1 + {}^4C_1x + {}^5C_2x^2 + {}^6C_3x^3 + \ldots)$$

$= {}^{10}C_7 - {}^5C_2 = 110$

152. Clearly, $x = 0, 1, 2, 3, \ldots, 10$. Let $x = k$, then $0 \le k \le 10$

When $x = k$, $y + z = 21 - 2k$

The number of non-negative integral solutions in above equation = Number of ways to distribute $(21 - 2k)$ identical things (each thing is number 1) among 2 persons

$$= {}^{21-2k+2-1}C_{2-1} = {}^{22-2k}C_1 = 22 - 2k$$

$\therefore$ Required number of solutions $= \sum_{k=0}^{10}(22 - 2k)$

$$= 22 + 20 + 18 + \ldots + 2$$
$$= 2(1 + 2 + 3 + \ldots + 11)$$
$$= 2 \times \frac{11 \times 12}{2} = 132$$

Entrances Gallery

1. When n_5 takes value from 10 to 6 the carry forward moves from 0 to 4 which can be arranged in

$${}^4C_0 + \frac{{}^4C_1}{4} + \frac{{}^4C_2}{3} + \frac{{}^4C_3}{2} + \frac{{}^4C_4}{1} = 7$$

Aliter

Possible solutions are

1, 2, 3, 4, 10
1, 2, 3, 5, 9
1, 2, 3, 6, 8
1, 2, 4, 5, 8
1, 2, 4, 6, 7
1, 3, 4, 5, 7
2, 3, 4, 5, 6

Hence, there are 7 solutions.

2. Number of red lines $= {}^nC_2 - n$

Number of blue lines $= n$

Hence, $\quad {}^nC_2 - n = n$

$\Rightarrow \quad {}^nC_2 = 2n$

$\Rightarrow \quad \dfrac{n(n-1)}{2} = 2n$

$\Rightarrow \quad n - 1 = 4$

$\therefore \quad n = 5$

3. Required number of ways

$$= 5! - \{4 \cdot 4! - {}^4C_2 \cdot 3! + {}^4C_3 \cdot 2! - 1\} = 53$$

4. Let $(1, 1, 1)$, $(-1, 1, 1)$, $(1, -1, 1)$, $(-1, -1, 1)$ be vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d}$ and rest of the vectors be $-\mathbf{a}, -\mathbf{b}, -\mathbf{c}, -\mathbf{d}$ and let us find the number of ways of selecting coplanar vectors.

Observe that out of any three coplanar vectors, two will be collinear (anti-parallel).

Number of ways of selecting the anti-parallel pair = 4

Number of ways of selecting the third vector = 6

Total = 24

$\therefore$ Number of non-coplanar selections

$$= {}^8C_3 - 24 = 32 = 2^5,\ p = 5$$

Aliter

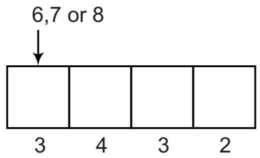
$$\text{Required value} = \frac{8 \times 6 \times 4}{3!}$$

$\therefore \quad p = 5$

5. The integer greater than 6000 may be of 4 digit or 5 digit. So, here two cases arise.

***Case* I** When number is of 4 digit.

Four-digit number can starts from 6, 7 or 8.



Thus, total number of 4-digit number, which are greater than 600 $= 3 \times 4 \times 3 \times 2 = 72$

***Case* II** When number is of 5 digit.

Total number of five-digit number which are greater than 6000 $= 5! = 120$

$\therefore$ Total number of integers $= 72 + 120 = 192$

6. Given, $n(A) = 2$, $n(B) = 4$

$\therefore \quad n(A \times B) = 8$

Now, the number of subsets of $A \times B$ having 3 or more elements

$= {}^8C_3 + {}^8C_4 + \ldots + {}^8C_8$

$= ({}^8C_0 + {}^8C_1 + \ldots + {}^8C_8) - ({}^8C_0 + {}^8C_1 + {}^8C_2)$

$= 2^8 - {}^8C_0 - {}^8C_1 - {}^8C_2\ [\because {}^nC_0 + {}^nC_1 + \ldots + {}^nC_n = 2^n]$

$= 256 - 1 - 8 - 28 = 219$

7. Number of ways $= 3^5 - {}^3C_1 \cdot 2^5 + {}^3C_2 \cdot 1^5$

$$= 243 - 96 + 3 = 150$$

8. As, $a_n = b_n + c_n$

$\Rightarrow \quad a_n = 1 \ldots (1 \text{ or } 0)$

$$\Rightarrow a_n = 1\underbrace{\_\ \_\ \_\ \_\ \_\ \_\ \_}_{(n-1)\text{ places}}1 = a_{n-1} + 1\underbrace{\_\ \_\ \_\ \_\ \_\ \_\ \_}_{(n-2)\text{ places}}1\ 0 = a_{n-2}$$

$$a_n = a_{n-1} + a_{n-2}$$

$\therefore \quad a_{17} = a_{16} + a_{15}$

9. b_6 = Six-digit numbers ending with 1.

$\Rightarrow$ $\boxed{1}\boxed{-}\boxed{-}\boxed{-}\boxed{-}\ \boxed{1}$

Now, the four places are to be filled.

***Case* I** $\boxed{1}$ .... $\boxed{1}\boxed{1}$

For 3 places, all 1's are used in 1 way.

One zero is used $= {}^3C_1 = 3$

Two zeros are used = 1 way 0 1 0 1...

Total = 5 ways

***Case* II** $\boxed{1}$ .... $\boxed{0}\boxed{1}$

For 3 places,

All 1's are used = 1 way

One zero is used $= {}^2C_1 = 2$ ways

$\therefore$ Total ways = 3 ways

Thus, $b_6 = 5 + 3 = 8$

10. The number of ways of distributing n identical objects among r persons such that each person gets atleast one object is same as the number of ways of selecting $(r-1)$ places out of $(n-1)$ different places, i.e. is ${}^{n-1}C_{r-1}$.

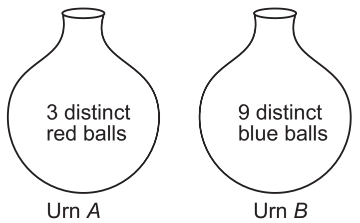
11. If out of n points, m are collinear.

Number of triangles $= {}^nC_3 - {}^mC_3$

$\therefore$ Number of triangles $= {}^{10}C_3 - {}^6C_3 = 120 - 20$

$\Rightarrow$ $N = 100$

12.



The number of ways in which two balls from urn A and two balls from urn B can be selected

$= {}^3C_2 \times {}^9C_2 = 3 \times 36 = 108$

13. The number of ways in which 4 novels can be selected

$= {}^6C_4 = 15$

The number of ways in which 1 dictionary can be selected

$= {}^3C_1 = 3$

4 novels can be arranged in 4! ways.

[since, dictionary is fixed in the middle]

$\therefore$ Total number of ways $= 15 \times 3 \times 4!$

$= 15 \times 3 \times 24 = 1080$

14. The number of different ways the child can buy the six ice-creams = Total number of non-negative integral solution of the equation $x_1 + x_2 + x_3 + x_4 + x_5 = 6$

$= {}^{6+5-1}C_{5-1} = {}^{10}C_4$

and number of ways to arrange 6A's and 4B's in a row

$= \dfrac{10!}{6!\,4!} = {}^{10}C_4$

$\therefore$ Statement I is false and Statement II is true.

15. Given word is MISSISSIPPI.

Here, I = 4 times, S = 4 times, P = 2 times, M = 1 time

_M_I_I_I_I_P_P_

$\therefore$ Required number of words $= {}^8C_4 \times \dfrac{7!}{4!\,2!}$

$= {}^8C_4 \times \dfrac{7 \times 6!}{4!\,2!}$

$= 7 \cdot {}^8C_4 \cdot {}^6C_4$

16. Required number of ways $= {}^{12}C_4 \times {}^8C_4 \times {}^4C_4$

$= \dfrac{12!}{8! \times 4!} \times \dfrac{8!}{4! \times 4!} \times 1 = \dfrac{12!}{(4!)^3}$

17. Total number of ways

$= {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4$

$= 10 + 45 + 120 + 210$

$= 385$

18. In the word SACHIN, order of alphabets is A, C, H, I, N, S. Number of words start with A = 5! so with C, H, I, N. Now, words start with S and after that ACHIN are in ascending orders of position, so $5 \cdot 5! = 600$ words are in dictionary before words with start S. Thus, position of given word is 601.

19. Given that, $f(x) = {}^{7-x}P_{x-3}$

The above function is defined, if

$7 - x \ge 0$ and $x - 3 \ge 0$

and $7 - x \ge x - 3$

$\Rightarrow$ $x \le 7$ and $x \ge 3$

and $x \le 5$

$\therefore$ $D_f = \{3, 4, 5\}$

Now, $f(3) = {}^4P_0 = 1$

$f(4) = {}^3P_1 = 3$

and $f(5) = {}^2P_2 = 2$

$\therefore$ $R_f = \{1, 2, 3\}$

20. Total number of ways in which all letters can be arranged = 6!

There are two vowels (A, E) in the word GARDEN. Total number of ways in which these two vowels can be arranged = 2!

$\therefore$ Total number of required ways

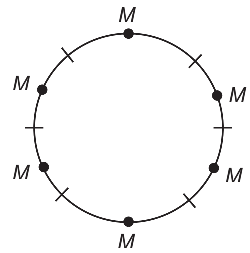
$= \dfrac{6!}{2!} = 360$

21. Required number of ways $= {}^{8-1}C_{3-1} = {}^7C_2 = \dfrac{7!}{2!\,5!}$

$= \dfrac{7 \cdot 6}{2 \cdot 1} = 21$

22. First, we fix the position of men, the number of ways in which men can sit = 5!.

Now, the number of ways in which women can sit $= {}^6P_5$



$\therefore$ Total number of ways $= 5! \times {}^6P_5$

$= 5! \times 6!$

23. Now, ${}^nC_{r+1} + {}^nC_{r-1} + 2\,{}^nC_r$

$$= {}^nC_{r+1} + {}^nC_r + {}^nC_{r-1} + {}^nC_r$$
$$= {}^{n+1}C_{r+1} + {}^{n+1}C_r = {}^{n+2}C_{r+1}$$

24. Since, telephone number start with 67, so two digits is already fixed. Now, we have to arrange three digits from remaining eight digits i.e. 0, 1, 2, 3, 4, 5, 8, 9 in ${}^8P_3$ ways

$$= \frac{8!}{5!} = 8 \times 7 \times 6 = 336 \text{ ways}$$

Thus, required number of telephone numbers = 336

25. Number of ways

$$= {}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n$$
$$= \frac{1}{2}(2^{2n+1}) = 2^{2n}$$

Thus, $\quad 2^{2n} = 64 \;\Rightarrow\; 2^{2n} = 2^6$

On comparing, $2n = 6$

$\therefore \qquad n = 3$

26. Set $S = \{1, 2, 3, \ldots, 20\}$ is to be partitioned into four sets of equal size i.e. having 5-5 numbers. The number of ways in which it can be done

$$= {}^{20}C_5 \times {}^{15}C_5 \times {}^{10}C_5 \times {}^5C_5$$
$$= \frac{20!}{15! \times 5!} \times \frac{15!}{10! \times 5!} \times \frac{10!}{5! \times 5!} \times 1$$
$$= \frac{(20!)}{(5!)^4}$$

27. Total number of available courses = 9

Out of these, 5 courses can be chosen. But it is given that 2 courses are compulsory for every student i.e. you have to choose only 3 courses instead of 5, out of 7 instead of 9.

It can be done in ${}^7C_3$ ways $= \dfrac{7 \times 6 \times 5}{6}$

$= 35$ ways

28. There may be two cases.

***Case* I** Two children get none and one get three and others get one each. Then, total number of ways

$$= \frac{10!}{2! \times 3! \times 7!} \times 10!$$

***Case* II** Two get none and two get 2 each and the others get one each. Then, total number of ways

$$= \frac{10!}{(2!)^4 \times 6!} \times 10!$$

Hence, total number of ways

$$= \frac{(10!)^2}{2! \times 3! \times 7!} + \frac{(10!)^2}{(2!)^4 \times 6!}$$
$$= \frac{(10!)^2 \times 25}{(2!)^2 \times 6! \times 84}$$

29. 3 consonants can be selected from 7 consonants in ${}^7C_3$ ways.

2 vowels can be selected from 4 vowels in ${}^4C_2$ ways.

$\therefore$ Required number of words $= {}^7C_3 \times {}^4C_2 \times 5!$

[selected 5! letters can be arranged in 5! ways, to get different words]

$= 35 \times 6 \times 120 = 25200$

30. We have, ${}^mC_{r+1} + \displaystyle\sum_{k=m}^{n} {}^kC_r = ({}^mC_{r+1} + {}^mC_r) + {}^{m+1}C_r + {}^{m+2}C_r + \ldots + {}^nC_r$

$$= ({}^{m+1}C_{r+1} + {}^{m+1}C_r) + {}^{m+2}C_r + \ldots + {}^nC_r$$
$$= {}^{m+2}C_{r+1} + {}^{m+2}C_r + \ldots + {}^nC_r$$
$$\vdots \qquad\qquad \vdots \qquad\qquad \vdots$$
$$= {}^{n+1}C_{r+1}$$

31. We have, $\dfrac{C_1}{C_0} + 2\dfrac{C_2}{C_1} + 3\dfrac{C_3}{C_2} + \ldots + n\dfrac{C_n}{C_{n-1}}$

$$= \frac{{}^nC_1}{{}^nC_0} + 2\frac{{}^nC_2}{{}^nC_1} + 3\frac{{}^nC_3}{{}^nC_2} + \ldots + n\frac{{}^nC_n}{{}^nC_{n-1}}$$
$$= \frac{n}{1} + 2 \times \frac{\frac{n(n-1)}{2}}{n} + 3 \times \frac{\frac{n(n-1)(n-2)}{3 \times 2}}{\frac{n(n-1)}{2}} + \ldots + n \times \frac{1}{n}$$
$$= n + (n-1) + (n-2) + \ldots + 1 = \Sigma n = \frac{n(n+1)}{2}$$

32. We know, ${}^{11}C_n$ is maximum when $n = 5$.

$$\therefore \qquad {}^{11}C_n = \frac{11!}{n!\,(11-n)!}$$

$\therefore\; n!\,(11-n)!$ is minimum, when $n = 5$.

33. Given, ${}^nC_{10} = {}^nC_{11}$

$$\Rightarrow \qquad \frac{n!}{10!\,(n-10)!} = \frac{n!}{11!\,(n-11)!}$$
$$\Rightarrow \qquad 11 \times 10!\,(n-11)! = 10!\,(n-10)\,(n-11)!$$
$$\Rightarrow \qquad 11 = n - 10 \;\Rightarrow\; n = 11 + 10 = 21$$

Now, $\qquad {}^nC_{21} = {}^{21}C_{21} = 1$

34. Given, ${}^{2n}C_2 : {}^nC_2 = 9 : 2 \Rightarrow \dfrac{{}^{2n}C_2}{{}^nC_2} = \dfrac{9}{2}$

$$\Rightarrow \qquad \frac{(2n)!}{2!\,(2n-2)!} \times \frac{2!\,(n-2)!}{n!} = \frac{9}{2}$$
$$\Rightarrow \qquad \frac{(2n)\,(2n-1)\,(2n-2)!}{2(2n-2)!} \times \frac{2(n-2)!}{n\,(n-1)\,(n-2)!} = \frac{9}{2}$$
$$\Rightarrow \qquad \frac{2(2n-1)}{n-1} = \frac{9}{2} \;\Rightarrow\; 4\,(2n-1) = 9\,(n-1)$$
$$\Rightarrow \qquad 8n - 4 = 9n - 9 \;\Rightarrow\; 9n - 8n = -4 + 9$$
$$\therefore \qquad n = 5$$

35. Total number of points in a plane is 30.

Out of them, 8 points are collinear.

$\therefore$ Total number of straight lines formed

$$= {}^{30}C_2 - {}^8C_2 + 1 = \frac{30 \times 29}{2} - \frac{8 \times 7}{2 \times 1} + 1$$
$$= 435 - 28 + 1 = 408$$

36. We have, 0, 1, 2, 3, 4, 5 i.e. six numbers, one zero and 5 positive numbers.

One-digit number $= {}^5P_1 = 5$

Two-digit numbers $= {}^6P_2 - {}^5P_1 = 25$

Three-digit numbers $= {}^6P_3 - {}^5P_2 = 100$

Four-digit numbers $= {}^6P_4 - {}^5P_3 = 300$

Five-digit numbers $= {}^6P_5 - {}^5P_4 = 600$

Six-digit numbers $= {}^6P_6 - {}^5P_5 = 600$

$\therefore$ Total possible numbers

$= 5 + 25 + 100 + 300 + 600 + 600 = 1630$

37. First, we fix the 5 plus '+' in five alternate positions.

$$\ldots + \ldots + \ldots + \ldots + \ldots + \ldots$$

Now, select the three positions for three 'minus' out of 6 blank positions.

$\therefore$ Required number of ways

$$= 1 \times \frac{{}^6P_3}{3!} = 1 \times {}^6C_3 = 1 \times \frac{6 \times 5 \times 4}{3 \times 2 \times 1} = 1 \times 5 \times 4 = 20$$

38. ***Case* I** When he chooses 4 questions from first five questions.

Now, the number of choices $= {}^5C_4 \times {}^8C_6$

$$= 5 \times \frac{8 \times 7}{2 \times 1} = 140$$

***Case* II** When he chooses 5 questions from first five questions.

Now, the number of choices

$$= {}^5C_5 \times {}^8C_5 = 1 \times {}^8C_3 = \frac{8 \times 7 \times 6}{3 \times 2 \times 1} = 56$$

Now, the total number of choices available

$$= 140 + 56 = 196$$

39. ***Case* I** When 3 drawn balls contain 1 black ball

$$= {}^3C_1 \cdot {}^2C_2 \cdot {}^4C_0 + {}^3C_1 \cdot {}^2C_1 \cdot {}^4C_1 + {}^3C_1 \cdot {}^4C_2 \cdot {}^2C_0$$
$$= 3 \cdot 1 + 3 \cdot 2 \cdot 4 + 3 \cdot 6 = 3 + 24 + 18 = 45$$

***Case* II** When 3 drawn balls contains 2 black balls

$$= {}^3C_2 \cdot {}^2C_1 \cdot {}^4C_0 + {}^3C_2 \cdot {}^4C_1 \cdot {}^2C_0$$
$$= 3 \cdot 2 \cdot 1 + 3 \cdot 4 \cdot 1 = 6 + 12 = 18$$

***Case* III** When 3 drawn balls contain all black balls

$$= {}^3C_3 \cdot {}^2C_0 \cdot {}^4C_0 = 1$$

On adding all three cases, we get required ways

$$= 45 + 18 + 1 = 64$$

Aliter

***Case* I** When 3 drawn balls contains 1 black ball

$$= {}^6C_2 \times {}^3C_1 = \frac{6 \times 5}{2 \times 1} \times 3 = 45$$

***Case* II** When 3 drawn balls contain 2 black balls

$$= {}^6C_1 \times {}^3C_2 = 6 \times \frac{3 \times 2}{2 \times 1} = 18$$

***Case* III** When 3 drawn balls contain all black balls

$$= {}^3C_3 = 1$$

On adding all three cases, we get

Required ways $= 45 + 18 + 1 = 64$

40. Four speakers will address the meeting in 4! ways $= 24$ different ways in which half number of cases will be such that P speaks before Q and half number of cases will be such that P speaks after Q.

$\therefore$ Required number of ways $= \frac{24}{2} = 12$

41. Required sum $= 3!\,(1 + 2 + 3 + 4) = 6\,(10) = 60$

42. Number of ways of selecting 3 children from n children $= {}^nC_3$

Since, the number of times she will go to the garden $= 84 \times$ (Number of ways that a particular child goes to the zoo)

$\Rightarrow {}^nC_3 = 84 \times (1 \times {}^{n-1}C_2) \quad \Rightarrow \quad {}^nC_3 = 84 \times \frac{(n-1)(n-2)}{2}$

$$\Rightarrow \quad \frac{n(n-1)(n-2)}{3 \times 2 \times 1} = 84 \times \frac{(n-1)(n-2)}{2}$$

$$\Rightarrow \quad \frac{n}{3} = 84$$

$$\therefore \quad n = 252$$

43. Since, the student is allowed to select atmost n books out of $(2n + 1)$ books. Therefore, in order to select atleast one book, he has the choice to select one, two, three, ..., n books. Thus, if T is the total number of ways of selecting atleast one book, then

$$T = {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n = 255 \qquad \ldots(\text{i})$$

Now, ${}^{2n+1}C_0 + {}^{2n+1}C_1 + \ldots + {}^{2n+1}C_n + {}^{2n+1}C_{n+1}$
$$+ {}^{2n+1}C_{n+2} + \ldots + {}^{2n+1}C_{2n+1}$$
$$= (1 + 1)^{2n+1} = 2^{2n+1}$$

$\therefore \quad {}^{2n+1}C_0 + 2({}^{2n+1}C_1 + \ldots + {}^{2n+1}C_n)$
$$+ {}^{2n+1}C_{2n+1} = 2^{2n+1}$$

$\Rightarrow \quad 1 + 2T + 1 = 2^{2n+1}$

$\Rightarrow \quad 1 + 2\,(255) + 1 = 2^{2n+1}$ [from Eq. (i)]

$\Rightarrow \quad 255 + 1 = 2^{2n} \Rightarrow 256 = 2^{2n} \Rightarrow 4^4 = 4^n$

$\therefore \quad n = 4$

44. Clearly, first prize can be distributed among 4 students in ${}^4C_1 = 4$ ways

and second prize can be distributed among 4 students in ${}^4C_1 = 4$ ways.

Similarly, 3rd, 4th and 5th prizes can be distributed in 4 ways each.

Hence, by fundamental principle of counting, the total number of ways $= 4 \times 4 \times 4 \times 4 \times 4 = 4^5 = 1024$

45. Required number of ways $= \frac{4!}{2!\,2!} \times \frac{3!}{2!} = 18$

46. The number of integers greater than 6000

$$= 5! + (3 \times 4 \times 3 \times 2) = 192$$

47. $\because \quad \frac{{}^{56}P_{r+6}}{{}^{54}P_{r+3}} = 30800$

$\therefore \quad \frac{56!}{54!} \times \frac{(51-r)!}{(50-r)!} = 30800$

$\Rightarrow \quad 56 \times 55 \times (51 - r) = 56 \times 55 \times 10$

$\Rightarrow \quad 51 - r = 10$

$\therefore \quad r = 41$

48. The vowels in the word COMBINE are O, I, E which can be arranged at 4 places in ${}^4P_3$ ways and other words can be arranged in 4! ways.

Hence, total number of ways

$$= {}^4P_3 \times 4! = 4! \times 4! = 576$$

49. Required number of ways

$$= {}^{11}C_5 - {}^{11}C_4 = \frac{11!}{5!\,6!} - \frac{11!}{4!\,7!} = 132$$

50. ${}^{n-1}C_3 + {}^{n-1}C_4 > {}^nC_3$

$\Rightarrow \quad {}^nC_4 > {}^nC_3 \qquad [\because {}^nC_r + {}^nC_{r+1} = {}^{n+1}C_{r+1}]$

$\Rightarrow \quad \frac{n!}{(n-4)!\,4!} > \frac{n!}{(n-3)!\,3!}$

$\Rightarrow \quad (n-3)\,(n-4)! > (n-4)!\,4$

$\therefore \quad n > 7$

7

Mathematical Induction

Chapter Snapshot

- Introduction
- Statement
- Principle of Mathematical Induction
- Algorithm for Mathematical Induction
- Types of Problems

Introduction

There are two basic processes of reasoning.

Deduction (result is deduced from general to particular) and **induction** (result is generalised from a particular result).

Deduction is the application of a general case to a particular case i.e. given a statement to be proven, often called a conjecture or a theorem in Mathematics, valid deductive steps are derived and a proof may or may not be established.

In contrast to deduction, induction depends on working with each case and developing a conjecture by observing incidences till each and every case is observed.

Induction is a key aspect of scientific reasoning, where collecting and analysing data is the norm. Thus, induction means the generalisation from particular cases or facts.

In algebra or in other disciplines of Mathematics, there are certain results or statements that are formulated in terms of n (where, n is a positive integer).

To prove such statements, the well suited principles that is used based on the specific technique, is the principle of mathematical induction.

Statement

A sentence or description which can be judged to be true or false, is called a statement.

e.g. (i) 3 divides 9.

(ii) Jaipur is the capital of Rajasthan.

A statement involving mathematical relations is known as the mathematical statement. e.g. 3 divides 9.

Principle of Mathematical Induction

Suppose there is a given statement $P(n)$ involving the natural number n, such that

(i) statement is true for $n = 1$ i.e. $P(1)$ is true and

(ii) if the statement is true for $n = k$ (where, k is some positive integer), then statement is also true for $n = k + 1$ i.e. truth of $P(k)$ implies the truth of $P(k + 1)$.

Then, $P(n)$ is true for all natural numbers n.

i.	It is simply a statement of fact. There may be a situation when a statement is true for all $n \geq 4$. In this case, (i) will start from $n = 4$ and we shall verify the result for $n = 4$ i.e. $P(4)$.
ii.	It is a conditional property, it does not assert that the given statement is true for $n = k$ but only that, if it is true for $n = k$, then it is also true for $n = k + 1$. So, to prove that property holds, only prove that conditional proposition.

The step 'if the statement is true for $n = k$, then it is also true for $n = k + 1$' is sometimes referred as the inductive step and the assumption in this step that statement is true for $n = k$ is called the inductive hypothesis.

Algorithm for Mathematical Induction

The steps used to prove that a statement is true for all natural numbers by using principle of mathematical induction are given below:

***Step* I** Consider the given statement as $P(n)$.

***Step* II** Put $n = 1$, then verify that it is a true statement.

***Step* III** Suppose that the statement is true, for $n = k$ (any arbitrary number).

***Step* IV** Show that the statement is true for $n = k + 1$. Combining the results of steps II and IV conclude by principle of mathematical induction that $P(n)$ is true for all $n \in N$.

This algorithm for principle of mathematical induction is used to solve problems which can be categorised into the following types.

Types of Problems

Identity Type Problems

In this type of problems, we use principle of mathematical induction to show LHS is equal to RHS.

Example 1. $1 + 2 + 3 + \ldots + n$ *is equal to*

(a) $\frac{n(n-1)}{2}$ *(b)* $\frac{n(n+1)}{2}$ *(c)* $\frac{n(n+1)}{3}$ *(d)* $\frac{n(n-1)}{3}$

Sol. (b) By the help of AP, we have

$$P(n) : 1 + 2 + 3 + \ldots + n = \frac{n(n+1)}{2}$$

Put $n = 1$, LHS = 1

and RHS $= \frac{1(1+1)}{2} = 1 =$ LHS

Therefore, $P(1)$ is true.

Suppose that the statement is true, for $n = k$, $k \in N$.

$$\therefore \quad P(k) : 1 + 2 + 3 + \ldots + k = \frac{k(k+1)}{2} \quad \ldots \text{(i)}$$

Now, show that the result is true, for $n = k + 1$.

$$P(k+1) : 1 + 2 + 3 + \ldots + k + (k+1) = \frac{(k+1)(k+2)}{2}$$

Then, $$\text{LHS} = 1 + 2 + 3 + \ldots + k + (k+1) = \frac{k(k+1)}{2} + (k+1) \quad \text{[from Eq. (i)]}$$
$$= \left(\frac{k+1}{2}\right)(k+2) = \text{RHS}$$

Therefore, $P(k+1)$ is true, whenever $P(k)$ is true.

Hence, from the principle of mathematical induction, the statement is true for all natural numbers.

Example 2. *For a natural number n, which one is the correct statement?*

(a) $1^3 + 2^3 + 3^3 + \ldots + n^3 = (1 + 2 + 3 + \ldots + n)^2$

(b) $1^3 + 2^3 + 3^3 + \ldots + n^3 > (1 + 2 + 3 + \ldots + n)^2$

(c) $1^3 + 2^3 + 3^3 + \ldots + n^3 < (1 + 2 + 3 + \ldots + n)^2$

(d) $1^3 + 2^3 + 3^3 + \ldots + n^3 \neq (1 + 2 + 3 + \ldots + n)^2$

Sol. (a) We have, $1^3 + 2^3 + 3^3 + \ldots + n^3 = \left(\frac{n(n+1)}{2}\right)^2 = (1 + 2 + 3 + \ldots + n)^2$

Aliter

Let $P(n) : 1^3 + 2^3 + 3^3 + \ldots + n^3 = (1 + 2 + 3 + \ldots + n)^2$

For $n = 1$, we have

$P(1) : 1^3 = 1^2 \Rightarrow 1 = 1$, which is true and for $n = 2$, we have

$P(2) : 1^3 + 2^3 = (1 + 2)^2 \Rightarrow 9 = 9$, which is true.

Similarly, we can prove that $P(n)$ is true for all $n \in N$.

Divisibility Type Problems

In this type of problems, we use principle of mathematical induction to show that given statement $P(n)$ is divisible by given number or $P(n)$ is a multiple of given number.

This process can also be explained with the following examples:

Example 3. *The greatest positive integer, which divides* $(n+2)(n+3)(n+4)(n+5)(n+6)$ *for all* $n \in N$*, is*

(a) 4 *(b)* 120

(c) 240 *(d)* 24

Sol. (b) Let $P(n) : (n+2)(n+3)(n+4)(n+5)(n+6)$

Put $n = 1$, $P(1) = (1+2)(1+3)(1+4)(1+5)(1+6) = 3 \times 4 \times 5 \times 6 \times 7 = 120 \times 21$

Put $n = 2$, $P(2) = (2+2)(2+3)(2+4)(2+5)(2+6) = 4 \times 5 \times 6 \times 7 \times 8 = 120 \times 56$ and so on.

Hence, $P(n)$ is always divisible by 120.

Aliter

$\because n$ consecutive positive integer is divided by $n!$.

$\therefore 5$ consecutive positive integer is divided by $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$

Example 4. *If $n \in N$, then $11^{n+2} + 12^{2n+1}$ is divisible by*

(a) 113 (b) 123
(c) 133 (d) None of these

Sol. (c) Putting $n = 1$ in $11^{n+2} + 12^{2n+1}$, we get $11^3 + 12^3 = 3059$, which is divisible by 133.

Inequality Type Problems

In this type of problems, we have inequality symbols like >, <, ≥ or ≤ and use the principle of mathematical induction to show that LHS and RHS satisfies the given inequality.

Example 5. *For each $n \in N$, the correct statement is*

(a) $2^n < n$
(b) $n^2 > 2n$
(c) $n^4 < 10^n$
(d) $2^{3n} > 7n + 1$

Sol. (c) Let $n = 1$, then options (a), (b) and (d) do not satisfy. Only option (c) satisfied.

Example 6. *For any natural number n, $2^n\ (n-1)! < n^n$, if*

(a) $n < 2$ (b) $n > 2$ (c) $n \geq 2$ (d) Never

Sol. (b) Check through option, the condition $2^n (n-1)! < n^n$ is satisfied for $n > 2$.

Recursion Type Problems

In this type of problems, we get a sequence in which later terms are deduced from earlier ones by using the principle of mathematical induction.

This process can be explained by following examples:

Example 7. *If $u_{n+1} = 3u_n - 2u_{n-1}$ and $u_0 = 2$, $u_1 = 3$, then u_n is equal to*

(a) $1 - 2^n$ (b) $2^n + 1$ (c) $2^n - 1$ (d) $2^n + 2$

Sol. (b) We have, $u_{n+1} = 3u_n - 2u_{n-1}$ ...(i)

***Step* I** Given, $u_{1+1} = 3 = 2 + 1 = 2^1 + 1$

which is true, for $n = 1$.

Put $n = 1$ in Eq. (i), then $u_{1+1} = 3u_1 - 2u_{1-1}$

$$\Rightarrow \quad u_2 = 3u_1 - 2u_0 = 3 \cdot 3 - 2 \cdot 2 = 5 = 2^2 + 1$$

which is true, for $n = 2$.

Therefore, the result are true, for $n = 1$ and $n = 2$.

***Step* II** Assume it is true for $n = k$, then it is also true for $n = k - 1$.

Then, $u_k = 2^k + 1$ ...(ii)

and $u_{k-1} = 2^{k-1} + 1$ ...(iii)

***Step* III** On putting $n = k$ in Eq. (i), we get

$$\begin{aligned} u_{k+1} &= 3u_k - 2u_{k-1} \\ &= 3(2^k + 1) - 2(2^{k-1} + 1) \quad \text{[from Eqs. (ii) and (iii)]} \\ &= 3 \cdot 2^k + 3 - 2 \cdot 2^{k-1} - 2 \\ &= 3 \cdot 2^k + 3 - 2^k - 2 = (3-1)2^k + 1 \\ &= 2 \cdot 2^k + 1 = 2^{k+1} + 1 \end{aligned}$$

This shows that the result is true for $n = k + 1$, hence by the principle of mathematical induction, the result is true for all $n \in N$.

Example 8. *If $a_1 = 2$, $a_n = 5\,a_{n-1}$, for all natural numbers $n \geq 2$, then the value of a_4 is equal to*

(a) 150 (b) 50
(c) 200 (d) None of these

Sol. (d) We have, $a_1 = 2$

Then, $a_2 = 5a_{2-1} = 5a_1 = 10$

$a_3 = 5a_{3-1} = 5a_2 = 5 \times 10 = 50$

$\therefore \quad a_4 = 5a_{4-1} = 5a_3 = 5 \times 50 = 250$

Work Book Exercise

1 Let $P(n)$ be a statement and let $P(n) \to P(n+1)$ is true for all natural numbers n, then $P(n)$ is true

a for all n
b for all $n > 1$
c for all $n > m$, m being a fixed integer
d Nothing can be said

2 The value of the natural numbers n such that the inequality $2^n > 2n + 1$ is valid, is

a for $n \geq 3$ b for $n < 3$
c for $n \in N$ d for any n

3 If $n \in N$, then $7^{2n} + 2^{3n-3} \cdot 3^{n-1}$ is always divisible by

a 25 b 35
c 45 d None of these

4 For every positive integral value of n, $3^n > n^3$ when

a $n > 2$ b $n \geq 3$ c $n \geq 4$ d $n < 4$

5 For every positive integer n, $2^n < n!$ when

a $n < 4$ b $n \geq 4$
c $n < 3$ d None of these

6 For every natural number n, $n(n+1)$ is always

a even b odd
c multiple of 3 d multiple of 4

7 If n is a natural number, then $\left(\frac{n+1}{2}\right)^n > n!$ is true, when

a $n < 1$ b $n \geq 1$
c $n \geq 2$ d $n < 3$

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. The value of sum in the nth bracket of $(1) + (2 + 3) + (4 + 5 + 6 + 7) + (8 + 9 + 10 + \dots 15) + \dots$, is

(a) $2^n\ (2^n + 2^{n-1} - 1)$

(b) $2^{n-1}\ (2^n + 2^{n-1} - 1)$

(c) $2^{n-2}\ (2^n + 2^{n-1} - 1)$

(d) None of the above

Sol. If $n = 1$, then $2^n\ (2^n + 2^{n-1} - 1)$
$= 2\ (2 + 1 - 1) = 2(2) = 4,$

$2^{n-1}\ (2^n + 2^{n-1} - 1) = 2^0\ (2 + 2^0 - 1) = (2 + 1 - 1) = 2$

and $2^{n-2}\ (2^n + 2^{n-1} - 1) = 2^{-1}(2^1 + 2^0 - 1)$
$= 2^{-1}(2) = 1$

$\therefore$ Sum of nth bracket $= 2^{n-2}\ (2^n + 2^{n-1} - 1)$

Hence, (c) is the correct answer.

Ex 2. If $(1) + (2 + 3 + 4) + (5 + 6 + 7 + 8 + 9) + \dots$, then the sum of terms in the nth bracket is

(a) $(n-1)^3 + n^3$

(b) $(n+1)^3 + 8n^2$

(c) $\dfrac{(n+1)(n+2)}{6n}$

(d) $(n+1)^3 + n^3$

Sol. If $n = 1$, then $(n-1)^3 + n^3 = 0 + 1 = 1,$

$(n+1)^3 + 8n^2 = 8 + 8 = 16,$

$\dfrac{(n+1)(n+2)}{6n} = \dfrac{6}{6} = 1,$

and $(n+1)^3 + n^3 = 8 + 1 = 9$

If $n = 2$, then $(n-1)^3 + n^3 = 1 + 8 = 9,$

$\dfrac{(n+1)(n+2)}{6n} = \dfrac{12}{12} = 1$

$\therefore$ Sum of nth bracket $= (n-1)^3 + n^3$

Hence, (a) is the correct answer.

Ex 3. $(1) + (2 + 3) + (4 + 5 + 6) + \dots n$ brackets is equal to

(a) $\dfrac{n(n+1)(n^2 + n + 2)}{8}$

(b) $\dfrac{n(n+1)(n^2 - n + 2)}{8}$

(c) $\dfrac{n(n-1)(n^2 + n + 2)}{8}$

(d) $\dfrac{n(n-1)(n^2 - n + 2)}{8}$

Sol. If $n = 1$, then $\dfrac{n(n+1)(n^2 + n + 2)}{8} = \dfrac{2(4)}{8} = 1$

Hence, (a) is the correct answer.

Ex 4. Sum of nth bracket of

$$(1) + \left(\frac{1}{3} + \frac{1}{3^2}\right) + \left(\frac{1}{3^3} + \frac{1}{3^4} + \frac{1}{3^5}\right) + \dots \text{ is}$$

(a) $\dfrac{(3^n - 1)^3}{2 \cdot 4^{n-1}}$

(b) $\dfrac{(3^n - 1)}{2 \cdot 3^{(n-1)(n+2)/2}}$

(c) $\dfrac{(3^n + 1)}{3 \cdot 7^{n-1}}$

(d) None of these

Sol. If $n = 1$, then $\dfrac{(3^n - 1)^3}{2 \cdot 4^{n-1}} = \dfrac{(2)^3}{2} = 4;$

$\dfrac{(3^n - 1)}{2 \cdot 3^{(n-1)(n+2)/2}} = \dfrac{2}{2 \cdot 3^0} = 1$ and $\dfrac{3^n + 1}{3 \cdot 7^{n-1}} = \dfrac{4}{3}$

$\therefore$ Sum of nth bracket $= \dfrac{(3^n - 1)}{2 \cdot 3^{(n-1)(n+2)/2}}$

Aliter

nth bracket

$$= \frac{1}{3^{n(n-1)/2}} + \dots + \frac{1}{3^{(n+1)n/2 - 1}} = \frac{1}{3^{n(n-1)/2}}\left[\frac{1 - 1/3^n}{1 - 1/3}\right]$$

$$= \left[\frac{3(3^n - 1)}{2 \cdot 3^n 3^{n(n-1)/2}}\right] = \frac{3^n - 1}{2 \cdot 3^{(n-1)(n+2)/2}}$$

Hence, (b) is the correct answer.

Ex 5. The sum of $(1^2) + (1^2 + 2^2) + (1^2 + 2^2 + 3^2) + \dots n$ brackets is equal to

(a) $\dfrac{n(n+1)(n+2)}{6}$

(b) $\dfrac{n(n+1)^2\ (n+2)}{12}$

(c) $n(n+1)(n+2)$

(d) $\dfrac{n(n+1)(2n+1)}{6}$

Sol. $\because t_n = 1^2 + 2^2 + \dots + n^2$

$$= \frac{n(n+1)(2n+1)}{6} = \frac{n(2n^2 + 3n + 1)}{6}$$

$$= \frac{n^3}{3} + \frac{n^2}{2} + \frac{n}{6}$$

$$\therefore S_n = \sum\left(\frac{n^3}{3} + \frac{n^2}{2} + \frac{n}{6}\right)$$

$$= \frac{n^2(n+1)^2}{12} + \frac{n(n+1)(2n+1)}{12} + \frac{n(n+1)}{12}$$

$$= \left[\frac{n(n+1)}{12}\right][n(n+1) + 2n + 1 + 1]$$

$$= \frac{n(n+1)(n^2 + 3n + 2)}{12} = \frac{n(n+1)^2(n+2)}{12}$$

Hence, (b) is the correct answer.

Ex 6. $(1)+(1+3)+(1+3+5)+\ldots n$ brackets is equal to

(a) $\dfrac{n(n+1)(n+2)}{6}$

(b) $\dfrac{n(n+1)(3n^2+23n+46)}{12}$

(c) $\dfrac{n(27n^3+90n^2+45n-50)}{4}$

(d) $\dfrac{n(n+1)(2n+1)}{6}$

Sol. nth bracket $=1+3+5+\ldots+(2n-1)=n^2$

$\therefore \quad S_n=\Sigma n^2=\dfrac{n(n+1)(2n+1)}{6}$

Hence, (d) is the correct answer.

Ex 7. $(1)+(1+2)+(1+2+3)+\ldots n$ brackets is equal to

(a) $\dfrac{n(n+1)(n+2)}{6}$

(b) $\dfrac{n(n+1)(3n^2+23n+46)}{12}$

(c) $\dfrac{n(27n^3+90n^2+45n-50)}{4}$

(d) $\dfrac{n(n+1)(2n+1)}{16}$

Sol. If $n=1$, then the sum of the terms $=(1)=1$,

$\therefore \quad \dfrac{n(n+1)(n+2)}{6}=\dfrac{1\times2\times3}{6}$

$=1$

Hence, (a) is the correct answer.

Ex 8. $1\cdot3\cdot4+2\cdot4\cdot5+3\cdot5\cdot6+\ldots$ upto n terms is equal to

(a) $\dfrac{n(n+1)(n+2)}{6}$

(b) $\dfrac{n(n+1)(3n^2+23n+46)}{12}$

(c) $\dfrac{n(27n^3+90n^2+45n-50)}{4}$

(d) $\dfrac{n(n+1)(2n+1)}{6}$

Sol. Given expression

$\Sigma n(n+2)(n+3)=\Sigma(n^3+5n^2+6n)$

$=\dfrac{n^2(n+1)^2}{4}+\dfrac{5n(n+1)(2n+1)}{6}+\dfrac{6n(n+1)}{2}$

$=\dfrac{n(n+1)}{12}[3n(n+1)+10(2n+1)+36]$

$=\dfrac{n(n+1)(3n^2+23n+46)}{12}$

Hence, (b) is the correct answer.

Ex 9. $2\cdot1^2+3\cdot2^2+4\cdot3^2+\ldots+(n+1)n^2$ is equal to

(a) $\dfrac{n(n+1)(n+2)(3n+5)}{12}$

(b) $\dfrac{n(n+1)(n+2)(n+3)}{4}$

(c) $2n(n+1)(n+2)(n+3)$

(d) $\dfrac{n(n+1)(n+2)(3n+1)}{12}$

Sol. $\because t_n=(n+1)n^2=n^3+n^2$

$=\dfrac{n^2(n+1)^2}{4}+\dfrac{n(n+1)(2n+1)}{6}$

$=\dfrac{n(n+1)}{12}[3n(n+1)+2(2n+1)]$

$=\dfrac{n(n+1)(3n^2+7n+2)}{12}$

$=\dfrac{n(n+1)(n+2)(3n+1)}{12}$

Hence, (d) is the correct answer.

Ex 10. $1\cdot2^2+2\cdot3^2+3\cdot4^2+\ldots+n(n+1)^2$ is equal to

(a) $\dfrac{n(n+1)(n+2)(3n+5)}{12}$

(b) $\dfrac{n(n+1)(n+2)(n+3)}{4}$

(c) $2n(n+1)(n+2)(n+3)$

(d) $\dfrac{n(n+1)(n+2)(3n+1)}{12}$

Sol. $\because t_n=n(n+1)^2=n(n^2+2n+1)=n^3+2n^2+n$

$\therefore S_n=\Sigma n^3+2\Sigma n^2+\Sigma n$

$=\dfrac{n^2(n+1)^2}{4}+\dfrac{2n(n+1)(2n+1)}{6}+\dfrac{n(n+1)}{2}$

$=\dfrac{n(n+1)}{12}[3n(n+1)+4(2n+1)+6]$

$=\dfrac{n(n+1)(3n^2+11n+10)}{12}$

$=\dfrac{n(n+1)(n+2)(3n+5)}{12}$

Hence, (a) is the correct answer.

Ex 11. $\dfrac{1^2}{3}+\dfrac{1^2+2^2}{5}+\dfrac{1^2+2^2+3^2}{7}+\ldots$ upto n terms is equal to

(a) $\dfrac{n(n+1)(n+2)}{18}$ (b) $\dfrac{n(n+1)(n+2)}{6}$

(c) $\dfrac{n(n+1)(n+2)}{3}$ (d) $\dfrac{2n(n+1)(n+2)}{3}$

Sol. $\because t_n=\dfrac{1^2+2^2+\ldots+n^2}{2n+1}=\dfrac{n(n+1)}{6}$

$\therefore S_n=\Sigma\dfrac{(n^2+n)}{6}=\dfrac{1}{6}\left[\dfrac{n(n+1)(2n+1)}{6}+\dfrac{n(n+1)}{2}\right]$

$=\dfrac{n(n+1)(n+2)}{18}$

Hence, (a) is the correct answer.

Ex 12. $1\cdot 2+2\cdot 3+3\cdot 4+\ldots$ upto n terms is equal to

(a) $\dfrac{n(n+1)(n+5)}{3}$ (b) $\dfrac{n(n+1)(n+2)}{3}$

(c) $\dfrac{n(4n^2+6n-1)}{3}$ (d) $n(n+1)(n+2)$

Sol. If $n=1$, then the sum of the terms $=1\cdot 2=2$

$$\frac{n(n+1)(n+2)}{3}=\frac{1\times 2\times 3}{3}=2$$

Hence, (b) is the correct answer.

Ex 13. $1\cdot 3+2\cdot 3^2+3\cdot 3^3+\ldots+n\cdot 3^n$ is equal to

(a) $\dfrac{(2n-1)3^{n+1}+3}{4}$ (b) $\dfrac{(2n+1)3^{n+1}+3}{4}$

(c) $\dfrac{(2n+1)3^{n+1}-3}{4}$ (d) $\dfrac{(2n-1)3^{n+1}-3}{4}$

Sol. If $n=1$, then

$$\frac{(2n-1)3^{n+1}+3}{4}=3,\ \frac{(2n+1)3^{n+1}+3}{4}=\frac{15}{2},$$
$$\frac{(2n+1)3^{n+1}-3}{4}=6,\ \frac{(2n-1)3^{n+1}-3}{4}=\frac{3}{2}$$

$\therefore$ Sum $=\dfrac{(2n-1)3^{n+1}+3}{4}$

Hence, (a) is the correct answer.

Ex 14. $1\cdot 1!+2\cdot 2!+3\cdot 3!+\ldots+n\cdot n!$ is equal to

(a) $(n+1)!-1$

(b) $(n-1)!+1$

(c) $(n+1)!+1$

(d) $(n-1)!-1$

Sol. If $n=1$, then $(n+1)!-1=2-1=1$, $(n-1)!+1=2$, $(n+1)!+1=2+1=3$, $(n-1)!-1=1-1=0$

$\therefore$ Sum $=(n+1)!-1$

Hence, (a) is the correct answer.

Ex 15. $1\cdot 3+3\cdot 5+5\cdot 7+\ldots$ upto n terms is equal to

(a) $\dfrac{n(n+1)(n+5)}{3}$

(b) $\dfrac{n(n+1)(n+2)}{3}$

(c) $\dfrac{n(4n^2+6n-1)}{3}$

(d) $n(n+1)(n+2)$

Sol. If $n=1$, then $\dfrac{n(n+1)(n+5)}{3}=4$, $\dfrac{n(n+1)(n+2)}{3}=2$,

$\dfrac{n(4n^2+6n-1)}{3}=3$, $n(n+1)(n+2)=6$

Hence, (c) is the correct answer.

Ex 16. $1+4+13+40+\ldots$ upto n terms is equal to

(a) $\dfrac{3^{n+1}-2^n}{2n}$ (b) $\dfrac{(3^{n+1}-2n-3)}{4}$

(c) $\dfrac{3n-1+3^n}{9}$ (d) $\dfrac{(3^{n-1}+2n^2)}{8}$

Sol.

$$S_n=1+4+13+40+\ldots+t_n$$
$$S_n=\quad 1+4+13+\ldots+t_{n+1}+t_n$$
$$\Rightarrow\quad 0=1+3+9+27+\ldots-t_n$$
$$\Rightarrow\quad t_n=\frac{(3^n-1)}{(3-1)}=\frac{(3^n-1)}{2}$$
$$\therefore\quad S_n=\Sigma\frac{(3^n-1)}{2}$$
$$=\frac{3(3^n-1)}{2(3-1)}-\frac{n}{2}$$
$$=\frac{(3^{n+1}-3-2n)}{4}$$

Hence, (b) is the correct answer.

Ex 17. $1+4+10+19+\ldots+\dfrac{(3n^2-3n+2)}{2}$ is equal to

(a) $\dfrac{n(n+1)(2n+1)}{6}$

(b) $\dfrac{n^2(n+1)^2}{4}$

(c) $\dfrac{n(n+1)(n+2)}{6}$

(d) $\dfrac{n(n^2+1)}{2}$

Sol. Sum $=\Sigma\dfrac{(3n^2-3n+2)}{2}$

$$=\frac{3}{2}\Sigma n^2-\frac{3}{2}\Sigma n+\Sigma 1$$
$$=\frac{3n(n+1)(2n+1)}{12}-\frac{3n(n+1)}{4}+n$$
$$=\frac{n}{4}[2n^2+3n+1-3n-3+4]$$
$$=\frac{n}{4}[2n^2+2]=\frac{n(n^2+1)}{2}$$

Hence, (d) is the correct answer.

Ex 18. $\left(1-\dfrac{1}{2}\right)\left(1-\dfrac{1}{3}\right)\left(1-\dfrac{1}{4}\right)\ldots\left(1-\dfrac{1}{n+1}\right)$ is equal to

(a) $\dfrac{1}{n+1}$

(b) $\dfrac{n}{n+1}$

(c) $\dfrac{n}{2n+1}$

(d) $\dfrac{n}{3n+1}$

Sol. If $n=1$, then $\dfrac{1}{n+1}=\dfrac{1}{2}$, $\dfrac{n}{n+1}=\dfrac{1}{2}$,

$\dfrac{n}{2n+1}=\dfrac{1}{3}$, $\dfrac{n}{3n+1}=\dfrac{1}{4}$

If $n=2$, then $\dfrac{1}{n+1}=\dfrac{1}{3}$, $\dfrac{n}{n+1}=\dfrac{2}{3}$

$\therefore$ Sum $=\dfrac{n}{n+1}$

Hence, (b) is the correct answer.

Target Exercises

Type 1. Only One Correct Option

1. $\frac{3}{4}+\frac{15}{16}+\frac{63}{64}+\ldots n$ terms is equal to

(a) $n-\frac{1}{3}4^n-\frac{1}{3}$ (b) $n+\frac{1}{3}4^{-n}-\frac{1}{3}$
(c) $n+\frac{1}{3}4^n-\frac{1}{3}$ (d) $n-\frac{1}{3}4^{-n}+\frac{1}{3}$

2. $\frac{\frac{1}{2}\cdot\frac{2}{2}}{1^3}+\frac{\frac{2}{2}\cdot\frac{3}{2}}{1^3+2^3}+\frac{\frac{3}{2}\cdot\frac{4}{2}}{1^3+2^3+3^3}+\ldots n$ terms is equal to

(a) $\frac{n^2}{(n+1)^2}$ (b) $\frac{n^3}{(n+1)^3}$ (c) $\frac{n}{n+1}$ (d) $\frac{1}{n+1}$

3. $\Sigma\frac{1^2+2^2+3^2+\ldots+n^2}{1+2+3+\ldots+n}$ is equal to

(a) $\frac{(n^2+2n)}{3}$ (b) $\frac{n^2-2n}{6}$
(c) $\frac{n^2+11}{12n}$ (d) None of these

4. $\frac{1\cdot 2^2+2\cdot 3^2+3\cdot 4^2+\ldots+n(n+1)^2}{1^2\cdot 2+2^2\cdot 3+3^2\cdot 4+\ldots+n^2(n+1)}$ is equal to

(a) $\frac{3n+5}{3n+1}$ (b) $\frac{3n+1}{3n+5}$
(c) $(3n+1)(3n+5)$ (d) None of these

5. $\frac{1^4}{1\cdot 3}+\frac{2^4}{3\cdot 5}+\frac{3^4}{5\cdot 7}+\ldots+\frac{n^4}{(2n+1)(2n-1)}$ is equal to

(a) $\frac{n(n+1)(n+2)}{6n}$
(b) $\frac{n(n+1)(n^2+n+1)}{6(2n+1)}$
(c) $n(n+2)(n+3)^2$
(d) None of the above

6. $\frac{1}{1\cdot 2}+\frac{1}{2\cdot 3}+\frac{1}{3\cdot 4}+\ldots n$ terms is equal to

(a) $\frac{1}{n+1}$ (b) $\frac{n}{n+1}$ (c) $\frac{n}{2n+1}$ (d) $\frac{n}{3n+1}$

7. $\frac{1}{1\cdot 3}+\frac{1}{3\cdot 5}+\frac{1}{5\cdot 7}+\ldots n$ terms is equal to

(a) $\frac{1}{n+1}$ (b) $\frac{n}{n+1}$ (c) $\frac{n}{2n+1}$ (d) $\frac{n}{3n+1}$

8. $\cos\theta\cos 2\theta\cos 4\theta\ldots\cos 2^{n-1}\theta$ is equal to

(a) $\frac{\sin 2^n\theta}{2^n\sin\theta}$ (b) $\frac{\sin 2^n\theta}{\sin\theta}$
(c) $\frac{\cos 2^n\theta}{2^n\cos\theta}$ (d) $\frac{\cos 2^n\theta}{2^n\sin\theta}$

9. $1+\frac{x}{a_1}+\frac{x(x+a_1)}{a_1a_2}+\ldots+\frac{x(x+a_1)(x+a_2)\ldots(x+a_{n-1})}{a_1a_2\ldots a_n}$ is equal to

(a) $\frac{(x+a_1)(x+a_2)\ldots(x+a_n)}{a_1a_2\ldots a_n}$
(b) $\frac{(x-a_1)(x-a_2)\ldots(x-a_n)}{a_1a_2\ldots a_n}$
(c) $(x+a_1)(x+a_2)\ldots(x+a_n)$
(d) $(x-a_1)(x-a_2)\ldots(x-a_n)$

10. Using mathematical induction, the numbers a_n's are defined by $a_0=1, a_{n+1}=3n^2+n+a_n, (n\geq 0)$. Then, a_n is equal to

(a) n^3+n^2+1 (b) n^3-n^2+1 (c) n^3-n^2 (d) n^3+n^2

11. For $n\in N$, $\frac{1}{5}n^5+\frac{1}{3}n^3+\frac{7}{15}n$ is

(a) an integer (b) a natural number
(c) a positive fraction (d) None of these

12. If $n\in N$, then x^n-y^n is divisible by

(a) $x-1$ (b) $x-y$ (c) $x+y$ (d) $y-1$

13. x^n+a^n is divisible by $x+a$ for n is any

(a) positive integer (b) integer
(c) odd positive integer (d) None of these

14. $x^{n+1}+(x+1)^{2n-1}$ is divisible by

(a) x (b) $x+1$ (c) x^2+x+1 (d) x^2-x+1

15. If $n\in N$, then 2^n

(a) $=n$ (b) $>n$
(c) $<n$ (d) None of these

16. If $n\in N$, then $1+\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{3}}+\ldots+\frac{1}{\sqrt{n}}$

(a) $=\sqrt{n}$ (b) $\geq\sqrt{n}$
(c) $\leq\sqrt{n}$ (d) None of these

17. $\frac{(2n)!}{2^{2n}(n!)^2}\leq$

(a) $\frac{1}{\sqrt{3n+1}}$ (b) $\frac{1}{\sqrt{3n+2}}$ (c) $\frac{1}{\sqrt{3n+4}}$ (d) $\frac{1}{\sqrt{3n+5}}$

18. If $n>1$, then

(a) $\frac{(2n)!}{(n!)^2}=\frac{4n}{2n+1}$ (b) $\frac{(2n)!}{(n!)^2}<\frac{4n}{2n+1}$
(c) $\frac{(2n)!}{(n!)^2}>\frac{4n}{2n+1}$ (d) None of these

Type 2. **More than One Correct Option**

19. If $a_1 = 1$ and $a_n = na_{n-1} + 5$ for all positive integer $n \geq 2$, then a_5 is equal to

(a) 550
(b) 120
(c) $5a_4 + 5$
(d) 24

20. $x(x^{n-1} - na^{n-1}) + a^n(n-1)$ is divisible by $(x-a)^2$ for

(a) $n \geq 1 (n \in Z)$ (b) $n > 2$
(c) all $n \in N$ (d) None of these

21. If p is prime number, then $n^p - n$ is divisible by p, when n is

(a) natural number greater than 1
(b) irrational number
(c) complex number
(d) positive integer greater than or equal to 2

Type 3. **Assertion and Reason**

Directions (Q. Nos. 22-24) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

22. Statement I Sum of 20th group of {1}, {1, 2}, {1, 2, 3},... is 110.

Statement II Sum of n natural numbers is $\frac{n(n+1)}{2}$.

23. Statement I If n is a positive integer, then $3^{2n} + 7$ is divisible by 8.

Statement II HCF of 16 and 88 is 8.

24. Statement I If $n \in N$, product of $n(n+1)(n+2)$ is divisible by 6.

Statement II Product of 3 consecutive positive integers is divisible by 3!.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 25-26) *If* $a_n = \sqrt{7 + \sqrt{7 + \sqrt{7 + \dots}}}$ *having n radical signs, then by methods of mathematical induction, answer the following questions.*

25. Which of the following is true?

(a) $a_n > 7, \forall\, n \geq 1$
(b) $a_n > 3, \forall\, n \geq 1$
(c) $a_n < 4, \forall\, n \geq 1$
(d) $a_n < 3, \forall\, n \geq 1$

26. The value of $a_1 + a_2 + a_3$ is

(a) < 6
(b) < 4
(c) < 12
(d) None of the above

Passage II (Q. Nos. 27-28) *Consider S(k) is the sum of first k odd natural numbers expressed as*

$$S(k): 1 + 3 + 5 + \dots + (2k-1)$$

27. $S(k)$ can be expressed as

(a) k^2
(b) $2k^2$
(c) $2 + k^2$
(d) None of the above

28. If $S(k)$ expressed as $3 + k^2$, then

(a) $S(1)$ is true (b) $S(k) \not\Rightarrow S(k+1)$
(c) $S(k) \Rightarrow S(k+1)$ (d) None of these

Passage III (Q. Nos. 29-30) *Consider* $a_n = 2^{2^n} + 1$, *if* $n > 1$.

29. The last digit of a_2 is

(a) 1 (b) 2
(c) 3 (d) None of these

30. The last digit of a_n is

(a) 2 (b) 3 (c) 7 (d) 4

Type 5. **Match the Column**

31. Match the following:

	Column I		Column II
A.	The smallest positive integer for which the statement $3^{n+1} < 4^n$ holds is	p.	1
B.	If $x^n - 1$ is divisible by $x - k$. Then, the least positive integral value of k is	q.	4
C.	If $49^n + 16n + k$ is divisible by 64 for $n \in N$. Then, the numerically least negative integral value of k is	r.	2
D.	For all $n \in N$, $2^{4n} - 15n - 1$ is divisible by 15^k. Then, the maximum integer value of k is	s.	3

Type 6. **Single Integer Answer Type Questions**

32. If $\dfrac{(n+2)!}{6(n-1)!}$ divisible by n, $n \in N$ and $1 \le n \le 9$, then n is__________ .

33. If $n \in N$ and $1 < n \le 9$, then $n^3 + 2n$ is divisible by__________ .

34. The minimum value of n for which $10^n + 3 \cdot 4^{n+2} + 5$ is an integral multiple of 97, is__________ .

Explanations

Target Exercises

1. If $n = 1$, then

$$n - \frac{1}{3}4^n - \frac{1}{3} = 1 - \frac{4}{3} - \frac{1}{3} = \frac{-2}{3},$$

$$n + \frac{1}{3}4^{-n} - \frac{1}{3} = 1 + \frac{1}{12} - \frac{1}{3} = \frac{9}{12} = \frac{3}{4},$$

$$n + \frac{1}{3}4^n - \frac{1}{3} = 1 + \frac{4}{3} - \frac{1}{3} = 2,$$

and $$n - \frac{1}{3}4^{-n} + \frac{1}{3} = 1 - \frac{1}{12} + \frac{1}{3} = \frac{15}{12} = \frac{5}{4}$$

$\therefore$ $$\text{Sum} = n + \frac{1}{3}4^{-n}\frac{-1}{3}$$

2. If $n = 1$, then

$$\frac{n^2}{(n+1)^2} = \frac{1}{4},$$

$$\frac{n^3}{(n+1)^3} = \frac{1}{8},$$

$$\frac{n}{n+1} = \frac{1}{2},$$

and $$\frac{1}{n+1} = \frac{1}{2}$$

If $n = 2$, then

$$\frac{n}{n+1} = \frac{2}{3}$$

$$\frac{1}{n+1} = \frac{1}{3}$$

$\therefore$ $$\text{Sum} = \frac{n}{n+1}$$

3. We have, $\dfrac{1^2 + 2^2 + 3^2 + \ldots + n^2}{1 + 2 + 3 + \ldots + n}$

$$= \frac{n(n+1)(2n+1)2}{n(n+1)6} = \frac{(2n+1)}{3}$$

$$S_n = 2\frac{(\Sigma n)}{3} + \frac{n}{3} = \frac{n(n+1)}{3} + \frac{n}{3}$$

$$= \frac{(n^2 + 2n)}{3}$$

4. $\Sigma\, n(n+1)^2 = \Sigma\,(n^3 + 2n^2 + n)$

$$= \frac{n^2(n+1)^2}{4} + \frac{2n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}$$

$$= \left[\frac{n(n+1)}{12}\right][3n(n+1) + 4(2n+1) + 6]$$

$$= \frac{n(n+1)(3n^2 + 11n + 10)}{12}$$

$$= \frac{n(n+1)(n+2)(3n+5)}{12}$$

$\Sigma n^2(n+1) = \Sigma(n^3 + n^2)$

$$= \frac{n^2(n+1)^2}{4} + \frac{n(n+1)(2n+1)}{6}$$

$$= \left[\frac{n(n+1)}{12}\right][3n(n+1) + 2(2n+1)]$$

$$= \frac{n(n+1)(3n^2 + 7n + 2)}{12}$$

$$= \frac{n(n+1)(n+2)(3n+1)}{12}$$

$$\therefore \quad \frac{\Sigma n\,(n+1)^2}{\Sigma n^2\,(n+1)} = \frac{\dfrac{n\,(n+1)(n+2)(3n+5)}{12}}{\dfrac{n(n+1)(n+2)(3n+1)}{12}}$$

$$= \frac{3n+5}{3n+1}$$

5. $$S_n = \Sigma\frac{n^4}{(2n+1)(2n-1)}$$

$$= \Sigma\frac{n^4}{4n^2 - 1}$$

$$= \Sigma\left(\frac{n^2}{4} + \frac{1}{16} + \frac{1}{16(2n+1)(2n-1)}\right)$$

$$= \frac{n(n+1)(2n+1)}{24} + \frac{n}{16} + \Sigma\frac{(2n+1) - (2n-1)}{32(2n+1)(2n-1)}$$

$$= \frac{n(n+1)(2n+1)}{24} + \frac{n}{16} + \frac{1}{32}\left(1 - \frac{1}{2n+1}\right)$$

$$= \frac{n(n+1)(2n+1)}{24} + \frac{n}{16} + \frac{n}{16(2n+1)}$$

$$= \frac{n(n+1)(2n+1)}{24} + \frac{n(2n+2)}{16(2n+1)}$$

$$= \frac{n(n+1)}{24}\left[\frac{(2n+1)^2 + 3}{2n+1}\right]$$

$$= \frac{n(n+1)(n^2 + n + 1)}{6(2n+1)}$$

6. $$t_n = \frac{1}{n(n+1)}$$

$$\therefore \quad S_n = \frac{2-1}{1\cdot 2} + \frac{3-2}{2\cdot 3} + \frac{4-3}{3\cdot 4} + \ldots + \frac{(n+1) - n}{n(n+1)}$$

$$= 1 - \frac{1}{2} + \frac{1}{2} - \frac{1}{3} + \ldots + \frac{1}{n} - \frac{1}{n+1}$$

$$= 1 - \frac{1}{n+1} = \frac{n}{n+1}$$

7. If $n = 1$, then

$$\frac{1}{n+1} = \frac{1}{2},$$

$$\frac{n}{n+1} = \frac{1}{2},$$

$$\frac{n}{2n+1} = \frac{1}{3},$$

and $$\frac{n}{3n+1} = \frac{1}{4}$$

$\therefore$ $$\text{Sum} = \frac{n}{2n+1}$$

8. If $n = 1$, then

$$\frac{\sin 2^n\theta}{2^n \sin\theta} = \frac{\sin 2\theta}{2\sin\theta}$$

$$= \frac{2\sin\theta\cos\theta}{2\sin\theta} = \cos\theta$$

9. If $n=1$, then given sum $=1+\dfrac{x}{a_1}=\dfrac{x+a_1}{a_1}$

10. Given, $a_0=1, a_{n+1}=3n^2+n+a_n$

$\Rightarrow \quad a_1=3(0)+0+a_0=1$

$\Rightarrow \quad a_2=3(1)^2+1+a_1$

$=3+1+1=5$

From option (b),

Let $P(n)=n^3-n^2+1$

$\therefore \quad P(0)=0-0+1=1=a_0$

$P(1)=1^3-1^2+1=1=a_1$

and $P(2)=(2)^3-(2)^2+1=5=a_2$

$\therefore \quad a_n=n^3-n^2+1$

11. If $n=1$, then

$$\frac{1}{5}n^5+\frac{1}{3}n^3+\frac{7}{15}n$$
$$=\frac{1}{5}+\frac{1}{3}+\frac{7}{15}$$
$$=\frac{3+5+7}{15}$$
$$=1$$

12. If $n=1$, then

$x^n-y^n=x-y$, divisible by $x-y$.

13. If $n=1$, then

$x^n+a^n=x+a$

If $n=3$, then

$x^n+a^n=x^3+a^3=(x+a)(x^2+a^2+ax)$

$\therefore$ x^n+a^n is divisible for odd positive integer n.

14. If $n=1$, then

$x^{n+1}+(x+1)^{2n-1}$

$=x^2+x+1$, divisible by x^2+x+1.

15. If $n=1$, then

$2^n=2, >1=n$

$\Rightarrow \quad 2^n>n$

16. If $n=2$, then given sum $=1+\dfrac{1}{\sqrt{2}}$

$$=\frac{\sqrt{2}+1}{\sqrt{2}}=\frac{2+\sqrt{2}}{2}$$
$$=\frac{3.414}{2}$$
$$=1.707$$

$\Rightarrow \quad \sqrt{2}=1.414$

$\therefore \quad$ Sum $\geq \sqrt{n}$

17. If $n=1$, then

$$\frac{(2n)!}{2^{2n}(n!)^2}=\frac{2}{4}=\frac{1}{2}$$

Now, $\dfrac{1}{\sqrt{3n+1}}=\dfrac{1}{\sqrt{4}}=\dfrac{1}{2}$,

$$\frac{1}{\sqrt{3n+2}}=\frac{1}{\sqrt{5}},$$
$$\frac{1}{\sqrt{3n+4}}=\frac{1}{\sqrt{7}},$$

and $\dfrac{1}{\sqrt{3n+5}}=\dfrac{1}{\sqrt{8}}$

$\therefore \quad \dfrac{(2n)!}{2^{2n}(n!)^2}\leq\dfrac{1}{\sqrt{3n+1}}$

18. If $n=2$, then

$$\frac{(2n)!}{(n!)^2}=\frac{24}{4}=6$$

and $\dfrac{4n}{2n+1}=\dfrac{8}{3}$

$\Rightarrow \quad \dfrac{(2n)!}{(n!)^2}>\dfrac{4n}{2n+1}$

19. Given, $a_n=na_{n-1}+5$

For $n=2$, then

$a_2=2a_1+5=7 \quad [\because a_1=1]$

$a_3=3a_2+5=21+5=26$

$a_4=4a_3+5=104+5=109$

$\therefore \quad a_5=5a_4+5=545+5=550$

20. Check through options, the condition is satisfied, $\forall\, n \in N$.

21. n^p-n is divisible by p for any natural number greater than 1.

It is Fermet's theorem.

Aliter

Let $n=4$ and $p=2$

Then, $(4)^2-4=16-4=12$

It is divisible by 2. So, it is true for any natural number greater than 1.

22. Sum of 20th group $=\dfrac{20\cdot 21}{2}=210$

Sum of n natural numbers $=\dfrac{n(n+1)}{2}$

It is true, for $n=1$, $\dfrac{1\cdot 2}{2}=1$

Assume, it is true, for $n=k$.

So, $1+2+3+\ldots+k=\dfrac{k(k+1)}{2}$

Now, for $k+1$, $1+2+3+\ldots+k+k+1$

$$=\frac{k(k+1)}{2}+k+1=\frac{(k+1)(k+2)}{2}$$

So, Statement II is true, for all $n \in N$.

23. Let statement $P(n)=3^{2n}+7$

For $P(n=1)=16$

For $P(n=2)=88$

$\therefore$ HCF of 16 and 88 is 8.

24. Let $P(n)\equiv n(n+1)(n+2)$

$P(n=1)\equiv 1\cdot 2\cdot 3=3!$

$P(n=2)\equiv 2\cdot 3\cdot 4=2\cdot(1\cdot 2\cdot 3)=2\cdot 3!$

$P(n=3)\equiv 3\cdot 4\cdot 5=2\cdot 5\cdot(1\cdot 2\cdot 3)=10\cdot 3!$

So, Statement I is true, Statement II is also true and Statement II is a correct explanation of Statement I.

25. We have, $a_1=\sqrt{7}<4$. Assume $a_k<4$ for some natural number k.

We have,

$$a_{k+1}=\sqrt{7+a_k}<\sqrt{7+4}<4$$

$\therefore \quad a_n<4, \forall\, n\geq 1$

26. $\because a_1 < 4, a_2 < 4, a_3 < 4$

$\therefore \quad a_1 + a_2 + a_3 < 4 + 4 + 4 = 12$

27. Consider $1 + 3 + 5 + \ldots + (2k-1) = \frac{k}{2}[1 + (2k-1)]$

$\left[\because \text{ if } a \text{ and } l \text{ are the first term and last term of an AP, then } S_n = \frac{n}{2}(a+l)\right]$

$\Rightarrow 1 + 3 + 5 + \ldots + (2k-1) = k^2$

Thus, $S(k)$ can be expressed as k^2.

i.e. $S(k): 1 + 3 + 5 + \ldots + (2k-1) = k^2$

28. Consider $S(k): 1 + 3 + 5 + \ldots + (2k-1) = 3 + k^2$

Then, $S(1): 1 = 3 + 1^2$, which is not true.

Suppose $S(k)$ is true, then

$1 + 3 + 5 + \ldots + (2k-1) = 3 + k^2$

On adding $(2k+1)$ both sides, we get

$1 + 3 + 5 + \ldots + (2k-1) + (2k+1) = 3 + k^2 + (2k+1)$
$= 3 + (k+1)^2$

which is $S(k+1)$.

Thus, $\quad S(k) \Rightarrow S(k+1)$

29. For $n = 2$, $a_2 = 2^{2^2} + 1 = 2^4 + 1$
$= 16 + 1 = 17$

Thus, the last digit of a_2 is 7.

30. Assume that $a_k = 2^{2^k} + 1 = 10m + 7$

where, $k > 1$ and m is some positive integer.

Now, $a_{k+1} = 2^{2^{k+1}} + 1 = (2^{2^k})^2 + 1$
$= (10m + 6)^2 + 1$
$= 10(10m^2 + 12m + 3) + 7$

Thus, last digit of a_n is 7, $\forall\, n > 1$.

31. A. If $n = 1$, then $3^2 \not< 4$

If $n = 2$, then $27 \not< 16$

If $n = 3$, then $81 \not< 64$

If $n = 4$, then $243 < 256$

B. $x^n - 1$ is divisible by $x - 1$, so $k = 1$

C. Value of $k = -1$, so numerically 1 is smallest.

D. If $n = 1 \Rightarrow 2^{4n} - 15n - 1 = 0$; $n = 2$

$\Rightarrow \quad 256 - 30 - 1 = 225 = 15^2$

So, maximum value of k is 2.

32. If $n = 1$, then $\frac{(n+2)!}{6(n-1)!} = \frac{3!}{6 \times 0!} = \frac{6}{6} = 1$, divisible by 1.

33. If $n = 1$, then $n^3 + 2n = 1 + 2 = 3$, divisible by 3.

34. For $n = 1$, we have given expression $= 207 = 9 \times 23$

and for $n = 2$, we have given expression $= 873 = 9 \times 97$

Thus, for $n = 2$ given expression is an integral multiple of 97.

Entrances Gallery

1. Let $P(n) = 2^{3n} - 7n - 1$

$\Rightarrow \quad P(1) = 0,\ P(2) = 49$

$P(1)$ and $P(2)$ are divisible by 49.

Let $\quad P(k) = 2^{3k} - 7k - 1 = 49I$

$P(k+1) = 2^{3k+3} - 7k - 8$
$= 8(49I + 7k + 1) - 7k - 8$
$= 49(8I) + 49k = 49\lambda$

[where $\lambda = 8I + k$, which is an integer]

2. We have, $\sum_{k=1}^{n} [k^3 - (k-1)^3]$

$= (1^3 - 0^3) + (2^3 - 1^3) + (3^3 - 2^3) + \ldots + [n^3 - (n-1)^3] = n^3$

$\therefore 1 + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + \ldots + (361 + 380 + 400)$

$= (1^3 - 0^3) + (2^3 - 1^3) + (3^3 - 2^3) + (4^3 - 3^3) + \ldots + (20^3 - 19^3)$

$= (20)^3 = 8000$

3. Let $P_1(n) = (n+1)^7 - n^7 - 1$

$= ({}^7C_0 n^7 + {}^7C_1 n^6 + \ldots + {}^7C_6\, n + 1) - n^7 - 1$

$= (n^7 + {}^7C_1 n^6 + \ldots + {}^7C_6\, n + 1) - n^7 - 1$

$= {}^7C_1 n^6 + \ldots + {}^7C_6 n$

$= 7n^6 + \frac{7(7-1)}{2} n^5 + \ldots + 7n$

which is divisible by 7.

Now, let $P_2(n) = (n)^7 - n$

for $n = 1$, $P_2(1) = 0$

which is divisible by 7.

For $n = k$, $P_2(k) = k^7 - k$

Let $P_2(k)$ be divisible by 7.

$\therefore \quad k^7 - k = 7\lambda \quad \ldots(i)$

For $\quad n = k+1$, $P_2(k+1) = (k+1)^7 - (k+1)$

$= (k^7 - k) + 7(k^6 + 3k^5 + \ldots + k)$

$= 7\lambda + 7(k^6 + 3k^5 + \ldots + k)$ [from Eq. (i)]

$\Rightarrow$ Divisible by 7.

4. Let $P(n) = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \ldots + \frac{1}{\sqrt{n}}$

$\therefore \quad P(2) = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}}$
$= 1.707 > \sqrt{2}$

Let us assume that

$P(k) = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \ldots + \frac{1}{\sqrt{k}} > \sqrt{k}$ is true, for $n = k+1$

$\text{LHS} = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \ldots + \frac{1}{\sqrt{k}} + \frac{1}{\sqrt{k+1}}$

$> \sqrt{k} + \frac{1}{\sqrt{k+1}} = \frac{\sqrt{k(k+1)} + 1}{\sqrt{(k+1)}}$

$> \frac{k+1}{\sqrt{k+1}} \quad [\because \sqrt{k(k+1)} > k, \forall\, k \ge 0]$

$= \sqrt{(k+1)}$

$\therefore \quad P(k+1) > \sqrt{k+1}$

By mathematical induction, Statement I is true, $\forall\ n \geq 2$.

Now, let $\quad \alpha(n) = \sqrt{n(n+1)}$

$\therefore \quad \alpha(2) = \sqrt{2(2+1)} = \sqrt{6} < 3$

Let us assume that

$$\alpha(k) = \sqrt{k(k+1)} < (k+1) \text{ is true.}$$

For $n = k + 1$

LHS $= \sqrt{(k+1)(k+2)} < (k+2) \qquad [\because (k+1) < (k+2)]$

$\therefore \quad \alpha(k+1) < (k+2)$

By mathematical induction, Statement II is true but Statement II is not a correct explanation for Statement I.

5. $A^2 = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$

$A^3 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix}$

$\vdots \qquad \vdots \qquad \vdots$

$A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix}$ can be verified by induction.

Now, taking options

(b) $nA + (n-1)I = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix} + \begin{bmatrix} n-1 & 0 \\ 0 & n-1 \end{bmatrix}$

$= \begin{bmatrix} 2n-1 & 0 \\ n & 2n-1 \end{bmatrix} \neq A^n$

(d) $nA - (n-1)I = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix} - \begin{bmatrix} n-1 & 0 \\ 0 & n-1 \end{bmatrix}$

$= \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} = A^n$

6. $1 + 3 + 5 + \ldots + (2k+1)$

$= [1 + 3 + 5 + \ldots + (2k-1)] + (2k+1)$

$= 3 + k^2 + 2k + 1 \qquad$ [given]

$= 3 + (k+1)^2$

$\therefore \quad S(k) \Rightarrow S(k+1)$

7. $t_n = n(n+1)(n+2)$

$= n(n^2 + 3n + 2)$

$= n^3 + 3n^2 + 2n$

$\therefore S_n = \Sigma n^3 + 3\Sigma n^2 + 2\Sigma n$

$= \dfrac{n^2(n+1)^2}{4} + \dfrac{3n(n+1)(2n+1)}{6} + \dfrac{2n(n+1)}{2}$

$= \left[\dfrac{n(n+1)}{4}\right][n(n+1) + 4n + 2 + 4]$

$= \dfrac{n(n+1)(n^2 + 5n + 6)}{4}$

$= \dfrac{n(n+1)(n+2)(n+3)}{4}$

8. Let $\quad P(n) = n^3 + 2n$

Now, $\quad P(1) = 1 + 2 = 3$

$P(2) = 8 + 4 = 12$

$P(3) = 27 + 6 = 33$

Clearly, we see that all these numbers are divisible by 3.

9. For $n = 1$, $10^n + 3 \cdot 4^{n+2} + 5 = 10 + 3 \cdot 4^3 + 5$

$= 207$, which is divisible by 9.

So, by induction, the result is divisible by 9.

10. Given, $A = \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Now, $A \times A = \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\times \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Arrange properly in a line

$= \begin{bmatrix} \cos^2\left(\frac{2\pi}{n}\right) - \sin^2\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right)\sin\left(\frac{2\pi}{n}\right) + \sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) - \sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & -\sin^2\left(\frac{2\pi}{n}\right) + \cos^2\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$= \begin{bmatrix} \cos\left(2 \times \frac{2\pi}{n}\right) & 2\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & 0 \\ -2\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & \cos\left(2 \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$= \begin{bmatrix} \cos\left(2 \times \frac{2\pi}{n}\right) & \sin\left(2 \times \frac{2\pi}{n}\right) & 0 \\ -\sin\left(2 \times \frac{2\pi}{n}\right) & \cos\left(2 \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Similarly,

$A^n = \begin{bmatrix} \cos\left(2^{n-1} \times \frac{2\pi}{n}\right) & \sin\left(2^{n-1} \times \frac{2\pi}{n}\right) & 0 \\ -\sin\left(2^{n-1} \times \frac{2\pi}{n}\right) & \cos\left(2^{n-1} \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$

$$\text{and } A^{n-1}=\begin{bmatrix}\cos\left(2^{n-2}\times\frac{2\pi}{n}\right) & \sin\left(2^{n-2}\times\frac{2\pi}{n}\right) & 0\\ -\sin\left(2^{n-2}\times\frac{2\pi}{n}\right) & \cos\left(2^{n-2}\times\frac{2\pi}{n}\right) & 0\\ 0 & 0 & 1\end{bmatrix}\neq I$$

11. $\dfrac{kn}{n+1}=\left[\dfrac{1}{2\cdot 4}+\dfrac{1}{4\cdot 6}+\dfrac{1}{6\cdot 8}+\dots n\text{ terms}\right]$

$$=\frac{1}{2}\left[\frac{4-2}{2\cdot 4}+\frac{6-4}{4\cdot 6}+\frac{8-6}{6\cdot 8}+\dots+\frac{2n+2-2n}{2n(2n+2)}\right]$$

$$=\frac{1}{2}\left[\frac{1}{2}-\frac{1}{4}+\frac{1}{4}-\frac{1}{6}+\frac{1}{6}-\frac{1}{8}+\dots+\frac{1}{2n}-\frac{1}{2n+2}\right]$$

$$=\frac{1}{2}\left[\frac{1}{2}-\frac{1}{2(n+1)}\right]$$

$$=\frac{n}{4(n+1)}\quad\Rightarrow\quad k=\frac{1}{4}$$

12. $2n-1$ is an odd positive integer.

$\Rightarrow$ $a^{2n-1}+b^{2n-1}$ is divisible by $a+b$.

13. Let $P(n):(1+x)^n\geq(1+nx)$

For $n=1$, $(1+x)^1=1+x=1+1\cdot x\geq 1+1\cdot x$

$\therefore\qquad (1+x)^1\geq 1+1\cdot x$

For $n=k$, let $P(k):(1+x)^k\geq(1+kx)$ is true.

For $n=k+1$, $P(k+1):(1+x)^{k+1}\geq\{1+(k+1)x\}$ is also true.

We will show $P(k+1)$ is true.

Consider $(1+x)^{k+1}=(1+x)^k\cdot(1+x)\geq(1+kx)(1+x)$ [if $x>-1$]

$=1+x+kx+kx^2\geq 1+x+kx\qquad [\because\ k>0 \text{ and } x>-1]$

$=1+(k+1)x$

Thus, $\quad(1+x)^{k+1}\geq 1+(k+1)x$, if $x>-1$

14. By taking option (d),

When $n=1$, then $1>\frac{1}{3}$ [true]

When $n=2$, then $5>\frac{8}{3}$, [true]

When $n=3$, then $14>9$, [true]

When $n=4$, then $30>\frac{64}{3}=21.33$, [true]

15. Given, $a_n=na_{n-1}$

$\Rightarrow\qquad a_2=2a_1=2\qquad[\because a_1=1]$

$a_3=3a_2=3(2)=6$

$a_4=4(a_3)=4(6)=24$

$\therefore\qquad a_5=5(a_4)=5(24)=120$

8

Binomial Theorem

Binomial Theorem for Positive Integral Index

If x and a are real numbers, then for all $n \in N$,

$$(x+a)^n = {}^nC_0 x^n a^0 + {}^nC_1 x^{n-1} a^1 + {}^nC_2 x^{n-2} a^2 + \ldots + {}^nC_r x^{n-r} a^r + \ldots + {}^nC_{n-1} x^1 a^{n-1} + {}^nC_n x^0 a^n$$

i.e. $$(x+a)^n = \sum_{r=0}^{n} {}^nC_r x^{n-r} a^r$$.

Example 1. $x^{10} + 10x^8 a + 40x^6 a^2 + 80x^4 a^3 + 80x^2 a^4 + 32a^5$ *is equal to*

(a) $(x^2 + a)^5$ *(b)* $(x+a)^{10}$ *(c)* $(x^2 + 2a)^5$ *(d)* $(x^2 - 2a)^5$

Sol. (c) Using binomial theorem, we have

$$(x^2 + 2a)^5 = {}^5C_0 (x^2)^5 (2a)^0 + {}^5C_1 (x^2)^4 (2a)^1 + {}^5C_2 (x^2)^3 (2a)^2 + {}^5C_3 (x^2)^2 (2a)^3 + {}^5C_4 (x^2)(2a)^4 + {}^5C_5 (x^2)^0 (2a)^5$$

$$= x^{10} + 5(x^8)(2a) + 10(x^6)(4a^2) + 10(x^4)(8a^3) + 5(x^2)(16a^4) + 32a^5$$

$$= x^{10} + 10x^8 a + 40x^6 a^2 + 80x^4 a^3 + 80x^2 a^4 + 32a^5$$

Properties of Binomial Expansion

i. The above expansion is also valid when x and a are complex numbers.

ii. We have, $(x+a)^n = \sum_{r=0}^{n} {}^nC_r x^{n-r} a^r$. Since, r can have values from 0 to n, the total number of terms in the expansion is $(n+1)$.

iii. The sum of the indices of x and a in each term is n.

e.g. $(2x+3y)^9 = \sum_{r=0}^{9} {}^9C_r (2x)^{9-r} (3y)^r$ and it has $(9+1)$ i.e. 10 terms.

Also, the sum of indices of $2x$ and $3y$ in each term is 9.

iv. Replacing a by $-a$, in the expansion of $(x+a)^n$, we get

$$(x-a)^n = {}^nC_0 x^n a^0 - {}^nC_1 x^{n-1} a^1 + {}^nC_2 x^{n-2} a^2 - {}^nC_3 x^{n-3} a^3 + \ldots + (-1)^r \; {}^nC_r x^{n-r} a^r + \ldots + (-1)^n \; {}^nC_n x^0 a^n$$

i.e. $$(x-a)^n = \sum_{r=0}^{n} (-1)^r \; {}^nC_r x^{n-r} a^r$$

Chapter Snapshot

v. Putting $x=1$ and $a=x$ in the expansion of $(x+a)^n$, we get

$$(1+x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + \ldots + {}^nC_rx^r + \ldots + {}^nC_nx^n$$

i.e. $(1+x)^n = \sum_{r=0}^{n} {}^nC_rx^r$

known as the expansion of $(1+x)^n$ in ascending powers of x.

vi. Putting $a=1$ in the expansion of $(x+a)^n$, we get

$$(x+1)^n = {}^nC_0x^n + {}^nC_1x^{n-1} + {}^nC_2x^{n-2} + \ldots + {}^nC_rx^{n-r} + \ldots + {}^nC_{n-1}x + {}^nC_n$$

i.e. $(x+1)^n = \sum_{r=0}^{n} {}^nC_rx^{n-r}$

known as the expansion of $(x+1)^n$ in descending powers of x.

vii. Putting $x=1$ and $a=-x$ in the expansion of $(x+a)^n$, we get

$$(1-x)^n = {}^nC_0 - {}^nC_1x + {}^nC_2x^2 - {}^nC_3x^3 + \ldots + (-1)^r\ {}^nC_r\ x^r + \ldots + (-1)^n\ {}^nC_nx^n$$

i.e. $(1-x)^n = \sum_{r=0}^{n}(-1)^r\ {}^nC_r\ x^r$

Example 2. *Expand $(2x-3y)^4$ by binomial theorem.*

Sol. Using binomial theorem, we have

$$(2x-3y)^4 = \{2x+(-3y)\}^4 = \sum_{r=0}^{4}(-1)^r\ {}^4C_r(2x)^{4-r}(3y)^r$$

$$= {}^4C_0(2x)^4(3y)^0 - {}^4C_1(2x)^3(3y)^1 + {}^4C_2(2x)^2(3y)^2 - {}^4C_3(2x)(3y)^3 + {}^4C_4(2x)^0(3y)^4$$

$$= 16x^4 - 4(8x^3)(3y) + 6(4x^2)(9y^2) - 4(2x)(27y^3) + 81y^4$$

$$= 16x^4 - 96x^3y + 216x^2y^2 - 216xy^3 + 81y^4$$

viii. We have,

$$(x+a)^n + (x-a)^n = 2[{}^nC_0x^na^0 + {}^nC_2x^{n-2}a^2 + \ldots]$$

and $(x+a)^n - (x-a)^n = 2[{}^nC_1x^{n-1}a^1 + {}^nC_3x^{n-3}a^3 + \ldots]$

ix. If n is odd, then $\{(x+a)^n + (x-a)^n\}$ and $\{(x+a)^n - (x-a)^n\}$ both have the same number of terms equal to $\left(\frac{n+1}{2}\right)$ whereas, if n is even, then $\{(x+a)^n + (x-a)^n\}$ has $\left(\frac{n}{2}+1\right)$ terms and $\{(x+a)^n - (x-a)^n\}$ has $\left(\frac{n}{2}\right)$ terms.

Example 3. *The number of terms in the expansion of $(1+5\sqrt{2}x)^9 + (1-5\sqrt{2}x)^9$ are*

(a) 3 (b) 6
(c) 5 (d) None of these

Sol. (c) Since, here $n=9$ is odd, therefore the expansion of $(1+5\sqrt{2}x)^9 + (1-5\sqrt{2}x)^9$ has $\left(\frac{9+1}{2}\right) = 5$ terms.

Example 4. *Using binomial theorem, expand $\{(x+y)^5 + (x-y)^5\}$ and hence find the value of $\{(\sqrt{2}+1)^5 + (\sqrt{2}-1)^5\}$.*

Sol. We have,

$$(x+y)^5 + (x-y)^5 = 2[{}^5C_0x^5 + {}^5C_2x^3y^2 + {}^5C_4x^1y^4]$$
$$= 2(x^5 + 10x^3y^2 + 5xy^4)$$

Putting $x=\sqrt{2}$ and $y=1$, we get

$$(\sqrt{2}+1)^5 + (\sqrt{2}-1)^5 = 2\{(\sqrt{2})^5 + 10(\sqrt{2})^3 + 5\sqrt{2}\}$$
$$= 2(4\sqrt{2} + 20\sqrt{2} + 5\sqrt{2}) = 58\sqrt{2}$$

x. We have,

$$(x+a)^n = {}^nC_0x^na^0 + {}^nC_1x^{n-1}a^1 + {}^nC_2x^{n-2}a^2 + \ldots + {}^nC_rx^{n-r}a^r + \ldots + {}^nC_nx^0a^n$$

Here, $(r+1)$th term is given by ${}^nC_rx^{n-r}a^r$.

If T_{r+1} denotes the $(r+1)$th term, then

$$T_{r+1} = {}^nC_r\ x^{n-r}a^r$$

This is called the general term, because by giving different values to r we can determine all terms of the expansion.

Also, the general term can be expressed as $\frac{n!}{r!s!}x^sa^r$, where $r+s=n$.

xi. In the binomial expansion of $(x-a)^n$, the general term is given by

$$T_{r+1} = (-1)^r\ {}^nC_rx^{n-r}a^r$$

xii. In the binomial expansion of $(1+x)^n$, we have

$$T_{r+1} = {}^nC_rx^r$$

xiii. In the binomial expansion of $(1-x)^n$, we have

$$T_{r+1} = (-1)^r\ {}^nC_rx^r$$

To find the terms free from radicals or rational indicies in the expansion of $(a^{1/p}+b^{1/q})^n$, where a and b are prime numbers, first find the general term $T_{r+1} = {}^NC_r(a^{1/p})^{N-r}(b^{1/q})^r = {}^NC_ra^{\frac{N-r}{p}}b^{\frac{r}{q}}$, then put the values of r, where $0 \le r \le N$, for which indicies of a and b become integers.

Example 5. *If the rth term in the expansion of $\left(\frac{x}{3}-\frac{2}{x^2}\right)^{10}$ contains x^4, then r is equal to*

(a) 2 (b) 1 (c) 3 (d) 5

Sol. (c) Clearly, the general term in the binomial expansion of $\left(\frac{x}{3}-\frac{2}{x^2}\right)^{10}$ is given by

$$T_{r+1} = {}^{10}C_r\left(\frac{x}{3}\right)^{10-r}\left(\frac{-2}{x^2}\right)^r$$
$$= {}^{10}C_r\left(\frac{1}{3}\right)^{10-r}(-2)^r x^{10-r-2r}$$
$$= {}^{10}C_r\left(\frac{1}{3}\right)^{10-r}(-2)^r x^{10-3r}$$

Now, replace r by $r-1$, we get the rth term i.e.

$$T_r = {}^{10}C_{r-1}\left(\frac{1}{3}\right)^{11-r}(-2)^{r-1}x^{13-3r}$$

Since, the rth term contains the x^4, therefore we have

$$13-3r=4$$
$$\Rightarrow \quad 3r = 9 \quad \Rightarrow \quad r = 3$$

Example 6. *The number of integral terms in the expansion of* $\left(5^{\frac{1}{2}}+7^{\frac{1}{6}}\right)^{642}$ *is*

(a) 106 *(b)* 108
(c) 103 *(d)* 109

Sol. (b) Clearly, the general term in binomial expansion of $\left(5^{\frac{1}{2}}+7^{\frac{1}{6}}\right)^{642}$ is given by

$$T_{r+1} = {}^{642}C_r\left(5^{\frac{1}{2}}\right)^{642-r}\left(7^{\frac{1}{6}}\right)^r$$

Obviously, r should be a multiple of 6.

Total numbers $=\frac{642}{6}=107$, but first term for $r=0$ is also integral. Hence, total terms are $107+1=108$

xiv. The coefficient of x^k in the expansion of $(x+a)^n$ can be obtained by equating the power of x in the general term to k. This will give value of r and on substituting this value in general term we can find the coefficient of x^k.

If r is not a positive integer, then there will be no term containing x^k and hence coefficient of x^k will be zero.

xv. The coefficient of $(r+1)$th term in the expansion of $(1+x)^n$ is ${}^nC_r$.

xvi. The coefficient of x^r in the expansion of $(1+x)^n$ is ${}^nC_r$.

Example 7. *The coefficient of* x^{11} *in the expansion of* $\left(x^3-\frac{2}{x^2}\right)^{12}$ *is*

(a) -25344 *(b)* 25344
(c) 23544 *(d)* -23544

Sol. (a) Let the general term i.e. $(r+1)$th contains x^{11}.

We have, $T_{r+1} = {}^{12}C_r(x^3)^{12-r}\left(\frac{-2}{x^2}\right)^r$

$$= {}^{12}C_r x^{36-3r-2r}(-1)^r 2^r$$
$$= {}^{12}C_r(-1)^r 2^r x^{36-5r} \quad \ldots(i)$$

to find the coefficient of x^{11}, put $36-5r=11$

$$\Rightarrow \quad 5r = 25 \quad \Rightarrow \quad r=5$$

On substituting the value of r in Eq. (i), we get

$$T_6 = {}^{12}C_5(-1)^5 2^5 x^{11}$$

Thus, the coefficient of x^{11} is

$${}^{12}C_5(-1)^5 2^5 = \frac{-12\times11\times10\times9\times8}{5\times4\times3\times2}\times32$$
$$= -25344$$

Example 8. *The coefficient of* x^p *and* x^q *(p and q are positive integers) in the expansion of* $(1+x)^{p+q}$ *are*

(a) equal
(b) equal with opposite signs
(c) reciprocal of each other
(d) None of the above

Sol. (a) Coefficient of x^p and x^q in the expansion of $(1+x)^{p+q}$ are ${}^{p+q}C_p$ and ${}^{p+q}C_q$

and $\quad {}^{p+q}C_p = {}^{p+q}C_q = \frac{(p+q)!}{p!\,q!}$

xvii. Independent term or constant term of a binomial expansion is the term in which exponent of the variable is zero. i.e. the coefficient of x^0.

Example 9. *The ratio of the coefficient of* x^{15} *to the term independent of x in* $\left(x^2+\frac{2}{x}\right)^{15}$ *is*

(a) 12 : 32 *(b)* 1 : 32
(c) 32 : 12 *(d)* 32 : 1

Sol. (b) Clearly, the general term in the expansion of $\left(x^2+\frac{2}{x}\right)^{15}$ is given by

$$T_{r+1} = {}^{15}C_r(x^2)^{15-r}\left(\frac{2}{x}\right)^r$$
$$= {}^{15}C_r(2)^r x^{30-3r} \quad \ldots(i)$$

Now, for the coefficient of term containing x^{15},

$$30-3r=15, \text{ i.e. } r=5$$

Therefore, ${}^{15}C_5(2)^5$ is the coefficient of x^{15} [from Eq.(i)]

Now, to find the term independent of x, put $30-3r=0$

Thus, ${}^{15}C_{10}2^{10}$ is the term independent of x [from Eq.(i)]

Now, the ratio is $\frac{{}^{15}C_5 2^5}{{}^{15}C_{10}2^{10}} = \frac{1}{2^5} = \frac{1}{32}$

xviii. In the binomial expansion of $(x+a)^n$, the rth term from the end is $(n-r+2)$th term from the beginning.

Example 10. *The 4th term from the end in the expansion of* $\left(\frac{x^3}{2}-\frac{2}{x^2}\right)^9$ *is*

(a) $\frac{670}{x^3}$ (b) $\frac{671}{x^3}$

(c) $\frac{672}{x^3}$ (d) None of these

Sol. (c) Clearly, the 4th term from the end is 9 – 4 + 2 i.e. 7th term from the beginning, which is given by

$$T_7 = {}^9C_6\left(\frac{x^3}{2}\right)^3\left(\frac{-2}{x^2}\right)^6 = {}^9C_3\,\frac{x^9}{8}\cdot\frac{64}{x^{12}}$$
$$= \frac{9\times 8\times 7}{3\times 2\times 1}\times\frac{64}{x^3} = \frac{672}{x^3}$$

xix. **Middle term in a binomial expansion** If n is an even natural number, then in the binomial expansion of $(x+a)^n$, $\left(\frac{n}{2}+1\right)$th term is the middle term.

xx. If n is odd natural number, then $\left(\frac{n+1}{2}\right)$th and $\left(\frac{n+3}{2}\right)$th are the middle terms in the binomial expansion of $(x+a)^n$.

When there are two middle terms in the expansion, then their binomial coefficients are equal.

Example 11. *The middle term (terms) in the expansion of* $\left(\frac{p}{x}+\frac{x}{p}\right)^9$ *is/are*

(a) $\frac{126p}{x}$ (b) $\frac{126x}{p}$ (c) $\frac{125p}{x}$ (d) $\frac{125x}{p}$

Sol. (a, b) Since, the power of binomial is odd, therefore we have two middle terms which are 5th and 6th terms. These are given by

$$T_5 = {}^9C_4\left(\frac{p}{x}\right)^5\left(\frac{x}{p}\right)^4 = {}^9C_4\,\frac{p}{x} = \frac{126p}{x}$$

and $$T_6 = {}^9C_5\left(\frac{p}{x}\right)^4\left(\frac{x}{p}\right)^5 = {}^9C_5\,\frac{x}{p} = \frac{126x}{p}$$

Multinomial Theorem

i. We know,

$$(x+a)^n = \sum_{r=0}^{n} {}^nC_r x^{n-r}a^r,\ n\in N$$
$$= \sum_{r=0}^{n}\frac{n!}{(n-r)!\,r!}x^{n-r}a^r$$
$$= \sum_{r+s=n}\frac{n!}{r!\,s!}x^s a^r,\ \text{where } s=n-r$$

Some another form of binomial expansion

ii. $$(x+y+z)^n = \sum_{r+s+t=n}\frac{n!}{r!\,s!\,t!}x^r y^s z^t$$

The above expansion has ${}^{n+3-1}C_{3-1}$ $= {}^{n+2}C_2$ terms

iii. $$(x+y+z+u)^n = \sum_{p+q+r+s=n}\frac{n!}{p!\,q!\,r!\,s!}x^p y^q z^r u^s$$

There are ${}^{n+4-1}C_{4-1} = {}^{n+3}C_3$ terms in the above expansion.

Above result can be generalized in the following form (known as multinomial theorem)

$$(x_1+x_2+\ldots+x_k)^n = \sum_{r_1+r_2+\ldots+r_k=n}\frac{n!}{r_1!\,r_2!\ldots r_k!}x_1^{r_1}x_2^{r_2}\ldots x_k^{r_k}$$

The general term in the above expansion is

$$\frac{n!}{r_1!\,r_2!\,r_3!\ldots r_k!}x_1^{r_1}x_2^{r_2}x_3^{r_3}\ldots x_k^{r_k}$$

The number of terms in the above expansion is equal to the number of non-negative integral solution of the equation $r_1+r_2+\ldots+r_k=n$, because each solution of this equation gives a term in the above expansion. The number of such solutions is ${}^{n+k-1}C_{k-1}$.

The coefficient of $x_1^{n_1}\cdot x_2^{n_2}\ldots x_m^{n_m}$ *in the expansion of* $(x_1+x_2+\ldots+x_m)^n$ *is* $\frac{n!}{n_1!\,n_2!\,n_3!\ldots n_m!}$

Example 12. *The number of distinct terms in the expansion of* $(x+y-z)^{16}$ *is*

(a) 136 (b) 153 (c) 16 (d) 17

Sol. (b) $(x+y-z)^{16} = {}^{16}C_0x^{16} + {}^{16}C_1x^{15}(y-z)+\ldots$
$+ {}^{16}C_rx^{16-r}(y-z)^r + \ldots + {}^{16}C_{16}(y-z)^{16}$

Clearly, all the terms are distinct.

∴ The number of distinct terms

$$= 1+2+3+\ldots+17$$
$$= \frac{17\times 18}{2} = 153$$

Aliter

Number of terms in $(x_1+x_2+\ldots+x_m)^n$
$= {}^{n+m-1}C_{m-1}$

∴ Number of terms in $(x+y-z)^{16}$

$$= {}^{16+3-1}C_{3-1} = {}^{18}C_2 = \frac{18\times 17}{2} = 153$$

Example 13. *The coefficient of* $a^8b^6c^4$ *in the expansion of* $(a+b+c)^{18}$ *is*

(a) ${}^{18}C_{14}\cdot{}^{14}C_8$ (b) ${}^{18}C_{14}$

(c) ${}^{12}C_8$ (d) None of these

Sol. (a) In $(a+b+c)^{18}$, general term is given by

$$\frac{(18)!}{(r_1)!(r_2)!(r_3)!}(a)^{r_1}(b)^{r_2}(c)^{r_3} \quad \ldots(i)$$

$\therefore$ Coefficient of $a^8b^6c^4$ is obtained by putting

$r_1 = 8, r_2 = 6, r_3 = 4$ in Eq.(i)

i.e. $\frac{(18)!}{8!\cdot 6!\cdot 4!}a^8b^6c^4$

Thus, required coefficient $= \frac{(18)!}{8!\cdot 6!\cdot 4!} \times \frac{14!}{14!} = {}^{18}C_{14} \times {}^{14}C_8$

Example 14. *The coefficient of $x^3y^4z^2$ in the expansion of $(2x-3y+4z)^9$ is*

(a) 12063600 *(b)* 13063680
(c) 11063600 *(d) None of these*

Sol. (b) The general term in the expansion of $(2x-3y+4z)^9$

$$= \frac{9!}{\alpha_1!\,\alpha_2!\,\alpha_3!}\cdot(2x)^{\alpha_1}(-3y)^{\alpha_2}(4z)^{\alpha_3}$$

$$= \frac{9!}{\alpha_1!\,\alpha_2!\,\alpha_3!}\cdot 2^{\alpha_1}(-3)^{\alpha_2}\,4^{\alpha_3}\cdot x^{\alpha_1}y^{\alpha_2}z^{\alpha_3}$$

$\therefore$ Coefficient of $x^3y^4z^2$

$$= \frac{9!}{3!4!2!}\cdot 2^3(-3)^4\cdot 4^2 \quad [\text{taking } \alpha_1 = 3, \alpha_2 = 4, \alpha_3 = 2]$$

$= 1260 \times 10368 = 13063680$

Example 15. *The coefficient of x^3 in the expansion of $(1-x+x^2)^5$ is*

(a) 10 *(b)* 8 *(c)* -50 *(d)* -30

Sol. (d) $(1-x+x^2)^5 = \{1+x(x-1)\}^5$

$= {}^5C_0 + {}^5C_1x(x-1) + {}^5C_2x^2(x-1)^2 + {}^5C_3x^3(x-1)^3 + \ldots$

$\therefore$ The coefficient of $x^3 = -2\cdot{}^5C_2 - {}^5C_3 = -30$

Aliter

General term of $(1-x+x^2)^5$ is

$$\frac{5!}{(r_1)!\,(r_2)!\,(r_3)!}(1)^{r_1}(-x)^{r_2}(x^2)^{r_3} \quad \ldots(i)$$

$\therefore$ For coefficient of x^3, $r_2 + 2r_3 = 3$

where $r_1 + r_2 + r_3 = 5$

Let $r_3 = 0$, then $r_2 = 3$ and $r_1 = 2$

$r_3 = 1$, then $r_2 = 1$ and $r_1 = 3$

If $r_3 = 2, 3, 4, 5$, then r_2 is not possible as negative.

$\therefore$ Only two terms contains x^5 i.e.

$(r_1 = 2, r_2 = 3, r_3 = 0)$ and $(r_1 = 3, r_2 = 1, r_3 = 1)$

Thus, from Eq.(i),

$$= \frac{5!}{2!3!0!}(-1)^3 + \frac{5!}{3!1!1!}(-1)^1 = -10-20 = -30$$

Example 16. *The total number of terms in the expansion of $(a+b+c+d)^n$, $n \in N$ is*

(a) $\frac{n(n+1)(n+2)}{6}$ *(b)* $\frac{n(n+1)(n+2)(n+3)}{6}$

(c) $\frac{(n+1)(n+2)(n+3)}{6}$ *(d) None of these*

Sol. (c) The number of terms in the expansion of $(a+b+c+d)^n$

$$= {}^{n+4-1}C_{4-1} = {}^{n+3}C_3 = \frac{(n+1)(n+2)(n+3)}{6}$$

Work Book Exercise 8.1

1 If the second, third and fourth terms in the expansion of $(x+y)^n$ are 135, 30 and 10/3 respectively, then

a $n = 7$ **b** $n = 5$
c $n = 6$ **d** None of these

2 The total number of dissimilar terms in the expansion of $(x_1 + x_2 + \ldots + x_n)^3$ is

a n^3 **b** $\frac{n^3+3n^2}{4}$
c $\frac{n(n+1)(n+2)}{6}$ **d** $\frac{n^2(n+1)^2}{4}$

3 If the coefficients of rth and $(r+1)$th term in the expansion of $(3+7x)^{29}$ are equal, then r equals

a 15 **b** 21 **c** 14 **d** 25

4 If $(1+2x+3x^2)^{10} = a_0 + a_1x + a_2x^2 + \ldots + a_{20}x^{20}$, then a_1 equals

a 10 **b** 20 **c** 210 **d** 110

5 The number of terms which are free from radical signs in the expansion of $(y^{1/5} + x^{1/10})^{55}$ is

a 5 **b** 6 **c** 7 **d** 4

6 The coefficient of x^6 in the expansion of $(1+x^2-x^3)^8$ is

a 80 **b** 84 **c** 88 **d** 92

7 The coefficient of x^5 in the expansion of $(1+x)^{21} + (1+x)^{22} + \ldots + (1+x)^{30}$ is

a ${}^{51}C_5$ **b** ${}^9C_5$
c ${}^{31}C_6 - {}^{21}C_6$ **d** ${}^{30}C_5 + {}^{20}C_5$

8 If the nineth term in the expansion of

$$[3^{\log_3\sqrt{25^{x-1}+7}} + 3^{-1/8\log_3(5^{x-1}+1)}]^{10}$$

is equal to 180 and $x > 1$, then x equals

a $\log_{10}15$ **b** $\log_5 15$
c $\log_e 15$ **d** None of these

9 The expression

$$\frac{1}{\sqrt{4x+1}}\left\{\left(\frac{1+\sqrt{4x+1}}{2}\right)^7 - \left(\frac{1-\sqrt{4x+1}}{2}\right)^7\right\}$$

is a polynomial in x of degree

a 7 **b** 5
c 4 **d** 3

10 If $\frac{1}{\sqrt{4x+1}}\left\{\left(\frac{1+\sqrt{4x+1}}{2}\right)^n - \left(\frac{1-\sqrt{4x+1}}{2}\right)^n\right\}$

$= a_0 + a_1x + \ldots + a_5x^5$, then n is equal to

a 11 **b** 9
c 10 **d** 8

Greatest Coefficient

In the binomial expansion of $(x+a)^n$, the coefficient ${}^nC_0, {}^nC_1, {}^nC_2, \ldots, {}^nC_n$ are known as the binomial coefficients.

For given value of n,

(a) If n is even, then greatest coefficient $= {}^nC_{n/2}$

(b) If n is odd, then greatest coefficient are

$${}^nC_{\frac{n-1}{2}} \text{ and } {}^nC_{\frac{n+1}{2}}.$$

- *Binomial coefficient of middle term is the greatest binomial coefficient.*
- *The greatest coefficient in the expansion of* $(x_1+x_2+\ldots+x_m)^n$ *is* $\dfrac{n!}{(q!)^{m-r}[(q+1)!]^r}$, *where q and r are the quotient and remainder respectively when n is divided by m.*

Example 17. *Find the value of r for which* ${}^{200}C_r$ *is the greatest.*

Sol. Coefficient of terms in the expansion of $(x+y)^{200}$ are ${}^{200}C_0, {}^{200}C_1, {}^{200}C_2, \ldots, {}^{200}C_{200}$.

Since, middle term has greatest coefficient.

$\therefore$ Greatest coefficient = Coefficient of middle term

= Coefficient of 101st term $= {}^{200}C_{100}$

Hence, ${}^{200}C_r$ is the greatest, when $r = 100$

Example 18. *The greatest coefficient in the expansion of* $(x+y+z+w)^{15}$ *is*

(a) $\dfrac{15!}{3!(4!)^3}$ (b) $\dfrac{15!}{(3!)^3 4!}$

(c) $\dfrac{15!}{2!(4!)^2}$ (d) None of these

Sol. (a) The greatest coefficient is

$$= \frac{n!}{(q!)^{k-r}[(q+1)!]^r} \quad [\text{here, } n=15, q=3, r=3, k=4]$$

$$= \frac{15!}{(3!)^{4-3}[(3+1)!]^3} = \frac{15!}{3!(4!)^3}$$

Greatest Term

Let T_{r+1} and T_r be $(r+1)$th and rth terms, respectively in the expansion of $(x+a)^n$. Then,

$$T_{r+1} = {}^nC_r x^{n-r} a^r \text{ and } T_r = {}^nC_{r-1} x^{n-r+1} a^{r-1}$$

$$\therefore \quad \frac{T_{r+1}}{T_r} = \frac{{}^nC_r x^{n-r} a^r}{{}^nC_{r-1} x^{n-r+1} a^{r-1}}$$

$$= \frac{n!}{(n-r)!\,r!} \times \frac{(r-1)!(n-r+1)!}{n!} \cdot \frac{a}{x}$$

$$= \frac{n-r+1}{r} \cdot \frac{a}{x}$$

Now, $T_{r+1} >=< T_r \Rightarrow \dfrac{T_{r+1}}{T_r} >=< 1$

$$\Rightarrow \frac{n-r+1}{r} \cdot \frac{a}{x} >=< 1$$

$$\Rightarrow \left\{\left(\frac{n+1}{r}\right) - 1\right\} \frac{a}{x} >=< 1$$

$$\Rightarrow \frac{n+1}{r} - 1 >=< \frac{x}{a} \Rightarrow \frac{n+1}{r} >=< \left(1 + \frac{x}{a}\right)$$

$$\Rightarrow \frac{n+1}{1+\frac{x}{a}} >=< r \Rightarrow r >=< \left(\frac{n+1}{1+\frac{x}{a}}\right)$$

Thus, $T_{r+1} >=< T_r$ according as

$$r >=< \left(\frac{n+1}{1+\left|\frac{x}{a}\right|}\right) \quad \ldots\text{(i)}$$

Now, two cases arise.

***Case* I** When $\dfrac{n+1}{1+\frac{x}{a}}$ is an integer.

Let $\dfrac{n+1}{1+\frac{x}{a}} = m$. Then, from Eq. (i), we have

mth and $(m+1)$th terms are greatest terms.

***Case* II** When $\dfrac{n+1}{1+\frac{x}{a}}$ is not an integer.

Let m be the integral part of $\dfrac{n+1}{1+\frac{x}{a}}$. Then, from Eq. (i), we have $(m+1)$th term is the greatest term.

Above discussion suggests the following algorithm to find the greatest term in a binomial expansion.

Algorithm

***Step* I** Write T_{r+1} and T_r from the given expansion.

***Step* II** Find $\dfrac{T_{r+1}}{T_r}$

***Step* III** Put $\dfrac{T_{r+1}}{T_r} > 1$

***Step* IV** Solve the inequality in step III for r to get an inequality of the form $r < m$ or $r > m$.

If m is an integer, then mth and $(m+1)$th terms are equal in magnitude and these two are the greatest terms. If m is not an integer, then obtain the integral part of m, say k. In this case, $(k+1)$th term is the greatest term.

Shortcut Method

To find the greatest term (numerically) in the expansion of $(1+x)^n$.

(a) Calculate $\dfrac{|x|(n+1)}{|x|+1}$.

(b) If m is integer, then T_m and T_{m+1} are equal and both are greatest term.

(c) If m is not integer, there $T_{[m]+1}$ is the greatest term, where [ ] denotes the greatest integral part.

To find greatest term in $(x+y)^n$, express $(x+y)^n = x^n\left(1+\dfrac{y}{x}\right)^n$.

Then, find the greatest term in $\left(1+\dfrac{y}{x}\right)^n$.

Example 19. *The greatest term (numerically) in the expansion of $(3-5x)^{15}$, when $x=\dfrac{1}{5}$ is*

(a) ${}^{15}C_3 \times 3^{10}$ (b) ${}^{15}C_3 \times 3^{11}$
(c) ${}^{15}C_3 \times 3^{12}$ (d) None of these

Sol. (c) Let T_{r+1} and T_r denote the $(r+1)$th and rth terms respectively. Then,

$T_{r+1} = {}^{15}C_r 3^{15-r}(-5x)^r$ and $T_r = {}^{15}C_{r-1}3^{15-r+1}(-5x)^{r-1}$

$$\Rightarrow \frac{T_{r+1}}{T_r} = \frac{{}^{15}C_r 3^{15-r}(-5x)^r}{{}^{15}C_{r-1}3^{16-r}(-5x)^{r-1}}$$

$$\Rightarrow \frac{T_{r+1}}{T_r} = \frac{15-r+1}{r}\left(\frac{-5x}{3}\right)$$

$$\Rightarrow \frac{T_{r+1}}{T_r} = \frac{16-r}{r}\times\left(-\frac{5}{3}\times\frac{1}{3}\right), \text{ when } x=\frac{1}{5}$$

$$\Rightarrow \frac{T_{r+1}}{T_r} = \frac{16-r}{r}\times\frac{1}{3}, \text{ numerically}$$

[neglecting minus sign]

Now,
$$\frac{T_{r+1}}{T_r} > 1 \text{ (numerically)}$$
$$\Rightarrow \frac{16-r}{r}\times\frac{1}{3} > 1$$
$$\Rightarrow 16 > 4r$$
$$\Rightarrow r < 4$$

Since, 4 is an integer. Therefore, 4th and 5th terms are numerically greatest terms.

Now, $T_4 = T_{3+1} = {}^{15}C_3 3^{15-3}(-5x)^3$

$\Rightarrow T_4 = {}^{15}C_3 \times 3^{12}\left(-5\times\dfrac{1}{5}\right)^3$, when $x=\dfrac{1}{5}$

$\Rightarrow T_4 = {}^{15}C_3 \times 3^{12}$ (numerically)

and $T_5 = T_{4+1} = {}^{15}C_4 3^{15-4}(-5x)^4$

$= {}^{15}C_4 3^{11}\left(-5\times\dfrac{1}{5}\right)^4$, when $x=\dfrac{1}{5}$

$= {}^{15}C_4 \times 3^{11}$ (numerically)

$= {}^{15}C_3 \times 3^{12}$

From above, we see that the values of both greatest terms are equal.

Example 20. *The greatest term (numerically) in the expansion of $(2+3x)^9$, when $x=\dfrac{3}{2}$, is*

(a) $\dfrac{5\times 3^{11}}{2}$ (b) $\dfrac{5\times 3^{13}}{2}$
(c) $\dfrac{7\times 3^{13}}{2}$ (d) None of these

Sol. (c) We have,

$$(2+3x)^9 = 2^9\left(1+\frac{3x}{2}\right)^9 = 2^9\left(1+\frac{9}{4}\right)^9 \qquad \left[\because x=\frac{3}{2}\right]$$

$$\therefore \quad r = \left|\frac{x(n+1)}{(x+1)}\right| \qquad \left[\because -\frac{1}{3}<0\right]$$

$$= \left|\frac{\left(\frac{9}{4}\right)(9+1)}{\left(\frac{9}{4}\right)+1}\right| = \frac{90}{13} = 6\frac{12}{13} \neq \text{Integer}$$

The greatest term in the expansion is $T_{[r]+1} = T_{6+1} = T_7$

Hence, the greatest term $= 2^9 \cdot T_7$

$$= 2^9\cdot T_{6+1} = 2^9\cdot {}^9C_6\left(\frac{9}{4}\right)^6 = 2^9\cdot {}^9C_3\left(\frac{9}{4}\right)^6$$

$$= 2^9\cdot\frac{9\cdot 8\cdot 7}{1\cdot 2\cdot 3}\cdot\frac{3^{12}}{2^{12}} = \frac{7\times 3^{13}}{2}$$

R-f Factor Relation

To find the integral and fractional parts of an irrational number of the form $(a+b\sqrt{c})^n$, where a, b, c and n are natural number, follow the following algorithm.

Algorithm

***Step* I** Write the given expression equal to $I+f$, where I is its integral part and f is the fractional part.

***Step* II** Define G by replacing '+' sign in the given expression by '–'. Note that G always lies between 0 and 1.

***Step* III** Either add G to the expression in step I or subtract G from the expression in step I so that RHS is an integer.

***Step* IV** If G is added to the expression in step I, then $G+f$ will always come out to be equal to 1 i.e. $G=1-f$. If G is subtracted from the expression in step I, then G will always come out to be equal to f.

***Step* V** Obtain the value of the desired expression after getting f in terms of G.

Example 21. *Integral part of $(2+\sqrt{5})^{2n+1}$ is $(n\in N)$*

(a) an even number
(b) an odd number
(c) an even or an odd number depending upon the value of n
(d) None of the above

Sol. (a) Here, $\forall\ n \in N$, $(2+\sqrt{5})^{2n+1} \notin N$

$\therefore$ We denote $(2+\sqrt{5})^{2n+1}$ by $I + f$

where I is an integer and $f \in R$ such that $0 < f < 1$

$\because$ $0 < (\sqrt{5}-2) < 1$

$\therefore$ We denote $(\sqrt{5}-2)^{2n+1}$ by G

where $G \in R$ such that $0 < G < 1$

Now, $I + f = (\sqrt{5}+2)^{2n+1}$

$$= (\sqrt{5})^{2n+1} + {}^{2n+1}C_1(\sqrt{5})^{2n}\cdot 2 + {}^{2n+1}C_2(\sqrt{5})^{2n-1}\cdot 2^2 + \dots \quad \dots(i)$$

$$G = (\sqrt{5}-2)^{2n+1} = (\sqrt{5})^{2n+1} - {}^{2n+1}C_1(\sqrt{5})^{2n}\cdot 2 + {}^{2n+1}C_2(\sqrt{5})^{2n-1}\cdot 2^2 - \dots \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$I + f - G = 2[{}^{2n+1}C_1(5)^n\cdot 2 + {}^{2n+1}C_3(5)^{n-1}\cdot 2^3 + \dots]$$

$= 2k$, where k is an integer.

$\because I$ is an integer.

$\therefore$ $f - G = 2k - I$ is an integer. $\dots$(iii)

Now, $0 < f < 1$ and $0 < G < 1$ $\Rightarrow$ $0 < f < 1$, $-1 < -G < 0$, $\overline{-1 < f - g < 1}$ $\dots$(iv)

From Eqs. (iii) and (iv), $f - G = 0$

Now, from Eq. (iii), $I = 2k - (f - G) = 2k - 0 = 2k$

Example 22. *The integral part of* $(\sqrt{2}+1)^6$ *is*

(a) 198 (b) 196
(c) 197 (d) 199

Sol. (c) Let $(\sqrt{2}+1)^6 = I + f$, where $I \in N$ and $0 < f < 1$.

Clearly, I is the greatest integer less than or equal to $(\sqrt{2}+1)^6$.

Let $G = (\sqrt{2}-1)^6$. Then,

$$I + f + G = (\sqrt{2}+1)^6 + (\sqrt{2}-1)^6$$

$\Rightarrow$ $I + f + G = 2\{{}^6C_0(\sqrt{2})^6 + {}^6C_2(\sqrt{2})^{6-2} + \dots\}$

$\Rightarrow$ $I + f + G =$ An even integer

$\Rightarrow$ $f + G = 1$

Again, $I + f + G$

$= 2\{{}^6C_0(\sqrt{2})^6 + {}^6C_2(\sqrt{2})^{6-2} + {}^6C_4(\sqrt{2})^{6-4} + {}^6C_6(\sqrt{2})^{6-6}\}$

$\Rightarrow$ $I + 1 = 2(8 + 15\times 4 + 15\times 2 + 1)$ $[\because f + G = 1]$

$\Rightarrow$ $I = 197$

Divisibility Problems

From the expansion,

$$(1+\alpha)^n = 1 + {}^nC_1\alpha + {}^nC_2\alpha^2 + \dots + {}^nC_n\alpha^n$$

We can conclude that

i. $(1+\alpha)^n - 1 = {}^nC_1\alpha + {}^nC_2\alpha^2 + \dots + {}^nC_n\alpha^n$ is divisible by α i.e. it is a multiple of α.
In short, we can write that $(1+\alpha)^n - 1 = M(\alpha)$

ii. $(1+\alpha)^n - 1 - n\alpha = {}^nC_2\alpha^2 + {}^nC_3\alpha^3 + \dots + {}^nC_n\alpha^n = M(\alpha^2)$

iii. $(1+\alpha)^n - 1 - n\alpha - \dfrac{n(n-1)}{2}\alpha^2 = {}^nC_3\alpha^3 + {}^nC_4\alpha^4 + \dots + {}^nC_n\alpha^n = M(\alpha^3)$

e.g. (i) $(1+7)^{51} - 1 = 8^{51} - 1$ is $M(7)$ i.e. multiple of 7

(ii) $(1+7)^{51} - 1 - 51\times 7 = 8^{51} - 358$ is $M(7^2)$ i.e. multiple of 49.

(iii) $(1+7)^{51} - 1 - 51\times 7 - \dfrac{51\times 50}{2}\times 7^2$
$= 8^{51} - 358 - 62475$
$= 8^{51} - 62833$ is $M(7^3)$ i.e. multiple of 343.

Example 23. *Which of the following expression is divisible by* 1225?

(a) $6^{2n} - 35n - 1$ (b) $6^{2n} - 35n + 1$
(c) $6^{2n} - 35n$ (d) $6^{2n} - 35n + 2$

Sol. (a) Consider expression $= 6^{2n} - 35n - 1$

$$= (6^2)^n - 35n - 1 = 36^n - 35n - 1$$

So, $6^{2n} - 35n - 1 = (1+35)^n - 35n - 1$

$$= 1 + 35n + {}^nC_2\cdot 35^2 + \dots + 35^n - 35n - 1$$
$$= 35^2[{}^nC_2 + {}^nC_3\cdot 35 + \dots + 35^{n-2}]$$
$$= 1225 \times \text{a positive integer, if } n \ge 2$$

If $n = 1$, then $6^{2n} - 35n - 1 = 0$, which is divisible by 1225.

So, options (b), (c) and (d) are not divisible by 1225.

Example 24. *If* 7^{103} *is divided by 25, then the remainder is*

(a) 20 (b) 16 (c) 18 (d) 15

Sol. (c) We have, $7^{103} = 7(49)^{51} = 7(50-1)^{51}$

$$= 7\{50^{51} - {}^{51}C_1 50^{50} + {}^{51}C_2 50^{49} - \dots - 1\}$$
$$= 7\{(50^{51} - {}^{51}C_1 50^{50} + {}^{51}C_2 50^{49} - \dots) - (7 + 18 - 18)\}$$

$= k + 18$ (say) $[\because k$ is divisible by 25$]$

$\therefore$ Remainder is 18.

Example 25. *The fractional part of* $\dfrac{2^{4n}}{15}$ *is*

(a) $\dfrac{1}{15}$ (b) $\dfrac{2}{15}$
(c) $\dfrac{4}{15}$ (d) None of these

Sol. (a) $\dfrac{2^{4n}}{15} = \dfrac{16^n}{15} = \dfrac{(1+15)^n}{15}$

$$= \frac{1 + {}^nC_1 15 + {}^nC_2 15^2 + \dots + {}^nC_n 15^n}{15}$$

$= \dfrac{1 + 15k}{15}$, where $k \in N = \dfrac{1}{15} + k$

$$\therefore \left\{\frac{2^{4n}}{15}\right\} = \left\{\frac{1}{15} + k\right\} = \frac{1}{15}$$

Example 26. *Larger of* $99^{50} + 100^{50}$ *and* 101^{50} *is*

(a) 101^{50} (b) $99^{50} + 100^{50}$
(c) both are equal (d) None of these

Sol. (a) We have, $101^{50} = (100+1)^{50}$

$$= 100^{50} + 50\cdot 100^{49} + \frac{50\cdot 49}{1\cdot 2}\cdot 100^{48} + \dots \quad \dots\text{(i)}$$

and $99^{50} = (100-1)^{50}$

$$= 100^{50} - 50\cdot 100^{49} + \frac{50\cdot 49}{1\cdot 2}\cdot 100^{48} - \dots \quad \dots\text{(ii)}$$

On subtracting Eq. (ii) from Eq. (i), we get

$$101^{50} - 99^{50} = 2\left[50\cdot 100^{49} + \frac{50\cdot 49\cdot 48}{1\cdot 2\cdot 3}\times 100^{47} + \dots\right]$$

$$= 100^{50} + 2\cdot\frac{50\cdot 49\cdot 48}{1\cdot 2\cdot 3}\cdot 100^{47} + \dots > 100^{50}$$

$$\Rightarrow \quad 101^{50} > 99^{50} + 100^{50}$$

Example 27. *If $9^7 + 7^9$ is divisible by*

(a) 6 (b) 24 (c) 64 (d) 72

Sol. (c) We have, $9^7 + 7^9 = (1+8)^7 - (1-8)^9$

$$= (1 + {}^7C_1\cdot 8^1 + {}^7C_2\cdot 8^2 + \dots + {}^7C_7\cdot 8^7)$$
$$- (1 - {}^9C_1\cdot 8^1 + {}^9C_2\cdot 8^2 - \dots - {}^9C_9\cdot 8^9)$$
$$= 16\times 8 + 64[({}^7C_2 + \dots + {}^7C_7\cdot 8^5)$$
$$- ({}^9C_2 - \dots - {}^9C_9\cdot 8^7)]$$
$$= 64 \text{ (an integer)}$$

Example 28. *The greatest integer which divides the number $101^{100} - 1$ is*

(a) 100
(b) 1000
(c) 10000
(d) 100000

Sol. (c) By binomial theorem,

$$(1+x)^n = \left[1 + nx + \frac{n(n-1)}{2}\cdot x^2 + \dots + x^n\right]$$

$$\Rightarrow \quad (1+x)^n - 1 = nx + \frac{n(n-1)}{2}x^2 + \dots + x^n$$

If $x = n$, $(1+n)^n - 1 = n^2 + \dfrac{n(n-1)}{2}n^2 + \dots + n^n$

$$(1+n)^n - 1 = n^2\left[1 + \frac{n(n-1)}{2} + \dots + n^{n-2}\right]$$

Put $n = 100$,

$$(1+100)^{100} - 1 = (100)^2\left[1 + \frac{100(100-1)}{2} + \dots + 100^{98}\right]$$

Clearly, $(101)^{100} - 1$ is divisible by $(100)^2 = 10000$

Work Book Exercise 8.2

1 If n is even, then the greatest coefficient in the expansion of $(x+a)^n$ is

a ${}^nC_{\frac{n}{2}+1}$ b ${}^nC_{\frac{n}{2}-1}$
c ${}^nC_{\frac{n}{2}}$ d None of these

2 If n is even positive integer, then the condition that the greatest term in the expansion of $(1+x)^n$ may have the greatest coefficient also is

a $\dfrac{n}{n+2} < x < \dfrac{n+2}{n}$
b $\dfrac{n+1}{n} < x < \dfrac{n}{n+1}$
c $\dfrac{n}{n+4} < x < \dfrac{n+4}{4}$
d None of the above

3 If $n > 1$, then $(1+x)^n - nx - 1$ is divisible by

a x^5 b x^2 c x^3
d x^4

4 The positive integer just greater than $(1+0.0001)^{10000}$ is

a 3
b 4
c 5
d None of the above

5 If $[x]$ denotes the greatest integer less than or equal to x, then $[(1+0.0001)^{10000}]$ equals

a 3
b 2
c 0
d None of the above

6 If $R = (6\sqrt{6} + 14)^{2n+1}$ and $f = R - [R]$, where $[\cdot]$ denotes the greatest integer function, then Rf equals

a 20^n b 20^{2n}
c 20^{2n+1} d None of these

7 If $R = (\sqrt{2} + 1)^{2n+1}$ and $f = R - [R]$, where [ ] denotes the greatest integer function, then $[R]$ equals

a $f + \dfrac{1}{f}$
b $f - \dfrac{1}{f}$
c $\dfrac{1}{f} - f$
d None of the above

8 If $(5 + 2\sqrt{6})^n = I + f$, where $I \in N$, $n \in N$ and $0 \le f < 1$, then I equals

a $\dfrac{1}{f} - f$ b $\dfrac{1}{1+f} - f$
c $\dfrac{1}{1-f} - f$ d $\dfrac{1}{1-f} + f$

9 If $R = (7 + 4\sqrt{3})^{2n} = I + f$, where $I \in N$ and $0 < f < 1$, then $R(1-f)$ equals

a $(7 - 4\sqrt{3})^{2n}$ b $\dfrac{1}{(7+4\sqrt{3})^{2n}}$
c 1 d None of these

10 The digit at unit's place in the number $17^{1995} + 11^{1995} - 7^{1995}$ is

a 0 b 1
c 2 d 3

Properties of the Binomial Coefficients

i. In the expansion of $(1+x)^n$ the coefficients of terms equidistant from the beginning and the end are equal.

Proof

We have,

$$(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_rx^r + \ldots + C_{n-1}x^{n-1} + C_nx^n$$

In this expansion the coefficient of $(r+1)$th term from the beginning is ${}^nC_r$. The $(r+1)$th term from the end is $(n-r+1)$th term from the beginning. Therefore, its coefficients is ${}^nC_{n-r}$. But, we have ${}^nC_r = {}^nC_{n-r}$.

Hence, the coefficients of terms equidistant from the beginning and the end are equal.

ii. The sum of the binomial coefficients in the expansion of $(1+x)^n$ is 2^n.

i.e. $C_0 + C_1 + C_2 + \ldots + C_n = 2^n$

or $\sum_{r=0}^{n} {}^nC_r = 2^n$

Proof

We have, $(1+x)^n = C_0 + C_1x + C_2x^2 + C_3x^3 + \ldots + C_{n-1}x^{n-1} + C_nx^n$ ...(i)

Putting $x = 1$ in this expansion, we get

$$2^n = C_0 + C_1 + C_2 + C_3 + \ldots + C_{n-1} + C_n$$

- *It follows from the above result that*
- $\sum_{r=0}^{n} {}^nC_r = 2^n, \sum_{r=1}^{n} {}^{n-1}C_{r-1} = 2^{n-1}$ *etc.*
- *By putting $x = -1$ in Eq. (i), we get*
  $\sum_{r=0}^{n} (-1)^n C_r = 0$ *i.e.* $C_0 - C_1 + C_2 - C_3 + \ldots = 0$
- *Sum of coefficients in the expansion of $(a + bx + cx^2)^n$ is $(a + b + c)^n$.*

Example 29. *The sum of the last ten coefficients in the expansion of $(1+x)^{19}$ when expanded in ascending powers of x, is*

(a) 2^{18} *(b)* 2^{19}

(c) $2^{18} - {}^{19}C_{10}$ *(d) None of these*

Sol. (a) The required sum

$$= {}^{19}C_{10} + {}^{19}C_{11} + \ldots + {}^{19}C_{19} \quad \ldots(i)$$
$$= {}^{19}C_0 + {}^{19}C_1 + {}^{19}C_2 + \ldots + {}^{19}C_9 \quad \ldots(ii)$$
$$[\because {}^nC_r = {}^nC_{n-r}]$$

On adding Eqs. (i) and (ii), we get

$2 \times$ (Required sum) $= {}^{19}C_0 + {}^{19}C_1 + \ldots + {}^{19}C_{19} = 2^{19}$

$\therefore$ Required sum $= 2^{18}$

Example 30. *If the sum of the coefficients in the expansion of $(a^2x^2 - 2ax + 1)^{51}$ vanishes, then the value of a is*

(a) 2 *(b)* -1 *(c)* 1 *(d)* -2

Sol. (c) The sum of the coefficients of the polynomial $(a^2x^2 - 2ax + 1)^{51}$ is obtained by putting $x = 1$ in $(a^2x^2 - 2ax + 1)^{51}$.

By hypothesis, $(a^2 - 2a + 1)^{51} = 0$

$\Rightarrow \quad a = 1$

iii. The sum of the coefficients of the odd terms in the expansion of $(1+x)^n$ is equal to the sum of the coefficients of the even terms and each is equal to 2^{n-1}.

i.e.

$$C_0 + C_2 + C_4 + \ldots = C_1 + C_3 + C_5 \ldots = 2^{n-1}$$

Proof

We have, $(1+x)^n = C_0 + C_1x + C_2x^2 + C_3x^3 + \ldots + C_{n-1}x^{n-1} + C_nx^n$

Putting $x = 1$ and -1 respectively in the above expansion, we get

$$2^n = C_0 + C_1 + C_2 + C_3 + \ldots + C_{n-1} + C_n$$

and $0 = C_0 - C_1 + C_2 - C_3 + \ldots + (-1)^{n-1} C_{n-1} + (-1)^n C_n$

On adding and subtracting these two expressions, we get

$$2^n = 2(C_0 + C_2 + C_4 + \ldots)$$

and $$2^n = 2(C_1 + C_3 + C_5 + \ldots)$$

$$\Rightarrow C_0 + C_2 + C_4 + \ldots = 2^{n-1} = C_1 + C_3 + C_5 + \ldots$$

iv. ${}^nC_r = \frac{n}{r} \cdot {}^{n-1}C_{r-1} = \frac{n}{r} \cdot \frac{n-1}{r-1} \cdot {}^{n-2}C_{r-2}$ and so on.

Proof

We have,

$${}^nC_r = \frac{n!}{(n-r)!\,r!}$$
$$= \frac{n(n-1)!}{r(r-1)!\{(n-1)-(r-1)\}!}$$
$$= \frac{n}{r} \cdot {}^{n-1}C_{r-1}$$

Similarly, we have ${}^{n-1}C_{r-1} = \frac{n-1}{r-1} \cdot {}^{n-2}C_{r-2}$

$$\therefore \quad {}^nC_r = \frac{n}{r} \cdot {}^{n-1}C_{r-1}$$
$$= \frac{n}{r} \cdot \frac{n-1}{r-1} \cdot {}^{n-2}C_{r-2}$$

Example 31. $\frac{1}{n!}+\frac{1}{2!(n-2)!}+\frac{1}{4!(n-4)!}+\ldots$ *is equal to*

(a) $\frac{2^{n-1}}{n!}$ (b) $\frac{2^n}{(n+1)!}$

(c) $\frac{2^n}{n!}$ (d) $\frac{2^{n-2}}{(n-1)!}$

Sol. (a) Given expression

$$=\frac{1}{n!}[{}^nC_0+{}^nC_2+{}^nC_4+\ldots]=\frac{2^{n-1}}{n!}$$

Example 32. *The sum*

$1\cdot{}^{20}C_1-2\cdot{}^{20}C_2+3\cdot{}^{20}C_3-\ldots-20\cdot{}^{20}C_{20}$ *is equal to*

(a) 2^{19} (b) 0

(c) $2^{20}-1$ (d) None of these

Sol. (b) Using $r\cdot{}^nC_r=n\cdot{}^{n-1}C_{r-1}$

$$\therefore \sum_{r=1}^{20}(-1)^{r-1}r\cdot{}^{20}C_r=\sum_{r=1}^{20}(-1)^{r-1}\cdot 20\cdot{}^{19}C_{r-1}$$
$$=20\{{}^{19}C_0-{}^{19}C_1+{}^{19}C_2-\ldots-{}^{19}C_{19}\}$$
$$=20\times 0=0$$

v. $C_0C_r+C_1C_{r+1}+\ldots+C_{n-r}C_n={}^{2n}C_{n+r}$

$$=\frac{(2n)!}{(n+r)!(n-r)!}$$

Proof Replacing x by $\frac{1}{x}$ in Eq. (i), we get

$$\left(1+\frac{1}{x}\right)^n=C_0+\frac{C_1}{x}+\frac{C_2}{x^2}+\ldots+\frac{C_n}{x^n} \quad \ldots\text{(ii)}$$

On multiplying Eqs. (i) and (ii), we get

$$\frac{(1+x)^{2n}}{x^n}=(C_0+C_1x+C_2x^2+\ldots)\left(C_0+\frac{C_1}{x}+\frac{C_2}{x^2}+\ldots\right)$$

Now, comparing coefficient of x^r on both sides, we get

$$C_0C_r+C_1C_{r+1}+\ldots+C_{n-r}C_n={}^{2n}C_{n+r}$$
$$=\frac{(2n)!}{(n+r)!(n-r)!} \quad \ldots\text{(iii)}$$

vi. Sum of squares of coefficients is ${}^{2n}C_n$ i.e.

$$C_0^2+C_1^2+C_2^2+\ldots+C_n^2=\frac{(2n)!}{n!\,n!}$$

Proof On putting $r=0$ in Eq. (iii), we get

$$C_0^2+C_1^2+C_2^2+\ldots+C_n^2=\frac{(2n)!}{n!\,n!}$$

Example 33. *If* $(1+x)^n=C_0+C_1x+C_2x^2+\ldots+C_nx^n$, *then* $\sum\sum_{0\le i<j\le n}(C_i+C_j)^2$ *is equal to*

(a) $(n-1)\cdot{}^{2n}C_n+2^{2n}$

(b) $n\cdot{}^{2n}C_n+2^{2n}$

(c) $(n+1)\cdot{}^{2n}C_n+2^{2n}$

(d) None of the above

Sol. (a) $\sum\sum_{0\le i<j\le n}(C_i+C_j)^2$

$$=n(C_0^2+C_1^2+\ldots+C_n^2)+2\sum\sum_{0\le i<j\le n}C_iC_j$$
$$=n\cdot{}^{2n}C_n+[(C_0+C_1+\ldots+C_n)^2-(C_0^2+C_1^2+\ldots+C_n^2)]$$
$$=n\cdot{}^{2n}C_n+(2^n)^2-{}^{2n}C_n$$
$$=(n-1)\cdot{}^{2n}C_n+2^{2n}$$

vii. $C_0C_1+C_1C_2+C_2C_3+\ldots+C_{n-1}C_n={}^{2n}C_{n+1}$

Proof On putting $r=1$ in Eq. (iii), we get

$$C_0C_1+C_1C_2+C_2C_3+\ldots+C_{n-1}C_n={}^{2n}C_{n+1}$$
$$=\frac{(2n)!}{(n+1)!(n-1)!}$$

viii. $C_0C_2+C_1C_3+C_2C_4+\ldots+C_{n-2}C_n={}^{2n}C_{n+2}$

Proof On putting $r=2$ in Eq. (iii), we get

$$C_0C_2+C_1C_3+C_2C_4+\ldots+C_{n-2}C_n={}^{2n}C_{n+2}$$
$$=\frac{(2n)!}{(n+2)!(n-2)!}$$

ix. $C_0+2C_1+3C_2+\ldots+(n+1)C_n=2^{n-1}(n+2)$

Proof Consider,

$$(1+x)^n=C_0+C_1x+C_2x^2+\ldots+C_nx^n$$

Now, on multiplying both sides by x, we get

$$x(1+x)^n=C_0x+C_1x^2+C_2x^3+\ldots+C_nx^{n+1}$$

On differentiating both sides w.r.t. x, we get

$$(1+x)^n+nx(1+x)^{n-1}=C_0+2C_1x+3C_2x^2+\ldots+(n+1)C_nx^n$$

Now, putting $x=1$, we get

$$2^n+n(2)^{n-1}=C_0+2C_1+3C_2+\ldots+(n+1)C_n$$
$$\Rightarrow C_0+2C_1+3C_2+\ldots+(n+1)C_n=2^{n-1}(n+2)$$

x. (i) $C_0+\frac{C_1}{2}+\frac{C_2}{3}+\ldots+\frac{C_n}{n+1}=\frac{2^{n+1}-1}{n+1}$

(ii) $C_0-\frac{C_1}{2}+\frac{C_2}{3}-\frac{C_3}{4}+\ldots+\frac{(-1)^nC_n}{n+1}=\frac{1}{n+1}$

Proof (i) Integrating expansion of $(1+x)^n$ w.r.t. x, between the limits 0 to 1, we get

$$\left[\frac{(1+x)^{n+1}}{n+1}\right]_0^1 = \left[C_0x + C_1\frac{x^2}{2} + C_2\frac{x^3}{3} + \ldots + C_n\frac{x^{n+1}}{n+1}\right]_0^1$$

$$\Rightarrow \quad \frac{2^{n+1}-1}{n+1} = C_0 + \frac{C_1}{2} + \frac{C_2}{3} + \ldots + \frac{C_n}{n+1}$$

(ii) Integrating expansion of $(1+x)^n$ between limits -1 to 0, we get

$$\left[\frac{(1+x)^{n+1}}{n+1}\right]_{-1}^0 = \left[C_0x + C_1\frac{x^2}{2} + C_2\frac{x^3}{3} + \ldots + \frac{C_nx^{n+1}}{n+1}\right]_{-1}^0$$

$$\Rightarrow \quad \frac{1}{n+1} = C_0 - \frac{C_1}{2} + \frac{C_2}{3} - \frac{C_3}{4} + \ldots + \frac{(-1)^n C_n}{n+1}$$

Some Other Important Properties

xi. ${}^nC_r = {}^nC_s$, then either $r = s$ or $r + s = n$

xii. $\dfrac{{}^nC_r}{{}^nC_{r-1}} = \dfrac{n-r+1}{r}$

xiii. ${}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r$

xiv. $C_0^2 - C_1^2 + C_2^2 - C_3^2 + \ldots = \begin{cases} 0, & \text{if } n \text{ is odd} \\ (-1)^{n/2}\, {}^nC_{n/2}, & \text{if } n \text{ is even} \end{cases}$

Example 34. *The value of*

$${}^{47}C_4 + \sum_{j=0}^{3} {}^{50-j}C_3 + \sum_{k=0}^{5} {}^{56-k}C_{53-k} \text{ is}$$

(a) ${}^{57}C_4$ *(b)* ${}^{57}C_3$ *(c)* ${}^{57}C_5$ *(d)* ${}^{57}C_6$

Sol. (a) We have, ${}^{47}C_4 + \sum_{j=0}^{3} {}^{50-j}C_3 + \sum_{k=0}^{5} {}^{56-k}C_{53-k}$

$= {}^{47}C_4 + ({}^{50}C_3 + {}^{49}C_3 + {}^{48}C_3 + {}^{47}C_3) + ({}^{56}C_{53} + {}^{55}C_{52} + {}^{54}C_{51} + {}^{53}C_{50} + {}^{52}C_{49} + {}^{51}C_{48})$

$= {}^{47}C_4 + ({}^{47}C_3 + {}^{48}C_3 + {}^{49}C_3 + {}^{50}C_3) + ({}^{56}C_3 + {}^{55}C_3 + {}^{54}C_3 + {}^{53}C_3 + {}^{52}C_3 + {}^{51}C_3)$ $[\because {}^nC_r = {}^nC_{n-r}]$

$= ({}^{47}C_4 + {}^{47}C_3) + ({}^{48}C_3 + {}^{49}C_3 + {}^{50}C_3) + ({}^{51}C_3 + {}^{52}C_3 + \ldots + {}^{56}C_3)$ $[\because {}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r]$

$= ({}^{48}C_4 + {}^{48}C_3) + {}^{49}C_3 + {}^{50}C_3 + \ldots + {}^{56}C_3 = {}^{57}C_4$

Example 35. *If n is a positive integer and $C_k = {}^nC_k$, then the value of $\sum_{k=1}^{n} k^3\left(\frac{C_k}{C_{k-1}}\right)^2$ is*

(a) $\dfrac{n(n+2)(n+1)^2}{12}$ *(b)* $\dfrac{n(n+1)(n+2)^2}{12}$

(c) $\dfrac{n(n+1)(n+2)}{12}$ *(d) None of these*

Sol. (a) $\sum_{k=1}^{n} k^3\left(\frac{C_k}{C_{k-1}}\right)^2 = \sum_{k=1}^{n} k^3\left(\frac{n-k+1}{k}\right)^2$ $\left[\because \frac{{}^nC_k}{{}^nC_{k-1}} = \frac{n-k+1}{k}\right]$

$= \sum_{k=1}^{n} k(n-k+1)^2 = \sum_{k=1}^{n} k[(n+1)^2 - 2k(n+1) + k^2]$

$= (n+1)^2 \sum_{k=1}^{n} k - 2(n+1)\sum_{k=1}^{n} k^2 + \sum_{k=1}^{n} k^3$

$= (n+1)^2 \cdot \frac{n(n+1)}{2} - 2(n+1)\cdot\frac{n(n+1)(2n+1)}{6} + \frac{n^2(n+1)^2}{4}$

$= \frac{n(n+1)^2}{12}[6(n+1) - 4(2n+1) + 3n]$

$= \frac{n(n+1)^2}{12}\cdot(n+2) = \frac{n(n+2)(n+1)^2}{12}$

Example 36. *If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$, then $(C_0 + C_1)(C_1 + C_2)\ldots(C_{n-1} + C_n) = k \cdot C_1C_2C_3\ldots C_n$, where k is equal to*

(a) $\dfrac{(n+1)^n}{n!}$ *(b)* $\dfrac{n^n}{(n-1)!}$

(c) $\dfrac{(n+1)^n}{(n-1)!}$ *(d) None of these*

Sol. (a) We have, $C_0 + C_1 = {}^{n+1}C_1, C_1 + C_2 = {}^{n+1}C_2, \ldots,$
$C_{n-1} + C_n = {}^{n+1}C_n$

$\therefore$ Given expression $= {}^{n+1}C_1\,{}^{n+1}C_2 \ldots {}^{n+1}C_n$ ...(i)

Now, ${}^{n+1}C_r = \frac{(n+1)!}{r!(n-r+1)!} = \frac{(n+1)n!}{r!(n-r+1)(n-r)!}$

or ${}^{n+1}C_r = \frac{n+1}{n-r+1}\,{}^nC_r$ ...(ii)

Putting $n = 1, 2, 3, \ldots, n$ in Eq. (ii), we get

$(C_0 + C_1)(C_1 + C_2)\ldots(C_{n-1} + C_n)$

$= \frac{n+1}{n}\cdot C_1 \cdot \frac{n+1}{n-1}C_2 \ldots \frac{n+1}{1}C_n = \frac{(n+1)^n}{n!}C_1C_2C_3\ldots C_n$

Example 37. *The value of ${}^{15}C_0^2 - {}^{15}C_1^2 + {}^{15}C_2^2 - \ldots - {}^{15}C_{15}^2$ is*

(a) 15 *(b)* -15 *(c)* 0 *(d)* 51

Sol. (c) As we know that,

$C_0^2 - C_1^2 + C_2^2 - C_3^2 + \ldots + (-1)^n C_n^2 = 0$ (if n is odd)

Here, $n = 15$ (odd)

$\therefore \quad C_0^2 - C_1^2 + C_2^2 - \ldots - C_{15}^2 = 0$

Example 38. *If* $(1+x-2x^2)^6 = 1 + a_1x + a_2x^2 + a_3x^3 + \dots,$ then the value of $a_2 + a_4 + a_6 + \dots + a_{12}$ will be

(a) 32 (b) 31 (c) 64 (d) 1024

Sol. (b) We have, $(1+x-2x^2)^6 = 1 + a_1x + a_2x^2$

Putting $x = 1$, we get

$$0 = 1 + a_1 + a_2 + a_3 + \dots + a_{12} \quad \dots\text{(i)}$$

Putting $x = -1$, we get

$$64 = 1 - a_1 + a_2 - a_3 + \dots + a_{12} \quad \dots\text{(ii)}$$

On adding Eqs. (i) and (ii), we get

$$64 = 2 + 2a_2 + 2a_4 + 2a_6 + \dots + 2a_{12}$$

$$\Rightarrow \quad a_2 + a_4 + a_6 + \dots + a_{12} = 31$$

Example 39. *The sum* ${}^{20}C_0 + {}^{20}C_1 + {}^{20}C_2 + \dots + {}^{20}C_{10}$ *is equal to*

(a) $2^{20} + \dfrac{20!}{(10!)^2}$

(b) $2^{19} - \dfrac{1}{2}\cdot\dfrac{20!}{(10!)^2}$

(c) $2^{19} + {}^{20}C_{10}$

(d) None of the above

Sol. (d) Let $S = {}^{20}C_0 + {}^{20}C_1 + {}^{20}C_2 + \dots + {}^{20}C_{10} \quad \dots\text{(i)}$

$$S = {}^{20}C_{20} + {}^{20}C_{19} + {}^{20}C_{18} + \dots + {}^{20}C_{10}$$

$$[\because {}^nC_r = {}^nC_{n-r}] \dots\text{(ii)}$$

On adding Eqs. (i) and (ii), we get

$$2S = ({}^{20}C_0 + {}^{20}C_1 + \dots + {}^{20}C_{20}) + {}^{20}C_{10}$$

$$= 2^{20} + {}^{20}C_{10}$$

$$\therefore \quad S = 2^{19} + \frac{{}^{20}C_{10}}{2}$$

Example 40. *If* $A = {}^{2n}C_0 \cdot {}^{2n}C_1 + {}^{2n}C_1 \cdot {}^{2n-1}C_1 + {}^{2n}C_2 \cdot {}^{2n-2}C_1 + \dots,$ *then A is*

(a) 0 (b) 2^n (c) $n \cdot 2^{2n}$ (d) 1

Sol. (c) $A =$ Coefficient of x in

$$[{}^{2n}C_0(1+x)^{2n} + {}^{2n}C_1(1+x)^{2n-1} + \dots]$$

$=$ Coefficient of x in $([1+(1+x)]^{2n}$

$=$ Coefficient of x in $(2+x)^{2n}$

$=$ Coefficient of x in $2^{2n}\left(1+\dfrac{x}{2}\right)^{2n} = n \cdot 2^{2n}$

Example 41. $\displaystyle\sum_{r=0}^{n} {}^nC_r \sin rx \cos(n-r)x$ *is equal to*

(a) $2^{n-1}\sin(n-1)x$ (b) $2^n \sin nx$

(c) $2^{n-1}\sin nx$ (d) None of these

Sol. (c) We have, $\displaystyle\sum_{r=0}^{n} {}^nC_r \sin rx \cos(n-r)x$

$$= \frac{1}{2}[({}^nC_0 \sin 0x \cos nx + {}^nC_n \sin nx \cos 0x)$$

$$+({}^nC_1 \sin x \cos(n-1)x + {}^nC_{n-1}\sin(n-1)x \cdot \cos x)$$

$$+ \dots + ({}^nC_n \sin nx \cos 0x + {}^nC_0 \sin 0x \cos nx)]$$

$$= \frac{1}{2}[{}^nC_0 \sin nx + {}^nC_1 \sin nx + \dots + {}^nC_n \sin nx]$$

$$= \frac{1}{2}[{}^nC_0 + {}^nC_1 + \dots + {}^nC_n]\sin nx = \frac{2^n \sin nx}{2}$$

$$\therefore \quad \sum_{r=0}^{n} {}^nC_r \sin rx \cos(n-r)x = 2^{n-1}\sin nx$$

Work Book Exercise 8.3

1 If the sum of the coefficients in the expansion of $(a+b)^n$ is 4096, then the greatest coefficient in the expansion is

a 924 b 792
c 1594 d None of these

2 If the sum of the coefficients in the expansion of $(1+2x)^n$ is 6561, the greatest term in the expansion for $x = \dfrac{1}{2}$, is

a 4th b 5th
c 6th d None of these

3. If the sum of the coefficients in the expansion of $(1+2x)^n$ is 6561, then the greatest coefficient in the expansion is

a 896
b 3594
c 1792
d None of the above

4 If n is an odd natural number, then $\displaystyle\sum_{r=0}^{n} \frac{(-1)^r}{{}^nC_r}$ equals

a 0 b $\dfrac{1}{n}$
c $\dfrac{n}{2^n}$ d None of these

5 If n is an even natural number, then $\displaystyle\sum_{r=0}^{n} \frac{(-1)^r}{{}^nC_r}$ equals

a 0 b $\dfrac{1}{n}$
c $\dfrac{(-1)^{n/2}}{{}^nC_{n/2}}$ d None of these

6 If $a_n = \displaystyle\sum_{r=0}^{n} \frac{1}{{}^nC_r}$, then $\displaystyle\sum_{r=0}^{n} \frac{r}{{}^nC_r}$ equals

a $(n-1)\,a_n$ b $n a_n$
c $\dfrac{n}{2}a_n$ d None of these

7 The value of $1 \cdot C_1 + 3 \cdot C_3 + 5 \cdot C_5 + 7 \cdot C_7 + \dots$, where $C_0, C_1, C_2, \dots, C_n$ are the binomial coefficients in the expansion of $(1+x)^n$, is

a $n \cdot 2^{n-1}$ b $n \cdot 2^{n-2}$
c $n(n-1)2^{n-1}$ d None of these

8 If C_r is the coefficient of x^r in $(1+x)^n$, then the value of $\sum_{r=0}^{n}(r+1)^2 C_r$ is

a $(n+1)(n+4)2^{n-2}$ b $(n+1)(n+4)2^{n-1}$
c $(n+1)^2 2^{n-2}$ d None of these

9 If C_r stands for ${}^nC_r$, then the sum of the series

$$\frac{2\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}{n!}[C_0^2 - 2C_1^2 + \dots + (-1)^n(n+1)C_n^2],$$

where n is an even positive integer, is equal to

a 0 b $(-1)^{n/2}(n+1)$
c $(-1)^{n/2}(n+2)$ d $(-1)^n n$

10 In the expansion of $(1+x)^n(1+y)^n(1+z)^n$, the sum of the coefficients of the terms of degree r is

a $({}^nC_r)^3$ b $3 \cdot {}^nC_r$
c ${}^{3n}C_r$ d ${}^nC_{3r}$

11 There are two bags each of which contains n balls. A man has to select an equal number of balls from both the bags. The number of ways in which a man can choose atleast one ball from each bag is

a ${}^{2n}C_n$ b $({}^nC_n)^2$
c ${}^{2n}C_1$ d ${}^{2n}C_n - 1$

12 P is a set containing n elements. A subset A of P is chosen and the set P is reconstructed by replacing the elements of A. A subset B of P is chosen again. The number of ways of choosing A and B such that A and B have no common elements is

a 2^n
b 3^n
c 4^n
d None of the above

13 P is a set containing n elements. A subset A of P is chosen and the set P is reconstructed by replacing the elements of A. A subset B of P is chosen again. The number of ways of choosing A and B such that $A = B$, is

a 2^n b 3^n
c ${}^{2n}C_n$ d None of these

14 P is a set containing n elements. A subset A of P is chosen and the set P is reconstructed by replacing the elements of A. A subset B of P is chosen again. The number of ways of choosing A and B such that B is a subset of A, is

a 2^n b 3^n
c ${}^{2n}C_n$ d None of these

15 P is a set containing n elements. A subset A of P is chosen and the set P is reconstructed by replacing the elements of A. A subset B of P is chosen again. The number of ways of choosing A and B such that B contains just one element more than A, is

a ${}^{2n}C_{n-1}$ b 3^n c $(2^n)^2$ d ${}^{2n}C_n$

16 P is a set containing n elements. A subset A of P is chosen and the set P is reconstructed by replacing the elements of A. A subset B of P is chosen again. The number of ways of choosing A and B such that A and B have equal number of elements, is

a 2^n b 3^n c $(2^n)^2$ d ${}^{2n}C_n$

17 If $n > 3$, then
$xyC_0 - (x-1)(y-1)C_1 + (x-2)(y-2)C_2 - (x-3)(y-3)C_3 + \dots + (-1)^n(x-n)(y-n)C_n$
equals

a $xy \times 2^n$ b $n\,xy$
c xy d None of these

18 If $n > 3$, then $xyzC_0 - (x-1)(y-1)(z-1)C_1 + (x-2)(y-2)(z-2)C_2 - (x-3)(y-3)(z-3)C_3 + \dots + (-1)^n(x-n)(y-n)(z-n)C_n$ equals

a xyz b 0
c $-xyz$ d None of these

Binomial Theorem for any Index

Statement (Binomial theorem for any index)

Let n be a rational number and x be a real number such that $|x| < 1$, then

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots + \frac{n(n-1)(n-2)\dots(n-r+1)}{r!}x^r + \dots$$

- *The condition $|x| < 1$ is unnecessary, if n is a whole number while the same condition is essential if n is a rational number other than a whole number.*
- *There are infinite number of terms in the expansion of $(1+x)^n$, when n is a negative integer or a fraction.*
- *If first term is not 1, then make first term unity in the following ways,*

$$(x+a)^n = a^n\left(1+\frac{x}{a}\right)^n, \text{ if } \left|\frac{x}{a}\right| < 1$$

- *Expansion of $(x+a)^n$ for any index*

Case I *When $|x| > |a|$ i.e. $\left|\frac{a}{x}\right| < 1$*

In this case, $(x+a)^n = \left\{x\left(1+\frac{a}{x}\right)\right\}^n = x^n\left(1+\frac{a}{x}\right)^n$

$$= x^n\left\{1 + n\cdot\frac{a}{x} + \frac{n(n-1)}{2!}\left(\frac{a}{x}\right)^2 + \frac{n(n-1)(n-2)}{3!}\left(\frac{a}{x}\right)^3 + \dots\right\}$$

Case II When $|x|<|a|$ i.e. $\left|\frac{a}{x}\right|<1$.

In this case, $(x+a)^n=\left\{a\left(1+\frac{x}{a}\right)\right\}^n=a^n\left(1+\frac{x}{a}\right)^n$

$$=a^n\left\{1+n\cdot\frac{x}{a}+\frac{n(n-1)}{2!}\left(\frac{x}{a}\right)^2+\frac{n(n-1)(n-2)}{3!}\left(\frac{x}{a}\right)^3\ldots\right\}$$

- If n is a positive integer, the expansion of $(1+x)^n$ contains $(n+1)$ terms and coincides with

$$(1+x)^n={}^nC_0+{}^nC_1x+{}^nC_2x^2+\ldots+{}^nC_nx^n,$$

because ${}^nC_0=1,\ {}^nC_1=n,$

$${}^nC_2=\frac{n(n-1)}{2!},$$

$${}^nC_3=\frac{n(n-1)(n-2)}{3!},\ \ldots$$

- The general term in the expansion of $(1+x)^n$ is given by

$$T_{r+1}=\frac{n(n-1)(n-2)\ldots\{n-(r-1)\}}{r!}x^r$$

Some Important Deductions

i. Replacing n by $-n$ in the expansion for $(1+x)^n$, we get

$$(1+x)^{-n}=1-nx+\frac{n(n+1)}{2!}x^2-\frac{n(n+1)(n+2)}{3!}x^3+\ldots+(-1)^r\frac{n(n+1)(n+2)\ldots(n+r-1)}{r!}x^r+\ldots$$

The general term in this expansion is

$$T_{r+1}=(-1)^r\frac{n(n+1)(n+2)\ldots(n+r-1)}{r!}x^r$$

ii. Replacing x by $-x$ and n by $-n$ in the expansion of $(1+x)^n$, we get

$$(1-x)^{-n}=1+nx+\frac{n(n+1)}{2!}x^2+\frac{n(n+1)(n+2)}{3!}x^3+\ldots+\frac{n(n+1)(n+2)\ldots(n+r-1)}{r!}x^r+\ldots$$

The general term in this expansion is

$$T_{r+1}=\frac{n(n+1)(n+2)\ldots(n+r-1)}{r!}x^r$$

iii. Replacing x by $-x$ in the expansion of $(1+x)^n$, we get

$$(1-x)^n=1-nx+\frac{n(n-1)}{2!}x^2-\frac{n(n-1)(n-2)}{3!}x^3+\ldots+(-1)^r\frac{n(n-1)(n-2)\ldots(n-r+1)}{r!}x^r+\ldots$$

The general term is

$$T_{r+1}=(-1)^r\frac{n(n-1)(n-2)\ldots(n-r+1)}{r!}x^r$$

iv. Putting $n=1,2,3$ in the expansion of $(1+x)^{-n}$, we get

$$(1+x)^{-1}=1-x+x^2-x^3+x^4-\ldots+(-1)^rx^r+\ldots$$

$$(1+x)^{-2}=1-2x+3x^2-4x^3+5x^4-\ldots+(-1)^r(r+1)x^r+\ldots$$

$$(1+x)^{-3}=1-3x+6x^2-10x^3+\ldots+(-1)^r\frac{(r+1)(r+2)}{2}x^r+\ldots$$

Replacing x by $-x$ in the above expansions, we get

$$(1-x)^{-1}=1+x+x^2+x^3+\ldots+x^r+\ldots$$

$$(1-x)^{-2}=1+2x+3x^2+\ldots+(r+1)x^r+\ldots$$

$$(1-x)^{-3}=1+3x+6x^2+\ldots+\frac{(r+1)(r+2)}{2}x^r+\ldots$$

In all these expansion, it is assumed that $|x|<1$. Students are advised to learn these expansions.

Example 42. *The expansion of* $\frac{1}{(4-3x)^{1/2}}$, *binomial theorem will be valid, if*

(a) $x<1$ (b) $|x|<1$

(c) $-\frac{2}{\sqrt{3}}<x<\frac{2}{\sqrt{3}}$ (d) None of these

Sol. (d) The given expression can be written as

$4^{-1/2}\left(1-\frac{3}{4}x\right)^{-1/2}$ and it is valid only when

$$\left|\frac{3}{4}x\right|<1\ \Rightarrow\ -\frac{4}{3}<x<\frac{4}{3}$$

Example 43. *Evaluate* $\frac{1}{\sqrt[3]{6-3x}}$.

(a) $6^{1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$ (b) $6^{-1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$

(c) $6^{1/3}\left[1-\frac{x}{6}+\frac{2x^2}{6^2}-\ldots\right]$ (d) $6^{-1/3}\left[1-\frac{x}{6}+\frac{2x^2}{6^2}-\ldots\right]$

Sol. (b) $\frac{1}{(6-3x)^{1/3}}=(6-3x)^{-1/3}=6^{-1/3}\left(1-\frac{x}{2}\right)^{-1/3}$

$$=6^{-1/3}\left[1+\left(-\frac{1}{3}\right)\left(-\frac{x}{2}\right)+\frac{\left(-\frac{1}{3}\right)\left(-\frac{4}{3}\right)}{2\cdot1}\left(-\frac{x}{2}\right)^2+\ldots\right]$$

$$=6^{-1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$$

Example 44. *If* $\frac{1}{1-2x+x^2}=1+a_1x+a_2x^2+\ldots,$ *then the value of* a_r *is*

(a) $2r$ (b) $r+1$ (c) r (d) $r-1$

Sol. (b) $\frac{1}{1-2x+x^2} = (1-x)^{-2} = 1 + 2x + 3x^2 + \dots$

$= 1 + a_1x + a_2x^2 + \dots \Rightarrow a_r = r + 1$

Example 45. *The coefficient of* x^n *in the expansion of* $\frac{1}{(1-x)(1-2x)(1-3x)}$ *is*

(a) $\frac{1}{2}(2^{n+2} - 3^{n+3} + 1)$ *(b)* $\frac{1}{2}(3^{n+2} - 2^{n+3} + 1)$

(c) $\frac{1}{2}(2^{n+3} - 3^{n+2} + 1)$ *(d) None of these*

Sol. (b) We have, $\frac{1}{(1-x)(1-2x)(1-3x)}$

$$= \frac{1}{2(1-x)} - \frac{4}{1-2x} + \frac{9}{2(1-3x)}$$

[by resolving into partial fractions]

$$= \frac{1}{2}(1-x)^{-1} - 4(1-2x)^{-1} + \frac{9}{2}(1-3x)^{-1}$$

$$= \frac{1}{2}[1 + x + x^2 + \dots + x^n + \dots]$$

$$- 4[1 + 2x + (2x)^2 + \dots + (2x)^n + \dots]$$

$$+ \frac{9}{2}[1 + (3x) + (3x)^2 + \dots + (3x)^n + \dots]$$

$\therefore$ Coefficient of $x^n = \frac{1}{2}[1 - 8\cdot 2^n + 9\cdot 3^n]$

$$= \frac{1}{2}[1 - 2^{n+3} + 3^{n+2}]$$

Example 46. *If x is nearly equal to one, then the approximate value of* $\frac{mx^m - nx^n}{m-n}$ *is*

(a) x^m *(b)* x^n

(c) x^{m+n} *(d) None of these*

Sol. (c) Since, x is very nearly equal to one, let $x = 1 + h$, where h is very nearly equal to zero, so that h^2 may be neglected.

Now, $\frac{mx^m - nx^n}{m-n} = \frac{m(1+h)^m - n(1+h)^n}{m-n}$

$$= \frac{m(1+mh) - n(1+nh)}{m-n}$$

[neglecting h^2 and higher powers]

$$= \frac{(m-n)[1+(m+n)h]}{m-n}$$

$$= 1 + (m+n)h = (1+h)^{m+n} = x^{m+n}$$

Approximation

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{1\cdot 2}x^2 + \frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}x^3 + \dots$$

If $x < 1$, the terms of the above expansion go on decreasing and if x is very small, a stage may be reached when we may neglect the terms containing higher powers of x in the expansion.

Thus, if x is so small that its squares and higher powers may be neglected, then $(1+x)^n = 1 + nx$, approximately. This is an approximate value of $(1+x)^n$.

Example 47. *If x is so small such that its square and higher powers may be neglected, then the value of* $\frac{(8+3x)^{2/3}}{(2+3x)(4-5x)^{1/2}}$ *is*

(a) $1 - \frac{3}{2}x$ *(b)* $1 + \frac{5}{8}x$

(c) $1 - \frac{5}{8}x$ *(d) None of these*

Sol. (c) We have, $\frac{(8+3x)^{2/3}}{(2+3x)\sqrt{(4-5x)}}$

$$= \frac{8^{2/3}\left(1+\frac{3x}{8}\right)^{2/3}}{2\left(1+\frac{3}{2}x\right)2\sqrt{\left(1-\frac{5x}{4}\right)}}$$

$$= \left(1+\frac{3x}{8}\right)^{2/3}\left(1+\frac{3}{2}x\right)^{-1}\left(1-\frac{5}{4}x\right)^{-1/2}$$

$$= \left(1+\frac{2}{3}\cdot\frac{3}{8}x+\dots\right)\left(1-\frac{3}{2}x+\dots\right)\left(1+\frac{5}{8}x+\dots\right)$$

$$= 1 + \left(\frac{1}{4} - \frac{3}{2} + \frac{5}{8}\right)x = 1 - \frac{5}{8}x$$

Example 48. *If* $\frac{(1-3x)^{1/2} + (1-x)^{5/3}}{\sqrt{4-x}}$ *is approximately equal to a + bx for all small values of x, then*

(a) $a = 1, b = -\frac{35}{24}$ *(b)* $a = -\frac{35}{24}, b = 1$

(c) $a = 1, b = \frac{35}{24}$ *(d) None of these*

Sol. (a) Since, the given expression is equal to $a + bx$, so we have to neglect the terms x^2 and higher powers of x.

$\therefore$ $\frac{(1-3x)^{1/2} + (1-x)^{5/3}}{\sqrt{4-x}}$

$$= [(1-3x)^{1/2} + (1-x)^{5/3}][4-x]^{-1/2}$$

$$= \left[1 + \frac{1}{2}(-3x) + 1 + \frac{5}{3}(-x)\right](4)^{-1/2}\left(1-\frac{x}{4}\right)^{-1/2}$$

$$= \frac{1}{2}\left(2 - \frac{3}{2}x - \frac{5x}{3}\right)\left[1 + \left(-\frac{1}{2}\right)\left(-\frac{x}{4}\right)\right]$$

$$= \frac{1}{2}\left(2 - \frac{19}{6}x\right)\left(1 + \frac{x}{8}\right)$$

$$= \frac{1}{2}\left(2 + \frac{x}{4} - \frac{19x}{6}\right) = \frac{1}{2}\left(2 - \frac{35x}{12}\right) = 1 - \frac{35x}{24}$$

$\therefore$ $1 - \frac{35x}{24} = a + bx \Rightarrow a = 1$ and $b = -\frac{35}{24}$

Example 49. *Cube root of* 217 *is*

(a) 6.01 *(b)* 6.04

(c) 6.02 *(d) None of these*

Sol. (a) Consider, $(217)^{1/3} = (6^3 + 1)^{1/3} = 6\left(1 + \frac{1}{6^3}\right)^{1/3}$

On expanding by binomial theorem, we get

$$(217)^{1/3} = 6\left(1 + \frac{1}{3 \times 216} - \frac{1 \times 2}{3 \times 3 \times 2}\left(\frac{1}{216}\right)^2 + \ldots\right) = 6.01$$

Example 50. *The approximate value of $(7.995)^{1/3}$ correct to four decimal places is*

(a) 1.9995 *(b)* 1.9996 *(c)* 1.9990 *(d)* 1.9991

Sol. (a) $(7.995)^{1/3} = (8 - 0.005)^{1/3} = (8)^{1/3}\left[1 - \frac{0.005}{8}\right]^{1/3}$

$$= 2\left[1 - \frac{1}{3} \times \frac{0.005}{8} + \frac{\frac{1}{3}\left(\frac{1}{3} - 1\right)}{2!}\left(\frac{0.005}{8}\right)^2 - \ldots\right]$$

$$= 2\left[1 - \frac{0.005}{24} - \frac{\frac{1}{3} \times \frac{1}{3}}{1} \times \left(\frac{0.005}{8}\right)^2 - \ldots\right]$$

$$= 2(1 - 0.000208) = 2 \times 0.999792 = 1.9995$$

Exponential Series

(a) $e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots$, where x may be any real or complex and $e = \lim_{n \to \infty}\left(1 + \frac{1}{n}\right)^n$

(b) $a^x = 1 + \frac{x}{1!} \ln a + \frac{x^2}{2!} \ln^2 a + \frac{x^3}{3!} \ln^3 a + \ldots$ where $a > 0$

- $e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \ldots$
- *e is an irrational number lying between 2.7 and 2.8. Its value correct upto 10 places of decimal is 2.7182818284.*
- $e + e^{-1} = 2\left(1 + \frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + \ldots\right)$
- $e - e^{-1} = 2\left(1 + \frac{1}{3!} + \frac{1}{5!} + \frac{1}{7!} + \ldots\right)$
- *Logarithms to the base e are known as the Napierian system, so named after Napier, their inventor. They are also called natural logarithm.*

Example 51. *If $x < 1$, then find the coefficient of x^n in the expansion of $\frac{e^x}{1 - x}$.*

Sol. We have, $\frac{e^x}{1 - x} = e^x(1 - x)^{-1}$

$$= \left(1 + \frac{x}{1!} + \frac{x^2}{2!} + \ldots + \frac{x^{n-2}}{(n-2)!} + \frac{x^{n-1}}{(n-1)!} + \frac{x^n}{n!} + \ldots\right)$$
$$(1 + x + x^2 + \ldots + x^{n-2} + x^{n-1} + x^n + \ldots)$$

$\therefore$ Coefficient of x^n in $\frac{e^x}{(1 - x)}$

$$= 1 + \frac{1}{1!} + \frac{1}{2!} + \ldots + \frac{1}{(n-1)!} + \frac{1}{n!}$$

Example 52. *The value of* $\dfrac{1 + \frac{2^2}{2!} + \frac{2^4}{3!} + \frac{2^6}{4!} + \ldots}{1 + \frac{1}{2!} + \frac{2}{3!} + \frac{2^2}{4!} + \ldots}$ *is*

(a) e^2 *(b)* $e^2 + 1$ *(c)* $e^2 - 1$ *(d)* $e + 1$

Sol. (c) Numerator $= 1 + \frac{2^2}{2!} + \frac{2^4}{3!} + \frac{2^6}{4!} + \ldots$

$$= \frac{1}{2^2}\left\{2^2 + \frac{2^4}{2!} + \frac{2^6}{3!} + \frac{2^8}{4!} + \ldots\right\}$$

$$= \frac{1}{2^2}\left\{\frac{(2^2)}{1!} + \frac{(2^2)^2}{2!} + \frac{(2^2)^3}{3!} + \frac{(2^2)^4}{4!} + \ldots\right\}$$

$$= \frac{1}{2^2}\{e^{2^2} - 1\}$$

$$= \frac{e^4 - 1}{4} \quad \ldots(i)$$

and denominator

$$= 1 + \frac{1}{2!} + \frac{2}{3!} + \frac{2^2}{4!} + \ldots = \frac{1}{2^2}\left\{2^2 + \frac{2^2}{2!} + \frac{2^3}{3!} + \frac{2^4}{4!} + \ldots\right\}$$

$$= \frac{1}{4}\left\{1 + \left(1 + 2 + \frac{2^2}{2!} + \frac{2^3}{3!} + \frac{2^4}{4!} + \ldots\right)\right\}$$

$$= \frac{1}{4}\{1 + e^2\} \quad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{1 + \frac{2^2}{2!} + \frac{2^4}{3!} + \frac{2^6}{4!} + \ldots}{1 + \frac{1}{2!} + \frac{2}{3!} + \frac{2^2}{4!} + \ldots} = \frac{\frac{1}{4}(e^4 - 1)}{\frac{1}{4}(e^2 + 1)} = \frac{(e^2 + 1)(e^2 - 1)}{(e^2 + 1)}$$

$$= e^2 - 1$$

Logarithmic Series

(a) $\ln(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots$ where, $-1 < x \le 1$

(b) $\ln(1 - x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \frac{x^4}{4} - \ldots$ where, $-1 \le x < 1$

(c) $\ln\frac{(1 + x)}{(1 - x)} = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \ldots\right), |x| < 1$

Remember

(a) $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \ldots = \ln 2$ (b) $e^{\ln x} = x$

(c) $\ln 2 = 0.693$ (d) $\ln 10 = 2.303$

(e) $\sum_{n=1}^{\infty} \frac{n}{n!} = e$ (f) $\sum_{n=1}^{\infty} \frac{n^2}{n!} = 2e$

(g) $\sum_{n=1}^{\infty} \frac{n^3}{n!} = 5e$ (h) $\sum_{n=1}^{\infty} \frac{n^4}{n!} = 15e$

Example 53. *The value of*

$$1+\left(\frac{1}{2}+\frac{1}{3}\right)\frac{1}{4}+\left(\frac{1}{4}+\frac{1}{5}\right)\frac{1}{4^2}+\left(\frac{1}{6}+\frac{1}{7}\right)\frac{1}{4^3}+\ldots \text{ is}$$

(a) $\log_e \sqrt{12}$ *(b)* $\frac{1}{3}\log_e 12$

(c) $\frac{1}{4}\log_e 4$ *(d) None of these*

Sol. (a) Consider,

$$1+\left(\frac{1}{2}+\frac{1}{3}\right)\frac{1}{4}+\left(\frac{1}{4}+\frac{1}{5}\right)\frac{1}{4^2}+\left(\frac{1}{6}+\frac{1}{7}\right)\frac{1}{4^3}+\ldots$$

$$=\left(\frac{1}{2}\cdot\frac{1}{4}+\frac{1}{4}\cdot\frac{1}{4^2}+\frac{1}{6}\cdot\frac{1}{4^3}+\ldots\right)$$

$$+\left(1+\frac{1}{3}\cdot\frac{1}{4}+\frac{1}{5}\cdot\frac{1}{4^2}+\frac{1}{7}\cdot\frac{1}{4^3}+\ldots\right)$$

$$=\frac{1}{2}\left[\frac{1}{4}+\frac{1}{2}\left(\frac{1}{4}\right)^2+\frac{1}{3}\left(\frac{1}{4}\right)^3+\ldots\right]$$

$$+2\left[\frac{1}{2}+\frac{1}{3}\left(\frac{1}{2}\right)^3+\frac{1}{5}\left(\frac{1}{2}\right)^5+\ldots\right]$$

$$=\frac{1}{2}\left\{-\log_e\left(1-\frac{1}{4}\right)\right\}+\log_e\left(\frac{1+\frac{1}{2}}{1-\frac{1}{2}}\right)$$

$$=-\frac{1}{2}\log_e\left(\frac{3}{4}\right)+\log_e(3)=\log_e 3-\log_e\sqrt{\frac{3}{4}}$$

$$=\log_e 3+\log_e\left(\frac{2}{\sqrt{3}}\right)=\log_e\left(3\cdot\frac{2}{\sqrt{3}}\right)=\log_e(2\sqrt{3})$$

$$=\log_e(\sqrt{12})$$

Example 54. *In the expansion of* $2\log_e x-\log_e(x+1)-\log_e(x-1)$, *the coefficient of* x^{-4} *is*

(a) $\frac{1}{2}$

(b) -1

(c) 1

(d) None of the above

Sol. (a) $2\log_e x-\log_e\left\{\left(1+\frac{1}{x}\right)x\right\}-\log_e\left\{\left(1-\frac{1}{x}\right)x\right\}$

$$=2\log_e x-\left\{\log_e\left(1+\frac{1}{x}\right)+\log_e x\right\}$$

$$-\left\{\log_e\left(1-\frac{1}{x}\right)+\log_e x\right\}$$

$$=-\left\{\log_e\left(1+\frac{1}{x}\right)+\log_e\left(1-\frac{1}{x}\right)\right\}=2\left\{\frac{1}{2x^2}+\frac{1}{4x^4}+\ldots\right\}$$

Thus, coefficient of $x^{-4}=2\cdot\frac{1}{4}=\frac{1}{2}$

Work Book Exercise 8.4

1 $\dfrac{1}{\left(x^2+\frac{1}{x}\right)^{4/3}}$ can be expanded by binomial theorem, if

- **a** $x<1$
- **b** $|x|<1$
- **c** $x>1$
- **d** $|x|>1$

2 If $|x|<1$, then $1+n\left(\frac{2x}{1+x}\right)+\frac{n(n+1)}{2!}\left(\frac{2x}{1+x}\right)^2+\ldots$ is equal to

- **a** $\left(\frac{1-x}{1+x}\right)^n$
- **b** $\left(\frac{1+x}{1-x}\right)^n$
- **c** $\left(\frac{1+x}{2x}\right)^n$
- **d** $\left(\frac{2x}{1+x}\right)^n$

3 The coefficient of x^3 in the expansion of $\frac{(1+3x)^2}{1-2x}$ will be

- **a** 8
- **b** 32
- **c** 50
- **d** None of these

4 The coefficient of x^r in the expansion of $(1-4x)^{-1/2}$ is

- **a** $\frac{(2r)!}{(r!)^2}$
- **b** ${}^{2r}C_{r+1}$
- **c** $\frac{1\cdot3\cdot5\ldots(2r-1)}{2^r\cdot r!}$
- **d** None of the above

5 If the binomial expansion of $(a+bx)^{-2}$ is $\frac{1}{4}-3x+\ldots$, then the values of a and b are

- **a** 2, 12
- **b** 2, 10
- **c** 1, 12
- **d** None of these

6 In the expansion of $(e^x-1)(e^{-x}+1)$, the coefficient of x^3 is

- **a** 0
- **b** $\frac{1}{3}$
- **c** $\frac{2}{3}$
- **d** $\frac{1}{6}$

7 In the expansion of $\frac{e^{7x}+e^{3x}}{e^{5x}}$, the constant term is

- **a** 0
- **b** 1
- **c** 2
- **d** None of these

8 The value of $\frac{1}{1\cdot3}+\frac{1}{2}\cdot\frac{1}{3\cdot5}+\frac{1}{3}\cdot\frac{1}{5\cdot7}+\ldots$ is

- **a** $2\log_e 2-1$
- **b** $\log_e 2-1$
- **c** $\log_e 2$
- **d** None of these

9 The coefficient of n^{-r} in the expansion of $\log_{10}\left(\frac{n}{n-1}\right)$ is

- **a** $\frac{1}{r\log_e 10}$
- **b** $\frac{-1}{r\log_e 10}$
- **c** $\frac{-1}{r!\log_e 10}$
- **d** None of these

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. The coefficient of x^{50} in the expansion $(1+x)^{1000}+2x(1+x)^{999}+3x^2(1+x)^{998}$ $+\ldots+1001x^{1000}$ is

(a) ${}^{1002}C_{50}$ (b) ${}^{1002}C_{51}$ (c) ${}^{1005}C_{50}$ (d) ${}^{1005}C_{48}$

Sol. Let $S=(1+x)^{1000}+2x(1+x)^{999}+3x^2(1+x)^{998}$
$$+\ldots+1000(1+x)x^{999}+1001x^{1000} \quad \ldots\text{(i)}$$
$$\Rightarrow \frac{xS}{1+x}=x(1+x)^{999}+2x^2(1+x)^{998}$$
$$+\ldots+1000x^{1000}+1001\frac{x^{1001}}{1+x} \quad \ldots\text{(ii)}$$

On subtracting Eq.(ii) from Eq.(i), we get
$$S-\frac{xS}{1+x}=\{(1+x)^{1000}+x(1+x)^{999}+x^2(1+x)^{998}$$
$$+\ldots+x^{1000}\}-1001\frac{x^{1001}}{1+x}$$
$$\Rightarrow \frac{S}{1+x}=(1+x)^{1000}\left\{\frac{1-\left(\frac{x}{1+x}\right)^{1001}}{1-\frac{x}{1+x}}\right\}-1001\frac{x^{1001}}{1+x}$$
$$\Rightarrow \frac{S}{1+x}=(1+x)^{1001}-x^{1001}-1001\frac{x^{1001}}{1+x}$$
$$\Rightarrow S=(1+x)^{1002}-x^{1001}(1+x)-1001x^{1001}$$
$$\Rightarrow S=(1+x)^{1002}-1002x^{1001}-x^{1002}$$

$\therefore$ Coefficient of x^{50} in S = Coefficient of x^{50} in $(1+x)^{1002}$
$$={}^{1002}C_{50}$$

Hence, (a) is the correct answer.

Ex 2. If $(1-x+x^2)^n=a_0+a_1x+a_2x^2+\ldots+a_{2n}x^{2n}$, where $a_0,a_1,a_2,\ldots,a_{2n}$ are in AP, then a_n is equal to

(a) $\dfrac{1}{2n+1}$ (b) $\dfrac{1}{2n-1}$ (c) $\dfrac{2}{2n-1}$ (d) $\dfrac{1}{n+1}$

Sol. We have,
$$(1-x+x^2)^n=a_0+a_1x+a_2x^2+\ldots+a_{2n}x^{2n}$$

Putting $x=1$ on both sides, we get
$$a_0+a_1+a_2+\ldots+a_n+\ldots+a_{2n}=1$$
$$\Rightarrow \frac{2n+1}{2}[a_0+a_{2n}]=1$$
$$[\because a_0,a_1,\ldots,a_{2n} \text{ are in AP}]$$
$$\Rightarrow a_0+a_{2n}=\frac{2}{2n+1}$$
$$\Rightarrow a_0+[a_0+(2n+1-1)d]=\frac{2}{2n+1}$$

where, d denotes the common difference of the AP.
$$\Rightarrow a_0+nd=\frac{1}{2n+1}$$
$$\Rightarrow a_n=\frac{1}{2n+1}$$
$$[\because a_n=(n+1)\text{th term}=a_0+(n+1-1)d]$$

Hence, (a) is the correct answer.

Ex 3. The coefficient of $x^r\ \{0\le r\le(n-1)\}$ in the expansion of $(x+2)^{n-1}+(x+2)^{n-2}(x+1)+(x+2)^{n-3}(x+1)^2+\ldots+(x+1)^{n-1}$ is equal to

(a) $(2^{n+r}+1)\,{}^nC_r$

(b) $(2^{n-r}+1)\,{}^nC_r$

(c) $(2^{n-r}-1)\,{}^nC_r$

(d) $(2^{n+r}-1)\,{}^nC_r$

Sol. We have,
$$(x+2)^{n-1}+(x+2)^{n-2}(x+1)+(x+2)^{n-3}(x+1)^2$$
$$+\ldots+(x+1)^{n-1}$$
$$=(x+2)^{n-1}\left\{\frac{1-\left(\frac{x+1}{x+2}\right)^n}{1-\frac{x+1}{x+2}}\right\}$$
$$=(x+2)^n-(x+1)^n$$

$\therefore$ Coefficient of x^r in the given expression
$$=\text{Coefficient of } x^r \text{ in } (x+2)^n$$
$$-\text{Coefficient of } x^r \text{ in } (x+1)^n$$
$$={}^nC_r\,2^{n-r}-{}^nC_r$$
$$=(2^{n-r}-1)\,{}^nC_r$$

Hence, (c) is the correct answer.

Ex 4. If k and n are positive integer and $s_k=1^k+2^k+\ldots+n^k$, then $\sum_{r=1}^{m}{}^{m+1}C_r s_r$ is equal to

(a) $(n+1)^{m+1}-(n+1)$

(b) $(n+1)^{m+1}+(n+1)$

(c) $(n-1)^{m+1}-(n-1)$

(d) None of the above

Sol. We have, $\sum_{r=1}^{m}{}^{m+1}C_r s_r$
$$=\sum_{r=1}^{m}{}^{m+1}C_r(1^r+2^r+\ldots+n^r)$$
$$=\sum_{k=1}^{n}\left\{\sum_{r=1}^{m}{}^{m+1}C_r k^r\right\}$$

$$= \sum_{k=1}^{n}\left(\left\{\sum_{r=0}^{m+1} {}^{m+1}C_r k^r\right\} - {}^{m+1}C_0 - {}^{m+1}C_{m+1}k^{m+1}\right)$$

$$= \sum_{k=1}^{n}\{(1+k)^{m+1} - 1 - k^{m+1}\}\left[\because \sum_{r=0}^{n} {}^{n}C_r x^r = (1+x)^n\right]$$

$$= \sum_{k=1}^{n}\{(1+k)^{m+1} - k^{m+1}\} - \sum_{k=1}^{n} 1$$

$$= \sum_{k=1}^{n}\{(1+k)^{m+1} - k^{m+1}\} - n$$

$$= [(2^{m+1} - 1^{m+1}) + (3^{m+1} - 2^{m+1}) + \ldots + \{(n+1)^{m+1} - n^{m+1}\}] - n$$

$$= \{(n+1)^{m+1} - 1\} - n = (n+1)^{m+1} - (n+1)$$

Hence, (a) is the correct answer.

Ex 5. If $C_0, C_1, C_2, \ldots, C_n$ denote the binomial coefficients in the expansion of $(1+x)^n$, then $\sum_{r=0}^{n} (-1)^r {}^nC_r \dfrac{1 + r\log_e 10}{(1+\log_e 10^n)^r}$ is equal to

(a) 0

(b) 1

(c) 2

(d) Cannot be discussed

Sol. Let $\log_e 10 = x$. Then,

$$\sum_{r=0}^{n}(-1)^r\, {}^nC_r \frac{1 + r\log_e 10}{(1+\log_e 10^n)^r} = \sum_{r=0}^{n}(-1)^r\, {}^nC_r \frac{1+rx}{(1+nx)^r}$$

$$= \sum_{r=0}^{n}(-1)^r\, {}^nC_r\left(\frac{1}{1+nx}\right)^r + \sum_{r=0}^{n}(-1)^r \frac{n}{r}\, {}^{n-1}C_{r-1}\frac{rx}{(1+nx)^r}$$

$$= \sum_{r=0}^{n}(-1)^r\, {}^nC_r\left(\frac{1}{1+nx}\right)^r - \frac{nx}{1+nx}\cdot\sum_{r=1}^{n}(-1)^{r-1}\, {}^{n-1}C_{r-1}\left(\frac{1}{1+nx}\right)^{r-1}$$

$$= \left(1 - \frac{1}{1+nx}\right)^n - \frac{nx}{1+nx}\left(1 - \frac{1}{1+nx}\right)^{n-1}$$

$$= \left(\frac{nx}{1+nx}\right)^n - \left(\frac{nx}{1+nx}\right)^n = 0$$

Hence, (a) is the correct answer.

Ex 6. The coefficient of $x^3y^4z^5$ in the expansion of $(xy + yz + zx)^6$ is

(a) 70

(b) 60

(c) 50

(d) None of the above

Sol. We have,

$$(xy + yz + zx)^6 = \sum_{r+s+t=6} \frac{6!}{r!s!t!}(xy)^r (yz)^s (zx)^t$$

$$= \sum_{r+s+t=6} \frac{6!}{r!s!t!} x^{r+t} y^{r+s} z^{s+t}$$

If the general term in the above expansion contains $x^3y^4z^5$, then

$$r + t = 3,\ r + s = 4 \quad \text{and} \quad s + t = 5$$

Also, $r + s + t = 6$

On solving these equations, we get

$$r = 1,\ s = 3,\ t = 2$$

$\therefore$ Coefficient of $x^3y^4z^5 = \dfrac{6!}{1!3!2!} = \dfrac{6!}{2!3!} = 60$

Hence, (b) is the correct answer.

Ex 7. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n,\ n \in N$, then for $2 \le m \le n$, $C_0 - C_1 + C_2 - C_3 + \ldots + (-1)^{m-1}C_{m-1}$ is equal to

(a) $(-1)^{m-1}\cdot{}^{n-1}C_{m-1}$ (b) ${}^{n-1}C_{m-1}$

(c) $(-1)^m\cdot{}^{n-1}C_{m-1}$ (d) None of these

Sol. We have, $(1-x)^n(1-x)^{-1}$

$$= \{C_0 - C_1x + C_2x^2 - C_3x^3 + \ldots + (-1)^{m-1}C_{m-1}x^{m-1} + \ldots + (-1)^nC_nx^n\} \times \{1 + x + x^2 + x^3 + \ldots + x^{m-1} + x^m + \ldots\}$$

Equating coefficients of x^{m-1} on both sides, we get

$$(-1)^{m-1}\cdot{}^{n-1}C_{m-1} = C_0 - C_1 + C_2 - C_3 + \ldots + (-1)^{m-1}C_{m-1}$$

$$\Rightarrow C_0 - C_1 + C_2 - C_3 + \ldots + (-1)^{m-1}C_{m-1}$$

$$= (-1)^{m-1}\frac{(n-1)!}{(n-m)!\,(m-1)!}$$

$$= (-1)^{m-1}\cdot{}^{n-1}C_{m-1}$$

Hence, (a) is the correct answer.

Ex 8. For any positive integers m, n with $n \ge m$, let $\dbinom{n}{m} = {}^nC_m$. Then, $\dbinom{n}{m} + \dbinom{n-1}{m} + \dbinom{n-2}{m} + \ldots + \dbinom{m}{m}$ is equal to

(a) ${}^nC_m$ (b) ${}^nC_{m+1}$

(c) ${}^{n+1}C_{m+1}$ (d) None of these

Sol. We know that,

${}^nC_r =$ Coefficient of x^r in $(1+x)^n$

$$\therefore \binom{n}{m} + \binom{n-1}{m} + \binom{n-2}{m} + \ldots + \binom{m}{m}$$

$=$ Coefficient of x^m in $(1+x)^n$ + Coefficient of x^m in $(1+x)^{n-1} + \ldots +$ Coefficient of x^m in $(1+x)^m$

$=$ Coefficient of x^m in $[(1+x)^n + (1+x)^{n-1} + \ldots + (1+x)^m]$

$=$ Coefficient of x^m in $(1+x)^m\left\{\dfrac{(1+x)^{n-m+1} - 1}{(1+x) - 1}\right\}$

$=$ Coefficient of x^{m+1} in $\{(1+x)^{n+1} - (1+x)^m\}$

$=$ Coefficient of x^{m+1} in $(1+x)^{n+1} = {}^{n+1}C_{m+1}$

Hence, (c) is the correct answer.

Ex 9. Let n be an even integer and $k = \dfrac{3n}{2}$. Then, the value of $\sum_{r=1}^{k} (-3)^{r-1}\ {}^{3n}C_{2r-1}$ is

(a) 0 (b) 1 (c) 2 (d) 3

Sol. Since, n is an even integer. Therefore, $n = 2m, m \in N$

Also, $k = \dfrac{3n}{2} \Rightarrow k = 3m$

$$\therefore \sum_{r=1}^{k} (-3)^{r-1}\ {}^{3n}C_{2r-1} = \sum_{r=1}^{3m} (-3)^{r-1}\ {}^{6m}C_{2r-1}$$

$$= {}^{6m}C_1 - {}^{6m}C_3(3) + {}^{6m}C_5(3)^2 - {}^{6m}C_7(3)^3 + \dots + (-3)^{3m-1}\ {}^{6m}C_{6m-1}$$

Now, $(1 + i\sqrt{3})^{6m} = \sum_{r=0}^{6m} {}^{6m}C_r (i\sqrt{3})^r$

$$\Rightarrow 2^{6m}\left\{\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right\}^{6m} = {}^{6m}C_0 + {}^{6m}C_1(i\sqrt{3})$$

$$+{}^{6m}C_2(i\sqrt{3})^2 + {}^{6m}C_3(i\sqrt{3})^3 + \dots + {}^{6m}C_{6m}(i\sqrt{3})^{6m}$$

$$\Rightarrow 2^{6m}(\cos 2m\pi + i\sin 2m\pi) = \{{}^{6m}C_0 - {}^{6m}C_2 3 + {}^{6m}C_4 3^2 - \dots\} + i\sqrt{3}\ \{{}^{6m}C_1 - {}^{6m}C_3(3) + {}^{6m}C_5(3)^4 - \dots\}$$

[using De-Moivre's theorem on LHS]

Equating imaginary parts on both sides, we get

$$2^{6m}\sin 2m\pi = \sqrt{3}\ \{{}^{6m}C_1 - {}^{6m}C_3(3) + {}^{6m}C_5(3)^4 - \dots\}$$

$$\Rightarrow {}^{6m}C_1 - {}^{6m}C_3(3) + {}^{6m}C_5(3)^4 - \dots = 0 \quad [\because \sin 2m\pi = 0]$$

$$\Rightarrow \sum_{r=1}^{3m} (-3)^{r-1}\ {}^{6m}C_{2r-1} = 0$$

$$\Rightarrow \sum_{r=1}^{k} (-3)^{r-1}\ {}^{3n}C_{2r-1} = 0,$$

where $n = 2m$ and $k = \dfrac{3n}{2}$

Hence, (a) is the correct answer.

Ex 10. The value of ${}^nC_3 + {}^nC_7 + {}^nC_{11} + \dots$ is

(a) $\dfrac{1}{2}\left\{2^{n-1} - 2^{n/2}\sin\dfrac{n\pi}{4}\right\}$

(b) $\dfrac{1}{2}\left\{2^{n-1} + 2^{n/2}\sin\dfrac{n\pi}{4}\right\}$

(c) $\dfrac{1}{4}\left\{2^{n+1} - 2^{n/2}\sin\dfrac{n\pi}{4}\right\}$

(d) None of the above

Sol. We have, $(1 + x)^n = C_0 + C_1x + C_2x^2 + \dots + C_nx^n$ ...(i)

Putting $x = 1$ and -1 respectively in Eq. (i), we get

$$C_0 + C_1 + C_2 + \dots + C_n = 2^n$$

$$C_0 - C_1 + C_2 - C_3 + \dots + (-1)^n C_n = 0$$

On adding and subtracting these two, we get

$$C_0 + C_2 + C_4 + \dots = 2^{n-1}$$

$$C_1 + C_3 + C_5 + \dots = 2^{n-1} \quad \text{...(ii)}$$

Putting $x = i$ in Eq. (i), we get

$$(C_0 - C_2 + C_4 - C_6 + \dots) + i\,(C_1 - C_3 + C_5 - \dots) = (1 + i)^n$$

$$\Rightarrow (C_0 - C_2 + C_4 - C_6 + \dots) + i\,(C_1 - C_3 + C_5 - C_7 + \dots) = 2^{n/2}\left(\cos\frac{n\pi}{4} + i\sin\frac{n\pi}{4}\right)$$

On equating imaginary parts on both sides, we get

$$C_1 - C_3 + C_5 - C_7 + \dots = 2^{n/2}\sin\frac{n\pi}{4} \quad \text{...(iii)}$$

On subtracting Eq. (iii) from Eq. (ii), we get

$$2\,(C_3 + C_7 + C_{11} + \dots) = \left[2^{n-1} - 2^{n/2}\sin\frac{n\pi}{4}\right]$$

$$\Rightarrow C_3 + C_7 + C_{11} + \dots = \frac{1}{2}\left[2^{n-1} - 2^{n/2}\sin\frac{n\pi}{4}\right]$$

Hence, (a) is the correct answer.

Ex 11. The integer just greater than $(\sqrt{3} + 1)^{2m}$ contains

(a) 2^{m+2} as a factor (b) 2^{m+1} as a factor

(c) 2^{m+3} as a factor (d) None of these

Sol. Let $(\sqrt{3} + 1)^{2m} = I + F$, where $I \in N$ and $0 < F < 1$

Let $G = (\sqrt{3} - 1)^{2m}$. Then,

$$I + F + G = (\sqrt{3} + 1)^{2m} + (\sqrt{3} - 1)^{2m} = 2^m\,(2 + \sqrt{3})^m + 2^m(2 - \sqrt{3})^m = 2^{m+1} \times \text{an integer} \quad \text{...(i)}$$

$\Rightarrow I + F + G =$ an even integer

$\Rightarrow F + G =$ an even integer $- I$

$\Rightarrow F + G =$ an integer

$\Rightarrow F + G = 1 \quad [\because 0 < F < 1, 0 < G < 1]$

Putting $F + G = 1$ in Eq. (i), we get

$$I + 1 = 2^{m+1} \times \text{an integer}$$

$\Rightarrow 2^{m+1}$ is a factor of the integer just greater than $(\sqrt{3} + 1)^{2m}$.

Hence, (b) is the correct answer.

Ex 12. If $\sum_{r=0}^{2n} a_r(x-2)^r = \sum_{r=0}^{2n} b_r(x-3)^r$ and $a_k = 1$ for all $k \geq n$, then b_n is equal to

(a) ${}^{n+1}C_{2n+1}$ (b) ${}^{2n+1}C_{n+1}$

(c) ${}^{2n+1}C_{n+2}$ (d) None of these

Sol. Clearly, b_n is the coefficient of $(x - 3)^n$ in the expression $\sum_{r=0}^{2n} b_r(x - 3)^r$. Therefore,

$$b_n = \text{Coefficient of } (x-3)^n \text{ in } \left(\sum_{r=0}^{2n} a_r(x-2)^r\right) \quad \text{...(i)}$$

$$= \text{Coefficient of } (x-3)^n \text{ in } \left\{\sum_{r=0}^{n-1} a_r(x-2)^r + \sum_{r=n}^{2n} a_r(x-2)^r\right\}$$

$= \text{Coefficient of } (x-3)^n \text{ in}$

$$\left\{ \sum_{r=0}^{n-1} a_r (x-2)^r + \sum_{r=n}^{2n} (x-2)^r \right\}$$

$$[\because a_k = 1 \text{ for all } k \geq n]$$

$$= \text{Coefficient of } (x-3)^n \text{ in } \sum_{r=0}^{2n} (x-2)^r$$

$$= \text{Coefficient of } (x-3)^n \text{ in} \left[(x-2)^n \left\{ \frac{(x-2)^{n+1}-1}{(x-2)-1} \right\} \right]$$

$$= \text{Coefficient of } (x-3)^n \text{ in} \left\{ \frac{(x-2)^{2n+1}-(x-2)^n}{x-3} \right\}$$

$$= \text{Coefficient of } (x-3)^{n+1} \text{ in } \{(x-2)^{2n+1}-(x-2)^n\}$$

$$= \text{Coefficient of } (x-3)^{n+1} \text{ in } (x-2)^{2n+1}$$

$$= \text{Coefficient of } (x-3)^{n+1} \text{ in } [(x-3)+1]^{2n+1}$$

$$= \text{Coefficient of } (x-3)^{n+1} \text{ in} \left\{ \sum_{r=0}^{2n+1} {}^{2n+1}C_r (x-3)^r \right\}$$

$$= {}^{2n+1}C_{n+1}$$

Hence, (b) is the correct answer.

Ex 13. Let $f(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2x}$ and

$$g(x) = b_0 + b_1 x + b_2 x^2 + \ldots + b_{n-1} x^{n-1} + x^n + x^{n+1} + \ldots + x^{2n}$$

If $f(x) = g(x+1)$, then a_n in terms of n is equal to

(a) ${}^{2n+1}C_{n+1}$ (b) ${}^{2n-1}C_{n-1}$

(c) ${}^{2n-1}C_{n+1}$ (d) ${}^{n+1}C_{n+1}$

Sol. We have, $f(x) = g(x+1)$

$$\Rightarrow \sum_{r=0}^{2n} a_1 x^r = \sum_{r=0}^{n-1} b_r (x+1)^r + \sum_{r=n}^{2n} (x+1)^r$$

$$\Rightarrow \sum_{r=0}^{2n} a_r x^r = \sum_{r=0}^{n-1} b_r (x+1)^r + (x+1)^n + (x+1)^{n+1} + \ldots + (x+1)^{2n}$$

$$\Rightarrow \sum_{r=0}^{2n} a_r x^r = \sum_{r=0}^{n-1} b_r (x+1)^r + (x+1)^n \left\{ \frac{(x+1)^{n+1}-1}{x+1-1} \right\}$$

$$\Rightarrow \sum_{r=0}^{2n} a_r x^r = \sum_{r=0}^{n-1} b_r (x+1)^r + \frac{(x+1)^{2n+1}-(x+1)^n}{x}$$

Now, $a_n = \text{Coefficient of } x^n \text{ in } \sum_{r=0}^{2n} a_r x^r$

$= \text{Coefficient of } x^n \text{ in}$

$$\left\{ \sum_{r=0}^{n-1} b_r (x+1)^r + \frac{(x+1)^{2n+1}-(x+1)^n}{x} \right\}$$

$$= \text{Coefficient of } x^n \text{ in} \left\{ \frac{(x+1)^{2n+1}-(x+1)^n}{x} \right\}$$

$$= \text{Coefficient of } x^{n+1} \text{ in } \{(x+1)^{2n+1}-(x+1)^n\}$$

$$= \text{Coefficient of } x^{n+1} \text{ in } (x+1)^{2n+1}$$

$$= {}^{2n+1}C_{n+1}$$

Hence, (a) is the correct answer.

Ex 14. The greatest term in the expansion of $(1+x)^{10}$, when $x = \frac{2}{3}$, is

(a) $210\left(\frac{2}{3}\right)^4$ (b) $\left(\frac{2}{3}\right)^4$

(c) $210\left(\frac{1}{3}\right)^4$ (d) $210\left(\frac{2}{3}\right)^6$

Sol. Let T_r and T_{r+1} denote the rth and $(r+1)$th terms in the expansion of $(1+x)^{10}$. Then,

$$T_r = {}^{10}C_{r-1} x^{r-1} \quad \text{and} \quad T_{r+1} = {}^{10}C_r x^r$$

$$\therefore \quad \frac{T_{r+1}}{T_r} = \frac{{}^{10}C_r x^r}{{}^{10}C_{r-1} x^{r-1}}$$

$$\Rightarrow \quad \frac{T_{r+1}}{T_r} = \frac{{}^{10}C_r}{{}^{10}C_{r-1}} \cdot x$$

$$\Rightarrow \quad \frac{T_{r+1}}{T_r} = \frac{11-r}{r} \cdot x$$

$$\Rightarrow \quad \frac{T_{r+1}}{T_r} = \left(\frac{11-r}{r}\right) \times \frac{2}{3} \qquad \left[\because x = \frac{2}{3}\right]$$

$$\text{Now,} \quad \frac{T_{r+1}}{T_r} > 1$$

$$\Rightarrow \quad \left(\frac{11-r}{r}\right) \times \frac{2}{3} > 1$$

$$\Rightarrow \quad 22 > 5r$$

$$\Rightarrow \quad r < 4\frac{2}{5}$$

$\therefore$ $(4+1)$th i.e. 5th term is the greatest term.

Putting $r = 4$ in T_{r+1}, we get

$$T_5 = {}^{10}C_4 x^4$$

$$\Rightarrow \quad T_5 = {}^{10}C_4 \left(\frac{2}{3}\right)^4 \qquad \left[\because x = \frac{2}{3}\right]$$

$$\Rightarrow \quad T_5 = 210\left(\frac{2}{3}\right)^4$$

Hence, (a) is the correct answer.

Ex 15. The greatest term in the expansion of $(1+x)^{2n}$ has also the greatest coefficient, then

(a) $x \in \left(\frac{n}{n-1}, \frac{n+1}{n}\right)$ (b) $x \in \left(\frac{n}{n-1}, \frac{n-1}{n}\right)$

(c) $x \in \left(\frac{n}{n+1}, \frac{n+1}{n}\right)$ (d) $x \in \left(\frac{n}{n-1}, \frac{n+1}{n}\right)$

Sol. Let $(r+1)$th term be the greatest term in the expansion of $(1+x)^{2n}$. Then,

$$T_{r+1} = {}^{2n}C_r x^{2n-r}$$

The coefficient of T_{r+1} is ${}^{2n}C_r$. Clearly, ${}^{2n}C_r$ will be greatest, if $r = \frac{2n}{2} = n$

Thus, $T_{n+1} = {}^{2n}C_n x^n$ has the greatest coefficient.

Now, T_{n+1} will be the greatest term, if

$$T_n < T_{n+1} > T_{n+2}$$

$$\Rightarrow \quad T_{n+1} > T_n \quad \text{and} \quad T_{n+2} < T_{n+1}$$

$$\Rightarrow \quad \frac{T_{n+1}}{T_n} > 1 \quad \text{and} \quad \frac{T_{n+2}}{T_{n+1}} < 1$$

$$\Rightarrow \quad \frac{{}^{2n}C_n x^n}{{}^{2n}C_{n-1} x^{n-1}} > 1 \quad \text{and} \quad \frac{{}^{2n}C_{n+1} x^{n+1}}{{}^{2n}C_n x^n} < 1$$

$$\Rightarrow \quad \left(\frac{n+1}{n}\right) x > 1 \quad \text{and} \quad \left(\frac{n}{n+1}\right) x < 1$$

$$\Rightarrow \quad x > \frac{n}{n+1} \quad \text{and} \quad x < \frac{n+1}{n}$$

$$\Rightarrow \quad \frac{n}{n+1} < x < \frac{n+1}{n}$$

$$\Rightarrow \quad x \in \left(\frac{n}{n+1}, \frac{n+1}{n}\right)$$

Hence, (c) is the correct answer.

Ex 16. $\sum_{r=0}^{n} (-1)^r \frac{{}^nC_r}{{}^{r+3}C_r}$ is equal to

(a) $\frac{3!}{2(n-3)}$

(b) $\frac{3!}{2(n+3)}$

(c) $\frac{3!}{(n+3)}$

(d) None of the above

Sol. We have, $\sum_{r=0}^{n} (-1)^r \frac{{}^nC_r}{{}^{r+3}C_r}$

$$= \sum_{r=0}^{n} (-1)^r \frac{n! \cdot 3!}{(n-r)!\,(r+3)!}$$

$$= 3! \sum_{r=0}^{n} (-1)^r \frac{n!}{(n-r)!\,(r+3)!}$$

$$= \frac{3!}{(n+1)(n+2)(n+3)} \sum_{r=0}^{n} \frac{(-1)^r (n+3)!}{\{(n+3)-(r+3)\}!\,(r+3)!}$$

$$= \frac{3!}{(n+1)(n+2)(n+3)} \sum_{r=0}^{n} (-1)^r \, {}^{n+3}C_{r+3}$$

$$= \frac{3!}{(n+1)(n+2)(n+3)} \sum_{s=3}^{n+3} (-1)^{s-3} \, {}^{n+3}C_s$$

$$= \frac{3!\,(-1)^3}{(n+1)(n+2)(n+3)} \sum_{s=3}^{n+3} (-1)^s \, {}^{n+3}C_s$$

$$= \frac{-3!}{(n+1)(n+2)(n+3)} \left[\left(\sum_{s=0}^{n+3} (-1)^s \cdot {}^{n+3}C_s\right) - {}^{n+3}C_0 + {}^{n+3}C_1 - {}^{n+3}C_2\right]$$

$$= \frac{3!}{2(n+3)}$$

Hence, (b) is the correct answer.

Ex 17. The value of $\sum_{r=0}^{n} (-2)^r \left(\frac{{}^nC_r}{{}^{r+2}C_r}\right)$ is

(a) $\frac{1}{n+1}$, n is odd (b) $\frac{1}{n+2}$, n is even

(c) $\frac{1}{n+1}$, n is even (d) None of these

Sol. For $r \geq 0$, we have $\frac{{}^nC_r}{{}^{r+2}C_r}$

$$= \frac{n!}{(n-r)!\,r!} \times \frac{r!\,2!}{(r+2)!}$$

$$= \frac{n! \times 2!}{(n-r)!\,(r+2)!}$$

$$= \frac{2}{(n+1)(n+2)} \times \frac{(n+1)(n+2)\,n!}{\{(n+2)-(r+2)\}!\,(r+2)!}$$

$$= \frac{2}{(n+1)(n+2)} \times {}^{n+2}C_{r+2}$$

$$\therefore \quad \sum_{r=0}^{n} (-2)^r \left(\frac{{}^nC_r}{{}^{r+2}C_r}\right)$$

$$= \frac{2}{(n+1)(n+2)} \sum_{r=0}^{n} {}^{n+2}C_{r+2} (-2)^r$$

$$= \frac{1}{2(n+1)(n+2)} \sum_{r=0}^{n} {}^{n+2}C_{r+2} (-2)^{r+2}$$

$$= \frac{1}{2(n+1)(n+2)} \sum_{s=2}^{n+2} {}^{n+2}C_s (-2)^s$$

[putting $r + 2 = s$]

$$= \frac{1}{2(n+1)(n+2)} \times \left[\sum_{s=0}^{n+2} {}^{n+2}C_s (-2)^s - {}^{n+2}C_0 (-2)^0 - {}^{n+2}C_1 (-2)^1\right]$$

$$= \frac{1}{2(n+1)(n+2)} [(1-2)^{n+2} - 1 + 2(n+2)]$$

$$= \begin{cases} \frac{1}{2(n+1)(n+2)} (2n+4), & \text{if } n \text{ is even} \\ \frac{1}{2(n+1)(n+2)} (2n+3-1), & \text{if } n \text{ is odd} \end{cases}$$

$$= \begin{cases} \frac{1}{n+1}, & \text{if } n \text{ is even} \\ \frac{1}{n+2}, & \text{if } n \text{ is odd} \end{cases}$$

Hence, (c) is the correct answer.

Ex 18. The sum of $\sum_{r=0}^{n} (-1)^r \frac{{}^nC_r}{{}^{r+2}C_r}$ is

(a) $\frac{2}{n+1}$ (b) $\frac{1}{n+2}$

(c) $\frac{2}{n-2}$ (d) $\frac{2}{n+2}$

Sol. We have, $\sum_{r=0}^{n}(-1)^r \frac{{}^nC_r}{{}^{r+2}C_r}$

$$= \sum_{r=0}^{n}(-1)^r \frac{n!}{(n-r)!\,r!} \times \frac{2!\,r!}{(r+2)!}$$

$$= 2\sum_{r=0}^{n}(-1)^r \frac{n!}{(n-r)!\,(r+2)!}$$

$$= \frac{2}{(n+1)(n+2)}\sum_{r=0}^{n}(-1)^r \frac{(n+2)!}{\{(n+2)-(r+2)\}!\,(r+2)!}$$

$$= \frac{2}{(n+1)(n+2)}\sum_{r=0}^{n}(-1)^{r+2}\,{}^{n+2}C_{r+2}$$

$$= \frac{2}{(n+1)(n+2)}\sum_{s=2}^{n+2}(-1)^s\,{}^{n+2}C_s$$

$$= \frac{2}{(n+1)(n+2)}\left[\left(\sum_{s=0}^{n+2}(-1)^s\,{}^{n+2}C_s\right) - ({}^{n+2}C_0 - {}^{n+2}C_1)\right]$$

$$= \frac{2}{n+2}$$

Hence, (d) is the correct answer.

Ex 19. If ${}^nC_0, {}^nC_1, {}^nC_2, \ldots, {}^nC_n$ denote the binomial coefficients in the expansion of $(1+x)^n$ and $p+q=1$, then $\sum_{r=0}^{n} r^2\,{}^nC_r p^r q^{n-r}$ is

(a) np (b) npq

(c) $n^2p^2 + npq$ (d) None of these

Sol. We have, $\sum_{r=0}^{n} r^2\,{}^nC_r p^r q^{n-r}$

$$= \sum_{r=0}^{n}[r(r-1)+r]\,{}^nC_r p^r q^{n-r}$$

$$= \sum_{r=0}^{n} r(r-1)\,{}^nC_r p^r q^{n-r} + \sum_{r=0}^{n} r\cdot{}^nC_r p^r q^{n-r}$$

$$= \sum_{r=2}^{n} r(r-1)\frac{n}{r}\cdot\frac{n-1}{r-1}\,{}^{n-2}C_{r-2}\,p^r q^{n-r} + \sum_{r=1}^{n} r\cdot\frac{n}{r}\,{}^{n-1}C_{r-1}p^r q^{n-r}$$

$$= n(n-1)p^2(p+q)^{n-2} + np(p+q)^{n-1}$$

$$= n(n-1)p^2 + np \qquad [\because p+q=1]$$

$$= n^2p^2 - np^2 + np$$

$$= n^2p^2 + npq \qquad [\because p+q=1]$$

Hence, (c) is the correct answer.

Ex 20. Let $a_n = (\log 3)^n \sum_{r=1}^{n}\frac{r^2}{r!\,(n-r)!}$, $n \in N$. Then, the sum of the series $a_1 + a_2 + a_3 + a_4 + \ldots$ is

(a) $(1+\log 3)(9\log 3)$ (b) $(1+\log 3)$

(c) $(1-\log 3)(9\log 3)$ (d) $(1+\log 3)(\log 3)$

Sol. We have,

$$a_n = (\log 3)^n \sum_{r=1}^{n}\frac{r^2}{r!\,(n-r)!}$$

$$= \frac{(\log 3)^n}{n!}\sum_{r=1}^{n}\frac{n!}{(n-r)!\,r!}\cdot r^2$$

$$= \frac{(\log 3)^n}{n!}\sum_{r=1}^{n}{}^nC_r\cdot r^2$$

$$= \frac{(\log 3)^n}{n!}[n(n-1)2^{n-2} + n\cdot 2^{n-1}]$$

$$\left[\because \sum_{r=1}^{n} r^2\cdot{}^nC_r = n(n-1)2^{n-2} + n\cdot 2^{n-1}\right]$$

$$= \frac{(\log 3)^n}{n!}[n(n-1)+2n]\,2^{n-2}$$

$$= \frac{1}{(n-2)!}(\log 3)^n 2^{n-2} + \frac{2}{(n-1)!}(\log 3)^n\cdot 2^{n-2}$$

$$= (\log 3)^2\frac{(2\log 3)^{n-2}}{(n-2)!} + (\log 3)\frac{(2\log 3)^{n-1}}{(n-1)!}$$

$\therefore$ Required sum

$$= \sum_{n=1}^{\infty} a_n$$

$$= (\log 3)^2\sum_{n=2}^{\infty}\frac{(\log 9)^{n-2}}{(n-2)!} + (\log 3)\sum_{n=1}^{\infty}\frac{(\log 9)^{n-1}}{(n-1)!}$$

$$= (\log 3)^2 e^{\log 9} + (\log 3)e^{\log 9}$$

$$\left[\because \sum_{n=1}^{\infty}\frac{x^{n-1}}{(n-1)!} = \sum_{n=2}^{\infty}\frac{x^{n-2}}{(n-2)!} = e^x\right]$$

$$= (1+\log 3)(9\log 3)$$

Hence, (a) is the correct answer.

Ex 21. If $(1+x)^n = \sum_{r=0}^{n}{}^nC_r x^n$, then $\frac{C_0}{1\cdot 2}2^2 + \frac{C_1}{2\cdot 3}2^3 + \frac{C_2}{3\cdot 4}2^4 + \ldots + \frac{C_n}{(n+1)(n+2)}2^{n+2}$ is equal to

(a) $\frac{3^{n+2}+2n-5}{(n+1)(n+2)}$

(b) $\frac{3^{n+2}-2n+5}{(n+1)(n+2)}$

(c) $\frac{3^{n+2}-2n-5}{(n+1)(n+2)}$

(d) None of the above

Sol. We have,

$$\frac{C_0}{1\cdot 2}2^2 + \frac{C_1}{2\cdot 3}2^3 + \frac{C_2}{3\cdot 4}2^4 + \ldots + \frac{C_n}{(n+1)(n+2)}2^{n+2}$$

$$= \sum_{r=0}^{n}\frac{1}{(r+1)(r+2)}\,{}^nC_r\cdot 2^{r+2}$$

$$= \frac{1}{(n+1)(n+2)}\sum_{r=0}^{n}\frac{n+2}{r+2}\cdot\frac{n+1}{r+1}\,{}^nC_r 2^{r+2}$$

$$= \frac{1}{(n+1)(n+2)}\sum_{r=0}^{n}{}^{n+2}C_{r+2}2^{n+2}$$

$$= \frac{1}{(n+1)(n+2)}\left\{\sum_{s=2}^{n+2} {}^{n+2}C_s 2^s\right\}$$

$$= \frac{1}{(n+1)(n+2)}$$

$$\left[\left\{\sum_{s=0}^{n+2} {}^{n+2}C_s 2^s\right\} - \{{}^{n+2}C_0 2^0 + {}^{n+2}C_1 2^1\}\right]$$

$$= \frac{1}{(n+1)(n+2)}[(1+2)^{n+2} - \{1 + 2(n+2)\}]$$

$$= \frac{3^{n+2} - 2n - 5}{(n+1)(n+2)}$$

Hence, (c) is the correct answer.

Ex 22. The value of

${}^{n-1}C_0 \cdot {}^nC_1 + {}^{n-1}C_1 \cdot {}^nC_2 + {}^{n-1}C_2 \cdot {}^nC_3 + \dots + {}^{n-1}C_{n-1} \cdot {}^nC_n$ is equal to

(a) ${}^{2n}C_n$

(b) ${}^{2n-1}C_{n-1}$

(c) ${}^{2n}C_{n+1}$

(d) None of the above

Sol. We have,

$$(C_0x^n + C_1x^{n-1} + C_2x^{n-2} + \dots + C_{n-1}x + C_n)$$
$$\times ({}^{n-1}C_0 + {}^{n-1}C_1x + {}^{n-1}C_2x^2 + \dots + {}^{n-1}C_{n-1}x^{n-1})$$
$$= (1+x)^n (1+x)^{n-1}$$

$$\Rightarrow ({}^nC_0x^n + {}^nC_1x^{n-1} + {}^nC_2x^{n-2} + \dots + {}^nC_{n-1}x + {}^nC_n)$$
$$\times ({}^{n-1}C_0 + {}^{n-1}C_1x + {}^{n-1}C_2x^2 + \dots + {}^{n-1}C_{n-1}x^{n-1})$$
$$= (1+x)^{2n-1}$$

On equating the coefficient of x^{n-1} both sides, we get

$${}^{n-1}C_0{}^nC_1 + {}^{n-1}C_1{}^nC_2 + \dots + {}^{n-1}C_{n-1}{}^nC_n = {}^{2n-1}C_{n-1}$$

Hence, (b) is the correct answer.

Ex 23. The value of

${}^{n-1}C_0 \cdot {}^nC_2 + {}^{n-1}C_1 \cdot {}^nC_3 + {}^{n-1}C_2 \cdot {}^nC_4 + \dots + {}^{n-1}C_{n-2} \cdot {}^nC_n$ is

(a) ${}^{2n}C_{n-2}$

(b) ${}^{2n-1}C_n$

(c) ${}^{2n-1}C_{n-2}$

(d) None of the above

Sol. We have,

$$(C_0x^n + C_1x^{n-1} + C_2x^{n-2} + \dots + C_{n-1}x + C_n)$$
$$\times ({}^{n-1}C_0 + {}^{n-1}C_1x + {}^{n-1}C_2x^2 + \dots + {}^{n-1}C_{n-1}x^{n-1})$$
$$= (1+x)^n(1+x)^{n-1}$$

$$\Rightarrow ({}^nC_0x^n + {}^nC_1x^{n-1} + {}^nC_2x^{n-2} + \dots + {}^nC_{n-1}x + {}^nC_n)$$
$$\times ({}^{n-1}C_0 + {}^{n-1}C_1x + {}^{n-1}C_2x^2 + \dots + {}^{n-1}C_{n-1}x^{n-1})$$
$$= (1+x)^{2n-1}$$

On equating the coefficient of x^{n-2} both sides, we get

$${}^{n-1}C_0{}^nC_2 + {}^{n-1}C_1{}^nC_3 + \dots + {}^{n-1}C_{n-2}{}^nC_n = {}^{2n-1}C_{n-2}$$

Hence, (c) is the correct answer.

Ex 24. If $(1+x)^n = C_0 + C_1x + \dots + C_nx^n$, then the value of $\sum_{r=0}^{n}\sum_{s=0}^{n}(C_r + C_s)$ is equal to

(a) $(n+1)\,2^{n+1}$

(b) $(n-1)\,2^{n+1}$

(c) $(n+1)\,2^n$

(d) None of the above

Sol. $\sum_{r=0}^{n}\sum_{s=0}^{n}(C_r + C_s)$

$$= \sum_{r=0}^{n}\sum_{s=0}^{n}C_r + \sum_{r=0}^{n}\sum_{s=0}^{n}C_s$$

$$= \sum_{s=0}^{n}\left(\sum_{r=0}^{n}C_r\right) + \sum_{r=0}^{n}\left(\sum_{s=0}^{n}C_s\right)$$

$$= \sum_{s=0}^{n}2^n + \sum_{r=0}^{n}2^n$$

$$= (n+1)\,2^n + (n+1)\,2^n = (n+1)\,2^{n+1}$$

Hence, (a) is the correct answer.

Ex 25. If $(1+x)^n = C_0 + C_1x + \dots + C_nx^n$, then the value of $\sum_{r=0}^{n}\sum_{s=0}^{n}C_rC_s$ is equal to

(a) 2^n (b) 2^{2n} (c) 2^{n+1} (d) 2^{3n}

Sol. We have, $\sum_{r=0}^{n}\sum_{s=0}^{n}C_rC_s = \sum_{r=0}^{n}\left(C_r\sum_{s=0}^{n}C_s\right)$

$$= \sum_{r=0}^{n}2^n \cdot C_r = 2^n\left(\sum_{r=0}^{n}C_r\right)$$

$$= 2^n \cdot 2^n = (2^n)^2 = 2^{2n}$$

Aliter

$$\sum_{r=0}^{n}\sum_{s=0}^{n}C_rC_s = \left(\sum_{r=0}^{n}C_r\right)\left(\sum_{s=0}^{n}C_s\right) = 2^n \cdot 2^n = 2^{2n}$$

Hence, (b) is the correct answer.

Ex 26. If $(1+x)^n = C_0 + C_1x + \dots + C_nx^n$, then the value of $\sum\sum_{0 \le r < s \le n} C_rC_s$ is equal to

(a) $\frac{1}{2}[2^{2n} - {}^{2n}C_n]$ (b) $\frac{1}{4}[2^{2n} - {}^{2n}C_n]$

(c) $\frac{1}{2}[2^{2n} + {}^{2n}C_n]$ (d) $\frac{1}{2}[2^n - {}^{2n}C_n]$

Sol. We have,

$$\sum_{r=0}^{n}\sum_{s=0}^{n}C_rC_s = \left(\sum_{r=0}^{n}C_r^2\right) + 2\sum\sum_{0 \le r < s \le n}C_rC_s$$

$$\Rightarrow \quad 2^{2n} = {}^{2n}C_n + 2\sum\sum_{0 \le r < s \le n}C_rC_s$$

$$\Rightarrow \quad \sum\sum_{0 \le r < s \le n}C_rC_s = \frac{1}{2}[2^{2n} - {}^{2n}C_n]$$

Hence, (a) is the correct answer.

Ex 27. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$, then the value of $\sum\limits_{0 \le r < s \le n} \sum (r \cdot s) C_r C_s$ is

(a) $n^2\left[2^{2n-3} + \frac{1}{2}\ {}^{2n-2}C_{n-1}\right]$

(b) $\left[2^{2n-3} - \frac{1}{2}\ {}^{2n-2}C_{n-1}\right]$

(c) $n^2\left[2^{2n-3} - \frac{1}{2}\ {}^{2n-2}C_{n-1}\right]$

(d) None of the above

Sol. We have, $\sum\limits_{0 \le r < s \le n} \sum (r \cdot s) C_r C_s = \sum\limits_{0 \le r < s \le n} \sum (r \cdot {}^nC_r)(s \cdot {}^nC_s)$

$$= \sum\limits_{0 \le r < s \le n} \sum \left(r \cdot \frac{n}{r}\ {}^{n-1}C_{r-1}\right)\left(s \cdot \frac{n}{s}\ {}^{n-1}C_{s-1}\right)$$

$$= n^2 \cdot \frac{1}{2}[2^{2(n-1)} - {}^{2(n-1)}C_{n-1}]$$

$$= n^2\left[2^{2n-3} - \frac{1}{2}\ {}^{2n-2}C_{n-1}\right]$$

Hence, (c) is the correct answer.

Ex 28. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$, then the value of $\sum\limits_{0 \le r < s \le n} \sum (C_r \pm C_s)^2$ is

(a) $(n+1)\ {}^{2n}C_n$ (b) $(n \mp 1)\ {}^{2n}C_n \pm 2^n$

(c) $(n \mp 1)\ {}^{2n}C_n$ (d) $(n \mp 1)\ {}^{2n}C_n \pm 2^{2n}$

Sol. We have, $\sum\limits_{0 \le r < s \le n} \sum (C_r \pm C_s)^2$

$$= (C_0 \pm C_1)^2 + (C_0 \pm C_2)^2 + \ldots + \ldots + (C_0 \pm C_n)^2$$
$$+ (C_1 \pm C_2)^2 + (C_1 \pm C_3)^2 + \ldots + (C_1 \pm C_n)^2$$
$$+ (C_2 \pm C_3)^2 + \ldots + (C_2 \pm C_n)^2$$

....+.......................................

....+.......................................

$$+ (C_{n-2} + C_{n-1})^2 + (C_{n-2} \pm C_n)^2 + (C_{n-1} \pm C_n)^2$$

$$= n(C_0^2 + C_1^2 + \ldots + C_n^2) \pm 2\sum\limits_{0 \le r < s \le n} \sum C_r S_s$$

$$= n \cdot {}^{2n}C_n \pm [2^{2n} - {}^{2n}C_n] = (n \mp 1)\ {}^{2n}C_n \pm 2^{2n}$$

Hence, (d) is the correct answer.

Ex 29. The value of $\sum\limits_{\substack{r=0 \\ r \le s}}^{n} \sum\limits_{s=1}^{n} {}^nC_s\ {}^sC_r$ is

(a) $3^n - 1$ (b) $3^n + 1$

(c) 3^n (d) None of these

Sol. We have, $\sum\limits_{\substack{r=0 \\ r \le s}}^{n} \sum\limits_{s=1}^{n} {}^nC_s\ {}^sC_r$

$$= \sum_{s=1}^{n} {}^nC_s({}^sC_0 + {}^sC_1 + {}^sC_2 + \ldots + {}^sC_s) \quad [\because r \le s]$$

$$= \sum_{s=1}^{n} {}^nC_s(2)^s = \sum_{s=0}^{n} {}^nC_s 2^n - {}^nC_0 2^0$$

$$= (1+2)^n - 1 = 3^n - 1$$

Hence, (a) is the correct answer.

Ex 30. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$, then $\sum\limits_{r=0}^{n} \sum\limits_{s=0}^{n} (r+s) C_r C_s$ is equal to

(a) 2^{2n} (b) $n \cdot 2^{2n}$

(c) $n \cdot 2^n$ (d) None of these

Sol. We have, $\sum\limits_{r=0}^{n} \sum\limits_{s=0}^{n} (r+s) C_r C_s$

$$= \sum_{r=0}^{n} \sum_{s=0}^{n} (r \cdot {}^nC_r \cdot {}^nC_s + s \cdot {}^nC_r \cdot {}^nC_s)$$

$$= \sum_{r=0}^{n} \sum_{s=0}^{n} r \cdot {}^nC_r {}^nC_s + \sum_{r=0}^{n} \sum_{s=0}^{n} s\ {}^nC_r {}^nC_s$$

$$= \sum_{r=0}^{n} r \cdot {}^nC_r \left(\sum_{s=0}^{n} {}^nC_s\right) + \sum_{s=0}^{n} s \cdot {}^nC_s \left(\sum_{r=0}^{n} {}^nC_r\right)$$

$$= \sum_{r=0}^{n} r \cdot {}^nC_r \cdot 2^n + \sum_{s=0}^{n} s \cdot {}^nC_s \cdot 2^n$$

$$= 2^n\left(\sum_{r=0}^{n} r \cdot {}^nC_r\right) + 2^n\left(\sum_{s=0}^{n} s \cdot {}^nC_s\right)$$

$$= 2^n\left(\sum_{r=0}^{n} r \cdot \frac{n}{r}\ {}^{n-1}C_{r-1}\right) + 2^n\left(\sum_{s=0}^{n} s \cdot \frac{n}{s}\ {}^{n-1}C_{s-1}\right)$$

$$= 2^n(n \cdot 2^{n-1}) + 2^n(n \cdot 2^{n-1})$$

$$= n \cdot 2^{2n-1} + n \cdot 2^{2n-1} = n \cdot 2^{2n}$$

Hence, (b) is the correct answer.

Ex 31. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$, then $\sum\limits_{0 \le r < s \le n} \sum (r+s) C_r C_s$ is equal to

(a) $n[2^{2n-1} - {}^{2n-1}C_{n-1}]$

(b) $n[2^{2n-1} + {}^{2n-1}C_{n-1}]$

(c) $2n[2^{2n-1} - {}^{2n-1}C_{n-1}]$

(d) None of the above

Sol. We have, $\sum\limits_{r=0}^{n} \sum\limits_{s=0}^{n} (r+s) C_r C_s$

$$= \sum_{r=0}^{n} 2r\, C_r^2 + 2\sum_{0 \le r < s \le n} \sum (r+s) C_r C_s$$

$$\Rightarrow \quad \sum_{r=0}^{n} \sum_{s=0}^{n} (r+s) C_r C_s = 2\sum_{r=0}^{n} r \cdot C_r^2$$
$$+ 2\sum_{0 \le r < s \le n} \sum (r+s) C_r C_s$$

$$\Rightarrow n \cdot 2^{2n} = 2 \cdot \left(\frac{n}{2}\ {}^{2n}C_n\right) + 2\sum_{0 \le r < s \le n} \sum (r+s) C_r C_s$$

$$\Rightarrow \sum_{0 \le r < s \le n} \sum (r+s) C_r C_s = \frac{1}{2}[n \cdot 2^{2n} - n \cdot {}^{2n}C_n]$$

$$= \frac{n}{2}\left[2^{2n} - \frac{2n}{n}\ {}^{2n-1}C_{n-1}\right]$$

$$= n[2^{2n-1} - {}^{2n-1}C_{n-1}]$$

Hence, (a) is the correct answer.

Ex 32. If $(1+x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$, then the value of $\sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s)$ is

(a) $n^2 \cdot 2^n$ (b) $n \cdot 2^n$
(c) $n^2 \cdot 2^{2n}$ (d) None of these

Sol. We have, $\sum_{r=0}^{n} \sum_{s=0}^{n} (r+s)(C_r + C_s)$

$$= \sum_{r=0}^{n} \sum_{s=0}^{n} (r C_r + r C_s + s C_r + s C_s)$$

$$= \sum_{r=0}^{n} \left[\sum_{s=0}^{n} r C_r + r \sum_{s=0}^{n} C_s + C_r \sum_{s=0}^{n} s + \sum_{s=0}^{n} s C_s \right]$$

$$= \sum_{r=0}^{n} \left[(n+1) r \cdot C_r + r 2^n + \frac{n(n+1)}{2} C_r + n \cdot 2^{n-1} \right]$$

$$= (n+1)(n \cdot 2^{n-1}) + 2^n \frac{n(n+1)}{2} + \frac{n(n+1)}{2} 2^n + n\, 2^{n-1}(n+1)$$

$$= n(n+1)\, 2^n + n(n+1)\, 2^n = 2n(n+1)\, 2^n \quad \ldots\text{(i)}$$

Also, $\sum_{r=0}^{n} \sum_{s=0}^{n} (r+s)(C_r + C_s)$

$$= \sum_{r=0}^{n} 4r C_r + 2 \sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s)$$

$$\therefore 2n(n+1)\, 2^n = 4n \cdot 2^{n-1} + 2 \sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s)$$

$$\Rightarrow \sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s) = n^2 \cdot 2^n$$

Hence, (a) is the correct answer.

Ex 33. If $(1+x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$, then the value of $\sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s + C_r C_s)$ is

(a) $n^2 \cdot 2^n - \frac{n}{2}[2^{2n} - {}^{2n}C_n]$

(b) $n^2 \cdot 2^n + \frac{n}{2}[2^{2n} - {}^{2n}C_n]$

(c) $n^2 \cdot 2^n + \frac{n}{2}[2^n + {}^{2n}C_n]$

(d) None of the above

Sol. We have, $\sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s + C_r C_s)$

$$= \sum\sum_{0 \le r < s \le n} (r+s)(C_r + C_s) + \sum\sum_{0 \le r < s \le n} (r+s) C_r C_s$$

$$= n^2 \cdot 2^n + \frac{n}{2}[2^{2n} - {}^{2n}C_n]$$

Hence, (b) is the correct answer.

Ex 34. Let n be a positive integer such that $(1+x+x^2)^n = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2n}$, then $\sum_{r=0}^{2n} a_r$ is

(a) 3^n
(b) 3^{n-1}
(c) $\frac{3^n}{2}$
(d) None of the above

Sol. We have, $(1+x+x^2)^n = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2n}$

Putting $x = 1$ on both sides, we get

$$a_0 + a_1 + a_2 + \ldots + a_{2n} = 3^n$$

Hence, (a) is the correct answer.

Ex 35. Let n be a positive integer such that $(1+x+x^2)^n = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2n}$, then a_r is

(a) a_{2n}, $0 \le r \le 2n$ (b) a_{2n-r}, $0 \le r \le 2n$
(c) a_{n-r}, $0 \le r \le 2n$ (d) None of these

Sol. We have,

$$(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r \quad \ldots\text{(i)}$$

$$\Rightarrow \left(1 + \frac{1}{x} + \frac{1}{x^2}\right)^n = \sum_{r=0}^{2n} \frac{a_r}{x^r} \quad \left[\text{replacing } x \text{ by } \frac{1}{x}\right]$$

$$\Rightarrow (1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^{2n-r} \quad \ldots\text{(ii)}$$

[multiplying both sides by x^{2n}]

$$\Rightarrow \sum_{r=0}^{2n} a_r x^r = \sum_{r=0}^{2n} a_r x^{2n-r} \quad \text{[from Eqs. (i) and (ii)]}$$

On equating the coefficient of x^{2n-r} both sides, we get

$$a_{2n-r} = a_r, \quad \text{for } 0 \le r \le 2n$$

Hence, (b) is the correct answer.

Ex 36. Let n be a positive integer such that $(1+x+x^2)^n = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2n}$, then $a_0 + a_1 + a_2 + \ldots + a_{n-1}$ is

(a) $\frac{1}{2}(3^n + a_n)$ (b) $\frac{1}{2}(3^{3n} - a_n)$

(c) $\frac{1}{2}(3^n - a_n)$ (d) None of these

Sol. We have, $a_r = a_{2n-r}$ for $0 \le r \le 2n$

$$\Rightarrow \sum_{r=0}^{n-1} a_r = \sum_{r=0}^{n-1} a_{2n-r}$$

$$\Rightarrow a_0 + a_1 + \ldots + a_{n-1} = a_{2n} + a_{2n-1} + \ldots + a_{n+1}$$

$$\Rightarrow 2(a_0 + a_1 + \ldots + a_{n-1}) + a_n = 3^n \quad \left[\because \sum_{r=0}^{2n} a_r = 3^n\right]$$

$$\Rightarrow a_0 + a_1 + \ldots + a_{n-1} = \frac{1}{2}(3^n - a_n)$$

Hence, (c) is the correct answer.

Ex 37. Let n be a positive integer such that $(1+x+x^2)^n = a_0 + a_1 x + a_2 x^2 + \ldots + a_{2n} x^{2n}$, then $(n-r) a_r + (2n-r+1) a_{r-1}$, $0 < r < 2n$ is

(a) $(r+1) a_{r+1}$ (b) $(r-1) a_{r+1}$
(c) $(2r+1) a_{r+1}$ (d) None of these

Sol. We have, $(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$

Differentiating both sides w.r.t. x, we get

$$n(1+x+x^2)^{n-1}(1+2x) = \sum_{r=0}^{2n} r\, a_r\, x^{r-1}$$

$$\Rightarrow n(1+2x)(1+x+x^2)^n = (1+x+x^2)\left[\sum_{r=0}^{2n} r\,a_r\,x^{r-1}\right]$$

[multiplying both sides by $(1+x+x^2)$]

$$\Rightarrow n(1+2x)\left(\sum_{r=0}^{2n} a_r x^r\right) = (1+x+x^2)\left(\sum_{r=0}^{2n} r\,a_r\,x^{r-1}\right)$$

Equating the coefficients of x^r $(0<r<2n)$ on both sides, we get

$$na_r + 2na_{r-1} = (r+1)\,a_{r+1} + ra_r + (r-1)\,a_{r-1}$$

$$\Rightarrow \quad (r+1)\,a_{r+1} = (n-r)\,a_r + (2n-r+1)\,a_{r-1}$$

Hence, (a) is the correct answer.

Ex 38. The value of ${}^nC_0 \cdot {}^{2n}C_n - {}^nC_1 \cdot {}^{2n-2}C_n + {}^nC_2 \cdot {}^{2n-4}C_n - \dots$ is

(a) 3^n
(b) 4^n
(c) 2^n
(d) None of the above

Sol. We have,

$${}^nC_0 \cdot {}^{2n}C_n - {}^nC_1 \cdot {}^{2n-2}C_n + {}^nC_2 \cdot {}^{2n-4}C_n - \dots + (-1)^n\,{}^nC_n\,{}^{2n-2n}C_n$$

$$= \text{Coefficient of } x^n \text{ in } [{}^nC_0\,(1+x)^{2n} - {}^nC_1\,(1+x)^{2n-2} + {}^nC_2(1+x)^{2n-4} - \dots + (-1)^n\,{}^nC_n(1+x)^{2n-2n}]$$

$$= \text{Coefficient of } x^n \text{ in } [(1+x)^2 - 1]^n$$

$$= \text{Coefficient of } x^n \text{ in } (2n + x^2)^n$$

$$= \text{Coefficient of } x^0 \text{ in } (2+x)^n = 2^n$$

Hence, (c) is the correct answer.

Ex 39. The value of ${}^nC_0 \cdot {}^{2n}C_r - {}^nC_1 \cdot {}^{2n-2}C_r + {}^nC_2 \cdot {}^{2n-4}C_r + \dots + (-1)^n\,{}^nC_n\,{}^{2n-2n}C_n$ is

(a) $\begin{cases} 2^{2n-r}\,{}^nC_{r-n}, & \text{if } r>n \\ 0, & \text{if } r<n \end{cases}$

(b) $\begin{cases} 3^{2n-r}\,{}^nC_{r-n}, & \text{if } r>n \\ 0, & \text{if } r<n \end{cases}$

(c) $\begin{cases} 2^{2n+r}\,{}^nC_{r+n}, & \text{if } r>n \\ 0, & \text{if } r<n \end{cases}$

(d) None of the above

Sol. We have, ${}^nC_0 \cdot {}^{2n}C_r - {}^nC_1 \cdot {}^{2n-2}C_r + {}^nC_2 \cdot {}^{2n-4}C_r + \dots + (-1)^n\,{}^nC_n\,{}^{2n-2n}C_n$

$$= \text{Coefficient of } x^r \text{ in } [{}^nC_0\,(1+x)^{2n} - {}^nC_1\,(1+x)^{2n-2} + {}^nC_2\,(1+x)^{2n-4} - \dots + (-1)^n\,{}^nC_n\,(1+x)^{2n-2n}]$$

$$= \text{Coefficient of } x^r \text{ in } [(1+x)^2 - 1]^n$$

$$= \text{Coefficient of } x^r \text{ in } (2x + x^2)^n$$

$$= \text{Coefficient of } x^{r-n} \text{ in } (2+x)^n$$

$$= \begin{cases} 2^{2n-r}\,{}^nC_{r-n}, & \text{if } r>n \\ 0, & \text{if } r<n \end{cases}$$

Hence, (a) is the correct answer.

Ex 40. If $(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$, then $\sum_{r=0}^{n} (-1)^r\,a_r\,{}^nC_r = {}^nC_{n/3}$, where n is

(a) $3k+1$ (b) $3k+2$
(c) $3k$ (d) None of these

Sol. We have,

$$(1+x+x^2)^n = a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n} \quad \text{...(i)}$$

and $$(x-1)^n = {}^nC_0x^n - {}^nC_1x^{n-1} + {}^nC_2x^{n-2} - \dots + (-1)^n\,{}^nC_n \quad \text{...(ii)}$$

On multiplying Eqs. (i) and (ii), we get

$$(1+x+x^2)^n\,(x-1)^n$$
$$= (a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n}) \times \{{}^nC_0x^n - {}^nC_1x^{n-1} + {}^nC_2x^{n-2} - \dots + (-1)^n\,{}^nC_n\}$$

$$\Rightarrow \quad (x^3-1)^n = (a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n}) \times \{{}^nC_0x^n - {}^nC_1x^{n-1} + \dots + (-1)^n\,{}^nC_n\} \quad \text{...(iii)}$$

Now, coefficient of x^n on RHS of Eq. (iii)

$$= a_0\,{}^nC_0 - a_1\,{}^nC_1 + a_2\,{}^nC_2 - \dots + (-1)^n\,a_n{}^nC_n$$

LHS of Eq. (iii)

$$= (x^3-1)^n = (-1)^n\,(1-x^3)^n = (-1)^n \sum_{r=0}^{n} {}^nC_r(-x^3)^r$$

$$= (-1)^n \sum_{r=0}^{n} (-1)^r\,{}^nC_r x^{3r} \quad \text{...(iv)}$$

Clearly, if n is not a multiple of 3, then x^n does not occur in Eq. (iv).

$\therefore$ Coefficient of x^n in LHS $= 0$

When n is not a multiple of 3.

If n is a multiple of 3 i.e. if $n = 3m$, then

$$\text{LHS} = (-1)^{3m}(-1)^m\,{}^{3m}C_m$$
$$= {}^{3m}C_m = {}^nC_{n/3} \qquad [\because n = 3m]$$

Thus, equating the coefficients of x^n on both sides, we get

$$a_0{}^nC_0 - a_1{}^nC_1 + a_2{}^nC_2 - a_3{}^nC_3 + \dots + (-1)^n a_n{}^nC_n = \begin{cases} 0, & \text{if } n \text{ is not a multiple of 3} \\ {}^nC_{n/3}, & \text{if } n \text{ is multiple of 3} \end{cases}$$

Hence, (c) is the correct answer.

Ex 41. If $n \in N$ and $(1+x+x^2+\dots+x^p)^n = \sum_{r=0}^{np} a_r\,x^r$, if $0 \le r \le np$ and r is not a multiple of $p+1$, then ${}^nC_0a_r - {}^nC_1a_{r-1} + {}^nC_2a_{r-2} - \dots + (-1)^r\,a_0\,{}^nC_r$ is

(a) 3^n (b) 2^n
(c) 0 (d) None of these

Sol. We have,

$$(1-x)^n = {}^nC_0 - {}^nC_1x + {}^nC_2x^2 - {}^nC_3x^3 + \dots + (-1)^n\,{}^nC_nx^n$$

and $$(1+x+x^2+\dots+x^p)^n = (a_0 + a_1x + a_2x^2 + \dots + a_{np}x^{np})$$

$$\therefore \quad (1-x)^n\,(1+x+x^2+\dots+x^p)^n$$
$$= ({}^nC_0 - {}^nC_1x + {}^nC_2x^2 - {}^nC_3x^3 + \dots + (-1)^n\,{}^nC_nx^n) \times (a_0 + a_1x + a_2x^2 + \dots + a_{np}x^{np}) \quad \text{...(i)}$$

Now, coefficient of x^r on RHS of Eq. (i)

$= a_r\,{}^nC_0 - a_{r-1}\,{}^nC_1 + a_{r-2}\,{}^nC_2 - \ldots + a_0(-1)^r\ {}^nC_r$

LHS of Eq. (i)

$$= (1-x)^n\,(1 + x + x^2 + \ldots + x^p)$$

$$= (1-x)^n \left\{\frac{1-x^{p+1}}{1-x}\right\}^n$$

$$= (1-x^{p+1})^n$$

Since, r is not a multiple of $(p+1)$. Therefore, the expansion of $(1-x^{p+1})^n$ does not contain x^r in any term.

$\therefore$ Coefficient of x^r on LHS of Eq. (i) = 0

Hence,

${}^nC_0 a_r - {}^nC_1 a_{r-1} + {}^nC_2 a_{r-2} - \ldots + (-1)^r\ {}^nC_r a_0 = 0$,

if r is not a multiple of $(p+1)$.

Hence, (c) is the correct answer.

Ex 42. When $32^{(32)^{(32)}}$ is divided by 7, then the remainder is

(a) 2

(b) 8

(c) 4

(d) None of the above

Sol. We have, $32^{32} = (2^5)^{32} = 2^{160} = (3-1)^{160}$

$= {}^{160}C_0 3^{160} - {}^{160}C_1\, 3^{159} + \ldots - {}^{160}C_{159}\ 3 + {}^{160}C_{160} 3^0$

$= 3m + 1$, where $m \in N$ $32^{(32)^{(32)}} = (32)^{3m+1}$

$= (2^5)^{3m+1} = 2^{15m+5}$

$= 2^{3\,(5m+1)} \cdot 2^2 = (2^3)^{5m+1} \cdot 2^2 = (7+1)^{5m+1} \times 4$

$= \{{}^{5m+1}C_0 7^{5m+1} + {}^{5m+1}C_1 7^{5m}$

$+ \ldots + {}^{5m+1}C_{5m} 7 + {}^{5m+1}C_{5m+1}\ 7^0\} \times 4$

$= (7n+1) \times 4$,

where, $n = {}^{5m+1}C_0 7^{5m+1} + \ldots + {}^{5m+1}C_{5m}\, 7$

$= 28n + 4$

Thus, when $32^{(32)^{(32)}}$ is divided by 7, the remainder is 4.

Hence, (c) is the correct answer.

Ex 43. The coefficient of $x^n\ y^n$ in the expansion of $\{(1+x)\,(1+y)\,(x+y)\}^n$ is

(a) $\sum_{r=0}^{n} C_r^2$ (b) $\sum_{r=0}^{n} C_r^3$

(c) $\sum_{r+s=0}^{n} {}^nC_r\, {}^nC_s^2$ (d) None of these

Sol. We have, $\{(1+x)\,(1+y)\,(x+y)\}^n$

$= (C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n)$

$\times (C_0 y^n + C_1 y^{n-1} + \ldots + C_{n-1}\, y + C_n)$

$\times (C_0 x^n + C_1 x^{n-1} y + \ldots + C_{n-1} x y^{n-1} C_n y^n)$

Clearly, coefficient of $x^n\ y^n$ on RHS

$$= C_0^3 + C_1^3 + C_2^3 + \ldots + C_n^3 = \sum_{r=0}^{n} C_r^3$$

Hence, (b) is the correct answer.

Type 2. **More than One Correct Option**

Ex 44. The largest term in the expansion of $(3+2x)^{50}$, where $x = \dfrac{1}{5}$ is

(a) 5th (b) 51st (c) 7th (d) 6th

Sol. Consider, $(3+2x)^{50} = 3^{50}\left(1 + \dfrac{2x}{3}\right)^{50}$

Let T_{r+1} be the largest term in the expansion.

$\therefore\ \dfrac{T_{r+1}}{T_r} \ge 1 \ \Rightarrow\ 102 - 2r \ge 15r \ \Rightarrow\ r \le 6$

Hence, (a) and (d) are the correct answers.

Ex 45. If $(1+x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$, $n \in N$, then $C_0 - C_1 + C_2 - \ldots + (-1)^{m-1} C_{m-1}$ is equal to $(m < n)$

(a) $\dfrac{(n-1)\,(n-2)\ldots(n-m+1)}{(m-1)!}(-1)^{m-1}$

(b) ${}^{n-1}C_{m-1}(-1)^{m-1}$

(c) $\dfrac{(n-1)\,(n-2)\ldots(n-m)}{(m-1)!}(-1)^{m-1}$

(d) ${}^{n-1}C_{n-m}(-1)^{m-1}$

Sol. $\dfrac{(n-1)\,(n-2)\ldots(n-m+1)}{(m-1)!}$

$= \dfrac{(n-1)\,(n-2)\ldots(n-m+1)\,(n-m)\ldots 2\cdot 1}{(n-m)!\,(m-1)!}$

$= {}^{n-1}C_{m-1}$

= Coefficient of x^{m-1} in $(1+x)^{n-1}$

= Coefficient of x^{m-1} in $(1+x)^n\,(1+x)^{-1}$

Now, $(1+x)^n = C_0 + C_1 x + C_2 x^2$

$+ \ldots + C_{m-1} x^{m-1} + \ldots + C_n x^n$ ...(i)

$(1+x)^{-1} = 1 - x + x^2 - x^3 + \ldots + (-1)^{m-1} x^{m-1} + \ldots$ ...(ii)

Collecting the coefficients of x^{m-1} in the product of Eqs. (i) and (ii), we get

$(-1)^{m-1} C_0 + (-1)^{m-2} C_1 + \ldots + C_{m-1}$

= Coefficient of x^{m-1} in $(1+x)^{n-1} = {}^{n-1}C_{m-1}$

$\therefore\quad C_0 - C_1 + C_2 - \ldots + (-1)^{m-1} C_{m-1}$

$= {}^{n-1}C_{m-1}(-1)^{m-1}$

$= \dfrac{(n-1)\,(n-2)\ldots(n-m+1)}{(m-1)!}(-1)^{m-1}$

Hence, (a), (b) and (d) are the correct answers.

Ex 46. For which of the following values of x, 5th term is the numerically greatest term in the expansion of $(1+x/3)^{10}$?

(a) -2 (b) 1.8
(c) 2 (d) -1.9

Sol. Let T_5 be numerically the greatest term in the expansion of $(1+x/3)^{10}$.

Then, $$\left|\frac{T_5}{T_4}\right| \ge 1$$

and $$\left|\frac{T_6}{T_5}\right| \le 1$$

Now, $$\frac{T_{r+1}}{T_r} = \frac{10-r+1}{r}\cdot\frac{x}{3}$$

$$\Rightarrow \left|\frac{7}{4}\times\frac{x}{3}\right| \ge 1$$

and $$\left|\frac{6}{5}\cdot\frac{x}{3}\right| \le 1$$

$$\Rightarrow |x| \ge \frac{12}{7}$$

and $$|x| \le \frac{5}{2} \quad \text{...(i)}$$

$$\Rightarrow \frac{12}{7} \le |x| \le \frac{5}{2}$$

$$\Rightarrow x \in \left[-\frac{5}{2}, -\frac{12}{7}\right] \cup \left[\frac{12}{7}, \frac{5}{2}\right]$$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 47. The coefficient of $a^8b^6c^4$ in the expansion of $(a+b+c)^{18}$ is

(a) ${}^{18}C_{14}\cdot{}^{14}C_8$ (b) ${}^{18}C_{10}\cdot{}^{10}C_6$
(c) ${}^{18}C_6\cdot{}^{12}C_8$ (d) ${}^{18}C_4\cdot{}^{14}C_6$

Sol. Given expression

$$= \{a+(b+c)\}^{18} = {}^{18}C_0a^{18} + {}^{18}C_1a^{17}(b+c) + \dots + {}^{18}C_{10}a^8(b+c)^{10} + \dots$$

$\therefore$ The coefficient of $a^8b^6c^4 = {}^{18}C_{10}\cdot{}^{10}C_6 = \dfrac{18!}{8!6!4!}$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 48. The term independent of x in the expansion of $(1+x)^n\cdot\left(1-\dfrac{1}{x}\right)^n$ is

(a) 0, if n is odd
(b) $(-1)^{\frac{n-1}{2}}\cdot{}^nC_{\frac{n-1}{2}}$, if n is odd
(c) $(-1)^{n/2}$, ${}^nC_{n/2}$, if n is even
(d) None of the above

Sol. Expression $= (-1)^n\cdot\dfrac{(1-x^2)^n}{x^n}$

$\therefore$ The term independent of x
= The coefficient of x^n in $(-1)^n\cdot(1-x^2)^n$
= The coefficient of x^n in
$(-1)^n\{{}^nC_0 + {}^nC_1(-x^2) + {}^nC_2(-x^2)^2 + \dots + {}^nC_n(-x^2)^n\}$,
and the expansion contains only even powers of x.
Hence, (a) and (c) are the correct answers.

Ex 49. Let $R = (8+3\sqrt{7})^{20}$ and $[R]$ = The greatest integer less than or equal to R. Then,

(a) $[R]$ is even
(b) $[R]$ is odd
(c) $R-[R] = 1-\dfrac{1}{(8+3\sqrt{7})^{20}}$
(d) None of the above

Sol. $R = [R] + g = (8+3\sqrt{7})^{20}$

$= {}^{20}C_0 8^{20} + {}^{20}C_1 8^{19}(3\sqrt{7}) + \dots$, where $0 < g < 1$

$f = (8-3\sqrt{7})^{20} = {}^{20}C_0 8^{20} - {}^{20}C_1 8^{19}(3\sqrt{7}) + \dots$,

where $0 < f < 1$

$\therefore$ $[R] + g + f = 2[{}^{20}C_0 8^{20} + {}^{20}C_2 8^{18}(3\sqrt{7})^2 + \dots]$
= an even integer

$\therefore$ $g + f$ = an integer $= 1$ as $0 < g < 1, 0 < f < 1$

$\therefore$ $[R]$ = an even integer -1 = an odd integer

Also, $R - [R] = g = 1 - f$

$$= (8-3\sqrt{7})^{20} = 1 - \frac{1}{(8+3\sqrt{7})^{20}}$$

Hence, (b) and (c) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 50-54) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

Ex 50. Statement I Coefficient of $a^2b^3c^4$ in the expansion of $(a+b+c)^8$ is $\dfrac{8!}{2!3!4!}$.

Statement II Coefficient of $a^\alpha b^\beta c^\gamma$, where $\alpha+\beta+\gamma = n$, in the expansion of $(a+b+c)^n$ is $\dfrac{n!}{\alpha!\beta!\gamma!}$.

Sol. $\because (a+b+c)^n = \sum \dfrac{n!}{p!q!r!}\cdot a^pb^qc^r,\ p+q+r = n$

In Statement I, $p+q+r$ exceeds n.
Hence, (d) is the correct answer.

Ex 51. Statement I If $q = \frac{1}{3}$ and $p + q = 1$, then
$$\sum_{r=0}^{15} r\ {}^{15}C_r\, p^r q^{15-r} = 15 \times \frac{1}{3} = 5$$

Statement II If $p + q = 1, 0 < p < 1$, then
$$\sum_{r=0}^{n} r\ {}^{n}C_r\, p^r q^{n-r} = np$$

Sol. $\sum_{r=0}^{n} r\ {}^{n}C_r p^r q^{n-r}$
$$= np \sum_{r=1}^{n} {}^{n-1}C_{r-1} p^{r-1} q^{n-r} = np\,(q + p)^{n-1} = np$$

Hence, (d) is the correct answer.

Ex 52. Statement I Coefficient of x^{51} in the expansion of $(x-1)(x^2-2)(x^3-3)\ldots(x^{10}-10)$ is -1.

Statement II Coefficient of $x^{\frac{n(n+1)}{2} - 4}$, $n \ge 4$, in the expansion of $(x-1)(x^2-2)(x^3-3)\ldots(x^n-n)$ is
$$-4 + (-1)(-3) = -1$$

Sol. Statement II is obviously true and it explains Statement I.
Hence, (a) is the correct answer.

Ex 53. Statement I The greatest value of ${}^{40}C_0 \cdot {}^{60}C_r + {}^{40}C_1 \cdot {}^{60}C_{r-1} \ldots {}^{40}C_{40} \cdot {}^{60}C_{r-40}$ is ${}^{100}C_{50}$.

Statement II The greatest value of ${}^{2n}C_r$ occurs at $r = n$.

Sol. The number of ways of selecting committee of r persons among 40 women and 60 men $= {}^{100}C_r$. This will assume greatest value at $r = 50$.
Hence, (a) is the correct answer.

Ex 54. Statement I If $x = {}^{n}C_{n-1} + {}^{n+1}C_{n-1} + \ldots + {}^{2n}C_{n-1}$, then $\frac{x+1}{2n+1}$ is an integer.

Statement II ${}^{n}C_r + {}^{n}C_{r-1} = {}^{n+1}C_r$ and ${}^{n}C_r$ is divisible by n, if n and r are coprime.

Sol. $1 + x = {}^{n}C_n + {}^{n}C_{n-1} + {}^{n+1}C_{n-1} + \ldots + {}^{2n}C_{n-1}$
$$= {}^{2n+1}C_n$$

Since, $2n + 1$ and n are coprime for every natural number n.

$\therefore$ ${}^{2n+1}C_n$ is divisible by $2n + 1$.

$\therefore$ $\frac{x+1}{2n+1}$ is an integer.

Hence, (a) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 55-57) *Consider the identity $(1+x)^{6m} = \sum_{r=0}^{6m} {}^{6m}C_r \cdot x^r$. By putting different values of x on both sides, we can get summation of several series involving binomial coefficient. For example, By putting $x = \frac{1}{2}$, we get $\sum_{r=0}^{6m} {}^{6m}C_r \cdot \frac{1}{2^r} = \left(\frac{3}{2}\right)^{6m}$.*

Ex 55. The value of $\sum_{r=0}^{6m} {}^{6m}C_r\, 2^{r/2}$ is equal to

(a) $\frac{3^{6m}}{2}$
(b) $(1+\sqrt{2})^{3m}$
(c) $(3+2\sqrt{2})^{3m}$
(d) None of the above

Sol. $\sum_{r=0}^{6m} {}^{6m}C_r 2^{r/2}$ put $x = \sqrt{2} = (1+\sqrt{2})^{6m} = (3+2\sqrt{2})^{3m}$

Hence, (c) is the correct answer.

Ex 56. The value of $\sum_{r=0}^{3m} (-1)^r\ {}^{6m}C_{2r}$ is

(a) 2^{3m}
(b) 0, if m is odd
(c) -2^{3m}, if m is even
(d) None of the above

Sol. $\sum_{r=0}^{3m} (-1)^r\ {}^{6m}C_{2r} = \frac{1}{2}\left[(\sqrt{2})^{6m}\left(\frac{1}{\sqrt{2}} + i\frac{1}{\sqrt{2}}\right)^{6m} + (\sqrt{2})^{6m}\left(\frac{1}{\sqrt{2}} - i\frac{1}{\sqrt{2}}\right)^{6m}\right]$
$$= 2^{3m}\cos\frac{3m\pi}{2} = \begin{cases} 0, & \text{if } m \text{ is odd} \\ (-1)^{m/2} 2^{3m}, & \text{if } m \text{ is even} \end{cases}$$

Hence, (b) is the correct answer.

Ex 57. The value of $\sum_{r=1}^{3m} (-3)^{r-1}\ {}^{6m}C_{2r-1}$ is

(a) 0
(b) 1
(c) depends on m
(d) None of the above

Sol. $\sum_{r=1}^{3m} (-3)^{r-1}\ {}^{6m}C_{2r-1}$
$$= \frac{1}{\sqrt{3}i}\{\sqrt{3}i\ {}^{6m}C_1 + (\sqrt{3}i)^3\ {}^{6m}C_3 + (\sqrt{3}i)^5\ {}^{6m}C_5 + \ldots + (\sqrt{3}i)^{6m-1}\ {}^{6m}C_{6m-1}\}$$
$$(1+\sqrt{3}i)^{6m} = {}^{6m}C_0 + \sqrt{3}i\ {}^{6m}C_1 + (\sqrt{3}i)^2\ {}^{6m}C_2 + (\sqrt{3}i)^3\ {}^{6m}C_3 + \ldots$$
$$(1-\sqrt{3}i)^{6m} = {}^{6m}C_0 - \sqrt{3}i\ {}^{6m}C_1 + (\sqrt{3}i)^2\ {}^{6m}C_2 - (\sqrt{3}i)^3\ {}^{6m}C_3 + \ldots$$

$\therefore\ (1+\sqrt{3}i)^{6m}-(1-\sqrt{3}i)^{6m}$
$$=2[\sqrt{3}i\ {}^{6m}C_1+(\sqrt{3}i)^3\ {}^{6m}C_3+\dots]$$

$\therefore$ Given expression

$$=\frac{1}{2\sqrt{3}i}[(1+\sqrt{3}i)^{6m}-(1-\sqrt{3}i)^{6m}]$$
$$=\frac{2^{6m}}{2\sqrt{3}i}$$
$$(\cos 2m\pi+i\sin 2m\pi-\cos 2m\pi+i\sin 2m\pi)$$
$$=0$$

Hence, (a) is the correct answer.

Passage II (Ex. Nos. 58-60)

If $(1+x)^n=C_0+C_1x+C_2x^2+\dots+C_nx^n$ ...(i)

Then, sum of the series $C_0+C_k+C_{2k}+\dots$ *can be obtained by putting all the roots of the equation* $x^k-1=0$ *in Eq.* (i) *and then adding vertically.*

For example, Sum of the series $C_0+C_2+C_4+\dots$ *can be obtained by putting roots of the equation* $x^2-1=0$

$\Rightarrow$ $x=\pm 1$ *in Eq.* (i)

$$x=1, C_0+C_1+C_2+C_3+\dots=2^n$$
$$x=-1, C_0-C_1+C_2-C_3+\dots=0$$
$$2(C_0+C_2+C_4+\dots)=2^n$$
$$C_0+C_2+C_4+\dots=2^{n-1}$$

Ex 58. The values of x, we should substitute in Eq. (i) to get the sum of the series $C_0+C_3+C_6+C_9+\dots$, are

(a) $1, -1, \omega$ (b) $\omega, \omega^2, \omega^3$
(c) $\omega, \omega^2, -1$ (d) None of these

Ex 59. If n is a multiple of 3, then $C_0+C_3+C_6+\dots$ is equal to

(a) $\frac{2^n+2}{3}$ (b) $\frac{2^n-2}{3}$
(c) $\frac{2^n+2(-1)^n}{3}$ (d) $\frac{2^n-2(-1)^n}{3}$

Ex 60. Sum of values of x, which we should substitute in Eq. (i) to give the sum of the series $C_0+C_4+C_8+C_{12}+\dots$ is

(a) 2
(b) $2(1+i)$
(c) $2(1-i)$
(d) 0

Sol. (Ex. Nos. 58-60) x^3-1

$x=1,\omega,\omega^2$ or $x=\omega,\omega^2,\omega^3$

$x=1, C_0+C_1+C_2+C_3+C_4+\dots=2^n$

$x=\omega, C_0+C_1\omega+C_2\omega^2+C_3\omega^3+C_4\omega^4+\dots=(1+\omega)^n$

$x=\omega^2, C_0+C_1\omega^2+C_2\omega^4+C_3\omega^6+\dots=(1+\omega^2)^n$

Now, $3(C_0+0+0+C_3+0+0+C_6+\dots)$
$=2^n+(-\omega^2)^n+(-\omega)^n=2^n+(-1)^n+(-1)^n$

$$\therefore\ C_0+C_3+C_6+\dots=\frac{2^n+2(-1)^n}{3}$$
$$x^4-1=0$$
$$\Rightarrow\quad x=\pm 1, \pm i$$

$\therefore$ Sum of values of $x=1+(-1)+i+(-i)=0$

58. (b) **59.** (c) **60.** (d)

Type 5. **Match the Columns**

Ex 61. Match the statement of Column I with values of Column II.

Column I	Column II
A. ${}^mC_1{}^nC_m-{}^mC_2{}^{2n}C_m+{}^mC_3{}^{3n}C_m\dots$ is	p. the coefficient of x^m in the expansion of $((1+x)^n-1)^m$
B. ${}^nC_m+{}^{n-1}C_m+{}^{n-2}C_m+\dots+{}^mC_m$ is	q. the coefficient of x^m in $\frac{(1+x)^{n+1}}{x}$
C. $C_0C_n+C_1C_{n-1}+\dots+C_nC_0$ is	r. the coefficient of x^n in $(1+x)^{2n}$
D. $2^k\ {}^nC_0-2^{k-1}\ {}^nC_1\ {}^{n-1}C_{k-1}\dots(-1)^k\ {}^nC_k\ {}^{n-k}C_0$ is	s. the coefficient of x^k in the expansion of $(1+x)^n$

Sol. A. $({}^mC_1{}^nC_m-{}^mC_2{}^{2n}C_m+{}^mC_3{}^{3n}C_m-\dots(-1)^{m-1}\ {}^mC_m\ {}^{mn}C_m)$

$=$ Coefficient of x^m in $[{}^mC_1(1+x)^n-{}^mC_2(1+x)^{2n}+{}^mC_3(1+x)^{3n}-\dots+(-1)^{m-1}\ {}^mC_m\cdot(1+x)^{mn}]$

$=$ Coefficient of x^m in $({}^mC_0-[{}^mC_0-{}^mC_1(1+x)^n+{}^mC_2(1+x)^{2n}-{}^mC_3(1+x)^{3m}+\dots+(-1)^m\ {}^mC_m(1+x)^{mn}])$

$=$ Coefficient of x^m in $(1-[1-(1+x)^n]^m)$

$=$ Coefficient of x^m in $(1-(1+x)^n)^m$

B. ${}^nC_m+{}^{n-1}C_m+{}^{n-2}C_m+\dots+{}^mC_m$ is the coefficient of x^m in the series $(1+x)^n+(1+x)^{n-1}(1+x)^{n-2}+\dots+(1+x)^m$

$=(1+x)^m[1+(1+x)+(1+x)^2+\dots+(1+x)^{n-m}]$

$$=(1+x)^m\left(\frac{1-(1+x)^{n-m+1}}{1-(1+x)}\right)$$
$$=\frac{(1+x)^{n+1}-(1+x)^m}{x}$$

$\because \frac{(1+x)^m}{x}$ does not have x^m,

$\therefore {}^nC_m+{}^{n-1}C_m+{}^{n-2}C_m+\dots+{}^mC_m$ is the coefficient of x^m in the series $\frac{(1+x)^{n+1}}{x}$.

C. $(1+x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + {}^nC_3x^3 + \dots + {}^nC_nx^n$ ...(i)

$(1+x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + {}^nC_3x^3 + \dots + {}^nC_nx^n$ ...(ii)

On multiplying Eqs. (i) and (ii) and equate coefficient of x^n both sides, we get

Coefficient of x^n in $(1+x)^n(1+x)^n = {}^nC_0{}^nC_n + {}^nC_1{}^nC_{n-1} + {}^nC_2{}^nC_{n-2} + \dots + {}^nC_n{}^nC_0$

$\therefore$ Coefficient of x^n in $(1+x)^{2n}$

$= C_0C_n + C_1C_{n-1} + \dots + C_nC_0$

D. $2^k\,{}^nC_k =$ Coefficient of x^k in $(1+2x)^n$

$2^{k-1}\,{}^{n-1}C_{k-1} =$ Coefficient of x^{k-1} in $(1+2x)^{n-1}$

$=$ Coefficient of x^k in $x(1+2x)^{n-1}$

$\because {}^nC_0(1+2x)^n - {}^nC_1x(1+2x)^{n-1} + {}^nC_2x^2(1+2x)^{n-2} - \dots = (1+2x-x)^n$

Hence, given expression is coefficient of x^k in $(1+x)^n$.

A $\to$ p; B $\to$ q; C $\to$ r; D $\to$ s

Ex 62. Match the statement of Column I with values of Column II.

	Column I		Column II
A.	If $(r+1)$th term is the first negative term in the expansion of $(1+x)^{7/2}$, then the value of r (where $\lvert x \rvert < 1$) is	p.	divisible by 2
B.	The coefficient of y in the expansion of $(y^2 + 1/y)^5$ is	q.	divisible by 5
C.	If the second term in the expansion $\left(a^{\frac{1}{13}} + \frac{a}{\sqrt{a^{-1}}}\right)^n$ is $14a^{5/2}$, then the value of n is	r.	divisible by 10
D.	The coefficient of x^4 in the expression $(1+2x+3x^2+4x^3+\dots\infty)^{1/2}$ is $c, c \in N$, then $c+1$ (where $\lvert x \rvert < 1$) is	s.	a prime number

Sol. A. $T_{r+1} = \dfrac{\frac{7}{2}\left(\frac{7}{2}-1\right)\left(\frac{7}{2}-2\right)\dots\left(\frac{7}{2}-r+1\right)x^r}{r!}$

First negative term, if $\frac{7}{2} - r + 1 < 0$ i.e. $r > \frac{9}{2}$

Hence, $r = 5$

B. $T_{r+1} = {}^5C_r(y^2)^{5-r}\left(\frac{1}{y}\right)^r = {}^5C_r\,y^{10-3r}$

$\therefore \quad 10 - 3r = 1$

$\Rightarrow \quad r = 3$

So, coefficient of $y = {}^5C_3 = 10$

C. $T_2 = 14a^{5/2} \Rightarrow {}^nC_1(a^{1/13})^{n-1}(a^{3/2})^1 = 14a^{5/2}$

$\Rightarrow \quad na^{\frac{n-1}{13}+\frac{3}{2}} = 14a^{5/2}$

$\Rightarrow \quad n = 14$

D. $(1+2x+3x^2+4x^3+\dots)^{1/2}$

$= [(1-x)^{-2}]^{1/2} = (1-x)^{-1}$

$= 1 + x + x^2 + \dots + x^n + \dots$

Hence, coefficient of $x^4 = 1$

$\therefore \quad c = 1$

Hence, $c + 1 = 2$

A $\to$ q, s; B $\to$ p, q, r; C $\to$ p; D $\to$ p, s

Type 6. **Single Integer Answer Type Questions**

Ex 63. If $6^{83} + 8^{83}$ is divided by 49, then the sum of the digits of remainder is ________ .

Sol. (8) $(1+7)^{83} + (7-1)^{83} = (1+7)^{83} - (1-7)^{83}$

$= 2[{}^{83}C_1 \cdot 7 + {}^{83}C_3 \cdot 7^3 + \dots + {}^{83}C_{83} \cdot 7^{83}]$

$= (2 \cdot 7 \cdot 83) + 49I$, where I is an integer.

$\therefore \quad 14 \times 83 = 1162$

$\Rightarrow \quad \frac{1162}{49} = 23\frac{35}{49}$

$\therefore$ Remainder is 35.

$\Rightarrow$ Sum of digits = 8

Ex 64. The remainder, when $(15^{23} + 23^{23})$ is divided by 19, is ________ .

Sol. (0) $E = (19-4)^{23} + (19+4)^{23}$

$= 2[19^{23} + {}^{23}C_2 \cdot 19^{21} \cdot 4^2 + \dots + {}^{23}C_{22} \cdot 19 \cdot 4^{22}]$

$= 2 \cdot 19[19^{22} + {}^{23}C_2 \cdot 19^{20} \cdot 4^2 + \dots + {}^{23}C_{22} \cdot 4^{22}]$

$\Rightarrow$ E is divisible by 19.

$\Rightarrow$ Remainder = 0

Ex 65. The term independent of x in the expansion of $\left(9x - \frac{1}{3\sqrt{x}}\right)^{18}$, $x > 0$, is α times the corresponding binomial coefficient. Then, α is ________ .

Sol. (1) $T_{r+1} = {}^{18}C_r \cdot (9x)^{18-r} \cdot (-1)^r \cdot \frac{(x)^{-r/2}}{3^r}$

$$T_{r+1} = {}^{18}C_r \cdot 9^{18-r} \cdot \frac{(-1)^r}{3^r} \cdot x^{18 - \frac{3r}{2}}$$

$$\therefore \quad 18 - \frac{3r}{2} = 0$$

$$\Rightarrow \quad r = 120$$

$${}^{18}C_{12} \cdot \frac{9^6}{3^{12}} = \alpha \cdot {}^{18}C_{12}$$

$$\therefore \quad \alpha = 1$$

Ex 66. $(1+x)(1+x+x^2)(1+x+x^2+x^3)\ldots(1+x+x^2+\ldots+x^{100})$ when written in the ascending power of x, then the highest exponent of x is λ (1010), where λ equals ___ .

Sol. (5) Highest exponent in the product of first two is

$$3 = 1 + 2$$

Highest exponent in the product of first three is

$$6 = 1 + 2 + 3$$

Similarly, highest exponent in the product of first hundred

$$= 1 + 2 + \ldots + 100 = 5050 = 5\,(1010)$$

$$\Rightarrow \quad \lambda = 5$$

Ex 67. Given $(1 - 2x + 5x^2 - 10x^3)(1+x)^n = 1 + a_1x + a_2x^2 + \ldots$ and that $a_1^2 = 2a_2$, then the value of n is ________ .

Sol. (6) $(1 - 2x + 5x^2 - 10x^3)\,[C_0 + C_1x + C_2x^2 + \ldots]$

$$= 1 + a_1x + a_2x^2 + \ldots$$

$$\Rightarrow \quad a_1 = n - 2$$

$$\text{and} \quad a_2 = \frac{n\,(n-1)}{2} - 2n + 5$$

Now, $a_1^2 = 2a_2$. Therefore, we have

$$(n-2)^2 = n\,(n-1) - 4n + 10$$

$$\Rightarrow \quad n^2 - 4n + 4 = n^2 - 5n + 10$$

$$\therefore \quad n = 6$$

Ex 68. If $(1 + x - 3x^2)^{2145} = a_0 + a_1x + a_2x^2 + \ldots$, then $a_0 - a_1 + a_2 - a_3 + \ldots$ ends with _______ .

Sol. (3) Put $x = -1$, $(-3)^{2145} = a_0 - a_1 + a_2 - a_3 + \ldots$;

$$-(3)^{2145} = -(3^4)^{536} \cdot 3$$

which ends with 3.

Target Exercises

Type 1. **Only One Correct Option**

1. The expansion $[x+(x^3-1)^{1/2}]^5+[x-(x^3-1)^{1/2}]^5$ is a polynomial of degree

(a) 5 (b) 6
(c) 7 (d) 8

2. The value of x, for which the 6th term in the expansion of $\left\{2^{\log_2\sqrt{(9^{x-1}+7)}}+\frac{1}{2^{(1/5)\log_2(3^{x-1}+1)}}\right\}^7$ is 84, is equal to

(a) 4 (b) 3
(c) -2 (d) 1

3. The 10th term in the expansion of $(x-1)^{11}$ (in decreasing powers of x) is

(a) $-x$ (b) $-11x$
(c) $-x^2$ (d) $-{}^{11}C_9x^2$

4. If the third term in the expansion of $[x+x^{\log_{10}x}]^5$ is 10^6, then x must be

(a) 1 (b) $\sqrt{10}$
(c) 10 (d) $10^{-3/5}$

5. If the 4th term in the expansion of $(px+x^{-1})^m$ is 2.5 for all $x\in R$, then

(a) $p=\frac{5}{2}, m=3$
(b) $p=\frac{1}{2}, m=6$
(c) $p=-\frac{1}{2}, m=6$
(d) None of the above

6. If the coefficient of 4th term in the expansion of $\left(x+\frac{\alpha}{2x}\right)^n$ is 20, then the respective values of α and n are

(a) 2, 7 (b) 5, 8
(c) 3, 6 (d) 2, 6

7. If coefficients of 2nd, 3rd and 4th terms in the expansion of $(1+x)^{2n}$ are in AP, then

(a) $2n^2+9n+7=0$ (b) $2n^2-9n+7=0$
(c) $2n^2-9n-7=0$ (d) $2n^2+9n-7=0$

8. If the numerical coefficient of the pth term in the expansion of $(2x+3)^6$ is 4860, then the value(s) of p is/are

(a) 2 (b) 3
(c) 4 (d) 5

9. The coefficient of the $(r+1)$th term of $\left(x+\frac{1}{x}\right)^{20}$ when expanded in the descending powers of x, is equal to the coefficient of the 6th term of $\left(x^2+2+\frac{1}{x^2}\right)^{10}$ when expanded in ascending powers of x. The value of r is

(a) 5
(b) 6
(c) 14
(d) None of the above

10. Let $n\in N$. If $(1+x)^n=a_0+a_1x+a_2x^2+\ldots+a_nx^n$ and $a_{n-3}, a_{n-2}, a_{n-1}$ are in AP, then

(a) a_1, a_2, a_3 are in AP
(b) a_1, a_2, a_3 are in HP
(c) $n=17$
(d) $n=14$

11. The number of terms with integral coefficients in the expansion of $(7^{1/3}+5^{1/2}\cdot x)^{600}$ is

(a) 100 (b) 50
(c) 101 (d) None of these

12. The sum of the rational terms in the expansion of $(\sqrt{2}+\sqrt[5]{10})^{10}$ is

(a) 32 (b) 9
(c) 41 (d) None of these

13. The coefficient of x^3 in $\left(\sqrt{x^5}+\frac{3}{\sqrt{x^3}}\right)^6$ is

(a) 0 (b) 120 (c) 420 (d) 540

14. If the coefficients of x^7 and x^8 in $\left(2+\frac{x}{3}\right)^n$ are equal, then n is equal to

(a) 56 (b) 55
(c) 45 (d) 15

15. If $(1+2x+x^2)^n=\sum_{r=0}^{2n}a_rx^r$, then a_r is equal to

(a) $({}^nC_r)^2$ (b) ${}^nC_r\cdot{}^nC_{r+1}$
(c) ${}^{2n}C_r$ (d) ${}^{2n}C_{r+1}$

16. If in the expansion of $(1+x)^m(1-x)^n$, the coefficients of x and x^2 are 3 and -6 respectively, then m is

(a) 6 (b) 9
(c) 12 (d) 24

17. The coefficient of x^{53} in $\sum_{r=0}^{100} {}^{100}C_r (x-3)^{100-r} 2^r$ is

(a) ${}^{100}C_{51}$ (b) ${}^{100}C_{52}$ (c) $-{}^{100}C_{53}$ (d) ${}^{100}C_{54}$

18. If the coefficients of x^2 and x^3 in the expansion of $(3+kx)^9$ are equal, then the value of k is

(a) –9/7 (b) 9/7
(c) 7/9 (d) None of these

19. The coefficient of x^6 in $\{(1+x)^6+(1+x)^7+\ldots+(1+x)^{15}\}$ is

(a) ${}^{16}C_9$
(b) ${}^{16}C_5 - {}^{6}C_5$
(c) ${}^{16}C_6 - 1$
(d) None of the above

20. The coefficient of x^{13} in the expansion of $(1-x)^5\,(1+x+x^2+x^3)^4$ is

(a) 4 (b) – 4
(c) 0 (d) None of these

21. The coefficient of $x^6 \cdot y^{-2}$ in the expansion of $\left(\frac{x^2}{y}-\frac{y}{x}\right)^{12}$ is

(a) ${}^{12}C_6$ (b) $-{}^{12}C_5$
(c) 0 (d) None of these

22. Let $f(x)=\left(\sqrt{x^2+1}+\sqrt{x^2-1}\right)^6 + \left(\frac{2}{\sqrt{x^2+1}+\sqrt{x^2-1}}\right)^6$. Then,

(a) $f(x)$ is a polynomial of the fourth degree in x
(b) $f(x)$ has exactly two terms
(c) $f(x)$ is not a polynomial in x
(d) coefficient of x^6 is 46

23. The coefficient of x^4 in the expansion of $(1+x+x^2+x^3)^n$ is

(a) ${}^nC_n$ (b) ${}^nC_4 + {}^nC_2$
(c) ${}^nC_4 + {}^nC_1 + {}^nC_4 - {}^nC_2$ (d) ${}^nC_4 + {}^nC_2 + {}^nC_1 \cdot {}^nC_2$

24. The coefficient of $\lambda^n \mu^n$ in the expansion of $(1+\lambda)^n\,(1+\mu)^n\,(\lambda+\mu)^n$ is

(a) $\sum_{r=0}^{n} ({}^nC_r)^2$ (b) $\sum_{r=0}^{n} ({}^nC_{r-2})^2$
(c) $\sum_{r=0}^{n} ({}^nC_{r+3})^2$ (d) $\sum_{r=0}^{n} ({}^nC_r)^3$

25. If in the expansion of $(1+x)^n$, a, b and c are three consecutive coefficients, then n is equal to

(a) $\frac{ac+ab+bc}{b^2+ac}$ (b) $\frac{2ac+ab+bc}{b^2-ac}$
(c) $\frac{ab+ac}{b^2-ac}$ (d) None of these

26. If $f(x)=1-x+x^2-x^3+\ldots-x^{15}+x^{16}-x^{17}$. Then, the coefficient of x^2 in $f(x-1)$ is

(a) 826 (b) 816
(c) 822 (d) None of these

27. The value of $\binom{30}{0}\binom{30}{10}-\binom{30}{1}\binom{30}{11}+\binom{30}{2}\binom{30}{12}+\ldots+\binom{30}{20}\binom{30}{30}$ is equal to

(a) ${}^{60}C_{20}$ (b) ${}^{30}C_{10}$
(c) ${}^{60}C_{30}$ (d) ${}^{40}C_{30}$

28. If the coefficient of x^n in $(1+x)^{101}(1-x+x^2)^{100}$ is non-zero, then n cannot be of the form

(a) $3r+1$ (b) $3r$
(c) $3r+2$ (d) None of these

29. If the expansion of $\left(x^2+\frac{2}{x}\right)^n$ for positive n has a term independent of x, then n is

(a) 23 (b) 18
(c) 16 (d) 0

30. The term independent of x in $\left[\sqrt{\frac{x}{3}}+\sqrt{\frac{3}{2x^2}}\right]^{10}$ is

(a) 1
(b) ${}^{10}C_1$
(c) 5/12
(d) None of these

31. The term independent of x in the expansion of $[(t^{-1}-1)x+(t^{-1}+1)^{-1}x^{-1}]^8$ is

(a) $56\left(\frac{1-t}{1+t}\right)^3$ (b) $56\left(\frac{1+t}{1-t}\right)^3$
(c) $70\left(\frac{1-t}{1+t}\right)^4$ (d) $70\left(\frac{1+t}{1-t}\right)^4$

32. The term that is independent of x, in the expansion of $\left(\frac{3}{2}x^2-\frac{1}{3x}\right)^9$ is

(a) ${}^9C_6\left(\frac{3}{2}\right)^5\left(-\frac{1}{3}\right)^4$
(b) ${}^9C_6\left(\frac{1}{6}\right)^3$
(c) ${}^9C_4\left(\frac{3}{2}\right)^4\left(-\frac{1}{3}\right)^5$
(d) ${}^9C_6\left(\frac{3}{2}\right)^6\left(-\frac{1}{3}\right)^6$

33. Total number of terms, that are dependent on the value of x, in the expansion of $\left(x^2-2+\frac{1}{x^2}\right)^n$ is equal to

(a) $2n+1$ (b) $2n$
(c) n (d) $n+1$

34. The range of the values of the term independent of x in the expansion of $\left(x\sin^{-1}\alpha + \dfrac{\cos^{-1}\alpha}{x}\right)^{10}$, $\alpha \in [-1, 1]$, is

(a) $\left[-\dfrac{{}^{10}C_5\pi^{10}}{2^5}, \dfrac{{}^{10}C_5\pi^{10}}{2^{20}}\right]$ (b) $\left[-\dfrac{{}^{10}C_5\pi^2}{2^{20}}, \dfrac{{}^{10}C_5\pi^2}{2^5}\right]$

(c) $[1, 2]$ (d) $(1, 2)$

35. The term independent of x in the expansion of $(1-x)^2\left(x+\dfrac{1}{x}\right)^{10}$ is

(a) ${}^{11}C_5$ (b) ${}^{10}C_5$

(c) ${}^{10}C_4$ (d) None of these

36. The term independent of x in the expansion of $(1+x)^n\cdot\left(1-\dfrac{1}{x}\right)^n$ is

(a) 0, if n is odd

(b) $(-1)^{\frac{n-1}{2}}\cdot {}^nC_{\frac{n-1}{2}}$, if n is odd

(c) $(-1)^{n/2}\cdot {}^nC_{\frac{n}{2}-1}$, if n is even

(d) None of the above

37. The term independent of x in the expansion of $(1+x)^n\left(1+\dfrac{1}{x}\right)^n$ is

(a) $C_0^2 + 2C_1^2 + 3C_2^2 + \ldots + (n+1)C_n^2$

(b) $(C_0 + C_1 + \ldots + C_n)^2$

(c) $C_0^2 + C_1^2 + \ldots + C_n^2$

(d) None of the above

38. $\left(\sqrt[6]{3}\sqrt{2}+\dfrac{1}{\sqrt[3]{3}}\right)^n$, $\dfrac{t_7 \text{ from the 1st}}{t_7 \text{ from the last}} = \dfrac{1}{6}$, n is equal to

(a) 9 (b) 10

(c) 8 (d) 7

39. If sum of middle terms is S in the expansion of $\left(2a-\dfrac{a^2}{4}\right)^9$, then the value(s) of S is/are

(a) $\left(\dfrac{63}{32}\right)a^{14}(8+a)$ (b) $\left(\dfrac{63}{32}\right)a^{13}(8+a)$

(c) $\left(\dfrac{63}{32}\right)a^{14}(8-a)$ (d) $\left(\dfrac{63}{32}\right)a^{13}(8-a)$

40. If the rth term is the middle term in the expansion of $\left(x^2-\dfrac{1}{2x}\right)^{20}$, then the $(r+3)$th term is

(a) ${}^{20}C_{14}\cdot\dfrac{1}{2^{14}}\cdot x$ (b) ${}^{20}C_{12}\cdot\dfrac{1}{2^{12}}\cdot x^2$

(c) $-\dfrac{1}{2^{13}}\cdot {}^{20}C_{13}\cdot x$ (d) None of these

41. In the expansion of $\left(\sqrt[3]{4}+\dfrac{1}{\sqrt[4]{6}}\right)^{20}$

(a) the number of rational terms = 4

(b) the number of irrational terms = 18

(c) the middle term is irrational

(d) the number of irrational terms = 17

42. If n is an integer between 0 and 21, then the minimum value of $n!(21-n)!$ is attained for n, is equal to

(a) 1 (b) 10

(c) 12 (d) 20

43. If the middle term in the expansion of $\left(x^2+\dfrac{1}{x}\right)^n$ is $924\,x^6$, then n is equal to

(a) 10 (b) 12

(c) 14 (d) None of these

44. Middle term in the expansion of $(1+3x+3x^2+x^3)^6$ is

(a) 4th (b) 3rd

(c) 10th (d) None of these

45. The coefficient of $a^8b^4c^9d^9$ in $(abc+abd+acd+bcd)^{10}$ is

(a) 10! (b) $\dfrac{10!}{8!\,4!\,9!\,9!}$

(c) 2520 (d) None of these

46. The coefficient of x^2y^3 in the expansion of $(1-x+y)^{20}$ is

(a) $\dfrac{20!}{2!\,3!}$ (b) $-\dfrac{20!}{2!\,3!}$

(c) $\dfrac{20!}{5!\,2!\,3!}$ (d) None of these

47. The coefficient of x^2 in the expansion of $(1+x+x^2)^{10}$ is

(a) ${}^{10}C_2$ (b) ${}^{10}C_1$

(c) ${}^{11}C_2$ (d) None of these

48. The coefficient of x^4 in the expansion of $(1+x-2x^2)^7$ is

(a) -81 (b) -91

(c) 81 (d) 91

49. The total number of different terms in the expansion of $(x_1+x_2+x_3+\ldots+x_n)^m$ is equal to

(a) ${}^{n+m}C_m$ (b) ${}^{n+m-1}C_{n-1}$

(c) ${}^{n+m+1}C_{m+1}$ (d) ${}^{n+m+1}C_{n+1}$

50. The coefficient of a^3b^4c in the expansion of $(1+a-b+c)^9$ is equal to

(a) $\dfrac{9!}{3!\,6!}$ (b) $\dfrac{9!}{4!5!}$

(c) $\dfrac{9!}{3!5!}$ (d) $\dfrac{9!}{3!4!}$

51. The number of distinct terms in the expansion of $(x+2y-3z+5w-7u)^n$ is

(a) $n+1$ (b) ${}^{n-4}C_4$
(c) ${}^{n+4}C_{n+2}$ (d) None of these

52. If n is an even integer and a, b and c are distinct numbers, then the number of distinct terms in the expansion of $(a+b+c)^n+(a+b-c)^n$ is

(a) $\left(\frac{n+2}{2}\right)^2$ (b) $n+2$
(c) $\frac{n+4}{2}$ (d) None of these

53. In the expansion of $(x+y+z)^{25}$

(a) every term is of the form ${}^{25}C_r \cdot {}^rC_k \, x^{25-r} \cdot y^{r-k} \cdot z^k$
(b) the coefficient of $x^8y^9z^9$ is ${}^{25}C_8\ {}^8C_{17}$
(c) the number of terms is 325
(d) None of the above

54. The greatest coefficient in the expansion of $(1+x)^{2n}$ is

(a) $\frac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}\cdot 2^n$ (b) ${}^{2n}C_{n-1}$
(c) ${}^{2n}C_{n+1}$ (d) None of these

55. The largest term in the expansion of $(3+2x)^{50}$, where $x=1/5$, is

(a) 15th (b) 51st (c) 7th (d) 6th

56. If n is positive integer and $(3\sqrt{3}+5)^{2n+1}=\alpha+\beta$, where α is an integer and $0<\beta<1$, then

(a) α is an even integer
(b) $(\alpha+\beta)^2$ is divisible by 2^{2n+1}
(c) α is an odd integer
(d) None of the above

57. If $x=(2+\sqrt{3})^n$, then the value of $x-x^2+x[x]$, where [ ] denotes the greatest integer function, is equal to

(a) 1 (b) 2
(c) 2^{2n} (d) 2^n

58. The last digit of $(2137)^{754}$ is

(a) 2 (b) 3
(c) 7 (d) 9

59. The remainder when 3^{37} is divided by 80 is

(a) 78 (b) 3
(c) 2 (d) 35

60. The remainder when 4^{101} is divided by 101 is

(a) 4 (b) 64
(c) 84 (d) 36

61. The remainder obtained when $1!+2!+3!+\ldots+95!$ is divided by 15, is

(a) 3
(b) 14
(c) 1
(d) None of the above

62. The value of $\left\{\frac{3^{2003}}{28}\right\}$, where { } denotes the fractional part, is equal to

(a) $\frac{15}{28}$ (b) $\frac{5}{28}$ (c) $\frac{19}{28}$ (d) $\frac{9}{28}$

63. p is prime number and $n<p<2n$, if $N={}^{2n}C_n$, then

(a) p divides N (b) p^2 divides N
(c) p cannot divide N (d) None of these

64. Let $f(n)=10^n+3\cdot 4^{n+2}+5, n\in N$. The greatest value of the integer which divides $f(n)$ for all n is

(a) 27 (b) 9
(c) 3 (d) None of these

65. 2^{60} when divided by 7 leave the remainder

(a) 1 (b) 6 (c) 5 (d) 2

66. If sum of coefficients in the expression of $(\alpha x^2-2x+1)^{35}$ is equal to sum of coefficients in the expansion of $(x-\alpha y)^{35}$, then α is equal to

(a) 0 (b) 1
(c) any real number (d) None of these

67. The sum of the coefficient of the binomial expansion of $\left(\frac{1}{x}+2x\right)^n$ is equal to 6561. The constant term in the expansion is

(a) ${}^8C_4$ (b) $16\cdot {}^8C_4$
(c) ${}^6C_4\cdot 2^4$ (d) None of these

68. The sum of the numerical coefficients in the expansion of $\left(1+\frac{x}{3}+\frac{2y}{3}\right)^{12}$ is

(a) 1 (b) 2
(c) 2^{12} (d) None of these

69. The sum of the coefficients x^{2r}, $r=1,2,3,\ldots$, in the expansion of $(1+x)^n$ is

(a) 2^n (b) $2^{n-1}-1$
(c) 2^n-1 (d) $2^{n-1}+1$

70. The sum of the coefficients in the polynomial expansion of $(1+x-3x^2)^{2163}$ is

(a) 1 (b) -1
(c) 0 (d) None of these

71. If $(1+x-2x^2)^8=a_0+a_1x+a_2x^2+\ldots+a_{16}x^{16}$, then the sum $a_1+a_3+a_5+\ldots+a_{15}$ is equal to

(a) -2^7 (b) 2^7
(c) 28 (d) None of these

72. If $(1+x)^{10}=a_0+a_1x+a_2x^2+\ldots+a_{10}x^{10}$, then $(a_0-a_2+a_4-a_6+a_8-a_{10})^2+(a_1-a_3+a_5-a_7+a_9)^2$ is equal to

(a) 3^{10} (b) 2^{10}
(c) 2^9 (d) None of these

73. In the expansion of $(1+x)^{50}$, let S be the sum of coefficients of odd power of x, then S is

(a) 0 (b) 2^{49} (c) 2^{50} (d) 2^{51}

74. If $(1+x-2x^2)^{20} = a_0 + a_1x + a_2x^2 + a_3x^3 + \dots + a_{40}x^{40}$, then $a_1 + a_3 + a_5 + \dots + a_{39}$ is equal to

(a) -2^{19} (b) -2^{20} (c) -2^{21} (d) -2^{18}

75. If $n \in N$ and n is not a multiple of three and $(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$, then the value of $\sum_{r=0}^{n} (-1)^r \cdot a_r \cdot {}^nC_r$ is equal to

(a) 2 (b) –2 (c) 1 (d) None of these

76. If $(1+x)^{2n} = a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n}$, then

(a) $a_0 + a_2 + a_4 + \dots = 2^n$
(b) $a_{n+1} > a_n$
(c) $a_{n-3} = a_{n+3}$
(d) None of the above

77. The value of $\sum_{r=0}^{n} {}^nC_r \sin rx \cdot \cos(n-r)x$ is equal to

(a) $2^{n-1} \cdot \sin(nx)$ (b) $2^{n+1} \cdot \sin(nx)$
(c) $2^n \cdot \sin(nx)$ (d) None of these

78. The value of $\sum_{r=0}^{n} {}^nC_r (\sin rx)$ is equal to

(a) $2^n \cdot \cos^n \frac{x}{2} \cdot \sin \frac{nx}{2}$ (b) $2^n \cdot \sin^n \frac{x}{2} \cdot \cos \frac{nx}{2}$
(c) $2^{n+1} \cdot \cos^n \frac{x}{2} \cdot \sin \frac{nx}{2}$ (d) $2^{n+1} \cdot \sin^n \frac{x}{2} \cdot \cos \frac{nx}{2}$

79. The value of $\sum_{r=1}^{n} \frac{r \cdot {}^nC_r}{{}^nC_{r-1}}$ is equal to

(a) $\frac{n(n+1)}{2}$ (b) $\frac{n(n-1)}{2}$
(c) $n(n+1)$ (d) $n(n-1)$

80. The value of $\sum_{r=0}^{2n} r \cdot ({}^{2n}C_r) \cdot \frac{1}{(r+2)}$ is equal to

(a) $\frac{2^{2n+1}(2n^2+2n-1)}{(2n+1)(2n+2)}$
(b) $\frac{2^{2n+1}(2n^2-n+1)-2}{(2n+1)(2n+2)}$
(c) $\frac{2^{2n+1}(2n^2+2n+1)}{(2n+1)(2n+2)}$
(d) None of the above

81. In ΔABC, the value of $\sum_{r=0}^{n} {}^nC_r\, a^r \cdot b^{n-r} \cdot \cos\{rB-(n-r)A\}$ is equal to

(a) c^n (b) zero
(c) a^n (d) b^n

82. The sum of the series $\sum_{r=1}^{n} (-1)^{r-1} \cdot {}^nC_r\,(a-r)$ is equal to

(a) $n \cdot 2^{n-1} + a$ (b) 0
(c) a (d) None of these

83. The sum $\sum_{r=1}^{n} r \cdot {}^{2n}C_r$ is equal to

(a) $n \cdot 2^{2n-1}$ (b) 2^{2n-1}
(c) $2^{n-1}+1$ (d) None of these

84. If $(1-x+x^2)^n = a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n}$, then $a_0 + a_2 + a_4 + \dots + a_{2n}$ is equal to

(a) $\frac{3^n+1}{2}$ (b) $\frac{3^n-1}{2}$
(c) $3^n - \frac{1}{2}$ (d) $3^n + \frac{1}{2}$

85. $aC_0 + (a+b)C_1 + (a+2b)C_2 + \dots + (a+nb)C_n$ is equal to

(a) $(2a+nb)2^n$ (b) $(2a+nb)2^{n-1}$
(c) $(na+2b)2^n$ (d) $(na+2b)2^{n-1}$

86. If $C_1, C_2, \dots, C_n$ are coefficients in the expansion of $(1+x)^n = 1 + C_1x + C_2x^2 + \dots + C_nx^n$, then the value of $C_1^2 - 2C_2^2 + 3C_3^2 - \dots - 2nC_{2n}^2$ is

(a) n^2 (b) $(-1)^{n-1}n$
(c) $2(-1)^{n-1}n \cdot {}^{2n-1}C_n$ (d) $-n^2$

87. $({}^{10}C_0)^2 - ({}^{10}C_1)^2 + \dots - ({}^{10}C_9)^2 + ({}^{10}C_{10})^2$ equals

(a) ${}^{10}C_5$ (b) $-{}^{10}C_5$ (c) $({}^{10}C_5)^2$ (d) $(n!)^2$

88. The sum to $(n+1)$ terms of the series $\frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \frac{C_3}{5} + \dots$ is

(a) $\frac{1}{n+1}$ (b) $\frac{1}{n+2}$
(c) $\frac{1}{n(n+1)}$ (d) None of these

89. If $C_0, C_1, C_2, \dots, C_n$ denote the coefficients in the expansion of $(1+x)^n$, then the value of $C_1 + 2C_2 + 3C_3 + \dots + nC_n$ is

(a) $n\,2^{n-1}$ (b) $(n+2)\,2^n$
(c) $(n+1)2^{n-1}$ (d) $(n+2)\,2^{n-1}$

90. The value of $C_0 + 3C_1 + 5C_2 + 7C_3 + \dots + (2n+1)C_n$ is equal to

(a) 2^n (b) $2^n + n\,2^{n-1}$
(c) $2^n(n+1)$ (d) None of these

91. The value of $\sum_{r=0}^{50} ({}^{100}C_r \cdot {}^{200}C_{150+r})$ is equal to

(a) ${}^{300}C_{50}$ (b) ${}^{100}C_{50} \cdot {}^{200}C_{150}$
(c) ${}^{100}C_{50}$ (d) None of these

92. The value of $\sum_{r=0}^{2n}(-1)^r\cdot({}^{2n}C_r)^2$ is equal to

(a) ${}^{4n}C_{2n}$ (b) ${}^{2n}C_n$
(c) $(-1)^n\cdot{}^{2n}C_n$ (d) None of these

93. The value of $\sum_{r=0}^{2n} r\cdot({}^{2n}C_r)^2$ is equal to

(a) $n\cdot{}^{4n}C_{2n}$ (b) $4n\cdot{}^{4n}C_{2n}$
(c) $2n\cdot{}^{4n}C_{2n}$ (d) None of these

94. The value of $\sum_{i=0}^{n-r}{}^{n-i}C_r, r\in[1,n]$ is equal to

(a) ${}^{n+1}C_r$ (b) ${}^nC_r$ (c) ${}^nC_{r+1}$ (d) ${}^{n+1}C_{r+1}$

95. If $C_0, C_1, C_2, \ldots, C_n$ are the coefficients of the expansion of $(1+x)^n$, then the value of $\sum_{k=0}^{n}\frac{C_k}{k+1}$ is

(a) 0 (b) $\frac{2^n-1}{n}$
(c) $\frac{2^{n+1}-1}{n+1}$ (d) None of these

96. If $(1+x)^{2n}=a_0+a_1x+a_2x^2+\ldots+a_{2n}x^{2n}$, then $\left(1+\frac{a_1}{a_0}\right)\left(1+\frac{a_2}{a_1}\right)\left(1+\frac{a_3}{a_2}\right)\ldots\left(1+\frac{a_{2n}}{a_{2n-1}}\right)$ is equal to

(a) $\frac{n^n}{(2n)!}$ (b) $\frac{(2n+1)^{2n}}{(2n)!}$
(c) $\frac{n^{n+1}}{(2n+1)!}$ (d) None of these

97. The value of $\sum\sum_{0\le i<j\le n} i\cdot{}^nC_j$ is equal to

(a) $n(n+1)\cdot 2^{n-3}$ (b) $n^2\cdot 2^{n-3}$
(c) $n(n-1)\cdot 2^{n-3}$ (d) None of these

98. The value of $\sum\sum_{0\le i\le j\le n} j\cdot{}^nC_j$ is equal to

(a) $n\cdot 2^{n-3}$ (b) $n(n+3)\cdot 2^{n-3}$
(c) $(n+3)\cdot 2^{n-3}$ (d) None of these

99. The value of $\sum_{r=0}^{n}(-1)^r\cdot r^2\cdot{}^nC_r$ is equal to

(a) n (b) $-n$
(c) $(n+1)$ (d) None of these

100. If $(1+x)^n=C_0+C_1x+C_2x^2+\ldots+C_nx^n$, then $\sum\sum_{0\le i<j\le n}(C_i-C_j)^2$

(a) $(n+1)\,{}^{2n}C_n-2^{2n}$ (b) $(n+1)^2\times{}^{2n}C_n-2^n$
(c) $(n+1)\times{}^{2n}C_n+2^n$ (d) None of these

101. If $A={}^{2n}C_0\,{}^{2n}C_1+{}^{2n}C_1\,{}^{2n-1}C_1+{}^{2n}C_2\,{}^{2n-2}C_1+\ldots$, then A is

(a) 0 (b) $2n$ (c) $n\cdot 2^{2n}$ (d) 1

102. $\sum\sum_{0\le i<j\le n}{}^nC_i$ is equal to

(a) $n\,2^{n-1}$ (b) $(n+1)\,2^{n-1}$
(c) $(n+1)\,2^n$ (d) $n\,2^n$

103. The value of $\sum\sum\sum\sum_{0\le i<j<k<l\le n} 2$ is equal to

(a) $2(n+1)^3$ (b) $2\,{}^{n+1}C_4$
(c) $2(n+1)^4$ (d) None of these

104. The value of $\sum\sum_{1\le i<j\le n-1}(i\cdot j)\,{}^nC_i\cdot{}^nC_j$ is equal to

(a) $\frac{n^2}{2}(2^{2n-2}-{}^{2n-2}C_{n-1})$
(b) $\frac{n^2}{2}(2^{2n-2}+{}^{2n-2}C_{n-1})$
(c) $n^2(2^{2n-2}+{}^{2n-2}C_{n-1})$
(d) $n^2(2^{2n-2}-{}^{2n-2}C_{n-1})$

105. If $S=\sum_{n=1}^{\infty}\left(\frac{{}^nC_0+{}^nC_1+{}^nC_2+\ldots+{}^nC_n}{{}^nP_n}\right)$, then S is equal to

(a) $2e$ (b) $2e-1$
(c) $2e+1$ (d) None of these

106. The value of $\sum_{r=0}^{n} r(n-r)\cdot({}^nC_r)^2$ is equal to

(a) $n^2\cdot{}^{2n-1}C_n$ (b) $n^2\cdot{}^{2n}C_{n-1}$
(c) $n^2\cdot{}^{2n-1}C_{n-1}$ (d) $n^2\cdot{}^{2n-2}C_n$

107. If ${}^{n+1}C_{r+1}:{}^nC_r:{}^{n-1}C_{r-1}=11:6:3$, then nr is equal to

(a) 20 (b) 30 (c) 40 (d) 50

108. If $f(x)=x^n$, then the value of $f(1)+\frac{f^1(1)}{1!}+\frac{f^2(1)}{2!}+\ldots+\frac{f^n(1)}{n!}$, where $f^r(x)$ denotes the rth order derivative of $f(x)$ with respect to x, is

(a) n (b) 2^n
(c) 2^{n-1} (d) None of these

109. The value of $\sum_{k=1}^{\infty}\sum_{r=0}^{k}\frac{1}{3^k}({}^kC_r)$ is

(a) $\frac{2}{3}$ (b) $\frac{4}{3}$ (c) 2 (d) 1

110. $1+\frac{1}{3}x+\frac{1\times4}{3\times6}x^2+\frac{1\times4\times7}{3\times6\times9}x^3+\ldots$ is equal to

(a) x (b) $(1+x)^{1/3}$ (c) $(1-x)^{1/3}$ (d) $(1-x)^{-1/3}$

111. If $\alpha=\frac{5}{2!\,3}+\frac{5\cdot7}{3!\,3^2}+\frac{5\cdot7\cdot9}{4!\,3^3}+\ldots$, then $\alpha^2+4\alpha$ is equal to

(a) 21 (b) 23 (c) 25 (d) 27

Type 2. **More than One Correct Option**

112. For the expansion $(x\sin p + x^{-1}\cos p)^{10}, (p \in R)$
(a) the greatest value of the term independent of x is $10!/2^5(5!)^2$
(b) the least value of sum of coefficient is zero
(c) the greatest value of sum of coefficient is 32
(d) the least value of the term independent of x occurs when $p = (2n+1)\frac{\pi}{4}, n \in Z$

113. In the expansion of $\left(x + \frac{a}{x^2}\right)^n (a \neq 0)$, if term independent of x does not exist, then n must be
(a) 20 (b) 16 (c) 15 (d) 10

114. If the expansion of $\left(x + \frac{\alpha}{x}\right)^n$ and $\left(x + \frac{\beta}{x^2}\right)^n$ in powers of n have one term independent of x, then n is divisible by
(a) 2 (b) 3
(c) 1 (d) None of these

115. If n is a positive integer, then in the trinomial expansion of $(x^2 + 2x + 2)^n$ coefficient of
(a) x is $2^n \cdot n$ (b) x^2 is $n^2 \cdot 2^{n-1}$
(c) x^3 is $2^n \cdot {}^{n+1}C_3$ (d) None of these

116. Which of the following will not be true?
(a) The last two digits of 3^{100} will be 73
(b) The last two digits of 3^{50} will be 51
(c) The last two digits of 3^{50} will be 49
(d) The last three digits of 3^{50} will be 249

117. If $ac > b^2$, then the sum of the coefficients in the expansion of $(a\alpha^2 x^2 + 2b\alpha x + c)^n$, where $a, b, c, \alpha \in R$ and $n \in N$,
(a) positive, if $a > 0$
(b) positive, if $c > 0$
(c) negative, if $a < 0$ and n is odd
(d) positive, if $c < 0$ and n is even

118. If $f(n) = \sum_{r=1}^{n} [r({}^{n-1}C_{r-1} - r\,{}^nC_{r-1}) + (2r+1)\,{}^nC_r]$, then
(a) $f(n) = n^2 - 1$
(b) $f(n) = (n+1)^2 - 1$
(c) $\sum_{n=1}^{10} f(n) = 495$
(d) $\sum_{n=1}^{10} f(n) = 374$

119. The value of ${}^nC_0 + {}^{n+1}C_1 + {}^{n+2}C_2 + \ldots + {}^{n+k}C_k$ is equal to
(a) ${}^{n+k+1}C_k$ (b) ${}^{n+k+1}C_{n+1}$
(c) ${}^{n+k}C_{n+1}$ (d) None of these

120. Number of values of r satisfying the equation ${}^{69}C_{3r-1} - {}^{69}C_{r^2} = {}^{69}C_{r^2-1} - {}^{69}C_{3r}$ is
(a) 1 (b) 2 (c) 3 (d) 7

121. Suppose $x_1, x_2, \ldots, x_n$ $(n > 2)$ are real numbers such that $x_i = -x_{n-i+1}$ for $1 \le i \le n$. Consider the sum $S = \Sigma\Sigma\Sigma x_i\, x_j\, x_k$ $(1 \le i, j, k \le n)$ $(i, j, k$ distinct), then which of the following is not true?
(a) $S = n!\, x_1, x_2, \ldots, x_n$
(b) $S = (n-3)(n-4)$
(c) $S = (n-3)(n-4)(n-5)$
(d) $S = 0$ for all n

122. If $f(m) = \sum_{i=0}^{m} \binom{30}{30-i}\binom{20}{m-i}$, where $\binom{p}{q} = {}^pC_q$, then
(a) maximum value of $f(m)$ is ${}^{50}C_{25}$
(b) $f(0) + f(1) + \ldots + f(50) = 2^{50}$
(c) $f(m)$ is always divisible by 50 $(1 \le m \le 49)$
(d) The value of $\sum_{m=0}^{50} (f(m))^2 = {}^{100}C_{50}$

Type 3. **Assertion and Reason**

Directions (Q. Nos.123-128) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has* 4 *choices (a),(b),(c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

123. Statement I Greatest term in the expansion of $(1+x)^{12}$, when $x = 11/10$ is 7th.

Statement II 7th term in the expansion of $(1+x)^{12}$ has the factor ${}^{12}C_6$ which is greatest value of ${}^{12}C_r$.

124. Statement I If n is an odd prime, then integral part of $(\sqrt{5}+2)^n - 2^{n+1}$ is divisible by $20n$.

Statement II If n is prime, then ${}^nC_1, {}^nC_2, {}^nC_3, \ldots, {}^nC_{n-1}$ must be divisible by n.

Target Exercises

125. Statement I Any positive integral power of $(\sqrt{2}-1)$ can be expressed as $\sqrt{N}-\sqrt{N-1}$ for some natural number $N>1$.

Statement II Any positive integral power of $\sqrt{2}-1$ can be expressed as $A+B\sqrt{2}$, where A and B are integers.

126. Two integers n and m are such that $m=n^2-n$, where $n\geq 3$.

Statement I The number $m(m-2)$ is divisible by 24.

Statement II Product of r successive integers are divisible by $r!$.

127. Statement I If $S_n = {}^nC_1 - \frac{{}^nC_2}{2} + \frac{{}^nC_3}{3} - \ldots + \frac{(-1)^{n}\ {}^{n-1}C_n}{n}$ and $T_n = 1+\frac{1}{2}+\frac{1}{3}+\ldots+\frac{1}{n}$, then $S_n = T_n$ for all n.

Statement II $S_{n+1}-S_n = T_{n+1}-T_n$

128. Statement I $\sum\sum_{0\leq i<j\leq n}\left(\frac{i}{{}^nC_i}+\frac{j}{{}^nC_j}\right)$ is equal to $\frac{n^2}{2}a$, where $a=\sum_{r=0}^{n}\frac{1}{{}^nC_r}$

Statement II $\sum_{r=0}^{n}\frac{r}{{}^nC_r}=\sum_{r=0}^{n}\frac{n-r}{{}^nC_r}$

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos.129-131) *Consider following two infinite series in real r and θ*

$$C = 1 + r\cos\theta + \frac{r^2\cos 2\theta}{2!} + \frac{r^3\cos 3\theta}{3!} + \ldots$$

$$S = r\sin\theta + \frac{r^2\sin 2\theta}{2!} + \frac{r^3\sin 3\theta}{3!} + \ldots$$

If θ remains constant and r varies, then

129. The expression $C\frac{dC}{dr}+S\frac{dS}{dr}$ is equal to

(a) C^2+S^2 (b) $(C^2+S^2)\cos\theta$
(c) $(C^2+S^2)\sin^2\theta$ (d) 1

130. The expression $C\frac{dS}{dr}-S\frac{dC}{dr}$ is equal to

(a) C^2+S^2 (b) $(C^2+S^2)\cos\theta$
(c) $(C^2+S^2)\sin\theta$ (d) CS

131. $\left(\frac{dC}{dr}\right)^2+\left(\frac{dS}{dr}\right)^2$ is equal to

(a) C^2+S^2 (b) $(C^2+S^2)\cos^2\theta$
(c) $(C^2+S^2)\sin^2\theta$ (d) 1

Passage II (Q. Nos. 132-135)

If $(x+y)^n = \sum_{r=0}^{n} C_r x^{n-r} y^r$, where $C_r = {}^nC_r$.

132. $\frac{C_1}{2}+\frac{C_3}{4}+\frac{C_5}{6}+\frac{C_7}{8}+\ldots$ is equal to

(a) $\frac{2^n-1}{n+1}$ (b) $\frac{2^n+1}{n+1}$
(c) $\frac{2^{n+1}-1}{n+1}$ (d) None of these

133. If $\sum_{r=0}^{n}\left(\frac{r+2}{r+1}\right)C_r=\frac{2^8-1}{6}$, then n is equal to

(a) 8 (b) 6 (c) 5 (d) 4

134. $C_0 - C_2 + C_4 - C_6 + \ldots$ is equal to

(a) $2^{n/2}$ (b) $2^{n/2}(1+i)$
(c) $2^{n/2}\cos\pi/4$ (d) None of these

135. If $(1+x)^n=\sum_{r=0}^{n}{}^nC_r x^r$ and $\sum_{r=0}^{n}\frac{1}{{}^nC_r}=a$, then the value of $\sum_{0\leq i\leq n}\sum_{0\leq j\leq n}\left(\frac{i}{{}^nC_i}+\frac{j}{{}^nC_j}\right)$ is equal to

(a) n^2a (b) $\frac{n^2}{2a}$
(c) $\frac{n}{2}a$ (d) None of these

Passage III (Q. Nos. 136-138) *If $(1+x)^n=\sum_{r=0}^{n}{}^nC_r x^r$, then the sum of the binomial coefficients can be obtained by substituting $x=1$. But in case we have to find the sum of coefficients in some particular order, we can substitute x by $\pm ix$ or $\pm\omega x$ or $\pm\omega^2 x$ depending upon certain requirements.*

136. The sum of binomial coefficients ${}^nC_0+{}^nC_4+{}^nC_8+\ldots$ must be

(a) $2^{n/2}\cos\left(\frac{\pi}{8}\right)$ (b) $2^{n/2}\sin\left(\frac{n\pi}{8}\right)$
(c) $2^n+2^{n/2}\cos\left(\frac{n\pi}{4}\right)$ (d) $2^{n-2}+2^{\frac{n}{2}-1}\cos\left(\frac{n\pi}{4}\right)$

137. The sum of the binomial coefficients ${}^nC_0+{}^nC_3+{}^nC_6+\ldots$ must be

(a) $\frac{2^n}{3}$
(b) $\frac{1}{3}\left[2^n+\cos\left(\frac{n\pi}{3}\right)\right]$
(c) $\frac{1}{3}\left[2^n+2\cos\left(\frac{n\pi}{3}\right)\right]$
(d) $\frac{1}{3}\left[2^n+2\sin\left(\frac{n\pi}{3}\right)\right]$

138. If n is an even positive integer and $k = \frac{3n}{2}$, then the value of $\sum_{r=1}^{n} (-3)^{r-1} \, {}^{3n}C_{2r-1}$ is

(a) 3^n (b) 3^{n-1} (c) 6^n (d) zero

Passage IV (Q. Nos. 139-141) *Let n be positive integer such that* $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$.

139. The value of $\sum_{r=0}^{n} \sum_{s=0}^{n} (C_r + C_s)$ is

(a) $(n+1)\,2^{n+1}$ (b) $n\,2^n$
(c) $(n+1)\,2^n$ (d) $n\,2^{n-1}$

140. The value of $\sum_{r=0}^{s} \sum_{s=1}^{n} {}^nC_s \cdot {}^sC_r$ (when $r \le s$) is

(a) 3^n
(b) $n\,3^{n-1}$
(c) $n\,3^{n-1} - 1$
(d) $3^n - 1$

141. The value of $\sum_{r=0}^{n} \sum_{s=0}^{n} \sum_{t=0}^{n} \sum_{u=0}^{n} (1)$ is

(a) ${}^nC_4$
(b) ${}^{n+1}C_4$
(c) ${}^{4n+1}C_4$
(d) $(n+1)^4$

Type 5. **Match the Columns**

142. Consider an expression $f(x) = x_n + x^{n+1}, n \in N$. $f(x)$ is differentiated successively an arbitrary number of times, then multiplied by $(x+1)$ and again differentiated successively till it attains the form of $Ax + B$. It is found that $A - B$ is always divisible by a proper integer λ which depends on n. Now, in Column I different values of n are given and in Column II different values of λ are given, match the corresponding values of n and λ.

	Column I		Column II
A.	5	p.	15
B.	7	q.	81
C.	9	r.	49
D.	13	s.	91

143. Match the following.

	Column I		Column II
A.	If $x, y, z \in N$, then number of ordered triplet (x, y, z) satisfying $xyz = 243$ is	p.	19
B.	The number of terms in the expansion of $(x+y+z)^6$ is	q.	28
C.	If $x \in N$, then number of solutions of $x^2 + x - 400 \le 0$ is	r.	21
D.	If $x, y, z \in N$, then number of solutions of $x + y + z = 10$ is	s.	36

144. Match the following.

	Column I		Column II
A.	The last non-zero digit in the sum $2 \sum_{0 \le i} \sum_{\le j \le 10} i \cdot j \; {}^{10}C_i \; {}^{10}C_k$ is	p.	2
B.	The largest real value for x such that $\sum_{k=0}^{4} \left(\frac{3^{4-k}}{(4-k)!} \right) \left(\frac{x^k}{k!} \right) = \frac{32}{3}$	q.	4
C.	If the expansion of $(1 + x + x^2)^n$ be written as $a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n}$, then the value of $\frac{a_0 + a_1 + a_3 + a_4 + a_6 + a_7 + \ldots}{a_2 + a_5 + a_8 + \ldots}$ is	r.	1
D.	The value of $\left[\frac{{}^{47}C_4}{{}^{57}C_4} + \sum_{j=0}^{3} \frac{{}^{50-j}C_3}{{}^{57}C_{53}} + \sum_{j=0}^{5} \frac{{}^{56-k}C_{53-k}}{{}^{57}C_4} \right]$ is	s.	3

145. Match the statements of Column I with values of Column II.

	Column I		Column II
A.	${}^{32}C_0^2 - {}^{32}C_1^2 + {}^{32}C_2^2 - \ldots + {}^{32}C_{32}^2 =$	p.	${}^{63}C_{32}$
B.	${}^{32}C_0^2 + {}^{32}C_1^2 + {}^{32}C_2^2 + \ldots + {}^{32}C_{32}^2 =$	q.	${}^{32}C_{16}$
C.	$\frac{1}{32}(1 \times {}^{32}C_1^2 + 2 \times {}^{32}C_2^2 + \ldots + 32 \times {}^{32}C_{32}^2) =$	r.	0
D.	${}^{31}C_0^2 - {}^{31}C_1^2 + {}^{31}C_2^2 - \ldots - {}^{31}C_{31}^2 =$	s.	${}^{64}C_{32}$

Type 6 **Single Integer Answer Type Questions**

146. Let $a = 3^{\frac{1}{223}} + 1$, for all $n \geq 3$ and let $f(x) = {}^nC_0 a^{n-1} - {}^nC_1 a^{n-2} + {}^nC_2 a^{n-3} - \ldots + (-1)^{n-1}\, {}^nC_{n-1} a^0$.

If the value of $f(2007) + f(2008) = 3^k$, where $k \in N$, then the value of k is _______ .

147. The sum of roots of x for which the sixth term of $\left(\sqrt{2^{\log(10-3^x)}} + 5\sqrt{2^{(x-2)\log 3}}\right)^m$ is equal to 21 and binomial coefficients of second, third and fourth terms are the first, third and fifth terms of an arithmetic progression, is _______ .

148. The fractional part of the sum of all the rational terms in the expansion of $(3^{1/4} + 4^{1/3})^{12}$, is _______ .

149. The coefficient of x^{83} in $(1 + x + x^2 + x^3 + x^4)^n (x-1)^{n+3}$, is $-\,{}^nC_{2\lambda}$, then λ is _______ .

150. The coefficient of x^4 in the expansion of $(1 + x + x^2 + x^3)^{11}$ is λ. Then, the number of divisors of λ of the form $9k$, is _______ .

151. If the middle term in the expansion of $\left(\frac{x}{2} + 2\right)^8$ is 1120, then the sum of possible real values of x is ___.

152. The number formed by last two digits of the number $(17)^{256}$ is ab, then $(a + b)$ is _______ .

153. The remainder, if $1 + 2 + 2^2 + 2^3 + \ldots + 2^{1999}$ is divided by 5, is _______ .

154. The largest real value for $x = 2\sqrt{2} - \lambda$ such that $\sum_{k=0}^{4}\left(\frac{5^{4-k}}{(4-k)!}\right)\left(\frac{x^k}{k!}\right) = \frac{8}{3}$, then λ is _______ .

155. The value of

$$C_0 - C_1\frac{(1+x)}{(1+nx)} + C_2\cdot\frac{(1+2x)}{(1+nx)^2} - C_3\cdot\frac{(1+3x)}{(1+nx)^3} + \ldots = 1,$$ then λ is ….

JEE Advanced/IIT JEE

1. Coefficient of x^{11} in the expansion of $(1 + x^2)^4 (1 + x^3)^7 (1 + x^4)^{12}$ is **[2014]**

(a) 1051 (b) 1106
(c) 1113 (d) 1120

2. The coefficients of three consecutive terms of $(1 + x)^{n+5}$ are in the ratio 5 : 10 : 14. Then, n is…. **[2013]**

3. For $r = 0, 1, \ldots, 10$, let A_r, B_r and C_r denote, respectively the coefficient of x^r in the expansions of $(1 + x)^{10}$, $(1 + x)^{20}$ and $(1 + x^{30})$. Then, $\sum_{r=1}^{10} A_r (B_{10}B_r - C_{10}A_r)$ is equal to **[2010]**

(a) $B_{10} - C_{10}$ (b) $A_{10}(B_{10}^2 - C_{10}A_{10})$
(c) 0 (d) $C_{10} - B_{10}$

JEE Main/AIEEE

4. The sum of coefficients of integral powers of x in the binomial expansion of $(1 - 2\sqrt{x})^{50}$ is **[2015]**

(a) $\frac{1}{2}(3^{50} + 1)$ (b) $\frac{1}{2}(3^{50})$
(c) $\frac{1}{2}(3^{50} - 1)$ (d) $\frac{1}{2}(2^{50} + 1)$

5. If the coefficients of x^3 and x^4 in the expansion of $(1 + ax + bx^2)(1 - 2x)^{18}$ in powers of x are both zero, then (a, b) is equal to **[2014]**

(a) $\left(16, \frac{251}{3}\right)$ (b) $\left(14, \frac{251}{3}\right)$
(c) $\left(14, \frac{272}{3}\right)$ (d) $\left(16, \frac{272}{3}\right)$

6. If $X = \{4^n - 3n - 1 : n \in N\}$ and $Y = \{9(n-1) : n \in N\}$, where N is the set of natural numbers, then $X \cup Y$ is equal to **[2014]**

(a) N
(b) $Y - X$
(c) X
(d) Y

7. The term independent of x in expansion of $\left(\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{x-1}{x - x^{1/2}}\right)^{10}$ is **[2014]**

(a) 4 (b) 120
(c) 210 (d) 310

8. If n is a positive integer, then $(\sqrt{3}+1)^{2n}-(\sqrt{3}-1)^{2n}$ is **[2012]**
(a) an irrational number
(b) an odd positive integer
(c) an even positive integer
(d) a rational number other than positive integers

9. The coefficient of x^7 in the expansion of $(1-x-x^2+x^3)^6$ is **[2011]**
(a) -132 (b) -144
(c) 132 (d) 144

10. Let $S_1=\sum_{j=1}^{10} j(j-1)\,{}^{10}C_j$, $S_2=\sum_{j=1}^{10} j\,{}^{10}C_j$ and $S_3=\sum_{j=1}^{10} j^2\,{}^{10}C_j$

Statement I $S_3=55\times 2^9$
Statement II $S_1=90\times 2^8$ and $S_2=10\times 2^9$ **[2010]**
(a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

11. The remainder left out when $8^{2n}-(62)^{2n+1}$ is divided by 9, is **[2009]**
(a) 0 (b) 2
(c) 7 (d) 8

12. Statement I $\sum_{r=0}^{n}(r+1)\,{}^nC_r=(n+2)\,2^{n-1}$
Statement II $\sum_{r=0}^{n}(r+1)\,{}^nC_r\,x^r=(1+x)^n+nx\,(1+x)^{n-1}$ **[2008]**
(a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

13. In the binomial expansion of $(a-b)^n$, $n\geq 5$, the sum of 5th and 6th terms is zero, then $\frac{a}{b}$ equals **[2007]**
(a) $\frac{5}{n-4}$ (b) $\frac{6}{n-5}$
(c) $\frac{n-5}{6}$ (d) $\frac{n-4}{5}$

14. The sum of the series ${}^{20}C_0-{}^{20}C_1+{}^{20}C_2-{}^{20}C_3+\ldots+{}^{20}C_{10}$ is **[2007]**
(a) $-{}^{20}C_{10}$
(b) $\frac{1}{2}\,{}^{20}C_{10}$
(c) 0
(d) ${}^{20}C_{10}$

15. If the expansion in powers of x of the function $\frac{1}{(1-ax)(1-bx)}$ is $a_0+a_1x+a_2x^2+a_3x^3+\ldots$, then a_n is **[2006]**
(a) $\frac{a^n-b^n}{b-a}$ (b) $\frac{a^{n+1}-b^{n+1}}{b-a}$
(c) $\frac{b^{n+1}-a^{n+1}}{b-a}$ (d) $\frac{b^n-a^n}{b-a}$

16. For natural numbers m, n, if $(1-y)^m(1+y)^n=1+a_1y+a_2y^2+\ldots$ and $a_1=a_2=10$, then (m,n) is **[2006]**
(a) (35, 20)
(b) (45, 35)
(c) (35, 45)
(d) (20, 45)

17. The value of ${}^{50}C_4+\sum_{r=1}^{6}{}^{56-r}C_3$ is **[2005]**
(a) ${}^{56}C_4$ (b) ${}^{56}C_3$
(c) ${}^{55}C_3$ (d) ${}^{55}C_4$

18. If the coefficients of rth, $(r+1)$th and $(r+2)$th terms in the binomial expansion of $(1+y)^m$ are in AP, then m and r satisfy the equation **[2005]**
(a) $m^2-m(4r-1)+4r^2+2=0$
(b) $m^2-m(4r+1)+4r^2-2=0$
(c) $m^2-m(4r+1)+4r^2+2=0$
(d) $m^2-m(4r-1)+4r^2-2=0$

19. If the coefficient of x^7 in $\left[ax^2+\frac{1}{bx}\right]^{11}$ equals the coefficient of x^{-7} in $\left[ax-\frac{1}{bx^2}\right]^{11}$, then a and b satisfy the relation **[2005]**
(a) $ab=1$ (b) $\frac{a}{b}=1$
(c) $a+b=1$ (d) $a-b=1$

20. If x is so small that x^3 and higher powers of x may be neglected, then $\frac{(1+x)^{3/2}-\left(1+\frac{1}{2}x\right)^3}{(1-x)^{1/2}}$ may be approximated as **[2005]**
(a) $\frac{x}{2}-\frac{3}{8}x^2$ (b) $-\frac{3}{8}x^2$
(c) $3x+\frac{3}{8}x^2$ (d) $1-\frac{3}{8}x^2$

21. The coefficient of the middle term in the binomial expansion in powers of x of $(1+\alpha x)^4$ and of $(1-\alpha x)^6$ is the same, if α equals **[2004]**
(a) $-\frac{5}{3}$ (b) $\frac{10}{3}$
(c) $-\frac{3}{10}$ (d) $\frac{3}{5}$

22. The coefficient of x^n in expansion of $(1+x)(1-x)^n$ is **[2004]**

(a) $(n-1)$ (b) $(-1)^n(1-n)$
(c) $(-1)^{n-1}(n-1)^2$ (d) $(-1)^{n-1}n$

23. If $s_n = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$ and $t_n = \sum_{r=0}^{n} \frac{r}{{}^nC_r}$, then $\frac{t_n}{s_n}$ is equal to **[2004]**

(a) $\frac{n}{2}$ (b) $\frac{n}{2}-1$ (c) $n-1$ (d) $\frac{2n-1}{2}$

24. The number of integral terms in the expansion of $(\sqrt{3}+\sqrt[8]{5})^{256}$ is **[2003]**

(a) 32 (b) 33 (c) 34 (d) 35

25. If x is positive, the first negative term in the expansion of $(1+x)^{27/5}$ is **[2003]**

(a) 7th term (b) 5th term
(c) 8th term (d) 6th term

26. The coefficient of x^5 in $(1+2x+3x^2+\dots)^{-3/2}$ is **[2002]**

(a) 21
(b) 25
(c) 26
(d) None of the above

27. If $|x|<1$, then the coefficient of x^n in expansion of $(1+x+x^2+x^3+\dots)^2$ is **[2002]**

(a) n (b) $n-1$ (c) $n+2$ (d) $n+1$

Other Engineering Entrances

28. The sum of the coefficients in the expansion of $(5x-4y)^n$, where n is a positive integer, is **[BITSAT 2014]**

(a) 0 (b) n (c) 1 (d) -1

29. If 21st and 22nd terms in the expansion of $(1+x)^{44}$ are equal, then x is equal to **[Karnataka CET 2014]**

(a) 8/7 (b) 21/22 (c) 7/8 (d) 23/24

30. If the coefficient of x^8 in $\left(ax^2+\frac{1}{bx}\right)^{13}$ is equal to the coefficient of x^{-8} in $\left(ax-\frac{1}{bx^2}\right)^{13}$, then a and b will satisfy the relation **[WB JEE 2014]**

(a) $ab+1=0$ (b) $ab=1$
(c) $a=1-b$ (d) $a+b=-1$

31. The coefficient of x^3 in the infinite series expansion of $\frac{2}{(1-x)(2-x)}$, for $|x|<1$ is **[WB JEE 2014]**

(a) $-\frac{1}{16}$ (b) $\frac{15}{8}$ (c) $-\frac{1}{8}$ (d) $\frac{15}{16}$

32. If $(a+bx)^{-3} = \frac{1}{27}+\frac{1}{3}x+\dots$, then the ordered pair (a, b) equals **[EAMCET 2014]**

(a) $(3, -27)$ (b) $\left(1, \frac{1}{3}\right)$ (c) $(3, 9)$ (d) $(3, -9)$

33. If the term free from x in the expansion of $\left(\sqrt{x}-\frac{k}{x^2}\right)^{10}$ is 405, then the value of k is **[Manipal 2014]**

(a) ± 1 (b) ± 3
(c) ± 4 (d) ± 2

34. Middle term in the expansion of $\left(x^2+\frac{1}{x^2}+2\right)^n$ is **[Manipal 2014]**

(a) $\frac{n!}{(n!)^2}$ (b) $\frac{(2n)!}{(n!)^2}$
(c) $\frac{(2n-1)!}{n!}$ (d) $\frac{(2n)!}{n!}$

35. The term independent of x in the expansion of $\left(\sqrt{x}-\frac{2}{\sqrt{x}}\right)^{18}$ is **[EAMCET 2014]**

(a) $-{}^{18}C_9 2^9$ (b) ${}^{18}C_9 2^{12}$
(c) ${}^{18}C_6 2^6$ (d) ${}^{18}C_9 2^8$

36. The value of the sum $({}^nC_1)^2+({}^nC_2)^2+({}^nC_3)^2+\dots+({}^nC_n)^2$ is **[WB JEE 2014]**

(a) $({}^{2n}C_n)^2$ (b) ${}^{2n}C_n$
(c) ${}^{2n}C_n+1$ (d) ${}^{2n}C_n-1$

37. Let $S = \frac{2}{1}\,{}^nC_0+\frac{2^2}{2}\,{}^nC_1+\frac{2^3}{3}\,{}^nC_2+\dots+\frac{2^{n+1}}{n+1}\,{}^nC_n$.

Then, S equals **[WB JEE 2014]**

(a) $\frac{2^{n+1}-1}{n+1}$ (b) $\frac{3^{n+1}-1}{n+1}$
(c) $\frac{3^n-1}{n}$ (d) $\frac{2^n-1}{n}$

38. ${}^mC_{r+1}+\sum_{k=m}^{n} {}^kC_r$ is equal to **[AMU 2014]**

(a) ${}^nC_{r+1}$
(b) ${}^{n+1}C_{r+1}$
(c) ${}^nC_r$
(d) None of the above

39. $\frac{C_1}{C_0}+2\frac{C_2}{C_1}+3\frac{C_3}{C_2}+\dots+n\frac{C_n}{C_{n-1}}$ is equal to **[AMU 2014]**

(a) $\frac{n(n-1)}{2}$ (b) $\frac{n(n+1)}{2}$
(c) $\frac{(n+1)(n+2)}{2}$ (d) None of these

40. If n is an integer with $0 \le n \le 11$, then the minimum value of $n!(11-n)!$ is attained when a value of n equals **[EAMCET 2014]**

(a) 11 (b) 5
(c) 7 (d) 9

41. If the 6th term in the expansion of the binomial $[\sqrt{2^{\log(10-3^x)}} + \sqrt[5]{2^{(x-2)\log 3}}]^m$ is equal to 21 and it is known that the binomial coefficient of 2nd, 3rd and 4th terms in the expansion represent, respectively the first, third and fifth terms of an AP, then x is equal to **[BITSAT 2013]**

(a) 0 (b) 1 (c) -2 (d) 3

42. If the 4th term in the expansion of $\left(ax + \frac{1}{x}\right)^n$ is $\frac{5}{2}, \forall x \in R$, then the values of a and n are **[AMU 2013]**

(a) $\frac{1}{2}, 6$ (b) $6, \frac{1}{2}$
(c) 2, 6 (d) None of these

43. $\sum\limits_{0 \le r < s \le n} ({}^nC_r + {}^nC_s)$ is equal to **[Manipal 2013]**

(a) 2^{n+1} (b) $2^{n+1} - 1$
(c) $n2^n$ (d) $(n+1)\,2^n$

44. $\left(1+\frac{C_1}{C_0}\right)\left(1+\frac{C_2}{C_1}\right)\left(1+\frac{C_3}{C_2}\right)\dots\left(1+\frac{C_n}{C_{n-1}}\right)$ is equal to **[Manipal 2013]**

(a) $\frac{n+1}{n!}$ (b) $\frac{(n+1)^n}{(n-1)!}$
(c) $\frac{(n+1)^n}{n!}$ (d) $\frac{(n-1)^n}{n!}$

45. If $\frac{e^x}{1-x} = B_0 + B_1x + B_2x^2 + \dots + B_nx^n + \dots$, then $B_n - B_{n-1}$ equals **[Manipal 2012]**

(a) $\frac{1}{n!}$ (b) $\frac{1}{(n-1)!}$
(c) $\frac{1}{n!} - \frac{1}{(n-1)!}$ (d) 1

46. The coefficient of x^{10} in the expansion of $1 + (1+x) + \dots + (1+x)^{20}$ is **[WB JEE 2012]**

(a) ${}^{19}C_9$ (b) ${}^{20}C_{10}$
(c) ${}^{21}C_{11}$ (d) ${}^{22}C_{12}$

47. If rth and $(r+1)$th terms in the expansion of $(p+q)^n$ are equal, then $\frac{(n+1)q}{r(p+q)}$ is **[Karnataka CET 2012]**

(a) 0 (b) 1
(c) $\frac{1}{4}$ (d) $\frac{1}{2}$

48. If $(1+ax)^n = 1 + 6x + \frac{27}{2}x^2 + \dots + a^nx^n$, then the values of a and n are, respectively **[Kerala CEE 2012]**

(a) 2, 3 (b) 3, 2 (c) $\frac{3}{2}, 4$
(d) 1, 6 (e) $\frac{3}{2}, 6$

49. The 13th term in the expansion of $\left(x^2 + \frac{2}{x}\right)^n$ is independent of x, then the sum of the divisors of n is **[Karnataka CET 2012]**

(a) 36 (b) 37 (c) 38 (d) 39

50. Let $(1+x)^{10} = \sum\limits_{r=0}^{10} C_rx^r$ and $(1+x)^7 = \sum\limits_{r=0}^{7} d_rx^r$. If $P = \sum\limits_{r=0}^{5} C_{2r}$ and $Q = \sum\limits_{r=0}^{3} d_{2r+1}$, then $\frac{P}{Q}$ is equal to **[WB JEE 2012]**

(a) 4 (b) 8 (c) 16 (d) 32

51. If the binomial coefficients of $(3r)$th and $(r+2)$th terms in the binomial expansion of $(1+x)^{2n}$ are equal, then **[AMU 2012]**

(a) $n = r$ (b) $n = r + 1$
(c) $n = 2r$ (d) $n = 2r - 1$

52. If A and B are coefficients of x^n in the expansions of $(1+x)^{2n}$ and $(1+x)^{2n-1}$ respectively, then A/B is equal to **[WB JEE 2011; AMU 2011]**

(a) 4 (b) 2
(c) 9 (d) 6

53. In the expansion of $\left(x^3 - \frac{1}{x^2}\right)^n, n \in N$, if the sum of the coefficients of x^5 and x^{10} is 0, then n is **[GGSIPU 2011]**

(a) 25 (b) 20
(c) 15 (d) None of these

54. 5th term from the end in the expansion of $\left(\frac{x^3}{2} - \frac{2}{x^2}\right)^{12}$ is **[GGSIPU 2011]**

(a) $-7920x^{-4}$ (b) $7920x^4$
(c) $7920x^{-4}$ (d) $-7920x^4$

55. The coefficient of p^nq^n in the expansion of $[(1+p)(1+q)(p+q)]^n$ is **[J&K CET 2011]**

(a) $\sum\limits_{k=0}^{n}[C(n,k)]^2$ (b) $\sum\limits_{k=0}^{n}[C(n,k+2)]^2$
(c) $\sum\limits_{k=0}^{n}[C(n,k+3)]^2$ (d) $\sum\limits_{k=0}^{n}[C(n,k)]^3$

56. In the expansion of $(1 - 3x + 3x^2 - x^3)^{2n}$, the middle term is **[MP PET 2011]**

(a) $(n+1)$ th term (b) $(2n+1)$ th term
(c) $(3n+1)$ th term (d) None of the above

57. If ${}^nC_4, {}^nC_5$ and ${}^nC_6$ are in AP, then n is **[WB JEE 2011]**

(a) 7 or 14 (b) 7
(c) 14 (d) 14 or 21

58. ${}^{15}C_3 + {}^{15}C_5 + \dots + {}^{15}C_{15}$ will be equal to **[WB JEE 2011]**

(a) 2^{14} (b) $2^{14} - 15$ (c) $2^{14} + 15$ (d) $2^{14} - 1$

59. Let $C_0, C_1, \ldots, C_n$ denote the binomial coefficients in the expansion of $(1+x)^n$. The value of $C_1 - 2C_2 + 3C_3 - 4C_4 + \ldots$ (upto n terms) is **[UP SEE 2011]**

(a) 2^n (b) 2^{-n}
(c) 0 (d) 1

60. The expression ${}^nC_0 + 2 \cdot {}^nC_1 + 3 \cdot {}^nC_1 + \ldots + (n+1) \cdot {}^nC_n$ is equal to **[AMU 2011]**

(a) $(n+1)\,2^n$ (b) $2^n\,(n+2)$
(c) $(n+2)\,2^{n-1}$ (d) $(n+2)\,2^{n+1}$

61. If in the expansion of $(a-2b)^n$, the sum of the 5th and 6th terms is zero, then the value of $\frac{a}{b}$ is **[WB JEE 2010]**

(a) $\frac{n-4}{5}$ (b) $\frac{2(n-4)}{5}$
(c) $\frac{5}{n-4}$ (d) $\frac{5}{2(n-4)}$

62. The coefficient of the middle term in the expansion of $(x+2y)^6$ is **[Kerala CEE 2010]**

(a) ${}^6C_3$
(b) $8\,{}^6C_3$
(c) $8\,{}^6C_5$
(d) ${}^6C_4$
(e) $8\,{}^6C_4$

63. Let $(1+x)^n = 1 + a_1x + a_2x^2 + \ldots + a_nx^n$. If a_1, a_2 and a_3 are in AP, then the value of n is **[BITSAT 2010]**

(a) 4
(b) 5
(c) 6
(d) 7

64. If the sum of the coefficients in the expansion of $(a^2x^2 - 6ax + 11)^{10}$, where a is constant is 1024, then the value of a is **[Kerala CEE 2010]**

(a) 5 (b) 1 (c) 2
(d) 3 (e) 4

Explanations

Target Exercises

1. $\left(x+\sqrt{x^3-1}\right)^5+\left(x-\sqrt{x^3-1}\right)^5$

$=2\left[{}^5C_0x^5+{}^5C_2x^3\left(\sqrt{x^3-1}\right)^2+{}^5C_4x\left(\sqrt{x^3-1}\right)^4\right]$

$=2\left[x^5+10x^3(x^3-1)+5x(x^3-1)^2\right]$

This is a polynomial of degree 7.

2. Given expression $=\left[\sqrt{9^{x-1}+7}+\dfrac{1}{(3^{x-1}+1)^{1/5}}\right]^7$

$\therefore\quad T_6=T_{5+1}={}^7C_5\left(\sqrt{9^{x-1}+7}\right)^{7-5}\left(\dfrac{1}{(3^{x-1}+1)^{1/5}}\right)^5$

$=21(9^{x-1}+7)\cdot\dfrac{1}{3^{x-1}+1}$

$=\dfrac{21(3^{2x-2}+7)}{3^{x-1}+1}=84\quad$ [given]

$\Rightarrow\quad 3^{2x-2}+7=4(3^{x-1}+1)$

$\Rightarrow\quad y^2+7-4y-4=0$, where $y=3^{x-1}$

$\therefore\quad y=1\ \Rightarrow\ 3^{x-1}=1$

$\Rightarrow\quad x-1=0\ \Rightarrow\ x=1$

and $\quad y=3\ \Rightarrow\ 3^{x-1}=3$

$\Rightarrow\quad x-1=1\ \Rightarrow\ x=2$

3. $T_{10}=T_{9+1}={}^{11}C_9(x)^{11-9}(-1)^9=-{}^{11}C_9x^2$

4. $T_3=T_{2+1}={}^5C_2x^{5-2}(x^{\log_{10}x})^2$

$=10x^3x^{2\log_{10}x}=10x^{(3+2\log_{10}x)}=10^6\quad$ [given]

$\Rightarrow\quad x^{3+2\log_{10}x=10^5}$

$\Rightarrow\quad (3+2\log_{10}x)\log_{10}x=5\log_{10}10=5$

$\Rightarrow\quad \log_{10}x=-\dfrac{5}{2}\ \Rightarrow\ x=10^{-5/2}$

and $\quad \log_{10}x=1\ \Rightarrow\ x=10^1=10$

$\therefore\ x=10^{-5/2},10$

5. In $\left(px+\dfrac{1}{x}\right)^m,t_4=2.5$

$\therefore\quad {}^mC_3(px)^{m-3}\left(\dfrac{1}{x}\right)^3=2.5$

$\Rightarrow {}^mC_3p^{m-3}x^{m-6}=2.5$, which is independent of x.

$\therefore\quad m-6=0\ \Rightarrow\ m=6$

$\therefore\quad {}^6C_3p^3=\dfrac{5}{2}\ \Rightarrow\ 20p^3=\dfrac{5}{2}$

or $\quad p^3=\dfrac{1}{8}\ \Rightarrow\ p=\dfrac{1}{2}$

Thus, $\quad p=\dfrac{1}{2}$ and $m=6$

6. $T_4={}^nC_3x^{n-3}\left(\dfrac{\alpha}{2x}\right)^3\ \Rightarrow\ {}^nC_3\left(\dfrac{\alpha}{2}\right)^3x^{n-6}=20$

Since, independent of x.

$\Rightarrow\quad n-6=0$ or $n=6$

$\therefore\quad {}^6C_3\left(\dfrac{\alpha}{2}\right)^3=20\ \Rightarrow\ 20\cdot\dfrac{\alpha^3}{2^3}=20$

$\Rightarrow\quad \alpha=2$

7. Since, ${}^{2n}C_1,{}^{2n}C_2,{}^{2n}C_3$ are in AP.

$\therefore\quad 2^{2n}C_2={}^{2n}C_1+{}^{2n}C_3$

$\Rightarrow\quad 2n^2-9n+7=0$

8. $T_p=T_{(p-1)+1}={}^6C_{p-1}(2x)^{6-(p-1)}3^{p-1}$

$={}^6C_{p-1}2^{7-p}3^{p-1}x^{7-p}$

$\therefore\quad$ Coefficient of $T_p={}^6C_{p-1}2^{7-p}3^{p-1}=4860\quad$ [given]

Clearly, $p=5$ is the solution.

9. $T_{r+1}=x^{20}\cdot{}^{20}C_r\left(\dfrac{1}{x^2}\right)^r$ in descending powers of x.

$T_6=\dfrac{1}{x^{20}}\cdot{}^{20}C_5(x^2)^{15}$ in ascending powers of x

$\Rightarrow\quad {}^{20}C_r={}^{20}C_5$

$\therefore\quad r=5$

10. In an expansion, binomial coefficients equidistance from the beginning and the end are equal.

$\therefore\quad a_{n-1}=a_1,a_{n-2}=a_2,a_{n-3}=a_3$

Thus, a_1,a_2,a_3 are in AP.

$\Rightarrow\quad 2\cdot{}^nC_2={}^nC_1+{}^nC_3$

$\Rightarrow\quad 2=\dfrac{{}^nC_1}{{}^nC_2}+\dfrac{{}^nC_3}{{}^nC_2}$

$\Rightarrow\quad 2=\dfrac{2}{n-1}+\dfrac{n-2}{3}$

$\Rightarrow\quad n^2-9n+14=0$

$\therefore\quad n=2$ or 7, neglecting $n=2$; we get $n=7$

11. $T_{r+1}={}^{600}C_r\cdot7^{\frac{600-r}{3}}\cdot5^{\frac{r}{2}}x^r$

Here, $0\le r\le600$ and $\dfrac{r}{2},200-\dfrac{r}{3}$ are integers.

$\therefore\ r$ should be a multiple of 6.

$\therefore\ r=0,6,12,\ldots,600$ i.e. 101 terms

12. $T_{r+1}={}^{10}C_r\cdot2^{\frac{10-r}{2}}\cdot3^{\frac{r}{5}}$. This is rational, if $\dfrac{r}{5}$ and $5-\dfrac{r}{2}$ are integers. Also, $0\le r\le10$.

Now, r must be a multiple of 10 (LCM of 2 and 5).

So, $\quad r=0,10$

$\therefore$The rational terms are

${}^{10}C_0\cdot2^5\cdot3^0,\ {}^{10}C_{10}\cdot2^0\cdot3^2$

$\therefore$Sum of rational terms $=32+9=41$

13. $T_{r+1}={}^6C_r(x^{5/2})^{6-r}\left(\dfrac{3}{x^{3/2}}\right)^r$

$={}^6C_r3^rx^{15-\frac{5r}{2}-\frac{3r}{2}}$

$={}^6C_r3^rx^{15-4r}$

$\therefore\quad 15-4r=3$

$\Rightarrow\quad r=3$

$\therefore\quad T_{r+1}=T_{3+1}={}^6C_3(3)^3x^{15-4(3)}$

$=20\times27\times x^3$

$=540x^3$

$\therefore$Coefficient of $x^3=540$

14. T_{r+1} in $\left(2+\frac{x}{3}\right)^n = {}^nC_r 2^{n-r}\left(\frac{x}{3}\right)^r = {}^nC_r \frac{2^{n-r}}{3^r} x^r$

$\therefore$ Coefficient of $x^r = {}^nC_r \frac{2^{n-r}}{3^r}$

$\therefore \quad {}^nC_7 \cdot \frac{2^{n-7}}{3^7} = {}^nC_8 \cdot \frac{2^{n-8}}{3^8}$

$\Rightarrow \quad \frac{2}{n-7} = \frac{1}{8\times 3}$

$\Rightarrow \quad n-7 = 48$

$\Rightarrow \quad n = 55$

15. We have, $(1+2x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$

$\Rightarrow \quad (1+x)^{2n} = \sum_{r=0}^{2n} a_r x^r$

Comparing the coefficients of x^r, we get

$${}^{2n}C_r = a_r$$

16. $(1+x)^m(1-x)^n = \left(1+mx+\frac{m(m-1)}{2}x^2+\dots\right) \times \left(1-nx+\frac{n(n-1)}{2}x^2+\dots\right)$

$\therefore$ Coefficient of $x = m-n = 3$ [given]

Coefficient of $x^2 = \frac{n(n-1)}{2} - mn + \frac{m(m-1)}{2} = -6$ [given]

$\Rightarrow \quad n^2 - n - 2mn + m^2 - m = -12$

$\Rightarrow \quad (m-n)^2 - (m+n) = -12$

$\Rightarrow \quad (3)^2 - (m+n) = -12$

$\Rightarrow \quad m+n = 21$

$\therefore$ Solving $m-n=3$, $m+n=21$, we get

$m = 12$

$n = 9$

17. $\sum_{r=0}^{100} {}^{100}C_r (x-3)^{100-r} 2^r$

$= \{(x-3)+2\}^{100} = (x-1)^{100} = (1-x)^{100}$

$\therefore \quad$ Coefficient of $x^{53} = (-1)^{53}\,{}^{100}C_{53} = -{}^{100}C_{53}$

18. Coefficient of x^2 = Coefficient of x^3

$\therefore \quad {}^9C_2 3^{9-2}k^2 = {}^9C_3 3^{9-3}k^3$

$\Rightarrow \quad 36 = 28k$

$\Rightarrow \quad k = \frac{9}{7}$

19. Expression $= \frac{(1+x)^6\{1-(1+x)^{10}\}}{1-(1+x)}$ [sum of 10 terms of GP]

$= \frac{(1+x)^{16}-(1+x)^6}{x}$

$\therefore$ Required coefficient

= Coefficient of x^7 in $\{(1+x)^{16}-(1+x)^6\}$

$= {}^{16}C_7 = {}^{16}C_9$

20. $(1-x)^5(1+x)^4(1+x^2)^4$

$= (1-x^2)^4(1+x^2)^4(1-x)$

$= (1-x^4)^4(1-x)$

$\therefore$ Coefficient of x^{13} in $\{(1-x)(1-4x^4+6x^8-4x^{12})\} = 4$

21. $T_{r+1} = {}^{12}C_r\left(\frac{x^2}{y}\right)^{12-r}\left(-\frac{y}{x}\right)^r$

$= {}^{12}C_r x^{24-3r}\cdot y^{2r-12}(-1)^r$

$\therefore$ Coefficient of x^6y^{-2} is obtained,

when $24-3r=6$ and $2r-12=-2$

$\Rightarrow r=6$ and $r=5$, which is not possible.

22. $f(x) = (\sqrt{x^2+1}+\sqrt{x^2-1})^6 + (\sqrt{x^2+1}-\sqrt{x^2-1})^6$

After expansion and simplification

$$f(x) = 64x^6 - 48x^2$$

23. $(1+x+x^2+x^3)^n = [(1+x)(1+x^2)]^n = (1+x)^n(1+x^2)^n$

$= ({}^nC_0 + {}^nC_1x + {}^nC_2x^2 + {}^nC_3x^3 + {}^nC_4x^4 + \dots) \times ({}^nC_0 + {}^nC_1x^2 + {}^nC_2x^4 + \dots)$

$\therefore$ Coefficient of $x^4 = {}^nC_0\cdot{}^nC_2 + {}^nC_2\cdot{}^nC_1 + {}^nC_4\cdot{}^nC_0$

$= {}^nC_2 + {}^nC_1\cdot{}^nC_2 + {}^nC_4$

24. Coefficient of $\lambda^n\mu^n$ in $(1+\lambda)^n(1+\mu)^n(\lambda+\mu)^n$

$\Rightarrow$ Coefficient of $\lambda^n\mu^n$ in

$\{({}^nC_0 + {}^nC_1\lambda + {}^nC_2\lambda^2 + \dots + {}^nC_n\lambda^n)$

$({}^nC_0\mu^n + {}^nC_1\mu^{n-1} + \dots + {}^nC_n)$

$({}^nC_0\lambda^n + {}^nC_0\lambda^{n-1}\mu + \dots + {}^nC_n\mu^n)\}$

Clearly, coefficient of $\lambda^n\mu^n$ is $(C_0^3 + C_1^3 + C_2^3 + \dots + C_n^3)$

25. Here, $a = {}^nC_r$, $b = {}^nC_{r+1}$ and $c = {}^nC_{r+2}$

Put $n=2$, $r=0$, then option (b) holds the condition

i.e. $\quad n = \frac{2ac+ab+bc}{b^2-ac}$

26. $f(x) = 1 - x + x^2 - x^3 + \dots - x^{15} + x^{16} - x^{17}$

$= \frac{1-x^{18}}{1+x}$

$\Rightarrow \quad f(x-1) = \frac{1-(x-1)^{18}}{x}$

Therefore, required coefficient of x^2 is equal to coefficient of x^3 in $1-(x-1)^{18}$, which is given by ${}^{18}C_3 = 816$.

27. $(1-x)^{30} = {}^{30}C_0x^0 - {}^{30}C_1x^1 + {}^{30}C_2x^2 - \dots + (-1)^{30}\,{}^{30}C_{30}x^{30}$ ...(i)

$(x+1)^{30} = {}^{30}C_0x^{30} + {}^{30}C_1x^{29} + {}^{30}C_2x^{28} + \dots + {}^{30}C_{10}x^{20} + \dots + {}^{30}C_{30}x^0$ ...(ii)

On multiplying Eqs. (i) and (ii) and equating the coefficient of x^{20} on both sides, we get required sum is equal to coefficient of x^{20} in $(1+x^2)^{30}$, which is given by ${}^{30}C_{10}$.

28. We have,

$(1+x)^{101}(1-x+x^2)^{100} = (1+x)\{(1+x)(1-x+x^2)\}^{100}$

$= (1+x)(1+x^3)^{100} = (1+x)\{C_0 + C_1x^3 + C_2x^6 + \dots + C_{100}x^{300}\}$

$= (1+x)\sum_{r=0}^{n} {}^nC_r x^{3r} = \sum_{r=0}^{n} {}^nC_r x^{3r} + \sum_{r=0}^{n} {}^nC_r x^{3r+1}$

Hence, there will be no term containing $3r+2$.

29. ${}^nC_r 2^r \cdot x^{2n-3r} \Rightarrow 2n-3r=0$

$\Rightarrow \quad 2n = 3r$

n is multiple of 3/2.

30. $T_{r+1} = {}^{10}C_r\left(\sqrt{\dfrac{x}{3}}\right)^{10-r}\left(\sqrt{\dfrac{3}{2x^2}}\right)^r$

$= {}^{10}C_r\left(\dfrac{1}{\sqrt{3}}\right)^{10-r}\left(\sqrt{\dfrac{3}{2}}\right)^r x^{5-\frac{r}{2}-r}$

Let T_{r+1} be the term independent of x.

$\therefore \quad 5-\dfrac{r}{2}-r=0 \quad \Rightarrow \quad \dfrac{3r}{2}=5$

$\Rightarrow \quad r=\dfrac{10}{3}$

$\therefore$ r is not a whole number.

$\therefore$ Given expression does not have term independent of x.

31. $[(t^{-1}-1)x+(t^{-1}+1)^{-1}x^{-1}]^8$

$$=\left[\left(\frac{1}{t}-1\right)x+\left(\frac{1}{t}+1\right)^{-1}\frac{1}{x}\right]^8$$

$$T_{r+1}={}^8C_r\left[\left(\frac{1}{t}-1\right)x\right]^{8-r}\left[\left(\frac{1}{t}+1\right)^{-1}\frac{1}{x}\right]^r$$

$$={}^8C_r\left(\frac{1}{t}-1\right)^{8-r}\left(\frac{1}{t}+1\right)^{-r}x^{8-2r}$$

Let T_{r+1} be the term independent of x.

$\therefore \quad 8-2r=0$

i.e. $\quad r=4$

$$\therefore \quad T_{r+1}=T_{4+1}={}^8C_4\left(\frac{1}{t}-1\right)^{8-4}\left(\frac{1}{t}+1\right)^{-4}x^{8-2(4)}$$

$$=70\left(\frac{1-t}{t}\right)^4\left(\frac{t}{1+t}\right)^4=70\left(\frac{1-t}{1+t}\right)^4$$

32. $\left(\dfrac{3}{2}x^2-\dfrac{1}{3x}\right)^9=\displaystyle\sum_{r=0}^{9}{}^9C_r\left(\frac{3}{2}x^2\right)^{9-r}\left(-\frac{1}{3x}\right)^r$

For the term that is independent of x, we must have

$18-2r-r=0$

$\Rightarrow \quad r=6$

Thus, required term $={}^9C_6\left(\dfrac{3}{2}x^2\right)^3\left(-\dfrac{1}{3x}\right)^6$

i.e. $\quad {}^9C_6\left(\dfrac{3}{2}\right)^3\left(\dfrac{1}{3}\right)^6={}^9C_6\left(\dfrac{1}{6}\right)^3$

33. $\left(x^2-2+\dfrac{1}{x^2}\right)^n=\dfrac{1}{x^{2n}}(x^4-2x^2+1)^n$

$$=\frac{(x^2-1)^{2n}}{x^{2n}}$$

Total number of terms that are dependent on x = number of terms in the expansion of $(x^2-1)^{2n}$ that have degree of x different from $2n$.

$=(n+1)-1=n$

34. Term independent of $x={}^{10}C_5(\sin^{-1}\alpha)^5(\cos^{-1}\alpha)^5$

$$={}^{10}C_5(\sin^{-1}\alpha)^5\left(\frac{\pi}{2}-\sin^{-1}\alpha\right)^5$$

$$={}^{10}C_5\left\{\frac{\pi}{2}\sin^{-1}\alpha-(\sin^{-1}\alpha)^2\right\}^5$$

$$-{}^{10}C_5\left\{\left(\sin^{-1}\alpha-\frac{\pi}{4}\right)^2-\frac{\pi^2}{16}\right\}^5$$

$\Rightarrow$ Minimum value is $-{}^{10}C_5\left(\dfrac{9\pi^2-\pi^2}{16}\right)^5=\dfrac{-{}^{10}C_5\pi^{10}}{2^5}$

and maximum value is $-{}^{10}C_5\left(\dfrac{-\pi^{10}}{16^5}\right)=\dfrac{{}^{10}C_5\pi^{10}}{2^{20}}$

35. Expression $=\dfrac{1}{x^{10}}(1-2x+x^2)(1+x^2)^{10}$

$$=\frac{1}{x^{10}}(1+x^2)^{10}-\frac{2}{x^9}(1+x^2)^{10}+\frac{1}{x^8}(1+x^2)^{10}$$

$\therefore$ The term independent of x

$={}^{10}C_5-2\times 0+{}^{10}C_4={}^{11}C_5$

36. Expression $=(-1)^n\cdot\dfrac{(1-x^2)^n}{x^n}$

$\therefore$ Term independent of x

= Coefficient of x^n in $(-1)^n\cdot(1-x^2)^n$

= Coefficient of x^n in

$(-1)^n\{{}^nC_0+{}^nC_1(-x)^2+{}^nC_2(-x^2)^2+\ldots+{}^nC_n(-x^2)^n\}$

Since, the expansion contains only even powers of x. Thus, if n is odd $\Rightarrow$ Coefficient is zero.

37. $(1+x)^n\left(1+\dfrac{1}{x}\right)^n=(C_0+C_1x+C_2x^2+\ldots+C_nx^n)$

$$\times\left(C_0+\frac{C_1}{x}+\frac{C_2}{x^2}+\ldots+\frac{C_n}{x^n}\right)$$

Term independent of x on the RHS

$=C_0^2+C_1^2+C_2^2+\ldots+C_n^2$

38. T_n in $\left[\sqrt[6]{3}\sqrt{2}+\dfrac{1}{\sqrt[3]{3}}\right]^n={}^nC_6\,(2^{1/2}3^{1/6})^{n-6}\left[\dfrac{1}{3^{1/3}}\right]^6$

7th term from the end in $\left[\sqrt[6]{3}\sqrt{2}+\dfrac{1}{\sqrt[3]{3}}\right]^n$

$$=T_n\text{ in}\left[\frac{1}{\sqrt[3]{3}}+\sqrt[6]{3}\sqrt{2}\right]^n={}^nC_6\left(\frac{1}{3^{1/3}}\right)^{n-6}(3^{1/6}2^{1/2})^6$$

$$\therefore \quad \frac{{}^nC_6\,[2^{1/2}3^{1/6}]^{n-6}\left[\dfrac{1}{3^{1/3}}\right]^6}{{}^nC_6\left[\dfrac{1}{3^{1/3}}\right]^{n-6}[2^{1/2}3^{1/6}]^6}=\frac{1}{6}$$

$$\Rightarrow \quad \frac{\left[2^{\frac{n-6}{2}}\,3^{\frac{n-6}{6}}\right]\times[3^{-2}]}{3^{-\left(\frac{n-6}{3}\right)}2^3\cdot 3^1}=\frac{1}{6}$$

$$\Rightarrow \quad \frac{2^{\frac{n-6}{2}}\,3^{\frac{n-6}{6}}}{3^{\frac{6-n}{3}}\,2^3\cdot 3^1}\cdot\frac{1}{3^2}=\frac{1}{6}$$

$$\Rightarrow \quad \frac{2^{\frac{n-6}{2}}}{3^{\frac{6-n}{3}}}\cdot\frac{1}{3^{-\left(\frac{n-6}{6}\right)}}\cdot\frac{1}{2^3\cdot 3^3}=\frac{1}{6}$$

$$\Rightarrow \quad \frac{2^{\frac{n-6}{2}}}{3^{\frac{6-n}{2}}}=\frac{2^3\cdot 3^3}{6}$$

$$\Rightarrow \quad 2^{\frac{n-6}{2}}\cdot 3^{\frac{n-6}{2}}=2^2\times 3^2$$

Comparing the coefficients of 2 and 3, we get

$$\frac{n-6}{2}=2 \quad\Rightarrow\quad n=10$$

39. Middle terms are $T_{\frac{9+1}{2}} = T_5$ and $T_{\frac{9+3}{2}} = T_6$

$\therefore\ S = {}^9C_4(2a)^{9-4}\left(-\dfrac{a^2}{4}\right)^4 + {}^9C_5(2a)^{9-5}\left(-\dfrac{a^2}{4}\right)^5$

$= 126 \times 32a^5 \times \dfrac{a^8}{256} - 126 \times 16a^4 \times \dfrac{a^{10}}{1024}$

$= \dfrac{63}{4}a^{13} - \dfrac{63}{32}a^{14} = \dfrac{63}{32}(8-a)\,a^{13}$

40. As the index $= 20$, the 11th term is the middle term. So, we have to find the 14th term.

$$T_{14} = {}^{20}C_{13}(x^2)^{20-13}\left(-\frac{1}{2x}\right)^{13}$$

$$= -\,{}^{20}C_{13}x^{14}\cdot\frac{1}{2^{13}x^{13}}$$

$$= -\frac{1}{2^{13}}\,{}^{20}C_{13}x$$

41. $T_{r+1} = {}^{20}C_r \cdot 4^{\frac{20-r}{3}} \cdot 6^{-\frac{r}{4}} = {}^{20}C_r \cdot 2^{\frac{40-2r}{3}} \cdot 2^{-\frac{r}{4}} \cdot 3^{-\frac{r}{4}}$

$= {}^{20}C_r \cdot 2^{\frac{160-11r}{12}} \cdot 3^{-\frac{r}{4}}$

For rational terms, $\dfrac{r}{4}$ and $\dfrac{160-11r}{12}$ must be integers and $0 \le r \le 20$.

So, $\dfrac{r}{4} =$ integer $\Rightarrow r = 0,\ 4,\ 8,\ 12,\ 16,\ 20$

Clearly, for $r = 8, 16$ and 20, $\dfrac{160-11r}{12}$ is also an integer.

$\therefore$ Only three terms are rational. So, $21-3$, i.e. 18 terms are irrational.

42. $n!(21-n)! = 21!\dfrac{n!(21-n)!}{21!} = \dfrac{21!}{{}^{21}C_n}$, which is minimum when ${}^{21}C_n$ is maximum, which occurs when $n = 10$.

43. Since, n is even, therefore $\left(\dfrac{n}{2}+1\right)$th term is middle term.

Hence, ${}^nC_{n/2}(x^2)^{n/2}\left(\dfrac{1}{x}\right)^{n/2} = 924x^6$

$\Rightarrow \quad x^{n/2} = x^6 \quad \Rightarrow \quad n = 12$

44. $(1+3x+3x^2+x^3)^6 = \{(1+x)^3\}^6 = (1+x)^{18}$

Hence, the middle term is 10th.

45. $a^{10}b^{10}c^{10}d^{10}\left(\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}+\dfrac{1}{d}\right)^{10}$

Therefore, the required coefficient is equal to the coefficient of $a^{-2}b^{-6}c^{-1}d^{-1}$ in $\left(\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}+\dfrac{1}{d}\right)^{10}$, which is given by $\dfrac{10!}{2!6!1!1!} = \dfrac{10\times 9\times 8\times 7}{2} = 2520$

46. The general term in the expansion of $(1-x+y)^{20}$ is

$\dfrac{20!}{r!s!t!}1^r(-x)^s(y)^t$, where $r+s+t = 20$

For x^2y^3, we have the term

$$\frac{20!}{15!2!3!}1^{15}(-x)^2(y)^3$$

Hence, the coefficient of x^2y^3 is $\dfrac{20!}{15!2!3!}$.

47. $(1+x+x^2)^{10} = \left(\dfrac{(1-x)(1+x+x^2)}{1-x}\right)^{10}$

$= (1-x^3)^{10}(1-x)^{-10}$

Thus, coefficient of x^2 in $(1+x+x^2)^{10}$ = coefficient of x^2 in $(1-x)^{-10}$ i.e. ${}^{10+2-1}C_2 = {}^{11}C_2$

48. $(1+x-2x^2)^7 = \displaystyle\sum_{r=0}^{7}{}^7C_r(1+x)^{7-r}(-2x^2)^r$

Thus, required coefficient

$= {}^7C_0\cdot{}^7C_4 + {}^7C_1(-2)\cdot{}^6C_2 + {}^7C_2\cdot(-2)^2\cdot{}^5C_0$

$= 1\cdot 35 - 7\cdot 2\cdot 15 + 21\cdot 4\cdot 1 = -91$

49. Total number of different terms in the expansion of $(x_1+x_2+\ldots+x_n)^m$ is same as the number of non-negative integral solutions of $y_1+y_2+\ldots+y_n = m$ i.e. ${}^{n+m-1}C_{n-1}$

50. $(1+a-b+c)^9$

$$= \sum\frac{9!}{x_1!x_2!x_3!x_4!}\cdot(1)^{x_1}(a)^{x_2}(-b)^{x_3}(c)^{x_4}$$

$\Rightarrow$ Coefficient of $a^3b^4c = \dfrac{9!}{1!3!4!1!} = \dfrac{9!}{3!4!}$

51. Number of terms $= {}^{n+5-1}C_{5-1} = {}^{n+4}C_4$

52. $(a+b+c)^n + (a+b-c)^n = 2\{{}^nC_0c^0(a+b)^n + {}^nC_2c^2(a+b)^{n-2} + \ldots + {}^nC_nc^n(a+b)^0\}$

Number of terms $= (n+1)+(n-1)+(n-3)+\ldots+1$

$= \left(\dfrac{n+2}{2}\right)[1+(n+1)] = \dfrac{(n+2)^2}{2}$

53. $(x+y+z)^{25} = \{x+(y+z)\}^{25}$

$= {}^{25}C_0x^{25} + {}^{25}C_1x^{24}(y+z)+\ldots+{}^{25}C_rx^{25-r}(y+z)^r+\ldots$

$= \ldots + {}^{25}C_rx^{25-r}(\ldots+{}^rC_ky^{r-k}z^k+\ldots)+\ldots$

$8+9+9 \ne 25$. So, there is no term like $x^8y^9z^9$.

The number of terms

$= 1+2+3+\ldots+26$

$= \dfrac{26\times 27}{2}$

$= 351$

54. The greatest coefficient

= Coefficient of the middle term

$= {}^{2n}C_n = \dfrac{(2n)!}{n!n!}$

$= \dfrac{(2n)(2n-1)(2n-2)(2n-3)(2n-4)\ldots 5\cdot 4\cdot 3\cdot 2\cdot 1}{n!n!}$

$= \dfrac{2^n\{n\cdot(n-1)\ldots 2\cdot 1\}\{(2n-1)(2n-3)(2n-5)\ldots 5\cdot 3\cdot 1\}}{n!n!}$

$= \dfrac{2^n\cdot n!\cdot\{(2n-1)(2n-3)(2n-5)\ldots 5\cdot 3\cdot 1\}}{n!n!}$

$= \dfrac{2^n\{1\cdot 3\cdot 5\cdot\ldots\cdot(2n-1)\}}{n!}$

55. For largest term $\dfrac{n-r+1}{r}\cdot\left|\dfrac{y}{x}\right| \ge 1$

$\Rightarrow \quad \dfrac{51-r}{r}\cdot\dfrac{2x}{3} \ge 1$; if $\dfrac{51-r}{r}\cdot\dfrac{2}{3}\left(\dfrac{1}{5}\right) \ge 1$

if $102-2r \ge 15r$; if $17r \le 102$

if $r \le 6$

$\therefore$ We take $r = 6$

$\therefore$ Largest term $= T_{r+1} = T_{6+1} = T_7$

56. $\alpha + \beta = (3\sqrt{3} + 5)^{2n+1}$

$\beta_1 = (3\sqrt{3} - 5)^{2n+1}$, where $\beta_1 < 1$

$\Rightarrow \quad \alpha + \beta + \beta_1 = \text{Even integer}, \ \beta - \beta_1 = 0$

$\Rightarrow \quad \alpha = \text{Even integer}$

57. $x - x^2 + x[x] = x - x(x - [x]), = x - x\{x\}$

$= x(1 - \{x\})$

$x = (2 + \sqrt{3})^n = {}^nC_0 2^n + {}^nC_1 2^{n-1}\sqrt{3} + {}^nC_2 2^{n-2}(\sqrt{3})^2 + \dots$

Let $\quad x_1 = (2 - \sqrt{3})^n$

$= {}^nC_0 2^n - {}^nC_1 2^{n-1}\sqrt{3} + {}^nC_2 2^{n-2}(\sqrt{3})^2 + \dots$

$x + x_1 = 2({}^nC_0 2^n + {}^nC_2 2^{n-2}(\sqrt{3})^2 + \dots)$

$= \text{Even integer}$

Clearly, $x_1 \in (0, 1), \forall n \in N$

$\Rightarrow \quad [x] + \{x\} + x_1 = \text{Even integer}$

$\Rightarrow \quad \{x\} + x_1 = \text{Integer}$

$\{x\} \in (0, 1), x_1 \in (0, 1)$

$\Rightarrow \quad \{x\} + x_1 \in (0, 2)$

$\Rightarrow \quad \{x\} + x_1 = 1$

$\Rightarrow \quad x_1 = 1 - \{x\}$

$\Rightarrow \quad x(1 - \{x\}) = x \cdot x_1 = (2 + \sqrt{3})^n (2 - \sqrt{3})^n = 1$

58. End digit of 7^{4n+1} is 7 of 7^{4n+2} is 9,

of $7^{4n+3} = 1$ and $7^{4n} = 7 n \in N$

Now, $754 = 4 \cdot 188 + 2$. Thus, end digit of $(2137)^{754}$ will be same as that of 7^{4n+2} i.e. 9.

59. $3^{37} = 3^{4 \cdot 9} \cdot 3 = 3 \cdot (81)^9 = 3(80 + 1)^9$

$= 3({}^9C_0 80^9 + {}^9C_1 80^8 + \dots + {}^9C_9)$

Thus, required remainder is equal to 3.

60. $4^{101} = 4^{100} \cdot 4$, clearly $101 \div 4^{100}$

Thus, required remainder is 4.

61. $1! + 2! + 3! + 4! = 1 + 2 + 6 + 24 = 33$

$\Rightarrow$ Remainder = 3

62. $3^{2003} = 3^{2001} \cdot 3^2 = 9(27)^{667} = 9(28 - 1)^{667}$

$= 9[{}^{667}C_0 28^{667} + {}^{667}C_1 (28)^{666} + \dots + {}^{667}C_{667}(-1)^{667}]$

When 3^{2003} is divided by 28, remainder is 19.

Thus, $\quad \left\{\dfrac{3^{2003}}{28}\right\} = \dfrac{19}{28}$

63. $N = {}^{2n}C_n = \dfrac{(2n)!}{(n!)^2} = \dfrac{(n+1)(n+2)\dots(n+n)}{(n!)}$

$\Rightarrow \quad (n!)N = (n+1)(n+2)\dots(n+n)$

Since, $n < p < 2n$

$\Rightarrow \quad p/(n+1)(n+2)\dots(n+n)$

$\Rightarrow \quad p/N$

64. Expression $= 10^n - 1 + 3 \cdot 4^{n+2} + 6$

$= (10^n - 1) + 6(2^{2n+3} + 1)$

$= (10 - 1)\{10^{n-1} + 10^{n-2} + \dots + 10 + 1\} + 6(2 + 1)\{2^{2n+2} - 2^{2n+1} + \dots - 2 + 1\}$

$10^{n-1} + 10^{n-2} + \dots + 10 + 1$ is an odd number which is not divisible by any odd number of all n.

Again, $2^{2n+2} - 2^{2n+1} + \dots - 2 + 1$ is also an odd number which is not divisible by any odd number for all n.

$\therefore$ The expression is divisible by 9.

65. $2^{60} = (1 + 7)^{20}$

$= {}^{20}C_0 + {}^{20}C_1 \cdot 7 + {}^{20}C_2 \cdot 7^2 + \dots + {}^{20}C_{20} \cdot 7^{20}$

$\therefore$ The remainder $= {}^{20}C_0 = 1$

66. $(\alpha - 2 + 1)^{35} = (1 - \alpha)^{35}$

$\Rightarrow (\alpha - 1)^{35} = -(\alpha - 1)^{35} \quad \Rightarrow \quad \alpha = 1$

67. The sum of all the coefficients in an expansion is obtained by putting $x = 1$ in the expression.

$\therefore \quad \left(\dfrac{1}{1} + 2 \cdot 1\right)^n = 6561$

$\therefore \quad 3^n = 3^8 \quad \Rightarrow \quad n = 8$

In $\left(\dfrac{1}{x} + 2x\right)^8$, $T_{r+1} = {}^8C_r \cdot \left(\dfrac{1}{x}\right)^{8-r} \cdot (2x)^r$

This is a constant, if $8 - 2r = 0$ i.e. $r = 4$

$\therefore$ The constant term $= T_5 = {}^8C_4 \cdot 2^4$

68. The sum of all the numerical coefficients in the expansion is obtained by putting $x = 1, y = 1$

i.e. $\quad \left(1 + \dfrac{1}{3} + \dfrac{2}{3}\right)^{12} = (2)^{12}$

69. Sum of coefficient of $x^2, x^4, x^6, x^8, \dots$, is

${}^nC_2 + {}^nC_4 + {}^nC_6 + \dots = 2^{n-1} - 1$

70. The sum of coefficient is obtained by putting variable term as 1.

$\therefore \quad (1 + x - 3x^2)^{2163} = (1 + 1 - 3)^{2163} = -1$,

as sum of coefficient.

71. Putting $x = 1, x = -1$ and adding, we get

Sum $= \dfrac{1}{2}\{(a_0 + a_1 + a_2 + \dots + a_{16}) - (a_0 - a_1 + a_2 - \dots + a_{16})\}$

$\therefore \quad a_1 + a_3 + a_5 + \dots + a_{15}$

$= \dfrac{1}{2}\{(1 + 1 - 2)^8 - (1 - 1 - 2)^8\} = \dfrac{-1}{2}(2^8) = -2^7$

72. Putting $x = i, -i$ and multiplying both the results, we get the value of the required expression as,

$(a_0 - a_2 + a_4 - a_6 + a_8 - a_{10})^2 + (a_1 - a_3 + a_5 - a_7 + a_9)^2$

$= (1 + i)^{10}(1 - i)^{10} = (1 + 1)^{10} = 2^{10}$

73. Sum of coefficients of odd powers of x.

${}^{50}C_1 + {}^{50}C_3 + \dots + {}^{50}C_{49} = 2^{50-1} = 2^{49}$

74. $(1 + x - 2x^2)^{20} = a_0 + a_1 x + a_2 x^2 + \dots + a_{40} x^{40}$

$a_0 + a_1 + a_2 + a_3 + \dots + a_{40} = 0$

$a_0 - a_1 + a_2 - a_3 + \dots + a_{40} = 2^{20}$

$\therefore \quad a_1 + a_3 + \dots + a_{39} = -2^{19}$

75. $(1 + x + x^2)^n = \sum_{r=0}^{2n} a_r x^r \quad \dots(i)$

We know that, $(1 - x)^n = \sum_{r=0}^{n} (-1)^r \cdot {}^nC_r x^r$

$= \sum_{r=0}^{n} (-1)^{n-r} \cdot {}^nC_r x^{n-r} \quad \dots(ii)$

On multiplying Eqs. (i) and (ii), we get

$\sum_{r=0}^{n} (-1)^{-r} \cdot {}^nC_r a_r = \text{Coefficient of } x^n \text{ in } (1 - x^3)^n$

Since, $n \neq M(3)$

$\therefore \quad \sum_{r=0}^{n} (-1)^{-r} \cdot a_r \cdot {}^nC_r = 0 \quad \Rightarrow \quad \sum_{r=0}^{n} (-1)^r \cdot a_r \cdot {}^nC_r = 0$

76. $a_0 + a_1 + a_2 + \ldots = 2^{2n}$ and $a_0 + a_2 + a_4 + \ldots = 2^{2n-1}$

$a_n = {}^{2n}C_n$ = The greatest coefficient, being the middle coefficients.

$$a_{n-3} = {}^{2n}C_{n-3} = {}^{2n}C_{2n-(n-3)} = {}^{2n}C_{n+3} = a_{n+3}$$

77. $I = \sum_{r=0}^{n} {}^nC_r \sin rx \cdot \cos(n-r)x$

$$= \sum_{r=0}^{n} {}^nC_{n-r} \sin(n-r)x \cdot \cos rx$$

$$\Rightarrow \quad 2I = \sum_{r=0}^{n} {}^nC_r \cdot \sin nx = \sin nx \cdot 2^n$$

$$\Rightarrow \quad I = 2^{n-1} \cdot \sin nx$$

78. $\sum_{r=0}^{n} {}^nC_r \sin rx = \text{Im}\left(\sum_{r=0}^{n} {}^nC_r e^{irx}\right)$

$$= \text{Im}\left(\sum_{r=0}^{n} {}^nC_r (e^{ix})^r\right) = \text{Im}((1+e^{ix})^n)$$

$$= \text{Im}(1+\cos x + i\sin x)^n$$

$$= \text{Im}\left(2\cos^2\frac{x}{2} + 2i\sin\frac{x}{2}\cdot\cos\frac{x}{2}\right)^n$$

$$= \text{Im}\left(2\cos\frac{x}{2}\left(\cos\frac{x}{2} + i\sin\frac{x}{2}\right)\right)^n$$

$$= 2^n \cdot \cos^n\frac{x}{2}\cdot\sin\frac{nx}{2}$$

79. $\sum_{r=1}^{n} \frac{r\cdot{}^nC_r}{{}^nC_{r-1}} = \sum_{r=1}^{n} r\cdot\frac{n-r+1}{r}$

$$= (n+1)\sum_{r=1}^{n} 1 - \sum_{r=1}^{n} r$$

$$= n(n+1) - \frac{n(n+1)}{2} = \frac{n(n+1)}{2}$$

80. $\sum_{r=0}^{2n} r.{}^{2n}C_r \cdot \frac{1}{r+2} = \sum_{r=0}^{2n} (r+2-2)\cdot\frac{{}^{2n}C_r}{r+2}$

$$= \sum_{r=0}^{2n} {}^{2n}C_r - 2\cdot\sum_{r=0}^{2n}\frac{{}^{2n}C_r}{r+2}$$

$$= 2^{2n} - 2\cdot\int_0^1 x(1+x)^{2n}dx$$

$$= 2^{2n} - 2\left\{\left[x\cdot\frac{(1+x)^{2n+1}}{2n+1}\right]_0^1 - \left[\frac{(1+x)^{2n+2}}{(2n+1)(2n+2)}\right]_0^1\right\}$$

$$= \frac{2^{2n+1}(2n^2-n+1)-2}{(2n+1)(2n+2)}$$

81. $\sum_{r=0}^{n} {}^nC_r a^r \cdot b^{n-r} \cdot \cos\{rB-(n-r)A\}$

$$= \text{Re}\left(\sum_{r=0}^{n} {}^nC_r a^r \cdot b^{n-r} \cdot e^{i\{rB-(n-r)A\}}\right)$$

$$= \text{Re}\left(\sum_{r=0}^{n} {}^nC_r (a\cdot e^{iB})^r \cdot (b\cdot e^{-iA})^{n-r}\right)$$

$$= \text{Re}\,(ae^{iB} + be^{-iA})^n$$

$$= \text{Re}\,(a\cos B + ia\sin B + b\cos A - ib\sin A)^n$$

$$= (a\cos B + b\cos A)^n = c^n$$

82. Sum $= a\sum_{r=1}^{n}(-1)^{r-1}\cdot{}^nC_r - \sum_{r=1}^{n}(-1)^{r-1}\cdot r\cdot{}^nC_r$

$$= a\{{}^nC_1 - {}^nC_2 + {}^nC_3 - \ldots\} - n\{{}^{n-1}C_0 - {}^{n-1}C_1 + \ldots\}$$

$[\because r\cdot{}^nC_r = n\cdot{}^{n-1}C_{r-1}$ and ${}^nC_0 - {}^nC_1 + {}^nC_2 - \ldots = 0]$

$$= a\cdot{}^nC_0 = a$$

83. $r\cdot{}^{2n}C_r = 2n\cdot{}^{2n-1}C_{r-1}$

$$\therefore \quad \sum_{r=1}^{n} r\cdot{}^{2r}C_r = 2n\{{}^{2n-1}C_0 + {}^{2n-1}C_1 + \ldots + {}^{2n-1}C_{n-1}\}$$

$$= 2n\cdot 2^{(2n-1)-1} = n\cdot 2^{2n-1}$$

84. Putting $x = 1$ and -1, we get

$$1 = a_0 + a_1 + a_2 + a_3 + \ldots + a_{2n}$$

and $\quad 3^n = a_0 - a_1 + a_2 - a_3 + \ldots + a_{2n}$

Adding, we get $\quad 1 + 3^n = 2(a_0 + a_2 + a_4 + \ldots + a_{2n})$

$$\therefore a_0 + a_2 + a_4 + \ldots + a_{2n} = \frac{3^n + 1}{2}$$

85. $\sum_{r=0}^{n}(a+rb)\,{}^nC_r = a(2^n) + b\sum_{r=0}^{n} r\cdot\frac{n}{r}\cdot{}^{n-1}C_{r-1}$

$$= a\cdot 2^n + nb\cdot 2^{n-1} = (2a+nb)\,2^{n-1}$$

86. $(1+x)^{2n} = C_0 + C_1x + C_2x^2 + \ldots + C_{2n}x^{2n}$

On differentiating w.r.t. x, we get

$$2n(1+x)^{2n-1} = C_1 + 2C_2x + \ldots + 2nC_{2n}x^{2n-1} \quad \ldots(i)$$

Also, $\quad (1-x)^{2n} = C_0 - C_1x + C_2x^2 - \ldots + C_{2n}x^{2n}$

Replacing x by $\frac{1}{x}$, we get

$$\therefore \quad \left(1-\frac{1}{x}\right)^{2n} = C_0 - \frac{C_1}{x} + \frac{C_2}{x^2} - \ldots + \frac{C_{2n}}{x^{2n}} \quad \ldots(ii)$$

On multiplying Eqs. (i) and (ii), we get

$$2n(1+x)^{2n-1}\left(1-\frac{1}{x}\right)^{2n}$$

$$= (C_1 + 2C_2x + \ldots + 2nC_{2n}x^{2n-1})$$

$$\times\left(C_0 - \frac{C_1}{x} + \frac{C_2}{x^2} - \ldots + \frac{C_{2n}}{x^{2n}}\right)$$

Coefficient of $\frac{1}{x}$ on RHS

$$= -C_1^2 + 2C_2^2 - 3C_3^2 + \ldots + 2nC_{2n}^2$$

$$= -(C_1^2 - 2C_2^2 + 3C_3^2 - \ldots - 2nC_{2n}^2)$$

Also, coefficient of $\frac{1}{x}$ on LHS

$$= \text{Coefficient of } \frac{1}{x} \text{ in } \frac{2n(1+x)^{2n-1}(x-1)^{2n}}{x^{2n}}$$

$$= \text{Coefficient of } x^{2n-1} \text{ in } 2n(1-x^2)^{2n-1}(1-x)$$

$$= 2n\ {}^{2n-1}C_n(-1)^{n-1}$$

$$\therefore C_1^2 - 2C_2^2 + 3C_3^2 - \ldots - 2nC_{2n}^2 = 2n\ {}^{2n-1}C_n(-1)^{n-1}$$

87. $(1+x)^{10} = {}^{10}C_0 + {}^{10}C_1x + {}^{10}C_2x^2 + \ldots + {}^{10}C_{10}x^{10} \quad \ldots(i)$

Also,

$(1-x)^{10} = {}^{10}C_0 - {}^{10}C_1x + {}^{10}C_2x^2 - \ldots + {}^{10}C_{10}x^{10} \quad \ldots(ii)$

On multiplying, we get

$$(1-x^2)^{10} = ({}^{10}C_0 + {}^{10}C_1 x + {}^{10}C_2 x^2 + \dots + {}^{10}C_{10} x^{10}) \times ({}^{10}C_0 - {}^{10}C_1 x + {}^{10}C_2 x^2 - \dots + {}^{10}C_{10} x^{10})$$

Equating the coefficients of x^{10}, we get

$${}^{10}C_5 (-1)^5 = {}^{10}C_0\,{}^{10}C_{10} - {}^{10}C_1\,{}^{10}C_9 + {}^{10}C_2\,{}^{10}C_8 - \dots + {}^{10}C_{10}\,{}^{10}C_0$$

$$\Rightarrow \; -{}^{10}C_5 = ({}^{10}C_0)^2 - ({}^{10}C_1)^2 + ({}^{10}C_2)^2 - \dots + ({}^{10}C_{10})^2$$

88. $(1-x)^n = C_0 - C_1 x + C_2 x^2 - C_3 x^3 + \dots n$ terms

$\therefore \; x(1-x)^n = C_0 x - C_1 x^2 + C_2 x^3 - C_3 x^4 + \dots$

$$\therefore \int_0^1 x(1-x)^n\,dx = \int_0^1 (C_0 x - C_1 x^2 + C_2 x^3 - C_3 x^4 + \dots)\,dx$$

$$\Rightarrow -\int_1^0 (1-t)t^n\,dt = \left[C_0 \frac{x^2}{2} - C_1 \frac{x^3}{3} + C_2 \frac{x^4}{4} - C_3 \frac{x^5}{5} + \dots\right]_0^1$$

(where $t = 1-x$)

$$\Rightarrow -\left(\frac{t^{n+1}}{n+1} - \frac{t^{n+2}}{n+2}\right)\Bigg|_1^0 = \frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \frac{C_3}{5} + \dots$$

$$\therefore \frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \frac{C_3}{5} + \dots = \frac{1}{n+1} - \frac{1}{n+2} = \frac{1}{(n+1)(n+2)}$$

89. In $(1+x)^n = C_0 + C_1 x + C_2 x^2 + \dots + C_n x^n$

On differentiating both sides w.r.t. x, we get

$$n(1+x)^{n-1} = C_1 + 2C_2 x + \dots + nC_n x^{n-1}$$

Put $x = 1$

$$n \cdot 2^{n-1} = C_1 + 2C_2 + \dots + nC_n$$

90. In $(1+x^2)^n x = C_0 x + C_1 x^3 + C_2 x^5 + \dots + C_n x^{2n+1}$

On differentiating both sides w.r.t. x and putting $x = 1$

$$(n+1)\cdot 2^n = C_0 + 3C_1 + 5C_2 + \dots + (2n+1)C_n$$

91. ${}^{100}C_r \cdot {}^{200}C_{150+r} = {}^{100}C_r \cdot {}^{200}C_{50-r}$

Thus, $$\sum_{r=0}^{50} {}^{100}C_r \cdot {}^{200}C_{50-r} = {}^{300}C_{50}$$

92. $$\sum_{r=0}^{2n} (-1)^r \cdot ({}^{2n}C_r)^2 = \sum_{r=0}^{2n} (-1)^r \cdot {}^{2n}C_r \cdot {}^{2n}C_r = \sum_{r=0}^{2n} (-1)^r \cdot {}^{2n}C_r \cdot {}^{2n}C_{2n-r}$$

$=$ Coefficient of x^{2n} in $(1-x)^{2n} \cdot (1+x)^{2n}$

$=$ Coefficient of x^{2n} in $(1-x^2)^{2n} = (-1)^n \cdot {}^{2n}C_n$

93. $$I = \sum_{r=0}^{2n} r \cdot ({}^{2n}C_r)^2 = \sum_{r=0}^{2n} r \cdot \frac{2n}{r}\,{}^{2n-1}C_{r-1} \cdot {}^{2n}C_r$$

$$= 2n \sum_{r=0}^{2n} {}^{2n-1}C_{r-1} \cdot {}^{2n}C_r = 2n \cdot {}^{4n-1}C_{2n}$$

$$\Rightarrow \quad I = n \cdot {}^{4n}C_{2n}$$

94. $$\sum_{i=0}^{n-r} {}^{n-i}C_r = {}^nC_r + {}^{n-1}C_r + {}^{n-2}C_r + \dots + {}^{r+1}C_r + {}^rC_r = {}^{n+1}C_{r+1}$$

95. Here, $$T_{r+1} = \frac{{}^nC_r}{r+1} = \frac{1}{r+1} \cdot {}^nC_r = \frac{1}{n+1}\,{}^{n+1}C_{r+1}$$

Putting $r = 0, 1, 2, \dots, n$ and adding, we get

$$\sum_{k=0}^{n} \frac{C_k}{k+1} = \sum_{k=0}^{n} \frac{1}{n+1}\,{}^{n+1}C_{k+1}$$

$$= \frac{1}{n+1}[{}^{n+1}C_1 + {}^{n+1}C_2 + {}^{n+1}C_3 + \dots + {}^{n+1}C_{n+1}]$$

$$= \frac{1}{n+1}[2^{n+1} - {}^{n+1}C_0] = \frac{2^{n+1}-1}{n+1}$$

96. Clearly, $a_r = {}^{2n}C_r$

$$\Rightarrow \quad \frac{a_r}{a_{r-1}} = \frac{{}^{2n}C_r}{{}^{2n}C_{r-1}} = \frac{(2n-r+1)}{r}$$

$$\Rightarrow \quad 1 + \frac{a_r}{a_{r-1}} = \frac{2n+1}{r}$$

$$\Rightarrow \quad \prod_{r=1}^{2n}\left(1 + \frac{a_r}{a_{r-1}}\right) = \prod_{r=1}^{2n} \frac{(2n+1)}{r} = \frac{(2n+1)^{2n}}{(2n)!}$$

97. $$\sum_{0 \le i < j \le n} \sum i \cdot {}^nC_j = \sum_{r=1}^{n} {}^nC_r (0 + 1 + 2 + \dots + r - 1)$$

$$= \frac{1}{2}\{n(n-1)\cdot 2^{n-2} + n \cdot 2^{n-1} - n \cdot 2^{n-1}\}$$

$$= n(n-1)\cdot 2^{n-3}$$

98. $$\sum_{0 \le i < j \le n} \sum j \cdot {}^nC_i = \sum_{r=0}^{n-1} {}^nC_r [(r+1) + (r+2) + \dots + (n)]$$

$$= \sum_{r=0}^{n-1} {}^nC_r \left[\frac{(n-r)}{2}(r+1+n)\right]$$

$$= \sum_{r=0}^{n-1} {}^nC_r \left[\frac{(n+1)}{2}(n-r) + \frac{r(n-r)}{2}\right]$$

$$= \frac{n+1}{2}\sum_{r=0}^{n} (n-r) \cdot {}^nC_r - \frac{n}{2}\sum_{r=0}^{n} r \cdot {}^nC_r + \frac{1}{2}\sum_{r=0}^{n} r^2 \cdot {}^nC_r$$

$$= \frac{n+1}{2}\sum_{r=0}^{n} r \cdot {}^nC_r - \frac{n}{2}\sum_{r=0}^{n} r \cdot {}^nC_r + \frac{1}{2}\sum_{r=0}^{n} r^2 \cdot {}^nC_r$$

$$= \frac{1}{2}\left(\sum_{r=0}^{n} r \cdot {}^nC_r + \sum_{r=0}^{n} r^2 \cdot {}^nC_r\right) = n(n+3)\cdot 2^{n-3}$$

99. $$\sum_{r=0}^{n} (-1)^r \cdot r^2 \cdot {}^nC_r$$

Since, $$(1-x)^n = \sum_{r=0}^{n} (-1)^r \cdot {}^nC_r\, x^r$$

On differentiating both sides w.r.t. x, we get

$$-n(1-x)^{n-1} = \sum_{r=0}^{n} (-1)^r \cdot {}^nC_r \cdot r \cdot x^{r-1}$$

$$\Rightarrow \quad -nx(1-x)^{n-1} = \sum_{r=0}^{n} (-1)^r \cdot {}^nC_r \cdot r \cdot x^r$$

On differentiating both sides again w.r.t. x, we get

$$\sum_{r=0}^{n} (-1)^r \cdot {}^nC_r \cdot r^2 \cdot x^{r-1} = -n(1-x)^{n-1} + n(n-1)x(1-x)^{n-2}$$

Now, putting $x = 1$ on both sides, we get

$$\sum_{r=0}^{n} (-1)^r \cdot {}^nC_r \cdot r^2 = 0$$

100. $$\sum_{0 \le i < j \le n} \sum (C_i - C_j)^2 = \frac{\sum_{i=0}^{n} \sum_{j=0}^{n} (C_i - C_j)^2 - 0}{2}$$

$$= \frac{\sum\sum C_i^2 + \sum\sum C_j^2 - 2\sum\sum C_i C_j}{2}$$

$$= (n+1)\ {}^{2n}C_n - 2^{2n}$$

101. Coefficient of x in

$\{{}^{2n}C_0(1+x)^{2n} + {}^{2n}C_1(1+x)^{2n-1} + {}^{2n}C_2(1+x)^{2n-2} + \dots\}$

$\Rightarrow$ Coefficient of x in $(2+x)^{2n} = n \cdot 2^{2n}$

102. $$\sum_{0 \le i < j \le n} \sum {}^nC_i = \sum_{r=0}^{n-1} {}^nC_r \underbrace{(1+1+1+\dots+1)}_{(n-r)\text{ times}}$$

$$= \sum_{r=0}^{n-1} (n-r) \cdot {}^nC_r$$

$$= \sum_{r=0}^{n} (n-r) \cdot {}^nC_r = \sum_{r=0}^{n} \{n-(n-r)\} \cdot {}^nC_{n-r}$$

$$= \sum_{r=0}^{n} r \cdot {}^nC_r = n \cdot 2^{n-1}$$

103. $$\sum\sum_{0 \le i < j < k < l \le n} \sum \sum 2 = 2\ {}^{n+1}C_4$$

104. $$\sum_{1 \le i < j \le n-1} \sum (i \cdot {}^nC_i)(j \cdot {}^nC_j)$$

$$= n^2 \sum_{1 \le i < j \le n-1} \sum {}^{n-1}C_{i-1} \cdot {}^{n-1}C_{j-1}$$

$$= n^2 \cdot \left(\frac{2^{2(n-1)} - {}^{2(n-1)}C_{n-1}}{2}\right)$$

105. $\because {}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n = 2^n$

and ${}^nP_n = n!$

$$\therefore \quad S = \sum_{n=1}^{\infty} \left(\frac{{}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n}{{}^nP_n}\right)$$

$$= \sum_{n=1}^{\infty} \left(\frac{2^n}{n!}\right) = \frac{2^1}{1!} + \frac{2^2}{2!} + \frac{2^3}{3!} + \dots$$

$$= e^2 - 1 \quad \left[\begin{array}{l} \because e^x = 1 + \dfrac{x}{1!} + \dfrac{x^2}{2!} + \dfrac{x^3}{3!} + \dots \\ \text{so } e^2 = 1 + \dfrac{2}{1!} + \dfrac{2^2}{2!} + \dfrac{2^3}{3!} + \dots \end{array}\right]$$

106. $$\sum_{r=0}^{n} r(n-r)({}^nC_r)^2 = \sum_{r=0}^{n} r \cdot {}^nC_r (n-r) \cdot {}^nC_{n-r}$$

$$= \sum_{r=0}^{n} n \cdot {}^{n-1}C_{r-1} \cdot n \cdot {}^{n-1}C_{n-r-1}$$

$$= n^2 \sum_{r=0}^{n} {}^{n-1}C_{r-1} \cdot {}^{n-1}C_{n-r-1}$$

$= n^2 \cdot$ Coefficient of x^{n-2} in $(1+x)^{n-1} \cdot (1+x)^{n-1}$

$$= n^2 \cdot {}^{2n-2}C_{n-2}$$

$$= n^2 \cdot {}^{2n-2}C_n$$

107. Given,

$$\frac{{}^{n+1}C_{r+1}}{{}^nC_r} = \frac{11}{6} \Rightarrow \frac{\frac{n+1}{r+1} \times {}^nC_r}{{}^nC_r} = \frac{11}{6}$$

$$\Rightarrow 6n + 6 = 11r + 11 \Rightarrow 6n - 11r = 5 \quad \dots(\text{i})$$

Also,

$$\frac{{}^nC_r}{{}^{n-1}C_{r-1}} = \frac{6}{3}$$

$$\Rightarrow \quad \frac{\frac{n}{r} \times {}^{n-1}C_{r-1}}{{}^{n-1}C_{r-1}} = \frac{6}{3}$$

$$\Rightarrow \quad n = 2r \quad \dots(\text{ii})$$

From Eqs. (i) and (ii),

$$r = 5 \quad \text{and} \quad n = 10$$

$$\therefore \quad nr = 50$$

108. We have, $f(x) = x^n$. So,

$$f^1(x) = nx^{n-1} \Rightarrow f^1(1) = n$$

$$f^2(x) = n(n-1)x^{n-2} \Rightarrow f^2(1) = n(n-1)$$

$$f^3(x) = n(n-1)(n-2)x^{n-3} \Rightarrow f^3(1) = n(n-1)(n-2)$$

$$\dots\dots\dots$$

$$f^n(x) = n(n-1)(n-2)\dots 1$$

$$\Rightarrow \quad f^n(1) = n(n-1)(n-2)\dots 1$$

$$\Rightarrow f(1) + \frac{f^1(1)}{1} + \frac{f^2(1)}{2!} + \dots + \frac{f^n(1)}{n!}$$

$$= 1 + \frac{n}{1} + \frac{n(n-1)}{2!} + \frac{n(n-1)(n-2)}{3!} + \dots + \frac{n(n-1)(n-2)\dots 1}{n!}$$

$$= {}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC = 2^n$$

109. $$\sum_{k=1}^{\infty} \sum_{r=0}^{k} \frac{1}{3^k} ({}^kC_r)$$

$$= \sum_{k=1}^{\infty} \left(\frac{1}{3^k}\left(\sum_{r=0}^{k} {}^kC_r\right)\right)$$

$$= \sum_{k=1}^{\infty} \left(\frac{2^k}{3^k}\right)$$

$$= \frac{2}{3} + \left(\frac{2}{3}\right)^2 + \dots$$

$$= \frac{2/3}{1 - \frac{2}{3}} = 2$$

110. Let $(1+y)^n = 1 + \dfrac{1}{3}x + \dfrac{1 \times 4}{3 \times 6}x^2 + \dfrac{1 \times 4 \times 7}{3 \times 6 \times 9}x^3 + \dots$

$$= 1 + ny + \frac{n(n-1)}{2!}y^2 + \dots$$

Comparing the terms, we get

$$ny = \frac{1}{3}x, \frac{n(n-1)}{2!}y^2 = \frac{1 \times 4}{3 \times 6}x^2$$

Solving, $\quad n = -1/3,\ y = -x$

Hence, the given series is $(1-x)^{-1/3}$.

111. Given that,

$$\alpha = \frac{5}{2!3} + \frac{5\cdot 7}{3!3^2} + \frac{5\cdot 7\cdot 9}{4!3^3} + \dots \quad \dots(i)$$

We know that,

$$(1+x)^n = 1 + \frac{nx}{1!} + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots \quad \dots(ii)$$

On comparing Eqs. (i) and (ii), with respect to factorial

$$n(n-1)x^2 = \frac{5}{3} \quad \dots(iii)$$

$$n(n-1)(n-2)x^3 = \frac{5\cdot 7}{3^2} \quad \dots(iv)$$

and $n(n-1)(n-2)(n-3)x^4 = \frac{5\cdot 7\cdot 9}{3^3}$ ...(v)

On dividing Eq. (iv) by Eq. (iii) and Eq. (v) by Eq. (iv), we get

$$(n-2)x = \frac{7}{3} \quad \dots(vi)$$

and

$$(n-3)x = 3 \quad \dots(vii)$$

Again, dividing Eq. (vi) by Eq.(vii), we get

$$\frac{n-2}{n-3} = \frac{7}{9}$$

$\Rightarrow$ $9n - 18 = 7n - 21$

$\Rightarrow$ $2n = -3 \Rightarrow n = -\frac{3}{2}$

On putting the value of n in Eq. (vi), we get

$$\left(-\frac{3}{2} - 2\right)x = \frac{7}{3}$$

$\Rightarrow$ $x = -\frac{2}{3}$

$\therefore$ From Eq. (ii), we get

$$\left(1 - \frac{2}{3}\right)^{-3/2} = 1 + 1 + \frac{5}{2!3} + \frac{5\cdot 7}{3!3^2} + \dots$$

$\Rightarrow$ $3^{3/2} - 2 = \frac{5}{2!3} + \frac{5\cdot 7}{3!3^2} + \dots$

$\Rightarrow$ $\alpha = 3^{3/2} - 2$ [from Eq. (i)]

Now, $\alpha^2 + 4\alpha = (3^{3/2} - 2)^2 + 4(3^{3/2} - 2)$

$= 27 + 4 - 4\cdot 3^{3/2} + 4\cdot 3^{3/2} - 8$

$= 23$

112. $(x \sin p + x^{-1} \cos p)^{10}$

The general term in the expansion is

$$T_{r+1} = {}^{10}C_r (x \sin p)^{10-r} (x^{-1} \cos p)^r$$

For the term independent of x, we have $10 - 2r = 0$ or $r = 5$.

Hence, the independent term is

$${}^{10}C_5 \sin^5 p \cos^5 p = {}^{10}C_5 \frac{\sin^5 2p}{32}$$

which is the greatest when $\sin 2p = 1$

The least value of ${}^{10}C_5 \frac{\sin^5 2p}{32}$ is $-\frac{10!}{2^5(5!)^2}$,

when $\sin 2p = -1$ or $p = (4n-1)\frac{\pi}{4}, n \in Z$.

Sum of coefficients is $(\sin p + \cos p)^{10}$, when $x = 1$

or $(1 + \sin 2p)^5$, which is least, when $\sin 2p = -1$

Hence, least sum of coefficients is zero. Greatest sum of coefficients occurs, when $\sin 2p = 1$.

Hence, the greatest sum is $2^5 = 32$.

113. The general term of $\left(x + \frac{a}{x^2}\right)^n$ is

$$T_{r+1} = {}^nC_r \left(\frac{a}{x^2}\right)^r x^{n-r} = {}^nC_r\, a^r\, x^{n-3r}$$

If the term independent of x does not exist, then $n - 3r$ must not be zero for positive integers n and r.

$\Rightarrow r = \frac{n}{3}$ must not be an integer. Now, the integers given in options (a), (b) and (d) are not divisible by 3.

Options (a), (b) and (d) are correct options.

Since, 15 is divisible by 3, so option (c) is not true.

114. In $\left(x + \frac{\alpha}{x}\right)^n$,

$$T_{r+1} = {}^nC_r\, x^{n-r}\left(\frac{\alpha}{x}\right)^r$$

$$= {}^nC_r\, x^{n-2r}\alpha^r$$

T_{r+1} is independent of x, if $n - 2r = 0$

$\Rightarrow$ $2r \Rightarrow n$ is divisible by 2.

Again, in $\left(x + \frac{\beta}{x^2}\right)^n$

$$T_{r+1} = {}^nC_r x^{n-r}\left(\frac{\beta}{x^2}\right)^r = {}^nC_r x^{n-3r} - \beta^r$$

T_{r+1} is independent of x, if $n - 3r = 0$ i.e. $n = 3r$

n is divisible by 3.

115. $(x^2 + 2x + 2)^n = \{2 + x(2 + x)\}^n$

$= 2^n + {}^nC_1 2^{n-1} x(2+x) + {}^nC_2 2^{n-2} x^2 (2+x)^2 + {}^nC_3 2^{n-3} x^3 (2+x)^3 + \dots$

It is easy to observe that coefficient of $x = n\cdot 2^n$ and the coefficient of x^2

$$= n\cdot 2^{n-1} + \frac{n(n-1)2^{n-2}}{2} = n^2\cdot 2^{n-1}$$

Coefficient of $x^3 = {}^nC_2 \cdot 2^{n-2}\cdot 4 + {}^nC_3 \cdot 2^{n-3}\cdot 2^3$

$= 2^n \cdot {}^{n+1}C_3$

116. (a) $3^{100} = 9^{50} = (10-1)^{50}$

$= 10^{50} - {}^{50}C_1 10^{49} + \dots - {}^{50}C_{49} 10^1 + {}^{50}C_{50}$

$\Rightarrow$ A multiple of 100 + 1.

$\Rightarrow$ Last two digits of 3^{100} are 01.

$\Rightarrow$ Choice (a) is wrong.

Again, $3^{50} = 9^{25} = (10-1)^{25}$

$= 10^{25} - {}^{25}C_1 10^{24} + \dots + {}^{25}C_{24} 10 - {}^{25}C_{25}$

= A multiple of 100 + 249

$\Rightarrow$ The remainder when 3^{50} divided by 100 is 49

$\Rightarrow$ Last two digits of 3^{50} are 49.

$\Rightarrow$ Option (b) is false and option (c) becomes true.

(d) From the same expansion, we get

3^{50} = A multiple of 1000 + 249

$\Rightarrow$ The remainder when 3^{50} is divided by 1000 is 249.

$\therefore$ The last three digits are 249.

117. Sum of coefficients in $(a\alpha^2 x^2 + 2b\alpha x + c)^n$ is

$$(a\alpha^2 + 2b\alpha + c)$$

Let $f(\alpha) = a\alpha^2 + 2b\alpha + c$

Such that sum $= \{f(\alpha)\}^n$

Now, $f(\alpha) > 0$, $\forall\, n$ and $\alpha \in R$, then $a > 0$

Also, $f(\alpha) < 0$, $\forall\, n \in$ odd and $\alpha \in R$, if $a < 0$

118. $f(n) = \sum_{r=1}^{n} \{(r+1)^2\ {}^nC_r - r^2\ {}^nC_{r-1}\}$

$= (n+1)^2\ {}^nC_{n-1} = (n+1)^2 - 1$

Now, $\sum_{n=1}^{10} f(n) = (2^2-1) + (3^2-1) + (4^2-1) + (5^2-1)$

$+ (6^2-1) + (7^2-1) + (8^2-1) + (9^2-1) + (10^2-1) + (11^2-1)$

$= \dfrac{11\cdot(11+1)(22+1)}{6} - 11 = 495$

119. The given expression is the coefficient of x^n in $(1+x)^n + (1+x)^{n+1} + \dots + (1+x)^{n+k}$

$\Rightarrow$ Coefficient of x^n in $(1+x)^n \left\{\dfrac{(1+x)^{k+1}-1}{1+x-1}\right\}$

$= \dfrac{(1+x)^n(1+x)^{k+1} - (1+x)^n}{x}$

$\Rightarrow$ Coefficient of x^{n+1} in $[(1+x)^{n+k+1} - (1+x)^n]$

i.e. ${}^{n+k+1}C_{n+1}$ or ${}^{n+k+1}C_k$

120. Given, ${}^{69}C_{3r-1} + {}^{69}C_{3r} = {}^{69}C_{r^2-1} + {}^{69}C_{r^2}$, ${}^{70}C_{3r} = {}^{70}C_{r^2}$

Either $3r = r^2$ or $r^2 + 3r = 70$

i.e. either $r = 0, 3$ or $r = 7, -10$

But the given equation is not defined for $r = 0, -10$

Hence, $r = 3$ or 7

121. Since, i, j and k are distinct, $n-i+1, n-j+1, n-k+1$ are also distinct and they all lie from 1 to n.

Now, $S = \Sigma\Sigma\Sigma(-x_{n-i+1})(-x_{n-j+1})(-x_{n-k+1})$

$= -\Sigma\Sigma\Sigma x_i x_j x_k = -S \Rightarrow S = 0$ for all n

Options (a), (b) and (c) are correct since the statements given in options (a), (b) and (c) are not correct.

122. We have,

$$f(m) = \sum_{i=0}^{m} \binom{30}{30-i}\binom{20}{m-i} = \sum_{i=0}^{m}\binom{30}{i}\binom{20}{m-i} = {}^{50}C_m$$

Now, $f(m)$ is the greatest, when $m = 25$.

Also, $f(0) + f(1) + \dots + f(50)$

$= {}^{50}C_0 + {}^{50}C_1 + \dots + {}^{50}C_{50} = 2^{50}$

Also, ${}^{50}C_m$ is not divisible by 50 for any m as 50 is not a prime number.

$$\sum_{m=0}^{50}(f(m))^2 = ({}^{50}C_0)^2 + ({}^{50}C_1)^2 + \dots + ({}^{50}C_{50})^2 = {}^{100}C_{50}$$

123. $\dfrac{T_{r+1}}{T_r} = \dfrac{12-r+1}{r}\cdot\dfrac{11}{10}$

Let $T_{r+1} \ge T_r \Rightarrow 13 - r \ge 1.1x$

$\Rightarrow 13 \ge 2.1r \Rightarrow r \le 6.19$

Hence, the greatest term occurs for $r = 6$. Hence, 7th term is the greatest term. Also, the binomial coefficient of 7th term is ${}^{12}C_6$, which is the greatest binomial coefficient.

But this is not the reason for which T_7 is the greatest. Here, it is coincident that the greatest term has the greatest binomial coefficient.

Hence, Statement I is true, Statement II is true; but Statement II is not a correct explanation of Statement I.

124. Let $(\sqrt{5}+2)^n = N + f$, where N is an integer and $0 < f < 1$

Let $(\sqrt{5}-2)^n = f'$, then $0 < f' < 1$

Let $(\sqrt{5}+2)^n - (\sqrt{5}-2)^n$ = integer [$\because n$ is odd]

where $N = (\sqrt{5}+2)^n - (\sqrt{5}-2)^n$ [$\because f = f'$]

$$= 2\left[{}^nC_1\cdot 2\cdot 5^{\frac{n-1}{2}} + {}^nC_3\cdot 2^3\cdot 5^{\frac{n-3}{2}} + \dots\right]$$

$\Rightarrow N$ is divisible by $20n$ on using Statement II.

[if n is prime and $r < n$, then there is no factor which will cut n, so ${}^nC_r$ will be divisible by n]

125. Statement I is true, since

$(\sqrt{2}-1)^2 = 3 - 2\sqrt{2} = \sqrt{9} - \sqrt{8}$

$(\sqrt{2}-1)^3 = 5\sqrt{2} - 7 = \sqrt{50} - \sqrt{49}$

[this could be proved by induction]

Statement II is also true, since any integral power of $(\sqrt{2}-1)$ will have rational and irrational parts. The irrational part will have only one surd $\sqrt{2}$. Thus, $(\sqrt{2}-1)^n = A + B\sqrt{2}$, where A and B are integers.

But, Statement II does not explain the Statement I.

126. $X = (n^2-n)(n^2-n-2) = n(n-1)(n-2)(n+1)$

$= (n-2)(n-1)n(n+1)$

$\Rightarrow \dfrac{X}{24} = {}^{n+1}C_4 \in I$

Hence, $m(m-2)$ is divisible by 24.

127. Since, $S_1 = {}^1C_1$ and $T_1 = 1 \Rightarrow S_1 = T_1$

Thus, if Statement II is true and if $S_n = T_n$ for some n, then $S_{n+1} = T_{n+1}$

$\Rightarrow S_n = T_n$ for all n.

Thus, Statement I is true, if Statement II is true. Let us prove Statement II.

Now, $T_{n+1} - T_n = \dfrac{1}{n+1}$

and $S_{n+1} - S_n = {}^{n+1}C_1 - \dfrac{{}^{n+1}C_2}{2} + \dfrac{{}^{n+1}C_3}{3} - \dots$

$\dots + \dfrac{(-1)^{n-1}\ {}^{n+1}C_n}{n} + \dfrac{(-1)^n\ {}^{n+1}C_{n+1}}{n+1}$

$- \left({}^nC_1 - \dfrac{{}^nC_2}{2} + \dfrac{{}^nC_3}{3} - \dots + \dfrac{(-1)^{n-1}\ {}^nC_n}{n}\right)$

$= ({}^{n+1}C_1 - {}^nC_1) - \dfrac{1}{2}({}^{n+1}C_2 - {}^nC_1) + \dfrac{1}{3}({}^{n+1}C_3 - {}^nC_3)$

$- \dots + \dfrac{(-1)^{n-1}}{n}({}^{n+1}C_n - {}^nC_n) + \dfrac{(-1)^n}{n+1}$

$= {}^nC_0 - \dfrac{{}^nC_1}{2} + \dfrac{{}^nC_2}{2} - \dots + \dfrac{(-1)^n\ {}^nC_n}{n+1}$

$= \int_0^1 (1-x)^n\, dx = \dfrac{1}{n+1}$

Thus, Statement II is true.

128. $S = \sum\sum_{0\le i<j\le n}\left(\dfrac{i}{{}^nC_i} + \dfrac{j}{{}^nC_j}\right) = \sum\sum_{0\le i<j\le n}\left(\dfrac{n-i}{{}^nC_{n-i}} + \dfrac{n-j}{{}^nC_{n-j}}\right)$

$= n\sum\sum_{0\le i<j\le n}\left(\dfrac{1}{{}^nC_i} + \dfrac{1}{{}^nC_j}\right) - S$

$\Rightarrow S = \dfrac{n}{2}\sum\sum_{0\le i<j\le n}\left(\dfrac{1}{{}^nC_i} + \dfrac{1}{{}^nC_j}\right)$

$= \dfrac{n}{2}\left(\sum_{r=0}^{n-1}\dfrac{n-r}{{}^nC_r} + \sum_{r=1}^{n}\dfrac{r}{{}^nC_r}\right) = \dfrac{n}{2}\left(\sum_{r=0}^{n}\dfrac{n}{{}^nC_r}\right) = \dfrac{n^2}{2}a$

Solutions (Q. Nos. 129-131)

We have,

$$C + iS = 1 + re^{i\theta} + \frac{r^2 e^{2i\theta}}{2!} + \frac{r^3 e^{3i\theta}}{3!} + \ldots = e^{re^{i\theta}} \quad \ldots(\text{i})$$

and $$C - iS = 1 + re^{-i\theta} + \frac{r^2 e^{-2i\theta}}{2!} + \frac{r^3 e^{-3i\theta}}{3!} + \ldots = e^{re^{-i\theta}} \quad \ldots(\text{ii})$$

Clearly, $C^2 + S^2$

$$= e^{re^{i\theta}} \cdot e^{re^{-i\theta}} = e^{r(e^{i\theta} + e^{-i\theta})} = e^{2r\cos\theta} \quad \ldots(\text{iii})$$

On differentiating Eqs. (i) and (ii) w.r.t. r, we get

$$\frac{dC}{dr} + i\frac{dS}{dr} = e^{i\theta} + re^{2i\theta} + \frac{r^2 e^{3i\theta}}{2!} + \ldots = e^{i\theta} e^{re^{i\theta}} \quad \ldots(\text{iv})$$

$$\frac{dC}{dr} - \frac{i\,dS}{dr} = e^{-i\theta} + re^{-2i\theta} + \frac{r^2 e^{-3i\theta}}{2!} + \ldots$$

$$= e^{-i\theta}\left(1 + r\cdot e^{-i\theta} + \frac{r^2 e^{-2i\theta}}{2!} + \ldots\right)$$

$$= e^{-i\theta} \cdot e^{re^{-i\theta}} \quad \ldots(\text{v})$$

On multiplying Eqs. (iv) and (v), we get

$$\left(\frac{dC}{dr}\right)^2 + \left(\frac{dS}{dr}\right)^2 = e^{-i\theta} \cdot e^{re^{-i\theta}} \cdot e^{i\theta} \cdot e^{re^{i\theta}}$$

$$= e^{(-i\theta + i\theta)} \cdot e^{r(e^{-i\theta} + e^{i\theta})}$$

$$= e^{2r\cos\theta} = C^2 + S^2$$

Now, on multiplying Eqs. (ii) and (iv), we get

$$\left(\frac{dC}{dr} + i\frac{dS}{dr}\right)(C - iS) = e^{i\theta} e^{r(e^{i\theta} + e^{-i\theta})}$$

$$= e^{i\theta} e^{2r\cos\theta}$$

$$= (\cos\theta + i\sin\theta) e^{2r\cos\theta} \quad \ldots(\text{vi})$$

On equating real and imaginary parts from Eq. (vi)

$$C\frac{dC}{dr} + S\frac{dS}{dr} = (C^2 + S^2)\cos\theta$$

and $$C\frac{dS}{dr} - S\frac{dC}{dr} = (C^2 + S^2)\sin\theta$$

132. Given, $(x + y)^n = \sum_{r=0}^{n} {}^nC_r x^{n-r} y^r$, where $C_r = {}^nC_r$

Using $(1 + x)^n = \sum_{r=0}^{n} {}^nC_r x^r \quad \ldots(\text{i})$

On integrating between 0 to 1, we get

$$\left[\frac{(1 + x)^{n+1}}{n + 1}\right]_0^1 = C_0 + \frac{C_1}{2} + \frac{C_2}{3} + \ldots + \frac{C_n}{n + 1}$$

$$\therefore\ C_0 + \frac{C_1}{2} + \frac{C_2}{3} + \frac{C_3}{4} + \frac{C_4}{5} + \ldots + \frac{C_n}{n + 1} = \frac{2^{n+1} - 1}{n + 1} \quad \ldots(\text{ii})$$

Also, integrating Eq. (i) between 0 to –1, we get

$$\left[\frac{(1 + x)^{n+1}}{n + 1}\right]_0^{-1} = -C_0 + \frac{C_1}{2} - \frac{C_2}{3} + \frac{C_3}{4} - \ldots$$

$$\therefore\ -C_0 + \frac{C_1}{2} - \frac{C_2}{3} + \frac{C_3}{4} - \frac{C_4}{5} + \ldots = -\frac{1}{n + 1} \quad \ldots(\text{iii})$$

On adding Eqs. (ii) and (iii), we get

$$2\left(\frac{C_1}{2} + \frac{C_3}{4} + \frac{C_5}{6} + \ldots\right) = \frac{2^{n+1} - 2}{n + 1}$$

$$\therefore\ \frac{C_1}{2} + \frac{C_3}{4} + \frac{C_5}{6} + \ldots = \frac{2^n - 1}{n + 1}$$

133. Now, $$\sum_{r=0}^{n}\left(\frac{r + 1 + 1}{r + 1}\right) {}^nC_r = \sum_{r=0}^{n} {}^nC_r + \frac{1}{(n + 1)} \sum_{r=0}^{n} {}^{n+1}C_{r+1}$$

$$= 2^n + \frac{1}{(n + 1)}(2^{n+1} - 1)$$

Since, $$\sum_{r=0}^{n}\left(\frac{r + 2}{r + 1}\right) {}^nC_r = \frac{2^8 - 1}{6} \quad [\text{given}]$$

$$\therefore\ 2^n + \frac{2^{n+1} - 1}{n + 1} = \frac{2^8 - 1}{6}$$

$$\Rightarrow\ n = 5$$

134. Using, $(1 + x)^n = C_0 + C_1 x + C_2 x^2 + C_3 x^3 + C_4 x^4 + \ldots$

On putting $x = i$, we get

$$(1 + i)^n = (C_0 - C_2 + C_4 - C_6 + \ldots) + i(C_1 - C_3 + C_5 - C_7 + \ldots)$$

$$(\sqrt{2})^n\left(\cos\frac{n\pi}{4} + i\sin\frac{n\pi}{4}\right) = (C_0 - C_2 + C_4 - C_6 + \ldots) + i(C_1 - C_3 + C_5 - C_7 + \ldots)$$

On equating the real part, we get

$$C_0 - C_2 + C_4 - C_6 + \ldots = 2^{\frac{n}{2}} \cdot \cos\frac{n\pi}{4}$$

135. Given, $a = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$

Let $$y = \sum_{0 \le i \le n} \sum_{0 \le j \le n} \left(\frac{i}{{}^nC_i} + \frac{j}{{}^nC_j}\right)$$

$$= \sum_{0 \le i \le n} \sum_{0 \le j \le n} \left(\frac{n - i}{{}^nC_{n-i}} + \frac{n - j}{{}^nC_{n-j}}\right)$$

$$= n \sum_{0 \le i \le n} \sum_{0 \le j \le n} \left(\frac{1}{{}^nC_{n-i}} + \frac{1}{{}^nC_{n-j}}\right) - y$$

$$\Rightarrow\ 2y = n\{a \cdot (n + 1) + a \cdot (n + 1)\} \ \Rightarrow\ y = na(n + 1)$$

136. Since, $(1 + x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$

Replace x by ix, we get

$$(1 + ix)^n = C_0 + iC_1 x - C_2 x^2 - iC_3 x^3 + C_4 x^4 + iC_5 x^5 - \ldots$$

$$\Rightarrow (1 + ix)^n = (C_0 - C_2 x^2 + C_4 x^4 + \ldots) + i(C_1 x - C_3 x^3 + C_5 x^5 + \ldots) \quad \ldots(\text{i})$$

Similarly, $$(1 - ix)^n = (C_0 - C_2 x^2 + C_4 x^4 + \ldots) - i(C_1 x - C_3 x^3 + C_5 x^5 + \ldots) \quad \ldots(\text{ii})$$

On adding Eqs. (i) and (ii), we get

$$(1 + ix)^n + (1 - ix)^n = 2(C_0 - C_2 x^2 + C_4 x^4 - \ldots)$$

On putting $x = 1$, we get

$$C_0 - C_2 + C_4 - C_6 + C_8 - \ldots$$

$$= (1 + i)^n + (1 - i)^n = 2^{n/2}\cos\left(\frac{n\pi}{4}\right) \quad \ldots(\text{iii})$$

Also, $$C_0 + C_2 + C_4 + C_6 + C_8 + \ldots = 2^{n-1} \quad \ldots(\text{iv})$$

On adding Eqs. (iii) and (iv), we get

$$C_0 + C_4 + C_8 + C_{12} + \ldots = 2^{n-2} + 2^{\frac{n}{2} - 1}\cos\frac{n\pi}{4}$$

137. $${}^nC_0 + {}^nC_3 + {}^nC_6 + \ldots = \frac{1}{3}[2^n + (-1)^n \omega^{2n} + (-1)^n \omega^n]$$

$$= \frac{1}{3}[2^n + (-1)^n(\omega^n + \omega^{2n})]$$

$$= \frac{1}{3}[2^n + (-1)^n(\overline{\omega}^n + \omega^n)] \quad [\because \omega^2 = \overline{\omega}]$$

$$= \frac{1}{3}\left(2^n + 2\cos\left(\frac{n\pi}{3}\right)\right)$$

138. $\sum_{r=1}^{n}(-3)^{r-1}\cdot{}^{3n}C_{2r-1}$

$= \sum_{r=1}^{n}(\sqrt{3}i)^{2r-2}\cdot{}^{3n}C_{2r-1} = \frac{1}{\sqrt{3}i}\sum_{r=1}^{n}(\sqrt{3}i)^{2r-1}\cdot{}^{3n}C_{2r-1}$

$= \frac{1}{2i\sqrt{3}}$ Imaginary part of $\{(1+i\sqrt{3})^{2n}-(1-i\sqrt{3})^{2n}\}$

$= 0$

139. $\sum_{r=0}^{n}\sum_{s=0}^{n}(C_r + C_s) = \sum_{r=0}^{n}\sum_{s=0}^{n}C_r + \sum_{r=0}^{n}\sum_{s=0}^{n}C_s$

$= \sum_{s=0}^{n}\left(\sum_{r=0}^{n}C_r\right) + \sum_{r=0}^{n}\left(\sum_{s=0}^{n}C_s\right)$

$= (n+1)2^n + (n+1)2^n$

$= (n+1)2^{n+1}$

140. $\sum_{r=0}^{s}\sum_{s=1}^{n}{}^nC_s\,{}^sC_r$

$= \sum_{s=1}^{n}{}^nC_s\,({}^sC_0 + {}^sC_1 + \ldots + {}^sC_s) = \sum_{s=1}^{n}{}^nC_s\,(2^s)$

$= \sum_{s=0}^{n}{}^nC_s2^0 - {}^5C_02^0 = (1+2)^n - 1$

$= 3^n - 1$

141. $\sum_{r=0}^{n}\sum_{s=0}^{n}\sum_{t=0}^{n}\sum_{u=0}^{n}(1) = \sum_{r=0}^{n}(1)\sum_{s=0}^{n}(1)\sum_{t=0}^{n}(1)\sum_{u=0}^{n}(1)$

$= (n+1)(n+1)(n+1)(n+1)$

$= (n+1)^4$

142. Given, $f(x) = x^n + x^{n+1}$

$f^k(x) = \frac{n!}{(n-k)!}x^{n-k} + \frac{(n+1)!}{(n+1-k)!}x^{n+1-k}$

$\Rightarrow \quad (1+x)f^k(x)$

$= \left(\frac{n!}{(n-k)!}x^{n-k} + \frac{(n+1)!}{(n+1-k)!}x^{n+1-k}\right)(1+x) = g(x)$

[say]

$g^{(n+1-k)}(x) = \left(\frac{(n+1)!}{(n+1-k)!}(n+2-k)!\right)x$

$+\left(\frac{n!}{(n-k)!} + \frac{(n+1)!}{(n+1-k)!}\right)(n+1-k)!$

$\therefore \quad A - B = \frac{(n+1)!}{(n+1-k)!}(n+2-k)!$

$-\left(\frac{n!}{(n-k)!} + \frac{(n+1)!}{(n+1-k)!}\right)(n+1-k)!$

$= (n!)\,n(n+1-k)$

143. A. Since, $xyz = 3^5$

Number of solutions of $(x, y, z) = {}^{3+5-1}C_5 = 21$

B. Number of terms $= {}^{6+3-1}C_{3-1} = 28$

C. Since, $x^2 + x - 400 \le 0$

$\Rightarrow \quad x(x+1) \le 400$

Solutions are 1, 2, 3, …, 19.

Number of solutions = 19

D. Since, $x + y + z = 10$

Number of solutions

= Coefficient of t^{10} in $(t + t^2 + \ldots + t^8)^3$

= Coefficient of t^{10} in $t^3\left(\frac{1-t^8}{1-t}\right)^3$

= Coefficient of t^7 in $(1 + {}^3C_1t + {}^3C_2t^2 + \ldots)$

$= {}^9C_7 = 36$

144. A. Let $S = \sum\sum_{0 \le i \le j \le 10} i \cdot j \cdot {}^nC_i \cdot {}^nC_j$

$= \sum_{i=0}^{n}\sum_{j=0}^{n} i\cdot j\cdot {}^nC_i^n \cdot C_j - S + \sum_{i=0}^{n} i^2({}^nC_i)^2$

$\Rightarrow 2S = \sum_{i=0}^{n}\sum_{j=0}^{n} i\cdot j\cdot {}^nC_i \cdot {}^nC_k - \sum_{i=0}^{n} i^2({}^nC_i)^2$

$\Rightarrow 2S = (n2^{n-1})\cdot(n2^{n-1}) - \sum_{i=0}^{n} i^2({}^nC_i)^2$

where, $\sum_{i=0}^{n} i^2({}^nC_i)^2$ is the coefficient of x^0 in the product of $n(1+x)^{n-1}n\left(1+\frac{1}{x}\right)^{n-1}$.

Coefficient of x^0 in the product of $\frac{n^2(1+x)^{2n-2}}{x^{n-1}}$

= Coefficient of x^{n-1} in the product of $n^2(1+x)^{2n-1}$

$= n^2\,{}^{2n-2}C_{n-1}$

$\therefore \quad 2S = n^2\{2^{2n-2} - {}^{2n-2}C_{n-1}\}$

For $n = 10$, we have

$2S = 100\{2^{18} - {}^{18}C_9\} \times 100$

Last digit in 2^{18} is 4 and that the last digit in ${}^{18}C_9$ is zero (0).

Hence, last non-zero digit in $2^{18} - {}^{18}C_9$ is 4.

B. $\sum_{k=0}^{4}\left(\frac{3^{4-k}}{(4-k)!}\right)\left(\frac{x^k}{k!}\right)$

$= \sum_{k=0}^{4}\left(\frac{3^{4-k}}{(4-k)!}\right)\left(\frac{x^k}{k!}\right)\left(\frac{4!}{4!}\right)$

$= \sum_{k=0}^{4}\frac{{}^4C_k\cdot 3^{4-k}\cdot x^k}{4!} = \frac{(3+x)^4}{4!}$

According to the question,

$\frac{(3+x)^4}{4!} = \frac{32}{3}$

$\Rightarrow \quad (3+x)^4 = 256$

$\Rightarrow \quad x + 3 = 4$

$\Rightarrow \quad x = 1$

C. Since, $(1 + x + x^2)^n$

$= a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n}$ …(i)

On substituting $x = \omega, \omega^2$ and 1 and then adding them together

$a_0 + a_3 + a_6 + \ldots = 3^{n-1}$

On multiplying Eq. (i) by x^2 and then repeating the same process again, we get

$a_1 + a_4 + a_7 + \ldots = 3^{n-1}$

$\Rightarrow \quad a_0 + a_3 + a_6 + \ldots = a_1 + a_4 + a_7 + \ldots$

$= a_2 + a_5 + a_8 + \ldots$

$\therefore$ The required ratio is $\frac{2\cdot 3^{n-1}}{3^{n-1}} = 2$

D. Let $E = \frac{1}{{}^{57}C_4}\left[{}^{47}C_4 + \sum_{j=0}^{3} {}^{50-j}C_3 + \sum_{j=0}^{5} {}^{56-k}C_{53-k}\right]$

$$\Rightarrow E = \frac{1}{{}^{57}C_4}\left[{}^{47}C_4 + ({}^{47}C_4 + {}^{48}C_4 + {}^{49}C_4 + {}^{50}C_4) + \sum_{j=0}^{5} {}^{56-k}C_{53-k}\right]$$

$$\Rightarrow E = \frac{1}{{}^{57}C_4}[{}^{47}C_4 + ({}^{47}C_4 + {}^{48}C_4 + {}^{49}C_4 + {}^{50}C_4) + ({}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3 + {}^{56}C_3)]$$

$$\therefore \quad E = \frac{{}^{57}C_4}{{}^{57}C_4} = 1$$

$$\Rightarrow \quad 2E = 2$$

145. We know that ${}^nC_0^2 + {}^nC_1^2 + \ldots + {}^nC_n^2 = {}^{2n}C_n$

and ${}^nC_0^2 - {}^nC_1^2 + \ldots + (-1)^n\ {}^nC_n^2$

$$= \begin{cases} 0 & \text{,if } n \text{ is odd} \\ {}^nC_{n/2}(-1)^n & \text{,if } n \text{ is even} \end{cases}$$

From this,

$${}^{31}C_0^2 - {}^{31}C_1^2 + {}^{31}C_2^2 - \ldots - {}^{31}C_{31}^2 = 0$$

$${}^{32}C_0^2 - {}^{32}C_1^2 + {}^{32}C_2^2 - \ldots + {}^{32}C_{32}^2 = {}^{32}C_{16}$$

$${}^{32}C_0^2 + {}^{32}C_1^2 + {}^{32}C_2^2 + \ldots + {}^{32}C_{32}^2 = {}^{64}C_{32}$$

Also, $(1/32)(1 \times {}^{32}C_1^2 + 2 \times {}^{32}C_2^2 + \ldots + 32 \times {}^{32}C_{32}^2)$

$$= \frac{1}{32}\sum_{r=1}^{32} r\,({}^{32}C_r)^2 = \frac{1}{32}\sum_{r=1}^{32} r\,{}^{32}C_r{}^{32}C_{32-r}$$

$$= \frac{1}{32}\sum_{r=1}^{32} 32\,{}^{31}C_{r-1}{}^{32}C_{32-r}$$

$$= {}^{63}C_{31} = {}^{63}C_{32}$$

146. $f(n) = {}^nC_0\, a^{n-1} - {}^nC_1\, a^{n-2} + {}^nC_2\, a^{n-3} - \ldots + (-1)^{n-1}\ {}^nC_{n-1}a^0$

$$= \frac{1}{a}({}^nC_0\, a^n - {}^nC_1\, a^{n-1} + {}^nC_2\, a^{n-2} - \ldots + (-1)^{n-1}\ {}^nC_{n-1}\, a)$$

$$= \frac{1}{a}\{(a-1)^n - (-1)^n\ {}^nC_n\} = \frac{1}{a}\left\{(3^{\frac{1}{223}})^n - (-1)^n\right\}$$

$$\therefore \quad f(n) = \frac{3^{\frac{n}{223}} - (-1)^n}{3^{\frac{1}{223}} + 1}$$

$$\Rightarrow f(2007) + f(2008) = \frac{3^{\frac{2007}{223}} + 1}{3^{\frac{1}{223}} + 1} + \frac{3^{\frac{2008}{223}} - 1}{3^{\frac{1}{223}} + 1}$$

$$= \frac{3^{\frac{2007}{223}} + 3^{\frac{2008}{223}}}{3^{\frac{1}{223}} + 1} = \frac{3^9 + 3^{9 + \frac{1}{223}}}{3^{\frac{1}{223}} + 1}$$

$$= \frac{3^9\left(1 + 3^{\frac{1}{223}}\right)}{\left(1 + 3^{\frac{1}{223}}\right)} = 3^9$$

$$\Rightarrow \quad 3^9 = 3^k \quad \Rightarrow \quad k = 9$$

147. The sixth term of the given binomial expansion is

$${}^mC_5\left(\sqrt{2^{\log(10-3^x)}}\right)^{m-5} \cdot \left(5\sqrt{2^{x-2\log 3}}\right)^5 = 21 \quad \ldots\text{(i)}$$

The other given condition is ${}^mC_1 + {}^mC_3 = 2 \cdot {}^mC_2$

$\because \quad m \neq 0$, so $m^2 - 9m + 14 = 0 \Rightarrow (m-7)(m-2) = 0$

$\because \quad m = 2$ is not possible.

Putting $m = 7$ in Eq. (i), we get $x = 0, 2$

Hence, the sum of roots $= 0 + 2 = 2$

148. $T_{r+1} = {}^{12}C_r\left(3^{\frac{1}{4}}\right)^{12-r} \cdot (4)^{r/3}$

$$= {}^{12}C_r \cdot 3^{(3 - r/4)} \cdot (4)^{r/3}$$

For rational term, $r = 0$ or 12

$\therefore \quad$ Sum $= T_1 + T_{13} = {}^{12}C_0 \cdot 3^3 + {}^{12}C_{12} \cdot 4^4$

$$= 3^3 + 4^4 = 27 + 256 = 283$$

$$\Rightarrow \quad \{283\} = 0$$

149. We have, $(1 + x + x^2 + x^3 + x^4)^n\,(x-1)^{n+3}$

$$= \left(\frac{1-x^5}{1-x}\right)^n (1-x)^{n+3} = (1-x^5)^n\,(1-x)^3$$

$$= (-x^3 + 3x^2 - 3x + 1)\sum_{r=0}^{n} {}^nC_r(-1)^r x^{5r}$$

$$= -\sum_{r=0}^{n} {}^nC_r(-1)^r x^{5r+3} + 3\sum_{r=0}^{n} {}^nC_r(-1)^r x^{5r+2} - 3\sum_{r=0}^{n} {}^nC_r(-1)^r x^{5r+1} + 3\sum_{r=0}^{n} {}^nC_r(-1)^r x^{5r}$$

For term containing x^{83}, we have

$$5r + 3 = 83$$

$$\Rightarrow \quad r = 16$$

whereas $5r + 2 = 83$, $5r + 1 = 83$ and $5r = 83$ give no integral value of r.

Hence, their is only one term containing x^{83} whose coefficient

$$= -{}^nC_{16} = -{}^nC_{2\lambda}$$

$$\Rightarrow \quad 2\lambda = 16$$

$$\therefore \quad \lambda = 8$$

150. We have, coefficient of x^4 in $(1 + x + x^2 + x^3)^{11}$

= Coefficient of x^4 in $(1 + x^2)^{11}\,(1 + x)^{11}$

= Coefficient of x^4 in $(1 + x)^{11}$ + Coefficient of x^2 in $11 \cdot (1 + x)^{11}$ + Constant term in ${}^{11}C_2 \cdot (1 + x)^{11}$

$= {}^{11}C_4 + 11 \cdot {}^{11}C_2 + {}^{11}C_2$

$= 990 = 2 \times 3^2 \times 5 \times 11$

$\therefore$ Number of divisors of the form $9k$ is

$$2 \times 2 \times 2 \times 1 = 8$$

151. Middle term is $\left(\frac{n}{2} + 1\right)$th

i.e. $(4 + 1)$th i.e. T_5

$$\therefore \quad T_5 = {}^8C_4\left(\frac{x}{2}\right)^4 \cdot 2^4 = 1120$$

$$\Rightarrow \quad \frac{8 \cdot 7 \cdot 6 \cdot 5}{4 \cdot 3 \cdot 2 \cdot 1} \cdot x^4 = 1120$$

$$\Rightarrow \quad x^4 = \frac{1120}{70} = 16$$

$$\Rightarrow \quad (x^2 + 4)(x^2 - 4) = 0$$

$\therefore x = \pm 2$ only as $x \in R$

Thus, the sum of possible real values of x is 0.

152. $(17)^{256} = (289)^{128}$

$= (300-11)^{128}$

$= {}^{128}C_0(-11)^{128} + 100\,m$, for some integer m

$= 11^{128} + 100\,m$

$= (10+1)^{128} + 100\,m$

$= {}^{128}C_0 1^{128} + {}^{128}C_1 10 + 100\,m_1 + 100\,m$

for some integer m_1

$= 1 + 1280 + 100\,k,\ m + m_1 = k$

$= 1281 + 100\,k$

Hence, the required number is $81 = ab$

$\Rightarrow \quad a + b = 9$

153. $\dfrac{1(2^{2000}-1)}{1} = 2^{2000} - 1$

$= (5-1)^{1000} - 1 = (1-5)^{1000} - 1$

$= 1 - {}^{1000}C_1 \cdot 5 + {}^{1000}C_2 \cdot 5^2 + \ldots + {}^{1000}C_{1000} \cdot 5^{1000} - 1$

which is divisible by 5.

154. $\displaystyle\sum_{k=0}^{4}\left(\frac{5^{4-k}}{(4-k)!}\right)\left(\frac{x^k}{k!}\right) = \sum_{k=0}^{4}\left(\frac{5^{4-k}}{(4-k)!}\right)\left(\frac{x^k}{k!}\right)\frac{4!}{4!}$

$\displaystyle = \sum_{k=0}^{4}\frac{{}^4C_k \cdot 5^{4-k}\cdot x^k}{4!} = \frac{(5+x)^4}{4!}$

Now, $\quad \dfrac{(5+x)^4}{4!} = \dfrac{8}{3}$

$\Rightarrow \quad (5+x)^4 = 64$

$\Rightarrow \quad x + 5 = 2^{3/2} = 2\sqrt{2}$

$\Rightarrow \quad x = 2\sqrt{2} - 5$

$\therefore \quad \lambda = 5$

155. $C_0 - C_1\dfrac{(1+x)}{(1+nx)} + C_2\dfrac{(1+2x)}{(1+nx)^2} - C_3\dfrac{(1+3x)}{(1+nx)^3} + \ldots$

$$= \underbrace{\left[C_0 - \frac{C_1}{(1+nx)} + \frac{C_2}{(1+nx)^2} - \frac{C_3}{(1+nx)^3} + \ldots\right]}_{I_1}$$

$$+ \frac{x}{1+nx}\underbrace{\left[-C_1 + \frac{2C_2}{1+nx} - \frac{3C_3}{(1+nx)^2} + \ldots\right]}_{I_2} \quad \ldots\text{(i)}$$

$\because \quad (1-y)^n = C_0 - C_1y + C_2y^2 - C_3y^3 + \ldots + (-1)^n y^n \quad \ldots\text{(ii)}$

On differentiating w.r.t. y, we get

$-(1-y)^{n-1} = -C_1 + 2C_2y - 3C_3y^2 + \ldots \quad \ldots\text{(iii)}$

Now, $\quad I_1 = \left(1 - \dfrac{1}{1+nx}\right)^n = \left(\dfrac{nx}{1+nx}\right)^n \quad \ldots\text{(iv)}$

and $\quad I_2 = -C_1 + 2C_2 \cdot \dfrac{1}{1+nx} - 3C_3 \cdot \dfrac{1}{(1+nx)^2} + \ldots$

$= (-n)\left(1 - \dfrac{1}{1+nx}\right)^{n-1} = -n\left(\dfrac{nx}{1+nx}\right)^{n-1} \quad \ldots\text{(v)}$

Putting I_1 and I_2 from Eqs. (iii) and (v) in Eq. (i), we get

$C_0 - C_1\dfrac{(1+x)}{(1+nx)} + C_2\dfrac{(1+x)}{(1+nx)^2} - C_3\dfrac{(1+3x)}{(1+nx)^3}$

$+ \ldots + (-1)^n C_n \dfrac{1+nx}{(1+nx)^n}$

$= \left(\dfrac{nx}{1+nx}\right)^n - \left(\dfrac{x}{1+nx}\right)\cdot n \cdot \left(\dfrac{nx}{1+nx}\right)^{n-1}$

$= \left(\dfrac{nx}{1+nx}\right)^n - \left(\dfrac{nx}{1+nx}\right)^n = 0 \quad \Rightarrow \quad \lambda = 0$

Entrances Gallery

1. $2x_1 + 3x_2 + 4x_3 = 11$

Possibilities are (0, 1, 2); (1, 3, 0); (2, 1, 1); (4, 1, 0).

$\therefore$ Required coefficients

$= ({}^4C_0 \times {}^7C_1 \times {}^{12}C_2) + ({}^4C_1 \times {}^7C_3 \times {}^{12}C_0)$

$+ ({}^4C_2 \times {}^7C_1 \times {}^{12}C_1) + ({}^4C_4 \times {}^7C_1 \times {}^{12}C_0)$

$= (1 \times 7 \times 66) + (4 \times 35 \times 1) + (6 \times 7 \times 12) + (1 \times 7)$

$= 462 + 140 + 504 + 7$

$= 1113$

2. Let T_{r-1}, T_r, T_{r+1} be three consecutive terms of $(1+x)^{n+5}$.

$T_{r-1} = {}^{n+5}C_{r-2}(x)^{r-2}$, $T_r = {}^{n+5}C_{r-1}x^{r-1}$,

$T_{r+1} = {}^{n+5}C_r x^r$

where, ${}^{n+5}C_{r-2} : {}^{n+5}C_{r-1} : {}^{n+5}C_r = 5 : 10 : 14$

$\therefore \quad \dfrac{{}^{n+5}C_{r-2}}{5} = \dfrac{{}^{n+5}C_{r-1}}{10} = \dfrac{{}^{n+5}C_r}{14}$

Now, $\quad \dfrac{{}^{n+5}C_{r-2}}{5} = \dfrac{{}^{n+5}C_{r-1}}{10}$

$\Rightarrow \quad n - 3r = -9 \quad \ldots\text{(i)}$

and $\quad \dfrac{{}^{n+5}C_{r-1}}{10} = \dfrac{{}^{n+5}C_r}{14}$

$\Rightarrow \quad 5n - 12r = -30 \quad \ldots\text{(ii)}$

From Eqs. (i) and (ii), $n = 6$

3. Let $y = \displaystyle\sum_{r=1}^{10} A_r\,(B_{10}B_r - C_{10}A_r)$

$\displaystyle\sum_{r=1}^{10} A_rB_r =$ Coefficient of x^{20} in $\{(1+x)^{10}(x+1)^{20}\} - 1$

$= C_{20} - 1 = C_{10} - 1$ and $\displaystyle\sum_{r=1}^{10}(A_r)^2 =$ Coefficient of x^{10} in $\{(1+x)^{10}(x+1)^{10}\} - 1 = B_{10} - 1$

$\Rightarrow \quad y = B_{10}(C_{10} - 1) - C_{10}(B_{10} - 1) = C_{10} - B_{10}$

4. Let T_{r+1} be the general term in the expansion of $(1 - 2\sqrt{x})^{50}$.

$\therefore \quad T_{r+1} = {}^{50}C_r(1)^{50-r}(-2x^{1/2})^r = {}^{50}C_r 2^r x^{r/2}(-1)^r$

For the integral power of x, r should be even integer.

$\therefore$ Sum of coefficients $= \displaystyle\sum_{r=0}^{25} {}^{50}C_{2r}(2)^{2r}$

$= \dfrac{1}{2}[(1+2)^{50} + (1-2)^{50}]$

$= \dfrac{1}{2}[30^{50} + 1]$

Aliter

We have, $(1 - 2\sqrt{x})^{50} = C_0 - C_1 2\sqrt{x} + C_2(2\sqrt{x})^2$

$- \ldots + C_{50}(2\sqrt{x})^{50} \quad \ldots\text{(i)}$

and $(1 + 2\sqrt{x})^{50} = C_0 + C_1 2\sqrt{x} + C_2(2\sqrt{x})^2$

$+ \ldots + C_{50}(2\sqrt{x})^{50} \quad \ldots\text{(ii)}$

On adding Eqs. (i) and (ii), we get

$$(1-2\sqrt{x})^{50}+(1+2\sqrt{x})^{50}=2[C_0+C_2(2\sqrt{x})^2+\ldots+C_{50}(2\sqrt{x})^{50}]$$

$$\Rightarrow \frac{(1-2\sqrt{x})^{50}+(1+2\sqrt{x})^{50}}{2}=C_0+C_2(2\sqrt{x})^2+\ldots+C_{50}(2\sqrt{x})^{50}$$

On putting $x=1$, we get

$$\frac{(1-2\sqrt{1})^{50}+(1+2\sqrt{1})^{50}}{2}=C_0+C_2(2)^2+\ldots+C_{50}(2)^{50}$$

$$\Rightarrow \frac{(-1)^{50}+(3)^{50}}{2}=C_0+C_2(2)^2+\ldots+C_{50}(2)^{50}$$

$$\Rightarrow \frac{1+3^{50}}{2}=C_0+C_2(2)^2+\ldots+C_{50}(2)^{50}$$

5. Consider, $(1+ax+bx^2)(1-2x)^{18}$

$$=1(1-2x)^{18}+ax(1-2x)^{18}+bx^2(1-2x)^{18}$$

Coefficient of x^3

$$(-2)^3\ {}^{18}C_3+a(-2)^2\ {}^{18}C_2+b(-2)^{18}C_1=0$$

$$\frac{4\times(17\times 16)}{(3\times 2)}-2a\cdot\frac{17}{2}+b=0 \qquad \ldots\text{(i)}$$

Coefficient of x^4

$$(-2)^4\ {}^{18}C_4+a(-2)^3\ {}^{18}C_3+b(-2)^2\ {}^{18}C_2=0$$

$$(4\times 20)-2a\cdot\frac{16}{3}+b=0 \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$4\left(\frac{17\times 8}{3}-20\right)+2a\left(\frac{16}{3}-\frac{17}{2}\right)=0$$

$$\Rightarrow 4\left(\frac{17\times 8-60}{3}\right)+\frac{2a(-19)}{6}=0$$

$$\Rightarrow a=\frac{4\times 76\times 6}{3\times 2\times 19} \Rightarrow a=16$$

$$\Rightarrow b=\frac{2\times 16\times 16}{3}-80$$

$$=\frac{272}{3}$$

6. Set X contains elements of the form

$$4^n-3n-1=(1+3)^n-3n-1$$
$$=3^n+{}^nC_{n-1}3^{n-1}+\ldots+{}^nC_2 3^2$$
$$=9(3^{n-2}+{}^nC_{n-1}3^{n-3}+\ldots+{}^nC_2)$$

Set X has natural numbers which are multiples of 9 (not all)

Set Y has all multiples of 9

$$X\cup Y=Y$$

7. Consider, $\left[\frac{x+1}{x^{2/3}-x^{1/3}+1}-\frac{x-1}{x-x^{1/2}}\right]^{10}$

$$=\left[\frac{(x^{1/3})^3+1^3}{x^{2/3}-x^{1/3}+1}-\frac{\{(\sqrt{x})^2-1\}}{\sqrt{x}(\sqrt{x}-1)}\right]^{10}$$

$$=\left[(x^{1/3}+1)-\frac{(\sqrt{x}+1)}{\sqrt{x}}\right]^{10}$$

$$=(x^{1/3}-x^{-1/2})^{10}$$

$\therefore$ The general term is

$$T_{r+1}={}^{10}C_r(x^{1/3})^{10-r}(-x^{-1/2})^r$$

$$={}^{10}C_r(-1)^r x^{\frac{10-r}{3}-\frac{r}{2}}$$

For independent of x, put

$$\frac{10-r}{3}-\frac{r}{2}=0 \Rightarrow 20-2r-3r=0$$

$$\Rightarrow 20=5r \Rightarrow r=4$$

$$\therefore T_5={}^{10}C_4=\frac{10\times 9\times 8\times 7}{4\times 3\times 2\times 1}=210$$

8. $(\sqrt{3}+1)^{2n}={}^{2n}C_0(\sqrt{3})^{2n}+{}^{2n}C_1(\sqrt{3})^{2n-1}+{}^{2n}C_2(\sqrt{3})^{2n-2}+\ldots+{}^{2n}C_{2n}(\sqrt{3})^{2n-2n}$

$$\Rightarrow (\sqrt{3}-1)^{2n}={}^{2n}C_0(\sqrt{3})^{2n}(-1)^0+{}^{2n}C_1(\sqrt{3})^{2n-1}(-1)^1+{}^{2n}C_2(\sqrt{3})^{2n-2}(-1)^2+\ldots+{}^{2n}C_{2n}(\sqrt{3})^{2n-2n}(-1)^{2n}$$

On subtracting both the binomial expansions, we get

$$(\sqrt{3}+1)^{2n}-(\sqrt{3}-1)^{2n}$$
$$=2[{}^{2n}C_1(\sqrt{3})^{2n-1}+{}^{2n}C_3(\sqrt{3})^{2n-3}+{}^{2n}C_5(\sqrt{3})^{2n-5}+\ldots+{}^{2n}C_{2n-1}(\sqrt{3})^{2n-(2n-1)}]$$

which is most certainly an irrational number because of odd powers of $\sqrt{3}$ in each of the terms.

9. Here, $(1-x-x^2+x^3)^6=\{(1-x)-x^2(1-x)\}^6$

$$=\{(1-x)(1-x^2)\}^6=(1-x)^6\cdot(1-x^2)^6$$

$$=\left\{\sum_{r=0}^{6}(-1)^r\ {}^6C_r\cdot x^r\right\}\left\{\sum_{s=0}^{6}(-1)^s\ {}^6C_s\cdot x^{2s}\right\}$$

$$=\sum_{r=0}^{6}\sum_{s=0}^{6}(-1)^{r+s}\cdot{}^6C_r\cdot{}^6C_s\cdot x^{r+2s}$$

Now, consider $r+2s=7$

i.e. $(s=1, r=5)$

or $(s=2, r=3)$ or $(s=3, r=1)$

$\therefore$Coefficient of x^7 is

$$\{(-1)^{5+1}\cdot{}^6C_5\cdot{}^6C_1\}+\{(-1)^{3+2}\cdot{}^6C_3\cdot{}^6C_2\}+\{(-1)^{1+3}\cdot{}^6C_1\cdot{}^6C_3\}$$

$$=(36)-(20)(15)+6(20)$$
$$=36-300+120=-144$$

10. $\because S_1=\sum_{j=1}^{10}j(j-1)\frac{10!}{j(j-1)(j-2)!(10-j)!}$

$$=90\sum_{j=2}^{10}\frac{8!}{(j-2)!\{8-(j-2)\}!}=90\cdot 2^8$$

and $S_2=\sum_{j=1}^{10}j\frac{10!}{j(j-1)!\{9-(j-1)\}!}$

$$=10\sum_{j=1}^{10}\frac{9!}{(j-1)!\{9-(j-1)\}!}=10\cdot 2^9$$

Also, $S_3=\sum_{j=1}^{10}[j(j-1)+j]\frac{10!}{j!(10-j)!}$

$$=\sum_{j=1}^{10}j(j-1)\ {}^{10}C_j=\sum_{j=1}^{10}j\,{}^{10}C_j$$

$$=90\cdot 2^8+10\cdot 2^9$$
$$=90\cdot 2^8+20\cdot 2^8=110\cdot 2^8=55\cdot 2^9$$

11. $8^{2n}-(62)^{2n+1}=(1+63)^n-(63-1)^{2n+1}$

$$=(1+63)^n+(1-63)^{2n+1}$$

$$=[1+{}^nC_1\,63+{}^nC_2(63)^2+\ldots+(63)^n]+[1-{}^{(2n+1)}C_1\,63+{}^{(2n+1)}C_2(63)^2+\ldots+(-1)(63)^{(2n+1)}]$$

$$= 2 + 63\,[{}^nC_1 + {}^nC_2\,(63) + \ldots + (63)^{n-1} - {}^{(2n+1)}C_1 + {}^{(2n+1)}C_2(63) - \ldots - (63)^{(2n)}]$$

$\therefore$ Remainder is 2.

12. Since, $\sum_{r=0}^{n} {}^nC_r \cdot x^r = (1+x)^n$

On multiplying by x, we get

$$\sum_{r=0}^{n} {}^nC_r \cdot x^{r+1} = x(1+x)^n$$

On differentiating w.r.t. x, we get

$$\sum_{r=0}^{n} (r+1)\cdot {}^nC_r \cdot x^r = (1+x)^n + nx(1+x)^{n-1}$$

Statement II is true.
If $x = 1$, then

$$\sum_{r=0}^{n} (r+1)\cdot {}^nC_r = 2^n + n(2)^{n-1} = (n+2)2^{n-1}$$

$\therefore$ Statement I is true and Statement II is a correct explanation of Statement I.

13. Since, in a binomial expansion of $(a-b)^n$, $n \ge 5$, the sum of 5th and 6th terms is equal to zero.

$\therefore$ $${}^nC_4 a^{n-4}(-b)^4 + {}^nC_5 a^{n-5}(-b)^5 = 0$$

$\Rightarrow$ $$\frac{n!}{(n-4)!\,4!}a^{n-4}\cdot b^4 - \frac{n!}{(n-5)!\,5!}a^{n-5}\cdot b^5 = 0$$

$\Rightarrow$ $$\frac{n!}{(n-5)!\,4!}a^{n-5}\cdot b^4\left(\frac{a}{n-4} - \frac{b}{5}\right) = 0$$

$\Rightarrow$ $$\frac{a}{b} = \frac{n-4}{5}$$

14. We know that,

$$(1+x)^{20} = {}^{20}C_0 + {}^{20}C_1 x + \ldots + {}^{20}C_{10}x^{10} + \ldots + {}^{20}C_{20}x^{20}$$

On putting $x = -1$ in the above expansion, we get

$$0 = {}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_{11} + \ldots + {}^{20}C_{20}$$

$\Rightarrow$ $$0 = {}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_9 + \ldots + {}^{20}C_{10}$$

$\Rightarrow$ $$0 = 2\,({}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9) + {}^{20}C_{10}$$

$\Rightarrow$ $${}^{20}C_{10} = 2\,({}^{20}C_0 - {}^{20}C_1 + \ldots + {}^{20}C_{10})$$

$\Rightarrow$ $${}^{20}C_0 - {}^{20}C_1 + \ldots + {}^{20}C_{10} = \frac{1}{2}\,{}^{20}C_{10}$$

15. Now, $(1-ax)^{-1}(1-bx)^{-1}$

$$= (1 + ax + a^2x^2 + \ldots)(1 + bx + b^2x^2 + \ldots)$$

Hence, a_n = Coefficient of x^n in $(1-ax)^{-1}(1-bx)^{-1}$

$$= a^0b^n + ab^{n-1} + \ldots + a^nb^0$$

$$= a^0b^n\left(1 + \frac{a}{b} + \left(\frac{a}{b}\right)^2 + \ldots\right)$$

$$= a^0b^n\left(\frac{\left(\frac{a}{b}\right)^{n+1} - 1}{\frac{a}{b} - 1}\right)$$

$$= \frac{b^n\,(a^{n+1} - b^{n+1})}{a-b}\cdot\frac{b}{b^{n+1}}$$

$$= \frac{a^{n+1} - b^{n+1}}{a-b}$$

16. $(1-y)^m(1+y)^n = 1 + a_1y + a_2y^2 + a_3y^3 + \ldots$

On differentiating w.r.t. y, we get

$$-m(1-y)^{m-1}(1+y)^n + (1-y)^m n(1+y)^{n-1} = a_1 + 2a_2y + 3a_3y^2 + \ldots \quad \ldots\text{(i)}$$

On putting $y = 0$ in Eq. (i), we get

$$-m + n = a_1 = 10 \quad \ldots\text{(ii)}$$

$[\because a_1 = 10, \text{given}]$

On again differentiating Eq. (i), we get

$$-m\,[-(m-1)(1-y)^{m-2}(1+y)^n + (1-y)^{m-1}n(1+y)^{n-1}] + n[-m(1-y)^{m-1}(1+y)^{n-1} + (1-y)^m(n-1)(1+y)^{n-2}]$$
$$= 2a_2 + 6a_3y + \ldots \quad \ldots\text{(iii)}$$

On putting $y = 0$ in Eq. (iii), we get

$$-m\,[-(m-1) + n] + n[-m + (n-1)] = 2a_2 = 20$$

$\Rightarrow$ $m(m-1) - mn - mn + n(n-1) = 20$

$\Rightarrow$ $m^2 + n^2 - m - n - 2mn = 20$

$\Rightarrow$ $(m-n)^2 - (m+n) = 20$

$\Rightarrow$ $100 - (m+n) = 20$

$\Rightarrow$ $m + n = 80 \quad \ldots\text{(iv)}$

On solving Eqs. (ii) and (iv), we get

$$m = 35 \quad\text{and}\quad n = 45$$

17. Now, ${}^{50}C_4 + {}^{55}C_3 + {}^{54}C_3 + {}^{53}C_3 + {}^{52}C_3 + {}^{51}C_3 + {}^{50}C_3$

$= {}^{50}C_3 + {}^{50}C_4 + {}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{51}C_4 + {}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$[\because {}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r]$

$= {}^{52}C_4 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{53}C_4 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{54}C_4 + {}^{54}C_3 + {}^{55}C_3 = {}^{55}C_4 + {}^{55}C_3 = {}^{56}C_4$

18. Since, the coefficient of given terms are ${}^mC_{r-1}, {}^mC_r, {}^mC_{r+1}$ respectively and they also in AP.

$\therefore$ $${}^mC_{r-1} + {}^mC_{r+1} = 2\,{}^mC_r$$

$\Rightarrow$ $$\frac{m!}{(r-1)!\,(m-r+1)!} + \frac{m!}{(r+1)!\,(m-r-1)!} = 2\cdot\frac{m!}{r!\,(m-r)!}$$

$\Rightarrow$ $$\frac{1}{(m-r+1)(m-r)} + \frac{1}{(r+1)r} = \frac{2}{r(m-r)}$$

$\Rightarrow$ $$\frac{r(r+1) + (m-r+1)(m-r)}{r(r+1)(m-r+1)(m-r)} = \frac{2}{r\,(m-r)}$$

$\Rightarrow$ $$r^2 + r + m^2 + r^2 - 2mr + m - r = 2(mr - r^2 + r + m - r + 1)$$

$\Rightarrow$ $4r^2 - 4mr - m - 2 + m^2 = 0$

$\Rightarrow$ $m^2 - m(4r+1) + 4r^2 - 2 = 0$

19. Let x^7 is contained in $(r+1)$ th term in the expansion of $\left(ax^2 + \frac{1}{bx}\right)^{11}$.

$\therefore$ $$T_{r+1} = {}^{11}C_r\,(ax^2)^{11-r}\left(\frac{1}{bx}\right)^r = {}^{11}C_r\,\frac{a^{11-r}}{b^r}\cdot x^{22-3r}$$

For coefficient of x^7, put

$$22 - 3r = 7 \Rightarrow r = 5$$

$\therefore$ $$T_6 = {}^{11}C_5\,\frac{a^6}{b^5}\cdot x^7$$

$\therefore$ Coefficient of x^7 in the expansion of $\left(ax^2+\dfrac{1}{bx}\right)^{11}$ is ${}^{11}C_5\,\dfrac{a^6}{b^5}$.

Similarly, coefficient of x^{-7} in the expansion of $\left(ax-\dfrac{1}{bx^2}\right)^{11}$ is ${}^{11}C_6\,\dfrac{a^5}{b^6}$.

According to the given condition,

$$ {}^{11}C_5\,\frac{a^6}{b^5} = {}^{11}C_6\,\frac{a^5}{b^6} $$

$$ \Rightarrow \quad \frac{a^6}{b^5}=\frac{a^5}{b^6} \Rightarrow ab=1 $$

20. $\dfrac{(1+x)^{3/2}-\left(1+\dfrac{1}{2}x\right)^3}{(1-x)^{1/2}}$

$$ = \frac{\left(1+\dfrac{3}{2}x+\dfrac{\dfrac{3}{2}\cdot\dfrac{1}{2}}{2}x^2\right)-\left(1+\dfrac{3x}{2}+\dfrac{3\cdot 2}{2}\cdot\dfrac{x^2}{4}\right)}{(1-x)^{1/2}} $$

[neglecting higher powers of x]

$$ = -\frac{3x^2}{8}(1-x)^{-1/2} $$

$$ = -\frac{3x^2}{8}\left(1+\frac{1}{2}x+\frac{\dfrac{1}{2}\cdot\dfrac{3}{2}}{2}\cdot x^2\right) = -\frac{3x^2}{8} $$

[$\because$ higher powers of x^2 can be neglected]

21. The coefficient of the middle term in powers of x of $(1+\alpha x)^4 = {}^4C_2\alpha^2$

The coefficient of the middle term in powers of x of $(1-\alpha x)^6 = {}^6C_3(-\alpha)^3$

According to the given condition,

$$ {}^4C_2\alpha^2 = {}^6C_3(-\alpha)^3 $$

$$ \Rightarrow \quad \frac{4!}{2!2!}\alpha^2 = -\frac{6!}{3!3!}\alpha^3 \Rightarrow 6\alpha^2 = -20\alpha^3 $$

$$ \Rightarrow \quad \alpha = -\frac{6}{20} \Rightarrow \alpha = -\frac{3}{10} $$

22. The coefficient of x^n in the expansion of $(1+x)(1-x)^n$

$=$ Coefficient of x^n in $(1-x)^n$

$\quad +$ Coefficient of x^{n-1} in $(1-x)^n$

$$ = (-1)^n\,{}^nC_n + (-1)^{n-1}\,{}^nC_{n-1} $$

$$ = (-1)^n\left(1-\frac{n!}{1!(n-1)!}\right) = (-1)^n(1-n) $$

23. Given that, $s_n = \displaystyle\sum_{r=0}^{n}\frac{1}{{}^nC_r}$

$$ s_n = \sum_{r=0}^{n}\frac{1}{{}^nC_{n-r}} \qquad [\because {}^nC_r = {}^nC_{n-r}] $$

$$ \Rightarrow \quad ns_n = \sum_{r=0}^{n}\frac{n}{{}^nC_{n-r}} $$

$$ \Rightarrow \quad ns_n = \sum_{r=0}^{n}\left(\frac{n-r}{{}^nC_{n-r}}+\frac{r}{{}^nC_{n-r}}\right) $$

$$ \Rightarrow \quad ns_n = \sum_{r=0}^{n}\frac{n-r}{{}^nC_{n-r}} + \sum_{r=0}^{n}\frac{r}{{}^nC_r} $$

$$ \Rightarrow \quad ns_n = \left(\frac{n}{{}^nC_n}+\frac{n-1}{{}^nC_{n-1}}+\ldots+\frac{1}{{}^nC_1}\right)+\sum_{r=0}^{n}\frac{r}{{}^nC_r} $$

$$ \Rightarrow \quad ns_n = t_n + t_n \qquad \left[\because t_n = \sum_{r=0}^{n}\frac{r}{{}^nC_r},\text{ given}\right] $$

$$ \Rightarrow \quad ns_n = 2t_n \Rightarrow \frac{t_n}{s_n}=\frac{n}{2} $$

24. The general term of $(\sqrt{3}+\sqrt[8]{5})^{256}$ is

$$ T_{r+1} = {}^{256}C_r(3)^{(256-r)/2}(5)^{r/8} $$

For integral terms, $\dfrac{256-r}{2}$ and $\dfrac{r}{8}$ are both positive integers.

i.e. $\quad r = 0, 8, 16, 24, 32, \ldots, 256$

Hence, total number of terms are 33.

25. Since, $(r+1)$th term in the expansion of $(1+x)^{27/5}$

$$ = \frac{\dfrac{27}{5}\left(\dfrac{27}{5}-1\right)\ldots\left(\dfrac{27}{5}-r+1\right)}{r!}x^r $$

Now, this term will be negative, if the last factor in numerator is the only one negative factor.

$$ \Rightarrow \quad \frac{27}{5}-r+1<0 $$

$$ \Rightarrow \quad \frac{32}{5}<r $$

$\Rightarrow 6.4 < r \Rightarrow$ least value of r is 7.

Thus, first negative term will be 8th.

26. $(1+2x+3x^2+\ldots)^{-3/2} = [(1-x)^{-2}]^{-3/2}$

$$ = (1-x)^3 $$

$\therefore$ Coefficient of x^5 in $(1+2x+3x^2+\ldots)^{-3/2}$

$=$ Coefficient of x^5 in $(1-x)^3 = 0$

27. $(1+x+x^2+x^3+\ldots)^2 = [(1-x)^{-1}]^2$

$$ = (1-x)^{-2} $$

Coefficient of x^n in $(1+x+x^2+\ldots)^2$

$=$ Coefficient of x^n in $(1-x)^{-2}$

$= {}^{n+2-1}C_{2-1} = {}^{n+1}C_1 = n+1$

28. Using binomial theorem,

$$ (5x-4y)^n = {}^nC_0(5x)^n + {}^nC_1(5x)^{n-1}(-4y) + {}^nC_2(5x)^{n-2}(-4y)^2+\ldots+{}^nC_n(-4y)^n $$

Sum of coefficients

$$ = {}^nC_0 5^n + {}^nC_1 5^{n-1}(-4) + {}^nC_2 5^{n-2}\cdot(-4)^2 + \ldots + {}^nC_n(-4)^n $$

$$ = (5-4)^n = 1^n = 1 $$

29. Given, in the expansion of $(1+x)^{44}$, 21st and 22nd terms are equal.

i.e. $\quad T_{21} = T_{22}$

$$ {}^{44}C_{20}x^{20} = {}^{44}C_{21}x^{21} \Rightarrow x = \frac{{}^{44}C_{20}}{{}^{44}C_{21}} $$

$$ \Rightarrow \quad x = \frac{\dfrac{44!}{20!\times 24!}}{\dfrac{44!}{21!\times 23!}} = \frac{21!\times 23!}{20!\times 24!} = \frac{21}{24} = \frac{7}{8} $$

Target Exercises

30. The general term in $\left(ax^2 + \frac{1}{bx}\right)^{13}$ is

$$T_{r+1} = {}^{13}C_r\,(ax^2)^{13-r}\left(\frac{1}{bx}\right)^r$$
$$= {}^{13}C_r a^{13-r} \times b^{-r}(x)^{26-3r}$$

For coefficient of x^8, put $26 - 3r = 8$

$\Rightarrow \quad 3r = 18 \Rightarrow r = 6$

$\therefore \quad T_7 = {}^{13}C_6 a^{13-6} b^{-6} x^8 = {}^{13}C_6 a^7 b^{-6} x^8$

Now, the general term in $\left(ax - \frac{1}{bx^2}\right)^{13}$ is

$$T'_{r+1} = {}^{13}C_r (ax)^{13-r}\left(-\frac{1}{bx^2}\right)^r$$
$$= {}^{13}C_r a^{13-r} \times b^{-r} \times (x)^{13-3r}\,(-1)^r$$

For coefficient of x^{-8}, put $13 - 3r = -8$

$\Rightarrow \quad 3r = 21 \Rightarrow r = 7$

$\therefore \quad T_8' = (-1)^7\,{}^{13}C_7\,a^{13-7} b^{-7} x^{-8}$

$= (-1)^7\,{}^{13}C_7\,a^6 b^{-7} x^{-8}$

According to the given condition,

Coefficient of x^8 in $\left(ax^2 + \frac{1}{bx}\right)^{13}$

$= \text{Coefficient of } x^{-8} \text{ in } \left(ax - \frac{1}{bx^2}\right)^{13}$

$\therefore \quad {}^{13}C_6 a^7 b^{-6} = -\,{}^{13}C_7\,a^6 b^{-7}$

$\Rightarrow \quad {}^{13}C_7 \frac{a^7}{b^6} = -\,{}^{13}C_7 \frac{a^6}{b^7}$

$\Rightarrow \quad \frac{a^7}{a^6} = -\frac{b^6}{b^7} \Rightarrow a = -\frac{1}{b} \Rightarrow ab + 1 = 0$

31. Given expression can be rewritten as

$$2\,(1-x)^{-1} \times 2^{-1}\left(1 - \frac{x}{2}\right)^{-1}$$
$$= [1 + x + x^2 + x^3 + \ldots]\left[1 + \left(\frac{x}{2}\right) + \left(\frac{x}{2}\right)^2 + \left(\frac{x}{2}\right)^3 + \ldots\right]$$

$\therefore$ Coefficient of x^3 in the above expression

$$= \left[\left(\frac{1}{2}\right)^3 + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right) + 1\right]$$
$$= \left(\frac{1}{8} + \frac{1}{4} + \frac{1}{2} + 1\right) = \left(\frac{1+2+4+8}{8}\right) = \frac{15}{8}$$

32. Now, $(a + bx)^{-3} = a^{-3}\left(1 + \frac{bx}{a}\right)^{-3}$

$$= \frac{1}{a^3}\left(1 - {}^3C_1\left(\frac{bx}{a}\right) + \ldots\right)$$
$$= \frac{1}{a^3} - {}^3C_1 \frac{1}{a^3}\left(\frac{bx}{a}\right) + \ldots$$
$$= \frac{1}{27} + \frac{1}{3}x + \ldots \quad \text{[given]}$$

On equating constant terms and coefficients of x both sides, we get

$$\frac{1}{a^3} = \frac{1}{27}$$

and $\quad -\,{}^3C_1 \frac{1}{a^3}\left(\frac{b}{a}\right) = \frac{1}{3}$

$\Rightarrow \quad a = 3$

and $\quad -\,{}^3C_1\left(\frac{1}{3^4}\right) \times b = \frac{1}{3}$

$\Rightarrow \quad -3 \times \frac{1}{3^4} b = \frac{1}{3}$

$\Rightarrow \quad -b = 3^2 \Rightarrow b = -9$

$\therefore \quad (a, b) = (3, -9)$

33. General term in the expansion of $\left(\sqrt{x} - \frac{k}{x^2}\right)^{10}$ is

$$T_{r+1} = {}^{10}C_r\,(\sqrt{x})^{10-r} \cdot \left(\frac{-k}{x^2}\right)^r$$
$$= {}^{10}C_r x^{\frac{10-r}{2}} \cdot (-k)^r \cdot x^{-2r}$$
$$= {}^{10}C_r\,(-k)^r\,x^{\left(\frac{10-5r}{2}\right)}$$

The term is free from x

Put $\quad \frac{10 - 5r}{2} = 0 \Rightarrow r = 2$

Now, $\quad {}^{10}C_2\,(-k)^2 = 405$

$\Rightarrow \quad \frac{10 \times 9}{1 \times 2} \cdot k^2 = 405 \Rightarrow k^2 = \frac{405}{45} = 9$

$\therefore \quad k = \pm 3$

34. The given expression is

$$\left(x^2 + \frac{1}{x^2} + 2\right)^n = \left[\left(x + \frac{1}{x}\right)^2\right]^n = \left(x + \frac{1}{x}\right)^{2n}$$

The binomial contains $(2n + 1)$ terms in its expansion.
The middle term is T_{n+1}.

$\therefore \quad T_{n+1} = {}^{2n}C_n (x)^{2n-n}\left(\frac{1}{x}\right)^n$

$$= {}^{2n}C_n = \frac{(2n)!}{(2n-n)!\,n!} = \frac{(2n)!}{(n!)^2}$$

35. General term in the expansion of $\left(\sqrt{x} - \frac{2}{\sqrt{x}}\right)^{18}$ is

$$T_{r+1} = {}^{18}C_r (\sqrt{x})^{18-r}\left(-\frac{2}{\sqrt{x}}\right)^r$$
$$= {}^{18}C_r (x)^{\frac{18-r}{2}}\,(-2)^r\,(x)^{-\frac{r}{2}} = {}^{18}C_r (-2)^r x^{9-r}$$

For independent of x, put

$9 - r = 0 \Rightarrow r = 9$

$\therefore \quad T_{10} = {}^{18}C_9\,(-2)^9 = -\,{}^{18}C_9 2^9$

36. We know that,

$(1 + x)^n = {}^nC_0 + {}^nC_1 x + {}^nC_2 x^2 + \ldots + {}^nC_n x^n \quad \ldots\text{(i)}$

and $(x - 1)^n = {}^nC_0 x^n + {}^nC_1 x^{n-1} + {}^nC_2 x^{n-2} + \ldots + {}^nC_n \quad \ldots\text{(ii)}$

On multiplying Eqs. (i) and (ii), we get

$(1 + x)^{2n} = ({}^nC_0 + {}^nC_1 x + {}^nC_2 x^2 + \ldots + {}^nC_n x^n) \times ({}^nC_0 x^n + {}^nC_1 x^{n-1} + {}^nC_2 x^{n-2} + \ldots + {}^nC_n)$

Coefficient of x^n in RHS

$= ({}^nC_0)^2 + ({}^nC_1)^2 + \ldots + ({}^nC_n)^2$

and coefficient of x^n in LHS $= {}^{2n}C_n$

$\therefore \quad ({}^nC_0)^2 + ({}^nC_1)^2 + \ldots + ({}^nC_n)^2 = \frac{2n!}{n!\,n!}$

$\Rightarrow ({}^nC_1)^2 + \ldots + ({}^nC_n)^2 = \frac{(2n)!}{n!\,n!} - 1 = {}^{2n}C_n - 1$

37. We know that,

$$(1-x)^n = {}^nC_0 + x\,{}^nC_1 + x^2\,{}^nC_2 + \ldots + x^n\,{}^nC_n$$

On integrating both sides from 0 to 2, we get

$$\left[\frac{(1+x)^{n+1}}{n+1}\right]_0^2$$

$$= \left[x\,{}^nC_0 + \frac{x^2}{2}\,{}^nC_1 + \frac{x^3}{3}\,{}^nC_2 + \ldots + \frac{x^{n+1}}{n+1}\,{}^nC_n\right]_0^2$$

$$= \frac{(3)^{n+1}}{n+1} - \frac{1}{n+1} + 2\,{}^nC_0 = \frac{2^2}{2}\,{}^nC_1 + \frac{2^3}{3}\,{}^nC_2 + \ldots + \frac{2^{n+1}}{n+1}\,{}^nC_n - 0$$

$$= \frac{2}{1}\,{}^nC_0 + \frac{2^2}{2}\,{}^nC_1 + \frac{2^3}{3}\,{}^nC_2 + \ldots + \frac{2^{n+1}}{n+1}\,{}^nC_n$$

$$= \frac{3^{n+1}-1}{n+1}$$

38. $${}^mC_{r+1} + \sum_{k=m}^{n} {}^kC_r = ({}^mC_{r+1} + {}^mC_r) + {}^{m+1}C_r + {}^{m+2}C_r + \ldots + {}^nC_r$$

$$= ({}^{m+1}C_{r+1} + {}^{m+1}C_r) + {}^{m+2}C_r + \ldots + {}^nC_r$$

$$= ({}^{m+2}C_{r+1} + {}^{m+2}C_r) + \ldots + {}^nC_r$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$= {}^{n+1}C_{r+1}$$

39. $$\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \ldots + n\frac{C_n}{C_{n-1}}$$

$$= \frac{{}^nC_1}{{}^nC_0} + 2\frac{{}^nC_2}{{}^nC_1} + 3\frac{{}^nC_3}{{}^nC_2} + \ldots + n\frac{{}^nC_n}{{}^nC_{n-1}}$$

$$= \frac{n}{1} + 2\times\frac{\frac{n(n-1)}{2}}{n} + 3\times\frac{\frac{n(n-1)(n-2)}{3\times 2}}{\frac{n(n-1)}{2}} + \ldots + n\times\frac{1}{n}$$

$$= n + (n-1) + (n-2) + \ldots + 1 = \Sigma n = \frac{n(n+1)}{2}$$

40. We know that, ${}^{11}C_n$ is maximum when $n = 5$

$$\because \quad {}^{11}C_n = \frac{11!}{n!\,(11-n)!}$$

$\therefore$ $n!\,(11-n)!$ is minimum, when $n = 5$.

41. By given condition, $2\cdot{}^mC_2 = {}^mC_1 + {}^mC_3$

$$\Rightarrow \quad m(m-1) = m + \frac{m(m-1)(m-2)}{1\cdot 2\cdot 3}$$

$$\Rightarrow \quad m^2 - 9m + 14 = 0$$

$$\Rightarrow \quad (m-2)(m-7) = 0$$

$$\Rightarrow \quad m = 2, 7$$

Since, 6th term is 21, $m = 2$ is ruled out, so we have

$$T_6 = 21 = {}^7C_5\,[\sqrt{2^{\log(10-3^x)}}]^{7-5} \times [\sqrt[5]{2^{(x-2)\log 3}}]^5$$

$$\Rightarrow \quad 21 = \frac{7\times 6}{2\times 1}\,2^{\log(10-3^x)}\cdot 2^{(x-2)\log 3}$$

$$\Rightarrow \quad 2^{\log(10-3^x)+(x-2)\log 3} = 1 = 2^0$$

$$\Rightarrow \quad \log(10-3^x) = (2-x)\log 3$$

$$\Rightarrow \quad \log(10-3^x) = \log 3^{2-x}$$

$$\Rightarrow \quad 10 - 3^x = 3^{2-x} \quad \Rightarrow \quad 3^x\cdot 10 - 3^{2x} = 9$$

$$\Rightarrow \quad 3^{2x} - 3^x\cdot 10 + 9 = 0$$

Now, put $t = 3^x$

$$\Rightarrow \quad t^2 - 10t + 9 = 0$$

$$\Rightarrow \quad (t-1)(t-9) = 0$$

$$\therefore \quad t = 1 \text{ or } 9$$

$$\Rightarrow \quad 3^x = 1 \text{ or } 3^x = 9$$

$$\Rightarrow \quad x = 0 \text{ or } x = 2$$

42. Given expression is $\left(ax + \frac{1}{x}\right)^n$.

Here, $T_4 = T_{(3+1)} = {}^nC_3 (ax)^{n-3}\left(\frac{1}{x}\right)^3 = \frac{5}{2}$ [given]

$$\Rightarrow \quad {}^nC_3\cdot a^{n-3}\cdot x^{n-6} = \frac{5}{2} \qquad \ldots\text{(i)}$$

Since, $x \in R$

$$\therefore \quad n - 6 = 0 \quad \Rightarrow \quad n = 6$$

Now, for a, on substituting the value of n in Eq. (i), we get

$${}^6C_3 a^3 = \frac{5}{2} \quad \Rightarrow \quad a^3 = \frac{5}{2}\times\frac{3\times 2\times 1}{6\times 5\times 4}$$

$$\Rightarrow \quad a^3 = \frac{1}{8} = \left(\frac{1}{2}\right)^3 \quad \Rightarrow \quad a = \frac{1}{2}$$

43. We have,

$$\sum_{r=0}^{n}\sum_{s=0}^{n}(C_r + C_s) = \sum_{r=0}^{n}(C_r + C_r) + 2\sum_{0\le r<s\le n}\sum (C_r + C_s)$$

$$\Rightarrow \quad (n+1)\cdot 2^{n+1} = 2\left(\sum_{r=0}^{n} C_r\right) + 2\sum_{0\le r<s\le n}\sum (C_r + C_s)$$

$$(n+1)\cdot 2^{n+1} = 2\cdot 2^n + 2\sum_{0\le r<s\le n}\sum (C_r + C_s)$$

$$\Rightarrow \quad \sum_{0\le r<s\le n}\sum (C_r + C_s) = n2^n$$

44. $$\left(1+\frac{C_1}{C_0}\right)\left(1+\frac{C_2}{C_1}\right)\left(1+\frac{C_3}{C_2}\right)\cdots\left(1+\frac{C_n}{C_{n-1}}\right)$$

$$= \left(1+\frac{n}{1}\right)\left(1+\frac{n(n-1)}{2n}\right)\cdots\left(1+\frac{1}{n}\right)$$

$$= \left(\frac{1+n}{1}\right)\left(\frac{1+n}{2}\right)\cdots\left(\frac{1+n}{n}\right) = \frac{(1+n)^n}{n!}$$

45. We have, $\frac{e^x}{1-x} = B_0 + B_1x + B_2x^2 + \ldots + B_nx^n + \ldots$

$$\Rightarrow \quad e^x(1-x)^{-1} = B_0 + B_1x + B_2x^2 + \ldots + B_nx^n + \ldots$$

$$\Rightarrow \quad \left(1 + \frac{x}{1!} + \frac{x^2}{2!} + \ldots\right)(1 + x + x^2 + \ldots) = B_0 + B_1x + B_2x^2 + \ldots$$

$$\Rightarrow \quad (1 + x + x^2 + \ldots) + \left(\frac{x}{1!} + \frac{x^2}{1!} + \ldots\right) + \left(\frac{x^2}{2!} + \frac{x^3}{2!} + \ldots\right) + \ldots = B_0 + B_1x + B_2x^2 + \ldots$$

$$\Rightarrow \quad 1 + \left(1 + \frac{1}{1!}\right)x + \left(1 + \frac{1}{1!} + \frac{1}{2!}\right)x^2 + \ldots = B_0 + B_1x + B_2x^2 + \ldots$$

On comparing, we get

$$B_0 = 1,\ B_1 = 1 + \frac{1}{1!},\ B_2 = 1 + \frac{1}{1!} + \frac{1}{2!} + \ldots$$

$\therefore \quad B_n = 1 + \frac{1}{1!} + \frac{1}{2!} + \ldots + \frac{1}{n!}$

Now, $\quad B_n - B_{n-1} = \left(1 + \frac{1}{1!} + \ldots + \frac{1}{n!}\right)$

$$- \left(1 + \frac{1}{1!} + \ldots + \frac{1}{(n-1)!}\right) = \frac{1}{n!}$$

46. The given series is in GP.
Hence, its sum

$$S = \frac{1\{(1+x)^{20+1} - 1\}}{(1+x) - 1} \quad [\because a = 1, r = 1 + x]$$

$$= \frac{(1+x)^{21} - 1}{x}$$

Therefore, the required coefficient of x^{10} in the expansion of $\frac{(1+x)^{21} - 1}{x}$ = Coefficient of x^{11} in the expansion of $(1+x)^{21} - 1 = {}^{21}C_{11}$

47. We have, $T_r = T_{r+1}$

$\Rightarrow \quad {}^nC_{r-1}\, p^{n-r+1} \cdot q^{r-1} = {}^nC_r\, p^{n-r}\, q^r$

$\Rightarrow \quad {}^nC_{r-1}\, p^{n-r} \cdot pq^r \cdot q^{-1} = {}^nC_r\, p^{n-r}\, q^r$

$\Rightarrow \quad \frac{{}^nC_r}{{}^nC_{r-1}} = \frac{p}{q}$

$\Rightarrow \quad \frac{(r-1)!\,(n-r+1)!}{r!\,(n-r)!} = \frac{p}{q}$

$\Rightarrow \quad \frac{n-r+1}{r} = \frac{p}{q}$

$\Rightarrow \quad nq + q - qr = pr$

$\Rightarrow \quad (n+1)q = r(p+q)$

$\therefore \quad \frac{(n+1)\,q}{r\,(p+q)} = 1$

48. Here, $(1+ax)^n = 1 + nax + \frac{n(n-1)}{2!}(ax)^2 + \ldots$

On comparing the coefficients of like powers in the given equation, we get

$$na = 6 \quad \text{and} \quad \frac{27}{2} = \frac{n(n-1)}{2} \cdot a^2$$

$\Rightarrow \quad (n-1)\,a = \frac{9}{2} \qquad [\because na = 6]$

$\Rightarrow \quad \frac{(n-1)6}{n} = \frac{9}{2}$

$\therefore \quad n = 4 \quad \text{and} \quad a = \frac{3}{2}$

49. 13th term in the expansion of $\left(x^2 + \frac{2}{x}\right)^n$ is given by

$$T_{13} = {}^nC_{12}(x^2)^{n-12}\left(\frac{2}{x}\right)^{12} = {}^nC_{12}x^{2n-24}\left(\frac{2^{12}}{x^{12}}\right)$$

$$= {}^nC_{12}x^{2n-24-12}\,(2^{12})$$

$$= {}^nC_{12}x^{2n-36}\,(2^{12})$$

If the 13th term will be independent of x, then x^{2n-36} must be 1.

i.e. $\quad 2n - 36 = 0$

$\Rightarrow \quad 2n = 36$

$\Rightarrow \quad n = 18$

The divisors of $n = 18$ are 1, 2, 3, 6, 9, 18 and their sum is $1 + 2 + 3 + 6 + 9 + 18 = 39$.

50. $P = \sum_{r=0}^{5} C_{2r} = {}^{10}C_0 + {}^{10}C_2 + \ldots + {}^{10}C_{10} = \frac{2^{10}}{2} = 2^9$

$$Q = \sum_{r=0}^{3} d_{2r+1} = d_1 + d_3 + d_5 + d_7$$

$$= {}^7C_1 + {}^7C_3 + {}^7C_5 + {}^7C_7 = \frac{2^7}{2} = 2^6$$

$\therefore \quad \frac{P}{Q} = \frac{2^9}{2^6} = 2^3 = 8$

51. Given expansion is $(1+x)^{2n}$.
According to the given condition,

$${}^{2n}C_{3r-1} = {}^{2n}C_{r+1}$$

$\Rightarrow \quad (2n - 3r + 1) = (r + 1)$

$\Rightarrow \quad 2n = 4r \quad \Rightarrow \quad n = 2r$

52. Here, $A = {}^{2n}C_n$ and $B = {}^{2n-1}C_n$

$\therefore \quad \frac{A}{B} = \frac{{}^{2n}C_n}{{}^{2n-1}C_n} = \frac{2n}{n} = 2$

53. $T_{r+1} = {}^nC_r\,(x^3)^{n-r}\left(\frac{-1}{x^2}\right)^r$

$$= {}^nC_r x^{3n-3r}\,(-1)^r x^{-2r} = {}^nC_r x^{3n-5r}\,(-1)^r$$

For coefficient of x^5 and x^{10}, substitute $3n - 5r = 5$ and 10 respectively, we get coefficient of $x^5 = {}^nC_{\frac{3n-5}{5}}\,(-1)^{\frac{3n-5}{5}}$ and coefficient of $x^{10} = {}^nC_{\frac{3n-10}{5}}\,(-1)^{\frac{3n-10}{5}}$.

Coefficient of x^5 + Coefficient of $x^{10} = 0$

$\Rightarrow \quad {}^nC_{\frac{3n-5}{5}}\,(-1)^{\frac{3n-5}{5}} = -{}^nC_{\frac{3n-10}{5}}\,(-1)^{\frac{3n-10}{5}}$

$\Rightarrow \quad {}^nC_{\frac{3n-5}{5}}\,(-1)^{\frac{3n-5}{5}} = {}^nC_{\frac{3n-10}{5}}\,(-1)^{\frac{3n-5}{5}}$

$\Rightarrow \quad {}^nC_{\frac{3n-5}{5}} = {}^nC_{\frac{3n-10}{5}}$

$\Rightarrow \quad \frac{3n-5}{5} + \frac{3n-10}{5} = n$

$\Rightarrow \quad \frac{6n-15}{5} = n$

$\Rightarrow \quad 6n - 15 = 5n$

$\therefore \quad n = 15$

54. 5th term from end $= (12 - 5 + 2)$th term from beginning $= 9$th term

$$= {}^{12}C_8\left(\frac{x^3}{2}\right)^{12-8}\left(\frac{-2}{x^2}\right)^8 = {}^{12}C_8\, x^{-4}(2)^4$$

$$= \frac{12 \times 11 \times 10 \times 9}{4 \times 3 \times 2 \times 1} \times 2^4 \times x^{-4} = 7920\, x^{-4}$$

55. For $n = 1$, we have

$$= [(1+p)(1+q)(p+q)]^n$$

$$= (1 + q + p + pq)(p+q)$$

$$= p + q + pq + q^2 + p^2 + pq + p^2q + pq^2$$

$$= p + q + 2pq + q^2 + p^2 + p^2q + pq^2$$

$\therefore$ Coefficient of $p'q' = 2 = 1 + 1 = [C(1, 0)]^3 + [C(1, 1)]^3$

For $n=2$, we have

$$[(1+p)(1+q)(p+q)]^2=(1+p)^2(1+q)^2(p+q)^2$$
$$=(1+p^2+2p)(1+q^2+2q)(p^2+q^2+2pq)$$
$$=(1+q^2+2q+q^2+p^2q^2+2p^2q+2p+2pq^2+4pq)(p^2+q^2+2pq)$$

$\therefore$ Coefficient of $p^2q^2=1+1+8=10$

$$=[C(2,0)]^3[C(2,2)]^3+[C(2,1)]^3$$
$$=\sum_{k=0}^{2}[C(2,k)]^3$$

Thus, the coefficient of p^nq^n in $[(1+p)(1+q)(p+q)]^n$ is $\sum_{k=0}^{n}[(n,k)]^3$.

56. Given expansion is $(1-3x+3x^2-x^3)^{2n}=[(1-x)^3]^{2n}$
$=(1-x)^{6n}$

$\therefore$ Middle term $=\dfrac{(6n+2)\text{th}}{2}$ term $=(3n+1)$th term

[$\because$ here, $6n$ is even]

57. Since, ${}^nC_4$, ${}^nC_5$ and ${}^nC_6$ are in AP.

$$\therefore \quad 2\,{}^nC_5={}^nC_4+{}^nC_6$$
$$\Rightarrow \quad \frac{2}{5(n-5)}=\frac{1}{(n-4)(n-5)}+\frac{1}{30}$$
$$\Rightarrow \quad \frac{2}{5(n-5)}=\frac{30+n^2-9n+20}{30(n-4)(n-5)}$$
$$\Rightarrow \quad 12(n-4)=30+n^2-9n+20$$
$$\Rightarrow \quad 12n-48=n^2-9n+50$$
$$\Rightarrow \quad n^2-21n+98=0$$
$$\Rightarrow \quad (n-14)(n-7)=0$$
$$\Rightarrow \quad n=14 \text{ or } 7$$

58. Consider, ${}^{15}C_3+{}^{15}C_5+\dots+{}^{15}C_{15}$

$$=({}^{15}C_1+\dots+{}^{15}C_{15})-{}^{15}C_1$$
$$=\left(\frac{2^{15}}{2}\right)-15=2^{14}-15$$

59. Since, $(1+x)^n=C_0+C_1x+C_2x^2+\dots+C_nx^n$

On differentiating w.r.t. x, we get

$$n(1+x)^{n-1}=C_1+2C_2x+\dots+nC_nx^{n-1}$$

On putting $x=-1$, we get

$$0=C_1-2C_2+\dots+n(-1)^{n-1}C_n$$

60. We know, $(1+x)^n={}^nC_0+{}^nC_1x+{}^nC_2x^2+\dots+{}^nC_nx^n$

$$\Rightarrow \quad x(1+x)^n={}^nC_0x+{}^nC_1x^2+{}^nC_2x^3+\dots+{}^nC_nx^{n+1}$$

On differentiating w.r.t. x, we get

$$(1+x)^n+nx(1+x)^{n-1}={}^nC_0+2\,{}^nC_1x+\dots+(n+1)\,{}^nC_nx^n$$

Put $x=1$, we get

$$2^n+n\,2^{n-1}={}^nC_0+2\,{}^nC_1+\dots+(n+1)\,{}^nC_n$$
$$\Rightarrow \quad 2^{n-1}(n+2)={}^nC_0+2\cdot{}^nC_1+\dots+(n+1)\,{}^nC_n$$

61. Here, $T_5+T_6=0$

$$\Rightarrow {}^nC_4a^{n-4}(-2b)^4+{}^nC_5a^{n-5}(-2b)^5=0$$
$$\Rightarrow \quad 16\cdot{}^nC_4a^{n-4}b^4=32\,{}^nC_5a^{n-5}b^5$$
$$\Rightarrow \quad \frac{{}^nC_5}{{}^nC_4}\cdot\frac{a^{n-5}b^5}{a^{n-4}b^4}=\frac{1}{2} \quad \Rightarrow \quad \frac{b}{a}=\frac{1}{2}\cdot\frac{{}^nC_4}{{}^nC_5}$$
$$\Rightarrow \quad \frac{a}{b}=\frac{2\cdot\dfrac{n!}{5!(n-5)!}}{\dfrac{n!}{4!(n-4)!}}=\frac{4!(n-4)!}{5!(n-5)!}\times 2=\frac{2(n-4)}{5}$$

62. In the expansion of $(x+2y)^6$, $\left(\dfrac{6}{2}+1\right)$th term is the middle term.

So, $T_4=T_{3+1}={}^6C_3\,x^{6-3}(2y)^3=8\,({}^6C_3)\,(xy)^3$

$\therefore$ Coefficient of middle term $=8\,({}^6C_3)$

63. $a_1={}^nC_1$, $a_2={}^nC_2$, $a_3={}^nC_3$

$\because$ a_1, a_2 and a_3 are in AP.

$$\therefore \quad 2a_2=a_1+a_3$$
$$\Rightarrow \quad 2\cdot{}^nC_2={}^nC_1+{}^nC_3$$
$$\Rightarrow \quad 2\cdot\frac{n(n-1)}{2!}=n+\frac{n(n-1)(n-2)}{3!}$$
$$\Rightarrow \quad n^2-9n+14=0$$
$$\Rightarrow \quad (n-2)(n-7)=0$$
$$\therefore \quad n=7 \quad [\because n=2 \text{ is not possible}]$$

64. $(a^2-6a+11)^{10}=1024$

$$\Rightarrow \quad (a^2-6a+11)^{10}=2^{10}$$
$$\Rightarrow \quad a^2-6a+11=2$$
$$\Rightarrow \quad a^2-6a+9=0$$
$$\Rightarrow \quad (a-3)^2=0$$
$$\therefore \quad a=3$$

9

Trigonometric Functions and Equations

Chapter Snapshot

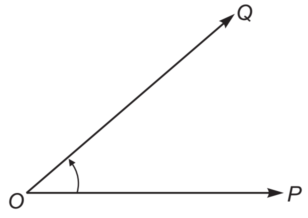
Introduction

Trigonometry is a branch of Mathematics in which we study triangles and relationships between the lengths of their sides and the angles between the sides.

The word 'Trigonometry' is derived from two Greek words '*trigonon*' and '*metron*'. The word '*trigonon*' means a triangle and the word '*metron*' means a measure. i.e. trigonometry means measuring the angles and sides of a triangle. Trigonometry defines the trigonometric functions, which describe the relationships and have applicability to physical phenomena such as waves.

Measure of Angles

The measure of angle is the amount of rotation from the direction of one ray of the angle to the other. The initial and final positions of the revolving rays are respectively called the initial and terminal sides. If initial and final positions of the revolving ray are OP and OQ, then the angle formed will be $\angle POQ$.



If the rotation is in clockwise direction, then the angle measured is negative and if the rotation is in anti-clockwise direction, then the angle measured is positive.

Systems of Measurement of Angles

There are three systems for measuring angles:

(i) **Sexagesimal system** In this system, a right angle is divided into 90 equal parts, called degrees. The symbol 1° is used to denote one degree. Thus, one degree is one-ninetieth $\left(\frac{1}{90}\text{th}\right)$ part of a right angle. Each degree is divided into 60 equal parts, called minutes and one minute is divided into 60 equal parts, called seconds. The symbols $1'$ and $1''$ are used to denote one minute and one second respectively.

Thus, 1 right angle $= 90$ degree $(= 90^\circ)$

$$1^\circ = 60 \text{ minutes } (= 60')$$
$$1' = 60 \text{ seconds } (= 60'')$$

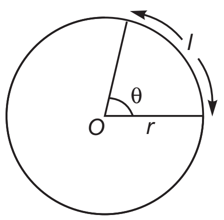
(ii) **Centesimal system** In this system, a right angle is divided into 100 equal parts, called grades. Each grade is subdivided into 100 minutes and each minute is subdivided into 100 seconds.

The symbols 1^g, $1'$ and $1''$ are used to denote a grade, a minute and a second, respectively.

Thus, 1 right angle $= 100$ grades $(= 100^g)$

$$1 \text{ grade} = 100 \text{ minutes } (= 100')$$
$$1 \text{ minute} = 100 \text{ seconds } (= 100'')$$

(iii) **Circular system** If the angle subtended by an arc of length l to the centre of circle of radius r is θ, then $\theta = \frac{l}{r}$.



If the length of arc is equal to the radius of the circle, then the angle subtended at the centre of the circle will be one radian. One radian is denoted by 1^c.

The ratio of the circumference of the circle to the diameter of the circle is denoted by a Greek letter π and it is a constant quantity.

$$\therefore \quad \frac{\text{Circumference of circle}}{\text{Diameter of circle}} = \pi$$

This constant quantity π is an irrational quantity and generally its approximate value is $\frac{22}{7}$ and its general value upto six places of decimal is 3.142857.

- *When an angle is expressed in radians, the word radian is generally omitted.*

  e.g. $1^c = 1, 22^c = 22$

- *We have,*

  π *radian* $= 180^\circ$

  $$\therefore \quad 1 \textit{ radian} = \frac{180^\circ}{\pi} = \left(\frac{180}{22} \times 7\right)^\circ = 57^\circ 16' 45'' (\textit{approx})$$

- *We have,* $180^\circ = \pi$ *radian*

  $$\Rightarrow 1^\circ = \frac{\pi}{180} \text{ radian}$$
  $$= \left(\frac{22}{7 \times 180}\right) \textit{radian} = 0.01746 \textit{ radian}$$

Relation among Three Systems of Measurement of an Angle

Let D be the number of degree, R be the number of radian and G be the number of grade in an angle θ.

Now, $\quad 90^\circ = 1$ right angle

$$\Rightarrow \quad 1^\circ = \frac{1}{90} \text{ right angle}$$
$$\Rightarrow \quad D^\circ = \frac{D}{90} \text{ right angle}$$
$$\Rightarrow \quad \theta = \frac{D}{90} \text{ right angle} \qquad \ldots\text{(i)}$$

Again, $\quad \pi$ radian $= 2$ right angles

$$\Rightarrow \quad 1 \text{ radian} = \frac{2}{\pi} \text{ right angles}$$
$$\Rightarrow \quad R \text{ radian} = \frac{2R}{\pi} \text{ right angles} \qquad \ldots\text{(ii)}$$

and $\quad 100$ grades $= 1$ right angle

$$\Rightarrow \quad 1 \text{ grade} = \frac{1}{100} \text{ right angle}$$
$$\Rightarrow \quad G \text{ grades} = \frac{G}{100} \text{ right angles}$$
$$\Rightarrow \quad \theta = \frac{G}{100} \text{ right angles} \qquad \ldots\text{(iii)}$$

From Eqs. (i), (ii) and (iii), we get

$$\frac{D}{90} = \frac{G}{100} = \frac{2R}{\pi}$$

This is the required relation between the three systems of measurement of an angle.

Example 1. *If the three angles of a quadrilateral are* 60°, 60^g *and* $\frac{5\pi}{6}$ *radian. Then, the fourth angle is*

(a) 60°
(b) 96°
(c) 96^g
(d) None of the above

Sol. (b) First angle = 60°

Second angle $= 60^g = 60 \times \frac{90}{100} = 54°$

Third angle $= \frac{5\pi}{6}$ radian

$= \frac{5 \times 180°}{6} = 150°$

Fourth angle = 360° – (60° + 54° + 150°)

= 360° – 264°

= 96°

Example 2. *The angle between the hour hand and the minute hand of a clock at half past three, is*

(a) 75°
(b) 60°
(c) 30°
(d) 175°

Sol. (a) The angle traces by the hour hand in 12 h is of 360°.

∴ The angle traced by the hour hand in 3 h 30 min.

i.e. $\frac{7}{2}\text{ h} = \left(\frac{360}{12} \times \frac{7}{2}\right)^\circ = 105°$

The angle traced by the minute hand in 60 min is 360°.

∴ The angle traced by the minute hand in 30 min

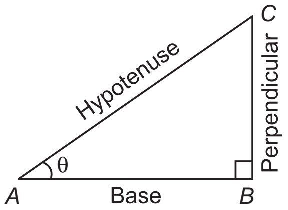
$= \left(\frac{360}{60} \times 30\right)^\circ = 180°$

Hence, the required angle between two hands

= 180° – 105° = 75°

Trigonometric Ratios

Let us take a right angled ΔABC right angled at B.



Let $\angle CAB = \theta$, then

$$\sin\theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$\cos\theta = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC}$$

$$\tan\theta = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB}$$

$$\cot\theta = \frac{1}{\tan\theta} = \frac{\text{Base}}{\text{Perpendicular}} = \frac{AB}{BC}$$

$$\sec\theta = \frac{1}{\cos\theta} = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{AC}{AB}$$

$$\operatorname{cosec}\theta = \frac{1}{\sin\theta} = \frac{\text{Hypotenuse}}{\text{Perpendicular}} = \frac{AC}{BC}$$

Except these six ratios, there are two other terms which are known as 'versed sine' and 'coversed sine', respectively.

i.e. $\text{ver}\sin\theta = 1 - \cos\theta$

and $\text{cover}\sin\theta = 1 - \sin\theta$

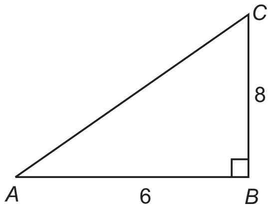
Trigonometric ratios of any angle is always constant.

Example 3. *In a right angled ΔABC, if base is 6 and perpendicular height is 8, then the trigonometric ratios* sin *A*, cos *A and* tan *A*, *respectively are*

(a) $\frac{4}{5}, \frac{3}{5}, \frac{4}{3}$ *(b)* $\frac{2}{5}, \frac{3}{5}, \frac{4}{5}$

(c) $\frac{4}{5}, \frac{1}{5}, \frac{2}{3}$ *(d) None of these*

Sol. (a) By Pythagoras theorem,



$AC^2 = AB^2 + BC^2$

$= 6^2 + 8^2 = 36 + 64 = 100$

$\Rightarrow AC = 10$

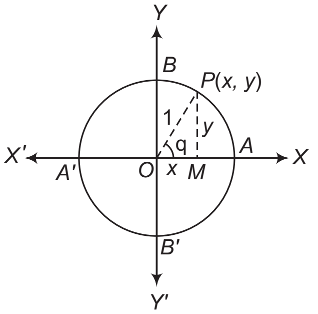
$\therefore \sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{8}{10} = \frac{4}{5}$

$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{6}{10} = \frac{3}{5}$

$\tan A = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB} = \frac{8}{6} = \frac{4}{3}$

Trigonometric Functions

Let $X'OX$ and YOY' be the coordinate axes. Taking O as the centre and a unit radius, draw a circle, cutting the coordinate axes at A, B, A' and B', as shown in the figure.



Let $\angle AOP = \theta$

$$\left[\because \angle AOP = \frac{\text{arc } AP}{\text{radius } OP} = \frac{\theta}{1} = \theta^c, \text{ using } \theta = \frac{l}{r}\right]$$

Now, the six trigonometric functions may be defined as under:

(i) $\cos\theta = \dfrac{OM}{OP} = x$

(ii) $\sin\theta = \dfrac{PM}{OP} = y$

(iii) $\sec\theta = \dfrac{OP}{OM} = \dfrac{1}{x}, x \neq 0$

(iv) $\operatorname{cosec}\theta = \dfrac{OP}{PM} = \dfrac{1}{y}, y \neq 0$

(v) $\tan\theta = \dfrac{PM}{OM} = \dfrac{y}{x}, x \neq 0$

(vi) $\cot\theta = \dfrac{OM}{PM} = \dfrac{x}{y}, y \neq 0$

Domain and Range of Trigonometrical Functions

The domain of a trigonometric ratio is the set of all values of angle θ for which it is meaningful and the range is the set of all values of the trigonometric ratio for different values of θ for which it is meaningful.

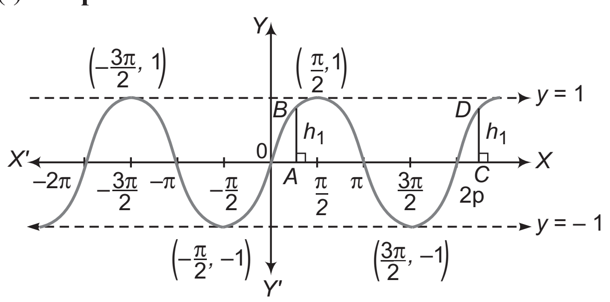
The following are domain and ranges of trigonometric ratios defined in the above section:

Trigonometric ratio	Domain	Range
$\sin\theta$	R	$[-1, 1]$
$\cos\theta$	R	$[-1, 1]$
$\tan\theta$	$R - \left\{(2n+1)\frac{\pi}{2}, n \in I\right\}$	R
$\operatorname{cosec}\theta$	$R - \{n\pi, n \in I\}$	$R - (-1, 1)$
$\sec\theta$	$R - \left\{(2n+1)\frac{\pi}{2}, n \in I\right\}$	$R - (-1, 1)$
$\cot\theta$	$R - \{n\pi, n \in I\}$	R

$|\sin\theta| \le 1$, $|\cos\theta| \le 1$, $|\sec\theta| \ge 1$, $|\operatorname{cosec}\theta| \ge 1$ *for all values of* θ *for which these functions are defined.*

Graph of Trigonometric Functions

(i) **Graph of sin *x***

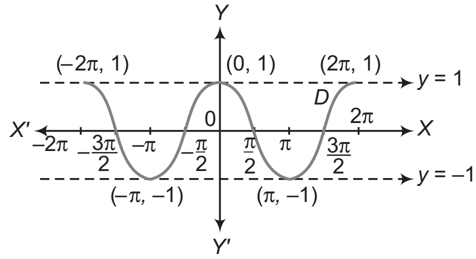


Facts related to sin *x*

(a) Period $= 2\pi$

(b) Graph of $\sin x$ is continuous for all real values of x.

(ii) **Graph of cos *x***

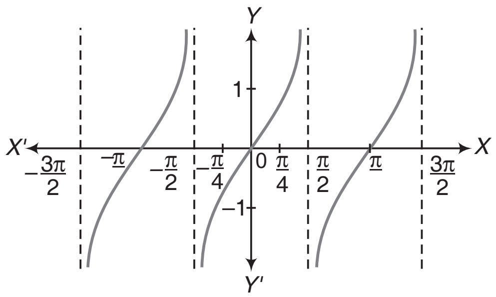


Facts related to cos *x*

(a) Period $= 2\pi$

(b) Graph of $\cos x$ is continuous for all real values of x.

(iii) **Graph of tan *x***

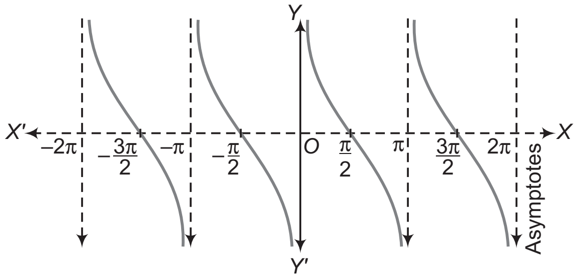


Facts related to tan *x*

(a) Period $= \pi$

(b) Graph of $\tan x$ is discontinuous at $x = \dfrac{m\pi}{2}$, where m is an odd integer.

(iv) **Graph of cot *x***

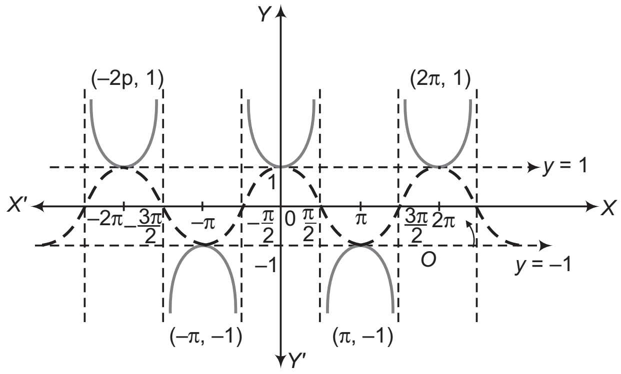


Facts related to cot *x*

(a) Period $= \pi$

(b) Graph of $\cot x$ is discontinuous at $x = m\pi$, where m is an integer.

(v) **Graph of sec x**

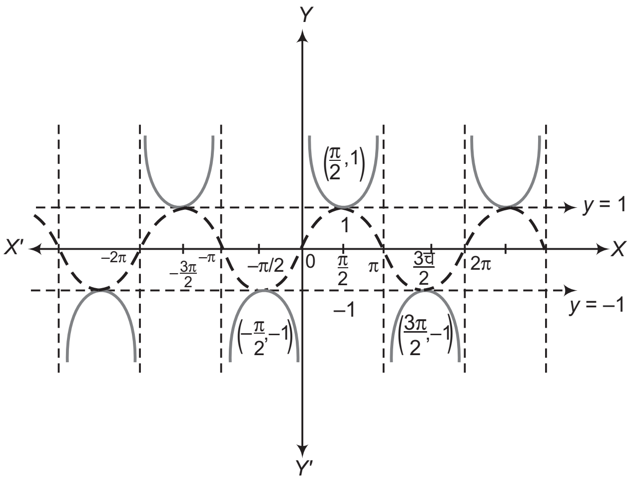


Facts related to sec x

(a) Period $= 2\pi$

(b) Graph of $\sec x$ is discontinuous at $x = \dfrac{m\pi}{2}$, where m is an odd integer.

(vi) **Graph of cosec x**



Facts related to cosec x

(a) Period $= 2\pi$

(b) Graph of $\operatorname{cosec} x$ is discontinuous at $x = m\pi$, where m is an integer.

Trigonometrical Identities

An equation involving trigonometric functions which is true for all those angles for which the functions are defined, is called a trigonometrical identity.

Following are some fundamental trigonometrical identities:

(i) $\sin\theta = \dfrac{1}{\operatorname{cosec}\theta}$ or $\operatorname{cosec}\theta = \dfrac{1}{\sin\theta}$

(ii) $\cos\theta = \dfrac{1}{\sec\theta}$ or $\sec\theta = \dfrac{1}{\cos\theta}$

(iii) $\cot\theta = \dfrac{1}{\tan\theta}$ or $\tan\theta = \dfrac{1}{\cot\theta}$

(iv) $\tan\theta = \dfrac{\sin\theta}{\cos\theta}$

(v) $\cot\theta = \dfrac{\cos\theta}{\sin\theta}$

(vi) $\cos^2\theta + \sin^2\theta = 1$ or $1 - \cos^2\theta = \sin^2\theta$

or $1 - \sin^2\theta = \cos^2\theta$

(vii) $1 + \tan^2\theta = \sec^2\theta$

(viii) $1 + \cot^2\theta = \operatorname{cosec}^2\theta$

Example 4. $(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2$ *is*

(a) ≥ 9
(b) ≤ 9
(c) $= 9$
(d) None of the above

Sol. (a) $(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2$

$$= \sin^2\theta + \operatorname{cosec}^2\theta + 2 + \cos^2\theta + \sec^2\theta + 2$$

$$= 7 + \tan^2\theta + \cot^2\theta \quad \text{...(i)}$$

Now, $\dfrac{\tan^2\theta + \cot^2\theta}{2} \geq \sqrt{\tan^2\theta \cdot \cot^2\theta}$ [$\because$ AM $\geq$ GM]

$\Rightarrow \quad \tan^2\theta + \cot^2\theta \geq 2$ ...(ii)

From Eq. (i), we get

$(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2 \geq 7 + 2$ [from Eq. (ii)]

$\Rightarrow \quad (\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2 \geq 9$

Example 5. *Prove that*

$$\sqrt{\frac{1+\sin\theta}{1-\sin\theta}} = \sec\theta + \tan\theta, \; -\frac{\pi}{2} < \theta < \frac{\pi}{2}.$$

Sol. LHS $= \sqrt{\dfrac{1+\sin\theta}{1-\sin\theta}}$

$$= \sqrt{\frac{1+\sin\theta}{1-\sin\theta} \cdot \frac{1+\sin\theta}{1+\sin\theta}}$$

$$= \sqrt{\frac{(1+\sin\theta)^2}{1-\sin^2\theta}}$$

$$= \sqrt{\frac{(1+\sin\theta)^2}{\cos^2\theta}}$$

$$= \frac{1+\sin\theta}{\cos\theta}$$

$$= \frac{1}{\cos\theta} + \frac{\sin\theta}{\cos\theta}$$

$= \sec\theta + \tan\theta =$ RHS **Hence proved.**

Signs of Trigonometrical Ratios

We have introduced six trigonometric ratios. Signs of these ratios depend on the quadrant in which the terminal side of the angle lies. We always take the length $OP = r$ to be positive.

Thus, $\sin\theta = \frac{y}{r}$ has the sign of y, $\cos\theta = \frac{x}{r}$ has the sign of x. The sign of $\tan\theta$ depends on the signs of x and y and similarly the signs of other trigonometric ratios are decided by the signs of x and/or y. Thus, we have the following:

In first quadrant

We have, $x > 0,\ y > 0$

$$\therefore \quad \sin\theta = \frac{y}{r} > 0,$$
$$\cos\theta = \frac{x}{r} > 0,$$
$$\tan\theta = \frac{y}{x} > 0,$$
$$\text{cosec}\,\theta = \frac{r}{y} > 0,$$
$$\sec\theta = \frac{r}{x} > 0$$
$$\text{and} \quad \cot\theta = \frac{x}{y} > 0$$

Thus, in the first quadrant, all trigonometric functions are positive.

In second quadrant

We have, $x < 0,\ y > 0$

$$\therefore \quad \sin\theta = \frac{y}{r} > 0,$$
$$\cos\theta = \frac{x}{r} < 0,$$
$$\tan\theta = \frac{y}{x} < 0,$$
$$\text{cosec}\,\theta = \frac{r}{y} > 0,$$
$$\sec\theta = \frac{r}{x} < 0$$
$$\text{and} \quad \cot\theta = \frac{x}{y} < 0$$

Thus, in the second quadrant, sine and cosecant functions are positive and all others are negative.

In third quadrant

We have, $x < 0,\ y < 0$

$$\therefore \quad \sin\theta = \frac{y}{r} < 0,$$
$$\cos\theta = \frac{x}{r} < 0,$$
$$\tan\theta = \frac{y}{x} > 0,$$
$$\text{cosec}\,\theta = \frac{r}{y} < 0,$$
$$\sec\theta = \frac{r}{x} < 0$$
$$\text{and} \quad \cot\theta = \frac{x}{y} > 0$$

Thus, in the third quadrant, all trigonometric functions are negative except tangent and cotangent.

In fourth quadrant

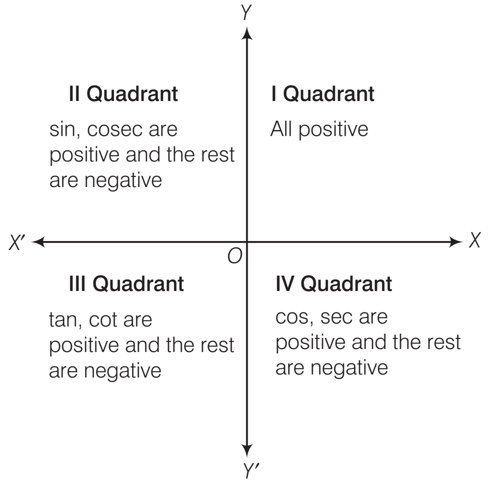
We have, $x > 0,\ y < 0$

$$\therefore \quad \sin\theta = \frac{y}{r} < 0,$$
$$\cos\theta = \frac{x}{r} > 0,$$
$$\tan\theta = \frac{y}{x} < 0,$$
$$\text{cosec}\,\theta = \frac{r}{y} < 0,$$
$$\sec\theta = \frac{r}{x} > 0$$
$$\text{and} \quad \cot\theta = \frac{x}{y} < 0$$

Thus, in the fourth quadrant, all trigonometric functions are negative except cosine and secant.

AID to Memory

The signs of trigonometrical ratios in different quadrants is the four word phrases 'AFTER SCHOOL TO COLLEGE'. The first letter of the first word in this phrase is 'A'. This may be taken to indicate that all trigonometric ratios are positive in the first quadrant. The first letter of the second word is 'S'. This indicates that sine and its reciprocal are positive in the second quadrant. The first letter of third word is 'T'. This may be taken as to indicate that tangent and its reciprocal are positive in the third quadrant. The first letter of the fourth word in the phrase is 'C' which may be taken as to indicate that only cosine and its reciprocal are positive in the fourth quadrant.



Variation of Values of Trigonometrical Ratios in Different Quadrants

Trigonometric Ratios of Allied Angles

Two angles are said to be allied when their sum or difference is either zero or a multiple of 90°.

The angles $-\theta, 90^\circ \pm \theta, 180^\circ \pm \theta, 360^\circ \pm \theta$, etc., are angles allied to the angle θ, if θ is measured in degree. However, if θ is measured in radian, then the angles allied to θ are $-\theta, \frac{\pi}{2} \pm \theta, \pi \pm \theta, 2\pi \pm \theta$, etc.

Using trigonometric ratios of allied angles, we can find the trigonometric ratios of angles of any magnitude.

Following are the trigonometrical ratios of allied angles:

$\sin(-\theta) = -\sin\theta$ $\quad$ $\cos(-\theta) = \cos\theta$

$\tan(-\theta) = -\tan\theta$ $\quad$ $\cot(-\theta) = -\cot\theta$

$\text{cosec}\,(-\theta) = -\text{cosec}\,\theta$ $\quad$ $\sec(-\theta) = \sec\theta$

$\sin\left(\frac{\pi}{2} - \theta\right) = \cos\theta$ $\quad$ $\cos\left(\frac{\pi}{2} - \theta\right) = \sin\theta$

$\tan\left(\frac{\pi}{2} - \theta\right) = \cot\theta$ $\quad$ $\cot\left(\frac{\pi}{2} - \theta\right) = \tan\theta$

$\sec\left(\frac{\pi}{2} - \theta\right) = \text{cosec}\,\theta$ $\quad$ $\text{cosec}\left(\frac{\pi}{2} - \theta\right) = \sec\theta$

$\sin\left(\frac{\pi}{2} + \theta\right) = \cos\theta$ $\quad$ $\cos\left(\frac{\pi}{2} + \theta\right) = -\sin\theta$

$\tan\left(\frac{\pi}{2} + \theta\right) = -\cot\theta$ $\quad$ $\cot\left(\frac{\pi}{2} + \theta\right) = -\tan\theta$

$\sec\left(\frac{\pi}{2} + \theta\right) = -\text{cosec}\,\theta$ $\quad$ $\text{cosec}\left(\frac{\pi}{2} + \theta\right) = \sec\theta$

$\sin(\pi - \theta) = \sin\theta$ $\quad$ $\cos(\pi - \theta) = -\cos\theta$

$\tan(\pi - \theta) = -\tan\theta$ $\quad$ $\cot(\pi - \theta) = -\cot\theta$

$\sec(\pi - \theta) = -\sec\theta$ $\quad$ $\text{cosec}\,(\pi - \theta) = \text{cosec}\,\theta$

$\sin(\pi+\theta) = -\sin\theta$ $\qquad$ $\cos(\pi+\theta) = -\cos\theta$

$\tan(\pi+\theta) = \tan\theta$ $\qquad$ $\cot(\pi+\theta) = \cot\theta$

$\sec(\pi+\theta) = -\sec\theta$ $\qquad$ $\text{cosec}(\pi+\theta) = -\text{cosec}\,\theta$

$\sin\left(\frac{3\pi}{2}-\theta\right) = -\cos\theta$ $\qquad$ $\cos\left(\frac{3\pi}{2}-\theta\right) = -\sin\theta$

$\tan\left(\frac{3\pi}{2}-\theta\right) = \cot\theta$ $\qquad$ $\cot\left(\frac{3\pi}{2}-\theta\right) = \tan\theta$

$\sec\left(\frac{3\pi}{2}-\theta\right) = -\text{cosec}\,\theta$ $\qquad$ $\text{cosec}\left(\frac{3\pi}{2}-\theta\right) = -\sec\theta$

$\sin\left(\frac{3\pi}{2}+\theta\right) = -\cos\theta$ $\qquad$ $\cos\left(\frac{3\pi}{2}+\theta\right) = \sin\theta$

$\tan\left(\frac{3\pi}{2}+\theta\right) = -\cot\theta$ $\qquad$ $\cot\left(\frac{3\pi}{2}+\theta\right) = -\tan\theta$

$\sec\left(\frac{3\pi}{2}+\theta\right) = \text{cosec}\,\theta$ $\qquad$ $\text{cosec}\left(\frac{3\pi}{2}+\theta\right) = -\sec\theta$

$\sin(2\pi-\theta) = -\sin\theta$ $\qquad$ $\cos(2\pi-\theta) = \cos\theta$

$\tan(2\pi-\theta) = -\tan\theta$ $\qquad$ $\cot(2\pi-\theta) = -\cot\theta$

$\sec(2\pi-\theta) = \sec\theta$ $\qquad$ $\text{cosec}(2\pi-\theta) = -\text{cosec}\,\theta$

$\sin(2\pi+\theta) = \sin\theta$ $\qquad$ $\cos(2\pi+\theta) = \cos\theta$

$\tan(2\pi+\theta) = \tan\theta$ $\qquad$ $\cot(2\pi+\theta) = \cot\theta$

$\sec(2\pi+\theta) = \sec\theta$ $\qquad$ $\text{cosec}(2\pi+\theta) = \text{cosec}\,\theta$

- $\sin\{n\pi+(-1)^n\theta\} = \sin\theta, n\in I$
- $\cos(2n\pi\pm\theta) = \cos\theta, n\in I$
- $\tan(n\pi+\theta) = \tan\theta, n\in I$

Example 6. *The value of* cosec $(-1410°)$ *is*

(a) 3 *(b)* 2 *(c)* -3 *(d)* -1

Sol. (b) cosec $(-1410°)$

$= -\text{cosec}(1410°)$ $\quad [\because \text{cosec}(-\theta) = -\text{cosec}\,\theta]$

$= -\text{cosec}(360\times 4 - 30)°$

$= -(-\text{cosec}\,30°)$ $\quad [\because \text{cosec}(2n\pi-\theta) = -\text{cosec}\,\theta]$

$= \text{cosec}\,30° = 2$

Example 7. *The value of* $\tan 1° \tan 2° \tan 3° \dots \tan 89°$ *is*

(a) 0 *(b)* 1 *(c)* 2 *(d)* 3

Sol. (b) $\tan 1° \tan 2° \tan 3° \dots \tan 89°$

$= (\tan 1° \tan 89°)(\tan 2° \tan 88°) \dots (\tan 44° \tan 46°) \tan 45°$

$= (\tan 1° \cot 1°)(\tan 2° \cot 2°) \dots \tan 45°$

$= 1\cdot 1 \dots 1 = 1$

Example 8. *The value of* $2\sin^2\frac{3\pi}{4} + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3}$ *is*

(a) 10 *(b)* -10 *(c)* 12 *(d)* 14

Sol. (a) $2\sin^2\frac{3\pi}{4} + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3}$

$= 2\sin^2\left(\pi - \frac{\pi}{4}\right) + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3}$

$= 2\sin^2\frac{\pi}{4} + 2\times\left(\frac{1}{\sqrt{2}}\right)^2 + 2(2)^2$ $\quad [\because \sin(\pi-\theta) = \sin\theta]$

$= 2\times\left(\frac{1}{\sqrt{2}}\right)^2 + 2\times\frac{1}{2} + 2\times 4 = 1 + 1 + 8 = 10$

Work Book Exercise 9.1

1 The value of $\cos 10° - \sin 10°$ is

a positive **b** negative
c 0 **d** 1

2 A circular wire of radius 7 cm is cut and bend again into an arc of a circle of radius 12 cm. The angle subtended by the arc at the centre is

a 50° **b** 210°
c 100° **d** 60°

3 Which of the following is correct?

a $\sin 1° > \sin 1$ **b** $\sin 1° < \sin 1$
c $\sin 1° = \sin 1$ **d** $\sin 1° = \frac{\pi}{180}\sin 1$

4 $\frac{\sec 8A - 1}{\sec 4A - 1}$ is equal to

a $\frac{\tan 8A}{\tan 2A}$

b $\frac{\cot 8A}{\cot 2A}$

c $\frac{\tan 2A}{\tan 8A}$

d None of the above

5 In a right angled triangle, if the hypotenuse is four times as long as the perpendicular drawn to it from the opposite vertex. One of the acute angle is

a 15° **b** 30°
c 45° **d** None of these

6 If the interior angles of a polygon are in AP with common difference 5° and the smallest angle 120°, then the number of sides of the polygon is

a 9 or 16 **b** 9
c 13 **d** 16

7 The value of x for which $f(x) = \sqrt{\sin x - \cos x}$ defined, is

a $\left(0, \frac{\pi}{4}\right)$ **b** $\left[\frac{\pi}{4}, \frac{5\pi}{4}\right]$
c $\left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$ **d** None of these

8 If A, B, C, D are angles of a cyclic quadrilateral, then $\cos A + \cos B + \cos C + \cos D$ equals

a 0 **b** 1
c -1 **d** None of these

9 The value of
$\log \tan 1° + \log \tan 2° + \ldots + \log \tan 89°$ is

a 0 **b** −1
c 1 **d** ∞

10 If $1 + \sin x + \sin^2 x + \ldots = 4 + 2\sqrt{3}$, $0 < x < \pi$, then x is equal to

a $\frac{\pi}{6}$ **b** $\frac{\pi}{4}$
c $\frac{\pi}{3}$ or $\frac{\pi}{6}$ **d** $\frac{\pi}{3}$ or $\frac{2\pi}{3}$

11 The value of
$e^{\log_{10} \tan 1° + \log_{10} \tan 2° + \log_{10} \tan 3° + \ldots + \log_{10} \tan 89°}$ is

a 0 **b** e
c $\frac{1}{e}$ **d** None of these

12 If $(\sec A - \tan A)(\sec B - \tan B)(\sec C - \tan C)$
$= (\sec A + \tan A)(\sec B + \tan B)(\sec C + \tan C)$,
then each side is equal to

a 0 **b** 1
c −1 **d** ± 1

Trigonometrical Ratios of Compound Angles

The algebraic sum of two or more angles are generally called compound angles and the angles are known as the constituent angles.

Cosine of the Difference and Sum of Two Angles

(i) $\cos(A - B) = \cos A \cos B + \sin A \sin B$
(ii) $\cos(A + B) = \cos A \cos B - \sin A \sin B$ for all angles A and B.

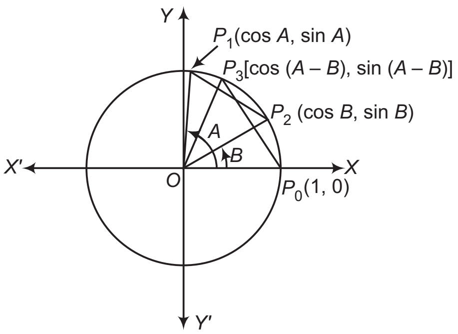
Proof (i) Let $X'OX$ and YOY' be the coordinate axes. Consider a unit circle with O as the centre.

Let P_1, P_2 and P_3 be three points on the circles such that $\angle XOP_1 = A$, $\angle XOP_2 = B$ and $\angle XOP_3 = A - B$.

The terminal side of any angle intersects the circle with centre O and unit radius at a point whose coordinates are respectively the cosine and sine of the angle. Therefore, coordinates of P_1, P_2 and P_3 are $(\cos A, \sin A)$, $(\cos B, \sin B)$ and $[\cos(A - B), \sin(A - B)]$, respectively.

We know that equal chords of a circle make equal angles at its centre. Since, chords P_0P_3 and P_1P_2 subtend equal angles at O. Therefore,

Chord P_0P_3 = Chord P_1P_2



$$\Rightarrow \sqrt{\{\cos(A - B) - 1\}^2 + \{\sin(A - B) - 0\}^2} = \sqrt{(\cos B - \cos A)^2 + (\sin B - \sin A)^2}$$

$$\Rightarrow \{\cos(A - B) - 1\}^2 + \sin^2(A - B) = (\cos B - \cos A)^2 + (\sin B - \sin A)^2$$

$$\Rightarrow \cos^2(A - B) - 2\cos(A - B) + 1 + \sin^2(A - B) = \cos^2 B + \cos^2 A - 2\cos A \cos B + \sin^2 B + \sin^2 A - 2\sin A \sin B$$

$$\Rightarrow 2 - 2\cos(A - B) = 2 - 2\cos A \cos B - 2\sin A \sin B$$

$$\Rightarrow \cos(A - B) = \cos A \cos B + \sin A \sin B$$

Hence, $\cos(A - B) = \cos A \cos B + \sin A \sin B$

Above formula is true for all values of angles A and B whether positive, zero or negative.

(ii) We have,

$$\cos(A + B) = \cos[A - (-B)] = \cos A \cos(-B) + \sin A \sin(-B) \quad \text{[from part (i)]}$$
$$= \cos A \cos B - \sin A \sin B$$

Hence, $\cos(A + B) = \cos A \cos B - \sin A \sin B$

Using above formula, a list of formula is formed:

(i) $\sin(A + B) = \sin A \cos B + \cos A \sin B$

(ii) $\sin(A - B) = \sin A \cos B - \cos A \sin B$

(iii) $\cos(A + B) = \cos A \cos B - \sin A \sin B$

(iv) $\cos(A - B) = \cos A \cos B + \sin A \sin B$

(v) $\left.\begin{array}{l} \tan(A + B) = \dfrac{\tan A + \tan B}{1 - \tan A \tan B} \\ \tan(A - B) = \dfrac{\tan A - \tan B}{1 + \tan A \tan B} \end{array}\right]$

where, $A \neq n\pi + \frac{\pi}{2}$, $B \neq n\pi + \frac{\pi}{2}$

and $A \pm B \neq m\pi + \frac{\pi}{2}$

(vi) $\left.\begin{array}{l} \cot(A + B) = \dfrac{\cot A \cot B - 1}{\cot A + \cot B} \\ \cot(A - B) = \dfrac{\cot A \cot B + 1}{\cot B - \cot A} \end{array}\right]$

where, $A \neq n\pi$, $B \neq n\pi$ and $A \pm B \neq n\pi$

(vii) $\sin(A + B)\sin(A - B) = \sin^2 A - \sin^2 B = \cos^2 B - \cos^2 A$

(viii) $\cos(A + B)\cos(A - B) = \cos^2 A - \sin^2 B = \cos^2 B - \sin^2 A$

(ix) $\sin(A+B+C)=\sin A\cos B\cos C+\cos A\sin B\cos C+\cos A\cos B\sin C-\sin A\sin B\sin C$

Also, $\sin(A+B+C)=\cos A\cos B\cos C(\tan A+\tan B+\tan C-\tan A\tan B\tan C)$

(x) $\cos(A+B+C)$
$=\cos A\cos B\cos C-\sin A\sin B\cos C-\sin A\cos B\sin C-\cos A\sin B\sin C$

Also, $\cos(A+B+C)$
$=\cos A\cos B\cos C(1-\tan A\tan B-\tan B\tan C-\tan C\tan A)$

(xi) $\tan(A+B+C)$
$$=\frac{\tan A+\tan B+\tan C-\tan A\tan B\tan C}{1-\tan A\tan B-\tan B\tan C-\tan C\tan A}$$

(xii) $\sin(A_1+A_2+\ldots+A_n)$
$=\cos A_1\cos A_2\ldots\cos A_n(S_1-S_3+S_5-S_7+\ldots)$

(xiii) $\cos(A_1+A_2+\ldots+A_n)$
$=\cos A_1\cos A_2\ldots\cos A_n(1-S_2+S_4-S_6+\ldots)$

(xiv) $\tan(A_1+A_2+\ldots+A_n)=\dfrac{S_1-S_3+S_5-S_7+\ldots}{1-S_2+S_4-S_6+\ldots}$

where, $S_1=\tan A_1+\tan A_2+\ldots+\tan A_n$
= sum of the tangents of the separate angles

$S_2=A_1\tan A_2+\tan A_1\tan A_3+\ldots$
= sum of the tangents taken two at a time

$S_3=\tan A_1\tan A_2\tan A_3$

$+\tan A_2\tan A_3\tan A_4+\ldots$
= sum of the tangents taken three at a time and so on.

If $A_1=A_2=\ldots=A_n=A$, we have
$S_1=n\tan A, S_2={}^nC_2\tan^2 A$,
$S_3={}^nC_3\tan^3 A,\ldots$

Example 9. *The value of* $\cos(45°-A)\cos(45°-B)-\sin(45°-A)\sin(45°-B)$ *is*

(a) $\sin(A+B)$
(b) $\cos(A+B)$
(c) $\sin(A-B)$
(d) $\cos(A-B)$

Sol. (a) We have,
$\cos(45°-A)\cos(45°-B)-\sin(45°-A)\sin(45°-B)$
$=\cos\{(45°-A)+(45°-B)\}$
$=\cos\{90°-(A+B)\}$
$=\sin(A+B)$

Example 10. *If* $\cos\theta+\sin\phi=m$ *and* $\sin\theta+\cos\phi=n$, *then* $\frac{1}{2}(m^2+n^2-2)$ *is equal to*

(a) $\sin(\theta-\phi)$ *(b)* $\sin(\theta+\phi)$
(c) $\cos(\theta-\phi)$ *(d)* $\cos(\theta+\phi)$

Sol. (b) Given, $m=\cos\theta+\sin\phi$ ...(i)
and $n=\sin\theta+\cos\phi$ ...(ii)
On squaring and adding Eqs. (i) and (ii), we get
$$m^2+n^2=\cos^2\theta+\sin^2\phi+2\sin\phi\cos\theta+\sin^2\theta+\cos^2\phi+2\sin\theta\cos\phi$$
$$\Rightarrow m^2+n^2=2+2(\sin\theta\cos\phi+\cos\theta\sin\phi)$$
$$\Rightarrow \sin(\theta+\phi)=\frac{m^2+n^2-2}{2}$$

Example 11. *If* $\tan A-\tan B=x$ *and* $\cot B-\cot A=y$, *then* $\cot(A-B)$ *is equal to*

(a) $\frac{1}{y}-\frac{1}{x}$ *(b)* $\frac{1}{x}-\frac{1}{y}$
(c) $\frac{1}{x}+\frac{1}{y}$ *(d) None of these*

Sol. (c) We have, $\tan A-\tan B=x$ and $\cot B-\cot A=y$
Now, $\cot B-\cot A=y$
$$\Rightarrow \frac{\tan A-\tan B}{\tan A\tan B}=y \Rightarrow \frac{x}{\tan A\tan B}=y$$
$$\Rightarrow \tan A\tan B=\frac{x}{y}$$
Now, $$\cot(A-B)=\frac{1}{\tan(A-B)}=\frac{1+\tan A\tan B}{\tan A-\tan B}$$
$$=\frac{1+\frac{x}{y}}{x}=\frac{x+y}{xy}=\frac{1}{x}+\frac{1}{y}$$

Example 12. *If* $\sin\alpha\sin\beta-\cos\alpha\cos\beta+1=0$, *then prove that* $1+\cot\alpha\tan\beta=0$.

Sol. Given, $\sin\alpha\sin\beta-\cos\alpha\cos\beta+1=0$
$\Rightarrow \cos\alpha\cos\beta-\sin\alpha\sin\beta=1$
$\Rightarrow \cos(\alpha+\beta)=1$
Now, $$1+\cot\alpha\tan\beta=1+\frac{\cos\alpha}{\sin\alpha}\times\frac{\sin\beta}{\cos\beta}$$
$$=\frac{\sin\alpha\cos\beta+\cos\alpha\sin\beta}{\sin\alpha\cos\beta}$$
$$=\frac{\sin(\alpha+\beta)}{\sin\alpha\cos\beta}=\frac{0}{\sin\alpha\cos\beta}$$
$=0$ **Hence proved.**

Transformation Formulae

In the previous section, we have learnt about the following formulae:

$\sin A\cos B+\cos A\sin B=\sin(A+B)$ ...(i)
$\sin A\cos B-\cos A\sin B=\sin(A-B)$ ...(ii)
$\cos A\cos B-\sin A\sin B=\cos(A+B)$ ...(iii)

$\cos A \cos B + \sin A \sin B = \cos (A - B)$ ...(iv)

On adding Eqs. (i) and (ii), we obtain

$2\sin A \cos B = \sin (A + B) + \sin (A - B)$

On subtracting Eq. (ii) from Eq. (i), we get

$2\cos A \sin B = \sin (A + B) - \sin (A - B)$

On adding Eqs. (iii) and (iv), we get

$2\cos A \cos B = \cos (A + B) + \cos (A - B)$

On subtracting Eq. (iii) from Eq. (iv), we get

$2\sin A \sin B = \cos (A - B) - \cos (A + B)$

Thus, we obtain the following formulae:

$2\sin A \cos B = \sin (A + B) + \sin (A - B)$

$2\cos A \sin B = \sin (A + B) - \sin (A - B)$

$2\cos A \cos B = \cos (A + B) + \cos (A - B)$

$2\sin A \sin B = \cos (A - B) - \cos (A + B)$

These four formulae convert the product of two sines or two cosines or one sine and one cosine into the sum or difference of two sines or two cosines.

In the above formulae, if we substitute $A + B = C$ and $A - B = D$, we obtain the following formulae to convert the sum into the product.

$$\sin C + \sin D = 2\sin \left(\frac{C + D}{2}\right) \cos \left(\frac{C - D}{2}\right)$$

$$\sin C - \sin D = 2\sin \left(\frac{C - D}{2}\right) \cos \left(\frac{C + D}{2}\right)$$

$$\cos C + \cos D = 2\cos \left(\frac{C + D}{2}\right) \cos \left(\frac{C - D}{2}\right)$$

$$\cos C - \cos D = -2\sin \left(\frac{C + D}{2}\right) \sin \left(\frac{C - D}{2}\right)$$

or

$$\cos C - \cos D = 2\sin \left(\frac{C + D}{2}\right) \sin \left(\frac{D - C}{2}\right)$$

Example 13. *The value of*

$2\cos \frac{\pi}{13} \cos \frac{9\pi}{13} + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$ *is*

(a) 2 *(b)* 0

(c) 1 *(d)* 3

Sol. (b) We have,

$$2\cos \frac{\pi}{13} \cos \frac{9\pi}{13} + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$$

$$= \cos \left(\frac{9\pi}{13} + \frac{\pi}{13}\right) + \cos \left(\frac{9\pi}{13} - \frac{\pi}{13}\right) + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$$

$$= \cos \frac{10\pi}{13} + \cos \frac{8\pi}{13} + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$$

$$= \cos \left(\pi - \frac{3\pi}{13}\right) + \cos \left(\pi - \frac{5\pi}{13}\right) + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$$

$$= -\cos \frac{3\pi}{13} - \cos \frac{5\pi}{13} + \cos \frac{3\pi}{13} + \cos \frac{5\pi}{13}$$

$$= 0$$

Example 14. *Prove that* $\cos 18° - \sin 18° = \sqrt{2} \sin 27°$.

Sol. Consider,

$$\cos 18° - \sin 18° = \cos 18° - \sin (90° - 72°)$$

$$= \cos 18° - \cos 72°$$

$$= 2\sin \left(\frac{18° + 72°}{2}\right) \sin \left(\frac{72° - 18°}{2}\right)$$

$$= 2\sin 45° \sin 27°$$

$$= 2 \cdot \frac{1}{\sqrt{2}} \cdot \sin 27°$$

$$= \sqrt{2} \sin 27°$$

Hence proved.

Example 15. *If* $\alpha, \beta, \gamma \in \left(0, \frac{\pi}{2}\right)$, *then* $\sin \alpha + \sin \beta + \sin \gamma$

(a) $> \sin (\alpha + \beta + \gamma)$ *(b)* $< \sin (\alpha + \beta + \gamma)$

(c) $= \sin (\alpha + \beta + \gamma)$ *(d)* $\le \sin (\alpha + \beta + \gamma)$

Sol. (a) We have,

$$\sin \alpha + \sin \beta + \sin \gamma - \sin (\alpha + \beta + \gamma)$$

$$= 2\sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} - 2\sin \frac{\alpha + \beta}{2} \cos \frac{\alpha + \beta + 2\gamma}{2}$$

$$= 2\sin \frac{\alpha + \beta}{2} \left\{\cos \frac{\alpha - \beta}{2} - \cos \frac{\alpha + \beta + 2\gamma}{2}\right\}$$

$$= 2\sin \frac{\alpha + \beta}{2} \left\{2\sin \frac{\alpha + \gamma}{2} \sin \frac{\beta + \gamma}{2}\right\}$$

$$= 4\sin \frac{\alpha + \beta}{2} \sin \frac{\beta + \gamma}{2} \sin \frac{\gamma + \alpha}{2}$$

We have, $\alpha, \beta, \gamma \in \left(0, \frac{\pi}{2}\right)$

$$\Rightarrow \frac{\alpha + \beta}{2}, \frac{\beta + \gamma}{2}, \frac{\gamma + \alpha}{2} \in \left(0, \frac{\pi}{2}\right)$$

$$\Rightarrow \sin \left(\frac{\alpha + \beta}{2}\right), \sin \left(\frac{\beta + \gamma}{2}\right), \sin \left(\frac{\gamma + \alpha}{2}\right) > 0$$

$$\Rightarrow 4\sin \left(\frac{\alpha + \beta}{2}\right) \sin \left(\frac{\beta + \gamma}{2}\right) \sin \left(\frac{\gamma + \alpha}{2}\right) > 0$$

$$\Rightarrow \sin \alpha + \sin \beta + \sin \gamma - \sin (\alpha + \beta + \gamma) > 0$$

$$\therefore \sin \alpha + \sin \beta + \sin \gamma > \sin (\alpha + \beta + \gamma)$$

Trigonometric Ratios of Multiples of an Angle

(i) $\sin 2\theta = 2\sin \theta \cos \theta = \frac{2\tan \theta}{1 + \tan^2 \theta}$

(ii) $\cos 2\theta = \cos^2 \theta - \sin^2 \theta = 1 - 2\sin^2 \theta$

$$= 2\cos^2 \theta - 1 = \frac{1 - \tan^2 \theta}{1 + \tan^2 \theta}$$

(iii) $\cos^2 \theta = \frac{1}{2}(1 + \cos 2\theta)$, $\sin^2 \theta = \frac{1}{2}(1 - \cos 2\theta)$

(iv) $\tan 2\theta = \frac{2\tan \theta}{1 - \tan^2 \theta}$

(v) $\cot 2\theta = \frac{\cot^2 \theta - 1}{2\cot \theta}$

(vi) $\sin 3\theta = 3\sin\theta - 4\sin^3\theta$

(vii) $\cos 3\theta = 4\cos^3\theta - 3\cos\theta$

(viii) $\tan 3\theta = \dfrac{3\tan\theta - \tan^3\theta}{1 - 3\tan^2\theta}$

(ix) $\cot 3\theta = \dfrac{\cot^3\theta - 3\cot\theta}{3\cot^2\theta - 1} = \dfrac{3\cot\theta - \cot^3\theta}{1 - 3\cot^2\theta}$

Trigonometric Ratios of Submultiple Angles

(i) $\sin\theta = 2\sin\frac{1}{2}\theta\cos\frac{1}{2}\theta = \dfrac{2\tan\frac{1}{2}\theta}{1+\tan^2\frac{1}{2}\theta}$

(ii) $\cos\theta = \cos^2\frac{1}{2}\theta - \sin^2\frac{1}{2}\theta = 1 - 2\sin^2\frac{1}{2}\theta$

$= 2\cos^2\frac{1}{2}\theta - 1$

$= \dfrac{1-\tan^2\frac{1}{2}\theta}{1+\tan^2\frac{1}{2}\theta}$

(iii) $\tan\theta = \dfrac{2\tan\frac{1}{2}\theta}{1-\tan^2\frac{1}{2}\theta}$

(iv) $\cot\theta = \dfrac{\cot^2\frac{1}{2}\theta - 1}{2\cot\frac{1}{2}\theta}$

(v) $\sin A = 3\sin\left(\frac{A}{3}\right) - 4\sin^3\left(\frac{A}{3}\right)$

(vi) $\cos A = 4\cos^3\left(\frac{A}{3}\right) - 3\cos\left(\frac{A}{3}\right)$

(vii) $\tan A = \dfrac{3\tan\left(\frac{A}{3}\right) - \tan^3\left(\frac{A}{3}\right)}{1 - 3\tan^2\left(\frac{A}{3}\right)}$

- $\sin(\alpha) + \sin(\alpha+\beta) + \sin(\alpha+2\beta) + \ldots + \sin[\alpha+(n-1)\beta]$

$$= \frac{\sin\left\{\alpha + (n-1)\left(\frac{\beta}{2}\right)\right\}\sin\left(\frac{n\beta}{2}\right)}{\sin\left(\frac{\beta}{2}\right)}$$

- $\cos(\alpha) + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos[\alpha+(n-1)\beta]$

$$= \frac{\cos\left\{\alpha + (n-1)\frac{\beta}{2}\right\}\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}$$

Example 16. *Prove that*

(i) $\dfrac{1+\sin 2\theta + \cos 2\theta}{1+\sin 2\theta - \cos 2\theta} = \cot\theta.$

(ii) $\dfrac{1+\sin\theta - \cos\theta}{1+\sin\theta+\cos\theta} = \tan\dfrac{\theta}{2}.$

(iii) $\dfrac{\cos\theta}{1+\sin\theta} = \tan\left(\dfrac{\pi}{4} - \dfrac{\theta}{2}\right).$

Sol. (i) LHS $= \dfrac{1+\sin 2\theta + \cos 2\theta}{1+\sin 2\theta - \cos 2\theta} = \dfrac{(1+\cos 2\theta) + \sin 2\theta}{(1-\cos 2\theta)+\sin 2\theta}$

$= \dfrac{2\cos^2\theta + 2\sin\theta\cos\theta}{2\sin^2\theta + 2\sin\theta\cos\theta} = \dfrac{2\cos\theta(\cos\theta+\sin\theta)}{2\sin\theta(\cos\theta+\sin\theta)}$

$= \cot\theta =$ RHS **Hence proved.**

(ii) LHS $= \dfrac{1+\sin\theta-\cos\theta}{1+\sin\theta+\cos\theta} = \dfrac{(1-\cos\theta)+\sin\theta}{(1+\cos\theta)+\sin\theta}$

$= \dfrac{2\sin^2\frac{\theta}{2} + 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{2\cos^2\frac{\theta}{2} + 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}$

$= \dfrac{2\sin\frac{\theta}{2}\left(\sin\frac{\theta}{2}+\cos\frac{\theta}{2}\right)}{2\cos\frac{\theta}{2}\left(\sin\frac{\theta}{2}+\cos\frac{\theta}{2}\right)} = \tan\dfrac{\theta}{2} =$ RHS

Hence proved.

(iii) LHS $= \dfrac{\cos\theta}{1+\sin\theta}$

$= \dfrac{\sin\left(\frac{\pi}{2}-\theta\right)}{1+\cos\left(\frac{\pi}{2}-\theta\right)}$

$= \dfrac{2\sin\left(\frac{\pi}{4}-\frac{\theta}{2}\right)\cos\left(\frac{\pi}{4}-\frac{\theta}{2}\right)}{2\cos^2\left(\frac{\pi}{4}-\frac{\theta}{2}\right)}$

$= \tan\left(\dfrac{\pi}{4}-\dfrac{\theta}{2}\right) =$ RHS **Hence proved.**

Example 17. *The value of*

$\sqrt{2+\sqrt{2+\sqrt{2+2\cos 8\theta}}}$, *where* $0 < \theta < \dfrac{\pi}{8}$, *is*

(a) $2\cos\theta$ *(b)* $\cos\theta$

(c) $2\sin\theta$ *(d)* $-2\cos\theta$

Sol. (a) We have,

$\sqrt{2+\sqrt{2+\sqrt{2+2\cos 8\theta}}}$

$= \sqrt{2+\sqrt{2+\sqrt{(4\cos^2 4\theta)}}}$ $\left[\because 1+\cos 8\theta = 2\cos^2\dfrac{8\theta}{2}\right]$

$= \sqrt{2+\sqrt{2+2\cos 4\theta}} = \sqrt{2+\sqrt{2(1+\cos 4\theta)}}$

$= \sqrt{2+\sqrt{2(2\cos^2 2\theta)}}$ $[\because 1+\cos 4\theta = 2\cos^2 2\theta]$

$= \sqrt{2+2\cos 2\theta} = \sqrt{2(1+\cos 2\theta)}$

$= \sqrt{2(2\cos^2\theta)} = 2\cos\theta$

Example 18. *The value of* $\dfrac{\sec 8\theta - 1}{\sec 4\theta - 1}$ *is*

(a) $\dfrac{\tan 2\theta}{\tan 8\theta}$ (b) $\dfrac{\tan 8\theta}{\tan 4\theta}$ (c) $\dfrac{\tan 8\theta}{\tan 2\theta}$ (d) $\dfrac{\tan 6\theta}{\tan 2\theta}$

Sol. (c) We have, $\dfrac{\sec 8\theta - 1}{\sec 4\theta - 1}$

$$= \frac{\frac{1}{\cos 8\theta} - 1}{\frac{1}{\cos 4\theta} - 1}$$
$$= \frac{1-\cos 8\theta}{\cos 8\theta} \cdot \frac{\cos 4\theta}{1-\cos 4\theta}$$
$$= \frac{2\sin^2 4\theta}{\cos 8\theta} \cdot \frac{\cos 4\theta}{1-\cos 4\theta}$$
$$= \frac{(2\sin 4\theta \cos 4\theta)}{\cos 8\theta} \times \frac{\sin 4\theta}{2\sin^2 2\theta}$$
$$= \left(\frac{2\sin 4\theta \cos 4\theta}{\cos 8\theta}\right) \times \left(\frac{2\sin 2\theta \cos 2\theta}{2\sin^2 2\theta}\right)$$
$$= \left(\frac{\sin 2(4\theta)}{\cos 8\theta}\right) \times \left(\frac{\cos 2\theta}{\sin 2\theta}\right) = \left(\frac{\sin 8\theta}{\cos 8\theta}\right) \times \left(\frac{\cos 2\theta}{\sin 2\theta}\right)$$
$$= \tan 8\theta \cdot \cot 2\theta = \frac{\tan 8\theta}{\tan 2\theta}$$

Example 19. *If* $\tan \alpha = \dfrac{p}{q}$, *where* $\alpha = 6\beta$ *and* α *being an acute angle, then* $\dfrac{1}{2}[p \operatorname{cosec} 2\beta - q \sec 2\beta]$ *is equal to*

(a) $\sqrt{p^2 + q^2}$ (b) $\sqrt{p^2 - q^2}$

(c) $\sqrt{2p^2 + q^2}$ (d) None of these

Sol. (a) We have, $\tan \alpha = \dfrac{p}{q}$

$\therefore$ $\sin \alpha = \dfrac{p}{\sqrt{p^2 + q^2}}$ and $\cos \alpha = \dfrac{q}{\sqrt{p^2 + q^2}}$

Now, $\dfrac{1}{2}[p \operatorname{cosec} 2\beta - q \sec 2\beta]$

$$= \frac{\sqrt{p^2+q^2}}{2}\left[\frac{p}{\sqrt{p^2+q^2}}\operatorname{cosec} 2\beta - \frac{q}{\sqrt{p^2+q^2}}\sec 2\beta\right]$$
$$= \frac{\sqrt{p^2+q^2}}{2}\left[\frac{\sin\alpha}{\sin 2\beta} - \frac{\cos\alpha}{\cos 2\beta}\right]$$
$$= \sqrt{p^2+q^2}\left[\frac{\sin(\alpha - 2\beta)}{2\sin 2\beta \cos 2\beta}\right]$$
$$= \sqrt{p^2+q^2}\left[\frac{\sin(6\beta - 2\beta)}{\sin 4\beta}\right] \qquad [\because \alpha = 6\beta]$$
$$= \sqrt{p^2+q^2}$$

Example 20. *If* $\tan^2\theta = 2\tan^2\phi + 1$, *then* $\cos 2\theta + \sin^2\phi$ *is equal to*

(a) 1 (b) 2

(c) −1 (d) None of these

Sol. (d) We have, $\cos 2\theta$

$$= \frac{1-\tan^2\theta}{1+\tan^2\theta}$$
$$= \frac{1-(2\tan^2\phi + 1)}{1 + 2\tan^2\phi + 1} \qquad [\because \tan^2\theta = 2\tan^2\phi + 1]$$
$$= \frac{-2\tan^2\phi}{2+2\tan^2\phi} = \frac{-\tan^2\phi}{\sec^2\phi} = -\sin^2\phi$$

$\therefore$ $\cos 2\theta + \sin^2\phi = 0$

Example 21. *The smallest positive value of x (in degree) for which* $\tan(x + 100^\circ) = \tan(x + 50^\circ)\tan x \tan(x - 50^\circ)$, *is*

(a) 60° (b) 90°

(c) 45° (d) 30°

Sol. (d) We have,

$$\tan(x+100^\circ) = \tan(x+50^\circ)\tan x \tan(x-50^\circ)$$
$$\Rightarrow \frac{\tan(x+100^\circ)}{\tan(x-50^\circ)} = \tan(x+50^\circ)\tan x$$
$$\Rightarrow \frac{\sin(x+100^\circ)\cos(x-50^\circ)}{\cos(x+100^\circ)\sin(x-50^\circ)} = \frac{\sin(x+50^\circ)\sin x}{\cos(x+50^\circ)\cos x}$$
$$\Rightarrow \frac{\sin(2x+50^\circ)}{\sin 150^\circ} = \frac{\cos 50^\circ}{-\cos(2x+50^\circ)}$$

[applying componendo and dividendo]

$$\Rightarrow \sin(2x+50^\circ)\cos(2x+50^\circ) = -\sin 150^\circ \cos 50^\circ$$
$$\Rightarrow 2\sin(2x+50^\circ)\cos(2x+50^\circ) = -\cos 50^\circ$$
$$\Rightarrow \sin(4x+100^\circ) = \sin(270^\circ - 50^\circ)$$
$$\Rightarrow \sin(4x+100^\circ) = \sin 220^\circ$$
$$\Rightarrow 4x + 100^\circ = 220^\circ \Rightarrow x = 30^\circ$$

Example 22. *The value of* $\displaystyle\sum_{n=1}^{\infty} \frac{\tan\left(\frac{\theta}{2^n}\right)}{2^{n-1}\cos\left(\frac{\theta}{2^{n-1}}\right)}$ *is*

(a) $\dfrac{2}{\sin 2\theta} - \dfrac{1}{\theta}$ (b) $\dfrac{2}{\sin 2\theta} + \dfrac{1}{\theta}$

(c) $\dfrac{1}{\sin 2\theta} - \dfrac{1}{\theta}$ (d) $\dfrac{2}{\sin \theta} - \dfrac{1}{\theta}$

Sol. (a) We have,

$$\sum_{r=1}^{n} \frac{\tan\left(\frac{\theta}{2^r}\right)}{2^{r-1}\cos\left(\frac{\theta}{2^{r-1}}\right)}$$
$$= \sum_{r=1}^{n} \frac{\sin\left(\frac{\theta}{2^r}\right)}{2^{r-1}\cos\left(\frac{\theta}{2^r}\right)\cos\left(\frac{\theta}{2^{r-1}}\right)}$$
$$= \sum_{r=1}^{n} \frac{2\sin^2\left(\frac{\theta}{2^r}\right)}{2^{r-1}\left\{2\sin\left(\frac{\theta}{2^r}\right)\cos\left(\frac{\theta}{2^r}\right)\right\}\cos\left(\frac{\theta}{2^{r-1}}\right)}$$
$$= \sum_{r=1}^{n} \frac{1-\cos\left(\frac{\theta}{2^{r-1}}\right)}{2^{r-1}\sin\left(\frac{\theta}{2^{r-1}}\right)\cos\left(\frac{\theta}{2^{r-1}}\right)}$$

$$= \sum_{r=1}^{n}\left[\frac{1}{2^{r-2}\sin\left(\frac{\theta}{2^{r-2}}\right)} - \frac{1}{2^{r-1}\sin\left(\frac{\theta}{2^{r-1}}\right)}\right]$$

$$= \left[\left(\frac{2}{\sin 2\theta} - \frac{1}{\sin\theta}\right) + \left(\frac{1}{\sin\theta} - \frac{1}{2\sin\left(\frac{\theta}{2}\right)}\right) + \left(\frac{1}{2\sin\frac{\theta}{2}} - \frac{1}{2^2\sin\left(\frac{\theta}{2^2}\right)}\right) + \ldots + \left(\frac{1}{2^{n-2}\sin\left(\frac{\theta}{2^{n-2}}\right)} - \frac{1}{2^{n-1}\sin\left(\frac{\theta}{2^{n-1}}\right)}\right)\right]$$

$$= \frac{2}{\sin 2\theta} - \frac{1}{2^{n-1}\sin\left(\frac{\theta}{2^{n-1}}\right)}$$

$$\therefore \sum_{n=1}^{\infty}\frac{\tan(\theta/2^n)}{2^{n-1}\cos\left(\frac{\theta}{2^{n-1}}\right)} = \lim_{n\to\infty}\sum_{r=1}^{n}\frac{\tan(\theta/2^r)}{2^{r-1}\cos\left(\frac{\theta}{2^{r-1}}\right)}$$

$$= \lim_{n\to\infty}\left[\frac{2}{\sin 2\theta} - \frac{1}{2^{n-1}\sin\left(\frac{\theta}{2^{n-1}}\right)}\right]$$

$$= \frac{2}{\sin 2\theta} - \lim_{n\to\infty}\left\{\frac{\theta/2^{n-1}}{\theta\cdot\sin\left(\frac{\theta}{2^{n-1}}\right)}\right\} = \frac{2}{\sin 2\theta} - \frac{1}{\theta}$$

Example 23. *The value of* $\cos A\cos 2A\cos 2^2 A\cos 2^3 A \ldots \cos 2^{n-1} A$ *is*

(a) $\dfrac{\cos 2^n A}{2^n \cos A}$ *(b)* $\dfrac{\sin 2^n A}{2^n \sin A}$

(c) $\dfrac{\sin 2^n A}{2^n \cos A}$ *(d)* $\dfrac{\cos 2^n A}{2^n \sin A}$

Sol. (b) We have,

$$\cos A\cos 2A\cos 2^2 A\cos 2^3 A \ldots \cos 2^{n-1} A$$

$$= \frac{1}{2\sin A}[(2\sin A\cos A)\cos 2A\cos 2^2 A\cos 2^3 A\ldots \cos 2^{n-1} A]$$

$$= \frac{1}{2\sin A}[(\sin 2A\cos 2A)\cos 2^2 A\cos 2^3 A\ldots\cos 2^{n-1} A]$$

$$= \frac{1}{2^2\sin A}[(2\sin 2A\cos 2A)\cos 2^2 A\cos 2^3 A\ldots\cos 2^{n-1} A]$$

$$= \frac{1}{2^2\sin A}[\sin 2(2A)\cdot\cos 2^2 A\cos 2^3 A\ldots\cos 2^{n-1} A]$$

$$= \frac{1}{2^3\sin A}[(2\sin 2^2 A\cos 2^2 A)\cos 2^3 A\ldots\cos 2^{n-1} A]$$

$$= \frac{1}{2^3\sin A}[\sin(2\cdot 2^2 A)\cos 2^3 A\ldots\cos 2^{n-1} A]$$

$$= \frac{1}{2^3\sin A}[(\sin 2^3 A\cos 2^3 A\cos 2^4 A\ldots\cos 2^{n-1} A]$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$= \frac{1}{2^{n-1}\sin A}[\sin 2^{n-1} A\cos 2^{n-1} A]$$

$$= \frac{1}{2^n\sin A}[2\sin 2^{n-1} A\cos 2^{n-1} A]$$

$$= \frac{1}{2^n\sin A}\cdot\sin(2\cdot 2^{n-1} A)$$

$$= \frac{1}{2^n\sin A}\cdot\sin 2^n A = \frac{\sin 2^n A}{2^n\sin A}$$

Remark

Students are advised to learn above result as standard formula.

Example 24. $\sin\dfrac{\pi}{n} + \sin\dfrac{3\pi}{n} + \sin\dfrac{5\pi}{n} + \ldots$ *to n terms is equal to*

(a) 1 *(b)* 2

(c) 3 *(d)* 0

Sol. (d) $\sin\dfrac{\pi}{n} + \sin\dfrac{3\pi}{n} + \sin\dfrac{5\pi}{n} + \ldots$ to n terms

$$= \frac{\sin\frac{n\cdot 2\pi}{2n}}{\sin\frac{2\pi}{2n}}\cdot\sin\left(\frac{2\cdot\frac{\pi}{n} + (n-1)\frac{2\pi}{n}}{2}\right)$$

$$= \frac{\sin\pi}{\sin\frac{\pi}{n}}\cdot\sin\left(\frac{2\pi + 2n\pi - 2\pi}{2n}\right) = \frac{\sin^2\pi}{\sin\frac{\pi}{n}} = 0$$

$$\therefore \quad \sin\frac{\pi}{n} + \sin\frac{3\pi}{n} + \sin\frac{5\pi}{n} + \ldots \text{ to } n \text{ terms} = 0$$

Computation of Trigonometrical Ratios of Some Useful Angles

By using the formulae introduced in the previous sections, we can now find the trigonometrical ratios of some important angles.

Value of sin 18°

Let $\theta = 18°$. Then,

$$5\theta = 90°$$

$$\Rightarrow \quad 2\theta + 3\theta = 90°$$

$$\Rightarrow \quad 2\theta = 90° - 3\theta$$

$$\Rightarrow \quad \sin 2\theta = \sin(90° - 3\theta)$$

$$\Rightarrow \quad \sin 2\theta = \cos 3\theta$$

$$\Rightarrow \quad 2\sin\theta\cos\theta = 4\cos^3\theta - 3\cos\theta$$

$$\Rightarrow \quad \cos\theta(2\sin\theta - 4\cos^2\theta + 3) = 0$$

$$\Rightarrow \quad 2\sin\theta - 4\cos^2\theta + 3 = 0 \quad [\because \cos\theta = \cos 18° \neq 0]$$

$$\Rightarrow \quad 2\sin\theta - 4(1 - \sin^2\theta) + 3 = 0$$

$$\Rightarrow \quad 4\sin^2\theta + 2\sin\theta - 1 = 0$$

$$\Rightarrow \quad \sin\theta = \frac{-2 \pm \sqrt{4 + 16}}{8}$$

$$\Rightarrow \quad \sin\theta = \frac{-1 \pm \sqrt{5}}{4}$$

$$\Rightarrow \quad \sin\theta = \frac{-1 \pm \sqrt{5}}{4} = \frac{\sqrt{5} - 1}{4} \quad [\because \sin 18° > 0]$$

Hence, $\sin 18° = \dfrac{\sqrt{5} - 1}{4}$

Value of cos 36°

Since, $\cos 2\theta = 1 - 2\sin^2\theta$

$\therefore \quad \cos 36° = 1 - 2\sin^2 18°$ [putting $\theta = 18°$]

$$\Rightarrow \quad \cos 36° = 1 - 2\left(\frac{\sqrt{5}-1}{4}\right)^2$$

$$= 1 - 2\left(\frac{6-2\sqrt{5}}{16}\right) = 1 - \left(\frac{3-\sqrt{5}}{4}\right)$$

$$= \frac{\sqrt{5}+1}{4}$$

Hence, $\cos 36° = \dfrac{\sqrt{5}+1}{4}$

Value of sin 36°

Putting $\theta = 36°$ in $\sin\theta = \sqrt{1-\cos^2\theta}$, we obtain

$$\sin 36° = \sqrt{1-\cos^2 36°}$$

$$= \sqrt{1-\left(\frac{\sqrt{5}+1}{4}\right)^2}$$

$$= \sqrt{\frac{16-(6+2\sqrt{5})}{16}}$$

$$= \frac{\sqrt{10-2\sqrt{5}}}{4}$$

Hence, $\sin 36° = \dfrac{\sqrt{10-2\sqrt{5}}}{4}$

Trigonometrical Ratios of Some More Angles between 0° and 90°

Example 25. *The value of* $\cos 12° + \cos 84° + \cos 156° + \cos 132°$ *is*

(a) 1 *(b)* $\frac{1}{2}$

(c) -1 *(d)* $\frac{-1}{2}$

Sol. (d) Consider,

$\cos 12° + \cos 84° + \cos 156° + \cos 132°$

$= (\cos 12° + \cos 132°) + (\cos 84° + \cos 156°)$

$$= 2\cos\left(\frac{12°+132°}{2}\right)\cos\left(\frac{132°-12°}{2}\right) + 2\cos\left(\frac{84°+156°}{2}\right)\cos\left(\frac{156°-84°}{2}\right)$$

$= 2\cos 72°\cos 60° + 2\cos 120°\cos 36°$

$= 2\sin 18°\cos 60° + 2\cos 120°\cos 36°$

$$= 2\left(\frac{\sqrt{5}-1}{4}\right)\frac{1}{2} + 2\left(\frac{-1}{2}\right)\left(\frac{\sqrt{5}+1}{4}\right)$$

$$= \frac{-1}{2}$$

Example 26. *Prove that* $4\sin 27° = \sqrt{5+\sqrt{5}} - \sqrt{3-\sqrt{5}}$.

Sol. Consider, $(\cos 27° + \sin 27°)^2 = \sin^2 27° + \cos^2 27° + 2\sin 27°\cos 27°$

$$= 1 + \sin 54° = 1 + \frac{\sqrt{5}+1}{4} = \frac{1}{4}(5+\sqrt{5})$$

$$\therefore \quad \cos 27° + \sin 27° = \frac{1}{2}\sqrt{5+\sqrt{5}} \qquad \text{...(i)}$$

[$\because \sin 27° > 0, \cos 27° > 0$]

Similarly, we have

$(\cos 27° - \sin 27°)^2 = 1 - \sin 54°$

$$= 1 - \frac{\sqrt{5}+1}{4} = \frac{3-\sqrt{5}}{4}$$

$$\therefore \quad \cos 27° - \sin 27° = \frac{1}{2}\sqrt{3-\sqrt{5}} \qquad \text{...(ii)}$$

$$\left[\because 0 < \theta < \frac{\pi}{4}, \cos\theta > \sin\theta\right]$$

On subtracting Eq. (ii) from Eq. (i), we get

$$2\sin 27° = \frac{1}{2}\sqrt{5+\sqrt{5}} - \frac{1}{2}\sqrt{3-\sqrt{5}}$$

$$\Rightarrow \quad 4\sin 27° = \sqrt{5+\sqrt{5}} - \sqrt{3-\sqrt{5}}$$ **Hence proved.**

Example 27. *If* $\theta = \dfrac{-4\pi}{3}$, *justify whether the relation* $2\sin\dfrac{\theta}{2} = -\sqrt{1+\sin\theta} + \sqrt{1-\sin\theta}$ *is true.*

Sol. $\theta = -\dfrac{4\pi}{3} = -240° \Rightarrow \dfrac{\theta}{2} = -120°$

$$\therefore \quad \sin\frac{\theta}{2} = \sin(-120°) = -\sin 120° = -\sin(180° - 60°)$$
$$= -\sin 60° = -\frac{\sqrt{3}}{2}$$
$$\cos\frac{\theta}{2} = \cos(-120°) = \cos 120° = \cos(180° - 60°)$$
$$= -\cos 60° = -\frac{1}{2}$$
$$\therefore \quad \cos\frac{\theta}{2} + \sin\frac{\theta}{2} = -\frac{1}{2} - \frac{\sqrt{3}}{2} = -\frac{\sqrt{3}+1}{2} < 0$$
$$\text{and} \quad \cos\frac{\theta}{2} - \sin\frac{\theta}{2} = -\frac{1}{2} + \frac{\sqrt{3}}{2} = \frac{\sqrt{3}-1}{2} > 0$$

Thus, $\cos\dfrac{\theta}{2} + \sin\dfrac{\theta}{2} = -\sqrt{1+\sin\theta}$ $[\because \sqrt{1+\sin\theta} > 0]$ ...(i)

and $\cos\dfrac{\theta}{2} - \sin\dfrac{\theta}{2} = \sqrt{1-\sin\theta}$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$2\sin\frac{\theta}{2} = -\sqrt{1+\sin\theta} - \sqrt{1-\sin\theta},$$

which shows that the given relation is not true.

Example 28. *Show that* $\tan\dfrac{\pi}{24} = \sqrt{6} - \sqrt{3} + \sqrt{2} - 2.$

Sol. Consider, $\sin 15° = \sin(45° - 30°)$

$$= \sin 45°\cos 30° - \cos 45°\sin 30°$$
$$= \frac{1}{\sqrt{2}}\cdot\frac{\sqrt{3}}{2} - \frac{1}{\sqrt{2}}\cdot\frac{1}{2} = \frac{\sqrt{3}-1}{2\sqrt{2}}$$
$$\cos 15° = \cos(45° - 30°)$$
$$= \cos 45°\cos 30° + \sin 45°\sin 30°$$
$$= \frac{1}{\sqrt{2}}\cdot\frac{\sqrt{3}}{2} + \frac{1}{\sqrt{2}}\cdot\frac{1}{2}$$
$$= \frac{\sqrt{3}+1}{2\sqrt{2}}$$
$$\therefore \quad \tan\frac{\pi}{24} = \frac{\sin\frac{\pi}{24}}{\cos\frac{\pi}{24}} = \frac{2\sin^2\frac{\pi}{24}}{2\sin\frac{\pi}{24}\cos\frac{\pi}{24}} = \frac{1-\cos\frac{\pi}{12}}{\sin\frac{\pi}{12}}$$
$$= \frac{1-\cos 15°}{\sin 15°} = \frac{1-\frac{\sqrt{3}+1}{2\sqrt{2}}}{\frac{\sqrt{3}-1}{2\sqrt{2}}}$$
$$= \frac{2\sqrt{2}-\sqrt{3}-1}{\sqrt{3}-1}$$
$$= \frac{(\sqrt{3}+1)(2\sqrt{2}-\sqrt{3}-1)}{(\sqrt{3}+1)(\sqrt{3}-1)}$$
$$= \frac{2\sqrt{6}-3-\sqrt{3}+2\sqrt{2}-\sqrt{3}-1}{2}$$
$$= \frac{2(\sqrt{6}-\sqrt{3}+\sqrt{2}-2)}{2}$$
$$= \sqrt{6}-\sqrt{3}+\sqrt{2}-2$$

Hence proved.

Example 29. *Prove that* $\tan 6° \tan 42° \tan 66° \tan 78° = 1.$

Sol. $\tan 6° \tan 42° \tan 66° \tan 78°$

$$= \frac{\sin 6°\sin 42°\sin 66°\sin 78°}{\cos 6°\cos 42°\cos 66°\cos 78°}$$
$$= \frac{(2\sin 66°\sin 6°)(2\sin 78°\sin 42°)}{(2\cos 66°\cos 6°)(2\cos 78°\cos 42°)}$$
$$= \frac{(\cos 60° - \cos 72°)(\cos 36° - \cos 120°)}{(\cos 60° + \cos 72°)(\cos 120° + \cos 36°)}$$
$$= \frac{\left(\frac{1}{2} - \sin 18°\right)\left(\cos 36° + \frac{1}{2}\right)}{\left(\frac{1}{2} + \sin 18°\right)\left(-\frac{1}{2} + \cos 36°\right)}$$
$$= \frac{\left(\frac{1}{2} - \frac{\sqrt{5}-1}{4}\right)\left(\frac{\sqrt{5}+1}{4} + \frac{1}{2}\right)}{\left(\frac{1}{2} + \frac{\sqrt{5}-1}{4}\right)\left(\frac{\sqrt{5}+1}{4} - \frac{1}{2}\right)}$$
$$= \frac{(3-\sqrt{5})(3+\sqrt{5})}{(1+\sqrt{5})(\sqrt{5}-1)}$$
$$= \frac{9-5}{5-1} = \frac{4}{4} = 1$$

Hence proved.

Example 30. *Prove that* $2\cos\dfrac{\pi}{32} = \sqrt{2+\sqrt{2+\sqrt{2+\sqrt{2}}}}.$

Sol. Consider, $2+\sqrt{2} = 2\left(1+\dfrac{1}{\sqrt{2}}\right) = 2\left(1+\cos\dfrac{\pi}{4}\right)$

$$= 2\cdot 2\cos^2\frac{\pi}{8} = \left(2\cos\frac{\pi}{8}\right)^2$$
$$\therefore \quad 2\cos\frac{\pi}{8} = \sqrt{2+\sqrt{2}} \qquad \left[\because \cos\frac{\pi}{8} > 0\right]$$
$$\text{Again,} \quad 2+\sqrt{2+\sqrt{2}} = 2 + 2\cos\frac{\pi}{8} = 2\left(1+\cos\frac{\pi}{8}\right)$$
$$= 2\times 2\cos^2\frac{\pi}{16} = \left(2\cos\frac{\pi}{16}\right)^2$$
$$\therefore \quad \sqrt{2+\sqrt{2+\sqrt{2}}} = 2\cos\frac{\pi}{16}$$
$$\text{Now,} \quad 2+\sqrt{2+\sqrt{2+\sqrt{2}}} = 2 + 2\cos\frac{\pi}{16}$$
$$= 2\left(1+\cos\frac{\pi}{16}\right)$$
$$= 2\cdot 2\cos^2\frac{\pi}{32} = \left(2\cos\frac{\pi}{32}\right)^2$$
$$\therefore \quad 2\cos\frac{\pi}{32} = \sqrt{2+\sqrt{2+\sqrt{2+\sqrt{2}}}} \qquad \left[\because \cos\frac{\pi}{32} > 0\right]$$

Hence proved.

Maximum and Minimum Values of Trigonometrical Expressions

In this section, we shall discuss problems on finding the maximum and minimum values of various trigonometrical expressions.

Consider the expression $a\cos\theta \pm b\sin\theta$, where θ is a variable.

Let $y = a\cos\theta \pm b\sin\theta$

Further, let $a = r\cos\alpha$ and $b = r\sin\alpha$. Then,

$$r = \sqrt{a^2 + b^2} \text{ and } \tan\alpha = \frac{b}{a}$$

$\therefore \quad y = r\cos\alpha\cos\theta \pm r\sin\alpha\sin\theta$

$\Rightarrow \quad y = r\cos(\theta \mp \alpha)$

We know that,

$$-1 \le \cos(\theta \mp \alpha) \le 1, \forall\theta$$

$\Rightarrow \quad -r \le r\cos(\theta \mp \alpha) \le r, \forall\theta$

$\Rightarrow \quad -\sqrt{a^2+b^2} \le y \le \sqrt{a^2+b^2}, \forall\theta$

$\Rightarrow \quad -\sqrt{a^2+b^2} \le a\cos\theta \pm b\cos\theta$

$$\le \sqrt{a^2+b^2} \text{ for all } \theta.$$

If follows from the above discussion that $-\sqrt{a^2+b^2}$ and $\sqrt{a^2+b^2}$ are minimum and maximum values of $a\cos\theta \pm b\sin\theta$ for varying values of θ.

The maximum and minimum values of $a\cos\theta \pm b\sin\theta + c$ are $c + \sqrt{a^2+b^2}$ and $c - \sqrt{a^2+b^2}$ respectively i.e. $c - \sqrt{a^2+b^2} \le a\cos\theta \pm b\sin\theta + c \le c + \sqrt{a^2+b^2}$.

Example 31. *The maximum and minimum values of $7\cos\theta + 24\sin\theta$ are*

(a) 25 and – 25 *(b) 24 and – 24*

(c) 5 and – 5 *(d) None of these*

Sol. (a) We know that the maximum and minimum values of $a\cos\theta + b\sin\theta$ are $\sqrt{a^2+b^2}$ and $-\sqrt{a^2+b^2}$ respectively.

So, the maximum and minimum values of $7\cos\theta + 24\sin\theta$ are $\sqrt{7^2+24^2} = 25$ and $-\sqrt{7^2+24^2} = -25$ respectively.

Example 32. *Prove that*

$$5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3 \text{ lies between } -4 \text{ and } 10.$$

Sol. We have, $5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3$

$$= 5\cos\theta + 3\left(\cos\theta\cos\frac{\pi}{3} - \sin\theta\sin\frac{\pi}{3}\right) + 3$$

$$= 5\cos\theta + \frac{3}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta + 3$$

$$= \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta + 3 \quad \text{...(i)}$$

Now, $-\sqrt{\left(\frac{13}{2}\right)^2 + \left(\frac{3\sqrt{3}}{2}\right)^2} \le \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta$

$$\le \sqrt{\left(\frac{13}{2}\right)^2 + \left(\frac{3\sqrt{3}}{2}\right)^2}$$

$\Rightarrow \quad -7 \le \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta \le 7, \forall\theta$

$\Rightarrow \quad -7 + 3 \le \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta + 3 \le 7 + 3, \forall\theta$

$\Rightarrow -4 \le 5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3 \le 10, \forall\theta$ [from Eq.(i)]

Hence proved.

Example 33. *Find a and b such that the inequality holds good for all θ, $a \le 3\cos\theta + 5\sin\left(\theta - \frac{\pi}{6}\right) \le b$.*

Sol. We have, $3\cos\theta + 5\sin\left(\theta - \frac{\pi}{6}\right)$

$$= 3\cos\theta + 5\left(\sin\theta\cos\frac{\pi}{6} - \cos\theta\sin\frac{\pi}{6}\right)$$

$$= 3\cos\theta + 5\left(\frac{\sqrt{3}}{2}\sin\theta - \frac{1}{2}\cos\theta\right)$$

$$= \frac{1}{2}\cos\theta + \frac{5\sqrt{3}}{2}\sin\theta$$

We have, $\sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{5\sqrt{3}}{2}\right)^2} \le \frac{1}{2}\cos\theta + \frac{5\sqrt{3}}{2}$

$$\sin\theta \le \sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{5\sqrt{3}}{2}\right)^2}, \forall\theta$$

$\Rightarrow \quad -\sqrt{19} \le 3\cos\theta + 5\sin\left(\theta - \frac{\pi}{6}\right) \le \sqrt{19}, \forall\theta$

Hence, $a = -\sqrt{19}$ and $b = \sqrt{19}$.

Example 34. *Show that for all real value θ, the expression $a\sin^2\theta + b\sin\theta\cos\theta + c\cos^2\theta$ lies between $\frac{1}{2}\{(a+c) - \sqrt{b^2 + (a-c)^2}\}$ and $\frac{1}{2}\{(a+c) + \sqrt{b^2 + (a-c)^2}\}$.*

Sol. Let $y = a\sin^2\theta + b\sin\theta\cos\theta + c\cos^2\theta$. Then,

$$y = a\left(\frac{1-\cos 2\theta}{2}\right) + \frac{b}{2}\sin 2\theta + c\left(\frac{1+\cos 2\theta}{2}\right)$$

$\Rightarrow \quad y = \frac{a+c}{2} + \frac{1}{2}\{(c-a)\cos 2\theta + b\sin 2\theta\}$

Now, $\quad -\sqrt{(c-a)^2 + b^2} \le (c-a)\cos 2\theta + b\sin 2\theta$

$$\le \sqrt{(c-a)^2 + b^2}, \forall\theta \in R$$

$\Rightarrow \quad -\frac{1}{2}\sqrt{(c-a)^2 + b^2} \le \frac{1}{2}\{(c-a)\cos 2\theta + b\sin 2\theta\}$

$$\le \frac{1}{2}\sqrt{(c-a)^2 + b^2}, \forall\theta \in R$$

$\Rightarrow \frac{a+c}{2} - \frac{1}{2}\sqrt{(c-a)^2 + b^2} \le \frac{a+c}{2}$

$$+ \frac{1}{2}\{(c-a)\cos 2\theta + b\sin 2\theta\}$$

$$\le \frac{a+c}{2} + \frac{1}{2}\sqrt{(c-a)^2 + b^2}, \forall\theta \in R$$

$\Rightarrow \quad \frac{1}{2}\{(a+c) - \sqrt{b^2 + (c-a)^2}\}$

$\le a\sin^2\theta + b\sin\theta\cos\theta + c\cos^2\theta$

$\le \frac{1}{2}[(a+c) + \sqrt{b^2 + (c-a)^2}], \forall\theta \in R$ **Hence proved.**

Example 35. *Show that for varying θ and fixed α, the expression $\cos\theta\,(\sin\theta + \sqrt{\sin^2\theta + \sin^2\alpha})$ always lies between $-\sqrt{1+\sin^2\alpha}$ and $\sqrt{1+\sin^2\alpha}$.*

Sol. Let $y = \cos\theta\,(\sin\theta + \sqrt{\sin^2\theta + \sin^2\alpha})$.

Then, $y = \sin\theta\cos\theta + \cos\theta\sqrt{\sin^2\theta + \sin^2\alpha}$

$\Rightarrow (y - \sin\theta\cos\theta)^2 = \cos^2\theta\,(\sin^2\theta + \sin^2\alpha)$

$\Rightarrow y^2 - 2y\sin\theta\cos\theta = \cos^2\theta\sin^2\alpha$

$\Rightarrow y^2 - 2y\sin\theta\cos\theta + \cos^2\theta = \cos^2\theta + \cos^2\theta\sin^2\alpha$

$\Rightarrow y^2\sec^2\theta - 2y\tan\theta + 1 = 1 + \sin^2\alpha$

[dividing throughout by $\cos^2\theta$]

$\Rightarrow y^2\tan^2\theta - 2y\tan\theta + 1 = (1+\sin^2\alpha) - y^2$

$\Rightarrow (y\tan\theta - 1)^2 = (1+\sin^2\alpha) - y^2$

$\Rightarrow (1+\sin^2\alpha) - y^2 \ge 0$

$\Rightarrow y^2 - (\sqrt{1+\sin^2\alpha})^2 \le 0$

$\Rightarrow -\sqrt{1+\sin^2\alpha} \le y \le \sqrt{1+\sin^2\alpha}$

Hence, $-\sqrt{1+\sin^2\alpha} \le \cos\theta(\sin\theta + \sqrt{\sin^2\theta + \sin^2\alpha})$

$\le \sqrt{1+\sin^2\alpha},\ \forall\,\theta$ **Hence proved.**

Example 36. *If in a ΔABC, $\tan\frac{A}{2}$, $\tan\frac{B}{2}$ and $\tan\frac{C}{2}$ are in HP, then find the minimum value of $\cot\frac{B}{2}$.*

Sol. In ΔABC, we have

$$\cot\frac{A}{2} + \cot\frac{B}{2} + \cot\frac{C}{2} = \cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2} \quad \ldots\text{(i)}$$

It is given that, $\tan\frac{A}{2}$, $\tan\frac{B}{2}$ and $\tan\frac{C}{2}$ are in HP.

$\Rightarrow \cot\frac{A}{2}, \cot\frac{B}{2}$ and $\cot\frac{C}{2}$ are in AP.

$$\Rightarrow 2\cot\frac{B}{2} = \cot\frac{A}{2} + \cot\frac{C}{2} \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we have

$$\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2} = 3\cot\frac{B}{2} \Rightarrow \cot\frac{A}{2}\cot\frac{C}{2} = 3$$

Since, AM $\ge$ GM

$$\Rightarrow \frac{\cot\frac{A}{2} + \cot\frac{C}{2}}{2} \ge \sqrt{\cot\frac{A}{2}\cot\frac{C}{2}}$$

$$\Rightarrow \cot\frac{B}{2} \ge \sqrt{3} \quad \left[\because \cot\frac{A}{2} + \cot\frac{C}{2} = 2\cot\frac{B}{2}\right]$$

Hence, the minimum value of $\cot\frac{B}{2}$ is $\sqrt{3}$.

Work Book Exercise 9.2

1 If $\sin A = \frac{1}{\sqrt{10}}$ and $\sin B = \frac{1}{\sqrt{5}}$, where A, B are acute angles, then $A + B$ equals

a $\frac{\pi}{4}$ b $\frac{\pi}{2}$
c $\frac{\pi}{3}$ d π

2 If the angle α is in the third quadrant and $\tan\alpha = 2$, then $\sin\alpha$ is equal to

a $\frac{2}{\sqrt{5}}$ b $\frac{2}{\sqrt{3}}$
c $\frac{\sqrt{5}}{2}$ d None of these

3 If θ lies in the first quadrant, then which of the following is not true?

a $\frac{\theta}{2} < \tan\left(\frac{\theta}{2}\right)$ b $\frac{\theta}{2} < \sin\frac{\theta}{2}$
c $\theta\cos^2\left(\frac{\theta}{2}\right) < \sin\theta$ d $\theta\sin\left(\frac{\theta}{2}\right) < 2\sin\frac{\theta}{2}$

4 $\cos 2\theta + 2\cos\theta$ is always

a $> -\frac{3}{2}$ b $\ge \frac{3}{2}$
c $\le -\frac{3}{2}$ d None of these

5 If $A = \tan 6^\circ \tan 42^\circ$ and $B = \cot 66^\circ \cot 78^\circ$, then

a $A = 2B$ b $A = \frac{1}{3}B$
c $A = B$ d $3A = 2B$

6 The value of $\sqrt{3}\operatorname{cosec} 20^\circ - \sec 20^\circ$ is

a 2 b 1
c 4 d -4

7 The equation $\sin^2\theta = \frac{x^2 + y^2}{2xy}$ is possible, if

a $x = y$ b $x = -y$
c $2x = y$ d None of these

8 If $\frac{\sin(x+y)}{\sin(x-y)} = \frac{a+b}{a-b}$, then $\frac{\tan x}{\tan y}$ is equal to

a $\frac{b}{a}$ b $\frac{a}{b}$
c ab d None of these

9 If $\tan^2\theta = 2\tan^2\phi + 1$, then $\cos 2\theta + \sin^2\phi$ equals

a -1
b 0
c 1
d None of the above

10 The value of $\sin\frac{\pi}{14}\sin\frac{3\pi}{14}\sin\frac{5\pi}{14}\sin\frac{7\pi}{14}\sin\frac{9\pi}{14}\sin\frac{11\pi}{14}\sin\frac{13\pi}{14}$ is

a $\frac{1}{16}$
b $\frac{1}{64}$
c $\frac{1}{128}$
d None of the above

11 If $x\cos\alpha + y\sin\alpha = 2a$, $x\cos\beta + y\sin\beta = 2a$ and $2\sin\frac{\alpha}{2}\sin\frac{\beta}{2} = 1$, then

a $\cos\alpha + \cos\beta = \frac{2ax}{x^2 + y^2}$

b $\cos\alpha\cos\beta = \frac{2a^2 - y^2}{x^2 + y^2}$

c $y^2 = 4a(\alpha - x)$

d $\cos\alpha + \cos\beta = 2\cos\alpha\cos\beta$

12 If $\sin\theta - \cos\theta < 0$, then θ lies between

a $n\pi - \frac{3\pi}{4}$ and $n\pi + \frac{\pi}{4}$, $n \in I$

b $n\pi - \frac{\pi}{4}$ and $n\pi + \frac{\pi}{4}$, $n \in I$

c $2n\pi - \frac{3\pi}{4}$ and $2n\pi - \frac{\pi}{4}$, $n \in I$

d $2n\pi - \frac{3\pi}{4}$ and $2n\pi + \frac{\pi}{4}$, $n \in I$

13 If $2\cos\frac{A}{2} = \sqrt{1+\sin A} + \sqrt{1-\sin A}$, then $\frac{A}{2}$ lies between $(n \in I)$

a $2n\pi + \frac{\pi}{4}$ and $2n\pi + \frac{3\pi}{4}$

b $2n\pi - \frac{\pi}{4}$ and $2n\pi + \frac{\pi}{4}$

c $2n\pi - \frac{3\pi}{4}$ and $2n\pi - \frac{\pi}{4}$

d $-\infty$ and $+\infty$

14 The angle θ whose cosine equals to its tangent, is given by

a $\cos\theta = 2\cos 18°$　　b $\cos\theta = 2\sin 18°$

c $\sin\theta = 2\sin 18°$　　d $\sin\theta = 2\cos 18°$

15 The value of $\tan 5\theta$ is

a $\frac{5\tan\theta - 10\tan^3\theta + \tan^5\theta}{1 - 10\tan^2\theta + 5\tan^4\theta}$

b $\frac{5\tan\theta + 10\tan^3\theta - \tan^5\theta}{1 + 10\tan^2\theta - 5\tan^4\theta}$

c $\frac{5\tan^5\theta - 10\tan^3\theta + \tan\theta}{1 - 10\tan^2\theta + 5\tan^4\theta}$

d None of the above

16 If $\left|a\sin^2\theta + b\sin\theta\cos\theta + c\cos^2\theta - \frac{1}{2}(a+c)\right| \le \frac{1}{2}k$, then k^2 is equal to

a $b^2 + (a-c)^2$

b $a^2 + (b-c)^2$

c $c^2 + (a-b)^2$

d None of the above

17 If α, β, γ and δ are the smallest positive angles in ascending order of magnitude which have their sines equal to the positive quantity λ, then the value of $4\sin\frac{\alpha}{2} + 3\sin\frac{\beta}{2} + 2\sin\frac{\gamma}{2} + \sin\frac{\delta}{2}$ is

a $\sqrt{1+\lambda}$

b $2\sqrt{1+\lambda}$

c $\sqrt{1-\lambda}$

d $2\sqrt{1-\lambda}$

18 If $\tan\left(\frac{\theta}{2}\right) = \frac{5}{2}$ and $\tan\left(\frac{\phi}{2}\right) = \frac{3}{4}$, then the value of $\cos(\theta + \phi)$ is

a $-\frac{364}{725}$

b $-\frac{627}{725}$

c $-\frac{240}{339}$

d None of the above

19 If $\alpha, \beta, \gamma \in \left(0, \frac{\pi}{2}\right)$, then the value of $\frac{\sin(\alpha+\beta+\gamma)}{\sin\alpha + \sin\beta + \sin\gamma}$ is

a < 1　　b > 1

c $= 1$　　d None of these

20 If $\cos x = \tan y$, $\cos y = \tan z$, $\cos z = \tan x$, then the value of $\sin x$ is

a $2\cos 18°$

b $\cos 18°$

c $\sin 18°$

d $2\sin 18°$

Trigonometric Equations

An equation involving one or more trigonometrical ratios of unknown angle is called a trigonometric equation.

e.g. $$\sin^2 x - 4\sin x = 1$$

It is to be noted that a trigonometrical identity is satisfied for every value of the unknown angle, whereas trigonometric equation is satisfied only for some values (finite or infinite) of unknown angle.

e.g. $\sin^2 x + \cos^2 x = 1$ is a trigonometrical identity as it is satisfied for every value of $x \in R$.

Solutions or Roots of a Trigonometric Equation

A value of the unknown angle which satisfies the given equation, is called a solution or root of the equation.

The trigonometric equation may have infinite number of solutions and can be classified as

(i) Principal solution　　(ii) General solution

(i) **Principal solution** The value of unknown angle which satisfies the given equation and lies in the interval $[0, 2\pi)$, is called a principal solution of trigonometric equation.

(ii) **General solution** We know that trigonometric functions are periodic and solutions of trigonometric equations can be generalised with the help of the periodicity of the trigonometric functions.

The solution consisting of all possible solutions of a trigonometric equation is called its general solution.

A function $f(x)$ is said to be a periodic function, if a least positive real number T is such that $f(x+T) = f(x)$, then T is known as period of function $f(x)$.

General Solution of Trigonometric Equations

(i) $\sin\theta = 0$	$\theta = n\pi, n \in I$
(ii) $\cos\theta = 0$	$\theta = (2n+1)\frac{\pi}{2}, n \in I$
(iii) $\tan\theta = 0$	$\theta = n\pi, n \in I$
(iv) $\sin\theta = \sin\alpha$	$\theta = n\pi + (-1)^n\alpha, \alpha \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right], n \in I$
(v) $\cos\theta = \cos\alpha$	$\theta = 2n\pi \pm \alpha, \alpha \in [0, \pi], n \in I$
(vi) $\tan\theta = \tan\alpha$	$\theta = n\pi + \alpha, \alpha \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right), n \in I$
(vii) $\left.\begin{array}{l}\sin^2\theta = \sin^2\alpha \\ \cos^2\theta = \cos^2\alpha \\ \tan^2\theta = \tan^2\alpha\end{array}\right\}$	$\theta = n\pi \pm \alpha, n \in I$
(viii) $\sin\theta = 1$	$\theta = (4n+1)\frac{\pi}{2}, n \in I$
(ix) $\cos\theta = 1$	$\theta = 2n\pi, n \in I$
(x) $\cos\theta = -1$	$\theta = (2n+1)\pi, n \in I$
(xi) $\sin x = \sin\alpha$ and $\cos x = \cos\alpha$	$x = 2n\pi + \alpha$

- *If θ is an odd multiple of $\frac{\pi}{2}$ i.e. when $\theta = (2n+1)\frac{\pi}{2}, n \in I$, then $\sec\theta$ and $\tan\theta$ are not defined.*
- *If θ is an even multiple of $\frac{\pi}{2}$ i.e. when $\theta = n\pi, n \in I$, then $\text{cosec}\,\theta$ and $\cot\theta$ are not defined.*
- *The general solution of equations containing $\text{cosec}\,\theta$, $\sec\theta$ and $\cot\theta$ is equivalent to that of the equation involving $\sin\theta$, $\cos\theta$ and $\tan\theta$.*
- *When $\cos\theta = 0$, then $\sin\theta = 1$ or -1*

  $\therefore \quad \theta = \left(n + \frac{1}{2}\right)\pi$

  If $\sin\theta = 1$, then n is even and if $\sin\theta = -1$, then n is odd.
  Similarly, when $\sin\theta = 0$, then $\cos\theta = 1$ or -1

  $\therefore \quad \theta = n\pi$

  If $\cos\theta = 1$, then n is even and if $\cos\theta = -1$, then n is odd.

  The general solution should be given unless the solution is required in a specified interval or range.

Example 37. *If the equation* $\sin^2\theta - \cos\theta = \frac{1}{4}$, *then the values of θ lying in the interval $0 \le \theta \le 2\pi$ are*

(a) $\frac{\pi}{3}, \frac{5\pi}{3}$ (b) $\frac{\pi}{3}, \frac{2\pi}{3}$ (c) $\frac{4\pi}{3}, \frac{5\pi}{3}$ (d) $\frac{3\pi}{5}, \frac{\pi}{5}$

Sol. (a) The given equation can be written as

$$1 - \cos^2\theta - \cos\theta = \frac{1}{4}$$

$$\Rightarrow \cos^2\theta + \cos\theta - \frac{3}{4} = 0$$

$$\Rightarrow 4\cos^2\theta + 4\cos\theta - 3 = 0$$

$$\Rightarrow \cos\theta = \frac{-4 \pm \sqrt{16+48}}{8} = \frac{1}{2}, -\frac{3}{2}$$

Since, $\cos\theta = -\frac{3}{2}$ is not possible.

$$\therefore \cos\theta = \frac{1}{2} = \cos\frac{\pi}{3}$$

$$\Rightarrow \theta = 2n\pi \pm \frac{\pi}{3}$$

For the given interval, $n = 0$ and $n = 1$

$$\Rightarrow \theta = \frac{\pi}{3}, \frac{5\pi}{3}$$

Example 38. *The solution of* $\tan x + \tan 2x + \tan 3x = \tan x \tan 2x \tan 3x$ *is*

(a) $x = n\pi,\ n \in I$ (b) $x = \frac{n\pi}{2},\ n \in I$

(c) $x = \frac{n\pi}{3},\ n \in I$ (d) None of these

Sol. (c) We know that,

$$\tan 3x = \tan(x + 2x) = \frac{\tan x + \tan 2x}{1 - \tan x \tan 2x}$$

$\Rightarrow \tan 3x - \tan x \tan 2x \tan 3x = \tan x + \tan 2x$

$\Rightarrow \tan x \tan 2x \tan 3x = \tan 3x - \tan x - \tan 2x$ ...(i)

Now, $\tan x + \tan 2x + \tan 3x = \tan x \tan 2x \tan 3x$

$\Rightarrow \tan x + \tan 2x + \tan 3x = \tan 3x - \tan x - \tan 2x$ [from Eq. (i)]

$$\Rightarrow 2\tan x = -2\tan 2x$$

$$\Rightarrow \tan 2x = \tan(-x)$$

$$2x = n\pi + (-x) \Rightarrow 3x = n\pi$$

$$\therefore x = \frac{n\pi}{3}, \quad \text{where } n \in I$$

Example 39. *The number of distinct solution of* $\sin 5\theta \cos 3\theta = \sin 9\theta \cos 7\theta$ *in* $\left[0, \frac{\pi}{2}\right]$, *is*

(a) 4 (b) 5

(c) 8 (d) 9

Sol. (d) $\sin 8\theta + \sin 2\theta = \sin 16\theta + \sin 2\theta$ or $\sin 16\theta = \sin 8\theta$

$$\therefore 16\theta = n\pi + (-1)^n 8\theta$$

$\Rightarrow 8\theta = 2m\pi$, when n is even, $n = 2m$

$24\theta = (2m+1)\pi$, when n is odd, $n = (2m+1)$

$$\therefore \theta = \frac{m\pi}{4}, \frac{(2m+1)\pi}{24}, \text{ when } m \in I$$

$$= 0, \frac{\pi}{2}, \frac{\pi}{4} \text{ and } \frac{\pi}{24}, \frac{\pi}{8}, \frac{5\pi}{24}, \frac{9\pi}{24}, \frac{7\pi}{24}, \frac{11\pi}{24}$$

Example 40. *If $0 \le x \le \frac{\pi}{2}$ and*

$81^{\sin^2 x} + 81^{\cos^2 x} = 30$, *then x is equal to*

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{4}$ (d) 0

Sol. (a) Given, $81^{\sin^2 x} + 81^{\cos^2 x} = 30$

$$\Rightarrow \quad 81^{\sin^2 x} + 81^{1-\sin^2 x} = 30$$

$$\Rightarrow \quad 81^{\sin^2 x} + \frac{81}{81^{\sin^2 x}} = 30$$

Let $81^{\sin^2 x} = y$

$$\therefore \quad y + \frac{81}{y} = 30$$

$$\Rightarrow \quad y^2 - 30y + 81 = 0$$

$$\Rightarrow \quad (y-27)(y-3) = 0$$

$$\Rightarrow \quad y = 27 \text{ or } y = 3$$

$$\Rightarrow \quad 81^{\sin^2 x} = 27 \text{ or } 81^{\sin^2 x} = 3$$

$$\Rightarrow \quad 3^{4\sin^2 x} = 3^3 \text{ or } 3^{4\sin^2 x} = 3^1$$

$$\Rightarrow \quad \sin^2 x = \frac{3}{4} \text{ or } 4\sin^2 x = 1$$

$$\Rightarrow \quad \sin x = \frac{\sqrt{3}}{2} \text{ or } \sin x = \frac{1}{2} \quad \left[\because x \in \left[0, \frac{\pi}{2}\right]\right]$$

$$\Rightarrow \quad x = \frac{\pi}{3} \text{ or } x = \frac{\pi}{6}$$

Example 41. *If $\frac{\tan 3\theta - 1}{\tan 3\theta + 1} = \sqrt{3}$, then the general value of θ is*

(a) $\frac{n\pi}{3} - \frac{\pi}{12}$ (b) $n\pi + \frac{7\pi}{12}$ (c) $\frac{n\pi}{3} + \frac{7\pi}{36}$ (d) $n\pi + \frac{\pi}{12}$

Sol. (c) Given, $\frac{\tan 3\theta - 1}{\tan 3\theta + 1} = \sqrt{3}$

$$\Rightarrow \quad \tan 3\theta - 1 = \sqrt{3}\tan 3\theta + \sqrt{3}$$

$$\Rightarrow \quad \tan 3\theta - 1 - \sqrt{3}\tan 3\theta - \sqrt{3} = 0$$

$$\Rightarrow \quad \tan 3\theta (1 - \sqrt{3}) - (1 + \sqrt{3}) = 0$$

$$\Rightarrow \quad \tan 3\theta = \frac{1+\sqrt{3}}{1-\sqrt{3}}$$

$$\Rightarrow \quad \tan 3\theta = \tan 105° = \tan\frac{7\pi}{12}$$

$$\therefore \quad 3\theta = n\pi + \frac{7\pi}{12} \Rightarrow \theta = \frac{n\pi}{3} + \frac{7\pi}{36}$$

Solution of Trigonometric Equation of the Form $a\cos\theta + b\sin\theta = c$

Let the equation be

$$a\cos\theta + b\sin\theta = c$$

On dividing both sides by $\sqrt{a^2+b^2}$, we get

$$\frac{a}{\sqrt{a^2+b^2}}\cos\theta + \frac{b}{\sqrt{a^2+b^2}}\sin\theta = \frac{c}{\sqrt{a^2+b^2}} \quad \ldots\text{(i)}$$

Let $\tan\alpha = \frac{b}{a}$

$$\therefore \quad \sin\alpha = \frac{b}{\sqrt{a^2+b^2}}$$

and $\cos\alpha = \frac{a}{\sqrt{a^2+b^2}}$

From Eq. (i), we get

$$\cos\theta\cos\alpha + \sin\theta\sin\alpha = \frac{c}{\sqrt{a^2+b^2}}$$

$$\Rightarrow \quad \cos(\theta - \alpha) = \frac{c}{\sqrt{a^2+b^2}}$$

If $|c| > \sqrt{a^2+b^2}$

Then, equation $a\cos\theta + b\sin\theta = c$ has no solution and if

$|c| \le \sqrt{a^2+b^2}$, then let

$$\cos\phi = \frac{|c|}{\sqrt{a^2+b^2}}$$

$$\Rightarrow \quad \cos(\theta - \alpha) = \cos\phi$$

$$\Rightarrow \quad \theta - \alpha = 2n\pi \pm \phi$$

$$\Rightarrow \quad \theta = 2n\pi \pm \phi + \alpha, \ n \in I$$

- *While solving a trigonometric equation, squaring the equation at any step should be avoided as far as possible.*
- *If squaring is necessary, check the solution for extraneous values.*
- *Never cancel terms containing unknown terms on the two sides, which are in product. It may cause loss of genuine solution.*
- *The answer should not contain such values of angles which make any of the terms undefined or infinite.*
- *Domain should not change. If it changes, necessary corrections must be made.*
- *Check that denominator is not zero at any stage while solving equations.*

Example 42. *If $\sin x + \sqrt{3}\cos x = \sqrt{2}$, then x is equal to*

(a) $2n\pi + \frac{\pi}{12}, 2n\pi - \frac{\pi}{3}$ (b) $2n\pi + \frac{5\pi}{12}, 2n\pi - \frac{\pi}{12}$

(c) $2n\pi - \frac{\pi}{12}, 2n\pi - \frac{\pi}{12}$ (d) None of the above

Sol. (b) Given, $\sqrt{3}\cos x + \sin x = \sqrt{2}$

$$\Rightarrow \quad \frac{\sqrt{3}}{2}\cos x + \frac{1}{2}\sin x = \frac{\sqrt{2}}{2}$$

$$\Rightarrow \quad \cos\left(x - \frac{\pi}{6}\right) = \cos\frac{\pi}{4}$$

$$\Rightarrow \quad x - \frac{\pi}{6} = 2n\pi \pm \frac{\pi}{4}$$

$$\Rightarrow \quad x = 2n\pi \pm \frac{\pi}{4} + \frac{\pi}{6}$$

$$\Rightarrow \quad x = 2n\pi + \frac{5\pi}{12}, 2n\pi - \frac{\pi}{12}, \text{ where } n \in I$$

Example 43. *General solution of* $\sin x + \cos x = \min_{a \in R} \{1, a^2 - 4a + 6\}$ *is*

(a) $\frac{n\pi}{2} + (-1)^n \frac{\pi}{4}$ (b) $2n\pi + (-1)^n \frac{\pi}{4}$

(c) $n\pi + (-1)^{n+1} \frac{\pi}{4}$ (d) $n\pi + (-1)^n \frac{\pi}{4} - \frac{\pi}{4}$

Sol. (d) Given,

$$\sin x + \cos x = \min_{a \in R} \{1, a^2 - 4a + 6\}$$

Now, $a^2 - 4a + 6 = (a-2)^2 + 2$

$\therefore \min_{a \in R} \{1, a^2 - 4a + 6\} = \min\{1, 2\} = 1$

Now, $\sin x + \cos x = 1$

$\Rightarrow \sin\left(x + \frac{\pi}{4}\right) = \frac{1}{\sqrt{2}}$

$\Rightarrow x + \frac{\pi}{4} = n\pi + (-1)^n \cdot \frac{\pi}{4}$

$\Rightarrow x = n\pi + (-1)^n \frac{\pi}{4} - \frac{\pi}{4}$

Example 44. *The equation* $\sqrt{3}\sin x + \cos x = 4$ *has*

(a) only one solution
(b) two solutions
(c) infinitely many solutions
(d) no solution

Sol. (d) We know that,

$$a\cos x + b\sin x = c$$

has solutions, if $|c| \le \sqrt{a^2 + b^2}$

So, given equation is

$$\sqrt{3}\sin x + \cos x = 4$$

$\therefore \sqrt{a^2 + b^2} = \sqrt{1^2 + (\sqrt{3})^2} = \sqrt{4} = 2$

and $|c| = 4 \Rightarrow |c| > \sqrt{a^2 + b^2}$

Hence, given equation has no solution.

Example 45. *If the equation* $\tan\theta + \sec\theta = \sqrt{3}$, *then the value of* $\theta \in (0, 2\pi)$ *is*

(a) $\frac{\pi}{4}$ (b) $\frac{3\pi}{2}$

(c) $\frac{\pi}{6}$ (d) None of these

Sol. (c) Given, $\frac{\sin\theta}{\cos\theta} + \frac{1}{\cos\theta} = \sqrt{3}$ $[\because \cos\theta \ne 0]$

$\Rightarrow \sqrt{3}\cos\theta - \sin\theta = 1$

On dividing both sides by 2, we have

$$\frac{\sqrt{3}}{2}\cos\theta - \frac{1}{2}\sin\theta = \frac{1}{2}$$

$\Rightarrow \cos\left(\theta + \frac{\pi}{6}\right) = \cos\frac{\pi}{3}$

$\Rightarrow \theta + \frac{\pi}{6} = 2n\pi \pm \frac{\pi}{3}$

Taking positive sign,

$$\theta + \frac{\pi}{6} = 2n\pi + \frac{\pi}{3}$$

$\Rightarrow \theta = 2n\pi + \frac{\pi}{6}$ ...(i)

Taking negative sign,

$$\theta + \frac{\pi}{6} = 2n\pi - \frac{\pi}{3}$$

$\Rightarrow \theta = 2n\pi - \frac{\pi}{2}$

$\Rightarrow \theta = (4n-1)\frac{\pi}{2}$ ...(ii)

From Eqs. (i) and (ii), values of θ between 0 and 2π are $\frac{\pi}{6}, \frac{3\pi}{2}$.

But when $\theta = \frac{3\pi}{2}$, then $\tan\theta$ and $\sec\theta$ does not exist, so it is rejected.

Hence, $\theta = \frac{\pi}{6}$

Work Book Exercise 9.3

1 In a ΔABC, $\angle A$ is greater than $\angle B$. If the values of the angles A and B satisfy the equation $3\sin x - 4\sin^3 x - k = 0$, $0 < k < 1$, then the measure of $\angle C$ is

a $\frac{\pi}{3}$ b $\frac{\pi}{2}$

c $\frac{2\pi}{3}$ d $\frac{5\pi}{6}$

2 The equation $(\cos p - 1)x^2 + (\cos p)x + \sin p = 0$, where x is a variable, has real roots. Then, p lies in

a $(0, 2\pi)$ b $(-\pi, 0)$ c $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ d $(0, \pi)$

3 The smallest positive root of the equation $\tan x - x = 0$, lies in

a $\left(0, \frac{\pi}{2}\right)$ b $\left(\frac{\pi}{2}, \pi\right)$ c $\left(\pi, \frac{3\pi}{2}\right)$ d $\left(\frac{3\pi}{2}, 2\pi\right)$

4 General solution of the equation $(\sqrt{3} - 1)\sin\theta + (\sqrt{3} + 1)\cos\theta = 2$ is

a $2n\pi \pm \frac{\pi}{4} + \frac{\pi}{12}$ b $n\pi + (-1)^n \frac{\pi}{4} + \frac{\pi}{12}$

c $2n\pi \pm \frac{\pi}{4} - \frac{\pi}{12}$ d $n\pi + (-1)^n \frac{\pi}{4} - \frac{\pi}{12}$

5 In a right angled triangle, the hypotenuse is $2\sqrt{2}$ times the length of perpendicular drawn from the opposite vertex on the hypotenuse, then the other two angles are

a $\frac{\pi}{3}, \frac{\pi}{6}$

b $\frac{\pi}{4}, \frac{\pi}{4}$

c $\frac{\pi}{8}, \frac{3\pi}{8}$

d $\frac{\pi}{12}, \frac{5\pi}{12}$

6 The solution set of $(2\cos x - 1)(3 + 2\cos x) = 0$ in the interval $0 \le x \le 2\pi$, is

a $\left\{\frac{\pi}{3}\right\}$

b $\left\{\frac{\pi}{3}, \frac{5\pi}{3}\right\}$

c $\left\{\frac{\pi}{3}, \frac{5\pi}{3}, \cos^{-1}\left(-\frac{3}{2}\right)\right\}$

d None of the above

7 The most general value of θ which satisfies both the equations $\tan\theta = -1$ and $\cos\theta = \frac{1}{\sqrt{2}}$, will be

a $n\pi + \frac{7\pi}{4}$

b $n\pi + (-1)^n \frac{7\pi}{4}$

c $2n\pi + \frac{7\pi}{4}$

d None of the above

8 General solution of $4\cot 2\theta = \cot^2\theta - \tan^2\theta$ is

a $n\pi, n \in I$ **b** $n\pi + (-1)^n \frac{\pi}{4}, n \in I$

c $n\pi \pm \frac{\pi}{4}, n \in I$ **d** None of these

9 The number of solutions of $2\sin^2 x + \sin^2 2x = 2$, $x \in [0, 2\pi]$ is

a 4 **b** 5

c 7 **d** 6

10 If the expression $\dfrac{\sin\frac{x}{2} + \cos\frac{x}{2} - i\tan x}{1 + 2i\sin\frac{x}{2}}$ is real, then x is equal to

a $2n\pi + 2\tan^{-1} k, k \in R, n \in Z$

b $2n\pi + 2\tan^{-1} k$, where $k \in (0, 1), n \in Z$

c $2n\pi + 2\tan^{-1} k$, where $k \in (1, 2), n \in Z$

d $2n\pi + 2\tan^{-1} k, k \in (2, 3), n \in Z$

Solving Simultaneous Equations

Here, we will discuss problems related to the solution of two equation satisfied simultaneously. We may divide the problems in two categories :

(i) Two equations in one 'unknown' satisfied simultaneously.

(ii) Two equations in two 'unknowns' satisfied simultaneously.

Example 46. *If the equations* $\sin\theta = -\frac{1}{2}$ *and* $\tan\theta = \frac{1}{\sqrt{3}}$, *then most common general value of* θ *is*

(a) $2n\pi \pm \frac{7\pi}{6}$

(b) $2n\pi - \frac{7\pi}{6}$

(c) $2n\pi + \frac{7\pi}{6}$

(d) None of the above

Sol. (c) First find the values of θ lying between 0 and 2π and satisfying the two given equations separately. Select the value of θ which satisfies both the equations, then generalise it.

$$\sin\theta = -\frac{1}{2}$$

$$\Rightarrow \quad \theta = \frac{7\pi}{6} \text{ or } \frac{11\pi}{6}$$

$$\tan\theta = \frac{1}{\sqrt{3}}$$

$$\Rightarrow \quad \theta = \frac{\pi}{6} \text{ or } \frac{7\pi}{6}$$

[values between 0 and 2π]

Common value of $\theta = \frac{7\pi}{6}$

The required solution is

$$\theta = 2n\pi + \frac{7\pi}{6}$$

Example 47. *If* $r > 0, -\pi \le \theta \le \pi$ *and* r, θ *satisfy* $r\sin\theta = 3$ *and* $r = 4(1 + \sin\theta)$, *then the number of possible solutions of the pair* (r, θ) *is*

(a) 2 *(b)* 4 *(c)* 0 *(d) infinite*

Sol. (a) On eliminating θ from two given equations, we get

$$r = 4\left(1 + \frac{3}{r}\right)$$

$$\Rightarrow \quad (r - 6)(r + 2) = 0 \Rightarrow r = 6$$

Neglecting $r = -2$, as $r > 0$

$$\therefore \quad \sin\theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{6}, \frac{5\pi}{6}$$

So, $(r, \theta) = \left(6, \frac{\pi}{6}\right), \left(6, \frac{5\pi}{6}\right)$

Example 48. *If* $3\sin^2\theta + 2\sin^2\phi = 1$ *and* $3\sin 2\theta = 2\sin 2\phi$, $0 < \theta < \frac{\pi}{2}$ *and* $0 < \phi < \frac{\pi}{2}$, *then the value of* $\theta + 2\phi$ *is*

(a) $\frac{\pi}{2}$ *(b)* $\frac{\pi}{4}$

(c) 0 *(d) None of these*

Sol. (a) Here, $3\sin^2\theta = \cos 2\phi$ and $3\sin\theta\cos\theta = \sin 2\phi$

On squaring and adding, we get

$$9\sin^2\theta(\sin^2\theta + \cos^2\theta) = 1$$

i.e. $\sin\theta = \frac{1}{3}$ and $\cos\theta = \frac{2\sqrt{2}}{3}$

$$\therefore \quad \cos 2\phi = 3 \cdot \frac{1}{9} = \frac{1}{3} \text{ and } \sin 2\phi = \frac{2\sqrt{2}}{3}$$

Now, $\cos(\theta + 2\phi) = \cos\theta\cos 2\phi - \sin\theta\sin 2\phi$

$$= \frac{2\sqrt{2}}{3} \cdot \frac{1}{3} - \frac{1}{3} \cdot \frac{2\sqrt{2}}{3} = 0$$

and $\theta + 2\phi < \frac{3\pi}{2}$

$$\therefore \quad \theta + 2\phi = \frac{\pi}{2}$$

Solution of Trigonometric Inequality

To solve trigonometric inequality, we must use graph of the trigonometric functions which would be clear from the following examples:

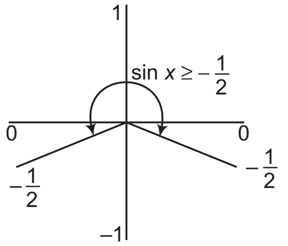
Example 49. *If* $2\sin x + 1 \geq 0$ *and* $x \in [0, 2\pi]$, *then the solution set for x is*

(a) $\left[0, \frac{7\pi}{6}\right]$ (b) $\left[0, \frac{7\pi}{6}\right] \cup \left[\frac{11\pi}{6}, 2\pi\right]$

(c) $\left[\frac{11\pi}{6}, 2\pi\right]$ (d) None of these

Sol. (b) $2\sin x + 1 \geq 0 \Rightarrow \sin x \geq -\frac{1}{2}$

The value scheme for this is shown below:



From the figure,

$$\frac{11\pi}{6} \leq x \leq 2\pi \quad \text{or} \quad 0 \leq x \leq \frac{7\pi}{6}$$

$$\therefore \quad x \in \left[0, \frac{7\pi}{6}\right] \cup \left[\frac{11\pi}{6}, 2\pi\right]$$

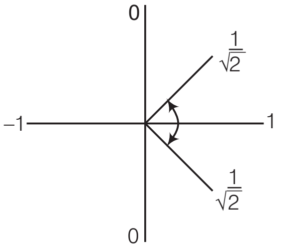
Example 50. *If* $\cos x - \sin x \geq 1$ *and* $0 \leq x \leq 2\pi$, *then the solution set for x is*

(a) $\left[0, \frac{\pi}{4}\right] \cup \left[\frac{7\pi}{4}, 2\pi\right]$ (b) $\left[\frac{3\pi}{2}, \frac{7\pi}{4}\right] \cup \{0\}$

(c) $\left[\frac{3\pi}{2}, 2\pi\right] \cup \{0\}$ (d) None of these

Sol. (c) $\cos\left(x + \frac{\pi}{4}\right) \geq \frac{1}{\sqrt{2}}$

The value scheme for this is shown below:



From the figure, $-\frac{\pi}{4} \leq x + \frac{\pi}{4} \leq \frac{\pi}{4}$

and in general, $2n\pi - \frac{\pi}{4} \leq x + \frac{\pi}{4} \leq 2n\pi + \frac{\pi}{4}$

$$\therefore \quad 2n\pi - \frac{\pi}{2} \leq x \leq 2n\pi$$

For $n = 0$, $-\frac{\pi}{2} \leq x \leq 0$; for $n = 1$, $\frac{3\pi}{2} \leq x \leq 2\pi$

Example 51. *The solution set of inequality* $\sin x > \frac{1}{2}$ *is*

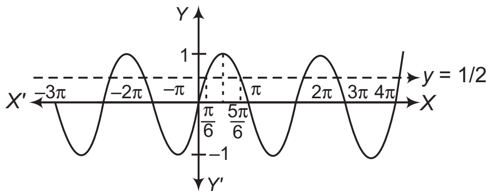
(a) $\bigcup_{n \in I}\left(2n\pi + \frac{\pi}{6}, n\pi + \frac{5\pi}{6}\right)$

(b) $\bigcup_{n \in I}\left(2n\pi - \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$

(c) $\bigcup_{n \in I}\left(n\pi + \frac{\pi}{6}, n\pi + \frac{5\pi}{6}\right)$

(d) $\bigcup_{n \in I}\left(2n\pi + \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$

Sol. (d) From the graph of $y = \sin x$, it obvious that between 0 and 2π,



$$\sin x > \frac{1}{2} \text{ for } \frac{\pi}{6} < x < \frac{5\pi}{6}$$

Hence, $\sin x > \frac{1}{2} \Rightarrow 2n\pi + \frac{\pi}{6} < x < 2n\pi + \frac{5\pi}{6}$

The required solution set is $\bigcup_{n \in I}\left(2n\pi + \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$.

Problems on Extremum Values

Example 52. *If equation* $\sin^4 x = 1 + \tan^8 x$, *then x is equal to*

(a) ϕ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{4}$

Sol. (a) $\sin^4 x = 1 + \tan^8 x$ only when

$\sin^4 x = 1$ and $1 + \tan^8 x = 1$

$\Rightarrow \quad \sin^2 x = 1$ and $\tan^8 x = 0$

which is never possible, since $\sin x$ and $\tan x$ vanish simultaneously. Therefore, the given equation has no solution.

Example 53. *If* $\sin^2 x + \cos^2 y = 2\sec^2 z$, *then*

(a) $x = (2m+1)\frac{\pi}{2}$, $y = n\pi$ *and* $z = t\pi$

(b) $x = (m+1)\frac{\pi}{2}$, $y = 2n\pi$ *and* $z = t\pi$

(c) $x = (2m-1)\frac{\pi}{2}$, $y = n\pi$ *and* $z = 2t\pi$

(d) None of the above

Sol. (a) $\sin^2 x + \cos^2 y = 2\sec^2 z$ only when

$\sin^2 x = 1$, $\cos^2 y = 1$, $\sec^2 z = 1$

$\Rightarrow \quad \cos^2 x = 0$, $\sin^2 y = 0$, $\cos^2 z = 1$

$\Rightarrow \quad \cos x = 0$, $\sin y = 0$, $\sin z = 0$

$\therefore \quad x = (2m+1)\frac{\pi}{2}$, $y = n\pi$ and $z = t\pi$

where, m, n and t are integers.

Example 54. *The number of solutions of the equation $x^3 + x^2 + 4x + 2\sin x = 0$ in $0 \le x \le 2\pi$, is*

(a) 0 (b) 1
(c) 2 (d) 4

Sol. (b) Here, $x^3 + (x+2)^2 + 2\sin x = 4$

Clearly, $x = 0$ satisfies the equation.

If $0 < x \le \pi$, $x^3 + (x+2)^2 + 2\sin x > 4$

If $\pi < x \le 2\pi$, $x^3 + (x+2)^2 + 2\sin x > 27 + 25 - 2$

So, $x = 0$ is the only solution.

Example 55. *The number of real solutions of $\sin e^x \cdot \cos e^x = 2^{x-2} + 2^{-x-2}$ is*

(a) 0 (b) 1
(c) 2 (d) infinite

Sol. (a) Here, $\frac{1}{2}\sin(2e^x) = \frac{1}{4}(2^x + 2^{-x}) \ge \frac{1}{4} \cdot 2 = \frac{1}{2}$

So, $\sin(2e^x) \ge 1$

But $\sin(2e^x) \not> 1$

$\therefore$ $\sin(2e^x) = 1$

But equality can hold when $2^x = 2^{-x} = 1$

i.e. $x = 0$

$\sin(2 \cdot e^0) = 1$

which is not true.

Example 56. *If $2\cos^2\frac{x}{2}\sin^2 x = x^2 + x^{-2}$, $0 < x \le \frac{\pi}{2}$, then x is equal to*

(a) ϕ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{4}, \frac{\pi}{3}$

Sol. (a) LHS $= 2\cos^2\frac{x}{2}\sin^2 x$

$= (1 + \cos x)\sin^2 x < 2$ $[\because 1 + \cos x < 2, \sin^2 x \le 1]$

RHS $= x^2 + x^{-2} = x^2 + \frac{1}{x^2} \ge 2$

Hence, the given equation has no solution.

Example 57. *If $\sin^6 x = 1 + \cos^4 3x$, then x is equal to*

(a) $(2n-1)\frac{\pi}{4}$, $n \in I$ (b) $(2n+1)\frac{3\pi}{4}$, $n \in I$

(c) $(2n+1)\frac{\pi}{2}$, $n \in I$ (d) None of these

Sol. (c) $\sin^6 x = 1 + \cos^4 3x \le 1$

$\sin^6 x = 1 + \cos^4 3x \le 1$ is possible only when

$\sin^6 x = 1 + \cos^4 3x = 1$

$\Rightarrow$ $\sin^6 x = 1$ and $1 + \cos^4 3x = 1$

$\Rightarrow$ $\sin^2 x = 1$ and $\cos^4 3x = 0$

$\Rightarrow$ $\cos^2 x = 0$ and $\cos 3x = 0$

$\Rightarrow$ $\cos x = 0$ and $\cos 3x = 0$

$\Rightarrow$ $x = (2m+1)\frac{\pi}{2}$

and $3x = (2n+1)\frac{\pi}{2}$, where $m, n \in I$

$\Rightarrow$ $x = (2m+1)\frac{\pi}{2}$

and $x = (2n+1)\frac{\pi}{6}$

Common value of x is $(2n+1)\frac{\pi}{2}$, where $n \in I$.

The required solution is $x = (2n+1)\frac{\pi}{2}$, $n \in I$.

Work Book Exercise 9.4

1 If A and B are acute positive angles satisfying the equations $3\sin^2 A + 2\sin^2 B = 1$ and $3\sin 2A - 2\sin 2B = 0$, then $A + 2B$ is equal to

a 0 b $\frac{\pi}{2}$
c $\frac{\pi}{4}$ d $\frac{\pi}{3}$

2 If $\sin A = \sin B$, $\cos A = \cos B$, then the value of A in terms of B is

a $n\pi + B$
b $n\pi + (-1)^n B$
c $2n\pi + B$
d $2n\pi - B$

3 The number of pairs (x, y) satisfying the equations $\sin x + \sin y = \sin(x + y)$ and $|x| + |y| = 1$ is

a 2
b 4
c 6
d infinite

4 If $\cos(\alpha - \beta) = 1$ and $\cos(\alpha + \beta) = \frac{1}{e}$, then the number of ordered pairs $(\alpha, \beta) \in [-\pi, \pi]$ is

a 0 b 1
c 2 d 4

5 The number of all possible ordered pairs (x, y), $x, y \in R$ satisfying the system of equations $x + y = \frac{2\pi}{3}$, $\cos x + \cos y = \frac{3}{2}$ is

a 0
b 1
c infinite
d None of the above

6 The number of distinct roots of the equation $A\sin^3 x + B\cos^3 x + C = 0$ no two of which differ by 2π, is

a 3
b 4
c infinite
d 6

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. The maximum value of

$4\sin^2 x + 3\cos^2 x + \sin\frac{x}{2} + \cos\frac{x}{2}$ is

(a) $4+\sqrt{2}$ (b) $3+\sqrt{2}$

(c) 9 (d) 4

Sol. Maximum value of $4\sin^2 x + 3\cos^2 x$ i.e. $\sin^2 x + 3$ is 4 and that of $\sin\frac{x}{2} + \cos\frac{x}{2}$ is $\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} = \sqrt{2}$, both attained at $x = \frac{\pi}{4}$. So, the given function has maximum value $4 + \sqrt{2}$.

Hence, (a) is the correct answer.

Ex 2. If in a ΔABC, $\angle C = 90°$, then the maximum value of $\sin A \sin B$ is

(a) $\frac{1}{2}$ (b) 1

(c) 2 (d) None of these

Sol.

$$\begin{aligned}\sin A \sin B &= \frac{1}{2} \times 2\sin A \sin B\\ &= \frac{1}{2}[\cos(A-B) - \cos(A+B)]\\ &= \frac{1}{2}[\cos(A-B) - \cos 90°]\\ &= \frac{1}{2}\cos(A-B) \le \frac{1}{2}\end{aligned}$$

$\therefore$ Maximum value of $\sin A \sin B = \frac{1}{2}$

Hence, (a) is the correct answer.

Ex 3. The maximum value of $\sin(\cos x)$ is

(a) $\sin 1$ (b) 1

(c) $\sin\left(\frac{1}{\sqrt{2}}\right)$ (d) $\sin\left(\frac{\sqrt{3}}{2}\right)$

Sol. $\cos x \in [-1, 1], \forall x \in R$ and $\sin x$ is increasing in $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

$\therefore$ Maximum value of $\sin(\cos x) = \sin 1$

Hence, (a) is the correct answer.

Ex 4. If $x \in (\pi, 2\pi)$ and

$\frac{\sqrt{1+\cos x} + \sqrt{1-\cos x}}{\sqrt{1+\cos x} - \sqrt{1-\cos x}} = \cot\left(a + \frac{x}{2}\right)$, then a is equal to

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$

(c) $\frac{\pi}{3}$ (d) None of these

Sol. $\because \sqrt{1+\cos x} = \sqrt{2\cos^2\frac{x}{2}} = \sqrt{2}\left|\cos\frac{x}{2}\right|$

and $\sqrt{1-\cos x} = \sqrt{2\sin^2\frac{x}{2}} = \sqrt{2}\left|\sin\frac{x}{2}\right|$

$$\begin{aligned}\therefore \frac{\sqrt{1+\cos x} + \sqrt{1-\cos x}}{\sqrt{1+\cos x} - \sqrt{1-\cos x}} &= \frac{\left|\cos\frac{x}{2}\right| + \left|\sin\frac{x}{2}\right|}{\left|\cos\frac{x}{2}\right| - \left|\sin\frac{x}{2}\right|} = \frac{-\cos\frac{x}{2} + \sin\frac{x}{2}}{-\cos\frac{x}{2} - \sin\frac{x}{2}}\\ &= \frac{\cos\frac{x}{2} - \sin\frac{x}{2}}{\cos\frac{x}{2} + \sin\frac{x}{2}}\\ &= \frac{1 - \tan\frac{x}{2}}{1 + \tan\frac{x}{2}} = \tan\left(\frac{\pi}{4} - \frac{x}{2}\right)\\ &= \cot\left[\frac{\pi}{2} - \left(\frac{\pi}{4} + \frac{x}{2}\right)\right] = \cot\left(\frac{\pi}{4} + \frac{x}{2}\right)\end{aligned}$$

$\therefore \quad a = \frac{\pi}{4}$

Hence, (a) is the correct answer.

Ex 5. Let $0 < A, B < \frac{\pi}{2}$ satisfying the equation $3\sin^2 A + 2\sin^2 B = 1$ and $3\sin 2A - 2\sin 2B = 0$, then $A + 2B$ is equal to

(a) π (b) $\frac{\pi}{2}$

(c) $\frac{\pi}{4}$ (d) 2π

Sol. From the second equation, we have

$$\sin 2B = \frac{3}{2}\sin 2A \qquad \text{...(i)}$$

and from the first equality,

$$3\sin^2 A = 1 - 2\sin^2 B = \cos 2B \qquad \text{...(ii)}$$

$$\begin{aligned}\text{Now, } \cos(A+2B) &= \cos A \cos 2B - \sin A \sin 2B\\ &= 3\cos A \sin^2 A - \frac{3}{2}\cdot \sin A \sin 2A\\ &= 3\cos A \sin^2 A - 3\sin^2 A \cos A = 0\end{aligned}$$

$\Rightarrow \quad A + 2B = \frac{\pi}{2}$ or $\frac{3\pi}{2}$

Given that, $\quad 0 < A < \frac{\pi}{2}$ and $\quad 0 < B < \frac{\pi}{2}$

$\Rightarrow \qquad 0 < A + 2B < \frac{\pi}{2} + \pi$

So, $\quad A + 2B = \frac{\pi}{2}$, neglecting $\frac{3\pi}{2}$

Hence, (b) is the correct answer.

Ex 6. If α, β, γ and δ are the solutions of the equation $\tan\left(\theta + \frac{\pi}{4}\right) = 3\tan 3\theta$, no two of which have equal tangents, then the value of $\tan\alpha + \tan\beta + \tan\gamma + \tan\delta$ is

(a) 1 (b) -1
(c) 2 (d) 0

Sol. We have,

$$\tan\left(\theta + \frac{\pi}{4}\right) = 3\tan 3\theta$$

$$\Rightarrow \frac{1+\tan\theta}{1-\tan\theta} = 3\cdot\frac{3\tan\theta - \tan^3\theta}{1-3\tan^2\theta}$$

$$\Rightarrow \frac{1+t}{1-t} = 3\left(\frac{3t-t^3}{1-3t^2}\right) \quad [\text{putting } t = \tan\theta]$$

$$\Rightarrow 3t^4 - 6t^2 + 8t - 1 = 0$$

So, $t_1 + t_2 + t_3 + t_4 = \frac{0}{3} = 0$

$\therefore \tan\alpha + \tan\beta + \tan\gamma + \tan\delta = 0$

Hence, (d) is the correct answer.

Ex 7. For all θ in $\left[0, \frac{\pi}{2}\right]$, $\cos(\sin\theta)$ is

(a) $< \sin(\cos\theta)$ (b) $> \sin(\cos\theta)$
(c) $= \sin(\cos\theta)$ (d) None of these

Sol. We have,

$$\cos\theta + \sin\theta = \sqrt{2}\left[\frac{1}{\sqrt{2}}\cos\theta + \frac{1}{\sqrt{2}}\sin\theta\right]$$

$$= \sqrt{2}\left[\cos\frac{\pi}{4}\cos\theta + \sin\frac{\pi}{4}\sin\theta\right]$$

$$= \sqrt{2}\cos\left(\theta - \frac{\pi}{4}\right)$$

$$\Rightarrow \cos\theta + \sin\theta \le \sqrt{2} < \frac{\pi}{2}$$

$$\Rightarrow \cos\theta < \frac{\pi}{2} - \sin\theta$$

$$\Rightarrow \sin(\cos\theta) < \sin\left(\frac{\pi}{2} - \sin\theta\right)$$

$$\Rightarrow \sin(\cos\theta) < \cos(\sin\theta)$$

$$\Rightarrow \cos(\sin\theta) > \sin(\cos\theta)$$

Hence, (b) is the correct answer.

Ex 8. The smallest positive number p for which the equation $\cos(p\sin x) = \sin(p\cos x)$ has a solution $x \in [0, 2\pi]$, is equal to

(a) π (b) $\frac{\pi}{\sqrt{2}}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{2\sqrt{2}}$

Sol. We have, $\cos(p\sin x) = \sin(p\cos x)$

$$\Rightarrow \sin\left(\frac{\pi}{2} \pm p\sin x\right) = \sin(p\cos x)$$

$$\Rightarrow \frac{\pi}{2} \pm p\sin x = p\cos x$$

$$\Rightarrow \frac{\pi}{2} = p\cos x \pm p\sin x$$

$$\Rightarrow \frac{\pi}{2p} = \cos x \pm \sin x = \sqrt{2}\left(\frac{1}{\sqrt{2}}\cos x \pm \frac{1}{\sqrt{2}}\sin x\right)$$

$$\Rightarrow \frac{\pi}{2\sqrt{2}p} = \cos\left(x \pm \frac{\pi}{4}\right) \le 1$$

$$\Rightarrow p \ge \frac{\pi}{2\sqrt{2}}$$

Now, the smallest value of $p = \frac{\pi}{2\sqrt{2}}$

Hence, (d) is the correct answer.

Ex 9. If α and β are solutions of $\sin^2 x + a\sin x + b = 0$ as well that of $\cos^2 x + c\cos x + d = 0$, then $(\alpha + \beta)$ is equal to

(a) $\frac{2bd}{b^2+d^2}$ (b) $\frac{a^2+c^2}{2ac}$
(c) $\frac{b^2+d^2}{2bd}$ (d) $\frac{2ac}{a^2+c^2}$

Sol. According to the given condition,

$\sin\alpha + \sin\beta = -a$ and $\cos\alpha + \cos\beta = -c$

$$\Rightarrow 2\sin\frac{\alpha+\beta}{2}\cos\frac{\alpha-\beta}{2} = -a$$

and
$$2\cos\frac{\alpha+\beta}{2}\cos\frac{\alpha-\beta}{2} = -c$$

$$\Rightarrow \tan\frac{\alpha+\beta}{2} = \frac{a}{c}$$

$$\Rightarrow \sin(\alpha+\beta) = \frac{2\tan\frac{\alpha+\beta}{2}}{1+\tan^2\frac{\alpha+\beta}{2}} = \frac{2ac}{a^2+c^2}$$

Hence, (d) is the correct answer.

Ex 10. If $S = \cos^2\frac{\pi}{n} + \cos^2\frac{2\pi}{n} + \ldots + \cos^2\frac{(n-1)\pi}{n}$, then S equals

(a) $\frac{n}{2}(n+1)$ (b) $\frac{1}{2}(n-1)$
(c) $\frac{1}{2}(n-2)$ (d) $\frac{n}{2}$

Sol. $S = \cos^2\frac{\pi}{n} + \cos^2\frac{2\pi}{n} + \ldots + \cos^2(n-1)\frac{\pi}{n}$

$$= \frac{1}{2}\left[1 + \cos\frac{2\pi}{n} + 1 + \cos\frac{4\pi}{n} + 1 + \cos\frac{6\pi}{n} + \ldots + 1 + \cos 2(n-1)\frac{\pi}{n}\right]$$

$$= \frac{1}{2}\left[n - 1 + \sum_{k=1}^{n-1}\cos\frac{2k\pi}{n}\right]$$

$$= \frac{1}{2}[n-1-1] = \frac{1}{2}(n-2)$$

Hence, (c) is the correct answer.

Ex 11. If $\sin\theta = 3\sin(\theta + 2\alpha)$, then the value of $\tan(\theta+\alpha) + 2\tan\alpha$ is

(a) 3 (b) 2 (c) 1 (d) 0

Sol. Given, $\sin\theta = 3\sin(\theta + 2\alpha)$

$$\Rightarrow \sin(\theta + \alpha - \alpha) = 3\sin(\theta + \alpha + \alpha)$$

$$\Rightarrow \sin(\theta+\alpha)\cos\alpha - \cos(\theta+\alpha)\sin\alpha = 3\sin(\theta+\alpha)\cos\alpha + 3\cos(\theta+\alpha)\sin\alpha$$

$$\Rightarrow -2\sin(\theta+\alpha)\cos\alpha = 4\cos(\theta+\alpha)\sin\alpha$$

$$\Rightarrow \quad -\frac{\sin(\theta+\alpha)}{\cos(\theta+\alpha)} = \frac{2\sin\alpha}{\cos\alpha}$$

$$\Rightarrow \quad \tan(\theta+\alpha) + 2\tan\alpha = 0$$

Hence, (d) is the correct answer.

Ex 12. The numerical value of $\tan 20° \tan 80° \cot 50°$ is

(a) $\sqrt{3}$ (b) $\frac{1}{\sqrt{3}}$

(c) $2\sqrt{3}$ (d) $\frac{1}{2\sqrt{3}}$

Sol. $\tan 20° \tan 80° \cot 50°$

$$= \tan(50° - 30°)\tan(50° + 30°)\frac{1}{\tan 50°}$$

$$= \frac{\tan 50° - 1/\sqrt{3}}{1+\tan 50°/\sqrt{3}} \cdot \frac{\tan 50° + 1/\sqrt{3}}{1-\tan 50°/\sqrt{3}} \frac{1}{\tan 50°}$$

$$= \frac{3\tan^2 50° - 1}{3\tan 50° - \tan^3 50°} = -\cot(150°) = \cot 30° = \sqrt{3}$$

Hence, (a) is the correct answer.

Ex 13. If $A + B = \frac{\pi}{3}$, where $A, B \in R^+$, then the minimum value of $\sec A + \sec B$ is

(a) $\frac{2}{\sqrt{3}}$ (b) $\frac{4}{\sqrt{3}}$

(c) $2\sqrt{3}$ (d) None of these

Sol. For $y = \sec x, x \in [0, \pi/2)$, tangent drawn to it any point lies completely below the graph of $y = \sec x$, thus

$$\frac{\sec A + \sec B}{2} \geq \sec\left(\frac{A+B}{2}\right)$$

$$\Rightarrow \quad \sec A + \sec B \geq 2 \cdot \sec\left(\frac{\pi}{6}\right) = \frac{4}{\sqrt{3}}$$

Hence, (b) is the correct answer.

Ex 14. If $A + B = \frac{\pi}{2}$, where $A, B \in R^+$, then the maximum value of $\sin A + \sin B$ is

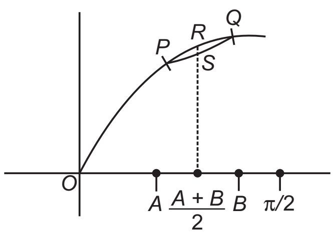
(a) 1

(b) $\sqrt{3}$

(c) $\sqrt{2}$

(d) None of the above

Sol. For $y = \sin x;\ x \in [0, \pi/2]$



From the above curve,

$$\frac{\sin A + \sin B}{2} \leq \sin\left(\frac{A+B}{2}\right) = \sin\frac{\pi}{4}$$

$$\Rightarrow \quad \sin A + \sin B \leq \sqrt{2}$$

Hence, (c) is the correct answer.

Ex 15. If $\cos x = \frac{2\cos y - 1}{2 - \cos y}$, where $x, y \in (0, \pi)$, then $\tan\frac{x}{2}\cot\frac{y}{2}$ is equal to

(a) $\sqrt{2}$ (b) $\sqrt{3}$

(c) $\frac{1}{\sqrt{2}}$ (d) $\frac{1}{\sqrt{3}}$

Sol. Given, $\quad \cos x = \frac{2\cos y - 1}{2 - \cos y}$

$$\Rightarrow \quad \frac{1-\tan^2\frac{x}{2}}{1+\tan^2\frac{x}{2}} = \frac{\frac{2(1-\tan^2 y/2)}{1+\tan^2 y/2} - 1}{2 - \frac{1-\tan^2 y/2}{1+\tan^2 y/2}}$$

$$\Rightarrow \quad 6\tan^2\frac{y}{2} = 2\tan^2\frac{x}{2}$$

$$\Rightarrow \quad \tan\frac{x}{2} \cdot \cot\frac{y}{2} = \sqrt{3}$$

Hence, (b) is the correct answer.

Ex 16. If $\sin x + \sin^2 x = 1$, then the value of $\cos^{12} x + 3\cos^{10} x + 3\cos^8 x + \cos^6 x$ is

(a) 1 (b) -1

(c) 2 (d) -2

Sol. Let $I = \cos^{12} x + 3\cos^{10} x + 3\cos^8 x + \cos^6 x$

$$= \cos^{12} x + 3 \cdot \cos^8 x(\cos^2 x + 1) + \cos^6 x$$

$$= (\cos^4 x)^3 + 3\cos^6 x(\cos^4 x + \cos^2 x) + (\cos^2 x)^3$$

$$= (\cos^4 x + \cos^2 x)^3 = [\cos^2 x(\cos^2 x + 1)]^3$$

We have, $\sin x = 1 - \sin^2 x = \cos^2 x$

$$\Rightarrow \quad \sin x = \cos^2 x = \frac{-1+\sqrt{5}}{2}$$

$$\Rightarrow \quad I = \left[\frac{\sqrt{5}-1}{2}\left(\frac{\sqrt{5}+1}{2}\right)\right]^3 = 1$$

Hence, (a) is the correct answer.

Ex 17. If $\frac{1+\sin 2x}{1-\sin 2x} = \cot^2(a + x)$,

$\forall x \in R \sim \left(n\pi + \frac{\pi}{4}\right), n \in N$, then a is equal to

(a) $\frac{\pi}{4}$

(b) $\frac{\pi}{2}$

(c) $\frac{3\pi}{4}$

(d) None of the above

Sol. $\frac{1+\sin 2x}{1-\sin 2x} = \frac{(\sin x + \cos x)^2}{(\sin x - \cos x)^2} = \left(\frac{1+\cot x}{1-\cot x}\right)^2$

$$\Rightarrow \left(\frac{1+\tan x}{1-\tan x}\right)^2 = \left[\tan\left(\frac{\pi}{4}+x\right)\right]^2 = \tan^2\left(\frac{\pi}{4}+x\right)$$

$$= \cot^2\left(\frac{\pi}{2}+\frac{\pi}{4}+x\right) = \cot^2\left(\frac{3\pi}{4}+x\right)$$

Hence, (c) is the correct answer.

Ex 18. If $\sin\alpha\sin\beta - \cos\alpha\cos\beta + 1 = 0$, then the value of $\cot\alpha\tan\beta$ is

(a) -1 (b) 0
(c) 1 (d) None of these

Sol. Given, $\sin\alpha\sin\beta - \cos\alpha\cos\beta + 1 = 0$

$\Rightarrow \cos(\alpha+\beta) = 1 \Rightarrow \alpha+\beta = 2n\pi$

$$1+\cot\alpha\tan\beta = 1+\frac{\cos\alpha}{\sin\alpha}\cdot\frac{\sin\beta}{\cos\beta} = \frac{\sin\alpha\cos\beta+\cos\alpha\sin\beta}{\sin\alpha\cos\beta} = \frac{\sin(\alpha+\beta)}{\sin\alpha\cos\beta} = \frac{\sin(2n\pi)}{\sin\alpha\cos\beta} = 0$$

$\Rightarrow \cot\alpha\tan\beta = -1$

Hence, (a) is the correct answer.

Ex 19. If $\tan x = n\tan y$, $n\in R^+$, then maximum value of $\sec^2(x-y)$ is

(a) $\frac{(n+1)^2}{2n}$ (b) $\frac{(n+1)^2}{n}$ (c) $\frac{(n+1)^2}{2}$ (d) $\frac{(n+1)^2}{4n}$

Sol. Given, $\tan x = n\tan y$

We know that, $\cos(x-y) = \cos x\cos y + \sin x\sin y$

$\Rightarrow \cos(x-y) = \cos x\cos y(1+\tan x\tan y) = \cos x\cos y(1+n\tan^2 y)$

$$\Rightarrow \sec^2(x-y) = \frac{\sec^2 x\sec^2 y}{(1+n\tan^2 y)^2} = \frac{(1+\tan^2 x)(1+\tan^2 y)}{(1+n\tan^2 y)^2} = \frac{(1+n^2\tan^2 y)(1+\tan^2 y)}{(1+n\tan^2 y)^2} = 1+\frac{(n-1)^2\tan^2 y}{(1+n\tan^2 y)^2}$$

Now, $\left(\frac{1+n\tan^2 y}{2}\right)^2 \ge n\tan^2 y$

$$\Rightarrow \frac{\tan^2 y}{(1+n\tan^2 y)^2} \le \frac{1}{4n}$$

$$\Rightarrow \sec^2(x-y) \le 1+\frac{(n-1)^2}{4n} = \frac{(n+1)^2}{4n}$$

Hence, (d) is the correct answer.

Ex 20. If $f(x) = \cos x(\sin x + \sqrt{\sin^2 x + \sin^2\theta})$, where θ is a given constant, then maximum value of $f(x)$ is

(a) $\sqrt{1+\cos^2\theta}$ (b) $\sqrt{1+\sin^2\theta}$
(c) $|\cos\theta|$ (d) $|\sin\theta|$

Sol. $f(x) = \cos x(\sin x + \sqrt{\sin^2 x + \sin^2\theta})$

$\Rightarrow (f(x)\cdot\sec x - \sin x)^2 = \sin^2 x + \sin^2\theta$

$\Rightarrow f^2(x)\cdot\sec^2 x - 2f(x)\cdot\tan x = \sin^2\theta$

$\Rightarrow f^2(x)\cdot\tan^2 x - 2f(x)\cdot\tan x + f^2(x) - \sin^2\theta = 0$

$\Rightarrow 4f^2(x) \ge 4f^2(x)[f^2(x) - \sin^2\theta]$

$\Rightarrow f^2(x) \le 1+\sin^2\theta \Rightarrow |f(x)| \le \sqrt{1+\sin^2\theta}$

Hence, (b) is the correct answer.

Ex 21. If $a\cos 2\theta + b\sin 2\theta = c$ has α and β as its solutions, then $\tan\alpha+\tan\beta$ and $\tan\alpha\tan\beta$ are, respectively

(a) $\frac{2b}{c+a}, \frac{c-a}{c+a}$ (b) $\frac{c+a}{2b}, \frac{c-a}{c+a}$
(c) $\frac{2b}{c-a}, \frac{c-a}{c+a}$ (d) $\frac{2b}{c+a}, \frac{c+a}{c-a}$

Sol. We have, $a\cos 2\theta + b\sin 2\theta = c$

$\Rightarrow a(\cos^2\theta - \sin^2\theta) + 2b\sin\theta\cos\theta = c$

$\Rightarrow a(1-\tan^2\theta) + 2b\tan\theta = c\sec^2\theta = c(1+\tan^2\theta)$

$\Rightarrow \tan^2\theta(c+a) - 2b\tan\theta + c - a = 0$

This equation has $\tan\alpha$ and $\tan\beta$ as its roots.

$$\Rightarrow \tan\alpha+\tan\beta = \frac{2b}{(c+a)} \text{ and } \tan\alpha\tan\beta = \left(\frac{c-a}{c+a}\right)$$

Hence, (a) is the correct answer.

Ex 22. If $\frac{\tan^3 A}{\tan A} = k$, then $\frac{\sin 3A}{\sin A}$ is equal to

(a) $\frac{2k}{k-1}$ (b) $\frac{2k}{k+1}$
(c) $\frac{3k}{k+1}$ (d) None of these

Sol. $$\frac{\tan 3A}{\tan A} = \frac{3\tan A - \tan^3 A}{1-3\tan^2 A}\cdot\frac{1}{\tan A} = k$$

$$\Rightarrow \frac{3-\tan^2 A}{1-3\tan^2 A} = k$$

$\Rightarrow 3-\tan^2 A = k(1-3\tan^2 A)$

$\Rightarrow (3k-1)\tan^2 A = k-3$

$$\therefore \tan^2 A = \frac{k-3}{3k-1}$$

Now, $$\frac{\sin 3A}{\sin A} = \frac{3\sin A - 4\sin^3 A}{\sin A}$$

$$= 3-4\sin^2 A = 3-\frac{4}{1+\frac{1}{\tan^2 A}} = 3-\frac{4}{1+\frac{3k-1}{k-3}} = 3-\frac{4(k-3)}{4(k-1)} = \frac{3k-3-k+3}{k-1} = \frac{2k}{k-1}$$

Hence, (a) is the correct answer.

Ex 23. If $1+\cot\theta \le \frac{\pi}{2}$, for $0<\theta<\pi$, then θ is equal to

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{8}$

Sol. $\because$ $$\tan\theta = \frac{2\tan\frac{\theta}{2}}{1-\tan^2\frac{\theta}{2}}$$

$$\Rightarrow \cot\theta = \frac{\cot^2\frac{\theta}{2}-1}{2\cot\frac{\theta}{2}}$$

Now, $1+\cot\theta-\cot\frac{\theta}{2}=1+\dfrac{\cot^2\frac{\theta}{2}-1}{2\cot\frac{\theta}{2}}-\cot\frac{\theta}{2}$

$$=\frac{2\cot\frac{\theta}{2}+\cot^2\frac{\theta}{2}-1-2\cot^2\frac{\theta}{2}}{2\cot\frac{\theta}{2}}$$

$$=\frac{-\left(\cot\frac{\theta}{2}-1\right)^2}{2\cot\frac{\theta}{2}}\le 0, \text{ for } 0<\theta<\pi$$

$\Rightarrow \quad 1+\cot\theta-\cot\frac{\theta}{2}\le 0$

Equality holds when $\cot\frac{\theta}{2}-1=0$

$\therefore \quad \theta=\frac{\pi}{2}$

Hence, (c) is the correct answer.

Ex 24. The value of $\cos\frac{2\pi}{15}\cos\frac{4\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}$ is

(a) $\frac{1}{16}$ (b) $\frac{1}{32}$
(c) $\frac{1}{64}$ (d) $\frac{1}{8}$

Sol. $\cos\frac{2\pi}{15}\cos\frac{4\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}$

$$=\frac{1}{2\sin\frac{2\pi}{15}}\cdot 2\sin\frac{2\pi}{15}\cos\frac{2\pi}{15}\cos\frac{4\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}$$

$$=\frac{1}{2\sin\frac{2\pi}{15}}\cdot\sin\frac{4\pi}{15}\cos\frac{4\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}$$

$$=\frac{1}{4\sin\frac{2\pi}{15}}\cdot\sin\frac{8\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}$$

$$=\frac{1}{8\sin\frac{2\pi}{15}}\cdot\sin\frac{16\pi}{15}\cos\frac{16\pi}{15}$$

$$=\frac{1}{16\sin\frac{2\pi}{15}}\cdot\sin\frac{32\pi}{15}$$

$$=\frac{1}{16\sin\frac{2\pi}{15}}\cdot\sin\left(2\pi+\frac{2\pi}{15}\right)$$

$$=\frac{1}{16\sin\frac{2\pi}{15}}\cdot\sin\frac{2\pi}{15}=\frac{1}{16}$$

Aliter

Use $\cos A\cos 2A\cos 2^2A\ldots\cos 2^{n-1}A=\dfrac{\sin 2^n A}{2^n\sin A}$

$$\therefore \cos\frac{2\pi}{15}\cos\frac{4\pi}{15}\cos\frac{8\pi}{15}\cos\frac{16\pi}{15}=\frac{\sin 2^4\cdot\frac{\pi}{15}}{2^4\sin\frac{\pi}{15}}=\frac{1}{16}$$

Hence, (a) is the correct answer.

Ex 25. The value of $\left(1+\cos\frac{\pi}{8}\right)\left(1+\cos\frac{3\pi}{8}\right)\left(1+\cos\frac{5\pi}{8}\right)\left(1+\cos\frac{7\pi}{8}\right)$ is

(a) $\frac{1}{4}$ (b) $\frac{1}{6}$ (c) $\frac{1}{8}$ (d) $\frac{1}{2}$

Sol. Using $\cos\frac{5\pi}{8}=\cos\left(\frac{\pi}{2}+\frac{\pi}{8}\right)=-\sin\frac{\pi}{8}$

$\Rightarrow \quad \cos\frac{3\pi}{8}=\cos\left(\frac{\pi}{2}-\frac{\pi}{8}\right)=\sin\frac{\pi}{8}$

$\Rightarrow \quad \cos\frac{7\pi}{8}=\cos\left(\pi-\frac{\pi}{8}\right)=-\cos\frac{\pi}{8}$

$\therefore \quad \left(1+\cos\frac{\pi}{8}\right)\left(1-\cos\frac{\pi}{8}\right)\left(1+\sin\frac{\pi}{8}\right)\left(1-\sin\frac{\pi}{8}\right)$

$=\left(1-\cos^2\frac{\pi}{8}\right)\left(1-\sin^2\frac{\pi}{8}\right)=\sin^2\frac{\pi}{8}\cos^2\frac{\pi}{8}$

$=\quad \frac{1}{4}\left(\sin\frac{\pi}{4}\right)^2=\frac{1}{4}\cdot\frac{1}{2}=\frac{1}{8}$

Hence, (c) is the correct answer.

Ex 26. Let $\cos A+\cos B+\cos C=\frac{3}{2}$ in a ΔABC. Then, the triangle is

(a) isosceles (b) right angled
(c) equilateral (d) None of these

Sol. In a ΔABC, $A+B+C=\pi$

$\Rightarrow \cos A+\cos B+\cos C=2\cos\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right)+\cos C=\frac{3}{2}$

$\Rightarrow \quad 2\cos\left(\frac{\pi}{2}-\frac{C}{2}\right)\cos\left(\frac{A-B}{2}\right)+1-2\sin^2\frac{C}{2}=\frac{3}{2}$

$\Rightarrow \quad 4\sin^2\frac{C}{2}-4\sin\frac{C}{2}\cos\left(\frac{A-B}{2}\right)+1=0 \quad \ldots\text{(i)}$

Now, $\sin\frac{C}{2}$ is real.

$\Rightarrow \quad 16\cos^2\left(\frac{A-B}{2}\right)-16>0$

$\Rightarrow \quad \cos^2\left(\frac{A-B}{2}\right)-1\ge 0$

$\Rightarrow \quad \cos^2\left(\frac{A-B}{2}\right)=1=\cos 0$

$\therefore \quad A=B \quad \ldots\text{(ii)}$

Similarly, it can be shown that $B=C$, $C=A$. So, the triangle is equilateral.

Hence, (c) is the correct answer.

Ex 27. $\left(\tan^2\frac{\pi}{7}+\tan^2\frac{2\pi}{7}+\tan^2\frac{3\pi}{7}\right)\left(\cot^2\frac{\pi}{7}+\cot^2\frac{2\pi}{7}+\cot^2\frac{3\pi}{7}\right)$ is equal to

(a) -105 (b) 105
(c) ± 105 (d) None of these

Sol. Let $\theta = \frac{n\pi}{7}$

$$\Rightarrow \quad 7\theta = n\pi$$
$$\Rightarrow \quad 4\theta + 3\theta = n\pi$$
$$\Rightarrow \quad \tan 4\theta = \tan(n\pi - 3\theta)$$
$$\Rightarrow \quad \tan 4\theta = -\tan 3\theta$$
$$\Rightarrow \quad \frac{4\tan\theta - 4\tan^3\theta}{1 - 6\tan^2\theta + \tan^4\theta} = -\frac{3\tan\theta - \tan^3\theta}{1 - 3\tan^2\theta}$$
$$\Rightarrow \quad \frac{4z - 4z^3}{1 - 6z^2 + z^4} = -\frac{3z - z^3}{1 - 3z^2}$$

[where, $\tan\theta = z$ (say)]

$$\Rightarrow \quad (4 - 4z^2)(1 - 3z^2) = -(3 - z^2)(1 - 6z^2 + z^4)$$
$$\Rightarrow \quad z^6 - 21z^4 + 35z^2 - 7 = 0 \quad \ldots\text{(i)}$$

This is a cubic equation in z^2 i.e. in $\tan^2\theta$. Therefore, the roots of this equation are $\tan^2\frac{\pi}{7}$, $\tan^2\frac{2\pi}{7}$ and $\tan^2\frac{3\pi}{7}$.

From Eq. (i), sum of the roots $= \frac{-(-21)}{1} = 21$

$$\Rightarrow \tan^2\frac{\pi}{7} + \tan^2\frac{2\pi}{7} + \tan^2\frac{3\pi}{7} = 21 \quad \ldots\text{(ii)}$$

On putting $\frac{1}{y}$ in place of z in Eq. (i), we get

$$-7y^6 + 35y^4 - 21y^2 + 1 = 0$$
$$\Rightarrow \quad 7y^6 - 35y^4 - 21y^2 + 1 = 0 \quad \ldots\text{(iii)}$$

This is a cubic equation in y^2 i.e. in $\cot^2\theta$. Therefore, the roots of this equation are, $\cot^2\frac{\pi}{7}$, $\cot^2\frac{2\pi}{7}$ and $\cot^2\frac{3\pi}{7}$.

From Eq. (iii), sum of the roots $= \frac{35}{7}$

$$\Rightarrow \quad \cot^2\frac{\pi}{7} + \cot^2\frac{2\pi}{7} + \cot^2\frac{3\pi}{7} = 5 \quad \ldots\text{(iv)}$$

By multiplying Eqs. (ii) and (iv), we get

$$\left(\tan^2\frac{\pi}{7} + \tan^2\frac{2\pi}{7} + \tan^2\frac{3\pi}{7}\right)\left(\cot^2\frac{\pi}{7} + \cot^2\frac{2\pi}{7} + \cot^2\frac{3\pi}{7}\right) = 21 \times 5 = 105$$

Hence, (b) is the correct answer.

Ex 28. $\sin\frac{2\pi}{7} + \sin\frac{4\pi}{7} + \sin\frac{8\pi}{7}$ is equal to

(a) $\frac{\sqrt{7}}{2}$

(b) $\sqrt{7}$

(c) 2

(d) $\frac{\sqrt{7}}{4}$

Sol. Let $x = \sin\frac{2\pi}{7} + \sin\frac{4\pi}{7} + \sin\frac{8\pi}{7}$

On squaring both sides, we get

$$x^2 = \sin^2\frac{2\pi}{7} + \sin^2\frac{4\pi}{7} + \sin^2\frac{8\pi}{7} + 2\sin\frac{2\pi}{7}\sin\frac{4\pi}{7} + 2\sin\frac{4\pi}{7}\sin\frac{8\pi}{7} + 2\sin\frac{8\pi}{7}\sin\frac{2\pi}{7}$$

Now consider,

$$2\sin\frac{2\pi}{7}\sin\frac{4\pi}{7} + 2\sin\frac{4\pi}{7}\sin\frac{8\pi}{7} + 2\sin\frac{8\pi}{7}\sin\frac{2\pi}{7}$$
$$= \left[\cos\frac{2\pi}{7} - \cos\frac{6\pi}{7} + \cos\frac{4\pi}{7} - \cos\frac{12\pi}{7} + \cos\frac{6\pi}{7} - \cos\frac{10\pi}{7}\right]$$
$$= \left[\cos\frac{2\pi}{7} + \cos\frac{4\pi}{7} - \cos\left(2\pi - \frac{2\pi}{7}\right) - \cos\left(2\pi - \frac{4\pi}{7}\right)\right]$$
$$= \left[\cos\frac{2\pi}{7} + \cos\frac{4\pi}{7} - \cos\frac{2\pi}{7} - \cos\frac{4\pi}{7}\right] = 0$$
$$\Rightarrow x^2 = \sin^2\frac{2\pi}{7} + \sin^2\frac{4\pi}{7} + \sin^2\frac{8\pi}{7}$$
$$= \frac{1 - \cos\frac{4\pi}{7}}{2} + \frac{1 - \cos\frac{8\pi}{7}}{2} + \frac{1 - \cos\frac{16\pi}{7}}{2}$$
$$= \frac{1}{2}\left[3 - \left(\cos\frac{4\pi}{7} + \cos\frac{8\pi}{7} + \cos\frac{16\pi}{7}\right)\right]$$
$$= \frac{1}{2}\left[3 - \frac{1}{2\sin\frac{\pi}{7}}\left\{2\sin\frac{\pi}{7}\cos\frac{2\pi}{7} + 2\sin\frac{\pi}{7}\cos\frac{4\pi}{7} + 2\sin\frac{\pi}{7}\cos\frac{6\pi}{7}\right\}\right]$$
$$= \frac{1}{2}\left[3 - \frac{1}{2\sin\frac{\pi}{7}}\left\{\left(\sin\frac{3\pi}{7} - \sin\frac{\pi}{7}\right) + \left(\sin\frac{5\pi}{7} - \sin\frac{3\pi}{7}\right) + \left(\sin\frac{7\pi}{7} - \sin\frac{5\pi}{7}\right)\right\}\right]$$
$$= \frac{1}{2}\left(3 + \frac{1}{2}\right) = \frac{7}{4} \quad \Rightarrow \quad x = \frac{\sqrt{7}}{2}$$

Hence, (a) is the correct answer.

Ex 29. If $3\sin\theta + 5\cos\theta = 5$, then the value of $5\sin\theta - 3\cos\theta$ is

(a) 5 (b) 3
(c) 4 (d) None of these

Sol. $3\sin\theta = 5(1 - \cos\theta) = 5 \times 2\sin^2\frac{\theta}{2} \Rightarrow \tan\frac{\theta}{2} = \frac{3}{5}$

$$\therefore \quad 5\sin\theta - 3\cos\theta = 5 \times \frac{2\tan\frac{\theta}{2}}{1 + \tan^2\frac{\theta}{2}} - 3\frac{\left(1 - \tan^2\frac{\theta}{2}\right)}{1 + \tan^2\frac{\theta}{2}}$$
$$= 5 \times \frac{2 \times \frac{3}{5}}{1 + \frac{9}{25}} - \frac{3 \times \left(1 - \frac{9}{25}\right)}{1 + \frac{9}{25}} = 3$$

Hence, (b) is the correct answer.

Ex 30. In a ΔABC, the maximum value of $\dfrac{a\cos^2\frac{A}{2} + b\cos^2\frac{B}{2} + c\cos^2\frac{C}{2}}{a + b + c}$ is

(a) $\frac{1}{4}$ (b) 2 (c) $\frac{3}{4}$ (d) 1

Sol. $\dfrac{a\cos^2\frac{A}{2}+b\cos^2\frac{B}{2}+c\cos^2\frac{C}{2}}{a+b+c}$

$$=\frac{a(1+\cos A)+b(1+\cos B)+c(1+\cos C)}{2(a+b+c)}$$

$$=\frac{a\cos A+b\cos B+c\cos C}{2(a+b+c)}+\frac{1}{2}$$

$$=\frac{R[\sin 2A+\sin 2B+\sin 2C]}{2(a+b+c)}+\frac{1}{2}$$

$$=\frac{4R\sin A\sin B\sin C}{2\cdot 2s}+\frac{1}{2}$$

$$=\frac{abc}{8sR^2}+\frac{1}{2}=\frac{r}{2R}+\frac{1}{2}\le\frac{1}{4}+\frac{1}{2}=\frac{3}{4}\text{ as } R\ge 2r$$

$$\Rightarrow\quad \frac{a\cos^2\frac{A}{2}+b\cos^2\frac{B}{2}+c\cos^2\frac{C}{2}}{a+b+c}\le\frac{3}{4}$$

Thus, the maximum value is $\frac{3}{4}$.

Hence, (c) is the correct answer.

Ex 31. If $A+B+C=\pi$, then the value of $\cos^2 A+\cos^2 B+\cos^2 C$ is

(a) $1-\cos A\cos B\cos C$
(b) $1-2\sin A\sin B\sin C$
(c) $1-\sin A\sin B\sin C$
(d) $1-2\cos A\cos B\cos C$

Sol. We have, $\cos^2 A+\cos^2 B+\cos^2 C$

$=\cos^2 A+(1-\sin^2 B)+\cos^2 C$

$=(\cos^2 A-\sin^2 B)+\cos^2 C+1$

$=\cos(A+B)\cos(A-B)+\cos^2 C+1$

$=\cos(\pi-C)\cos(A-B)+\cos^2 C+1$

$=-\cos C\cos(A-B)+\cos^2 C+1$

$=-\cos C[\cos(A-B)-\cos C]+1$

$=-\cos C[\cos(A-B)-\cos\{\pi-(A+B)\}]+1$

$=-\cos C[\cos(A-B)+\cos(A+B)]+1$

$=-2\cos C\cos A\cos B+1$

Hence, (d) is the correct answer.

Ex 32. Let A, B and C be three angles such that $A=\dfrac{\pi}{4}$ and $\tan B\tan C=p$. Then, all possible values of p such that A, B and C are the angles of a triangle, is

(a) $\le(\sqrt{2}+1)^2$ (b) $\ge(\sqrt{2}+1)^2$
(c) $>(\sqrt{2}+1)^2$ (d) $<(\sqrt{2}+1)^2$

Sol. $\because\quad A+B+C=\pi$

$$\Rightarrow\quad B+C=\frac{3\pi}{4}$$

$$\Rightarrow\quad 0<B,C<\frac{3\pi}{4}$$

Also, $\tan B\tan C=p$

$$\Rightarrow\quad \frac{\sin B\sin C}{\cos B\cos C}=\frac{p}{1}$$

$$\Rightarrow\quad \frac{\cos B\cos C-\sin B\sin C}{\cos B\cos C+\sin B\sin C}=\frac{1-p}{1+p}$$

$$\Rightarrow\quad \frac{\cos(B+C)}{\cos(B-C)}=\frac{1-p}{1+p}$$

$$\Rightarrow\quad \frac{1+p}{\sqrt{2}(p-1)}=\cos(B-C)\qquad\text{...(i)}$$

Since, B or C can vary from 0 to $\frac{3\pi}{4}$

$$0\le B-C<\frac{3\pi}{4}$$

$$\Rightarrow\quad -\frac{1}{\sqrt{2}}<\cos(B-C)\le 1$$

Eq. (i) will now lead to

$$-\frac{1}{\sqrt{2}}<\frac{p+1}{\sqrt{2}(p-1)}\le 1$$

$$\Rightarrow\quad \frac{2p}{p-1}>0$$

$$\Rightarrow\quad p<0\text{ or }p>1\qquad\text{...(ii)}$$

Also, $\dfrac{p+1-\sqrt{2}(p-1)}{\sqrt{2}(p-1)}\le 0$

$$\Rightarrow\quad \frac{\{p-(\sqrt{2}+1)^2\}}{(p-1)}\ge 0$$

$$\Rightarrow\quad p<1\text{ or }p\ge(\sqrt{2}+1)^2\qquad\text{...(iii)}$$

Combining Eqs. (ii) and (iii), we get $p\ge(\sqrt{2}+1)^2$

Hence, (b) is the correct answer.

Ex 33. If A, B and C are angles of anyone of the triangle such that $\tan A+\tan B+\tan C=100$. Then,

(a) there exist exactly three non-similar isosceles triangles
(b) there exist exactly two non-similar isosceles triangles
(c) there exist exactly three similar isosceles triangles
(d) None of the above

Sol. Let $A=B$, then $2A+C=180°$

and $2\tan A+\tan C=100$

Now, $2A+C=180°$

$$\Rightarrow\quad \tan 2A=-\tan C\qquad\text{...(i)}$$

Also, $2\tan A+\tan C=100$

$$\Rightarrow\quad 2\tan A-100=-\tan C\qquad\text{...(ii)}$$

From Eqs. (i) and (ii), we have

$$2\tan A-100=\frac{2\tan A}{1-\tan^2 A}$$

Let $\tan A=x$, then $\dfrac{2x}{1-x^2}=2x-100$

$$\Rightarrow\quad x^3-50x^2+50=0$$

Let $f(x)=x^3-50x^2+50=0$

Then, $f'(x)=3x^2-100x$

So, $f'(x)=0$ has roots $0,\ \dfrac{100}{3}$.

Also, $f(0)\cdot f\left(\dfrac{100}{3}\right)<0$

Thus, $f(x)=0$ has exactly three distinct real roots. Therefore, $\tan A$ and hence A has three distinct values.

So, there exist exactly three non-similar isosceles triangles.

Hence, (a) is the correct answer.

Ex 34. The sum of the series $\sin\theta\sec 3\theta+\sin 3\theta\sec 3^2\theta+\sin 3^2\theta\sec 3^3\theta$ $+\ldots n$ terms, is

(a) $\frac{1}{2}[\tan 3^n\theta-\tan 3^{n-1}\theta]$

(b) $[\tan 3^n\theta-\tan\theta]$

(c) $\frac{1}{2}[\tan 3^n\theta-\tan\theta]$

(d) None of the above

Sol. Here, $\sin\theta\sec 3\theta+\sin 3\theta\sec 3^2\theta+\sin 3^2\theta\sec 3^3\theta+\ldots n$ terms

$$=\sum_{r=1}^{n}\sin 3^{r-1}\theta\cdot\sec 3^r\theta=\sum_{r=1}^{n}\frac{\sin 3^{r-1}\theta}{\cos 3^r\theta}$$

$$=\sum_{r=1}^{n}\frac{2\cos 3^{r-1}\theta\cdot\sin 3^{r-1}\theta}{2\cos 3^{r-1}\theta\cdot\cos 3^r\theta}$$

$$=\frac{1}{2}\sum_{r=1}^{n}\frac{\sin(2\cdot 3^{r-1}\theta)}{\cos 3^{r-1}\theta\cdot\cos 3^r\theta}$$

$$=\frac{1}{2}\sum_{r=1}^{n}\frac{\sin(3^r\theta-3^{r-1}\theta)}{\cos 3^{r-1}\theta\cdot\cos 3^r\theta}$$

$$=\frac{1}{2}\sum_{r=1}^{n}\frac{\sin 3^r\theta\cdot\cos 3^{r-1}\theta-\cos 3^r\theta\cdot\sin 3^{r-1}\theta}{\cos 3^{r-1}\theta\cdot\cos 3^r\theta}$$

$$=\frac{1}{2}\sum_{r=1}^{n}(\tan 3^r\theta-\tan 3^{r-1}\theta)$$

$$=\frac{1}{2}[(\tan 3\theta-\tan\theta)+(\tan 3^2\theta-\tan 3\theta)+\ldots+(\tan 3^n\theta-\tan 3^{n-1}\theta)]$$

$$=\frac{1}{2}[\tan 3^n\theta-\tan\theta]$$

Hence, (c) is the correct answer.

Ex 35. The set of values of x for which $\frac{\tan 3x-\tan 2x}{1+\tan 3x\tan 2x}=1$, is

(a) ϕ

(b) $\left\{\frac{\pi}{4}\right\}$

(c) $\left\{n\pi+\frac{\pi}{4}, n=1,2,3,\ldots\right\}$

(d) $\left\{2n\pi+\frac{\pi}{4}, n=1,2,3,\ldots\right\}$

Sol. We have, $\frac{\tan 3x-\tan 2x}{1+\tan 3x\tan 2x}=1$

$\Rightarrow\quad \tan(3x-2x)=1\quad\Rightarrow\quad\tan x=1$

$\Rightarrow\quad \tan x=\tan\frac{\pi}{4}$

$\Rightarrow\quad x=n\pi+\frac{\pi}{4}$

But for this value of x, $\tan 2x=\tan\left(2n\pi+\frac{\pi}{2}\right)=\infty$

which does not satisfy the given equation as it reduces to indeterminate form.

Hence, (a) is the correct answer.

Ex 36. If $\exp^{[(\sin^2x+\sin^4x+\sin^6x+\ldots)\ln 2]}$ satisfies the equation $y^2-9y+8=0$, then the value of $\frac{\cos x}{\cos x+\sin x}, 0<x<\frac{\pi}{2}$, is

(a) $\sqrt{3}+1$ (b) $\frac{\sqrt{3}-1}{2}$

(c) $\sqrt{3}-1$ (d) None of these

Sol. $\sin^2x+\sin^4x+\sin^6x+\ldots\infty=\frac{\sin^2x}{1-\sin^2x}=\tan^2x$

$\Rightarrow\quad \exp^{[(\sin^2x+\sin^4x+\ldots)\ln 2]}=e^{\tan^2x\ln 2}=e^{\ln 2^{\tan^2x}}$

Given equation, $y^2-9y+8=0$

$\Rightarrow\quad (y-1)(y-8)=0$

Either $y=1$, then $2^{\tan^2x}=1=2^0$

$\Rightarrow\quad \tan^2x=0$, but $x\in\left(0,\frac{\pi}{2}\right)$

$\therefore\quad$ Neglecting $x=0$

or $\quad y=2^3\quad\Rightarrow\quad\tan^2x=3$

$\Rightarrow\quad \tan x=\pm\sqrt{3}$

$\Rightarrow\quad x=\frac{\pi}{3}$, as $0<x<\frac{\pi}{2}$

$\Rightarrow\quad \frac{\cos x}{\cos x+\sin x}=\frac{1/2}{1/2+\sqrt{3}/2}=\frac{1}{\sqrt{3}+1}=\frac{\sqrt{3}-1}{2}$

Hence, (b) is the correct answer.

Ex 37. If $\tan(\pi\cos\theta)=\cot(\pi\sin\theta)$, then the value(s) of $\cos\left(\theta-\frac{\pi}{4}\right)$ is/are

(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$

(c) $\pm\frac{1}{2\sqrt{2}}$ (d) None of these

Sol. We have, $\tan(\pi\cos\theta)=\cot(\pi\sin\theta)$

$\Rightarrow\quad \tan(\pi\cos\theta)=\tan\left(\frac{\pi}{2}-\pi\sin\theta\right)$

$\Rightarrow\quad \pi\cos\theta=\left(\frac{\pi}{2}-\pi\sin\theta\right)+n\pi, n\in Z$

$\Rightarrow\quad \frac{1}{\sqrt{2}}\cos\theta+\frac{1}{\sqrt{2}}\sin\theta=\frac{2n+1}{2\sqrt{2}}, n\in Z$

$\Rightarrow\quad \cos\left(\theta-\frac{\pi}{4}\right)=\frac{2n+1}{2\sqrt{2}}, n\in Z$

$\Rightarrow\quad \cos\left(\theta-\frac{\pi}{4}\right)=\pm\frac{1}{2\sqrt{2}}$

[for $n=0$ and $n=-1$]

Hence, (c) is the correct answer.

Ex 38. The set of all x in $(-\pi,\pi)$ satisfying $|4\sin x-1|<\sqrt{5}$ is given by

(a) $\left(-\frac{\pi}{10},\frac{3\pi}{10}\right)$ (b) $\left(\frac{\pi}{10},\frac{3\pi}{10}\right)$

(c) $\left(\frac{\pi}{10},-\frac{3\pi}{10}\right)$ (d) None of these

Sol. We have, $|4\sin x - 1| < \sqrt{5}$

$$\Rightarrow \quad -\sqrt{5} < 4\sin x - 1 < \sqrt{5}$$

$$\Rightarrow \quad -\left(\frac{\sqrt{5}-1}{4}\right) < \sin x < \left(\frac{\sqrt{5}+1}{4}\right)$$

$$\Rightarrow \quad -\sin\frac{\pi}{10} < \sin x < \cos\frac{\pi}{5}$$

$$\Rightarrow \quad \sin\left(-\frac{\pi}{10}\right) < \sin x < \sin\left(\frac{\pi}{2} - \frac{\pi}{5}\right)$$

$$\Rightarrow \quad \sin\left(-\frac{\pi}{10}\right) < \sin x < \sin\frac{3\pi}{10}$$

$$\Rightarrow \quad x \in \left(-\frac{\pi}{10}, \frac{3\pi}{10}\right)$$

Hence, (a) is the correct answer.

Ex 39. Total number of solutions of $\cos x = \sqrt{1 - \sin 2x}$ in $[0, 2\pi]$, is

(a) 2 (b) 3

(c) 5 (d) None of these

Sol. $\cos x = \sqrt{1 - \sin 2x} = |\sin x - \cos x|$

***Case* I** $\sin x \le \cos x$

$\Rightarrow \quad \cos x = \cos x - \sin x$

$\Rightarrow \quad \sin x = 0$

where, $x \in \left[0, \frac{\pi}{4}\right] \cup \left[\frac{5\pi}{4}, 2\pi\right]$

$\therefore \quad \sin x = 0$

$\Rightarrow \quad x = 0, 2\pi$

***Case* II** $\sin x > \cos x$

$\Rightarrow \quad \tan x = 2$

where, $x \in \left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$

$\therefore \quad \tan x = 2$

$\Rightarrow \quad x = \tan^{-1}(2)$

Thus, the given equation has three solutions.

Hence, (b) is the correct answer.

Ex 40. Total number of solutions of

$$|\cot x| = \cot x + \frac{1}{\sin x}, x \in [0, 3\pi], \text{ is}$$

(a) 1 (b) 2

(c) 3 (d) 0

Sol. $|\cot x| = \cot x + \frac{1}{\sin x}$

Let $\cot x > 0 \Rightarrow \cot x = \cot x + \frac{1}{\sin x} = 0$

$\Rightarrow \frac{1}{\sin x} = 0$, which is not possible.

Let $\cot x \le 0 \Rightarrow -\cot x = \cot x + \frac{1}{\sin x}$

$$\Rightarrow \quad -2\cot x = \frac{1}{\sin x}$$

$$\Rightarrow \quad \cos x = -\frac{1}{2}$$

$$\Rightarrow \quad x = \frac{2\pi}{3}, \frac{8\pi}{3}$$

So, the number of solutions is 2.

Hence, (b) is the correct answer.

Ex 41. The equation $p\cos x - q\sin x = r$ admits of a solution for x only, if

(a) $r < \max\{p, q\}$

(b) $-\sqrt{p^2 + q^2} < r < \sqrt{p^2 + q^2}$

(c) $r^2 = p^2 + q^2$

(d) None of the above

Sol. Let $p = a\cos\theta$ and $-q = a\sin\theta$

$\therefore \quad a(\cos\theta\cos x + \sin\theta\sin x) = r$

$\Rightarrow \quad a\cos(x - \theta) = r$

Thus, the condition for solution is

$$-a \le r \le a$$

where, $\quad a = \sqrt{p^2 + q^2}$

Thus, equation $p\cos x - q\sin x = r$ admits solution for

$$-\sqrt{p^2 + q^2} \le r \le \sqrt{p^2 + q^2}$$

Hence, (b) is the correct answer.

Ex 42. If $4\cos^2 x\sin x - 2\sin^2 x = 3\sin x$, then x is equal to

(a) $n\pi + \left(\frac{3\pi}{10}\right)$ (b) $n\pi + (-1)^{n+1}\left(\frac{3\pi}{10}\right)$

(c) $n\pi - \left(\frac{3\pi}{10}\right)$ (d) None of these

Sol. We have, $[4\cos^2 x - 2\sin x - 3]\sin x = 0$

Either $\quad \sin x = 0 \Rightarrow x = n\pi$

or $\quad 4(1 - \sin^2 x) - 2\sin x - 3 = 0$

$$\Rightarrow \quad 4\sin^2 x + 2\sin x - 1 = 0$$

$$\Rightarrow \quad \sin x = \frac{-2 \pm \sqrt{4 + 16}}{8}$$

$$= \frac{-1 \pm \sqrt{5}}{4} = \frac{\sqrt{5} - 1}{4}, -\frac{1 + \sqrt{5}}{4}$$

$$\Rightarrow \quad \sin x = \sin\frac{\pi}{10}$$

$$\Rightarrow \quad x = n\pi + (-1)^n\left(\frac{\pi}{10}\right)$$

or $\quad \sin x = -\cos\frac{\pi}{5} = \sin\left(-\frac{\pi}{10}\right)$

$$\Rightarrow \quad x = n\pi + (-1)^{n+1}\left(\frac{3\pi}{10}\right)$$

Hence, (b) is the correct answer.

Ex 43. If $\cos 3x + \cos 2x = \sin\frac{3x}{2} + \sin\frac{x}{2}, \quad 0 \le x \le 2\pi$, then the number of values of x is

(a) 6 (b) 7

(c) 4 (d) 5

Sol. We have, $2\cos\frac{5x}{2}\cos\frac{x}{2} = 2\sin x\cos\frac{x}{2}$

Either $\cos\frac{x}{2} = 0$

$$\Rightarrow \quad \frac{x}{2} = (2n + 1)\frac{\pi}{2} \Rightarrow x = (2n + 1)\pi$$

or $\quad \cos\frac{5x}{2} = \sin x = \cos\left(\frac{\pi}{2} - x\right)$

$$\Rightarrow \quad \frac{5x}{2} = 2n\pi \pm \left(\frac{\pi}{2} - x\right)$$

$$\Rightarrow \quad \frac{7x}{2} = 2n\pi + \frac{\pi}{2} \quad \Rightarrow \quad x = \frac{4n\pi}{7} + \frac{\pi}{7}$$

$$\text{or} \quad \frac{3x}{2} = 2n\pi - \frac{\pi}{2} \quad \Rightarrow \quad x = \frac{4n\pi}{3} - \frac{\pi}{3}$$

For $0 \le x \le 2\pi$, $x = \frac{\pi}{7}, \frac{5\pi}{7}, \frac{9\pi}{7}, \frac{13\pi}{7}, \pi$

Hence, (d) is the correct answer.

Ex 44. The number of points of intersection of the curves $y = \cos x$, $y = \sin 3x$, if $-\frac{\pi}{2} \le x \le \frac{\pi}{2}$, is

(a) 3 (b) 4
(c) 5 (d) 6

Sol. The point of intersection is given by

$$\sin 3x = \cos x = \sin\left(\frac{\pi}{2} - x\right)$$

$$\Rightarrow \quad 3x = n\pi + (-1)^n\left(\frac{\pi}{2} - x\right)$$

***Case* I** Let n be even i.e. $n = 2m \Rightarrow 3x = 2m\pi + \left(\frac{\pi}{2} - x\right)$

$$\Rightarrow \quad x = \frac{m\pi}{2} + \frac{\pi}{8}$$

***Case* II** Let n be odd i.e. $n = 2m + 1$

$$\Rightarrow \quad 3x = (2m+1)\pi - \left(\frac{\pi}{2} - x\right) = 2m\pi + \left(\frac{\pi}{2} + x\right)$$

$$\Rightarrow \quad x = m\pi + \frac{\pi}{4}$$

Now, $-\frac{\pi}{2} \le x \le \frac{\pi}{2}$

$$\Rightarrow \quad x = \frac{\pi}{8}, \frac{\pi}{4}, \frac{-3\pi}{8}$$

Points of intersection are

$\left(\frac{\pi}{8}, \cos\frac{\pi}{8}\right)\left(\frac{\pi}{4}, \cos\frac{\pi}{4}\right), \left(-\frac{3\pi}{8}, \cos\frac{3\pi}{8}\right)$.

Hence, (a) is the correct answer.

Ex 45. The number of values of θ in the interval $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, satisfying the equation

$(1 - \tan\theta)(1 + \tan\theta)\sec^2\theta + 2^{\tan^2\theta} = 0$ is

(a) 2 (b) 3
(c) 4 (d) None of these

Sol. $(1 - \tan\theta)(1 + \tan\theta)\sec^2\theta + 2^{\tan^2\theta} = 0$

$$\Rightarrow \quad (1 - \tan^2\theta)(1 + \tan^2\theta) + 2^{\tan^2\theta} = 0$$

$$\Rightarrow \quad 1 + 2^{\tan^2\theta} = \tan^4\theta$$

By observation, we have $\tan^2\theta = 3$

$$\Rightarrow \quad \theta = n\pi \pm \left(\frac{\pi}{3}\right)$$

Moreover there will be values of θ, satisfying, $3 < \tan^2\theta < 4$ and satisfying the given equation as if $f(x) = x^2 - 2^x - 1$, then $f(3^+)f(4^-) < 0$.

So, the number of values of θ is 4.

Hence, (c) is the correct answer.

Ex 46. The general solution of the equation

$$\left(\cos\frac{x}{4} - 2\sin x\right)\sin x + \left(1 + \sin\frac{x}{4} - 2\cos x\right)\cos x = 0 \text{ is}$$

(a) $2\pi + 8m\pi$ (b) $2\pi + m\pi$
(c) $2\pi + 4m\pi$ (d) None of these

Sol. The given equation can be simplified to

$$\sin\frac{5x}{4} + \cos x = 2$$

Since, the greatest value of $\sin\left(\frac{5x}{4}\right)$ and $\cos x$ is 1, their sum is equal to 2 only, if $\sin\left(\frac{5x}{4}\right) = 1$ and $\cos x = 1$ simultaneously i.e. $\frac{5x}{4} = 2n\pi + \frac{\pi}{2}$ and $x = 2k\pi$; $n, k \in I$.

Since, we have to choose those values of x which satisfy both of these equations, we have

$$2k\pi = \frac{8n\pi}{5} + \frac{2\pi}{5} \quad \Rightarrow \quad k = \frac{4n+1}{5}$$

where, k and n are integers.

We write $\quad k = n - \frac{n-1}{5}$

For $\frac{n-1}{5} = m$, we have $k = 1 + 4m$ $(m \in I)$

Therefore, $x = 2\pi + 8m\pi$ $(m \in I)$

Hence, (a) is the correct answer.

Ex 47. The values of x between 0 and 2π which satisfy the equation $\sin x\sqrt{8\cos^2 x} = 1$ are in AP with common difference

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{8}$ (c) $\frac{3\pi}{8}$ (d) $\frac{5\pi}{8}$

Sol. We have, $\sin x\sqrt{8\cos^2 x} = 1$

$$\Rightarrow \quad \sin x|\cos x| = \frac{1}{2\sqrt{2}}$$

***Case* I** When $\cos x > 0$

In this case, $\sin x \cos x = \frac{1}{2\sqrt{2}}$

$$\Rightarrow \quad \sin 2x = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \quad 2x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{9\pi}{4}, \frac{11\pi}{4}$$

$$\Rightarrow \quad x = \frac{\pi}{8}, \frac{3\pi}{8}, \frac{9\pi}{8}, \frac{11\pi}{8}$$

As x lies between 0 and 2π and $\cos x > 0$, $x = \frac{\pi}{8}, \frac{3\pi}{8}$.

***Case* II** When $\cos x < 0$

In this case, $\sin x|\cos x| = \frac{1}{2\sqrt{2}}$

$$\Rightarrow \sin x\cos x = -\frac{1}{2\sqrt{2}} \text{ or } \sin 2x = -\frac{1}{\sqrt{2}}$$

$$\Rightarrow \quad x = \frac{5\pi}{8}, \frac{7\pi}{8}, \frac{13\pi}{8}, \frac{15\pi}{8}$$

$$\Rightarrow \quad x = \frac{5\pi}{8}, \frac{7\pi}{8}$$

Thus, the values of x satisfying the given equation which lie between 0 and 2π are $\frac{\pi}{8}, \frac{3\pi}{8}, \frac{5\pi}{8}, \frac{7\pi}{8}$.

These are in AP with common difference $\frac{\pi}{4}$.

Hence, (a) is the correct answer.

Ex 48. The values of θ, for which the system $(\sin 3\theta)x - y + z = 0$, $(\cos 2\theta)x + 4y + 3z = 0$ and $2x + 7y + 7z = 0$, has a non-trivial solution, are

(a) $n\pi, n\pi + (-1)^n \frac{\pi}{6}$ (b) $n\pi, n\pi - (1)^n \frac{\pi}{6}$

(c) $2n\pi, n\pi + (-1)^n \frac{\pi}{6}$ (d) $n\pi, n\pi + (-1)^n \frac{\pi}{3}$

Sol. The system has non-trivial solutions, if

$$\begin{vmatrix} \sin 3\theta & -1 & 1 \\ \cos 2\theta & 4 & 3 \\ 2 & 7 & 7 \end{vmatrix} = 0$$

On expanding, we get

$$7\sin 3\theta + 14\cos 2\theta - 14 = 0$$

$\Rightarrow \quad \sin 3\theta + 2\cos 2\theta - 2 = 0$

$\Rightarrow \sin\theta \ (4\sin^2\theta + 4\sin\theta - 3) = 0$

$\Rightarrow \quad \sin\theta = 0 \Rightarrow \theta = n\pi$

or $\quad 4\sin^2\theta + 4\sin\theta - 3 = 0$

$\Rightarrow \quad (2\sin\theta - 1)(2\sin\theta + 3) = 0$

$\Rightarrow \quad 2\sin\theta - 1 = 0$

$\Rightarrow \quad \sin\theta = \frac{1}{2} = \sin\left(\frac{\pi}{6}\right)$

or $4\sin^2\theta + 4\sin\theta - 3 = 0$, which is not possible.

$\Rightarrow \quad \theta = n\pi + (-1)^n \frac{\pi}{6}$

$\Rightarrow \quad \theta = n\pi \quad \text{or} \quad n\pi + (-1)^n \frac{\pi}{6}$

Hence, (a) is the correct answer.

Ex 49. A ΔABC is such that $\sin(2A + B) = \frac{1}{2}$. If A, B and C are in AP, then the values of A, B and C are

(a) $\frac{\pi}{4}, \frac{\pi}{3}, \frac{5\pi}{12}$ (b) $\frac{\pi}{2}, \frac{\pi}{3}, \frac{\pi}{6}$

(c) $\frac{\pi}{2}, \frac{\pi}{4}, \frac{\pi}{4}$ (d) None of these

Sol. $\sin(2A + B) = \frac{1}{2} = \sin\left(\frac{\pi}{6}\right)$

$\Rightarrow \quad 2A + B = n\pi + (-1)^n \frac{\pi}{6} \quad \ldots(i)$

Also, $A + B + C = \pi$ and $2B = A + C$

$\Rightarrow \quad 3B = \pi \Rightarrow B = \frac{\pi}{3}$

From Eq. (i), for $n = 1$, $2A + B = \frac{5\pi}{6}$

$\Rightarrow \quad A = \frac{\pi}{4}$

and $\quad C = \frac{5\pi}{12}$

Hence, (a) is the correct answer.

Ex 50. The equation

$$3^{\sin 2x + 2\cos^2 x} + 3^{1 - \sin 2x + 2\sin^2 x} = 28$$

is satisfied for the values of x given by

(a) $\cos x = 0, \tan x = -1$ (b) $\tan x = 0$

(c) $\tan x = 1$ (d) None of these

Sol. The given equation is

$$3^{\sin 2x + 2\cos^2 x} + 3^{1 - \sin 2x + 2\sin^2 x} = 28$$

$\Rightarrow 3^{\sin 2x + 2\cos^2 x} + 3^{3 - (\sin 2x + 2\cos^2 x)} = 28$

$\Rightarrow \quad y + \frac{27}{y} = 28$

where, $y = 3^{\sin 2x + 2\cos^2 x} \Rightarrow y^2 - 28y + 27 = 0$

$\Rightarrow \quad y = 27 \text{ or } 1$

If $y = 27$, then $3^{\sin 2x + 2\cos^2 x} = 3^3$

$\Rightarrow \quad \sin 2x + 2\cos^2 x = 3$

$\Rightarrow \quad \sin 2x + \cos 2x = 2$

$\Rightarrow \quad \sin 2x = \cos 2x = 1$

which is not possible for any value of x and so $y \neq 27$.

Also, we have $y = 1$

$\Rightarrow \quad 3^{\sin 2x + 2\cos^2 x} = 1 = 3^0$

$\Rightarrow \quad \sin 2x + 2\cos^2 x = 0$

$\Rightarrow \quad 2\cos x (\sin x + \cos x) = 0$

Either $\quad \cos x = 0 \quad \text{or} \quad \tan x = -1$

Hence, (a) is the correct answer.

Ex 51. If $\cos^4 x + a\cos^2 x + 1 = 0$ has atleast one solution, then

(a) $a \in [2, \infty)$ (b) $a \in [-2, 2]$

(c) $a \in (-\infty, -2]$ (d) $a \in R \sim (-2, 2)$

Sol. $\cos^4 x + a\cos^2 x + 1 = 0$

Let $\quad t = \cos^2 x$, then $t \in [0, 1]$

Thus, we have $t^2 + at + 1 = 0$

This quadratic must have atleast one root in [0, 1].

$\Rightarrow \quad a^2 - 4 \geq 0, 1 + a + 1 \leq 0$

$\Rightarrow \quad a \in (-\infty, -2] \cup [2, \infty), a \leq -2$

$\Rightarrow \quad a \in (-\infty, -2]$

Hence, (c) is the correct answer.

Ex 52. Total number of solutions of $\cos x \cos 2x \cos 3x = \frac{1}{4}$ in $[0, \pi]$ is

(a) 4 ` (b) 6

(c) 8 (d) None of these

Sol. Given, $\quad \cos x \cos 2x \cos 3x = \frac{1}{4}$

$\Rightarrow \quad 4\cos 3x \cos x \cos 2x = 1$

$\Rightarrow \quad 2(\cos 4x + \cos 2x)\cos 2x = 1$

$\Rightarrow \quad 2(2\cos^2 2x - 1 + \cos 2x)\cos 2x = 1$

$\Rightarrow \quad 4\cos^3 2x + 2\cos^2 2x - 2\cos 2x - 1 = 0$

$\Rightarrow \quad 2\cos^2 2x(2\cos 2x + 1) - (2\cos 2x + 1) = 0$

$\Rightarrow \quad (2\cos 2x + 1)(2\cos^2 2x - 1) = 0$

$\Rightarrow \quad \cos 4x(2\cos 2x + 1) = 0$

$\Rightarrow \quad \cos 4x = 0 \Rightarrow 4x = (2n_1 + 1)\frac{\pi}{2}$

$\Rightarrow \quad x = (2n_1 + 1)\frac{\pi}{8} = \frac{\pi}{8}, \frac{3\pi}{8}, \frac{5\pi}{8}, \frac{7\pi}{8}$

or $\quad \cos 2x = -\frac{1}{2} \quad \Rightarrow \quad 2x = 2n_2\pi \pm \frac{2\pi}{3}$

$\Rightarrow \quad x = n_2\pi \pm \frac{\pi}{3} \quad \Rightarrow \quad x = \frac{\pi}{3}, \frac{2\pi}{3}$

Thus, there are six solutions.
Hence, (b) is the correct answer.

Ex 53. Total number of solutions of $\sin^4 x + \cos^4 x = \sin x \cos x$ in $[0, 2\pi]$ is

(a) 2 (b) 4 (c) 6 (d) 8

Sol. $\sin^4 x + \cos^4 x = \sin x \cos x$

$\Rightarrow \quad (\sin^2 x + \cos^2 x)^2 - 2\sin^2 x \cos^2 x = \sin x \cos x$

$\Rightarrow \quad 1 - \frac{\sin^2 2x}{2} = \frac{\sin 2x}{2} \Rightarrow \sin^2 2x + \sin 2x - 2 = 0$

$\Rightarrow \quad (\sin 2x + 2)(\sin 2x - 1) = 0 \Rightarrow \sin 2x = 1$

$\Rightarrow \quad 2x = (4n_1 + 1)\frac{\pi}{2} \quad \Rightarrow \quad x = (4n_1 + 1)\frac{\pi}{4}$

$\Rightarrow \quad x = \frac{\pi}{4}, \frac{5\pi}{4}$

Thus, there are two solutions.
Hence, (a) is the correct answer.

Ex 54. Total number of integral values of n so that $\sin x(\sin x + \cos x) = n$ has atleast one solution, is

(a) 2 (b) 1
(c) 3 (d) 0

Sol. $\sin x(\sin x + \cos x) = n$

$\Rightarrow \quad \sin^2 x + \sin x \cos x = n$

$\Rightarrow \quad \frac{1 - \cos 2x}{2} + \frac{\sin 2x}{2} = n$

$\Rightarrow \quad \sin 2x - \cos 2x = 2n - 1$

$\Rightarrow \quad -\sqrt{2} \le 2n - 1 \le \sqrt{2}$

$\Rightarrow \quad \frac{1 - \sqrt{2}}{2} \le n \le \frac{1 + \sqrt{2}}{2}$

$\Rightarrow \quad n = 0, 1$

Hence, (a) is the correct answer.

Ex 55. The equation $\tan^4 x - 2\sec^2 x + a^2 = 0$ will have atleast one solution, if

(a) $|a| \le 4$ (b) $|a| \le 2$
(c) $|a| \le \sqrt{3}$ (d) None of these

Sol. $\tan^4 x - 2\sec^2 x + a^2 = 0$

$\Rightarrow \quad \tan^4 x - 2(1 + \tan^2 x) + a^2 = 0$

$\Rightarrow \quad \tan^4 x - 2\tan^2 x + 1 = 3 - a^2$

$\Rightarrow \quad (\tan^2 x - 1)^2 = 3 - a^2 \quad \Rightarrow \quad 3 - a^2 \ge 0$

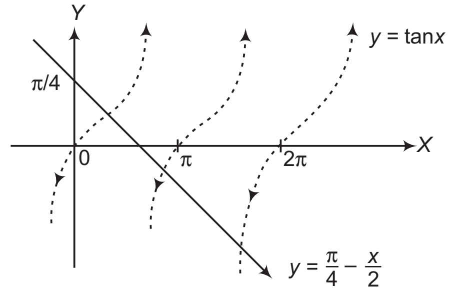
$\Rightarrow \quad a^2 \le 3 \quad \Rightarrow \quad |a| \le \sqrt{3}$

Hence, (c) is the correct answer.

Ex 56. The number of roots of the equation $x + 2\tan x = \frac{\pi}{2}$ in the interval $[0, 2\pi]$ is

(a) 1 (b) 2
(c) 3 (d) infinite

Sol. We have, $x + 2\tan x = \frac{\pi}{2} \Rightarrow \tan x = \frac{\pi}{4} - \frac{x}{2}$



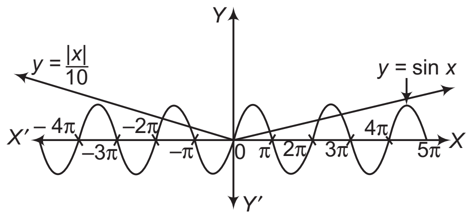
Now, the graph of the curve $y = \tan x$ and $y = \frac{\pi}{4} - \frac{x}{2}$, in the interval $[0, 2\pi]$ intersect at three points. The abscissa of these three points are the roots of the equation.
Hence, (c) is the correct answer.

Ex 57. Total number of solutions of $\sin x = \frac{|x|}{10}$ is

(a) 4 (b) 6
(c) 7 (d) None of these

Sol. Graph of $y = \sin x$ and $y = \frac{|x|}{10}$ meet exactly six times.

So, there are six solutions.



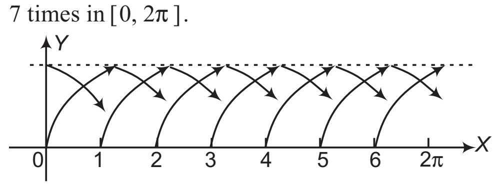
Hence, (b) is the correct answer.

Ex 58. Total number of solutions of $\sin \{x\} = \cos \{x\}$, where { } denotes the fractional part, in $[0, 2\pi]$ is

(a) 5 (b) 7
(c) 8 (d) None of these

Sol. $\sin \{x\} = \cos \{x\}$

The graph of $y = \sin \{x\}$ and $y = \cos \{x\}$ meet exactly 7 times in $[0, 2\pi]$.



Hence, (b) is the correct answer.

Ex 59. The number of all possible 5-tuples $(a_1, a_2, a_3, a_4, a_5)$ such that $a_1 + a_2 \sin x + a_3 \cos x + a_4 \sin 2x + a_5 \cos 2x = 0$ holds for all x, is

(a) zero (b) 1
(c) 2 (d) infinite

Sol. Since, the equation $a_1 + a_2 \sin x + a_3 \cos x + a_4 \sin 2x + a_5 \cos 2x = 0$ holds for all values of x.

$a_1 + a_3 + a_5 = 0 \qquad$ [on putting $x = 0$]

$$a_1 - a_3 + a_5 = 0 \quad \text{[on putting } x = \pi]$$
$$\Rightarrow \quad a_3 = 0 \quad \text{and} \quad a_1 + a_5 = 0 \quad \ldots\text{(i)}$$
Putting $x = \frac{\pi}{2}$ and $\frac{3\pi}{2}$, we get
$$a_1 + a_2 - a_5 = 0 \quad \text{and} \quad a_1 - a_2 + a_5 = 0$$
$$\Rightarrow \quad a_1 = 0 \quad \text{and} \quad a_2 - a_5 = 0 \quad \ldots\text{(ii)}$$
From Eqs. (i) and (ii),
$$a_1 = a_2 = a_3 = a_5 = 0$$
The given equation reduces to $a_4 \sin 2x = 0$. This is true for all values of x, therefore $a_4 = 0$.
So, $a_1 = a_2 = a_3 = a_4 = a_5 = 0$
Thus, the number of 5-tuples is one.
Hence, (b) is the correct answer.

Ex 60. The equation $e^{\sin x} - e^{-\sin x} - 4 = 0$ has
(a) no solution (b) two solutions
(c) three solutions (d) None of these

Sol. The given equation can be written as $e^{2\sin x} - 4e^{\sin x} - 1 = 0$
$$\Rightarrow e^{\sin x} = \frac{4 \pm \sqrt{16+4}}{2} = 2 + \sqrt{5}$$
$$\Rightarrow \sin x = \ln(2 + \sqrt{5})$$
$$[\because \ln(2 - \sqrt{5}) \text{ is not defined as } 2 - \sqrt{5} \text{ is } -\text{ve}]$$
Now, $2 + \sqrt{5} > e \Rightarrow \ln(2+\sqrt{5}) > 1 \Rightarrow \sin x > 1$
which is not possible.
$\therefore$ No real solution exists.
Hence, (a) is the correct answer.

Ex 61. If $0 \le x \le \frac{\pi}{2}$ and $81^{\sin^2 x} + 81^{\cos^2 x} = 30$, then x is equal to
(a) $\frac{\pi}{6}, \frac{\pi}{3}$ (b) $\frac{\pi}{3}, \frac{2\pi}{3}$
(c) $\frac{5\pi}{6}, \frac{\pi}{6}$ (d) None of these

Sol. Let $81^{\sin^2 x} = y$
Then, $81^{\cos^2 x} = 81^{1-\sin^2 x} = 81y^{-1}$
So that, the given equation can be written as
$$y^2 - 30y + 81 = 0$$
$$\Rightarrow \quad y = 3 \quad \text{or} \quad y = 27$$
$$\Rightarrow \quad 81^{\sin^2 x} = 3 \quad \text{or} \quad 27$$
$$\Rightarrow \quad 3^{4\sin^2 x} = 3^1 \quad \text{or} \quad 3^3$$
$$\Rightarrow \quad \sin^2 x = \frac{1}{4} \quad \text{or} \quad \frac{3}{4}$$
$$\Rightarrow \quad \sin x = \pm\frac{1}{2} \quad \text{or} \quad \pm\frac{\sqrt{3}}{2}$$
$$\Rightarrow \sin x = \frac{1}{2}, \frac{\sqrt{3}}{2} \quad \left[\text{neglecting} -\frac{1}{2}, -\frac{\sqrt{3}}{2} \text{ as } 0 \le x \le \frac{\pi}{2}\right]$$
$$\Rightarrow \quad x = \frac{\pi}{6} \quad \text{or} \quad \frac{\pi}{3}$$
Hence, (a) is the correct answer.

Type 2. **More than One Correct Option**

Ex 62. If $x = (\sec\phi - \tan\phi)$ and $y = \operatorname{cosec}\phi + \cot\phi$, then
(a) $x = \frac{y+1}{y-1}$ (b) $x = \frac{y-1}{y+1}$
(c) $y = \frac{1+x}{1-x}$ (d) $xy + x - y + 1 = 0$

Sol. We have, $x = \frac{1-\sin\phi}{\cos\phi}$, $y = \frac{1+\cos\phi}{\sin\phi}$
On multiplying, we get
$$xy = \frac{(1-\sin\phi)(1+\cos\phi)}{\cos\phi\sin\phi}$$
$$\Rightarrow \quad xy + 1 = \frac{1 - \sin\phi + \cos\phi - \sin\phi\cos\phi + \sin\phi\cos\phi}{\cos\phi\sin\phi}$$
$$= \frac{1 - \sin\phi + \cos\phi}{\cos\phi\sin\phi}$$
$$\text{and} \quad x - y = \frac{(1-\sin\phi)\sin\phi - \cos\phi(1+\cos\phi)}{\cos\phi\sin\phi}$$
$$= \frac{\sin\phi - \sin^2\phi - \cos\phi - \cos^2\phi}{\cos\phi\sin\phi}$$
$$= \frac{\sin\phi - \cos\phi - 1}{\cos\phi\sin\phi} = -(xy+1)$$
Thus, $\quad xy + x - y + 1 = 0$
$$\Rightarrow \quad x = \frac{y-1}{y+1}$$
$$\text{and} \quad y = \frac{1+x}{1-x}$$
Hence, (b), (c) and (d) are the correct answers.

Ex 63. If $\tan x = \frac{2b}{a-c} \ (a \ne c)$,
$y = a\cos^2 x + 2b\sin x\cos x + c\sin^2 x$ and $z = a\sin^2 x - 2b\sin x\cos x + c\cos^2 x$, then
(a) $y = z$
(b) $y + z = a + c$
(c) $y - z = a - c$
(d) $y - z = (a-c)^2 + 4b^2$

Sol. Adding the expression for y and z, we get
$$y + z = a(\cos^2 x + \sin^2 x) + c(\sin^2 x + \cos^2 x) = a + c$$
and subtracting them ,
$$y - z = a(\cos^2 x - \sin^2 x) + 4b\sin x\cos x - c(\cos^2 x - \sin^2 x)$$
$$= a\cos 2x + 2b\sin 2x - c\cos 2x$$
$$= (a-c)\cos 2x + 2b\sin 2x$$
Now, $\cos 2x = \frac{1-\tan^2 x}{1+\tan^2 x} = \frac{(a-c)^2 - 4b^2}{(a-c)^2 + 4b^2}$
and $\quad \sin 2x = \frac{2\tan x}{1+\tan^2 x} = \frac{4b(a-c)}{(a-c)^2 + 4b^2}$
$$\Rightarrow \quad y - z = \frac{(a-c)[(a-c)^2 - 4b^2] + 8b^2(a-c)}{(a-c)^2 + 4b^2}$$
$$= \frac{(a-c)[(a-c)^2 + 4b^2]}{(a-c)^2 + 4b^2} = a - c$$
As $a \ne c$, we get $y \ne z$
Hence, (b) and (c) are the correct answers.

Ex 64. If $x = \sin(\alpha-\beta)\sin(\gamma-\delta)$,
$y = \sin(\beta-\gamma)\sin(\alpha-\delta)$ and
$z = \sin(\gamma-\alpha)\sin(\beta-\delta)$, then

(a) $x+y+z=0$ (b) $x+y-z=0$
(c) $y+z-x=0$ (d) $x^3+y^3+z^3=3xyz$

Sol. $2x = \cos(\alpha-\beta-\gamma+\delta)-\cos(\alpha-\beta+\gamma-\delta)$
$2y = \cos(\beta-\gamma-\alpha+\delta)-\cos(\beta-\gamma+\alpha-\delta)$
and similarly for $2z$,
On adding, we get $2x+2y+2z=0$
$\Rightarrow \quad x+y+z=0$
Hence, (a) and (d) are the correct answers.

Ex 65. $\sin\dfrac{15\pi}{32}\sin\dfrac{7\pi}{16}\sin\dfrac{3\pi}{8}$ is equal to

(a) $\dfrac{1}{8\sqrt{2}\cos\dfrac{15\pi}{32}}$ (b) $\dfrac{1}{8\sin\dfrac{\pi}{32}}$

(c) $\dfrac{1}{4\sqrt{2}}\operatorname{cosec}\dfrac{\pi}{16}$ (d) $\dfrac{1}{8\sqrt{2}}\operatorname{cosec}\dfrac{\pi}{32}$

Sol. $\sin\dfrac{15\pi}{32}\sin\dfrac{7\pi}{16}\sin\dfrac{3\pi}{8}$

$$= \cos\left(\frac{\pi}{2}-\frac{15\pi}{32}\right)\cos\left(\frac{\pi}{2}-\frac{7\pi}{16}\right)\cos\left(\frac{\pi}{2}-\frac{3\pi}{8}\right)$$

$$= \cos\frac{\pi}{32}\cos\frac{\pi}{16}\cos\frac{\pi}{8}$$

$$= \frac{\left(2\sin\frac{\pi}{32}\cos\frac{\pi}{32}\right)\cos\frac{\pi}{16}\cos\frac{\pi}{8}}{2\sin\frac{\pi}{32}}$$

$$= \frac{2\sin\frac{\pi}{16}\cos\frac{\pi}{16}\cos\frac{\pi}{8}}{4\sin\frac{\pi}{32}} = \frac{2\sin\frac{\pi}{8}\cos\frac{\pi}{8}}{8\sin\frac{\pi}{32}}$$

$$= \frac{\sin\frac{\pi}{4}}{8\sin\frac{\pi}{32}} = \frac{1}{8\sqrt{2}\sin\frac{\pi}{32}} = \frac{1}{8\sqrt{2}\cos\frac{15\pi}{32}}$$

Hence, (a) and (d) are the correct answers.

Ex 66. If $a = \dfrac{1}{5\cos x + 12\sin x}$, then for all real x

(a) the least positive value of a is $\dfrac{1}{13}$

(b) the greatest negative value of a is $-\dfrac{1}{13}$

(c) $a \le \dfrac{1}{13}$

(d) $-\dfrac{1}{13} \le a \le \dfrac{1}{13}$

Sol. We know that,
$-\sqrt{5^2+12^2} \le 5\cos x + 12\sin x \le \sqrt{5^2+12^2}$
$\therefore \quad -13 \le 5\cos x + 12\sin x < 0$
$\Rightarrow \quad -13 \le \dfrac{1}{a} < 0$ and $0 < 5\cos x + 12\sin x \le 13$
$\Rightarrow \quad 0 < \dfrac{1}{a} \le 13$
$\therefore \quad a \le -\dfrac{1}{13}$ and $a \ge \dfrac{1}{13}$
Hence, (a) and (b) are the correct answers.

Ex 67. Let $[x]$ be the greatest integer less than or equal to x. The equation $\sin x = [1+\sin x]+[1-\cos x]$ has

(a) no solution in $\left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$

(b) no solution in $\left[\dfrac{\pi}{2}, \pi\right]$

(c) no solution in $\left[\pi, \dfrac{3\pi}{2}\right]$

(d) no solution for $x \in R$

Sol. At $x = -\dfrac{\pi}{2}, \dfrac{3\pi}{2}$; $[1+\sin x]=0$, $[1-\cos x]=1$
$\therefore \quad \sin x = 0+1 \Rightarrow -1=1$ [absurd]
At $x=0$, $[1+\sin x]=1$, $[1-\cos x]=0$
$\therefore \quad \sin x = 1+0 \Rightarrow 0=1$ [absurd]
At $x = \dfrac{\pi}{2}$, $[1+\sin x]=2$, $[1-\cos x]=1$
$\therefore \quad \sin x = 2+1=3$ [absurd]
At $x=\pi$, $[1+\sin x]=1$, $[1-\cos x]=2$
$\therefore \quad \sin x = 1+2=3$ [absurd]
In $\left(-\dfrac{\pi}{2}, 0\right)$, $[1+\sin x]=0$, $[1-\cos x]=0$
$\therefore \quad \sin x = 0+0=0$ [absurd]
In $\left(0, \dfrac{\pi}{2}\right)$, $[1+\sin x]=1$, $[1-\cos x]=0$
$\therefore \quad \sin x = 1+0=1$ [absurd]
In $\left(\dfrac{\pi}{2}, \pi\right)$, $[1+\sin x]=1$, $[1-\cos x]=1$
$\therefore \quad \sin x = 1+1=2$ [absurd]
In $\left(\pi, \dfrac{3\pi}{2}\right)$, $[1+\sin x]=0$, $[1-\cos x]=1$
$\therefore \quad \sin x = 0+1=1$ [absurd]
Hence, (a), (b), (c) and (d) are the correct answers.

Ex 68. If $\sin\theta = a$ for exactly one value of $\theta \in \left[0, \dfrac{7\pi}{3}\right]$, then the value of a is

(a) $\dfrac{\sqrt{3}}{2}$ (b) 1
(c) 0 (d) -1

Sol. Clearly, $-1 \le a \le 1$
For any value of a other than $1, -1$ we know $\sin\theta$ has two values (in quadrants I, II or III, IV).
Hence, (b) and (d) are the correct answers.

Type 3. **Assertion and Reason**

Directions (Ex. Nos. 69-77) *In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 69. Statement I The number of integral values of λ, for which the equation $7\cos x + 5\sin x = 2\lambda + 1$ has a solution, is 8.

Statement II $a\cos\theta + b\sin\theta = c$ has atleast one solution, if $|c| > \sqrt{a^2 + b^2}$

Sol. $7\cos x + 5\sin x = 2\lambda + 1$

$|2\lambda + 1| \le \sqrt{49 + 25}$

$\Rightarrow \quad |2\lambda + 1| \le \sqrt{74}$

$-\sqrt{74} \le 2\lambda + 1 \le \sqrt{74}$

$-9.6 \le 2\lambda \le 7.6, -4.8 \le \lambda \le 3.8$

$\lambda = -4, -3, -2, -1, 0, 1, 2, 3$

Also, $a\cos\theta + b\sin\theta = c$

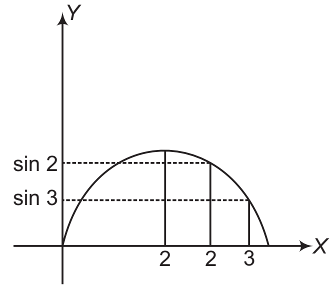
has no solution, if $|c| > \sqrt{a^2 + b^2}$

Hence, (c) is the correct answer.

Ex 70. Statement I $\sin 2 > \sin 3$

Statement II If $x,\ y \in \left(\dfrac{\pi}{2}, \pi\right), x < y$, then $\sin x > \sin y$.

Sol.



Hence, (a) is the correct answer.

Ex 71. Let $\alpha, \beta, \gamma > 0$ and $\alpha + \beta + \gamma = \dfrac{\pi}{2}$

Statement I If

$$\left|\tan\alpha\tan\beta - \frac{a!}{6}\right| + \left|\tan\beta\tan\gamma - \frac{b!}{2}\right| + \left|\tan\gamma\tan\alpha - \frac{c!}{3}\right| \le 0, \quad \text{where} \quad n! = 1\cdot 2\ldots n,$$

then $\tan\alpha\tan\beta, \tan\beta\tan\gamma, \tan\gamma\tan\alpha$ are in AP.

Statement II

$\tan\alpha\tan\beta + \tan\beta\tan\gamma + \tan\gamma\tan\alpha = 1$

Sol. Statement II $\alpha + \beta = \dfrac{\pi}{2} - \gamma$

$$\frac{\tan\alpha - \tan\beta}{1 - \tan\alpha\tan\beta} = \frac{1}{\tan\gamma}$$

$\Rightarrow \quad \Sigma\tan\alpha\tan\beta = 1$

$\therefore$ Statement II is true.

Statement I $\tan\alpha\tan\beta = \dfrac{a!}{6}, \tan\beta\tan\gamma = \dfrac{b!}{2}$

and $\tan\alpha\tan\gamma = \dfrac{c!}{3}$

$$\frac{a!}{6} + \frac{b!}{2} + \frac{c!}{3} = 1$$

$\Rightarrow \quad a! = 1, b! = 1, c! = 1$

$\Rightarrow \tan\alpha\tan\beta, \tan\gamma\tan\alpha$ and $\tan\beta\tan\gamma$ are in AP.

$\therefore$ Statement I is false.

Hence, (d) is the correct answer.

Ex 72. The angles of a triangle are given by the three values of x obtained from the equation

$\tan^3 x - 3\sqrt{3}\tan^2 x + 3\sqrt{3}\tan x - 3 = 0.$

Statement I The triangle so obtained is an equilateral triangle.

Statement II If roots of the equation are $\tan A$, $\tan B$ and $\tan C$, then $\tan A + \tan B + \tan C = 3\sqrt{3}$

Sol. $\tan A + \tan B + \tan C = 3\sqrt{3}$ and $\tan A\tan B\tan C = 3$

$\therefore \quad \tan A + \tan B + \tan C \ne \tan A\tan B\tan C$

So, triangle does not exists.

Hence, (b) is the correct answer.

Ex 73. Statement I $x = n\pi + \dfrac{\pi}{3}, n \in I$ satisfies the trigonometric equation

$\tan x\sin x + \sqrt{3} = \sqrt{3}\sin x + \tan x.$

Statement II $\tan x\sin x + \sqrt{3} = \sqrt{3}\sin x + \tan x$

$\Rightarrow \quad (\tan x - \sqrt{3})(\sin x - 1) = 0$

$\therefore$ General solution is given by

$x = n\pi + \dfrac{\pi}{6}, n \in I \cup x = r\pi + \dfrac{\pi}{2}, r \in I.$

Sol. $\tan x\sin x + \sqrt{3} = \sqrt{3}\sin x + \tan x \qquad \ldots\text{(i)}$

$\Rightarrow \quad \tan x(\sin x - 1) + \sqrt{3}(1 - \sin x) = 0$

$\Rightarrow \quad (\sin x - 1)(\tan x - \sqrt{3}) = 0$

$\therefore \quad \sin x = 1, \tan x = \sqrt{3}$, but $\sin x = 1$ is not possible as $\tan x$ is not defined at $x = (2n + 1)\dfrac{\pi}{2}$.

i.e. domain of Eq. (i) is $R - \left\{(2n + 1)\dfrac{\pi}{2}\right\}$.

$\therefore \quad \tan x = \sqrt{3} = \tan\left(\dfrac{\pi}{3}\right)$

$\Rightarrow x = n\pi + \frac{\pi}{3}, n \in I$

$\therefore$ Statement I is true and Statement II is false.

Hence, (c) is the correct answer.

Ex 74. Statement I $x = \frac{k\pi}{13}, k \in I$ does not represent the general solution of trigonometric equation $\sin 13x - \sin 13x \cos 2x = 0$.

Statement II Both $x = r\pi,\ r \in I$ and $x = \frac{k\pi}{13}$, $k \in I$ satisfies the trigonometric equation $\sin 13x - \sin 13x \cos 2x = 0$.

Sol. $\sin 13x(1 - \cos 2x) = 0$

$\Rightarrow \quad \sin 13x = 0 \quad \text{or} \quad \cos 2x = 1$

$\therefore \quad 13x = k\pi \quad \text{or} \quad \cos 2x = 1$

$x = \frac{k\pi}{13}, k \in I \quad \text{or} \quad 2x = 2n\pi$

$\Rightarrow x = n\pi, n \in I$

So, Statement I is false and Statement II is true.

Hence, (d) is the correct answer.

Ex 75. Statement I Common value(s) of x satisfying the equations

$\log_{\sin x}(\sec x + 8) > 0$ and

$\log_{\sin x}\cos x + \log_{\cos x}\sin x = 2$ in $(0, 4\pi)$ does not exist.

Statement II On solving above trigonometric equations we have to take intersection of trigonometric chains given by $\sec x > 1$ and $x = n\pi + \frac{\pi}{4}, n \in I$.

Sol. $\log_{\sin x}\cos x + \log_{\cos x}\sin x = 2$ only when

$\sin x = \cos x$

$\Rightarrow \quad x = n\pi + \frac{\pi}{4} \quad \ldots\text{(i)}$

Also, $\quad \log_{\sin x}(\sec x + 8) > 0$

$\Rightarrow \quad \sec x + 8 < 1$

$\Rightarrow \quad \sec x < -7 \quad \ldots\text{(ii)}$

Clearly, $x = \frac{\pi}{4} + n\pi$ satisfy Eq. (ii).

$\therefore$ Statement I is true and Statement II is false.

Hence, (c) is the correct answer.

Ex 76. Statement I If $f(x) = \cos x + 2\cos kx,\ k \in \theta$ $k \neq 0$, then $f(x) = 3$ has infinite solutions.

Statement II The function is periodic.

Sol. If $f(x) = \cos x + 2\cos kx, k \in \theta, k \neq 0$, then $f(x) = 3$ has only one solution when $x = 0$. It has infinite solutions, if $k \in I$ but it is given as $k \in \theta$.

$\therefore$ Statement I is false.

Hence, (d) is the correct answer.

Ex 77. Statement I The maximum value of $\sin\sqrt{2}x + \sin ax$ cannot be 2 (where, a is a positive rational number).

Statement II $\frac{\sqrt{2}}{a}$ is irrational.

Sol. $f(x) = \sin\sqrt{2}x + \sin ax$

The period of $\sin\sqrt{2}x = \frac{2\pi}{\sqrt{2}}$

and $\quad$ period of $\sin ax = \frac{2\pi}{a}$

$f(x)$ has period as

LCM of $\left\{\frac{2\pi}{\sqrt{2}}, \frac{2\pi}{a}\right\}$ does not exist.

As $\sqrt{2}$ is irrational and a is rational.

$\therefore$ Maximum value of $f(x)$ cannot be 2 as both cannot be 1.

Hence, (a) is the correct answer.

Type 4. **Linked Comprehension Based Questions**

Passage I (Ex. Nos. 78-80) *If θ is an angle, one measured in radian and $\theta \in [0, 2\pi]$, then $r\theta$ is length of arc AB, of circle of radius r, subtending angle θ at the centre O, of the circle. Area of sector OAB is $\frac{1}{2}r^2\theta$.*

Ex 78. The angle between minute hand and hour hand of a clock at 'half past 4' equals

(a) 42°

(b) 43°

(c) 44°

(d) None of the above

Sol. Angle subtended by two consecutive marks at centre $= 30°$

So, at 'half past 4', the angle is 45°.

Hence, (d) is the correct answer.

Ex 79. The wheel of a train is 1 m in diameter and it makes 5 revolutions per second. Then, the speed of the train is (approximately)

(a) 57 km/h (b) 66 km/h

(c) 68 km/h (d) 42.6 km/h

Sol. Distance covered in 1s $= 5\left(2\pi \cdot \frac{1}{2}\right) = 5\pi$ m

Distance covered in 1h $= \frac{5\pi}{1000} \times 60 \times 60 = 56.52$ km

So, speed of the train is 57 km/h.

Hence, (a) is the correct answer.

Ex 80. Two lines drawn through a point on the circumference of a circle divided the circle into three regions of equal area. Then, the angle θ between the lines is given by

(a) $3\theta + 3\sin\theta = \pi$ (b) $6\theta + 3\sin\theta = \pi$

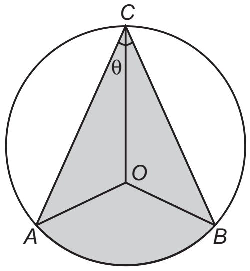
(c) $2\theta + \sin\theta = \pi$ (d) $\theta + \sin\theta = \pi/2$

Sol. Area of region $ABC = \dfrac{\pi r^2}{3}$

Area of $OAB = \dfrac{1}{2} r^2 2\theta = r^2\theta$

Area of $\Delta OAC = \dfrac{1}{2} r^2 \sin\theta =$ Area of ΔOBC

$$\Rightarrow \quad \frac{1}{2} r^2 \sin\theta + \frac{1}{2} r^2 \sin\theta + r^2\theta = \frac{\pi r^2}{3}$$



$$\Rightarrow \qquad 3\sin\theta + 3\theta = \pi$$

Hence, (a) is the correct answer.

Passage II (Ex. Nos. 81-83) *Given,*

$$\cos 2^m\theta \cos 2^{m+1}\theta \ldots \cos 2^n\theta = \frac{\sin 2^{n+1}\theta}{2^{n-m+1}\sin 2^m\theta}, \quad \textit{where}$$

$2^m\theta \neq k\pi$, *n, m,* $k \in I$.

Ex 81. $\sin\dfrac{9\pi}{14}\sin\dfrac{11\pi}{14}\sin\dfrac{13\pi}{14}$ is equal to

(a) $\dfrac{1}{64}$ (b) $-\dfrac{1}{64}$

(c) $\dfrac{1}{8}$ (d) $-\dfrac{1}{8}$

Sol. $\sin\dfrac{9\pi}{14}\sin\dfrac{11\pi}{14}\sin\dfrac{13\pi}{14} = \sin\dfrac{5\pi}{14}\sin\dfrac{3\pi}{14}\sin\dfrac{\pi}{14}$

$$= \cos\frac{\pi}{7}\cos\frac{2\pi}{7}\cos\frac{3\pi}{7}$$

$$= -\cos\frac{\pi}{7}\cos\frac{2\pi}{7}\cos\frac{4\pi}{7}$$

$$= -\frac{\sin\frac{8\pi}{7}}{8\sin\frac{\pi}{7}} = \frac{1}{8}$$

Hence, (c) is the correct answer.

Ex 82. $\cos 2^3\dfrac{\pi}{10}\cos 2^4\dfrac{\pi}{10}\cos 2^5\dfrac{\pi}{10}\ldots\cos 2^{10}\dfrac{\pi}{10}$ is equal to

(a) $\dfrac{1}{128}$ (b) $\dfrac{1}{256}$

(c) $\dfrac{1}{512}\sin\dfrac{\pi}{10}$ (d) $\dfrac{\sqrt{5}-1}{512}\sin\dfrac{3\pi}{10}$

Sol. $\cos 2^3\dfrac{\pi}{10}\cos 2^4\dfrac{\pi}{10}\cdot\cos 2^5\dfrac{\pi}{10}\ldots\cos 2^{10}\dfrac{\pi}{10}$

$$= \frac{\sin 2^{11}\frac{\pi}{10}}{256\sin 2^3\frac{\pi}{10}} = \frac{1}{256}$$

Hence, (b) is the correct answer.

Ex 83. $\cos\dfrac{\pi}{11}\cos\dfrac{2\pi}{11}\cos\dfrac{3\pi}{11}\ldots\cos\dfrac{11\pi}{11}$ is equal to

(a) $-\dfrac{1}{32}$ (b) $\dfrac{1}{512}$ (c) $\dfrac{1}{1024}$ (d) $-\dfrac{1}{2048}$

Sol. $\cos\dfrac{\pi}{11}\cos\dfrac{2\pi}{11}\cos\dfrac{3\pi}{11}\ldots\cos\dfrac{11\pi}{11}$

$$= \left(\cos\frac{\pi}{11}\cos\frac{2\pi}{11}\cos\frac{3\pi}{11}\cos\frac{4\pi}{11}\cos\frac{5\pi}{11}\right)^2$$

$$= \left(\cos\frac{\pi}{11}\cos\frac{2\pi}{11}\cos\frac{4\pi}{11}\cos\frac{8\pi}{11}\cos\frac{5\pi}{11}\right)^2$$

$$= \left(\frac{\sin\frac{16\pi}{11}}{16\sin\frac{\pi}{11}}\cdot\cos\frac{5\pi}{11}\right)^2 = \left(\frac{2\sin\frac{5\pi}{11}\cos\frac{5\pi}{11}}{32\sin\frac{\pi}{11}}\right)^2 = \frac{1}{1024}$$

Hence, (c) is the correct answer.

Passage III (Ex. Nos. 84-88) $y = ax^2 + bx + c = 0$ *is a quadratic equation which has real roots if and only if* $b^2 - 4ac \geq 0$. *If* $(x, y) = 0$ *is a second degree equation, then using above fact we can get the range of x and y by treating it as quadratic equation in y or x. Similarly,* $ax^2 + bx + c \leq 0, \forall\ x \in R$, *if* $a > 0$ *and* $b^2 - 4ac \leq 0$.

Ex 84. If $0 < \alpha, \beta < 2\pi$, then the number of ordered pairs (α, β) satisfying

$$\sin^2(\alpha+\beta) - 2\sin\alpha\sin(\alpha+\beta) + \sin^2\alpha + \cos^2\beta = 0, \text{ is}$$

(a) 2 (b) 0

(c) 4 (d) None of these

Sol. On solving it, we get

$$\sin(\alpha+\beta) = \sin\alpha \pm \sqrt{-\cos^2\beta}$$

$$\Rightarrow \quad \cos\beta = 0 \quad \Rightarrow \quad \beta = \frac{\pi}{2}, \frac{3\pi}{2}$$

If $\beta = \dfrac{\pi}{2}$, then $\tan\alpha = 1, \alpha \in \left\{\dfrac{\pi}{4}, \dfrac{5\pi}{4}\right\}$

If $\beta = \dfrac{3\pi}{2}$, then $\tan\alpha = -1, \alpha \in \left\{\dfrac{3\pi}{4}, \dfrac{7\pi}{4}\right\}$

Hence, (c) is the correct answer.

Ex 85. If $A + B + C = \pi$, then the maximum value of $\cos A + \cos B + k\cos C$ (where, $k > 1/2$) is

(a) $\dfrac{1}{k} + \dfrac{k}{2}$ (b) $\dfrac{2k^2+1}{3}$

(c) $\dfrac{k^2+2}{3}$ (d) $\dfrac{1}{2k} + k$

Sol. Let $\cos A + \cos B + k\cos C = y$

$$\Rightarrow \quad 2k\sin^2\frac{C}{2} - 2\cos\left(\frac{A-B}{2}\right)\sin\frac{C}{2} + y - k = 0$$

As $\qquad D \geq 0$

$$\Rightarrow \quad k(y-k) \leq \frac{1}{2}\cos^2\left(\frac{A-B}{2}\right) \leq \frac{1}{2}$$

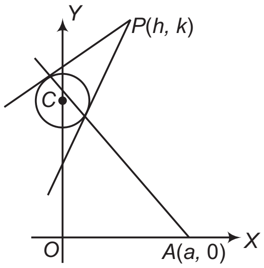
$$\Rightarrow \qquad y \leq \frac{1}{2k} + k$$

Hence, (d) is the correct answer.

Ex 86. A circle with radius $|a|$ and centre on Y-axis slides along it and a variable line through $(a, 0)$ cuts the circle at points P and Q. The region in which the point of intersection of tangents to the circle at points P and Q lies is represented by

(a) $y^2 \geq 4(ax - a^2)$
(b) $y^2 \leq 4(ax - a^2)$
(c) $y \geq 4(ax - a^2)$
(d) $y \leq (ax - a^2)$

Sol. Let the centre be $(0, \alpha)$ and equation of circle be $x^2 + (y - \alpha)^2 = |a|^2$



Equation of chord of contact for $P(h, k)$ is

$$xh + yk - \alpha(y + k) + \alpha^2 - a^2 = 0$$

It passes through $(a, 0)$.

$$\therefore \quad \alpha^2 - \alpha k + ah - a^2 = 0$$

As a is real $\Rightarrow \quad k^2 - 4(ah - a^2) \geq 0$

Thus, required equation is

$$y^2 \geq 4(ax - a^2)$$

Hence, (a) is the correct answer.

Ex 87. In above question let A_a represents the region asked in the problem (obviously $|a|$ is radius of circle), then the region represented by $\bigcap_{a \in R} A_a$ will be

(a) $h^2 - k^2 \leq 0$ (b) $h^2 - k^2 \geq 0$
(c) $h + 2k < 0$ (d) $h + 2k > 0$

Sol. Intersection of all region is nothing but the region which satisfy $k^2 - 4ah + 4a^2 \geq 0$ for all values of $a \in R$.

$$\Rightarrow \quad 16h^2 - 16k^2 \leq 0$$

$$\Rightarrow \quad h^2 - k^2 \leq 0$$

Hence, (a) is the correct answer.

Ex 88. If $3^{2x+2} + (a^2 - 4a - 2)3^x + 1 > 0, \forall x \in R$, then

(a) $a \in R$ (b) $a \in R^+$
(c) $a \in [1, \infty)$ (d) $a \in R - \{2\}$

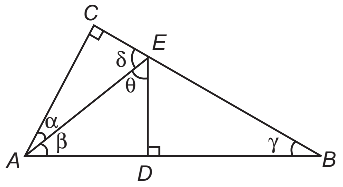
Sol. $3^x\left(9 \cdot 3^x + \dfrac{1}{3^x} + (a^2 - 4a - 2)\right) > 0$

$$\Rightarrow 3^x\left[\left(3 \cdot 3^{x/2} - \frac{1}{3^{x/2}}\right)^2 (a - 2)^2\right] > 0$$

$$\Rightarrow \qquad a \neq 2$$

Hence, (d) is the correct answer.

Passage IV (Ex. Nos. 89-93) *In the figure, it is given that* $\angle C = 90°$, $AD = DB$, ED *is perpendicular to* AB, $AB = 20$ *and* $AC = 12$.



Ex 89. Area of ΔAEC is

(a) 24 sq units (b) 21 sq units
(c) 42 sq units (d) $\dfrac{21}{2}$ sq units

Sol. Given, $AD = BD$

Now, $BC^2 = AB^2 - AC^2 = 16^2$

i.e. $BC = 16$

$\Delta AED \cong \Delta BED$ [by SAS property]

$$\tan\gamma = \frac{AC}{BC} = \frac{12}{16} = \frac{3}{4} \qquad \ldots\text{(i)}$$

$$\gamma = \beta \qquad \ldots\text{(ii)}$$

$$\cos\gamma = \frac{BD}{BE} \Rightarrow BE = \frac{10}{4/5} = \frac{25}{2} \qquad \ldots\text{(iii)}$$

$$\tan\gamma = \frac{DE}{BD} \Rightarrow DE = 10\left(\frac{3}{4}\right) = \frac{15}{2} \qquad \ldots\text{(iv)}$$

$$CE = BC - BE = 16 - \frac{25}{2} = \frac{7}{2}$$

Area of $\Delta AEC = \dfrac{1}{2}(AC)(CE) = \dfrac{1}{2} \times 12 \times \dfrac{7}{2} = 21$

Hence, (b) is the correct answer.

Ex 90. The value of $\tan\gamma \tan(60° - \gamma) \tan(60° + \gamma)$ is

(a) $-\dfrac{117}{44}$ (b) $\dfrac{17}{4}$ (c) $\dfrac{3}{4}$ (d) $\dfrac{5}{4}$

Sol. $\tan\gamma \tan(60° - \gamma) \tan(60° + \gamma)$

$$= \tan\gamma\left(\frac{\sqrt{3} - \tan\gamma}{1 + \sqrt{3}\tan\gamma}\right)\left(\frac{\sqrt{3} + \tan\gamma}{1 - \sqrt{3}\tan\gamma}\right)$$

Put $\tan\gamma = \dfrac{3}{4}$, we get

$$\tan\gamma \tan(60° - \gamma)\tan(60° + \gamma) = -\frac{117}{44}$$

Hence, (a) is the correct answer.

Ex 91. The value of $\cos(\alpha + \theta)$ is

(a) $\dfrac{4}{5}$ (b) $\dfrac{3}{5}$ (c) $\dfrac{117}{125}$ (d) $\dfrac{44}{125}$

Sol. We have, $\cos(\alpha + \theta) = \cos\alpha\cos\theta - \sin\alpha\sin\theta$

$$\Rightarrow \quad \tan\alpha = \frac{CE}{AC} = \frac{7}{2 \times 12} = \frac{7}{24}$$

$$\Rightarrow \quad \cos\alpha = \frac{24}{25};\ \sin\alpha = \frac{7}{25}$$

$$\Rightarrow \quad \tan\theta = \frac{10 \times 2}{15} = \frac{4}{3}$$

$$\Rightarrow \quad \cos\theta = \frac{3}{5};\ \sin\theta = \frac{4}{5}$$

$$\Rightarrow \quad \cos(\alpha + \theta) = \frac{24}{25} \cdot \frac{3}{5} - \frac{7}{25} \cdot \frac{4}{5} = \frac{72 - 28}{125} = \frac{44}{125}$$

Hence, (d) is the correct answer.

Ex 92. The value of

$$\sin\left(\frac{\alpha+\theta+\gamma+\delta}{2}\right)\sin\left(\frac{\alpha+\theta-\gamma-\delta}{2}\right) \text{ is}$$

(a) $\frac{4}{5}$ (b) $\frac{3}{5}$

(c) $\frac{117}{125}$ (d) $-\frac{44}{125}$

Sol. $\sin\left(\frac{\alpha+\theta+\gamma+\delta}{2}\right)\sin\left(\frac{\alpha+\theta-\gamma-\delta}{2}\right)$

$$= \frac{1}{2}[\cos(\gamma+\delta) - \cos(\alpha+\theta)]$$

$$= \frac{1}{2}[-\cos(\alpha+\theta) - \cos(\alpha+\theta)]$$

$$[\because \gamma+\delta = \pi - (\alpha+\theta)]$$

$$= -\cos(\alpha+\theta) = -\frac{44}{125}$$

Hence, (d) is the correct answer.

Ex 93. Which of the following is true?

(a) $\gamma+\delta = \theta+\alpha$ (b) $\theta+\delta > \gamma+\alpha$

(c) $\alpha+\theta > \gamma+\delta$ (d) $\alpha+\beta > \gamma+\delta$

Sol. Since, $AC > CE$

$$\delta > \alpha \qquad \text{...(i)}$$

Since, $AD > DE$

$$\theta > \beta$$

Since, $\beta = \gamma$

$$\theta > \gamma \qquad \text{...(ii)}$$

On adding Eqs. (i) and (ii), we get

$$\delta+\theta > \alpha+\gamma$$

Hence, (b) is the correct answer.

Type 5. **Match the Columns**

Ex 94. Match the statements of Column I with values of Column II.

Column I		Column II
A. The number of real roots of the equation $\cos^7 x + \sin^4 x = 1$ in $(-\pi, \pi)$ is	p.	1
B. The value of $\sqrt{3}$ cosec $20° - \sec 20°$ is	q.	4
C. $4\cos 36° - 4\cos 72° + 4\sin 18° \cos 36°$ equals	r.	3
D. The number of values of x, where $x \in [-2\pi, 2\pi]$, which satisfy cosec $x = 1 + \cot x$, is	s.	2

Sol. A. $\cos^7 x + \sin^4 x = 1$

$$\cos^7 x = (1+\sin^2 x)\cos^2 x$$

$\Rightarrow$ $\cos x = 0$

or $\cos^5 x = 1 + \sin^2 x$

$\cos x = 0$

$\Rightarrow$ $x = -\frac{\pi}{2}, \frac{\pi}{2}$

or $\cos^5 x = 1 + \sin^2 x$

$\Rightarrow$ $x = 0$ $[\because \text{LHS} \le 1 \text{ and RHS} \ge 1]$

$\therefore$ $x = -\frac{\pi}{2}, 0, \frac{\pi}{2}$

B. $\sqrt{3}$ cosec $20° - \sec 20°$

$$= \frac{\sqrt{3}}{\sin 20°} - \frac{1}{\cos 20°}$$

$$= \frac{\sqrt{3}\cos 20° - \sin 20°}{\sin 20° \cos 20°}$$

$$= \frac{2\left(\frac{\sqrt{3}}{2}\cos 20° - \frac{1}{2}\sin 20°\right)}{\sin 20° \cos 20°}$$

$$= \frac{4\cos 50°}{\sin 40°} = 4$$

C. $4\cos 36° - 4\cos 72° + 4\sin 18° \cos 36°$

$$= 4\left(\frac{\sqrt{5}+1}{4}\right) - 4\left(\frac{\sqrt{5}-1}{4}\right) + 4\left(\frac{\sqrt{5}-1}{4}\right)\left(\frac{\sqrt{5}+1}{4}\right)$$

$$= \sqrt{5} + 1 - \sqrt{5} + 1 + 1 = 3$$

D. cosec $x = 1 + \cot x$

$$\Rightarrow \quad \frac{1}{\sin x} = \frac{\sin x + \cos x}{\sin x}$$

$$\Rightarrow \quad \sin x + \cos x = 1 \text{ and } \sin x \ne 0$$

$$\cos\left(x - \frac{\pi}{4}\right) = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \quad x - \frac{\pi}{4} = -2\pi + \frac{\pi}{4}, \frac{\pi}{4}$$

$$\left[\because x - \frac{\pi}{4} \in \left[-2\pi - \frac{\pi}{4}, 2\pi - \frac{\pi}{4}\right]\right]$$

$$\Rightarrow \quad x = -\frac{3\pi}{2}, \frac{\pi}{2}$$

Hence, A $\to$ r; B $\to$ q; C $\to$ r; D $\to$ s

Ex 95. Match the statements of Column I with values of Column II.

Column I	Column II	
A. The number of solutions of the equation $\lvert\cot x\rvert = \cot x + \frac{1}{\sin x}$ $(0 < x < \pi)$ is	p. No solution	
B. If $\sin\theta + \sin\phi = \frac{1}{2}$ and $\cos\theta + \cos\phi = 2$, then $\cot\left(\frac{\theta+\phi}{2}\right)$ is equal to	q.	$\frac{1}{3}$
C. $\sin^2\alpha + \sin\left(\frac{\pi}{3} - \alpha\right)\sin\left(\frac{\pi}{3} + \alpha\right)$ is equal to	r.	1
D. If $\tan\theta = 3\tan\phi$, then maximum value of $\tan^2(\theta - \phi)$ is	s.	$\frac{3}{4}$

Sol. A. $\lvert\cot x\rvert = \cot x + \frac{1}{\sin x}$

If $0 < x < \frac{\pi}{2}$, then $\cot x > 0$

So, $\cot x = \cot x + \frac{1}{\sin x}$

$$\Rightarrow \frac{1}{\sin x} = 0, \text{ no solution}$$

If $\frac{\pi}{2} < \cot x < \pi$, then $-\cot x = \cot x + \frac{1}{\sin x}$

$$\frac{2\cos x}{\sin x} + \frac{1}{\sin x} = 0$$

$$\Rightarrow 1 + 2\cos x = 0 \text{ and } \sin x \neq 0 \quad \Rightarrow \quad x = \frac{2\pi}{3}$$

B. Since, $\sin\phi + \sin\theta = \frac{1}{2}$ and $\cos\theta + \cos\phi = 2$ has no solution.

C. $\sin^2\alpha + \sin\left(\frac{\pi}{3} - \alpha\right)\sin\left(\frac{\pi}{3} + \alpha\right)$

$$= \sin^2\alpha + \sin^2\frac{\pi}{3} - \sin^2\alpha = \frac{3}{4}$$

D. $\tan\theta = 3\tan\phi$

$$\tan(\theta - \phi) = \frac{\tan\theta - \tan\phi}{1 + \tan\theta\tan\phi} = \frac{2\tan\phi}{1 + 3\tan^2\phi}$$

$$= \frac{2}{\cot\phi + 3\tan\phi} \qquad [\text{maximum, if } \tan\theta > 0]$$

$$\frac{\cot\phi + 3\tan\phi}{2} \geq \sqrt{3} \qquad [\text{using AM} \geq \text{GM}]$$

$$\Rightarrow (\cot\phi + 3\tan\phi)^2 \geq 12 \Rightarrow \tan^2(\theta - \phi) \leq \frac{1}{3}$$

A $\to$ r; B $\to$ p; C $\to$ s; D $\to$ q

Ex 96. Match the statements of Column I with values of Column II.

Column I		Column II
A. The value of $\cos 1° \cos 2° \cos 3° \ldots \cos 170°$ is	p.	4
B. The value of $\sqrt{3}$ cosec 20° − sec 20° is	q.	1
C. Maximum value of $3\sin x + 4\cos x$ is	r.	0
D. $\tan 15° + \tan 30° + \tan 15° \tan 30°$ is	s.	5

Sol. A. $\cos 1° \cos 2° \cos 3° \ldots \cos 170° = 0$

B. $\sqrt{3}$ cosec 20° − sec 20°

$$= \frac{\sqrt{3}}{\sin 20°} - \frac{1}{\cos 20°} = \frac{\sqrt{3}\cos 20° - \sin 20°}{\cos 20° \sin 20°}$$

$$= \frac{4[\sin 60° \cos 20° - \cos 60° \sin 20°]}{2\cos 20° \sin 20°} = \frac{4\sin 40°}{\sin 40°} = 4$$

C. $3\sin x + 4\cos x$

Maximum value = 5

D. $\tan 15° + \tan 30° + \tan 15° \tan 30°$

$$= \frac{\sqrt{3}-1}{\sqrt{3}+1} + \frac{1}{\sqrt{3}} + \frac{\sqrt{3}-1}{\sqrt{3}+1} \times \frac{1}{\sqrt{3}}$$

$$= \frac{\sqrt{3}-1}{\sqrt{3}+1}\left(\frac{1}{\sqrt{3}} + 1\right) + \frac{1}{\sqrt{3}}$$

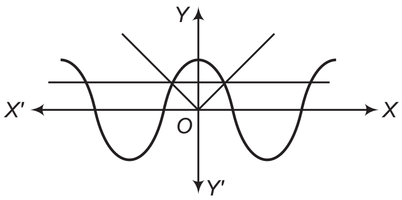
$$= \frac{\sqrt{3}-1}{\sqrt{3}+1} \times \frac{\sqrt{3}+1}{\sqrt{3}} + \frac{1}{\sqrt{3}} = 1$$

A $\to$ r; B $\to$ p; C $\to$ s; D $\to$ q

Ex 97. Match the statements of Column I with values of Column II.

Column I		Column II
A. Maximum value of $-x^2 - 2x + 2$ is	p.	3
B. Number of real solutions of $\cos(e^x) = 2^x + 2^{-x}$ is	q.	2
C. Number of solutions of equation $\lvert x \rvert = \cos x$ is	r.	1
D. Minimum value of $x^2 - 2x + 4, \forall x \in R$, is	s.	0

Sol. A. Maximum value $= -\frac{D}{4a} = 3$



B. LHS ≤ 1, whereas RHS ≥ 2

So, no solution.

C. Number of solutions = 2

D. Minimum value $= -\frac{D}{4a} = -\left[-\frac{12}{4}\right] = 3$

A $\to$ p; B $\to$ s; C $\to$ q; D $\to$ p

Type 6. **Single Integer Answer Type Questions**

Ex 98. In a ΔABC, $2\left(\sin\frac{A}{2} + \sin\frac{B}{2} + \sin\frac{C}{2}\right)$ has the maximum value λ, then λ is equal to ______.

Sol. (3) Let $\sin\frac{A}{2} + \sin\frac{B}{2} + \sin\frac{C}{2} = k$

or $\quad 2\sin\frac{A+B}{4}\cos\frac{A-B}{4} + \cos\frac{A+B}{2} = k$

$$\Rightarrow 2\sin^2\frac{A+B}{4} - 2\cos\frac{A-B}{4}\sin\frac{A+B}{4} + k - 1 = 0$$

Since, $\sin\frac{A+B}{4}$ is real, $4\cos^2\frac{A-B}{4} - 8(k-1) \geq 0$

$$\Rightarrow \quad 2(k-1) \leq \cos^2\frac{A-B}{4} \leq 1$$

$$\Rightarrow \quad k \leq \frac{3}{2}$$

So, $2\cos\frac{A-B}{4}\sin\frac{A+B}{4} - 2\sin^2\frac{A+B}{4} + 1 \leq \frac{3}{2}$

Hence, $\lambda = 3$

Ex 99. If $\sqrt{a+b}\tan\frac{\theta}{2}=\sqrt{a-b}\tan\frac{\phi}{2}$ and $(b-a\sec\theta)(b+a\cos\phi)$ has maximum value λ, then λ is equal to _______.

Sol. (0) Given that,

$$\sqrt{a+b}\tan\frac{\theta}{2}=\sqrt{a-b}\tan\frac{\phi}{2} \Rightarrow a\ge b \quad \ldots\text{(i)}$$

$$\Rightarrow \cos\theta=\frac{1-\tan^2\frac{\theta}{2}}{1+\tan^2\frac{\theta}{2}}=\frac{a\cos\phi+b}{a+b\cos\phi}$$

$$\Rightarrow (b-a\sec\theta)(b+a\cos\phi)=b^2-a^2$$

$$\Rightarrow (b-a\sec\theta)(b+a\cos\phi)\le 0 \quad \text{[from Eq. (i)]}$$

So, the maximum value is 0.

$$\therefore \lambda=0$$

Ex 100. If $\log_{|\sin x|}|\cos x|+\log_{|\cos x|}|\sin x|=2$, then $|\tan x|$ is equal to _______.

Sol. (1) Here, $\log_{|\sin x|}|\cos x|+\dfrac{1}{\log_{|\sin x|}|\cos x|}=2$

$$\Rightarrow y+\frac{1}{y}=2, \text{ where } y=\log_{|\sin x|}|\cos x|$$

$$\Rightarrow y=1$$

$$\Rightarrow \log_{|\sin x|}|\cos x|=1$$

$$\Rightarrow |\sin x|=|\cos x|$$

$$\Rightarrow |\tan x|=1$$

Ex 101. If $16\left(\cos\theta-\cos\frac{\pi}{8}\right)\left(\cos\theta-\cos\frac{3\pi}{8}\right)\left(\cos\theta-\cos\frac{5\pi}{8}\right)\left(\cos\theta-\cos\frac{7\pi}{8}\right)=\lambda\cos 4\theta$, then the value of λ is ________.

Sol. (2) LHS $=16\left(\cos\theta-\cos\frac{\pi}{8}\right)\left(\cos\theta-\cos\frac{3\pi}{8}\right)\left(\cos\theta-\cos\frac{5\pi}{8}\right)\left(\cos\theta-\cos\frac{7\pi}{8}\right)$

$$=16\left(\cos\theta-\cos\frac{\pi}{8}\right)\left(\cos\theta-\cos\frac{3\pi}{8}\right)\left(\cos\theta+\cos\frac{3\pi}{8}\right)\left(\cos\theta+\cos\frac{\pi}{8}\right)$$

$$=16\left(\cos^2\theta-\cos^2\frac{\pi}{8}\right)\left(\cos^2\theta-\cos^2\frac{3\pi}{8}\right)$$

$$=16\left(\cos^4\theta-\cos^2\theta+\sin^2\frac{\pi}{8}\cos^2\frac{\pi}{8}\right)$$

$$=16\left(\cos^4\theta-\cos^2\theta+\frac{1}{4}\sin^2\frac{\pi}{4}\right)$$

$$=16\left(\cos^4\theta-\cos^2\theta+\frac{1}{8}\right)$$

$$=16\left(-\cos^2\theta\sin^2\theta+\frac{1}{8}\right)=16\left(\frac{-\sin^2 2\theta}{4}+\frac{1}{8}\right)$$

$$=16\left(\frac{1-2\sin^2 2\theta}{8}\right)=16\left(\frac{\cos^2 2\theta-\sin^2 2\theta}{8}\right)$$

$$=\frac{16\cos 4\theta}{8}=2\cos 4\theta$$

Hence, the value of λ is 2.

Ex 102. If $x\in[0,2\pi]$ for which

$$2\cos x\le\left|\sqrt{1+\sin 2x}-\sqrt{1-\sin 2x}\right|\le\sqrt{2}$$

has solution set $x\in\left[\frac{\lambda\pi}{4},\frac{\mu\pi}{4}\right]$, then $\mu-\lambda$ is equal to _______ .

Sol. (6) Let $y=\left|\sqrt{1+\sin 2x}-\sqrt{1-\sin 2x}\right|$

$$\Rightarrow y^2=2-2|\cos 2x|$$

If $x\in\left[0,\frac{\pi}{4}\right]$ or $\left[\frac{3\pi}{4},\frac{5\pi}{4}\right]$ or $\left[\frac{7\pi}{4},2\pi\right]$

$\cos 2x$ is non-negative.

So, $y^2=2-2\cos 2x-4\sin^2 x$

$$y=2|\sin x|$$

$$\Rightarrow \cos x\le|\sin x|$$

Except for x in $\left[0,\frac{\pi}{4}\right]$ and $\left[\frac{7\pi}{4},2\pi\right]$

so that leaves $\left[\frac{3\pi}{4},\frac{5\pi}{4}\right]$

In which we certainly have, $\sin x\le\frac{1}{\sqrt{2}}$

If $x\in\left(\frac{\pi}{4},\frac{3\pi}{4}\right)$ or $\left(\frac{5\pi}{4},\frac{7\pi}{4}\right)$, then

$\cos 2x$ is negative, so $y^2=2+2\cos 2x=4\cos^2 x$

$$\Rightarrow y=2|\cos x|$$

So the first inequality certainly holds, the second also holds.

Thus, solution set is $x\in\left[\frac{\pi}{4},\frac{7\pi}{4}\right]$.

$$\Rightarrow \mu-\lambda=6$$

Ex 103. If $2^7\cos^3\theta\sin^5\theta=a\sin 8\theta-b\sin 6\theta+c\sin 4\theta+d\sin 2\theta$ and θ is real, then the value of $a+b+c+d$ must be ________.

Sol. (7) Let $z=e^{i\theta}$

$$\therefore 2\cos\theta=z+\frac{1}{z} \text{ and } 2i\sin\theta=z-\frac{1}{z}$$

Now, $(2\cos\theta)^3\cdot(2i\sin\theta)^5=\left(z+\frac{1}{z}\right)^3\left(z-\frac{1}{z}\right)^5$

$$=\left(z^8-\frac{1}{z^8}\right)-2\left(z^6-\frac{1}{z^6}\right)-2\left(z^4-\frac{1}{z^4}\right)+6\left(z^2-\frac{1}{z^2}\right)$$

$$=2i\sin 8\theta-4i\sin 6\theta-4i\sin 4\theta+12i\sin 2\theta$$

$$\therefore 2^7\cos^3\theta\sin^5\theta=\sin 8\theta-2\sin 6\theta-2\sin 4\theta+6\sin 2\theta$$

On comparing, $a=1, b=2, c=-2, d=6$

$$\Rightarrow a+b+c+d=7$$

Ex 104. If $\sin x+\sin y\ge\cos\alpha\cos x, \forall x\in R$, then $\sin y+\cos\alpha$ is equal to _______.

Sol. (1) $\sin x+\sin y\ge\cos\alpha\cos x, \forall x\in R$

Let $x=-\frac{\pi}{2}$

$$\therefore -1+\sin y\ge 0$$

$$\Rightarrow \sin y\ge 1 \Rightarrow \sin y=1$$

If $\sin y = 1$, then

$$\sin x + 1 \geq \cos\alpha \cos x$$

$$\Rightarrow \quad \cos\alpha\cos x - \sin x \leq 1 \quad \ldots\text{(i)}$$

Using $a\sin\theta + b\sin\theta \leq \sqrt{a^2+b^2}, \forall \theta \in R$

$$\cos\alpha\cos x - \sin x \leq \sqrt{1+\cos^2\alpha}$$

$$\therefore \quad \sqrt{1+\cos^2\alpha} \leq 1$$

$$\Rightarrow \quad \cos\alpha = 0$$

$$\Rightarrow \quad \sin y + \cos\alpha = 1$$

Ex 105. If $0 \leq A, B, C \leq \pi$ and $A+B+C=\pi$, then the minimum value of $\sin 3A + \sin 3B + \sin 3C$ is ______.

Sol. (–2) Let $y = \sin 3A + \sin 3B + \sin 3C$ for $\sin 3A$ to be non-positive.

We have, $2\pi \leq 3A \leq 3\pi$

$$\Rightarrow \quad \frac{2\pi}{3} < A < \pi$$

Since, $A + B + C = \pi$

All of $\sin 3A$, $\sin 3B$, $\sin 3C$ can not be negative.

Let us take $\sin 3A = -1$

$$\Rightarrow \quad A = \frac{\pi}{2} \Rightarrow \sin 3B = -1 \Rightarrow B = \frac{\pi}{2}$$

$$\therefore \quad C = 0$$

i.e. $\sin 3A = -1, \sin 3B = -1, \sin 3C = 0$

Hence, minimum value of

$$\sin 3A + \sin 3B + \sin 3C = -2$$

Ex 106. If θ_1, θ_2 and θ_3 are three values lying in $[0, 2\pi]$ for which $\tan\theta = \lambda$, then $\left|\tan\frac{\theta_1}{3}\tan\frac{\theta_2}{3} + \tan\frac{\theta_2}{3}\tan\frac{\theta_3}{3} + \tan\frac{\theta_1}{3}\tan\frac{\theta_3}{3}\right|$ is equal to _______.

Sol. (3) $\tan\theta = \dfrac{3\tan\frac{\theta}{3} - \tan^3\frac{\theta}{3}}{1 - 3\tan^2\frac{\theta}{3}}$

$$\Rightarrow \quad \tan^3\frac{\theta}{3} - 3\lambda\tan\frac{\theta}{3} - 3\tan\frac{\theta}{3} + \lambda = 0$$

$$\therefore \quad \tan\frac{\theta_1}{3}\tan\frac{\theta_2}{3} + \tan\frac{\theta_2}{3}\tan\frac{\theta_3}{3} + \tan\frac{\theta_3}{3}\tan\frac{\theta_1}{3} = -3$$

$$\Rightarrow \quad \left|\tan\frac{\theta_1}{3}\tan\frac{\theta_2}{3} + \tan\frac{\theta_2}{3}\tan\frac{\theta_3}{3} + \tan\frac{\theta_1}{3}\tan\frac{\theta_3}{3}\right| = 3$$

Ex 107. The number of solutions of the equation $\log_{|x-1|}|x^2-1| = [|\sin x| + |\cos x|]$ where, [ ] denotes greatest integer function, is ______.

Sol. (1) As $1 \leq |\sin x| + |\cos x| \leq \sqrt{2}$

$$\therefore \quad [|\sin x| + |\cos x|] = 1$$

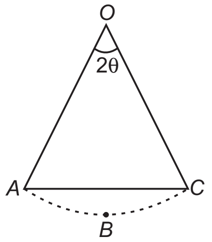
$$\Rightarrow \quad \log_{|x-1|}|x^2-1| = 1$$

$$\Rightarrow \quad |x^2-1| = |x-1|$$

$$\Rightarrow \quad x = 1, 0, -2, \text{ but } x \neq 0, 1$$

$\therefore$ Number of solutions is one.

Ex 108. For a given sector $OABC$, if $\theta \in \left(\frac{\pi}{6}, \frac{\pi}{3}\right)$, then minimum area of segment $ABCA$ is $r^2\left(\frac{\pi}{6} - \frac{\sqrt{3}}{\lambda}\right)$, then λ is _______.



Sol. (4) Area of segment $ABCA$

$$= \text{Area of sector } AOC - \text{Area of } \Delta AOC$$

$$= \frac{2\theta}{360°} \times \pi r^2 - \frac{r^2}{2}\sin 2\theta$$

$$= r^2\left\{\theta - \frac{1}{2}\sin 2\theta\right\}, \theta \in \left(\frac{\pi}{6}, \frac{\pi}{3}\right) \quad \ldots\text{(i)}$$

Let $f(\theta) = \theta - \frac{1}{2}\sin 2\theta$

$$\Rightarrow \quad f'(\theta) = 1 - \cos 2\theta > 0 \quad \text{[increasing]}$$

Hence, area of segment $ABCA = r^2\left\{\frac{\pi}{6} - \frac{1}{2}\sin\frac{2\pi}{3}\right\}$

$$= r^2\left\{\frac{\pi}{6} - \frac{\sqrt{3}}{4}\right\} = r^2\left\{\frac{\pi}{6} - \frac{\sqrt{3}}{\lambda}\right\} \Rightarrow \lambda = 4$$

Ex 109. The number of solutions for $2\sin^2 x + \sin^2 2x = 2$ when $-\pi < x < \pi$, is ____.

Sol. (6) We have, $2\sin^2 x + \sin^2 2x = 2$

$$\Rightarrow \quad 1 - \cos 2x + 1 - \cos^2 2x = 2$$

$$\Rightarrow \quad \cos 2x + \cos^2 2x = 0$$

$$\Rightarrow \quad \cos 2x(1 + \cos 2x) = 0$$

$$\Rightarrow \quad \cos 2x = 0, \cos 2x = -1$$

$$\Rightarrow \quad 2x = \pm\frac{\pi}{2}, \pm\frac{3\pi}{2}, 2x = \pm\pi$$

$$\Rightarrow \quad x = \pm\frac{\pi}{4}, \pm\frac{3\pi}{4}, \pm\frac{\pi}{2}$$

Hence, the number of solutions is six.

Target Exercises

Type 1. **Only One Correct Option**

1. The numerical value of

$\tan\frac{\pi}{3}+2\tan\frac{2\pi}{3}+4\tan\frac{4\pi}{3}+8\tan\frac{8\pi}{3}$ is

(a) $-5\sqrt{3}$ (b) $-\frac{5}{\sqrt{3}}$
(c) $5\sqrt{3}$ (d) $\frac{5}{\sqrt{3}}$

2. A quadratic equation whose roots are $\operatorname{cosec}^2\theta$ and $\sec^2\theta$, can be

(a) $x^2-2x+2=0$ (b) $x^2-3x+3=0$
(c) $x^2-5x+5=0$ (d) None of these

3. $\cos^2\frac{3\pi}{5}+\cos^2\frac{4\pi}{5}$ is equal to

(a) $\frac{4}{5}$ (b) $\frac{5}{2}$ (c) $\frac{5}{4}$ (d) $\frac{3}{4}$

4. The value of $\sin 600°\cos 330°+\cos 120°\sin 150°$ is

(a) -1 (b) 1 (c) $\frac{1}{2}$ (d) $\frac{3}{2}$

5. The value of expression $\frac{1-4\sin 10°\sin 70°}{2\sin 10°}$ is

(a) $\frac{1}{2}$ (b) 1
(c) 2 (d) None of these

6. The value of the expression $(\sqrt{3}\sin 75°-\cos 75°)$ is

(a) $2\sin 15°$ (b) $1+\sqrt{3}$ (c) $2\sin 105°$ (d) $\sqrt{2}$

7. If $\sin\alpha=\frac{1}{\sqrt{5}}$ and $\sin\beta=\frac{3}{5}$, then $\beta-\alpha$ lies in the interval

(a) $\left(0,\frac{\pi}{4}\right)\cup\left(\frac{3\pi}{4},\pi\right)$ (b) $\left[\frac{\pi}{2},\frac{3\pi}{4}\right]$
(c) $\left(\frac{\pi}{4},\frac{\pi}{2}\right)$ (d) $\left(\pi,\frac{5\pi}{4}\right]$

8. The numerical value of $\sqrt{3}\operatorname{cosec} 20°-\sec 20°$ is

(a) 2 (b) 4
(c) 6 (d) None of these

9. Which of the following numbers is rational?

(a) $\sin 15°$ (b) $\cos 15°$
(c) $\sin 15°\cos 15°$ (d) $\sin 15°\cos 75°$

10. The value of $\cos\frac{\pi}{7}\cos\frac{4\pi}{7}\cos\frac{5\pi}{7}$ is

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $-\frac{1}{8}$ (d) $\frac{1}{8}$

11. The value of

$6(\sin^6\theta+\cos^6\theta)-9(\sin^4\theta+\cos^4\theta)+4$ is

(a) -3 (b) 0 (c) 1 (d) 3

12. If $\frac{2\sin\alpha}{1+\cos\alpha+\sin\alpha}=x$, then $\frac{1-\cos\alpha-\sin\alpha}{\cos\alpha}$ is equal to

(a) $\frac{1}{x}$ (b) x
(c) $1-x$ (d) None of these

13. Which of the following is not correct?

(a) $\sin\theta=-\frac{1}{5}$ (b) $\cos\theta=1$
(c) $\sec\theta=\frac{1}{2}$ (d) $\tan\theta=20$

14. $\log(\sin 1°)\log(\sin 2°)\log(\sin 3°)\ldots\log(\sin 179°)$ is equal to

(a) 1 (b) 0 (c) 2 (d) -1

15. The value of $3\left[\sin^4\left(\frac{3\pi}{2}-\alpha\right)+\sin^4(3\pi+\alpha)\right]$

$-2\left[\sin^6\left(\frac{\pi}{2}+\alpha\right)+\sin^6(5\pi-\alpha)\right]$ is

(a) 0 (b) 1
(c) 3 (d) $\sin 4\alpha+\sin 6\alpha$

16. If $\tan x+\cot x=2$, then $\sin^{2n}x+\cos^{2n}x$ is equal to

(a) 2^n (b) $-\frac{1}{2}$
(c) $\frac{1}{2}$ (d) None of these

17. If $\frac{\pi}{2}<\alpha<\pi,\pi<\beta<\frac{3\pi}{2}$; $\sin\alpha=\frac{15}{17}$ and $\tan\beta=\frac{12}{5}$, then the value of $\sin(\beta-\alpha)$ is

(a) $-\frac{171}{221}$ (b) $-\frac{21}{221}$ (c) $\frac{21}{221}$ (d) $\frac{171}{221}$

18. If $\cos(\theta-\alpha)=a$ and $\sin(\theta-\beta)=b$, then $\cos^2(\alpha-\beta)+2ab\sin(\alpha-\beta)$ is equal to

(a) $4a^2b^2$ (b) a^2-b^2
(c) a^2+b^2 (d) $-a^2b^2$

19. The expression $\frac{\cos 6x+6\cos 4x+15\cos 2x+10}{\cos 5x+5\cos 3x+10\cos x}$ is equal to

(a) $\cos 2x$ (b) $2\cos x$
(c) $\cos^2 x$ (d) $1+\cos x$

20. $\sin 47^\circ + \sin 61^\circ - \sin 11^\circ - \sin 25^\circ$ is equal to

(a) $\sin 36^\circ$ (b) $\cos 36^\circ$
(c) $\sin 7^\circ$ (d) $\cos 7^\circ$

21. The value of $\cos y \cos\left(\frac{\pi}{2} - x\right) - \cos\left(\frac{\pi}{2} - y\right)\cos x + \sin y \cos\left(\frac{\pi}{2} - x\right) + \cos x \sin\left(\frac{\pi}{2} - y\right)$ is zero, if

(a) $x = 0$ (b) $y = 0$
(c) $x = y$ (d) $x = n\pi - \frac{\pi}{4} + y$

22. If $\operatorname{cosec} A + \cot A = \frac{11}{2}$, then $\tan A$ is equal to

(a) $\frac{21}{22}$ (b) $\frac{15}{16}$ (c) $\frac{44}{117}$ (d) $\frac{117}{43}$

23. The value of the expression $\frac{\sin^3 x}{1 + \cos x} + \frac{\cos^3 x}{1 - \sin x}$ is

(a) $\sqrt{2} \cos\left[\frac{\pi}{4} - x\right]$ (b) $\sqrt{2} \cos\left[\frac{\pi}{4} + x\right]$
(c) $\sqrt{2} \sin\left[\frac{\pi}{4} - x\right]$ (d) None of these

24. In ΔABC, the value of the expression $\operatorname{cosec} A(\sin B \cos C + \cos B \sin C)$ is

(a) 1 (b) $\frac{c}{a}$
(c) $\frac{a}{c}$ (d) None of these

25. If $\cos(A - B) = \frac{3}{5}$ and $\tan A \tan B = 2$, then

(a) $\cos A \cos B = \frac{1}{5}$ (b) $\sin A \sin B = -\frac{2}{5}$
(c) $\cos(A + B) = \frac{1}{5}$ (d) None of these

26. $f(\theta) = \sin^2 \theta + \sin^2\left(\theta + \frac{2\pi}{3}\right) + \sin^2\left(\theta + \frac{4\pi}{3}\right)$, then $f\left(\frac{\pi}{15}\right)$ is equal to

(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{1}{3}$ (d) None of these

27. If $\cos(x - y)$, $\cos x$ and $\cos(x + y)$ are in HP, then $\cos x \cdot \sec\left(\frac{y}{2}\right)$ is equal to

(a) ± 1 (b) $\pm\sqrt{2}$
(c) $\pm\sqrt{3}$ (d) None of these

28. If $\sin^3 x \sin 3x = \sum_{r=0}^{n} a_r \cos(rx), \forall x \in R$, where $a_0, a_1, \ldots, a_n$ are constants and $a_n \neq 0$, then

(a) $n = 5$
(b) $n = 6$
(c) $n = 7$
(d) None of the above

29. If $A + B = \frac{\pi}{4}$, where $A, B \in R^+$, then the minimum value of $(1 + \tan A)(1 + \tan B)$ is

(a) 2 (b) 4
(c) 1 (d) None of these

30. If $\frac{\sin x}{\sin y} = \frac{1}{2}, \frac{\cos x}{\cos y} = \frac{3}{2}$, where $x, y \in \left(0, \frac{\pi}{2}\right)$, then the value of $\tan(x + y)$ is

(a) $\sqrt{13}$ (b) $\sqrt{14}$ (c) $\sqrt{17}$ (d) $\sqrt{15}$

31. In ΔABC, if $\angle C = \frac{2\pi}{3}$, then the value of $\cos^2 A + \cos^2 B - \cos A \cos B$ is

(a) $\frac{3}{4}$ (b) $\frac{3}{2}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

32. The value of $\sum_{r=0}^{10} \cos^3 \frac{\pi r}{3}$ is

(a) $-\frac{9}{2}$ (b) $-\frac{7}{2}$ (c) $-\frac{9}{8}$ (d) $-\frac{1}{8}$

33. If in any ΔABC, the value of $\angle A$ is obtained from the equation $3\cos A + 2 = 0$, then the equation whose roots are $\sin A$ and $\tan A$, is

(a) $6x^2 + \sqrt{5}x - 5 = 0$ (b) $6x^2 + 5x - 5 = 0$
(c) $x^2 + \sqrt{5}x - 5 = 0$ (d) None of these

34. If $\cot^2 x = \cot(x - y)\cot(x - z)$, then $\cot 2x$ is equal to (where, $x \neq \pm \pi/4$)

(a) $\frac{1}{2}(\tan y + \tan z)$ (b) $\frac{1}{2}(\cot y + \cot z)$
(c) $\frac{1}{2}(\sin y + \sin z)$ (d) None of these

35. If $\alpha + \beta = \frac{\pi}{2}$ and $\beta + \gamma = \alpha$, then $\tan \alpha$ is equal to

(a) $2(\tan\beta + \tan\gamma)$ (b) $\tan\beta + \tan\gamma$
(c) $\tan\beta + 2\tan\gamma$ (d) $2\tan\beta + \tan\gamma$

36. If $\sin\theta = n\sin(\theta + 2\alpha)$, then $\tan(\theta + \alpha)$ is equal to

(a) $\left(\frac{2 + n}{2 - n}\right)\tan\alpha$ (b) $\left(\frac{1 + n}{1 - n}\right)\tan\alpha$
(c) $\tan\alpha$ (d) $\left(\frac{1 - n}{1 + n}\right)\tan\alpha$

37. If $\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha = 1$, $\frac{x}{a}\cos\beta + \frac{y}{b}\sin\beta = 1$ and $\frac{\cos\alpha\cos\beta}{a^2} + \frac{\sin\alpha\sin\beta}{b^2} = 0$, then

(a) $\tan\alpha\tan\beta = \frac{b^2(x^2 + a^2)}{a^2(y^2 + b^2)}$ (b) $x^2 + y^2 = a^2 + b^2$
(c) $\tan\alpha\tan\beta = \frac{a^2}{b^2}$ (d) None of these

38. If $x = \sin(\alpha - \beta)\sin(\gamma - \delta)$, $y = \sin(\beta - \gamma)\sin(\alpha - \delta)$ and $z = \sin(\gamma - \alpha)\sin(\beta - \delta)$, then

(a) $x + y + z = 0$ (b) $x + y - z = 0$
(c) $y + z - x = 0$ (d) None of these

39. $\cos\left(\frac{\pi}{4}-x\right)\cos\left(\frac{\pi}{4}-y\right)-\sin\left(\frac{\pi}{4}-x\right)\sin\left(\frac{\pi}{4}-y\right)$ is equal to

(a) $\sin(x-y)$ (b) $\sin(x+y)$
(c) $\cos(x+y)$ (d) $\cos(x-y)$

40. If $x\in(0,\pi)$ and $\sin x\cos^3 x>\cos x\sin^3 x$, then complete set of values of x is

(a) $x\in\left(0,\frac{\pi}{4}\right)\cup\left(\frac{\pi}{2},\frac{3\pi}{4}\right)$
(b) $x\in\left(\frac{\pi}{4},\frac{\pi}{2}\right)\cup\left(\frac{3\pi}{4},\pi\right)$
(c) $x\in\left(\frac{\pi}{4},\frac{\pi}{2}\right)$
(d) None of the above

41. For $0<\phi<\frac{\pi}{2}$, if $x=\sum_{n=0}^{\infty}\cos^{2n}\phi$, $y=\sum_{n=0}^{\infty}\sin^{2n}\phi$ and $z=\sum_{n=0}^{\infty}\cos^{2n}\phi\sin^{2n}\phi$, then

(a) $xyz=xz+y$ (b) $xyz=xy+y$
(c) $xyz=x+y+z$ (d) $xyz=yz+x$

42. If $\frac{x}{\cos\theta}=\frac{y}{\cos\left(\theta-\frac{2\pi}{3}\right)}=\frac{z}{\cos\left(\theta+\frac{2\pi}{3}\right)}$, then $x+y+z$ is equal to

(a) 1 (b) 0
(c) -1 (d) None of these

43. If $\cos\theta=\frac{1}{2}\left(x+\frac{1}{x}\right)$, then $\frac{1}{2}\left(x^2+\frac{1}{x^2}\right)$ is equal to

(a) $\sin 2\theta$ (b) $\cos 2\theta$
(c) $\tan 2\theta$ (d) None of these

44. If $-\pi\le x\le\pi$, $-\pi\le y\le\pi$ and $\cos x+\cos y=2$, then the value of $\cos(x-y)$ is

(a) -1 (b) 0
(c) 1 (d) None of these

45. If $\cos x+\cos y+\cos\alpha=0$ and $\sin x+\sin y+\sin\alpha=0$, then $\cot\left(\frac{x+y}{2}\right)$ is equal to

(a) $\sin\alpha$ (b) $\cos\alpha$
(c) $\cot\alpha$ (d) $\sin\left(\frac{x+y}{2}\right)$

46. If $\alpha+\beta-\gamma=\pi$, then $\sin^2\alpha+\sin^2\beta-\sin^2\gamma$ is equal to

(a) $2\sin\alpha\sin\beta\cos\gamma$ (b) $2\cos\alpha\cos\beta\cos\gamma$
(c) $2\sin\alpha\sin\beta\sin\gamma$ (d) None of these

47. If $\alpha+\beta+\gamma=2\pi$, then

(a) $\tan\frac{\alpha}{2}+\tan\frac{\beta}{2}+\tan\frac{\gamma}{2}=\tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$
(b) $\tan\frac{\alpha}{2}\tan\frac{\beta}{2}+\tan\frac{\beta}{2}\tan\frac{\gamma}{2}+\tan\frac{\gamma}{2}\tan\frac{\alpha}{2}=1$
(c) $\tan\frac{\alpha}{2}+\tan\frac{\beta}{2}+\tan\frac{\gamma}{2}=-\tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$
(d) None of the above

48. If $\sin x+\cos x=\frac{\sqrt{7}}{2}$, where $x\in\left[0,\frac{\pi}{4}\right]$, then $\tan\frac{x}{2}$ is equal to

(a) $\frac{3-\sqrt{7}}{3}$ (b) $\frac{\sqrt{7}-2}{3}$
(c) $\frac{7-\sqrt{7}}{4}$ (d) None of these

49. If $\sin B=\frac{1}{5}\sin(2A+B)$, then $\frac{\tan(A+B)}{\tan A}$ is equal to

(a) $\frac{5}{3}$ (b) $\frac{2}{3}$ (c) $\frac{3}{2}$ (d) $\frac{3}{5}$

50. If $\tan\alpha=\frac{1}{7}$ and $\sin\beta=\frac{1}{\sqrt{10}}$, where $0<\alpha,\beta<\frac{\pi}{2}$, then 2β is equal to

(a) $\frac{\pi}{4}-\alpha$ (b) $\frac{3\pi}{4}-\alpha$ (c) $\frac{\pi}{8}-\alpha$ (d) $\frac{3\pi}{8}-\frac{\alpha}{2}$

51. $\frac{3\cos\theta+\cos 3\theta}{3\sin\theta-\sin 3\theta}$ is equal to

(a) $1+\cot^2\theta$ (b) $\cot^4\theta$ (c) $\cot^3\theta$ (d) $2\cot\theta$

52. If $3\sin\alpha=5\sin\beta$, then $\frac{\tan\frac{\alpha+\beta}{2}}{\tan\frac{\alpha-\beta}{2}}$ is equal to

(a) 1 (b) 2 (c) 3 (d) 4

53. If $\cos 2B=\frac{\cos(A+C)}{\cos(A-C)}$, then

(a) $\tan A$, $\tan B$ and $\tan C$ are in AP
(b) $\tan A$, $\tan B$ and $\tan C$ are in GP
(c) $\tan A$, $\tan B$ and $\tan C$ are in HP
(d) None of the above

54. If $\tan x=\frac{b}{a}$, then the value of $a\cos 2x+b\sin 2x$ is

(a) a (b) $a-b$
(c) $a+b$ (d) b

55. The graph of the function $\cos x\cos(x+2)-\cos^2(x+1)$ is

(a) a straight line passing through $(0,-\sin^2\theta)$ with slope 2
(b) a straight line passing through (0, 0)
(c) a parabola with vertex $(1,-\sin^2 1)$
(d) a straight line passing through the point $\left(\frac{\pi}{2},-\sin^2 1\right)$ and parallel to the X-axis

56. If $\alpha\cos^2 3\theta+\beta\cos^4\theta=16\cos^6\theta+9\cos^2\theta$ is an identity, then

(a) $\alpha=1,\beta=18$ (b) $\alpha=1,\beta=24$
(c) $\alpha=3,\beta=24$ (d) $\alpha=4,\beta=2$

57. Let n be an odd integer. If $\sin n\theta=\sum_{r=0}^{n}b_r\sin^r\theta$ for every value of θ, then

(a) $b_0=1, b_1=3$ (b) $b_0=0, b_1=n$
(c) $b_0=-1, b_1=n$ (d) $b_0=0, b_1=n^2-n+3$

58. If $0 \le \theta \le \frac{\pi}{2}$ and $x = X\cos\theta + Y\sin\theta$, $y = X\sin\theta - Y\cos\theta$ such that $x^2 + 2xy + y^2 = aX^2 + bY^2$, where a and b are constants, then

(a) $a = -1, b = -3$ (b) $\theta = \frac{\pi}{2}$
(c) $a = 3, b = -1$ (d) $\theta = \frac{\pi}{3}$

59. If θ_1 and θ_2 are two values lying in $[0, 2\pi]$ for which $\tan\theta = \lambda$, then $\tan\frac{\theta_1}{2}\tan\frac{\theta_2}{2}$ is equal to

(a) 0 (b) −1 (c) 2 (d) 1

60. If $\alpha \in (0, \pi/2)$, then the expression $\sqrt{x^2+x} + \frac{\tan^2\alpha}{\sqrt{x^2+x}}$ is always greater than or equal to

(a) $2\tan\alpha$ (b) $2\cos\alpha$
(c) 1 (d) $\sec^2\alpha$

61. In ΔABC, $\tan\frac{A}{2}$, $\tan\frac{B}{2}$ and $\tan\frac{C}{2}$ are in HP, then the value of $\cot\frac{A}{2}\cot\frac{C}{2}$ is

(a) 1 (b) 2
(c) 3 (d) 4

62. The expression $\cos^2\phi + \cos^2(a+\phi) - 2\cos a\cos\phi\cos(a+\phi)$ is independent of

(a) ϕ (b) a
(c) both a and ϕ (d) None of these

63. If $\cos x - \sin\alpha\cot\beta\sin x = \cos\alpha$, then $\tan\frac{x}{2}$ is equal to

(a) $\cot\frac{\alpha}{2}\tan\frac{\beta}{2}$ (b) $\cot\frac{\beta}{2}\tan\frac{\alpha}{2}$
(c) $\tan\frac{\alpha}{2}\tan\frac{\beta}{2}$ (d) None of these

64. If $A + B = \frac{\pi}{3}$ and $\cos A + \cos B = 1$, then

(a) $\cos(A-B) = \frac{1}{3}$ (b) $|\cos A - \cos B| = \sqrt{\frac{2}{3}}$
(c) $\cos(A-B) = \frac{2}{3}$ (d) None of these

65. Let $I(n) = 2\cos nx, \forall\, n \in N$, then $I(1)\cdot I(n+1) - I(n)$ is equal to

(a) $I(n+3)$ (b) $I(n+2)$
(c) $I(n+1)\cdot I(2)$ (d) $I(n+2)\cdot I(2)$

66. The equation $(\cos p - 1)x^2 + (\cos p)x + \sin p = 0$ in x has real roots. Then, the set of values of p is

(a) $[0, 2\pi]$ (b) $[-\pi, 0]$
(c) $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ (d) $[0, \pi]$

67. If $x = \alpha$, β satisfies both the equation $\cos^2 x + a\cos x + b = 0$ and $\sin^2 x + p\sin x + q = 0$, then the relation between a, b, p and q is

(a) $1 + b + a^2 = p^2 - q$ (b) $a^2 + b^2 = p^2 + q^2$
(c) $b + q = a^2 + p^2 - 2$ (d) None of these

68. If $f(\theta) = |\sin\theta| + |\cos\theta|, \theta \in R$, then

(a) $f(\theta) \in [0, 2]$ (b) $f(\theta) \in [0, \sqrt{2}]$
(c) $f(\theta) \in [0, 1]$ (d) $f(\theta) \in [1, \sqrt{2}]$

69. If $f(\theta) = (\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2$, then minimum value of $f(\theta)$ is

(a) 7 (b) 8
(c) 9 (d) None of these

70. If $f(\theta) = \sin^4\theta + \cos^4\theta + 1$, then range of $f(\theta)$ is

(a) $\left[\frac{3}{2}, 2\right]$ (b) $\left[1, \frac{3}{2}\right]$
(c) $[1, 2]$ (d) None of these

71. If $f(x) = \sin^6 x + \cos^6 x + 1$, then range of $f(\theta)$ is

(a) $\left[\frac{1}{4}, 1\right]$ (b) $\left[\frac{1}{4}, \frac{3}{4}\right]$
(c) $\left[\frac{3}{4}, 1\right]$ (d) None of these

72. The maximum value of $\sin\left(x + \frac{\pi}{6}\right) + \cos\left(x + \frac{\pi}{6}\right)$ in the interval $\left(0, \frac{\pi}{2}\right)$ is attained at

(a) $\frac{\pi}{12}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

73. The number of integral value of k for which the equation $7\cos x + 5\sin x = 2k + 1$ has a solution, is

(a) 4 (b) 8 (c) 10 (d) 12

74. If $f(x) = \begin{vmatrix} \sin^2\theta & \cos^2\theta & x \\ \cos^2\theta & x & \sin^2\theta \\ x & \sin^2\theta & \cos^2\theta \end{vmatrix}, \theta \in (0, \pi/2)$, then roots of $f(x) = 0$ are

(a) 1/2, −1, 0 (b) 1/2, −1
(c) −1/2, 1, −1 (d) −1/2, −1, 1

75. If $f(\theta) = \frac{1}{2 - 3\cos\theta}$, then range of $f(\theta)$ is

(a) $\left(-\infty, \frac{1}{5}\right] \cup [1, \infty)$ (b) $\left[-1, \frac{1}{5}\right]$
(c) $(-\infty, -1] \cup \left(\frac{1}{5}, \infty\right]$ (d) None of these

76. If $f(\theta) = 5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3$, then range of $f(\theta)$ is

(a) $[-5, 11]$ (b) $[-3, 9]$
(c) $[-2, 10]$ (d) $[-4, 10]$

77. If $a\sin x + b\cos(x+\theta) + b\cos(x-\theta) = d$], then the minimum value of $|\cos\theta|$ is

(a) $\frac{1}{2|b|}\sqrt{d^2-a^2}$ (b) $\frac{1}{2|a|}\sqrt{d^2-a^2}$

(c) $\frac{1}{2|d|}\sqrt{d^2-a^2}$ (d) None of these

78. The minimum value of the expression $\sin\alpha + \sin\beta + \sin\gamma$, where α, β and γ are real numbers satisfying $\alpha + \beta + \gamma = \pi$, is

(a) positive (b) zero
(c) negative (d) None of these

79. If $A \ge 0, B \ge 0, A + B = \frac{\pi}{3}$ and $y = \tan A \tan B$, then

(a) $y \in \left(-\infty, \frac{1}{3}\right] \cup [3, \infty)$ (b) $0 \le y \le \frac{1}{3}$

(c) $y > \frac{1}{3}$ (d) None of these

80. If $(a\sin^4\theta + b)(a+b) = ab\cos^4\theta$, then

(a) $|a| \ge |b|$
(b) $|b| = |a|$
(c) $|a| \le |b|$
(d) None of the above

81. If $\sin\theta = x + \frac{a}{x}, \forall x \in R \sim \{0\}$, then

(a) $a \ge \frac{1}{4}$ (b) $a \ge \frac{1}{2}$

(c) $a \le \frac{1}{4}$ (d) $a \le \frac{1}{2}$

82. If $\sin^2 x + a\sin x + 1 = 0$ has no real number solution, then

(a) $|a| \ge 2$ (b) $|a| \ge 1$
(c) $|a| < 2$ (d) None of these

83. If $\sin\theta_1 - \sin\theta_2 = a$ and $\cos\theta_1 + \cos\theta_2 = b$, then

(a) $a^2 + b^2 \ge 4$ (b) $a^2 + b^2 \le 4$
(c) $a^2 + b^2 \ge 3$ (d) $a^2 + b^2 \le 2$

84. If $0 \le a \le 3$, $0 \le b \le 3$ and the equation $x^2 + 4 + 3\cos(ax+b) = 2x$ has atleast one solution, then the value of $a + b$ is

(a) 0 (b) $\frac{\pi}{2}$

(c) π (d) None of these

85. If $\tan^2 x + \sec x - a = 0$ has atleast one solution, then the complete set of values of a is

(a) $(-\infty, 1]$ (b) $[1, 1]$
(c) $[-1, 1]$ (d) $[-1, \infty)$

86. $\sec^2\theta = \frac{4xy}{(x+y)^2}$ is true if and only if

(a) $x + y \ne 0$
(b) $x = y, x \ne 0$
(c) $x = y$
(d) $x \ne 0, y \ne 0$

87. If $\sin\theta = \frac{x^2+y^2}{x^2-y^2}$, then

(a) $x \ne y$ (b) $x \ne y$ and $x, y \in R$
(c) $x = 0$ or $y = 0$ (d) $x \ne y$ and $x \ne 0, y \ne 0$

88. The most general values of θ satisfying the equation $(1 + 2\sin\theta)^2 + (\sqrt{3}\tan\theta - 1)^2 = 0$ is/are given by

(a) $n\pi \pm \frac{\pi}{6}$ (b) $n\pi + (-1)^n \frac{7\pi}{6}$

(c) $2n\pi + \frac{7\pi}{6}$ (d) $2n\pi + \frac{11\pi}{6}$

89. The number of solutions of the equation $\tan^2 x - \sec^{10} x + 1 = 0$ in $(0, 10)$, is

(a) 3 (b) 8
(c) 10 (d) None of these

90. Total number of solutions of $\tan x + \cot x = 2\operatorname{cosec} x$ in $[-2\pi, 2\pi]$ is

(a) 2 (b) 4 (c) 6 (d) 8

91. Total number of solutions of the equation $3x + 2\tan x = \frac{5\pi}{2}$ in $x \in [0, 2\pi]$, is

(a) 1 (b) 2 (c) 3 (d) 4

92. If $a, b \in [0, \pi]$ and the equation $x^2 + 4 + 3\sin(ax+b) - 2x = 0$ has atleast one solution, then the value of $(a+b)$ can be

(a) $\frac{7\pi}{2}$ (b) $\frac{3\pi}{2}$

(c) $\frac{9\pi}{2}$ (d) None of these

93. If $\frac{1}{6}\sin\theta$, $\cos\theta$ and $\tan\theta$ are in GP, then the general value(s) of θ is/are

(a) $2n\pi \pm \frac{\pi}{3}, n \in I$ (b) $2n\pi \pm \frac{\pi}{6}, n \in I$

(c) $2n\pi + (-1)^n \frac{\pi}{3}, n \in I$ (d) $n\pi + \frac{\pi}{3}, n \in I$

94. The general values of x for which $\cos 2x$, $\frac{1}{2}$ and $\sin 2x$ are in AP, are given by

(a) $n\pi, n\pi + \frac{\pi}{2}$ (b) $n\pi, n\pi + \frac{\pi}{4}$

(c) $n\pi + \frac{\pi}{4}$ (d) $n\pi$

95. The most general values of θ satisfying $\tan\theta + \tan\left(\frac{3\pi}{4} + \theta\right) = 2$ are

(a) $n\pi \pm \frac{\pi}{3}, n \in I$

(b) $2n\pi \pm \frac{\pi}{6}, n \in I$

(c) $2n\pi \pm \frac{\pi}{3}, n \in I$

(d) $2n\pi + (-1)^n \frac{\pi}{3}, n \in I$

96. The most general solutions of the equation $\sec x - 1 = (\sqrt{2} - 1)\tan x$ are given by

(a) $n\pi + \frac{\pi}{8}, n\pi$ (b) $2n\pi, 2n\pi + \frac{\pi}{4}$
(c) $2n\pi, n\pi$ (d) None of these

97. If $n \tan y = \tan x$, $n \in R^+$, then the maximum value of $\sec^2 (x - y)$ is equal to

(a) $\frac{(n+1)^2}{2n}$ (b) $\frac{(n+1)^2}{n}$
(c) $\frac{(n+1)^2}{2}$ (d) $\frac{(n+1)^2}{4n}$

98. Let α, β be any two positive values of x for which $2 \cos x$, $|\cos x|$ and $1 - 3\cos^2 x$ are in GP. The minimum value of $|\alpha - \beta|$ is

(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) None of these

99. The value(s) of $x \in [-2\pi, 2\pi]$ such that $\frac{\sin x + i\cos x}{1+i}$, $i = \sqrt{-1}$ is purely imaginary, is/are given by

(a) $n\pi - \frac{\pi}{4}$ (b) $n\pi + \frac{\pi}{4}$
(c) $n\pi$ (d) None of these

100. The number of solutions of the equation $1 + \sin x \sin^2 \frac{x}{2} = 0$ in $[-\pi, \pi]$ is

(a) 0 (b) 1
(c) 2 (d) 3

101. The number of solutions of $\cos x = |1 + \sin x|$, $0 \le x \le 3\pi$ is

(a) 3 (b) 2
(c) 4 (d) None of these

102. The most general solutions of

$2^{1 + |\cos x| + \cos^2 x + |\cos x|^3 + \dots \infty} = 4$ are given by

(a) $n\pi \pm \frac{\pi}{3}, n \in I$ (b) $2n\pi \pm \frac{\pi}{3}, n \in I$
(c) $2n\pi \pm \frac{2\pi}{3}, n \in I$ (d) None of these

103. If $x \ne \frac{n\pi}{2}$ and $(\cos x)^{\sin^2 x - 3\sin x + 2} = 1$, then all solutions of x is/are given by

(a) $2n\pi + \frac{\pi}{2}$ (b) $(2n+1)\pi - \frac{\pi}{2}$
(c) $2n\pi + (-1)^n \frac{\pi}{2}$ (d) None of these

104. If $0 \le x \le 3\pi$, $0 \le y \le 3\pi$ and $\cos x \sin y = 1$, then the possible number of values of the ordered pair (x, y) is

(a) 6 (b) 12
(c) 8 (d) 15

105. If $x, y \in [0, 2\pi]$, then total number of ordered pairs (x, y) satisfying $\sin x \cos y = 1$ is

(a) 1 (b) 3 (c) 5 (d) 7

106. The number of values of x for which $\sin 2x + \cos 4x = 2$, is

(a) 0 (b) 1 (c) 2 (d) infinite

107. If $|\tan x| \le 1$ and $x \in [-\pi, \pi]$, then the solution set for x is

(a) $\left[-\pi, -\frac{3\pi}{4}\right] \cup \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$
(b) $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$
(c) $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$
(d) None of the above

108. If $4\sin^2 x - 8\sin x + 3 \le 0$, $0 \le x \le 2\pi$, then the solution set for x is

(a) $\left[0, \frac{\pi}{6}\right]$ (b) $\left[0, \frac{5\pi}{6}\right]$ (c) $\left[\frac{5\pi}{6}, 2\pi\right]$ (d) $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$

109. The set of values of x for which $\sin x \cos^3 x > \cos x \sin^3 x$, $0 \le x \le 2\pi$, is

(a) $(0, \pi)$ (b) $\left(0, \frac{\pi}{4}\right)$
(c) $\left(\frac{\pi}{4}, \pi\right)$ (d) None of these

110. If x_1 and x_2 are two positive values of x for which $2\cos x$, $|\cos x|$ and $3\sin^2 x - 2$ are in GP. The minimum value of $|x_1 - x_2|$ is

(a) $\frac{4\pi}{3}$ (b) $\frac{\pi}{3}$
(c) $2\cos^{-1}\left(\frac{2}{3}\right)$ (d) $\cos^{-1}\left(\frac{2}{3}\right)$

111. If $3\sin x + 4\cos ax = 7$ has atleast one solution, then a has to be necessarily a/an

(a) odd integer
(b) even integer
(c) rational number
(d) irrational number

112. If the equation $a_1 + a_2 \cos 2x + a_3 \sin^2 x = 1$ is satisfied by every real value of x, then the number of possible values of the triplet (a_1, a_2, a_3) is

(a) 0 (b) 1 (c) 3 (d) infinite

113. If $\sin^2 \theta - 2\sin\theta - 1 = 0$ is to be satisfied for exactly 4 distinct values of $\theta \in [0, n\pi]$, $n \in N$, then the least value of n is

(a) 2 (b) 6 (c) 4 (d) 15

114. If $2\tan^2 x - 5\sec x$ is equal to 1 for exactly 7 distinct values of $x \in \left[0, \frac{n\pi}{2}\right]$, $n \in N$, then the greatest value of n is

(a) 6 (b) 12 (c) 13 (d) 15

115. If $\sin\alpha$, 1 and $\cos 2\alpha$ are in GP, then α is equal to

(a) $n\pi + (-1)^n \frac{\pi}{2}, n \in I$ (b) $n\pi + (-1)^{n-1} \frac{\pi}{2}, n \in I$
(c) $2n\pi, n \in I$ (d) None of these

116. If $\max\limits_{\theta \in R} \{5\sin\theta + 3\sin(\theta - \alpha)\} = 7$, then set of possible values of α is

(a) $\left\{x \mid x = 2n\pi \pm \frac{\pi}{3}; n \in I\right\}$
(b) $\left\{x \mid x = 2n\pi \pm \frac{2\pi}{3}; n \in I\right\}$
(c) $\left[\frac{\pi}{3}, \frac{2\pi}{3}\right]$
(d) None of the above

117. The number of solutions of $|\cos x| = \sin x$, $0 \le x \le 4\pi$ is

(a) 8 (b) 4
(c) 2 (d) None of these

118. The values of a for which the equation $\cos^4 x - (a+2)\cos^2 x - (a+3) = 0$ possesses a solution, lies in

(a) $[-3, -2]$ (b) $(-3, -2)$ (c) $(0, 2)$ (d) $(0, 3)$

119. The least positive non-integral solution of $\sin\pi(x^2 + x) - \sin\pi x^2 = 0$ is

(a) rational
(b) irrational of the form $\sqrt{p}$
(c) irrational of the form $\frac{\sqrt{p} - 1}{4}$, where p is an odd integer
(d) irrational of the form $\frac{\sqrt{p} + 1}{4}$, where p is an even integer

120. If $\theta \in [0, 5\pi]$ and $r \in R$ such that $2\sin\theta = r^4 - 2r^2 + 3$, then the maximum number of values of the pair (r, θ) is

(a) 8
(b) 10
(c) 6
(d) None of the above

121. Total number of solutions of $[\sin x] = \cos x$, where [ ] denotes the greatest integer function in $[0, 3\pi]$, is

(a) 2
(b) 6
(c) 5
(d) None of the above

122. If $1 - \sin x = \frac{\sqrt{3}}{2}\left|x - \frac{\pi}{2}\right| + a$ has no solution, where $a \in R^+$, then

(a) $a \in R^+$
(b) $a > \frac{3}{2} - \frac{\pi}{\sqrt{3}}$
(c) $a \in \left(0, \frac{3}{2} + \frac{\pi}{\sqrt{3}}\right)$
(d) None of the above

123. If $\sin^2(\theta - \alpha)\cos\alpha = \cos^2(\theta - \alpha)\sin\alpha$ $= m\sin\alpha\cos\alpha$, then

(a) $|m| \le \frac{1}{\sqrt{2}}$
(b) $|m| \ge \frac{1}{\sqrt{2}}$
(c) $|m| \ge 1$
(d) $|m| \le 1$

124. If $\cos x - \frac{\cot\beta \sin x}{2} = \frac{\sqrt{3}}{2}$, then the value of $\tan\frac{x}{2}$ is

(a) $\tan\frac{\beta}{2}\tan 15°$
(b) $\tan\frac{\beta}{2}$
(c) $\tan 15°$
(d) None of the above

125. If the expression $n\sin^2\theta + 2n\cos(\theta + \alpha)\sin\alpha\sin\theta + \cos 2(\alpha + \theta)$ is independent of θ, then the value of n is

(a) 1
(b) 2
(c) 3
(d) 4

126. For any real value of $\theta \ne \pi$, the value of the expression $y = \frac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$ is

(a) $1 \le y \le 2$
(b) $y < 0$ and $y > 2$
(c) $-1 \le y \le 1$
(d) $y \ge 1$

127. Solution of equation $[\sin x] = [1 + \sin x] + [1 - \cos x]$, $0 \le x \le 2\pi$ is

(a) $x = \frac{3\pi}{2}$
(b) $x = \frac{3\pi}{4}$
(c) no real solution
(d) None of the above

128. The general solution of the equation $\sin^{50} x - \cos^{50} x = 1$ is

(a) $2n\pi + \frac{\pi}{2}$
(b) $2n\pi + \frac{\pi}{3}$
(c) $n\pi + \frac{\pi}{2}$
(d) $n\pi + \frac{\pi}{3}$

129. Number of ordered pairs (a, x) satisfying the equation $\sec^2(a+2)x + a^2 - 1 = 0$, $-\pi < x < \pi$ is

(a) 2
(b) 1
(c) 3
(d) infinite

Type 2. **More than One Correct Option**

130. If $f_n(\theta) = \tan\frac{\theta}{2}(1+\sec\theta)(1+\sec 2\theta)(1+\sec 4\theta)\ldots(1+\sec 2^n\theta)$, then

(a) $f_2\left(\frac{\pi}{16}\right)=1$ (b) $f_3\left(\frac{\pi}{32}\right)=1$

(c) $f_4\left(\frac{\pi}{64}\right)=1$ (d) $f_5\left(\frac{\pi}{128}\right)=1$

131. Let $0\le\theta\le\frac{\pi}{2}$ and $x = X\cos\theta + Y\sin\theta$, $y = X\sin\theta - Y\cos\theta$ such that $x^2+4xy+y^2 = aX^2+bY^2$, where a and b are constants. Then,

(a) $a=-1, b=3$ (b) $\theta=\frac{\pi}{4}$

(c) $a=3, b=-1$ (d) $\theta=\frac{\pi}{3}$

132. $\dfrac{\sin^2 x+\alpha^2-2}{\cos 2x} = \dfrac{\alpha^2}{1-\tan^2 x}$ has a solution, if

(a) $\alpha\le-1$ (b) $\alpha\ge1$

(c) $\alpha=1/2$ (d) α is any real number

133. If $\cos^3 x\sin 2x = \sum_{m=1}^{n} a_m \sin mx$ is identity in x. Then,

(a) $a_3=\frac{3}{8}, a_2=0$ (b) $n=6, a_1=\frac{1}{2}$

(c) $n=5, a_1=\frac{1}{4}$ (d) $\Sigma a_n=\frac{3}{4}$

134. If $0\le x, y\le 180°$ and $\sin(x-y)=\cos(x+y)=1/2$, then x and y are given by

(a) $x=45°, y=15°$ (b) $x=45°, y=135°$

(c) $x=165°, y=15°$ (d) $x=165°, y=135°$

135. If $\tan\frac{x}{2}=\operatorname{cosec} x-\sin x$, then $\tan^2\frac{x}{2}$ is equal to

(a) $2-\sqrt{5}$ (b) $\sqrt{5}-2$

(c) $(9-4\sqrt{5})(2+\sqrt{5})$ (d) $(9+4\sqrt{5})(2-\sqrt{5})$

136. If $y=\dfrac{\sqrt{1-\sin 4A}+1}{\sqrt{1+\sin 4A}-1}$, then one of the values of y is

(a) $-\tan A$ (b) $\cot A$

(c) $\tan\left(\frac{\pi}{4}+A\right)$ (d) $-\cot\left(\frac{\pi}{4}+A\right)$

137. If $x=\sqrt{a^2\cos^2\alpha+b^2\sin^2\alpha}+\sqrt{a^2\sin^2\alpha+b^2\cos^2\alpha}$, then $x^2=a^2+b^2+2\sqrt{p(a^2+b^2)-p^2}$, where p is equal to

(a) $a^2\cos^2\alpha+b^2\sin^2\alpha$

(b) $a^2\sin^2\alpha+b^2\cos^2\alpha$

(c) $\frac{1}{2}[a^2+b^2+(a^2-b^2)\cos 2\alpha]$

(d) $\frac{1}{2}[a^2+b^2-(a^2-b^2)\cos 2\alpha]$

138. If $\tan\alpha$ and $\tan\beta$ are the roots of the equation $x^2+px+q=0$ with $p\ne0$, then

(a) $\sin^2(\alpha+\beta)+p\sin(\alpha+\beta)\cos(\alpha+\beta)+q\cos^2(\alpha+\beta)=q$

(b) $\tan(\alpha+\beta)=\frac{p}{q-1}$

(c) $\cos(\alpha+\beta)=1-q$

(d) $\sin(\alpha+\beta)=-p$

139. If $y=\sin^2 x+\cos^4 x$, then for all real x

(a) the maximum value of y is 2

(b) the minimum value of y is $\frac{3}{4}$

(c) $y\le1$

(d) $y\ge\frac{1}{4}$

140. If $k_1=\sin x\cos^3 x$ and $k_2=\cos x\sin^3 x$, then

(a) $k_1-k_2>0, x\in\left(0,\frac{\pi}{4}\right)$

(b) $k_1-k_2<0, x\in\left(0,\frac{\pi}{4}\right)$

(c) $k_1+k_2>0, x\in\left(0,\frac{\pi}{2}\right)$

(d) $k_1+k_2<0, x\in\left(0,\frac{\pi}{4}\right)$

141. If $\alpha\in[-2\pi,2\pi]$ and $\cos\frac{\alpha}{2}+\sin\frac{\alpha}{2}=\sqrt{2}(\cos 36°-\sin 18°)$, then a value of α is

(a) $\frac{7\pi}{6}$ (b) $\frac{\pi}{6}$

(c) $\frac{5\pi}{6}$ (d) $-\frac{\pi}{6}$

142. If $\cos x=\sqrt{1-\sin 2x}$, where $0\le x\le\pi$, then a value of x is

(a) π

(b) 0

(c) $\tan^{-1}2$

(d) None of the above

143. If $\sin\theta+\sqrt{3}\cos\theta=6x-x^2-11$, $0\le\theta\le4\pi$, $x\in R$, then holds for

(a) no value of x and θ

(b) one value of x and two values of θ

(c) two values of x and two values of θ

(d) two pairs of values of (x,θ)

144. If $0\le x\le2\pi$ and $|\cos x|\le\sin x$, then

(a) the set of values of x is $\left[\frac{\pi}{4},\frac{\pi}{2}\right]$

(b) the number of solutions that are integral multiples of $\frac{\pi}{4}$ is three

(c) the sum of the largest and the smallest solution is $\frac{3\pi}{4}$

(d) $x\in\left[\frac{\pi}{4},\frac{\pi}{2}\right]\cup\left[\frac{\pi}{2},\frac{3\pi}{4}\right]$

Type 3. **Assertion and Reason**

Directions (Q. Nos. 145-151) *In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

145. **Statement I** If A, B and C are the angles of a triangle such that $\angle A$ is obtuse, then $\tan B \tan C > 1$.

Statement II In any triangle, $\tan A = \dfrac{\tan B + \tan C}{\tan B \tan C - 1}$

146. **Statement I** If $2\sin\dfrac{\theta}{2} = \sqrt{1+\sin\theta} + \sqrt{1-\sin\theta}$, then $\dfrac{\theta}{2}$ lies between $2n\pi + \dfrac{\pi}{4}$ and $2n\pi + \dfrac{3\pi}{4}$.

Statement II If $\dfrac{\theta}{2}$ runs from $\dfrac{\pi}{4}$ to $\dfrac{3\pi}{4}$, then $\sin\dfrac{\theta}{2} > 0$.

147. **Statement I** The numbers $\sin 18°$ and $-\sin 54°$ are equations of such quadratic equations with integer coefficients.

Statement II If $x = 18°$, then $5x = 90°$ and if $y = -54°$, then $5y = -270°$.

148. **Statement I** $\cos 36° > \tan 36°$

Statement II $\cos 36° > \sin 36°$

149. **Statement I** The minimum value of the expression $\sin\alpha + \sin\beta + \sin\gamma$, where α, β and γ are real numbers such that $\alpha + \beta + \gamma = \pi$, is negative.

Statement II α, β and γ are angles of a triangle.

150. **Statement I** The equation $\sin x + \operatorname{cosec} x = 2$ possesses unique solution, if $x \in \left[0, \dfrac{\pi}{2}\right] \cup \left[2\pi, \dfrac{5\pi}{2}\right]$.

Statement II $x + \dfrac{1}{x} \ge 2, x > 0$ equality holds, only when $x = 1$.

151. **Statement I** If $(\sin x)^2 + (\tan x)^2 = 0$, then $x = n\pi$,

Statement II If $a^2 + b^2 = 0$, then $a, b = 0$.

Type 4. **Linked Comprehension Based Questions**

Passage I (Q. Nos. 152-154) *For each positive real number k, let C_k denotes the circle with centre at origin and radius k units. On a circle C_k, particle a moves k units in the counter-clockwise direction. After completing its motion on C_k, the particle moves onto the circle $C_{k+\gamma}$ in some well defined manner, where $\gamma > 0$. The motion of the particle continues in this manner.*

152. Let $k \in I^+$ and $\gamma = 1$, particle moves in the radical direction from circle C_k to C_{k+1}. If particle starts from the point $P(-1, 0)$, then

(a) it will cross the X-axis again at (3, 0)
(b) it will cross the X-axis again at (4, 0)
(c) it will cross the positive Y-axis at (0, 4)
(d) it will cross the positive Y-axis at (0, 6)

153. Let $k \in I^+$ and $\gamma \in R$, particle moves tangentially from the circle C_k to C_{k+y}, such that length of tangent is equal to k unit itself. If particle starts from the point $Q(1, 0)$, then

(a) the particle will cross positive X-axis again for $2\sqrt{2} < x < 4$
(b) the particle will cross positive X-axis again at $x = 2\sqrt{2}$
(c) the particle will cross X-axis again at $x = 4$
(d) the particle will cross X-axis again at $x = 3$

154. Let the particle starts from the point A (2, 0) and moves $\dfrac{\pi}{2}$ units on circle C_2 in the counter-clockwise direction, then moves on circle C_3 along the tangential path. Let this straight line (tangential path traced by particle) intersect the circle C_3 at points A and B and tangents drawn at A and B intersect at

(a) $(\sqrt{2}, \sqrt{2})$ (b) (9, 9)
(c) $\left(\dfrac{9}{2\sqrt{2}}, \dfrac{9}{2\sqrt{2}}\right)$ (d) $(9\sqrt{2}, 9\sqrt{2})$

Passage II (Q. Nos. 155-157) *Let* $f(\theta, \alpha) = 2\sin^2\theta + 4\cos(\theta + \alpha)\sin\theta\sin\alpha + \cos 2(\theta + \alpha)$

General solution of $\cos x = 0$ *is* $x = (2n+1)\dfrac{\pi}{2} : n \in I$

General solution of $\sin x = 0$ *is* $x = n\pi : n \in I$.

155. The value of $f\left(\dfrac{\pi}{3}, \dfrac{\pi}{4}\right)$ is

(a) 0 (b) 1 (c) 2 (d) 3

156. The general solution of $f\left(\dfrac{\pi}{3}, \alpha\right) = 0$ is

(a) $\alpha = (2n+1)\dfrac{\pi}{2}, n \in I$ (b) $\alpha = (2n+1)\dfrac{\pi}{4}, n \in I$
(c) $\alpha = (2n+1)\pi, n \in I$ (d) $\alpha = (2n+1)\dfrac{\pi}{3}, n \in I$

157. If $f\left(\theta, \frac{\pi}{6}\right) = \frac{1}{2}$, then

(a) $\theta = n\pi : n \in I$
(b) $\theta = \frac{n\pi}{2} : n \in I$
(c) $\theta = 2n\pi : n \in I$
(d) θ is any real

Passage III (Q. Nos. 158-160) *If A, B and C are angles of a triangle such that* $\tan A + \tan B + \tan C = k$*, then find the interval in which* k *should lie.*

158. There exists exactly one isosceles ΔABC, if

(a) $k < 0$ or $k = 3\sqrt{3}$
(b) $k > 0$
(c) $-1 < k < 0$
(d) $0 < k < 3$

159. There exist exactly two isosceles ΔABC, if

(a) $k < 3$
(b) $k > 3\sqrt{3}$
(c) $k < 3\sqrt{3}$
(d) $0 < k < 3\sqrt{3}$

160. There exist three or more non-similar isosceles triangles for

(a) no value of k
(b) $0 < k < 3\sqrt{3}$
(c) $k > \sqrt{3}$
(d) $k > 0$

Passage IV (Q. Nos. 161-163) *Use boundedness for solving trigonometric equations. Consider an equation*

$$\sin x + \sin y = 2 \qquad \ldots\text{(i)}$$

We know that, $\sin x \le 1, \sin y \le 1$ *and* $\sin x + \sin y \le 2, \forall\, x$ *and* y.

Therefore, $\sin x + \sin y = 2$ *if and only if* $\sin x = 1$ *and* $\sin y = 1 \Leftrightarrow x = 2n\pi + \frac{\pi}{2}$ *and* $y = 2m\pi + \frac{\pi}{2}$

which is the required solution of equation. To solve the Eq. (i), we have used the boundedness of $\sin x$ *rather than using conventional methods of solving equations.*

In general, we employ one or more of the following extreme value conditions

(i) $-1 \le \sin x \le 1 \Rightarrow |\sin x| \le 1$ *and* $\sin^2 x \le 1$

(ii) $-1 \le \cos x \le 1 \Rightarrow |\cos x| \le 1$ *and* $\cos^2 x \le 1$

(iii) $-\sqrt{a^2 + b^2} \le a \sin x + b \cos x \le \sqrt{a^2 + b^2}$

$\Rightarrow |a \sin x + b \cos x| \le \sqrt{a^2 + b^2}$

161. The minimum value of $27^{\cos 2x} \cdot 81^{\sin 2x}$ is

(a) 1 (b) $\frac{1}{9}$ (c) $\frac{1}{81}$ (d) $\frac{1}{243}$

162. Number of roots of the equation $\cos^7 x + \sin^4 x = 1$ in the interval $[0, 2\pi]$ is

(a) 0 (b) 1 (c) 2 (d) 4

163. The smallest positive number p for which the equation $\cos(p \sin x) = \sin(p \cos x)$ has a solution in $[a, 2\pi]$, is

(a) $\frac{\pi}{4}$
(b) $\frac{\pi}{3}$
(c) $\frac{\pi}{4\sqrt{2}}$
(d) $\frac{\pi}{2\sqrt{2}}$

Type 5. **Match the Columns**

164. Match the items of Column I with that of Column II.

	Column I		Column II
A.	The number of pairs (x, y) satisfying the equation $\sin x + \sin y = \sin(x + y)$ $\lvert x \rvert + \lvert y \rvert = 1$, is	p.	3
B.	The number of values of x for which $f(x)$ is valid, where $f(x) = \sqrt{\sec^{-1}\left(\frac{1 - \lvert x \rvert}{2}\right)}$, is	q.	8
C.	If $x, y \in [0, 2\pi]$, then total number of ordered pairs (x, y) satisfying $\sin x \cos y = 1$, is	r.	∞
D.	$f(x) = \sin x - \cos x - kx + b$ decreases for all values of real values of x when $4\sqrt{2}k$ is always greater than	s.	6

165. Match the items of Column I with that of Column II.

	Column I	Column II
A.	If in a ΔABC, $\sin^2 A + \sin^2 B = \sin(A + B)$, then the triangle must be	p. right angled
B.	If in a ΔABC, $\frac{bc}{2\cos A} = b^2 + c^2 - 2bc \cos A$, then the triangle must be	q. equilateral
C.	If in a ΔABC, $\tan\frac{A}{2} + \tan\frac{B}{2} + \tan\frac{C}{2} = \sqrt{3}$, then the triangle must be	r. isosceles
D.	If in a triangle, the sides and the altitudes are in AP, then the triangle must be	s. obtuse angles

166. Match the items of Column I with that of Column II.

Column I		Column II
A. The number of solutions of $\frac{x}{2}+\frac{\sin x}{\cos x}=\frac{\pi}{4}$ in $[-\pi, \pi]$, is	p.	1
B. The number of solutions of equation $\sin^{-1}(\lvert x^2-1\rvert)+\cos^{-1}(\lvert 2x^2-5\rvert)=\frac{\pi}{2}$ is	q.	0
C. The number of solutions of $x^4-2x^2\sin^2\frac{\pi}{2}x+1=0$ is	r.	3
D. The number of solutions of $x^2+2x+2\sec^2\pi x+\tan^2\pi x=0$ is	s.	2

167. Match the items of Column I with that of Column II.

Column I		Column II
A. $\sin x\cos^3 x > \cos x\sin^3 x$, $0\le x\le 2\pi$, is	p.	$\left[-\pi,-\frac{3\pi}{4}\right]\cup\left[-\frac{\pi}{4},\frac{\pi}{4}\right]\cup\left[\frac{3\pi}{4},\pi\right]$
B. $4\sin^2 x-8\sin x+3\le 0$, $0\le x\le 2\pi$, is	q.	$\left[\frac{3\pi}{2},2\pi\right]\cup\{0\}$
C. $\lvert\tan x\rvert\le 1$ and $x\in[-\pi,\pi]$, is	r.	$\left(0,\frac{\pi}{4}\right)$
D. $\cos x-\sin x\ge 1$ and $0\le x\le 2\pi$, is	s.	$\left[\frac{\pi}{6},\frac{5\pi}{6}\right]$

168. Match the items of Column I with that of Column II.

Column I		Column II
A. The ratio of greatest value of $2-\cos x+\sin^2 x$ to its least value is $\frac{k}{4}$, then k equals	p.	0
B. The equation $\cos 2x+p\sin x=2p-7$ possesses a solution, then number of integral values of p satisfying equation is	q.	12
C. If $\cos\alpha=\frac{3}{4}$, then value of $16\sin\frac{\alpha}{2}\sin\frac{3\alpha}{2}$ is	r.	13
D. If a is a real constant and A, B, C are variable angles and $\sqrt{a^2-4}\tan A+a\tan B+\sqrt{a^2-4}\tan C=6a$, then least value of $\tan^2 A+\tan^2 B+\tan^2 C$ is	s.	5

169. Match the items of Column I with that of Column II.

Column I		Column II
A. If $\cos A=\frac{3}{4}$, then the value of $\sin\frac{A}{2}\sin\frac{5A}{2}$ is	p.	0
B. The value of $\sin\frac{\pi}{7}+\sin\frac{2\pi}{7}+\sin\frac{3\pi}{7}$ is	q.	$\frac{11}{32}$
C. If $\tan^2\theta=2\tan^2\phi+1$, then $\cos 2\theta+\sin^2\phi$ equals	r.	$\frac{1}{2}\cot\frac{\pi}{14}$
D. If $\sin B=\frac{1}{5}\sin(2A+B)$, then $\frac{\tan(A+B)}{\tan A}$ is equal to	s.	$\frac{3}{2}$

170. Match the items of Column I with that of Column II.

Column I		Column II
A. The number of solutions of the equation $\lvert\tan 2x\rvert=\sin x$, $x\in[0,\pi]$ is	p.	1
B. The value of $4\tan\frac{\pi}{16}-4\tan^3\frac{\pi}{16}+6\tan^2\frac{\pi}{16}-\tan^4\frac{\pi}{16}-1$ is	q.	4
C. If the equation $\tan(p\cot x)=\cot(p\tan x)$ has a solution in $(0,\pi)-\left\{\frac{\pi}{2}\right\}$, then $\frac{4}{\pi}p_{max}$ is equal to	r.	3
D. The value of $\frac{2x}{\pi}$ in $[0,2\pi]$, if $5^{\cos^2 2x+2\sin^2 x}+5^{2\cos^2 x+\sin^2 2x}=126$ has a solution, is	s.	2

Type 6. **Single Integer Answer Type Questions**

171. The number of real solutions of $[x]^2-5[x]+6-\sin x=0$, where [ ] denotes the greatest integer function, is _______ .

172. If $f(n\theta)=\dfrac{2\sin 2\theta}{\cos 2\theta-\cos 4n\theta}$ and

$$f(\theta)+f(2\theta)+f(3\theta)+\ldots+f(n\theta)=\frac{\sin\lambda\theta}{\sin\theta\sin\mu\theta},$$

then the value of $\mu-\lambda$ is _____ .

173. If $\dfrac{3-\tan^2\frac{\pi}{7}}{1-\tan^2\frac{\pi}{7}}=\lambda\cos\frac{\pi}{7}$, then λ is ________ .

174. The number of integral values of α such that $\sin x\cos 3x-\alpha\cos x\sin 3x=0$ does not have any real root other than $(2n+1)\frac{\pi}{2}$, $n\in I$ for any real value of x, is ______.

175. The expression $n\sin^2\theta + 2n\cos(\theta+\alpha)\sin\alpha\sin\theta + \cos 2(\alpha+\theta)$ is independent of θ, the value of n is ________.

176. For any real value of $\theta \neq \pi$, the value of the expression $y = \dfrac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$, $y \in R - [a, b]$, then the value of $(b-a)$ is _______.

177. The number of solutions of equation $[\sin x] = [1+\sin x] + [1-\cos x], 0 \le x \le 2\pi$, is _____.

178. In a ΔABC, $\angle B = \dfrac{\pi}{3}$ and $\sin A \sin C = \lambda$, then the set of all possible values of $\lambda \in [a, b]$, then $(b-a)$ is _______.

179. In a ΔABC, $\cot\dfrac{A}{2}\cot\dfrac{B}{2}\cot\dfrac{C}{2} \ge \lambda\sqrt{3}$, then the value of λ is _____.

180. If in a ΔABC, $\tan\dfrac{A}{2}, \tan\dfrac{B}{2}, \tan\dfrac{C}{2}$ are in HP and $\cot\dfrac{B}{2} \ge \sqrt{\lambda}$, then the value of λ is _______.

181. If α and β satisfy the equation $12\sin\alpha + 5\cos\alpha = 2\beta^2 - 8\beta + 21$, then the value of $\beta^2 - 2\beta$ is _______.

182. If the values of x and y satisfy the equation $\tan^2(x+y) + \cot^2(x+y) = 1 - 2x - x^2$, then the value of $x^2 - 3x + 2$ is ______.

183. If the smallest positive values of x and y satisfying $x - y = \dfrac{\pi}{4}$ and $\cot x + \cot y = 2$ are $x = \dfrac{\lambda\pi}{12}$ and $y = \dfrac{\mu\pi}{6}$, then $\lambda + \mu$ is equal to ______.

184. The system of simultaneous equations for x and y, where $x, y \in \left(0, \dfrac{\pi}{2}\right)$, are $4^{\sin x} + 3^{\frac{1}{\cos y}} = 11$ and $5 \cdot 16^{\sin x} - 2 \cdot 3^{\frac{1}{\cos y}} = 2$.

If $x + y = \dfrac{\pi}{\lambda}$, then λ is equal to _______.

185. The number of solutions for

$$\left.\begin{array}{l}\sin\left(x - \dfrac{\pi}{4}\right) - \cos\left(x + \dfrac{3\pi}{4}\right) = 1 \\ \dfrac{2\cos 7x}{\cos 3 + \sin 3} > 2^{\cos 2x}\end{array}\right\} \text{ in } (0, 2\pi) \text{ is } \_\_\_\_\_ .$$

186. The integral value of p for which $\sqrt{p}\cos x - 2\sin x = \sqrt{2} + \sqrt{2-p}$ has a solution, is _______.

Entrances Gallery

JEE Advanced/IIT JEE

1. For $x \in (0, \pi)$, the equation $\sin x + 2\sin 2x - \sin 3x = 3$ has **[2014]**

(a) infinitely many solutions
(b) three solutions
(c) one solution
(d) no solution

2. The number of points in $(-\infty, \infty)$, for which $x^2 - x\sin x - \cos x = 0$, is **[2013]**

(a) 6 (b) 4
(c) 2 (d) 0

3. Let $\theta, \phi \in [0, 2\pi]$ be such that $2\cos\theta(1-\sin\phi) = \sin^2\theta\left(\tan\dfrac{\theta}{2} + \cot\dfrac{\theta}{2}\right)\cos\phi - 1$, $\tan(2\pi - \theta) > 0$ and $-1 < \sin\theta < -\dfrac{\sqrt{3}}{2}$. Then, ϕ cannot satisfy **[2012]**

(a) $0 < \phi < \dfrac{\pi}{2}$ (b) $\dfrac{\pi}{2} < \phi < \dfrac{4\pi}{3}$
(c) $\dfrac{4\pi}{3} < \phi < \dfrac{3\pi}{2}$ (d) $\dfrac{3\pi}{2} < \phi < 2\pi$

4. Let $f : (-1, 1) \to IR$ be such that $f(\cos 4\theta) = \dfrac{2}{2 - \sec^2\theta}$ for $\theta \in \left(0, \dfrac{\pi}{4}\right) \cup \left(\dfrac{\pi}{4}, \dfrac{\pi}{2}\right)$.

Then, the value(s) of $f\left(\dfrac{1}{3}\right)$ is/are **[2012]**

(a) $1 - \sqrt{\dfrac{3}{2}}$ (b) $1 + \sqrt{\dfrac{3}{2}}$ (c) $1 - \sqrt{\dfrac{2}{3}}$ (d) $1 + \sqrt{\dfrac{2}{3}}$

5. The positive integer value of $n > 3$ satisfying the equation $\dfrac{1}{\sin\left(\dfrac{\pi}{n}\right)} = \dfrac{1}{\sin\left(\dfrac{2\pi}{n}\right)} + \dfrac{1}{\sin\left(\dfrac{3\pi}{n}\right)}$ is ______. **[2011]**

6. Let $f(x) = x^2$ and $g(x) = \sin x$, for all $x \in R$. Then, the set of all x satisfying $(fogogof)(x) = (gogof)(x)$, where $(fog)(x) = f[g(x)]$, is **[2011]**

(a) $\pm\sqrt{n\pi}, n \in \{0, 1, 2, \ldots\}$
(b) $\pm\sqrt{n\pi}, n \in \{1, 2, \ldots\}$
(c) $\dfrac{\pi}{2} + 2n\pi, n \in \{\ldots, -2, -1, 0, 1, 2, \ldots\}$
(d) $2n\pi, n \in \{\ldots, -2, -1, 0, 1, 2, \ldots\}$

7. The number of all possible values of θ, where $0 < \theta < \pi$, for which the system of equations

$$(y+z)\cos 3\theta = (xyz)\sin 3\theta$$

$$x\sin 3\theta = \frac{2\cos 3\theta}{y} + \frac{2\sin 3\theta}{z}$$

$$(xyz)\sin 3\theta = (y+2z)\cos 3\theta + y\sin 3\theta$$

have a solution (x_0, y_0, z_0) with $y_0 z_0 \neq 0$, is _____. **[2010]**

8. The number of values of θ in the interval $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ such that $\theta \neq \frac{n\pi}{5}$ for $n = 0, \pm 1, \pm 2$ and $\tan\theta = \cot 5\theta$ as well as $\sin 2\theta = \cos 4\theta$, is __________. **[2010]**

9. The maximum value of the expression $\frac{1}{\sin^2\theta + 3\sin\theta\cos\theta + 5\cos^2\theta}$ is _______. **[2010]**

JEE Main/AIEEE

10. Let $f_k(x) = \frac{1}{k}(\sin^k x + \cos^k x)$, where, $x \in R$ and $k \geq 1$. Then, $f_4(x) - f_6(x)$ equals **[2014]**

(a) $\frac{1}{6}$ (b) $\frac{1}{3}$ (c) $\frac{1}{4}$ (d) $\frac{1}{12}$

11. The expression $\frac{\tan A}{1-\cot A} + \frac{\cot A}{1-\tan A}$ can be written as **[2013]**

(a) $\sin A\cos A + 1$ (b) $\sec A \operatorname{cosec} A + 1$
(c) $\tan A + \cot A$ (d) $\sec A + \operatorname{cosec} A$

12. In a ΔPQR, if $3\sin P + 4\cos Q = 6$ and $4\sin Q + 3\cos P = 1$, then $\angle R$ is equal to **[2012]**

(a) $\frac{5\pi}{6}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{3\pi}{4}$

13. If $A = \sin^2 x + \cos^4 x$, then for all real x **[2011]**

(a) $\frac{13}{16} \leq A \leq 1$ (b) $1 \leq A \leq 2$
(c) $\frac{3}{4} \leq A \leq \frac{13}{16}$ (d) $\frac{3}{4} \leq A \leq 1$

14. The possible values of $\theta \in (0, \pi)$ such that $\sin\theta + \sin 4\theta + \sin 7\theta = 0$ are **[2011]**

(a) $\frac{2\pi}{9}, \frac{\pi}{4}, \frac{4\pi}{9}, \frac{\pi}{2}, \frac{3\pi}{4}, \frac{8\pi}{9}$
(b) $\frac{\pi}{4}, \frac{5\pi}{12}, \frac{\pi}{2}, \frac{2\pi}{3}, \frac{3\pi}{4}, \frac{8\pi}{9}$
(c) $\frac{2\pi}{9}, \frac{\pi}{4}, \frac{\pi}{2}, \frac{2\pi}{3}, \frac{3\pi}{4}, \frac{35\pi}{36}$
(d) $\frac{2\pi}{9}, \frac{\pi}{4}, \frac{\pi}{2}, \frac{2\pi}{3}, \frac{3\pi}{4}, \frac{8\pi}{9}$

15. Let $\cos(\alpha+\beta) = \frac{4}{5}$ and $\sin(\alpha-\beta) = \frac{5}{13}$, where $0 \leq \alpha, \beta \leq \frac{\pi}{4}$. Then, $\tan 2\alpha$ is equal to **[2010]**

(a) $\frac{25}{16}$ (b) $\frac{56}{33}$ (c) $\frac{19}{12}$ (d) $\frac{20}{7}$

16. Let A and B denote the statements

$A: \cos\alpha + \cos\beta + \cos\gamma = 0$

$B: \sin\alpha + \sin\beta + \sin\gamma = 0$

If $\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta) = -\frac{3}{2}$, then **[2009]**

(a) A is true and B is false (b) A is false and B is true
(c) both A and B are true (d) both A and B are false

17. The number of values of x in the interval $[0, 3\pi]$ satisfying the equation $2\sin^2 x + 5\sin x - 3 = 0$ is **[2006]**

(a) 6 (b) 1 (c) 2 (d) 4

18. A triangular park is enclosed on two sides by a fence and on the third side by a straight river bank. The two sides having fence are of same length x. The maximum area enclosed by the park is **[2006]**

(a) $\sqrt{\frac{x^3}{8}}$ (b) $\frac{1}{2}x^2$ (c) πx^2 (d) $\frac{3}{2}x^2$

19. If $0 < x < \pi$ and $\cos x + \sin x = \frac{1}{2}$, then $\tan x$ is equal to **[2006]**

(a) $\frac{(4-\sqrt{7})}{3}$ (b) $-\frac{(4+\sqrt{7})}{3}$
(c) $\frac{(1+\sqrt{7})}{4}$ (d) $\frac{(1-\sqrt{7})}{4}$

20. Let α and β be such that $\pi < \alpha - \beta < 3\pi$. If $\sin\alpha + \sin\beta = -\frac{21}{65}$ and $\cos\alpha + \cos\beta = -\frac{27}{65}$, then the value of $\cos\left(\frac{\alpha-\beta}{2}\right)$ is **[2004]**

(a) $-\frac{3}{\sqrt{130}}$ (b) $\frac{3}{\sqrt{130}}$
(c) $\frac{6}{65}$ (d) $-\frac{6}{65}$

21. If $f: R \to S$, defined by $f(x) = \sin x - \sqrt{3}\cos x + 1$, is onto, then the interval of S is **[2004]**

(a) $[0, 3]$ (b) $[-1, 1]$
(c) $[0, 1]$ (d) $[-1, 3]$

22. $\sin^2\theta = \frac{4xy}{(x+y)^2}$ is true if and only if **[2002]**

(a) $x - y \neq 0$
(b) $x = -y$
(c) $x + y \neq 0$
(d) $x \neq 0, y \neq 0$

23. The value of $\frac{1-\tan^2 15^\circ}{1+\tan^2 15^\circ}$ is **[2002]**

(a) 1 (b) $\sqrt{3}$ (c) $\sqrt{3}/2$ (d) 2

24. If $\tan\theta = -\frac{4}{3}$, then $\sin\theta$ is **[2002]**

(a) $-\frac{4}{5}$ but not $\frac{4}{5}$
(b) $-\frac{4}{5}$ or $\frac{4}{5}$
(c) $\frac{4}{5}$ but not $-\frac{4}{5}$
(d) None of the above

25. If $\sin(\alpha+\beta)=1$ and $\sin(\alpha-\beta)=\frac{1}{2}$, then $\tan(\alpha+2\beta)\tan(2\alpha+\beta)$ is equal to **[2002]**

(a) 1
(b) -1
(c) 0
(d) None of the above

26. If $y = \sin^2\theta + \text{cosec}^2\theta, \theta \neq 0$, then **[2002]**

(a) $y = 0$ (b) $y \leq 2$
(c) $y \geq -2$ (d) $y \geq 2$

27. The equation $a\sin x + b\cos x = c$, where $|c| > \sqrt{a^2+b^2}$ has **[2002]**

(a) a unique solution
(b) infinite number of solutions
(c) no solution
(d) None of the above

28. If α is a root of $25\cos^2\theta + 5\cos\theta - 12 = 0$, $\frac{\pi}{2} < \alpha < \pi$, then $\sin 2\alpha$ is equal to **[2002]**

(a) $\frac{24}{25}$ (b) $-\frac{24}{25}$ (c) $\frac{13}{18}$ (d) $-\frac{13}{18}$

Other Engineering Entrances

29. The sum of the series $\sum_{n=1}^{\infty}\sin\left(\frac{n!\pi}{720}\right)$ is **[WB JEE 2014]**

(a) $\sin\left(\frac{\pi}{180}\right)+\sin\left(\frac{\pi}{360}\right)+\sin\left(\frac{\pi}{540}\right)$
(b) $\sin\left(\frac{\pi}{6}\right)+\sin\left(\frac{\pi}{30}\right)+\sin\left(\frac{\pi}{120}\right)+\sin\left(\frac{\pi}{360}\right)$
(c) $\sin\left(\frac{\pi}{6}\right)+\sin\left(\frac{\pi}{30}\right)+\sin\left(\frac{\pi}{120}\right)+\sin\left(\frac{\pi}{360}\right)+\sin\left(\frac{\pi}{720}\right)$
(d) $\sin\left(\frac{\pi}{180}\right)+\sin\left(\frac{\pi}{360}\right)$

30. If $\cos x = \tan y$, $\cot y = \tan z$ and $\cot z = \tan x$, then $\sin x$ is equal to **[EAMCET 2014]**

(a) $\frac{\sqrt{5}+1}{4}$ (b) $\frac{\sqrt{5}-1}{4}$ (c) $\frac{\sqrt{5}+1}{2}$ (d) $\frac{\sqrt{5}-1}{2}$

31. The value of $2\cot^2(\pi/6) + 4\tan^2(\pi/6) - 3\,\text{cosec}(\pi/6)$ is **[J&K CET 2014]**

(a) 2 (b) 4 (c) 4/3 (d) 3/4

32. Find the value of $\cos(29\pi/3)$. **[J&K CET 2014]**

(a) 1 (b) 0 (c) $\sqrt{3}/2$ (d) $1/2$

33. If $\sin\theta = \sin\alpha$, then **[Karnataka CET 2014]**

(a) $\frac{\theta+\alpha}{2}$ is any odd multiple of $\frac{\pi}{2}$ and $\frac{\theta-\alpha}{2}$ is any multiple of π
(b) $\frac{\theta+\alpha}{2}$ is any odd multiple of π and $\frac{\theta-\alpha}{2}$ is any multiple of π
(c) $\frac{\theta+\alpha}{2}$ is any multiple of $\frac{\pi}{2}$ and $\frac{\theta-\alpha}{2}$ is any even multiple of π
(d) $\frac{\theta+\alpha}{2}$ is any even multiple of $\frac{\pi}{2}$ and $\frac{\theta-\alpha}{2}$ is any odd multiple of π

34. $\tan 81° - \tan 63° - \tan 27° + \tan 9°$ equals **[EAMCET 2014]**

(a) 6 (b) 0 (c) 2 (d) 4

35. If $\sin A + \cos A = \sqrt{2}$, then the value of $\cos^2 A$ is **[RPET 2014]**

(a) $\sqrt{2}$ (b) 1/2 (c) 4 (d) -1

36. If $\tan\frac{\alpha}{2}$ and $\tan\frac{\beta}{2}$ are the roots of $8x^2 - 26x + 15 = 0$, then $\cos(\alpha+\beta)$ is equal to **[Manipal 2014]**

(a) $\frac{627}{726}$ (b) $-\frac{627}{725}$
(c) -1 (d) None of these

37. If $\tan x = \frac{3}{4}$, $\pi < x < \frac{3\pi}{2}$, then the value of $\cos\frac{x}{2}$ is **[Karnataka CET 2014]**

(a) $-\frac{1}{\sqrt{10}}$ (b) $\frac{3}{\sqrt{10}}$ (c) $\frac{1}{\sqrt{10}}$ (d) $-\frac{3}{\sqrt{10}}$

38. $\cos\frac{2\pi}{7}+\cos\frac{4\pi}{7}+\cos\frac{6\pi}{7}$ **[WB JEE 2014]**

(a) is equal to zero (b) lies between 0 and 3
(c) is a negative number (d) lies between 3 and 6

39. The value of $\tan\frac{\pi}{5}+2\tan\frac{2\pi}{5}+4\cot\frac{4\pi}{5}$ is **[WB JEE 2014]**

(a) $\cot\frac{\pi}{5}$ (b) $\cot\frac{2\pi}{5}$ (c) $\cot\frac{4\pi}{5}$ (d) $\cot\frac{3\pi}{5}$

40. If x and y are acute angles such that $\cos x + \cos y = \frac{3}{2}$ and $\sin x + \sin y = \frac{3}{4}$, then $\sin(x+y)$ equals **[Karnataka CET 2014]**

(a) $\frac{2}{5}$ (b) $\frac{3}{4}$
(c) $\frac{3}{5}$ (d) $\frac{4}{5}$

41. Find the value of $\cos(x/2)$, if $\tan x = 5/12$ and x lies in third quadrant. **[J&K CET 2014]**

(a) $5\sqrt{13}$ (b) $5/\sqrt{26}$ (c) $5/13$ (d) $\sqrt{\dfrac{1}{26}}$

42. Let n be a positive integer such that $\sin\dfrac{\pi}{2n} + \cos\dfrac{\pi}{2n} = \dfrac{\sqrt{n}}{2}$, then **[AMU 2014]**

(a) $6 \le n \le 8$ (b) $4 < n \le 8$
(c) $4 \le n < 8$ (d) $4 < n < 8$

43. The sum of the solutions in $(0, 2\pi)$ of the equation $\cos x \cos\left(\dfrac{\pi}{3} - x\right)\cos\left(\dfrac{\pi}{3} + x\right) = \dfrac{1}{4}$ is **[EAMCET 2014]**

(a) 4π (b) π (c) 2π (d) 3π

44. Which one of the following is not correct? **[AMU 2013]**

(a) $|\sin x| \le 1$
(b) $-1 \le \cos x \le 1$
(c) $|\sec x| < 1$
(d) $\operatorname{cosec} x \ge 1$ or $\operatorname{cosec} x \le -1$

45. If $0 < \beta < \alpha < \dfrac{\pi}{4}$, $\cos(\alpha + \beta) = \dfrac{3}{5}$ and $\cos(\alpha - \beta) = \dfrac{4}{5}$, then $\sin 2\alpha$ is equal to **[Karnataka CET 2013]**

(a) 0 (b) 1
(c) 2 (d) None of these

46. The most general solutions of the equation $\sec^2 x = \sqrt{2}(1 - \tan^2 x)$ are given by **[BITSAT 2013]**

(a) $n\pi \pm \dfrac{\pi}{4}$ (b) $2n\pi + \dfrac{\pi}{4}$
(c) $n\pi \pm \dfrac{\pi}{8}$ (d) None of these

47. The number of solutions of the equation $(1 - \cos 2x)(\cos 2x + \cos^2 x) = 0$, $0 \le x \le 2\pi$ is **[Manipal 2013]**

(a) 3 (b) 2 (c) 1 (d) 0

48. If $\log_{\cos x} \tan x + \log_{\sin x} \cot x = 0$, then the most general solution of x is **[UP SEE 2013]**

(a) $2n\pi - \dfrac{3\pi}{4}, n \in Z$ (b) $2n\pi + \dfrac{\pi}{4}, n \in Z$
(c) $n\pi - \dfrac{\pi}{4}, n \in Z$ (d) None of these

49. The number of real solutions of the equation $x^3 + x^2 + 4x + 2\sin x = 0$ in $0 \le x \le 2\pi$ is **[OJEE 2013]**

(a) 4 (b) 2 (c) 1 (d) 0

50. The general solution of $\sin 3x + \sin x - 3\sin 2x = \cos 3x + \cos x - 3\cos 2x$ is **[AMU 2013]**

(a) $\dfrac{n\pi}{2} + \dfrac{\pi}{8}$ for n integer (b) $\dfrac{n\pi}{2} - \dfrac{\pi}{8}$ for n integer
(c) $n\pi + \dfrac{\pi}{6}$ for n integer (d) $n\pi - \dfrac{\pi}{6}$ for n integer

51. If $\sin A + \sin B + \sin C = 3$, then $\cos A + \cos B + \cos C$ is equal to **[MP PET 2012]**

(a) 3 (b) 2 (c) 1 (d) 0

52. If $\cos\alpha + 2\cos\beta + 3\cos\gamma = 0$, $\sin\alpha + 2\sin\beta + 3\sin\gamma = 0$ and $\alpha + \beta + \gamma = \pi$, then $\sin 3\alpha + 8\sin 3\beta + 27\sin 3\gamma$ is equal to **[Karnataka CET 2012]**

(a) -18 (b) 0 (c) 3 (d) 9

53. If $\cos A = m\cos B$ and $\cot\left(\dfrac{A+B}{2}\right) = \lambda/\tan\left(\dfrac{B-A}{2}\right)$, then λ is equal to **[Manipal 2012]**

(a) $\dfrac{m}{m-1}$ (b) $\dfrac{m+1}{m}$
(c) $\dfrac{m+1}{m-1}$ (d) None of these

54. The least value of $3\sin^2\theta + 4\cos^2\theta$ is **[OJEE 2012]**

(a) 2 (b) 3 (c) 0 (d) 1

55. If $\sin 2x = 4\cos x$, then x is equal to **[Karnataka CET 2012]**

(a) $\dfrac{n\pi}{2} \pm \dfrac{\pi}{4}, n \in Z$ (b) no value
(c) $n\pi + (-1)^n\dfrac{\pi}{4}, n \in Z$ (d) $2n\pi \pm \dfrac{\pi}{2}, n \in Z$

56. Number of solutions of the equation $\tan x + \sec x = 2\cos x$, $x \in [0, \pi]$ is **[WB JEE 2012]**

(a) 0 (b) 1
(c) 2 (d) 3

57. The value of θ satisfying $\cos\theta + \sqrt{3}\sin\theta = 2$ is **[OJEE 2012]**

(a) 30° (b) 60°
(c) 45° (d) 90°

58. If $\sin\theta = \dfrac{2t}{1+t^2}$ and θ lies in second quadrant, then $\cos\theta$ is equal to **[WB JEE 2011]**

(a) $\dfrac{1-t^2}{1+t^2}$ (b) $\dfrac{t^2-1}{1+t^2}$
(c) $\dfrac{-|1-t^2|}{1+t^2}$ (d) $\dfrac{1+t^2}{|1-t^2|}$

59. If $\sin\theta = 3\sin(\theta + 2\alpha)$, then the value of $\tan(\theta + \alpha) + 2\tan\alpha$ is **[Kerala CEE 2011]**

(a) 3 (b) 2 (c) -1
(d) 0 (e) 1

60. If $\alpha, \beta, \gamma \in [0, \pi]$ and α, β, γ are in AP, then $\dfrac{\sin\alpha - \sin\gamma}{\cos\gamma - \cos\alpha}$ is equal to **[Kerala CEE 2011]**

(a) $\sin\beta$ (b) $\cos\beta$ (c) $\cot\beta$
(d) $\operatorname{cosec}\beta$ (e) $2\cos\beta$

61. If A, B and C are the angles of a triangle such that $\sec(A - B)$, $\sec A$ and $\sec(A + B)$ are in AP, then **[UP SEE 2011]**

(a) $\operatorname{cosec}^2 A = 2\operatorname{cosec}^2\dfrac{B}{2}$ (b) $2\sec^2 A = \sec^2\dfrac{B}{2}$
(c) $2\operatorname{cosec}^2 A = \operatorname{cosec}^2\dfrac{B}{2}$ (d) $2\sec^2 B = \sec^2\dfrac{A}{2}$

62. If $\sin\theta = \dfrac{1}{2}$ and $\tan\theta = \dfrac{1}{\sqrt{3}}$, $\forall\, n \in I$, then most general value of θ is **[BITSAT 2011]**

(a) $2n\pi + \dfrac{\pi}{6}, \forall\, n \in I$ (b) $2n\pi + \dfrac{\pi}{4}, \forall\, n \in I$

(c) $2n\pi + \dfrac{\pi}{3}, \forall\, n \in I$ (d) $2n\pi + \dfrac{\pi}{5}, \forall\, n \in I$

63. A value of θ satisfying $\sin 5\theta - \sin 3\theta + \sin\theta = 0$ such that $0 < \theta < \dfrac{\pi}{2}$ is **[Karnataka CET 2011]**

(a) $\dfrac{\pi}{12}$ (b) $\dfrac{\pi}{6}$ (c) $\dfrac{\pi}{4}$ (d) $\dfrac{\pi}{2}$

64. The number of solutions of $2\sin x + \cos x = 3$ is **[WB JEE 2011]**

(a) 1 (b) 2
(c) infinite (d) no solution

65. If $\sin\theta + \cos\theta = 0$ and $0 < \theta < \pi$, then θ is equal to **[WB JEE 2011]**

(a) 0 (b) $\dfrac{\pi}{4}$ (c) $\dfrac{\pi}{2}$ (d) $\dfrac{3\pi}{4}$

66. The solution of trigonometric equation $\cos^4 x + \sin^4 x = 2\cos(2x + \pi)\cos(2x - \pi)$ is **[UP SEE 2011]**

(a) $x = \dfrac{n\pi}{2} \pm \sin^{-1}\left(\dfrac{1}{5}\right)$

(b) $x = \dfrac{n\pi}{4} + \dfrac{(-1)^n}{4}\sin^{-1}\left(\dfrac{\pm 2\sqrt{2}}{3}\right)$

(c) $x = \dfrac{n\pi}{2} \pm \cos^{-1}\dfrac{1}{5}$

(d) $x = \dfrac{n\pi}{4} - \dfrac{(-1)^n}{4}\cos^{-1}\left(\dfrac{1}{5}\right)$

67. If $\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$, then the number of distinct real roots of this equation in the interval $-\pi/2 < x < \pi/2$ is **[AMU 2011]**

(a) 1 (b) 3 (c) 2 (d) 4

68. If $\dfrac{\cos A}{3} = \dfrac{\cos B}{4} = \dfrac{1}{5} - \dfrac{\pi}{2} < A < 0$ and $-\dfrac{\pi}{2} < B < 0$, then the value of $2\sin A + 4\sin B$ is **[BITSAT 2010]**

(a) 4 (b) -2 (c) -4 (d) 0

69. The value of $\dfrac{\cot 54^\circ}{\tan 36^\circ} + \dfrac{\tan 20^\circ}{\cot 70^\circ}$ is **[VITEEE 2010]**

(a) 0 (b) 2
(c) 3 (d) 1

70. The value of $\tan 40^\circ + \tan 20^\circ + \sqrt{3}\tan 20^\circ \tan 40^\circ$ is **[BITSAT 2010]**

(a) $\sqrt{12}$ (b) $\dfrac{1}{\sqrt{3}}$
(c) $\sqrt{2}$ (d) $\sqrt{3}$

71. The value of $\dfrac{\sin 55^\circ - \cos 55^\circ}{\sin 10^\circ}$ is **[VITEEE 2010]**

(a) $\dfrac{1}{\sqrt{2}}$ (b) 2
(c) 1 (d) $\sqrt{2}$

72. If $\alpha, \beta \in \left(0, \dfrac{\pi}{2}\right)$, $\sin\alpha = \dfrac{4}{5}$ and $\cos(\alpha + \beta) = -\dfrac{12}{13}$, then $\sin\beta$ is equal to **[Kerala CEE 2010]**

(a) $\dfrac{63}{65}$ (b) $\dfrac{61}{65}$
(c) $\dfrac{3}{5}$ (d) $\dfrac{5}{13}$
(e) $\dfrac{8}{65}$

73. If $\tan\alpha = \dfrac{b}{a}$, $a > b > 0$ and $0 < \alpha < \dfrac{\pi}{4}$, then $\sqrt{\dfrac{a+b}{a-b}} - \sqrt{\dfrac{a-b}{a+b}}$ is equal to **[Kerala CEE 2010]**

(a) $\dfrac{2\sin\alpha}{\sqrt{\cos 2\alpha}}$ (b) $\dfrac{2\cos\alpha}{\sqrt{\cos 2\alpha}}$
(c) $\dfrac{2\sin\alpha}{\sqrt{\sin 2\alpha}}$ (d) $\dfrac{2\cos\alpha}{\sqrt{\sin 2\alpha}}$
(e) $\dfrac{2\tan\alpha}{\sqrt{\cos 2\alpha}}$

74. The value of $\dfrac{\cot x - \tan x}{\cot 2x}$ is **[WB JEE 2010]**

(a) 1 (b) 2 (c) -1 (d) 4

75. The number of points of intersection of $2y = 1$ and $y = \sin x$ in $-2\pi \le x \le 2\pi$ is **[VITEEE 2010]**

(a) 1 (b) 2 (c) 3 (d) 4

76. The value of x in $\left(0, \dfrac{\pi}{2}\right)$ satisfying the equation $\sin x \cos x = \dfrac{1}{4}$ is **[Kerala CEE 2010]**

(a) $\dfrac{\pi}{6}$ (b) $\dfrac{\pi}{3}$ (c) $\dfrac{\pi}{8}$ (d) $\dfrac{\pi}{4}$
(e) $\dfrac{\pi}{12}$

77. The number of solutions of $\cos 2\theta = \sin\theta$ in $(0, 2\pi)$ is **[Kerala CEE 2010]**

(a) 1 (b) 2 (c) 3 (d) 4
(e) 0

78. If $\sin 6\theta + \sin 4\theta + \sin 2\theta = 0$, then the general values of θ are **[WB JEE 2010]**

(a) $\dfrac{n\pi}{4}, n\pi \pm \dfrac{\pi}{3}$
(b) $\dfrac{n\pi}{4}, n\pi \pm \dfrac{\pi}{6}$
(c) $\dfrac{n\pi}{4}, 2n\pi \pm \dfrac{\pi}{3}$
(d) $\dfrac{n\pi}{4}, 2n\pi \pm \dfrac{\pi}{6}$

Explanations

Target Exercises

1. $\tan\frac{\pi}{3}+2\tan\frac{2\pi}{3}+4\tan\frac{4\pi}{3}+8\tan\frac{8\pi}{3}$

$=\tan\frac{\pi}{3}+2\tan\left(\pi-\frac{\pi}{3}\right)+4\tan\left(\pi+\frac{\pi}{3}\right)+8\tan\left(3\pi-\frac{\pi}{3}\right)$

$=\tan\frac{\pi}{3}-2\tan\frac{\pi}{3}+4\tan\frac{\pi}{3}-8\tan\frac{\pi}{3}$

$=-5\tan\frac{\pi}{3}=-5\sqrt{3}$

2. $\sec^2\theta+\operatorname{cosec}^2\theta=\frac{1}{\cos^2\theta}+\frac{1}{\sin^2\theta}=\frac{4}{\sin^2 2\theta}\geq 4$

Also, $\sec^2\theta\operatorname{cosec}^2\theta=\frac{4}{\sin^2 2\theta}\geq 4$

Thus, required quadratic equation will be

$x^2-t\,x+t=0$, where $t\geq 4$

Hence, $x^2-5x+5=0$ can be the required equation.

3. $\cos^2\frac{3\pi}{5}+\cos^2\frac{4\pi}{5}=\cos^2 108°+\cos^2 144°.$

$=\sin^2 18°+\cos^2 36°=\left(\frac{\sqrt{5}-1}{4}\right)^2+\left(\frac{\sqrt{5}+1}{4}\right)^2$

$=\frac{2(5+1)}{16}=\frac{3}{4}$

4. $\sin(2\times 360°-120°)\cos(360°-30°)+\cos 120°\sin(180°-30°)$

$=-\sin 120°\cos 30°+\cos 120°\sin 30°$

$=-\sin(90°+30°)\cos 30°+\cos(90°+30°)\sin 30°$

$=-\cos^2 30°-\sin^2 30°$

$=-1$

5. Given expression

$=\frac{1-2(\cos 60°-\cos 80°)}{2\sin 10°}=\frac{1-2\left(\frac{1}{2}-\cos 80°\right)}{2\sin 10°}$

$=\frac{2\cos 80°}{2\sin 10°}=\frac{\cos(90°-10°)}{\sin 10°}=\frac{\sin 10°}{\sin 10°}=1$

6. Given expression

$=2\left(\frac{\sqrt{3}}{2}\sin 75°-\frac{1}{2}\cos 75°\right)$

$=2(\cos 30°\sin 75°-\sin 30°\cos 75°)$

$=2\sin(75°-30°)=2\sin 45°=2\times\frac{1}{\sqrt{2}}=\sqrt{2}$

7. Given, $\sin\alpha=\frac{1}{\sqrt{5}}$ and $\sin\beta=\frac{3}{5}$

$\Rightarrow\quad \cos\alpha=\frac{2}{\sqrt{5}}$ and $\cos\beta=\frac{4}{5}$

$\therefore\quad \sin(\beta-\alpha)=\sin\beta\cos\alpha-\cos\beta\sin\alpha$

$=\left(\frac{3}{5}\right)\left(\frac{2}{\sqrt{5}}\right)-\left(\frac{4}{5}\right)\left(\frac{1}{\sqrt{5}}\right)=\frac{2}{5\sqrt{5}}$

Clearly, $0<\sin(\beta-\alpha)<\frac{1}{\sqrt{2}}$

$\Rightarrow\quad 0<(\beta-\alpha)<\frac{\pi}{4}\quad\Rightarrow\quad\frac{3\pi}{4}<(\beta-\alpha)<\pi$

$\Rightarrow\quad (\beta-\alpha)\in\left(0,\frac{\pi}{4}\right)\quad\Rightarrow\quad(\beta-\alpha)\in\left(\frac{3\pi}{4},\pi\right)$

8. $\sqrt{3}\operatorname{cosec}20°-\sec 20°=\frac{\sqrt{3}\cos 20°-\sin 20°}{\sin 20°\cos 20°}$

$=\frac{4(\sqrt{3}/2\cos 20°-1/2\sin 20°)}{2\cdot\sin 20°\cos 20°}=\frac{4\cdot\sin 40°}{\sin 40°}=4$

9. We have, $\sin 15°=\sqrt{\frac{1}{2}(1-\cos 30°)}$

$=\sqrt{\frac{1}{2}\left(1-\frac{\sqrt{3}}{2}\right)}=\frac{1}{2}\sqrt{2-\sqrt{3}}$

which is an irrational number.

$\cos 15°=\frac{1}{2}\sqrt{2+\sqrt{3}}$ is also an irrational number.

$\sin 15°\cos 15°=\frac{1}{2}\sin 30°=\frac{1}{4}$

which is a rational number.

Further, $\sin 15°\cos 75°=\sin 15°\cos(90°-15°)$

$=\sin 15°\sin 15°=\frac{1}{4}(2-\sqrt{3})$

which is an irrational number.

10. We have,

$\cos\frac{\pi}{7}\cos\frac{4\pi}{7}\cos\frac{5\pi}{7}=-\cos\frac{\pi}{7}\cos\frac{2\pi}{7}\cos\frac{4\pi}{7}$

As $\quad\cos\frac{5\pi}{7}=\cos\left(\pi-\frac{2\pi}{7}\right)=-\cos\frac{2\pi}{7}$

$=-\frac{1}{2\sin\frac{\pi}{7}}\left[2\sin\frac{\pi}{7}\cos\frac{\pi}{7}\cos\frac{2\pi}{7}\cos\frac{4\pi}{7}\right]$

$=-\frac{1}{2^2\sin\frac{\pi}{7}}\left[\sin\frac{4\pi}{7}\cos\frac{4\pi}{7}\right]=-\frac{1}{8\sin\frac{\pi}{7}}\left[\sin\frac{8\pi}{7}\right]$

$=-\frac{1}{8\sin\frac{\pi}{7}}\left[\sin\left(\pi+\frac{\pi}{7}\right)\right]=-\frac{1}{8\sin\frac{\pi}{7}}\left[-\sin\frac{\pi}{7}\right]=\frac{1}{8}$

11. $6(\sin^6\theta+\cos^6\theta)-9(\sin^4\theta+\cos^4\theta)+4$

$=6[(\sin^2\theta+\cos^2\theta)^3-3\sin^2\theta\cos^2\theta(\sin^2\theta+\cos^2\theta)]-9[(\sin^2\theta+\cos^2\theta)^2-2\sin^2\theta\cos^2\theta]+4$

$=6[1-3\sin^2\theta\cos^2\theta]-9[1-2\sin^2\theta\cos^2\theta]+4$

$=6-9+4=1$

12. Given, $\frac{2\sin\alpha}{1+\cos\alpha+\sin\alpha}=x$

$\Rightarrow\quad\frac{2\sin\alpha(1-\cos\alpha-\sin\alpha)}{(1+\cos\alpha+\sin\alpha)(1-\cos\alpha-\sin\alpha)}=x$

$\Rightarrow\quad\frac{2\sin\alpha(1-\cos\alpha-\sin\alpha)}{1-\sin^2\alpha-\cos^2\alpha-2\sin\alpha\cos\alpha}=x$

$\Rightarrow\quad\frac{1-\cos\alpha-\sin\alpha}{\cos\alpha}=-x$

13. Since, $\sec\theta \notin (-1, 1)$

$\therefore \quad \sec\theta \neq \dfrac{1}{2}$

14. Since, $\log(\sin 90^\circ)$ is a factor in the given expression and the value of which is $\log(1) = 0$. Hence, the value of the given expression is 0.

15. We have, $3\left[\sin^4\left(\dfrac{3\pi}{2} - \alpha\right) + \sin^4(3\pi + \alpha)\right]$

$$-2\left[\sin^6\left(\frac{\pi}{2} + \alpha\right) + \sin^6(5\pi - \alpha)\right]$$

$= 3[(-\cos\alpha)^4 + (-\sin\alpha)^4] - 2[\cos^6\alpha + \sin^6\alpha]$

$= 3[(\cos^2\alpha + \sin^2\alpha)^2 - 2\sin^2\alpha\cos^2\alpha]$

$\qquad - 2[(\cos^2\alpha + \sin^2\alpha)^3 - 3\cos^2\alpha\sin^2\alpha$

$\qquad (\cos^2\alpha + \sin^2\alpha)]$

$= 3 - 6\sin^2\alpha\cos^2\alpha - 2 + 6\sin^2\alpha\cos^2\alpha = 3 - 2 = 1$

16. Since, $\tan x + \dfrac{1}{\tan x} = 2$

$\Rightarrow \quad \tan x = 1 \Rightarrow x = \dfrac{\pi}{4}$

$\therefore \quad \sin x = \dfrac{1}{\sqrt{2}}$ and $\cos x = \dfrac{1}{\sqrt{2}}$

Hence, $\sin^{2n} x + \cos^{2n} x = \dfrac{1}{2^n} + \dfrac{1}{2^n} = \dfrac{1}{2^{n-1}}$

17. Given, $\sin\alpha = \dfrac{15}{17}$, $\tan\beta = \dfrac{12}{5}$

Since, $\dfrac{\pi}{2} < \alpha < \pi$, $\pi < \beta < \dfrac{3\pi}{2}$

$\therefore \quad \cos\alpha = -\dfrac{8}{17}$, $\sin\beta = -\dfrac{12}{13}$

and $\quad \cos\beta = -\dfrac{5}{13}$

Now, $\sin(\beta - \alpha) = \sin\beta\cos\alpha - \cos\beta\sin\alpha$

$$= -\frac{12}{13}\left(\frac{-8}{17}\right) - \left(\frac{-5}{13}\right)\left(\frac{15}{17}\right)$$

$$= \frac{96}{221} + \frac{75}{221} = \frac{171}{221}$$

18. $\cos^2(\alpha - \beta) + 2ab\sin(\alpha - \beta)$

$= \cos^2(\alpha - \beta) + 2\cos(\theta - \alpha)\sin(\theta - \beta)\sin(\alpha - \beta)$

$= \cos^2(\alpha - \beta) + [\sin\{2\theta - (\alpha + \beta)\}$

$\qquad + \sin(\alpha - \beta)]\sin(\alpha - \beta)$

$= 1 + \sin\{2\theta - (\alpha + \beta)\}\sin(\alpha - \beta)$

$= 1 + \sin\{(\theta - \alpha) + (\theta - \beta)\}\sin\{(\theta - \beta) - (\theta - \alpha)\}$

$= 1 + \sin^2(\theta - \beta) - \sin^2(\theta - \alpha)$

$= \cos^2(\theta - \alpha) + \sin^2(\theta - \beta) = a^2 + b^2$

19. Put $x = 60^\circ$, then expression reduces to 1, therefore (b) is the appropriate choice.

20. $\sin 47^\circ + \sin 61^\circ - \sin 11^\circ - \sin 25^\circ$

$= 2\sin 54^\circ\cos 7^\circ - 2\sin 18^\circ\cos 7^\circ$

$= 2\cos 7^\circ(\sin 54^\circ - \sin 18^\circ)$

$= 2\cos 7^\circ(\cos 36^\circ - \sin 18^\circ)$

$= 2\cos 7^\circ\left[\left(\dfrac{\sqrt{5}+1}{4}\right) - \left(\dfrac{\sqrt{5}-1}{4}\right)\right]$

$= \cos 7^\circ$

21. $\cos y\cos\left(\dfrac{\pi}{2} - x\right) - \cos\left(\dfrac{\pi}{2} - y\right)\cos x$

$$+ \sin y\cos\left(\frac{\pi}{2} - x\right) + \cos x\sin\left(\frac{\pi}{2} - y\right) = 0$$

$\Rightarrow \cos y\sin x - \cos x\sin y$

$\qquad + \sin y\sin x + \cos x\cos y = 0$

$\Rightarrow \quad \sin(x - y) + \cos(x - y) = 0$

$\Rightarrow \quad \tan(x - y) = -1$

$\Rightarrow \quad x = n\pi - \dfrac{\pi}{4} + y$

22. $\operatorname{cosec} A + \cot A = \dfrac{11}{2}$

$\Rightarrow \quad \operatorname{cosec}^2 A - \cot^2 A = 1$

$\Rightarrow \quad \operatorname{cosec} A - \cot A = \dfrac{2}{11}$

$\Rightarrow \quad 2\cot A = \dfrac{117}{22} \quad \Rightarrow \quad \tan A = \dfrac{44}{117}$

23. Let $\dfrac{\sin^3 x}{1 + \cos x} + \dfrac{\cos^3 x}{1 - \sin x} = A$, then

$$A = \frac{(\sin^3 x + \cos^3 x) + (\cos^4 x - \sin^4 x)}{(1 + \cos x)(1 - \sin x)}$$

$$\Rightarrow \quad A = \frac{\{(\sin^3 x + \cos^3 x)\}\{(\cos x + \sin x)}{\begin{array}{c}(\cos x - \sin x)(\cos^2 x + \sin^2 x)\}\\ \hline (1 + \cos x)(1 - \sin x)\end{array}}$$

$$\Rightarrow \quad A = \frac{(\sin x + \cos x)\{(1 - \sin x\cos x) + (\cos x - \sin x)\}}{1 + \cos x - \sin x - \sin x\cos x}$$

$\Rightarrow \quad A = \sin x + \cos x$

$\Rightarrow \quad A = \sqrt{2}\left[\dfrac{1}{\sqrt{2}}\sin x + \dfrac{1}{\sqrt{2}}\cos x\right] \qquad \ldots(i)$

$\Rightarrow \quad A = \sqrt{2}\left[\cos\dfrac{\pi}{4}\sin x + \sin\dfrac{\pi}{4}\cos x\right]$

$\qquad = \sqrt{2}\sin\left[\dfrac{\pi}{4} + x\right]$

Again, by Eq. (i), we get

$$A = \sqrt{2}\left[\sin\frac{\pi}{4}\sin x + \cos\frac{\pi}{4}\cos x\right] = \sqrt{2}\cos\left[\frac{\pi}{4} - x\right]$$

24. Given expression $= \operatorname{cosec} A\sin(B + C)$

$= \operatorname{cosec} A \cdot \sin(\pi - A) \qquad [\because A + B + C = \pi]$

$= \operatorname{cosec} A \cdot \sin A = 1$

25. $\cos(A - B) = \dfrac{3}{5} \quad \Rightarrow \quad \tan(A - B) = \dfrac{4}{3}$

$\Rightarrow \quad \dfrac{\tan A - \tan B}{1 + \tan A\tan B} = \dfrac{4}{3}$

$\Rightarrow \quad \tan A - \tan B = 4$

Now, $\quad (\tan A + \tan B)^2 = (\tan A - \tan B)^2$

$\qquad + 4\tan A\tan B = 24$

$\Rightarrow \quad \tan A + \tan B = 2\sqrt{6}$

$\therefore \quad \tan A = 2 + \sqrt{6}$ and $\tan B = \sqrt{6} - 2$

$$\cos A = \frac{1}{\sqrt{11 + 4\sqrt{6}}}$$

$$\cos B = \frac{1}{\sqrt{11 - 4\sqrt{6}}}$$

$\therefore \quad \cos A\cos B = \dfrac{1}{\sqrt{121 - 96}} = \dfrac{1}{5}$

$$\sin A \sin B = \frac{(2+\sqrt{6})(\sqrt{6}-2)}{5} = \frac{2}{5}$$

$\therefore \quad \cos(A+B) = \cos A \cos B - \sin A \sin B$

$$= \frac{1}{5} - \frac{2}{5} = -\frac{1}{5}$$

26. $f(\theta) = \sin^2\theta + \sin^2\left(\theta + \frac{2\pi}{3}\right) + \sin^2\left(\theta + \frac{4\pi}{3}\right)$

$$= \frac{1}{2}\left[3 - \cos 2\theta - \cos\left(\frac{4\pi}{3} + 2\theta\right) - \cos\left(\frac{8\pi}{3} + 2\theta\right)\right]$$

$$= \frac{1}{2}\left[3 - \cos 2\theta - 2\cos(2\pi + 2\theta)\cos\left(\frac{2\pi}{3}\right)\right]$$

$$= \frac{1}{2}(3 - \cos 2\theta + \cos 2\theta) = \frac{3}{2}$$

$$\Rightarrow \quad f\left(\frac{\pi}{15}\right) = \frac{3}{2}$$

27. We have, $\dfrac{2}{\cos x} = \dfrac{1}{\cos(x-y)} + \dfrac{1}{\cos(x+y)}$

$$= \frac{2\cos x \cos y}{\cos^2 x - \sin^2 y}$$

$\Rightarrow \quad 2\cos^2 x - 2\sin^2 y = 2\cos^2 x \cos y$

$\Rightarrow \quad 2\cos^2 x(1 - \cos y) = 2\sin^2 y$

$\Rightarrow \quad 2\cos^2 x \, 2\sin^2 \frac{y}{2} = 8\sin^2\frac{y}{2}\cos^2\frac{y}{2}$

$\Rightarrow \quad \cos^2 x = 2\cos^2\frac{y}{2}$

$\Rightarrow \quad \cos^2 x \sec^2 \frac{y}{2} = 2$

$\Rightarrow \quad \cos x \sec \frac{y}{2} = \pm\sqrt{2}$

28. $\sin^3 x \sin 3x = \frac{1}{2}\sin^2 x(\cos 2x - \cos 4x)$

$$= \frac{1}{4}(1 - \cos 2x)(\cos 2x - \cos 4x)$$

$$= \frac{1}{4}(\cos 2x - \cos 4x - \cos^2 2x + \cos 2x \cos 4x)$$

$$= \frac{1}{4}\left(\cos 2x - \cos 4x - \frac{1+\cos 4x}{2} + \frac{1}{2}(\cos 6x + \cos 2x)\right)$$

$$= \frac{1}{4}\left(\frac{3}{2}\cos 2x - \frac{3}{2}\cos 4x + \frac{1}{2}\cos 6x - \frac{1}{2}\right)$$

$$= -\frac{1}{8} + \frac{3}{8}\cos 2x - \frac{3}{8}\cos 4x + \frac{1}{8}\cos 6x \quad \Rightarrow \quad n = 6$$

29. $A + B = \frac{\pi}{4} \Rightarrow \tan(A+B) = 1$

$\Rightarrow \quad \tan A + \tan B = 1 - \tan A \tan B$

$\Rightarrow \quad \tan A + \tan B + \tan A \tan B + 1 = 2$

$\Rightarrow \quad (1 + \tan A)(1 + \tan B) = 2$

30. $\dfrac{\sin x}{\sin y} = \dfrac{1}{2}, \dfrac{\cos x}{\cos y} = \dfrac{3}{2} \quad \Rightarrow \quad \dfrac{\tan x}{\tan y} = \dfrac{1}{3}$

$$\tan(x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y} = \frac{4\tan x}{1 - 3\tan^2 x}$$

Also, $\sin y = 2\sin x$ and $\cos y = \frac{2}{3}\cos x$

$\Rightarrow \quad \sin^2 y + \cos^2 y = 4\sin^2 x + \dfrac{4\cos^2 x}{9} = 1$

$\Rightarrow \quad 27\tan^2 x = 5 \quad \Rightarrow \quad \tan x = \dfrac{\sqrt{5}}{3\sqrt{3}}$

$\Rightarrow \quad \tan(x+y) = \sqrt{15}$

31. Given, $\angle C = \frac{2\pi}{3} \quad \Rightarrow \quad A + B = \frac{\pi}{3}$

Now, $\cos^2 A + \cos^2 B - \cos A \cos B$

$$= \frac{1}{2}[2 + \cos 2A + \cos 2B - \cos(A+B) - \cos(A-B)]$$

$$= \frac{1}{2}\left[2 + 2\cos(A+B)\cos(A-B) - \frac{1}{2} - \cos(A-B)\right]$$

$$= \frac{1}{2}\left[\frac{3}{2} + \cos(A-B) - \cos(A-B)\right] = \frac{3}{4}$$

32. Let $I = \displaystyle\sum_{r=0}^{10} \frac{1}{4}\left(\cos 3\frac{\pi r}{3} + 3\cos\frac{\pi r}{3}\right)$

$$= \sum_{r=0}^{10} \frac{1}{4}\left(\cos \pi r + 3\cos\frac{\pi r}{3}\right) = \frac{1}{4}(I_1 + I_2)$$

$\therefore \quad I_1 = \displaystyle\sum_{r=0}^{10} \cos \pi r = 1 - 1 + 1 - 1 + \ldots - 1 + 1 = 1$

and $I_2 = \displaystyle\sum_{r=0}^{10} \cos\frac{\pi r}{3} = \frac{\cos\left(\frac{10}{2}\cdot\frac{\pi}{3}\right)\cdot\sin\frac{11\pi}{6}}{\sin\frac{\pi}{6}} = -\frac{1}{2}$

$\therefore \quad I = \frac{1}{4}\left(1 - \frac{3}{2}\right) = -\frac{1}{8}$

33. The given equation is

$$3\cos A + 2 = 0 \quad \Rightarrow \quad \cos A = \frac{-2}{3}$$

Since, A is angle of triangle.

$\therefore \quad A < \pi \Rightarrow \sin A$ is positive.

$\therefore \quad \sin A = \sqrt{(1 - \cos^2 A)} = \dfrac{\sqrt{5}}{3}$

$\Rightarrow \quad \tan A = \dfrac{\sin A}{\cos A} = \dfrac{-\sqrt{5}}{2}$

$$\sin A + \tan A = \frac{-\sqrt{5}}{6}$$

$$\sin A \tan A = \frac{-5}{6}$$

Hence, the equation whose roots are $\sin A$ and $\tan A$, is

$$x^2 - (\sin A + \tan A)x + \sin A \tan A = 0$$

$\Rightarrow \quad x^2 + \dfrac{\sqrt{5}}{6}x + \left(\dfrac{-5}{6}\right) = 0$

$\Rightarrow \quad 6x^2 + \sqrt{5}x - 5 = 0$

34. $\cot^2 x = \cot(x-y)\cdot\cot(x-z)$

$\Rightarrow \cot^2 x = \left(\dfrac{\cot x \cot y + 1}{\cot y - \cot x}\right)\left(\dfrac{\cot x \cot z + 1}{\cot z - \cot x}\right)$

$\Rightarrow \quad \cot^2 x \cot y \cot z - \cot^3 x \cot y - \cot^3 x \cot z + \cot^4 x = 0$

$\Rightarrow \quad \cot^2 x \cot y \cot z + \cot x \cot y + \cot x \cot z + 1 = 0$

$\Rightarrow \quad \cot x \cot y(1 + \cot^2 x) + \cot x \cot z(1 + \cot^2 x) + 1 - \cot^4 x = 0$

$\Rightarrow \quad \cot x(\cot y + \cot z)(1 + \cot^2 x) + (1 - \cot^2 x)(1 + \cot^2 x) = 0$

$\Rightarrow \quad \cot x(\cot y + \cot z) + (1 - \cot^2 x) = 0$

$\Rightarrow \quad \dfrac{\cot^2 x - 1}{2\cot x} = \dfrac{1}{2}(\cot y + \cot z)$

$\Rightarrow \quad \dfrac{1}{2}(\cot y + \cot z) = \cot 2x$

35. Since, $\alpha + \beta = \frac{\pi}{2}$, then

$$\tan\beta = \tan\left(\frac{\pi}{2} - \alpha\right) = \cot\alpha$$

and $\beta + \gamma = \alpha \Rightarrow \gamma = \alpha - \beta$

$$\therefore \quad \tan\gamma = \tan(\alpha - \beta) = \frac{\tan\alpha - \tan\beta}{1 + \tan\alpha\tan\beta}$$

$$= \frac{\tan\alpha - \tan\beta}{1 + \tan\alpha\cot\alpha} = \frac{\tan\alpha - \tan\beta}{2}$$

Hence, $\tan\alpha = \tan\beta + 2\tan\gamma$

36. We have, $\sin\theta = n\sin(\theta + 2\alpha)$

$$\Rightarrow \quad \frac{\sin(\theta + 2\alpha)}{\sin\theta} = \frac{1}{n}$$

$$\Rightarrow \quad \frac{\sin(\theta + 2\alpha) + \sin\theta}{\sin(\theta + 2\alpha) - \sin\theta} = \frac{1+n}{1-n}$$

$$\Rightarrow \quad \frac{2\sin(\theta + \alpha)\cos\alpha}{2\sin\alpha\cos(\theta + \alpha)} = \frac{1+n}{1-n}$$

$$\Rightarrow \quad \tan(\theta + \alpha) = \left(\frac{1+n}{1-n}\right)\tan\alpha$$

37. Given, $\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha = 1$ ...(i)

$\frac{x}{a}\cos\beta + \frac{y}{b}\sin\beta = 1$ ...(ii)

and $\frac{\cos\alpha\cos\beta}{a^2} + \frac{\sin\alpha\sin\beta}{b^2} = 0$ ...(iii)

From Eqs. (i) and (ii), we get

$$x = a\frac{\sin\alpha - \sin\beta}{\sin(\alpha - \beta)} \text{ and } y = b\frac{\cos\beta - \cos\alpha}{\sin(\alpha - \beta)}$$

Now, $x^2 + y^2 = \frac{a^2(\sin\alpha - \sin\beta)^2 + b^2(\cos\beta - \cos\alpha)^2}{\sin^2(\alpha - \beta)}$

$$= \frac{a^2(\sin^2\alpha + \sin^2\beta) + b^2(\cos^2\alpha + \cos^2\beta) - 2(a^2\sin\alpha\sin\beta + b^2\cos\alpha\cos\beta)}{\sin^2(\alpha - \beta)}$$

$$= \frac{a^2(\sin^2\alpha + \sin^2\beta) + b^2(\cos^2\alpha + \cos^2\beta)}{\sin^2(\alpha - \beta)}$$

[from Eq. (iii)]

$$= a^2 + b^2 + \frac{\left[\begin{array}{l} a^2\{\sin^2\alpha + \sin^2\beta - \sin^2(\alpha - \beta)\} \\ + b^2\{\cos^2\alpha + \cos^2\beta - \sin^2(\alpha - \beta)\}\end{array}\right]}{\sin^2(\alpha - \beta)}$$

$$= a^2 + b^2 + \frac{1}{\sin^2(\alpha - \beta)}$$

$[a^2(\sin^2\alpha + \sin^2\beta - \sin^2\alpha\cos^2\beta - \cos^2\alpha\sin^2\beta + 2\sin\alpha\sin\beta\cos\alpha\cos\beta) + b^2\{\cos^2\alpha(1 - \sin^2\beta) + \cos^2\beta(1 - \sin^2\alpha) + 2\sin\alpha\sin\beta\sin\alpha\sin\beta\cos\alpha\cos\beta\}]$

$$= a^2 + b^2 + \frac{\left[\begin{array}{l} 2a^2\sin\alpha\sin\beta\cos(\alpha - \beta) + 2b^2 \\ \cos\alpha\cos\beta\cos(\alpha - \beta)\end{array}\right]}{\sin^2(\alpha - \beta)}$$

$$= a^2 + b^2 + \frac{2a^2b^2\cos(\alpha - \beta)}{\sin^2(\alpha - \beta)}\left[\frac{\sin\alpha\sin\beta}{b^2} + \frac{\cos\alpha\cos\beta}{a^2}\right]$$

[from Eq. (iii)]

$$= a^2 + b^2 + 0 = a^2 + b^2$$

Thus, $x^2 + y^2 = a^2 + b^2$

Now, $\quad x^2 + y^2 = a^2 + b^2$

$$\Rightarrow \quad x^2 - a^2 = -(y^2 - b^2)$$

$$\Rightarrow \quad \frac{x^2 - a^2}{y^2 - b^2} = -1$$

$$\Rightarrow \quad \frac{b^2(x^2 - a^2)}{a^2(y^2 - b^2)} = -\frac{b^2}{a^2} = \tan\alpha\tan\beta \text{ [from Eq. (iii)]}$$

38. $2x = \cos(\alpha - \beta - \gamma + \delta) - \cos(\alpha - \beta + \gamma - \delta)$

$2y = \cos(\beta - \gamma - \alpha + \delta) - \cos(\beta - \gamma + \alpha - \delta)$

and similarly for $2z$,

On adding, we get $\quad 2x + 2y + 2z = 0$

$$\Rightarrow \quad x + y + z = 0$$

39. $\cos\left(\frac{\pi}{4} - x\right)\cos\left(\frac{\pi}{4} - y\right) - \sin\left(\frac{\pi}{4} - x\right)\sin\left(\frac{\pi}{4} - y\right)$

Let $\quad \frac{\pi}{4} - x = A$ and $\frac{\pi}{4} - y = B$

Then, $\cos A\cos B - \sin A\sin B = \cos(A + B)$

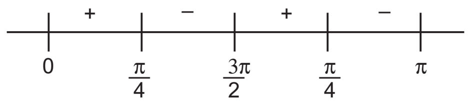
$$= \left(\cos\frac{\pi}{4} - x + \frac{\pi}{4} - y\right)$$

$$= \cos\left(\frac{\pi}{2} - x - y\right) = \cos\left[\frac{\pi}{2} - (x + y)\right] = \sin(x + y)$$

40. $\sin x\cos^3 x > \cos x\sin^3 x$

$\Rightarrow \sin x\cos x(\cos^2 x - \sin^2 x) > 0$

$\Rightarrow \sin x\cos x \cdot \cos 2x > 0 \Rightarrow \cos x\cos 2x > 0$



$$\therefore \quad x \in \left(0, \frac{\pi}{4}\right) \cup \left(\frac{\pi}{2}, \frac{3\pi}{4}\right)$$

41. We have,

$$x = \sum_{n=0}^{\infty}\cos^{2n}\phi = 1 + \cos^2\phi + \cos^4\phi + \ldots$$

$$= \frac{1}{1 - \cos^2\phi} = \frac{1}{\sin^2\phi}$$

Similarly, $y = \frac{1}{1 - \sin^2\phi} = \frac{1}{\cos^2\phi}$

and $\quad z = \frac{1}{1 - \sin^2\phi\cos^2\phi}$

$$= \frac{1}{1 - \frac{1}{x}\cdot\frac{1}{y}} = \frac{xy}{xy - 1} \Rightarrow xyz = xy + z$$

Also, $x + y = \frac{1}{\sin^2\phi} + \frac{1}{\cos^2\phi} = \frac{1}{\sin^2\phi\cos^2\phi} = xy$

Thus, $\quad xyz = xy + z = x + y + z$

42. We have, $\frac{x}{\cos\theta} = \frac{y}{\cos\left(\theta - \frac{2\pi}{3}\right)} = \frac{z}{\cos\left(\theta + \frac{2\pi}{3}\right)}$

Therefore, each ratio

$$= \frac{x + y + z}{\cos\theta + \cos\left(\theta - \frac{2\pi}{3}\right) + \cos\left(\theta + \frac{2\pi}{3}\right)}$$

$$= \frac{x + y + z}{\cos\theta + 2\cos\theta\cos\frac{2\pi}{3}} = \frac{x + y + z}{0} = 0$$

43. Given that, $\cos\theta = \frac{1}{2}\left(x + \frac{1}{x}\right)$

$$\Rightarrow \quad x + \frac{1}{x} = 2\cos\theta \quad \text{...(i)}$$

We know that,

$$x^2 + \frac{1}{x^2} = \left(x + \frac{1}{x}\right)^2 - 2$$
$$= (2\cos\theta)^2 - 2 = 4\cos^2\theta - 2$$
$$= 2\cos 2\theta \quad \text{[from Eq. (i)]}$$
$$\therefore \quad \frac{1}{2}\left(x^2 + \frac{1}{x^2}\right) = \frac{1}{2} \times 2\cos 2\theta = \cos 2\theta$$

44. Maximum value of $\cos\theta = 1$

So, the equation can have solution only when

$$\cos x = 1, \cos y = 1$$
$$\Rightarrow \quad x = 0, y = 0$$
$$\therefore \quad \cos(x - y) = \cos 0 = 1$$

45. Given equations may be written as

$$\cos x + \cos y = -\cos\alpha$$

and $\sin x + \sin y = -\sin\alpha$

$$\Rightarrow \quad 2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) = -\cos\alpha \quad \text{...(i)}$$

and $$2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) = -\sin\alpha \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)}{2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)} = \frac{\cos\alpha}{\sin\alpha}$$

$$\Rightarrow \quad \cot\left(\frac{x+y}{2}\right) = \cot\alpha$$

46. We have, $\alpha + \beta - \gamma = \pi$

Now, $\sin^2\alpha + \sin^2\beta - \sin^2\gamma$

$$= \sin^2\alpha + \sin(\beta - \gamma)\sin(\beta + \gamma)$$
$$= \sin^2\alpha + \sin(\pi - \alpha)\sin(\beta + \gamma) \quad [\because \alpha + \beta - \gamma = \pi]$$
$$= \sin^2\alpha + \sin\alpha\sin(\beta + \gamma)$$
$$= \sin\alpha[\sin\alpha + \sin(\beta + \gamma)]$$
$$= \sin\alpha[\sin\{\pi - (\beta - \gamma)\} + \sin(\beta + \gamma)]$$
$$= \sin\alpha[\sin(\beta - \gamma) + \sin(\beta + \gamma)]$$
$$= \sin\alpha[2\sin\beta\cos\gamma]$$
$$= 2\sin\alpha\sin\beta\cos\gamma$$

47. We have, $\alpha + \beta + \gamma = 2\pi$

$$\Rightarrow \quad \frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} = \pi$$
$$\Rightarrow \quad \frac{\alpha}{2} + \frac{\beta}{2} = \pi - \frac{\gamma}{2}$$
$$\Rightarrow \quad \tan\left(\frac{\alpha}{2} + \frac{\beta}{2}\right) = \tan\left(\pi - \frac{\gamma}{2}\right)$$
$$\Rightarrow \quad \frac{\tan\frac{\alpha}{2} + \tan\frac{\beta}{2}}{1 - \tan\frac{\alpha}{2}\tan\frac{\beta}{2}} = -\tan\frac{\gamma}{2}$$
$$\Rightarrow \quad \tan\frac{\alpha}{2} + \tan\frac{\beta}{2} + \tan\frac{\gamma}{2} = \tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$$

48. $\sin x + \cos x = \frac{\sqrt{7}}{2}$

$$\Rightarrow \quad \frac{2\tan\frac{x}{2}}{1 + \tan^2\frac{x}{2}} + \frac{1 - \tan^2\frac{x}{2}}{1 + \tan^2\frac{x}{2}} = \frac{\sqrt{7}}{2}$$
$$\Rightarrow (\sqrt{7} + 2)\tan^2\frac{x}{2} - 4\tan\frac{x}{2} + (\sqrt{7} - 2) = 0$$
$$\Rightarrow \quad \tan\frac{x}{2} = \frac{4 \pm \sqrt{16 - 4(7 - 4)}}{2(\sqrt{7} + 2)} = \frac{1}{\sqrt{7} + 2} \text{ as } \frac{x}{2} < \frac{\pi}{8}$$
$$\Rightarrow \quad \tan\frac{x}{2} = \frac{\sqrt{7} - 2}{3}$$

49. $\sin B = \frac{1}{5}\sin(2A + B) \Rightarrow \frac{\sin(2A + B)}{\sin B} = 5$

$$\Rightarrow \quad \frac{\sin(2A + B) + \sin B}{\cos(2A + B) - \sin B} = \frac{6}{4}$$
$$\Rightarrow \quad \frac{\sin(A + B)\cos A}{\cos(A + B)\sin A} = \frac{3}{2}$$
$$\Rightarrow \quad \frac{\tan(A + B)}{\tan A} = \frac{3}{2}$$

50. If $\tan\alpha = \frac{1}{7}$ and $\sin\beta = \frac{1}{\sqrt{10}}$

$$\sin 2\beta = 2\sin\beta\cos\beta = 2 \cdot \frac{1}{\sqrt{10}} \cdot \frac{3}{\sqrt{10}} = \frac{3}{5}$$
$$\tan(\alpha + 2\beta) = \frac{\tan\alpha + \tan 2\beta}{1 - \tan\alpha\tan 2\beta} = \frac{\frac{1}{7} + \frac{3}{4}}{1 - \frac{1}{7}\cdot\frac{3}{4}} = \frac{25}{25} = 1$$
$$\therefore \quad 2\beta = \frac{\pi}{4} - \alpha$$

51. $\frac{3\cos\theta + \cos 3\theta}{3\sin\theta - \sin 3\theta} = \frac{4\cos^3\theta}{4\sin^3\theta} = \cot^3\theta$

52. $3\sin\alpha = 5\sin\beta \Rightarrow \frac{\sin\alpha}{\sin\beta} = \frac{5}{3}$

$$\Rightarrow \frac{\sin\alpha + \sin\beta}{\sin\alpha - \sin\beta} = \frac{8}{2} \quad \Rightarrow \quad \frac{\tan\left(\frac{\alpha + \beta}{2}\right)}{\tan\left(\frac{\alpha - \beta}{2}\right)} = 4$$

53. $\cos 2B = \frac{\cos(A + C)}{\cos(A - C)}$

$$\Rightarrow \quad \frac{1 - \cos 2B}{1 + \cos 2B} = \frac{\cos(A - C) - \cos(A + C)}{\cos(A - C) + \cos(A + C)}$$
$$\Rightarrow \quad \frac{2\sin^2 B}{2\cos^2 B} = \frac{2\sin A\sin C}{2\cos A\cos C}$$
$$\Rightarrow \quad \tan A\tan C = \tan^2 B$$

Hence, $\tan A, \tan B, \tan C$ are in GP.

54. $a\cos 2x + b\sin 2x = a\frac{1 - \tan^2 x}{1 + \tan^2 x} + b\frac{2\tan x}{1 + \tan^2 x}$

$$= a \cdot \frac{1 - \frac{b^2}{a^2}}{1 + \frac{b^2}{a^2}} + b \cdot \frac{\frac{2b}{a}}{1 + \frac{b^2}{a^2}} = a\left(\frac{a^2 - b^2}{a^2 + b^2}\right) + \frac{2ab^2}{a^2 + b^2}$$
$$= \left(\frac{a}{a^2 + b^2}\right)(a^2 - b^2 + 2b^2) = a$$

55. Let $y = \cos x \cos(x+2) - \cos^2(x+1)$

$$= \frac{1}{2}[\cos(2x+2) + \cos 2] - \cos^2(x+1)$$

$$= \frac{1}{2}[2\cos^2(x+1) - 1 + \cos 2] - \cos^2(x+1)$$

$$= -\frac{1}{2}(1 - \cos 2) = -\frac{1}{2}(2\sin^2 1) = -\sin^2 1$$

This shows that $y = -\sin^2 1$ is a straight line which is parallel to X-axis and clearly passes through the point $\left(\frac{\pi}{2}, -\sin^2 1\right)$.

56. From the given identity, we have

$$\alpha[4\cos^3\theta - 3\cos\theta]^2 + \beta\cos^4\theta = 16\cos^6\theta + 9\cos^2\theta$$

$$\Rightarrow \quad 16\alpha\cos^6\theta + (\beta - 24\alpha)\cos^4\theta + 9\alpha\cos^2\theta = 16\cos^6\theta + 9\cos^2\theta$$

$$\Rightarrow \quad \alpha = 1 \text{ and } \beta - 24\alpha = 0 \quad \Rightarrow \quad \alpha = 1 \text{ and } \beta = 24$$

57. Given that,

$$\sin n\theta = \sum_{r=0}^{n} b_r \sin^r\theta = b_0 + b_1\sin\theta + b_2\sin^2\theta + \ldots + b_n\sin^n\theta \quad \ldots\text{(i)}$$

Putting $\theta = 0$ in Eq. (i), we get $0 = b_0$

Again, Eq. (i) can be written as $\sin n\theta = \sum_{r=0}^{n} b_r \sin^r\theta$

$$\Rightarrow \quad \frac{\sin n\theta}{\sin\theta} = \sum_{r=1}^{n} b_r \sin^{r-1}\theta$$

Taking limit as $\theta \to 0$, we get

$$\lim_{\theta\to 0}\frac{\sin n\theta}{\sin\theta} = b_1$$

$$\Rightarrow \quad \lim_{\theta\to 0} n\left(\frac{\sin n\theta}{n\theta}\right)\left(\frac{\theta}{\sin\theta}\right) = b_1$$

$$\Rightarrow \quad n = b_1$$

$$\Rightarrow \quad b_0 = 0,\ b_1 = n$$

58. $x^2 + y^2 = X^2 + Y^2$,

$$xy = (X^2 - Y^2)\sin\theta\cdot\cos\theta - XY(\cos^2\theta - \sin^2\theta)$$

$$x^2 + 4xy + y^2 = X^2 + Y^2 + 2(X^2 - Y^2)\sin 2\theta - 2XY\cos 2\theta$$

$$= (1 + 2\sin 2\theta)X^2 + (1 - 2\sin 2\theta)Y^2 - 2\cos 2\theta\cdot XY$$

According to the question,

$$a = 1 + 2\sin 2\theta,\ b = 1 - 2\sin 2\theta,\ \cos 2\theta = 0$$

$$\cos 2\theta = 0$$

$$\Rightarrow \quad \theta = \frac{\pi}{4}, \text{ then}$$

$$a = 1 + 2\sin\frac{\pi}{2},\ b = 1 - 2\sin\frac{\pi}{2}$$

$$\therefore \quad a = 3,\ b = -1$$

59. $\tan\theta = \lambda \Rightarrow \dfrac{2\tan\theta/2}{1 - \tan^2\theta/2} = \lambda$

$$\Rightarrow \quad \lambda\tan^2\frac{\theta}{2} + 2\tan\frac{\theta}{2} - \lambda = 0$$

$$\Rightarrow \quad \tan\frac{\theta_1}{2}\cdot\tan\frac{\theta_2}{2} = -1$$

60. Since, AM $\geq$ GM

$$\frac{1}{2}\left[\sqrt{x^2+x} + \frac{\tan^2\alpha}{\sqrt{x^2+x}}\right] \geq \sqrt{\sqrt{x^2+x}\times\frac{\tan^2\alpha}{\sqrt{x^2+x}}} = |\tan\alpha|$$

61. $\dfrac{2}{\tan\frac{B}{2}} = \dfrac{1}{\tan\frac{A}{2}} + \dfrac{1}{\tan\frac{C}{2}}$

$$\Rightarrow \quad 2\tan\frac{A}{2}\tan\frac{C}{2} = \tan\frac{B}{2}\tan\frac{C}{2} + \tan\frac{B}{2}\tan\frac{A}{2}$$

$$\Rightarrow \quad 2\tan\frac{A}{2}\tan\frac{C}{2} = \tan\frac{B}{2}\left(\tan\frac{A}{2} + \tan\frac{C}{2}\right)$$

$$\Rightarrow \quad \frac{2\tan\frac{A}{2}\tan\frac{C}{2}}{1 - \tan\frac{A}{2}\tan\frac{C}{2}} = \tan\frac{B}{2}\left(\frac{\tan\frac{A}{2} + \tan\frac{C}{2}}{1 - \tan\frac{A}{2}\tan\frac{C}{2}}\right)$$

$$= \tan\frac{B}{2}\tan\left(\frac{A}{2} + \frac{C}{2}\right)$$

$$= \tan\frac{B}{2}\tan\left(\frac{\pi}{2} - \frac{B}{2}\right)$$

$$\Rightarrow \quad \frac{2\tan\frac{A}{2}\tan\frac{C}{2}}{1 - \tan\frac{A}{2}\tan\frac{C}{2}} = 1$$

$$\Rightarrow \quad 2\tan\frac{A}{2}\tan\frac{C}{2} = 1 - \tan\frac{A}{2}\tan\frac{C}{2}$$

$$\Rightarrow \quad \tan\frac{A}{2}\tan\frac{C}{2} = \frac{1}{3}$$

$$\Rightarrow \quad \cot\frac{A}{2}\cot\frac{C}{2} = 3$$

62. The given expression

$$= \cos^2\phi + \cos^2(a+\phi) - [\cos(a+\phi) + \cos(a-\phi)]\cos(a+\phi)$$

$$= \cos^2\phi - \cos(a+\phi)\cos(a-\phi)$$

$$= \cos^2\phi - (\cos^2\phi - \sin^2 a) = \sin^2 a$$

which is independent of ϕ.

63. $\cos x - \sin\alpha\cot\beta\sin x = \cos\alpha$

$$\Rightarrow \quad \sin\beta\cos x - \sin\alpha\cos\beta\sin x = \cos\alpha\sin\beta$$

$$\Rightarrow \quad \sin\beta\left(1 - \tan^2\frac{x}{2}\right) - \sin\alpha\cos\beta\cdot 2\tan\frac{x}{2} = \cos\alpha\sin\beta\left(1 + \tan^2\frac{x}{2}\right)$$

$$\Rightarrow \quad \tan^2\frac{x}{2}(-\sin\beta - \cos\alpha\sin\beta) - \sin\alpha\cos\beta\cdot 2\tan\frac{x}{2} + \sin\beta(1 - \cos\alpha) = 0$$

$$\Rightarrow \quad \tan\frac{x}{2} = \frac{-2\sin\alpha\cos\beta \pm \sqrt{\begin{array}{l}4[\sin^2\alpha\cos^2\beta + \sin^2\beta\\(1+\cos\alpha)(1-\cos\alpha)]\end{array}}}{2\sin\beta(1+\cos\alpha)}$$

$$= \frac{-\sin\alpha\cos\beta \pm \sqrt{\sin^2\alpha(\sin^2\beta + \cos^2\beta)}}{\sin\beta(1+\cos\alpha)}$$

$$= \frac{-\sin\alpha\cos\beta \pm \sin\alpha}{\sin\beta(1+\cos\alpha)}$$

$$= \frac{\sin\alpha(-\cos\beta \pm 1)}{\sin\beta(1+\cos\alpha)}$$

$$= \tan\frac{\beta}{2}\tan\frac{\alpha}{2} \text{ or } -\tan\frac{\alpha}{2}\cot\frac{\beta}{2}$$

64. $2\cos\left(\frac{A+B}{2}\right)\cdot\cos\left(\frac{A-B}{2}\right)=1$ or $2\cdot\frac{\sqrt{3}}{2}\cdot\cos\left(\frac{A-B}{2}\right)=1$

$\therefore \quad \cos\left(\frac{A-B}{2}\right)=\frac{1}{\sqrt{3}}$

$\therefore \quad \cos(A-B)=2\cos^2\left(\frac{A-B}{2}\right)-1=\frac{2}{3}-1=-\frac{1}{3}$

$|\cos A-\cos B|=\left|2\sin\left(\frac{A+B}{2}\right)\cdot\sin\left(\frac{A-B}{2}\right)\right|$

$=2\cdot\frac{1}{2}\sqrt{1-\frac{1}{3}}=\sqrt{\frac{2}{3}}$

65. $I(n)=2\cos nx \Rightarrow I(1)\cdot I(n+1)-I(n)$

$=4\cos x\cos(n+1)x-2\cos nx$

$=2[2\cos(n+3)x\cdot\cos x-\cos nx]$

$=2[\cos(n+2)x+\cos nx-\cos nx]$

$=2\cos(n+2)x=I(n+2)$

66. $D\geq 0\Rightarrow \cos^2 p-4\sin p\cdot(\cos p-1)\geq 0$

or $\quad \cos^2 p+4\sin p(1-\cos p)\geq 0 \quad$ ...(i)

As, $\quad \cos^2 p\geq 0$ and $1-\cos p\geq 0$

Eq. (i) will hold for all $\sin p\geq 0$. So, $p\in[0,\pi]$

67. $\cos\alpha+\cos\beta=-a$, $\cos\alpha\cdot\cos\beta=b$

and $\sin\alpha+\sin\beta=-p$, $\sin\alpha\cdot\sin\beta=q$

$\therefore \quad a^2+p^2=2+\cos(\alpha-\beta)$

and $\quad b+q=\cos(\alpha-\beta)$

$\therefore \quad a^2+p^2=2+b+q$

68. $f(\theta)=|\sin\theta|+|\cos\theta|$, $\forall\theta\in R$. Clearly, $f(\theta)>0$.

Also, $\quad f^2(\theta)=\sin^2\theta+\cos^2\theta+|2\sin\theta\cdot\cos\theta|$

$=1+|\sin 2\theta|$

$0\leq|\sin 2\theta|\leq 1$

$\Rightarrow \quad 1\leq f^2(\theta)\leq 2$

$\Rightarrow \quad 1\leq f(\theta)\leq\sqrt{2}$

69. $f(\theta)=(\sin\theta+\text{cosec}\theta)^2+(\cos\theta+\sec\theta)^2$

$=\sin^2\theta+\cos^2\theta+\text{cosec}^2\theta+\sec^2\theta+4$

$=5+\frac{1}{\sin^2\theta}+\frac{1}{\cos^2\theta}$

$=5+\frac{4}{4\sin^2\theta\cos^2\theta}$

$=5+\frac{4}{\sin^2 2\theta}\geq 9$

70. $f(\theta)=\sin^4\theta+\cos^4\theta+1$

$=(\sin^2\theta+\cos^2\theta)^2-2\sin^2\theta\cdot\cos^2\theta+1$

$=2-\frac{1}{2}\sin^2 2\theta$

$\Rightarrow f(\theta)\in\left[\frac{3}{2},2\right]$

71. $f(x)=\cos^6 x+\sin^6 x$

$=(\cos^2 x+\sin^2 x)(\sin^4 x+\cos^4 x-\cos^2 x\cdot\sin^2 x)$

$=[(\sin^2 x+\cos^2 x)^2-3\sin^2 x\cdot\cos^2 x]$

$=1-\frac{3}{4}\sin^2 2x$

$\Rightarrow f(x)\in\left[\frac{1}{4},1\right]$

72. $\sin\left(x+\frac{\pi}{6}\right)+\cos\left(x+\frac{\pi}{6}\right)$

$=\sqrt{2}\left[\sin\left(x+\frac{\pi}{6}+\frac{\pi}{4}\right)\right]=\sqrt{2}\sin\left(x+\frac{5\pi}{12}\right)\leq\sqrt{2}$

Equality hods, when $x+\frac{5\pi}{12}=\frac{\pi}{2}$ i.e. $x=\frac{\pi}{12}$

Therefore, maximum value of given expression is attained at $x=\frac{\pi}{12}$.

73. Since, $-\sqrt{a^2+b^2}\leq a\sin x+b\cos x\leq\sqrt{a^2+b^2}$

$\therefore \quad -\sqrt{74}\leq 7\cos x+5\sin x\leq\sqrt{74}$

So, $\quad -\sqrt{74}<2k+1<\sqrt{74}$

Therefore, $2k+1=\pm 8, \pm 7 \pm 6, \ldots, \pm 1, 0$

So, $k=-4, \pm 3, \pm 2, \pm 1, 0$ i.e. 8 values of k.

74. $f(x)=(\sin^2\theta+\cos^2\theta+x)\begin{vmatrix}1 & \cos^2\theta & x\\ 1 & x & \sin^2\theta\\ 1 & \sin^2\theta & \cos^2\theta\end{vmatrix}$

$=(x+1)\begin{vmatrix}1 & \cos^2\theta & x\\ 0 & x-\cos^2\theta & \sin^2\theta-x\\ 0 & \sin^2\theta-\cos^2\theta & \cos^2\theta-x\end{vmatrix}$

$=(x+1)[(x-\cos^2\theta)(\cos^2\theta-x)$
$-(\sin^2\theta-\cos^2\theta)(\sin^2\theta-x)]$

$=(x+1)[-x^2-\cos^4\theta+2x\cos^2\theta$
$-x\cos^2\theta+x\sin^2\theta-\sin^4\theta+\sin^2\theta\cos^2\theta]$

$=(-1/2)(x+1)[(x-\sin^2\theta)^2+(x-\cos^2\theta)^2$
$+(\sin^2\theta-\cos^2\theta)^2]$

So $\quad f(x)=0$, if $x=-1$

or $\quad x=\sin^2\theta=\cos^2\theta$

If $\sin^2\theta=\cos^2\theta$, then $\theta=\frac{\pi}{4} \Rightarrow x=1/2$

Hence $x=-1, 1/2$

75. $3\geq 3\cos\theta\geq -3\Rightarrow -3\leq -3\cos\theta\leq 3$

For $f(\theta)=\frac{1}{2-3\cos\theta}$, $-1\leq 2-3\cos\theta\leq 5$ and $\neq 0$

For $-1\leq 2-3\cos\theta<0$, $-1\geq f(\theta)>-\infty$

For $\quad 0<2-3\cos\theta\leq 5$, $\infty>f(\theta)\geq\frac{1}{5}$

Thus, the range of $f(\theta)$ is $(-\infty,-1]\cup\left(\frac{1}{5},\infty\right]$.

76. $\because f(\theta)=5\cos\theta+3\cos\left(\theta+\frac{\pi}{3}\right)+3$

$=5\cos\theta+\frac{3}{2}\cos\theta-\frac{3\sqrt{3}}{2}\sin\theta+3$

$=\frac{13}{2}\cos\theta-\frac{3\sqrt{3}}{2}\sin\theta+3$

As, $-\sqrt{a^2+b^2}\leq a\sin\theta+b\cos\theta\leq\sqrt{a^2+b^2}$

Thus, range of $f(\theta)$ is $[-4, 10]$.

77. $a\sin x+b\cos(x+\theta)+b\cos(x-\theta)=d$

$\Rightarrow a\sin x+2b\cdot\cos x\cdot\cos\theta=d$

$\Rightarrow \quad |d|\leq\sqrt{a^2+4b^2\cdot\cos^2\theta}$

$\Rightarrow \quad \frac{d^2-a^2}{4b^2}\leq\cos^2\theta$

$\Rightarrow \quad |\cos\theta|\geq\frac{\sqrt{d^2-a^2}}{2|b|}$

78. Given that, $\alpha + \beta + \gamma = \pi$

Taking $\alpha = -\dfrac{\pi}{2}, \beta = -\dfrac{\pi}{2}$ and $\gamma = 2\pi$

$\therefore \quad \sin\alpha + \sin\beta + \sin\gamma = -1 - 1 + 0 = -2$

But $\sin\alpha + \sin\beta + \sin\gamma \ge -3$ for any α, β, γ.

Hence, the minimum value of $\sin\alpha + \sin\beta + \sin\gamma$ is negative.

79. $y = \tan A \cdot \tan\left(\dfrac{\pi}{3} - A\right)$

$\Rightarrow \quad \tan^2 A + \sqrt{3}(y-1)\tan A + y = 0$

As $\tan A$ is real, $D \ge 0 \Rightarrow 3(y-1)^2 - 4y \ge 0$

$\therefore \quad 3y^2 - 10y + 3 \ge 0 \Rightarrow y \le \dfrac{1}{3}$ or $y \ge 3$

80. We have,

$(a\sin^4\theta + b)(a + b) = ab\cos^4\theta$

$\Rightarrow a^2\sin^4\theta + ab\sin^4\theta + ba + b^2 = ab\cos^4\theta$

$\Rightarrow a^2\sin^4\theta + ab + b^2 = ab(\cos^4\theta - \sin^4\theta)$

$\Rightarrow a^2\sin^4\theta + ab + b^2 = ab(\cos^2\theta + \sin^2\theta) \times (\cos^2\theta - \sin^2\theta)$

$[\because a^2 - b^2 = (a+b)(a-b)]$

$\Rightarrow a^2\sin^4\theta + ab + b^2 = ab\cos 2\theta$

$[\because \cos 2\theta = \cos^2\theta - \sin^2\theta]$

$\Rightarrow a^2\sin^4\theta + ab + b^2 = ab(1 - 2\sin^2\theta)$

$\Rightarrow a^2\sin^4\theta + ab + b^2 = ab - 2ab\sin^2\theta$

$\Rightarrow a^2\sin^4\theta + 2ab\sin^2\theta + b^2 = 0$

$\Rightarrow (a\sin^2\theta + b)^2 = 0$

$\Rightarrow a\sin^2\theta + b = 0 \Rightarrow \sin^2\theta = \dfrac{-b}{a}$

$\Rightarrow \left|\dfrac{-b}{a}\right| \le 1 \Rightarrow \left|\dfrac{b}{a}\right| \le 1 \Rightarrow |b| \le |a|$

81. $x^2 - x\sin\theta + a = 0$

As, $D \ge 0$ for real roots.

$\Rightarrow \quad \sin^2\theta - 4a \ge 0 \Rightarrow 4a \le \sin^2\theta \le 1 \Rightarrow a \le \dfrac{1}{4}$

82. $\sin^2 x + a\sin x + 1 = 0$

Let $t = \sin x$, then we have

$\Rightarrow \quad t^2 + at + 1 = 0$

Clearly, $t = 0$ does not satisfy this equation.

Dividing throughout by t, we get $t + \dfrac{1}{t} = -a$

$\Rightarrow \quad |a| = \left|t + \dfrac{1}{t}\right| \ge 2 \Rightarrow |a| \ge 2$

Thus, for no real solution, $|a| < 2$.

83. $\sin\theta_1 - \sin\theta_2 = a, \cos\theta_1 + \cos\theta_2 = b$

$\Rightarrow \quad a^2 + b^2 = 2 + 2\cos(\theta_1 + \theta_2)$

$\Rightarrow \quad 0 \le a^2 + b^2 \le 4$

84. $x^2 - 2x + 4 = -3\cos(ax + b)$

$\Rightarrow \quad (x-1)^2 + 3 = -3\cos(ax + b)$

As, $\quad -1 \le \cos(ax + b) \le 1$

and $(x-1)^2 \ge 0$, the above is possible only, if

$\cos(ax + b) = -1$, when $x = 1$

So, $a + b = \pi, 3\pi, 5\pi$, etc., and $3\pi > 6$

85. $\tan^2 x + \sec x - a = 0$

$\Rightarrow \quad \sec^2 x + \sec x - 1 - a = 0$

$\Rightarrow \quad \left(\sec x + \dfrac{1}{2}\right)^2 = 1 + a + \dfrac{1}{4} = \dfrac{5}{4} + a$

Now, $\sec x \ge 1$ or ≤ -1

$\Rightarrow \quad \sec x + \dfrac{1}{2} \ge \dfrac{3}{2}$ or $\le -\dfrac{1}{2}$

$\Rightarrow \quad \left(\sec x + \dfrac{1}{2}\right)^2 \ge \dfrac{1}{4} \Rightarrow \dfrac{5}{4} + a \ge \dfrac{1}{4}$

$\Rightarrow a \ge -1, a \in [-1, \infty)$

86. Since, the value of $\sec^2\theta$ is always ≥ 1.

$\therefore \quad \dfrac{4xy}{(x+y)^2} \ge 1 \Rightarrow (x+y)^2 - 4xy \le 0$

$\Rightarrow \quad (x-y)^2 \le 0 \Rightarrow (x-y)^2 = 0$

As, $(x-y)^2$ can never be negative.

$\Rightarrow \quad x = y$

Here, the fraction $\dfrac{4xy}{(x+y)^2}$ is not defined for

$x + y = 0$

$\therefore \quad x + y \ne 0 \Rightarrow x + x \ne 0$

$\Rightarrow \quad 2x \ne 0$ or $x \ne 0$

Hence, $x = y, x \ne 0$

87. $\sin\theta = \dfrac{x^2 + y^2}{x^2 - y^2} \Rightarrow \left|\dfrac{x^2 + y^2}{x^2 - y^2}\right| \le 1$

$\Rightarrow \quad -1 \le \dfrac{x^2 + y^2}{x^2 - y^2} \le 1$

From $\dfrac{x^2 + y^2}{x^2 - y^2} \le 1$, we get $\dfrac{2y^2}{x^2 - y^2} \le 0$

$\Rightarrow \quad y^2 = 0$ or $x^2 - y^2 \le 0 \quad$ ...(i)

Also, $\quad -1 \le \dfrac{x^2 + y^2}{x^2 - y^2} \Rightarrow \dfrac{2x^2}{x^2 - y^2} \ge 0$

$\Rightarrow \quad x^2 = 0$ or $x^2 - y^2 > 0 \quad$ ...(ii)

From Eqs. (i) and (ii), we get $x^2 = 0$ and $y^2 = 0$

Thus, $x = 0$ or $y = 0$ is one only possibility.

88. Here, $\sin\theta = -\dfrac{1}{2}$ and $\tan\theta = \dfrac{1}{\sqrt{3}}$

As, $\quad a^2 + b^2 = 0 \Rightarrow a = b = 0$

$\sin\theta = -\dfrac{1}{2} \Rightarrow \theta = m\pi + (-1)^n\left(-\dfrac{\pi}{6}\right)$

and $\quad \tan\theta = \dfrac{1}{\sqrt{3}} \Rightarrow \theta = m\pi + \dfrac{\pi}{6}$

For common values, m must be odd.

i.e. $\quad m = 2n + 1 \Rightarrow \theta = 2n\pi + \dfrac{7\pi}{6}$

89. $\sec^2 x - \sec^{10} x = 0$

$\Rightarrow \quad \sec^2 x(1 - \sec^8 x) = 0$

$\Rightarrow \quad 1 - \sec^8 x = 0$ as $\sec^2 x \ge 1$

$\Rightarrow \quad \sec^8 x = 1 \Rightarrow \cos^8 x = 1 \Rightarrow \cos x = \pm 1$

$\Rightarrow \quad x = n\pi, n \in I$

$\Rightarrow \quad x = \{\pi, 2\pi, 3\pi\} \in (0, 10)$

So, the required number is 3.

90. $\tan x + \cot x = 2\operatorname{cosec} x \Rightarrow \dfrac{\sin x}{\cos x} + \dfrac{\cos x}{\sin x} = \dfrac{2}{\sin x}$

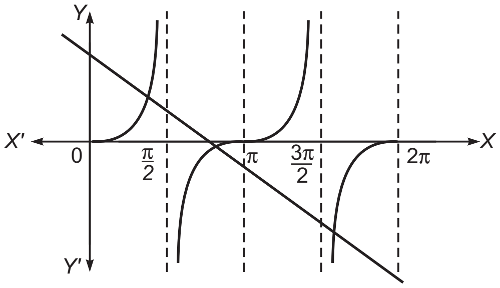
$\Rightarrow \quad \dfrac{1}{\sin x \cdot \cos x} = \dfrac{2}{\sin x}$

$\Rightarrow \quad \cos x = \dfrac{1}{2} \quad \Rightarrow \quad x = \pm\dfrac{\pi}{3}, \pm\dfrac{4\pi}{3}, \pm\dfrac{5\pi}{3}$

Thus, there are six solutions.

91. $3x + 2\tan x = \dfrac{5\pi}{2} \Rightarrow \tan x = \dfrac{5\pi}{4} - \dfrac{3x}{2}$

Graphs of $y = \dfrac{5\pi}{4} - \dfrac{3x}{2}$ and $y = \tan x$, meet exactly three times in $[0, 2\pi]$.



Thus, there are 3 solutions.

92. $x^2 + 4 - 2x + 3\sin(ax+b) = 0$

$(x-1)^2 + 3 + 3\sin(ax+b) = 0$

$\Rightarrow \quad x = 1 \quad \text{and} \quad \sin(ax+b) = -1$

$\Rightarrow \quad \sin(a+b) = -1 \quad \Rightarrow \quad a + b = \dfrac{3\pi}{2}$

93. $\cos^2\theta = \dfrac{1}{6}\sin\theta \cdot \tan\theta$ or $6\cos^3\theta + \cos^2\theta - 1 = 0$

As, $\cos\theta = \dfrac{1}{2}$ satisfies the equation (by trial)

$(2\cos\theta - 1)(3\cos^2\theta + 2\cos\theta + 1) = 0$

$\Rightarrow \quad \cos\theta = \dfrac{1}{2}$ [other values of $\cos\theta$ are imaginary]

So, $\quad \theta = 2n\pi \pm \dfrac{\pi}{3}, n \in I$

94. $1 = \cos 2x + \sin 2x$

$\Rightarrow \quad \sin\left(2x + \dfrac{\pi}{4}\right) = \dfrac{1}{\sqrt{2}}$

$\Rightarrow \quad 2x + \dfrac{\pi}{4} = n\pi + (-1)^n \dfrac{\pi}{4} \Rightarrow x = n\pi, n\pi + \dfrac{\pi}{4}$

95. Here, $\quad \tan\theta + \dfrac{-1 + \tan\theta}{1 + \tan\theta} = 2$

$\Rightarrow \tan\theta + \tan^2\theta - 1 + \tan\theta = 2 + 2\tan\theta$

$\Rightarrow \quad \tan^2\theta = 3 \quad \Rightarrow \quad \theta = n\pi \pm \dfrac{\pi}{3}, n \in I$

96. $1 - \cos x = (\sqrt{2} - 1)\sin x$

$\Rightarrow \quad \sin\dfrac{x}{2}\left\{\sin\dfrac{x}{2} - (\sqrt{2}-1)\cos\dfrac{x}{2}\right\} = 0$

$\therefore \quad \sin\dfrac{x}{2} = 0 \quad \text{or} \quad \tan\dfrac{x}{2} = \sqrt{2} - 1 = \tan\dfrac{45^\circ}{2}$

$\Rightarrow \quad \dfrac{x}{2} = n\pi \quad \text{or} \quad \dfrac{x}{2} = n\pi + \dfrac{\pi}{8}$

$\therefore \quad x = 2n\pi, 2n\pi + \dfrac{\pi}{4}$

97. $\tan x = n\tan y, \cos(x-y) = \cos x\cos y + \sin x\sin y$

$\Rightarrow \quad \cos(x-y) = \cos x\cos y(1 + \tan x \cdot \tan y)$

$= \cos x\cos y(1 + n\tan^2 y)$

$\Rightarrow \sec^2(x-y) = \dfrac{\sec^2 x\sec^2 y}{(1+n\tan^2 y)^2} = \dfrac{(1+\tan^2 x)(1+\tan^2 y)}{(1+n\tan^2 y)^2}$

$= \dfrac{(1+n^2\tan^2 y)(1+\tan^2 y)}{(1+n\tan^2 y)^2}$

$= 1 + \dfrac{(n-1)^2\tan^2 y}{(1+n\tan^2 y)^2}$

Now, $\quad \left(\dfrac{1+n\tan^2 y}{2}\right)^2 \geq n\tan^2 y \qquad [\because \text{AM} \geq \text{GM}]$

$\Rightarrow \quad \dfrac{\tan^2 y}{(1+n\tan^2 y)^2} \leq \dfrac{1}{4n}$

$\Rightarrow \quad \sec^2(x-y) \leq 1 + \dfrac{(n-1)^2}{4n} = \dfrac{(n+1)^2}{4n}$

98. $\cos^2 x = 2\cos x \cdot (1 - 3\cos^2 x)$

$\Rightarrow \cos x\,\{6\cos^2 x + \cos x - 2\} = 0$

$\therefore \cos x = 0, \dfrac{1}{2}, -\dfrac{2}{3}$

The two smallest positive values of x are $\dfrac{\pi}{3}$ and $\dfrac{\pi}{2}$.

$\Rightarrow \quad |\alpha - \beta| = \dfrac{\pi}{6}$

99. $\dfrac{\sin x + i\cos x}{1+i} = \dfrac{(1-i)(\sin x + i\cos x)}{(1+i)(1-i)}$

$= \dfrac{\sin x + \cos x + i(\cos x - \sin x)}{2}$

which is purely imaginary.

$\Rightarrow \sin x + \cos x = 0 \quad \Rightarrow \quad \tan x = -1$

$\therefore \quad x = n\pi - \dfrac{\pi}{4}$

100. Since, $1 + \sin x\sin^2\dfrac{x}{2} = 0$

$\therefore \quad 1 + \sin x\left(\dfrac{1-\cos x}{2}\right) = 0$

$\Rightarrow \quad 2 + \sin x - \sin x\cos x = 0$

$\Rightarrow \quad \sin 2x - 2\sin x = 4$

which is not possible for any x in $[-\pi, \pi]$.

101. Clearly, $1 + \sin x \geq 0$

So, the equation is

$\cos x - \sin x = 1 \Rightarrow \cos\left(x + \dfrac{\pi}{4}\right) = \dfrac{1}{\sqrt{2}}$

$\Rightarrow x + \dfrac{\pi}{4} = \dfrac{\pi}{4}, \dfrac{7\pi}{4}, \dfrac{9\pi}{4}, \dfrac{15\pi}{4} \Rightarrow x = 0, \dfrac{3\pi}{2}, 2\pi, \dfrac{7\pi}{2}, \ldots$

As $\quad 0 \leq x \leq 3\pi \quad \Rightarrow \quad x = 0, \dfrac{3\pi}{2}, 2\pi$

Thus, there are 3 solutions.

102. $2^{\frac{1}{1-|\cos x|}} = 2^2 \Rightarrow \dfrac{1}{1 - |\cos x|} = 2 \Rightarrow |\cos x| = \dfrac{1}{2}$

$\Rightarrow \quad \cos x = \pm\dfrac{1}{2}$

$\therefore \quad x = 2n\pi \pm \dfrac{\pi}{3}, 2n\pi \pm \left(\pi - \dfrac{\pi}{3}\right)$

$= 2n\pi \pm \dfrac{\pi}{3}, (2n \pm 1)\pi \mp \dfrac{\pi}{3} = n\pi \pm \dfrac{\pi}{3}$

103. As, $x \neq \frac{n\pi}{2}$, we get $\cos x \neq 0, 1, -1$

So, $\sin^2 x - 3\sin x + 2 = 0$

$\Rightarrow \quad \sin x = 1, 2$

which is not possible as $x \neq \frac{n\pi}{2}$.

$\therefore$ No solution.

104. Max $\cos\theta = 1$. So, $\cos x \cdot \sin y = 1$

$\Rightarrow \quad \cos x = 1, \sin y = 1$

or $\quad \cos x = -1, \sin y = -1$

$\cos x = 1, \sin y = 1$

$\Rightarrow \quad x = 0, 2\pi$

and $\quad y = \frac{\pi}{2}, \frac{5\pi}{2}$ [from the equation]

$\cos x = -1, \sin y = -1 \Rightarrow x = \pi, 3\pi$

and $\quad y = \frac{3\pi}{2}$ [from the equation]

$\therefore$ Required number of ordered pair

$= 2 \times 2 + 2 \times 1 = 6$

105. $\sin x \cdot \cos y = 1 \Rightarrow \sin x = 1, \cos y = 1$

or $\quad \sin x = -1, \cos y = -1$

If $\sin x = 1$, then $\cos y = 1$

$\Rightarrow \quad x = \frac{\pi}{2}, y = 0, 2\pi$

If $\sin x = -1$, then $\cos y = -1$

$\Rightarrow \quad x = \frac{3\pi}{2}, y = \pi$

Thus, possible ordered pairs are

$$\left(\frac{\pi}{2}, 0\right), \left(\frac{\pi}{2}, 2\pi\right), \left(\frac{3\pi}{2}, \pi\right).$$

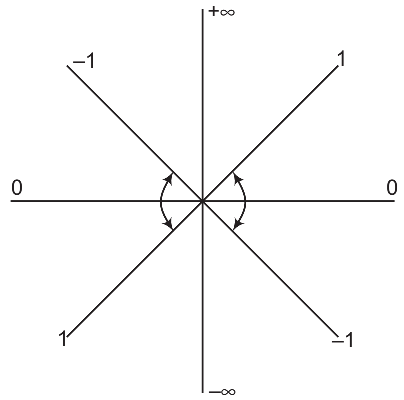
106. $\sin 2x + \cos 4x = 2$

$\Rightarrow \quad \sin 2x = 1, \cos 4x = 1$

$\therefore \quad 1 - 2\sin^2 2x = 1$ or $1 - 2 = 1$ [absurd]

Thus, no solution.

107. $-1 \leq \tan\theta \leq 1$ is shown below:



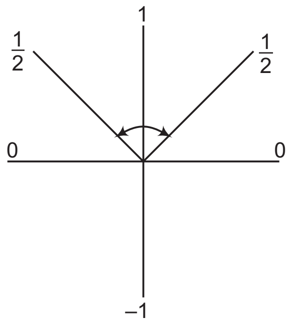
From the figure, $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$

or $\quad -\pi \leq x \leq -\frac{3\pi}{4}$

or $\quad \frac{3\pi}{4} \leq x \leq \pi$

$\therefore \quad x \in \left[-\pi, -\frac{3\pi}{4}\right] \cup \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$

108. Here, $(2\sin x - 1)(2\sin x - 3) \leq 0$. But $2\sin x - 3$ is always negative.



$\therefore \quad 2\sin x - 1 \geq 0$ i.e. $\sin x \geq \frac{1}{2}$

From the figure, $\frac{\pi}{6} \leq x \leq \frac{5\pi}{6}$

109. $\sin x \cdot \cos x (\cos^2 x - \sin^2 x) > 0$

$\Rightarrow \quad \frac{1}{2}\sin 2x \cdot \cos 2x > 0$

$\Rightarrow \quad \sin 4x > 0$

$\therefore \quad 0 < 4x < \pi$

$\Rightarrow \quad 0 < x < \frac{\pi}{4}$

110. $\cos^2 x = 2\cos x (3\sin^2 x - 2)$

$\Rightarrow \quad \cos x[\cos x - 2\{3(1 - \cos^2 x) - 2\}] = 0$

$\Rightarrow \quad \cos x(6\cos^2 x - 2 + \cos x)$

$\Rightarrow \quad \cos x = 0$, which is not possible.

or $\quad 6\cos^2 x + \cos x - 2 = 0$

$\Rightarrow \quad \cos x = \frac{1}{2}, -\frac{2}{3}$

$\Rightarrow \quad x = \frac{\pi}{3}, \frac{5\pi}{3}$

or $\quad x = \pi - \cos^{-1}\left(\frac{2}{3}\right), \pi + \cos^{-1}\left(\frac{2}{3}\right)$

$\Rightarrow \quad |x_1 - x_3| = \frac{4\pi}{3}$ or $|x_1 - x_2| = 2\cos^{-1}\left(\frac{2}{3}\right)$

$\Rightarrow \quad |x_1 - x_2|_{min} = 2\cos^{-1}\left(\frac{2}{3}\right)$

111. $3\sin x + 4\cos ax = 7$

$\Rightarrow \quad \sin x = 1, \cos ax = 1$

$\Rightarrow \quad x = (4n_1 + 1)\frac{\pi}{2}, ax = 2n_2\pi$

$\Rightarrow \quad (4n_1 + 1)\frac{\pi}{2} = \frac{2n_2\pi}{a}$

$\Rightarrow \quad a = \frac{4n_2}{4n_1 + 1} = \text{Rational}$

112. $a_1 + a_2(2\cos^2 x - 1) + a_3(1 - \cos^2 x) = 1$

or $(2a_2 - a_3)\cos^2 x + (a_1 - a_2 + a_3 - 1) = 0$

This can hold for all x, if $\quad 2a_2 - a_3 = 0$

and $\quad a_1 - a_2 + a_3 - 1 = 0$

As there are two equations in three unknowns, so the number of solutions is infinite.

113. Here, $\sin\theta = 1 \pm \sqrt{2}$; but $|\sin\theta| \leq 1$. So, $\sin x = 1 - \sqrt{2}$, which gives two values of θ in each of $[0, 2\pi]$, $(2\pi, 4\pi]$, $(4\pi, 6\pi]$, etc.

Thus, the least value of n is 4.

114. Here, $(2\sec x+1)(\sec x-3)=0$; but $|\sec x|\geq 1$. So, $\sec x=3$, which gives two values of θ in each of $[0,2\pi]$, $(2\pi,4\pi]$, $(4\pi,6\pi]$ and one value in $\left(6\pi,6\pi+\dfrac{3\pi}{2}\right]$.

Thus, $n=15$

115. Here, $1=\sin\alpha\cdot\cos 2\alpha$

$\Rightarrow \quad \sec 2\alpha=\sin\alpha$

which is only possible, if both are 1 or -1.

$\Rightarrow \quad \alpha=n\pi+(-1)^{n-1}\dfrac{\pi}{2}$

116. $5\sin\theta+3(\sin\theta\cdot\cos\alpha-\cos\theta\cdot\sin\alpha)$

$=(5+3\cos\alpha)\sin\theta-3\sin\alpha\cdot\cos\theta$

$\therefore \quad \theta\in R \min\{5\sin\theta+3\sin(\theta-\alpha)\}$

$=\sqrt{(5+3\cos\alpha)^2+9\sin^2\alpha}$

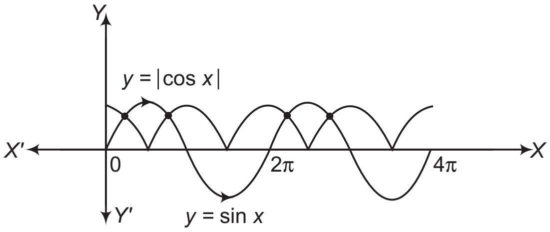
$=\sqrt{34+30\cos\alpha}$

$\therefore$ The given equation is $34+30\cos\alpha=49$

$\Rightarrow \quad \cos\alpha=\dfrac{1}{2}$

$\Rightarrow \quad \alpha=2n\pi\pm\dfrac{\pi}{3}$

117.



Clearly, from the graph, there are four solutions.

118. We have,

$\cos^4 x-(a+2)\cos^2 x-(a+3)=0$

$\Rightarrow \quad \cos^2 x=\dfrac{(a+2)\pm\sqrt{(a+2)^2+4(a+3)}}{2}$

$\Rightarrow \quad \cos^2 x=\dfrac{(a+2)\pm(a+4)}{2}$ $[\because \cos^2 x\neq -1]$

$\Rightarrow \quad \cos^2 x=a+3$

We know, $\quad 0\leq\cos^2 x\leq 1$

$\Rightarrow \quad 0\leq a+3\leq 1$

$\Rightarrow \quad -3\leq a\leq -2$

or $\quad a\in[-3,-2]$

119. $\sin\pi(x^2+x)=\sin\pi x^2$

$\Rightarrow \quad \pi(x^2+x)=n\pi+(-1)^n\pi x^2$

$\therefore \quad x^2+x=2m+x^2$, where $n=2m$

$\Rightarrow \quad x=2m\in Z$

or $\quad x^2+x=p'-x^2$

where, p' is an odd integer.

$\Rightarrow \quad x^2+x=p'-x^2$

For non-integral solution,

$x=\dfrac{-1\pm\sqrt{1+8p'}}{4}=\dfrac{-1+\sqrt{1+8p'}}{4}$

[taking the positive value]

$=\dfrac{\sqrt{p}-1}{4}$, where $p=(8p'+1)$ [an odd integer]

120. $2\sin\theta=(r^2-1)^2+2\geq 2$. But $\max\sin\theta=1$

$\therefore$ The equation implies $\sin\theta=1$, $r^2=1$

$\sin\theta=1 \Rightarrow \theta=\dfrac{\pi}{2},\dfrac{5\pi}{2},\dfrac{9\pi}{2}$ [from the equation]

$r^2=1 \Rightarrow r=1,-1$

$\therefore$ Number of values of pair $(r,\theta)=2\times 3=6$

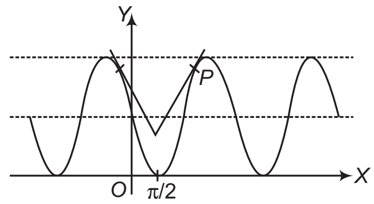
121. $[\sin x]=\cos x \Rightarrow \cos x=-1,0,1$

$x=-\pi,\dfrac{\pi}{2},2\pi \Rightarrow [\sin x]=0,1,0$

Thus, $[\sin x]=\cos x$ has no solution.

122. Slope of $y=1-\sin x$ is $-\cos x$.

Slope of $y=\dfrac{\sqrt{3}}{2}\left|x-\dfrac{\pi}{2}\right|+a$ for $x>\dfrac{\pi}{2}$ is $\dfrac{\sqrt{3}}{2}$.



$\Rightarrow \quad \cos x=-\dfrac{\sqrt{3}}{2} \Rightarrow x=\dfrac{7\pi}{6} \Rightarrow P\equiv\left(\dfrac{7\pi}{6},\dfrac{3}{2}\right)$

If $y=\dfrac{\sqrt{3}}{2}\left|x-\dfrac{\pi}{2}\right|+a$ passes through P, then

$a=\dfrac{3}{2}-\dfrac{\pi}{\sqrt{3}} \Rightarrow a>\dfrac{3}{2}-\dfrac{\pi}{\sqrt{3}}$

123. $\sin^2(\theta-\alpha)\cos\alpha=\cos^2(\theta-\alpha)\sin\alpha=m\sin\alpha\cos\alpha$

$\Rightarrow \quad \dfrac{\sin^2(\theta-\alpha)}{\sin\alpha}=\dfrac{\cos^2(\theta-\alpha)}{\cos\alpha}=m$

$=\dfrac{\sin^2(\theta-\alpha)+\cos^2(\theta-\alpha)}{\sin\alpha+\cos\alpha}=\dfrac{1}{\sin\alpha+\cos\alpha}$

$\Rightarrow \quad \sin\alpha+\cos\alpha=\dfrac{1}{m} \Rightarrow \sin\left(\alpha+\dfrac{\pi}{4}\right)=\dfrac{1}{\sqrt{2}m}$

$\Rightarrow \quad \left|\dfrac{1}{\sqrt{2}m}\right|\leq 1 \Rightarrow |m|\geq\dfrac{1}{\sqrt{2}}$

124. $\cos x-\dfrac{\cot\beta\sin x}{2}=\dfrac{\sqrt{3}}{2}$

$\Rightarrow \quad \dfrac{1-\tan^2\frac{x}{2}}{1+\tan^2\frac{x}{2}}-\dfrac{\cot\beta\tan\frac{x}{2}}{1+\tan^2\frac{x}{2}}=\dfrac{\sqrt{3}}{2}$

$\Rightarrow \quad 1-\tan^2\dfrac{x}{2}-\cot\beta\tan\dfrac{x}{2}=\dfrac{\sqrt{3}}{2}\left(1+\tan^2\dfrac{x}{2}\right)$

$\Rightarrow \quad (2+\sqrt{3})\tan^2\dfrac{x}{2}+2\cot\beta\tan\dfrac{x}{2}+(\sqrt{3}-2)=0$

$\Rightarrow \quad \tan\dfrac{x}{2}=\dfrac{-2\cot\beta\pm\sqrt{4\cot^2\beta+4}}{2(2+\sqrt{3})}$

$\Rightarrow \quad \tan\dfrac{x}{2}=\dfrac{-2\cot\beta\pm 2\operatorname{cosec}\beta}{2(2+\sqrt{3})}$

$\Rightarrow \quad \tan\dfrac{x}{2}=\dfrac{-\cot\beta+\operatorname{cosec}\beta}{(2+\sqrt{3})}$

or $\quad \tan\dfrac{x}{2}=\dfrac{-\cot\beta-\operatorname{cosec}\beta}{(2+\sqrt{3})}$

$\Rightarrow \quad \tan\dfrac{x}{2}=\tan\dfrac{\beta}{2}\tan 15^\circ$

125. $n\sin^2\theta + 2n\cos(\theta+\alpha)\sin\alpha\sin\theta + \cos 2(\alpha+\theta)$

$= n\sin^2\theta + n\cos(\theta+\alpha)\{\cos(\theta-\alpha) - \cos(\theta+\alpha)\} + 2\cos^2(\theta+\alpha) - 1$

$= n\sin^2\theta + n(\cos^2\theta - \sin^2\alpha) - n\cos^2(\theta+\alpha) + 2\cos^2(\alpha+\theta) - 1$

$= n\sin^2\theta + n\cos^2\theta - n\sin^2\alpha + (2-n)\cos^2(\theta+\alpha) - 1$

$= (n-1) - n\sin^2\alpha + (2-n)\cos^2(\theta+\alpha) \Rightarrow n = 2$

126. Given that, $y = \dfrac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$

$\Rightarrow (y-1)\cos^2\theta + y\cos\theta + 1 = 0$

$\Rightarrow \cos\theta = -1$

and $\cos\theta = \dfrac{1}{1-y}$

$\Rightarrow -1 < \dfrac{1}{1-y} < 1$

$\Rightarrow y < 0$ and $y > 2$

127. $[\sin x] = [1 + \sin x] + [1 - \cos x]$

$\Rightarrow 0 = 2 + [-\cos x]$

$\Rightarrow [-\cos x] = -2$

Since, $-1 \le \cos x \le 1$

$\Rightarrow -1 \le -\cos x \le 1$

$\Rightarrow [-\cos x] \ne -2$

Hecne, $[-\cos x] = -2$ has no real solution.

128. We have, $\sin^{50} x - \cos^{50} x = 1$

$\Rightarrow \sin^{50} x = 1 + \cos^{50} x$

Since, $\sin^{50} x \le 1$ and $\cos^{50} x \ge 1$, therefore the two sides are equal only, if

$\sin^{50} x = 1 = 1 + \cos^{50} x$ i.e. $\sin^{50} x = 1$

and $\cos^{50} x = 0$

$\therefore x = n\pi + \dfrac{\pi}{2}, n \in I$

129. Given equation is $\sec^2(a+2)x + a^2 - 1 = 0$

$\Rightarrow \tan^2(a+2)x + a^2 = 0$

$\Rightarrow \tan^2(a+2)x = 0$

and $a = 0$

$\Rightarrow \tan^2 2x = 0$

$\Rightarrow x = 0, \dfrac{\pi}{2}, -\dfrac{\pi}{2}$

Hence, $(0, 0), \left(0, \dfrac{\pi}{2}\right)\left(0, -\dfrac{\pi}{2}\right)$ are ordered pair satisfying the equation.

130. $1 + \sec\theta = \dfrac{1+\cos\theta}{\cos\theta} = \dfrac{2\cos^2\frac{\theta}{2}}{\cos\theta}$

Similarly, for others

$$f_n(\theta) = \tan\frac{\theta}{2}\cdot\frac{2\cos^2\frac{\theta}{2}}{\cos\theta}\cdot\frac{2\cos^2\theta}{\cos 2\theta}\ldots\frac{2\cos^2 2^{n-1}\theta}{\cos 2^n\theta}$$

$$= \tan\frac{\theta}{2}2^{n+1}\cdot(\cos\theta\cos 2\theta\ldots\cos 2^{n-1}\theta)\frac{\cos^2\frac{\theta}{2}}{\cos 2^n\theta}$$

$$= \frac{\sin\theta}{\cos 2^n\theta}\cdot 2^n\left\{\frac{2\sin\theta\cdot\cos\theta\ldots\cos 2^{n-1}\theta}{2\sin\theta}\right\} = \ldots$$

$$= \frac{\sin\theta}{\cos 2^n\theta}\cdot 2^n\cdot\frac{\sin 2^n\theta}{2^n\sin\theta} = \tan 2^n\theta$$

$\therefore f_2\left(\dfrac{\pi}{16}\right) = \tan\left(4\cdot\dfrac{\pi}{16}\right) = 1, f_3\left(\dfrac{\pi}{32}\right) = \tan\left(8\cdot\dfrac{\pi}{32}\right) = 1$

and so on.

131. $x^2 + y^2 = X^2 + Y^2$, $xy = (X^2 - Y^2)\sin\theta\cdot\cos\theta - XY(\cos^2\theta - \sin^2\theta)$

$x^2 + 4xy + y^2 = X^2 + Y^2 + 2(X^2 - Y^2)\sin 2\theta - 4XY\cos 2\theta$

$= (1 + 2\sin 2\theta)X^2 + (1 - 2\sin 2\theta)Y^2 - 4\cos 2\theta\cdot XY$

According to the question,

$a = 1 + 2\sin 2\theta, b = 1 - 2\sin 2\theta, \cos 2\theta = 0$

$\cos 2\theta = 0 \Rightarrow \theta = \dfrac{\pi}{4}$

Then, $a = 1 + 2\sin\dfrac{\pi}{2}, b = 1 - 2\sin\dfrac{\pi}{2}$

$\Rightarrow a = 3, b = -1$

132. $\dfrac{\alpha^2}{1-\tan^2 x} = \dfrac{(\sin^2 x + \alpha^2 - 2)(1 + \tan^2 x)}{1 - \tan^2 x}$

$\Rightarrow \alpha^2\cos^2 x = \sin^2 x + \alpha^2 - 2 \Rightarrow 2 = \sin^2 x(1 + \alpha^2)$

$\Rightarrow \sin^2 x = \dfrac{2}{1+\alpha^2} \Rightarrow 0 \le \dfrac{2}{1+\alpha^2} \le 1$

$\Rightarrow \alpha^2 \ge 1 \Rightarrow \alpha \le -1$ or $\alpha \ge 1$

133. $\cos^3 x\sin 2x = \dfrac{\cos 3x + 3\cos x}{4}\cdot\sin 2x$

$= \dfrac{1}{8}(\sin 5x - \sin x) + \dfrac{3}{8}(\sin 3x + \sin x)$

$= \dfrac{1}{4}\sin x + \dfrac{3}{8}\sin 3x + \dfrac{1}{8}\sin 5x$

$\therefore n = 5, a_1 = \dfrac{1}{4}, a_2 = 0, a_3 = \dfrac{3}{8}, a_4 = 0, a_5 = \dfrac{1}{8}$

134. $\sin(x-y) = 1/2 \Rightarrow x - y = 30°$ or $150°$ ...(i)

and $\cos(x+y) = 1/2 \Rightarrow x + y = 60°$ or $300°$ ...(ii)

Since, x and y lie between 0° and 180°, Eqs. (i) and (ii) are simultaneously true when $x = 45°$, $y = 15°$ or $x = 165°$, $y = 135°$. But for the values given by (b) or (c), Eqs. (i) and (ii) do not hold simultaneously.

135. The given relation can be written as

$\tan\dfrac{x}{2} = \dfrac{1}{\sin x} - \sin x$

$$\Rightarrow \tan\frac{x}{2} = \frac{1 + \tan^2\frac{x}{2}}{2\tan\frac{x}{2}} - \frac{2\tan\frac{x}{2}}{1 + \tan^2\frac{x}{2}}$$

$$\Rightarrow 2\tan^2\frac{x}{2}\left(1 + \tan^2\frac{x}{2}\right) = 1\left(1 + \tan^2\frac{x}{2}\right)^2 - 4\tan^2\frac{x}{2}$$

$\Rightarrow 2y(1+y) = (1+y)^2 - 4y$ $\left[\text{where, } y = \tan^2\dfrac{x}{2}\right]$

$\Rightarrow y^2 + 4y - 1 = 0$

$\Rightarrow y = \dfrac{-4 \pm \sqrt{16+4}}{2} = -2 \pm \sqrt{5}$

Since, $y > 0$, we get

$$y = \sqrt{5} - 2 = \frac{(\sqrt{5}-2)^2}{\sqrt{5}-2}\cdot\frac{2+\sqrt{5}}{2+\sqrt{5}} = (9 - 4\sqrt{5})(2 + \sqrt{5})$$

136. $y=\dfrac{\sqrt{(\cos 2A-\sin 2A)^2}+1}{\sqrt{(\cos 2A+\sin 2A)^2}-1}$

$\Rightarrow \quad y=\dfrac{\pm(\cos 2A-\sin 2A)+1}{\pm(\cos 2A+\sin 2A)-1}$

which gives us four values of y, say y_1, y_2, y_3 and y_4.

We have,

$$y_1=\frac{\cos 2A-\sin 2A+1}{\cos 2A+\sin 2A-1}=\frac{(1+\cos 2A)-\sin 2A}{(\cos 2A-1)+\sin 2A}$$
$$=\frac{2\cos^2 A-2\sin A\cos A}{-2\sin^2 A+2\sin A\cos A}=\frac{\cos A(\cos A-\sin A)}{\sin A(\cos A-\sin A)}=\cot A$$

$$y_2=\frac{-(\cos 2A-\sin 2A)+1}{-(\cos 2A+\sin 2A)-1}=\frac{(1-\cos 2A)+\sin 2A}{-(1+\cos 2A)-\sin 2A}$$
$$=\frac{2\sin^2 A+2\sin A\cos A}{-2\cos^2 A-2\sin A\cos A}=-\tan A$$

$$y_3=\frac{(\cos 2A-\sin 2A)+1}{-(\cos 2A+\sin 2A)-1}=\frac{(1+\cos 2A)-\sin 2A}{-(1+\cos 2A)-\sin 2A}$$
$$=\frac{2\cos^2 A-2\sin A\cos A}{-2\cos^2 A-2\sin A\cos A}=-\frac{\cos A-\sin A}{\cos A+\sin A}$$
$$=-\frac{1-\tan A}{1+\tan A}=-\tan\left(\frac{\pi}{4}-A\right)=-\cot\left(\frac{\pi}{4}+A\right)$$

$$y_4=\frac{-(\cos 2A-\sin 2A)+1}{(\cos 2A+\sin 2A)-1}=\frac{(1-\cos 2A)+\sin 2A}{-(1-\cos 2A)+\sin 2A}$$
$$=\frac{2\sin^2 A-2\sin A\cos A}{-2\sin^2 A+2\sin A\cos A}=\frac{\cos A+\sin A}{\cos A-\sin A}$$
$$=\frac{1+\tan A}{1-\tan A}=\tan\left(\frac{\pi}{4}+A\right)$$

137. $x=\sqrt{a^2\cos^2\alpha+b^2\sin^2\alpha}+\sqrt{a^2\sin^2\alpha+b^2\cos^2\alpha}$

$$\Rightarrow \quad x^2=a^2+b^2+2\sqrt{(a^2\cos^2\alpha+b^2\sin^2\alpha)(a^2\sin^2\alpha+b^2\cos^2\alpha)}$$
$$=a^2+b^2+k$$

where, $k^2=\sqrt{[(a^2+b^2)-(a^2\sin^2\alpha+b^2\cos^2\alpha)]\times(a^2\sin^2\alpha+b^2\cos^2\alpha)}$

$\therefore \quad x=a^2+b^2+2\sqrt{(a^2+b^2)p-p^2}$

where, $p=a^2\sin^2\alpha+b^2\cos^2\alpha$

$$\Rightarrow \quad p=\frac{a^2}{2}(1-\cos 2\alpha)+\frac{b^2}{2}(1+\cos 2\alpha)$$
$$=\frac{1}{2}[a^2+b^2-(a^2-b^2)\cos 2\alpha]$$

Also, $x^2=a^2+b^2+2\sqrt{(a^2\cos^2\alpha+b^2\sin^2\alpha)[(a^2+b^2)-(a^2\cos^2\alpha+b^2\sin^2\alpha)]}$

$$=a^2+b^2+2\sqrt{(a^2+b^2)p-p^2}$$

where, $p=a^2\cos^2\alpha+b^2\sin^2\alpha$

$\Rightarrow \quad p=\dfrac{1}{2}[a^2+b^2+(a^2-b^2)\cos 2\alpha]$

138. We have, $\tan\alpha+\tan\beta=-p$ and $\tan\alpha\tan\beta=q$, so that

$$\tan(\alpha+\beta)=\frac{-p}{1-q}=\frac{p}{q-1}$$

$$\Rightarrow \quad \cos^2(\alpha+\beta)=\frac{1}{1+\dfrac{p^2}{(q-1)^2}}=\frac{(q-1)^2}{(q-1)^2+p^2}\neq(q-1)^2$$

Similarly, $\sin^2(\alpha+\beta)\neq p$. Thus, option (b) is correct while options (c) and (d) are not.

Finally, the LHS of option (a) can be written as

$$\cos^2(\alpha+\beta)\,[\tan^2(\alpha+\beta)+p\tan(\alpha+\beta)+q]$$
$$=\frac{(q-1)^2}{p^2+(q-1)^2}\left[\frac{p^2}{(q-1)^2}+p\left(\frac{p}{q-1}\right)\right]=q$$

So, option (a) is also true.

139. $y=\cos^4 x-\cos^2 x+1=\left(\cos^2 x-\dfrac{1}{2}\right)^2+\dfrac{3}{4}$

$\therefore \quad y_{\min}=\dfrac{3}{4}$ and y is maximum when $\left(\cos^2 x-\dfrac{1}{2}\right)^2$ is the maximum.

$\therefore \quad y_{\max}=\dfrac{1}{4}+\dfrac{3}{4}=1$

140. $k_1-k_2=\sin x\cos x(\cos^2 x-\sin^2 x)$

$$=\frac{1}{2}\sin 2x\cos 2x=\frac{1}{4}\sin 4x$$

$\Rightarrow \quad k_1-k_2>0,\ 0<4x<\pi$

$\Rightarrow \quad 0<x<\dfrac{\pi}{4}$

$\Rightarrow \quad k_1+k_2=\dfrac{\sin 2x}{2}$

$\Rightarrow \quad k_1+k_2>0$

$\Rightarrow \quad 0<2x<\pi$

$\Rightarrow \quad 0<x<\dfrac{\pi}{2}$

141. Here, $\cos\left(\dfrac{\alpha}{2}-\dfrac{\pi}{4}\right)=\dfrac{\sqrt{5}+1}{4}-\dfrac{\sqrt{5}-1}{4}=\dfrac{1}{2}$

$\Rightarrow \quad \dfrac{\pi}{2}-\dfrac{\pi}{4}=2n\pi\pm\dfrac{\pi}{3}$

$\therefore \alpha=4n\pi+\dfrac{\pi}{2}\pm\dfrac{2\pi}{3}=4n\pi+\dfrac{7\pi}{6},\ 4n\pi-\dfrac{\pi}{6}$

For $n=0$, $\alpha=\dfrac{7\pi}{6},-\dfrac{\pi}{6}$

142. Here, $\cos x=|\cos x-\sin x|$

In $\left[0,\dfrac{\pi}{4}\right]$, $\cos x\geq\sin x$ and in $\left(\dfrac{\pi}{4},\pi\right)$, $\cos x<\sin x$

$\therefore \quad \cos x=\cos x-\sin x,\ 0\leq x\leq\dfrac{\pi}{4}$ ... (i) and $\cos x = \sin x - \cos x, \frac{\pi}{4} < x \le \pi$ ...(ii)

From Eq. (i), we get $\sin x = 0$

$\therefore$ $x = 0$

From Eq. (ii), we get $2\cos x = \sin x$

$\therefore$ $\tan x = 2$

$\therefore$ $x = \tan^{-1} 2$

143. $\sin\theta + \sqrt{3}\cos\theta = -2 - (x^2 - 6x + 9) = -2 - (x-3)^2$

$\therefore$ $\sin x + \sqrt{3}\cos\theta \le -2$

But the minimum value of $\sin x + \sqrt{3}\cos\theta$

So, we have $\sin\theta + \sqrt{3}\cos\theta = -2$ and then $x = 3$

$\therefore$ $x = 3$ and $\cos\left(\theta - \frac{\pi}{6}\right) = -1$

i.e. $\theta - \frac{\pi}{6} = \pi, 3\pi$

144. $|\cos x| \ge |0|$. So, $|\cos x| \le \sin x \Rightarrow \sin x \ge 0$

So, there is no x in $(\pi, 2\pi)$.

Now, if $x = 2\pi$, $|\cos 2\pi| k, \sin 2\pi$, which is not true.

So, $0 \le x \le \pi$

If $0 \le x \le \frac{\pi}{2}$, then $|\cos x| \le \sin x$

$\cos x \le \sin x \Rightarrow \tan x \ge 1$

$\therefore$ $\frac{x}{4} \le x \le \frac{\pi}{2}$

If $\frac{x}{2} < x \le \pi$, then $|\cos x| \le \sin x$

$-\cos x \le \pi \Rightarrow \tan x \le -1$ $[\because \cos x < 0]$

$\therefore$ $\frac{x}{2} < x \le \frac{3\pi}{4}$

$\therefore$ $x \in \left[\frac{\pi}{4}, \frac{\pi}{2}\right] \cup \left[\frac{\pi}{2}, \frac{3\pi}{4}\right]$

145. In any triangle,

$$\tan A = -\tan(B + C)$$
$$= \frac{-\tan B - \tan C}{1 - \tan B\tan C} = \frac{\tan B + \tan C}{\tan B\tan C - 1}$$

Statement II is true.

Since, $\tan A < 0$ as $\angle A$ is obtuse.

So, $\tan B\tan C - 1$ must be negative.

$\Rightarrow$ $\tan B, \tan C > 0$

$\therefore$ Statement I is false.

146. The RHS of the expression given in Statement I

$$= \sqrt{\left(\cos\frac{\theta}{2} + \sin\frac{\theta}{2}\right)^2} + \sqrt{\left(\cos\frac{\theta}{2} - \sin\frac{\pi}{2}\right)^2}$$

$$= \left|\cos\frac{\theta}{2} + \sin\frac{\theta}{2}\right| + \left|\cos\frac{\theta}{2} - \sin\frac{\theta}{2}\right| \quad \text{...(i)}$$

$$= \left|\sqrt{2}\sin\left(\frac{\theta}{2} + \frac{\pi}{4}\right)\right| + \left|\sqrt{2}\cos\left(\frac{\theta}{2} + \frac{\pi}{4}\right)\right|$$

From Eq. (i), it is clear that this expression will simplify to $2\sin\frac{\theta}{2}$, if

$$\cos\frac{\theta}{2} + \sin\frac{\theta}{2} > 0 \quad \text{and} \quad \cos\frac{\theta}{2} - \sin\frac{\theta}{2} < 0$$

$[\because |x| = x, \text{if } x > 0, |x| = -x, \text{if } x < 0]$

This will lead to

$$\sin\left(\frac{\theta}{2} + \frac{\pi}{4}\right) > 0, \cos\left(\frac{\theta}{2} + \frac{\pi}{4}\right) < 0$$

$\Rightarrow$ $2n\pi + \frac{\pi}{2} < \frac{\theta}{2} + \frac{\pi}{4} < 2n\pi + \pi$

$\Rightarrow$ $2n\pi + \frac{\pi}{4} < \frac{\theta}{2} < 2n\pi + \frac{3\pi}{4}$

Thus, Statement I is true but does not follow from Statement II.

147. Observe the following steps:

$x = 18°, y = -54°$

$\Rightarrow$ $5x = 90°, 5y = -270°$

$\Rightarrow$ $3x = 90° - 2x, 3y = -270° - 2y$

$\Rightarrow$ $\cos 3x = \sin 2x, \cos 3y = \sin 2y$

$\Rightarrow$ $4\cos^3 x - 3\cos x = 2\sin x\cos x$

$4\cos^3 y - 3\cos y = 2\sin y\cos y$

$\Rightarrow$ $4\cos^2 x - 3 = 2\sin x, 4\cos^2 y - 3 = 2\sin y$

$\Rightarrow 4\sin^2 x + 2\sin x - 1 = 0, 4\sin^2 y + 2\sin y - 1 = 0$

$\Rightarrow$ $\sin x$ (i.e. $\sin 18°$) and $\sin y$ ($-\sin 54°$) are roots of the same quadratic equation.

148. The Statement I is true but does not follow from Statement II.

Indeed $\cos 36° > \tan 36°$, if $\cos^2 36° > \sin 36°$ ...(i)

At this stage, we may think when $\cos 36°$ is greater than $\sin 36°$, $\cos^2 36°$ should also be greater than $\sin 36°$ but this is not true, since $\cos^2 36° < \cos 36°$.

Eq. (i) is proved as follows:

$1 + \cos 72° > 2\sin 36°$

$\Rightarrow$ $1 + \sin 18° \ge 2\sin(30° + 6°)$

$\Rightarrow$ $1 + \sin 18° \ge 2(\sin 30°\cos 6° + \cos 30°\sin 6°)$

$1 + 2\sin 9°\cos 9° \ge \cos 6° + 2\cos 30°\sin 6°$

The last inequality is true in the light of the facts

$1 > \cos 6°, \sin 9° > \sin 6°, \cos 9° > \cos 30°$

149. The minimum value of sum of three sines can be -3 provided it is attainable through some angle. Indeed value -3 is possible, if

$\sin\alpha = -1, \sin\beta = -1, \sin\gamma = -1$

$\Rightarrow$ $\alpha = (4l - 1)\frac{\pi}{2}, \beta = (4m - 1)\frac{\pi}{2}, \gamma = (4n - 1)\frac{\pi}{2}$

Now, $\alpha + \beta + \gamma = \pi$

$\Rightarrow$ $\frac{\pi}{2}[4(l + m + n) - 3] = \pi$

$\Rightarrow$ $4(l + m + n) = 5$ ...(i)

Since, l, m and n are integers, so Eq. (i) is impossible.

$\Rightarrow$ Minimum cannot be -3.

But for $\alpha = \frac{3\pi}{2}, \beta = \frac{2\pi}{2}, \gamma = -2\pi, \alpha + \beta + \gamma = \pi$

and $\sin\alpha + \sin\beta + \sin\gamma = -2$

Thus, $\sin\alpha + \sin\beta + \sin\gamma$ can attain negative values, hence the Statement I is true. The Statement II is false, since α, β and γ are arbitrary real numbers.

Though their sum is π but they can be of the type $\frac{\pi}{2}, \frac{\pi}{2}, 0$.

150. **Statement I** $\sin x + \operatorname{cosec} x = 2 \Rightarrow \sin x = \operatorname{cosec} x = 1$

$\therefore$ $x = \frac{\pi}{2}, \frac{5\pi}{2}$ $\Rightarrow$ Two solutions

$\Rightarrow$ Statement I is false.

Statement II $x + \frac{1}{x} \ge 2$, only when $x \ge 0$.

$\therefore$ Statement II is false.

151. $\sin^2 x + \tan^2 x = 0$ iff $\sin x = \tan x = 0$

$\Rightarrow \quad x = n\pi$

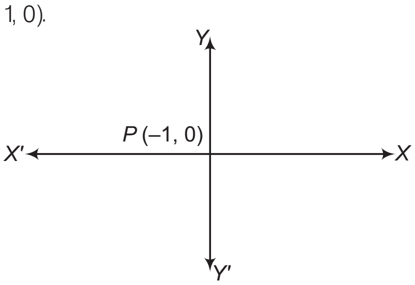
So, Statement I is true.

But Statement II is not always true.

i.e. if $a, b \in$ complex numbers, say $a = 2$ and $b = -2i$

$\Rightarrow \quad a^2 + b^2 = 0$

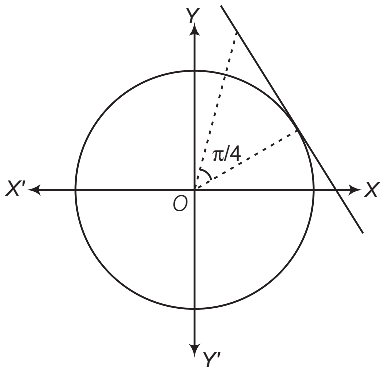
152. Particle moves 1 radian on each circle starts from $P(-1, 0)$.



To cross X-axis, it should cover π radian, hence will be on 4th circle.

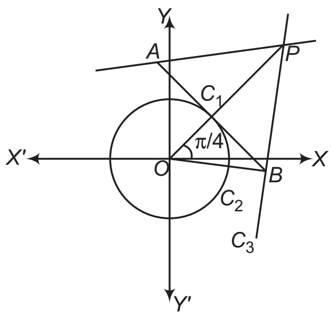
So, to cross positive Y-axis, it should cover a distance of $\frac{3\pi}{2}$ radian i.e. 5th circle.

153. Angular distance travelled from starting of motion on one circle to reach to other is $\left(1 + \frac{\pi}{4}\right)$.



$\Rightarrow$ On 4th circle, particle will cross the positive X-axis again $\Rightarrow x \in (2\sqrt{2}, 4)$

154. Angular distance travelled is $\frac{\pi}{4}$.



$\Rightarrow$ Coordinates of point C are $(\sqrt{2}, \sqrt{2})$.

$\Rightarrow$ Equation of tangent AB is $x + y = \sqrt{2}$.

It intersect the circle $x^2 + y^2 = 9$ at A and B.

$\Rightarrow \quad P = \left(\frac{9}{2\sqrt{2}}, \frac{9}{2\sqrt{2}}\right)$

155. $f(\theta, \alpha) = 2\sin^2\theta + 4\cos\theta(\theta + \alpha)\sin\theta\sin\alpha + 2\cos^2(\theta + \alpha) - 1$

$= 2\sin^2\theta + 2\cos(\theta + \alpha)[2\sin\theta\sin\alpha + \cos(\theta + \alpha)] - 1$

$= 2\sin^2\theta + 2\cos(\theta + \alpha)[\sin\theta\sin\alpha + \cos\theta\cos\alpha] - 1$

$= 2\sin^2\theta + 2\cos(\theta + \alpha)\cos(\theta - \alpha) - 1$

$= 2\sin^2\theta + 2\cos^2\theta - 2\sin^2\alpha - 1$

$= \cos 2\alpha$

$\therefore \quad f\left(\frac{\pi}{3}, \frac{\pi}{4}\right) = \cos\left(2 \times \frac{\pi}{4}\right) = 0$

156. $f(\theta, \alpha) = 0$

$\Rightarrow \quad \cos 2\alpha = 0$

$\Rightarrow \quad 2\alpha = (2n + 1)\frac{\pi}{2}$

$\therefore \quad \alpha = (2n + 1)\frac{\pi}{4}, n \in I$

157. $f\left(\theta, \frac{\pi}{6}\right) = \frac{1}{2}$

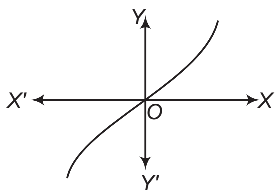
$\cos\left(\frac{2\pi}{6}\right) = \frac{1}{2}$

$\Rightarrow \quad \frac{1}{2} = \frac{1}{2}$

$\Rightarrow \quad \theta$ is any real.

Solutions (Q. Nos. 158-160)

$k = 0$, graph will be shown as given below:



So, no such triangle is possible.

Let $\quad A = B$, then $2A + C = 180°$

and $\quad 2\tan A + \tan C = k \quad$ ...(i)

Now, $\quad 2A + C = 180°$

$\tan 2A = -\tan C$

Also, $\quad 2\tan A + \tan C = k$

$\Rightarrow \quad 2\tan A + \tan(180° - 2A) = k$

$\Rightarrow \quad 2\tan A + \tan(180° - 2A) = k$

$\Rightarrow \quad 2\tan A - \tan 2A = k$

$\Rightarrow \quad -2\tan^3 A = k(1 - \tan^2 A)$

$\Rightarrow \quad 2\tan^3 A - k\tan^2 A + k = 0$

Let $\quad \tan A = x, x > 0$

Consider, $\quad f(x) = 2x^3 - kx^3 + k \quad$ ...(ii)

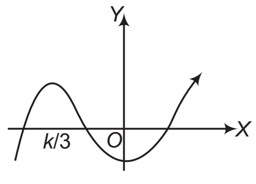
$f'(x) = 6x^2 - 2kx = 0$

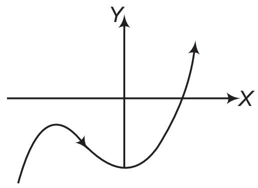
$x = \frac{k}{3}, 0$

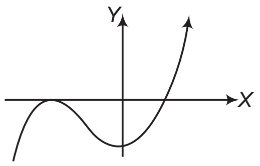
Following cases are arise:

***Case* I** If $k < 0$, then $f(0) < 0$ and the equation has only one positive solution.

$\therefore$ There is only one triangle.





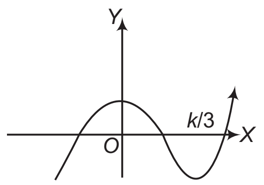


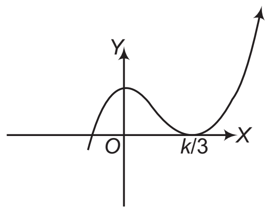
***Case* II** If $k = 0$, then $f(x) = 2x^3$

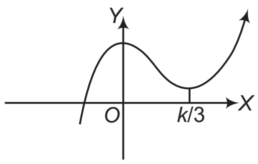
Thus, $f(x) = 0$ iff $x = 0$ which is not possible.

***Case* III** If $k > 0$, then $0, \dfrac{k}{3}$ are critical points.

$$f(0) = k > 0 \text{ and } f\left(\frac{k}{3}\right) = \frac{27k - k^3}{27}$$







There is one isosceles triangle, if $f\left(\dfrac{k}{3}\right) = 0$ i.e. $k = 3\sqrt{3}$

There are two isosceles triangle, if $f\left(\dfrac{k}{3}\right) < 0$ i.e. $k > 3\sqrt{3}$

There can never be three isosceles triangles.

161. Let $y = 27^{\cos 2x} \cdot 81^{\sin 2x} = 3^{3\cos 2x + 4\sin 2x}$

Now, $-\sqrt{3^2 + 4^2} \le 3\cos 2x + 4\sin 2x \le \sqrt{3^2 + 4^2}$

$\Rightarrow \quad -5 \le 3\cos 2x + 4\sin 2x \le 5$

$\therefore \quad 3^{-5} \le 3^{3\cos 2x + 4\sin 2x} \le 3^5$

162. $\cos^7 x \le \cos^2 x$ and $\sin^4 x = \sin^2 x$

$\Rightarrow \quad \cos^7 x + \sin^4 x \le \cos^2 x + \sin^2 x = 1$

So, the given equation is satisfies if and only if

$\cos^7 x = 0$ and $\sin^2 x = 1$

or $\quad \cos^7 x = 1$ and $\sin^2 x = 0$

$\Rightarrow \quad x = (2n+1)\dfrac{\pi}{2}$ or $x = 2m\pi$

$\because \quad 0 \le x \le 2\pi$, so $x = 0, \dfrac{\pi}{2}, \dfrac{3\pi}{2}, 2\pi$

163. $\cos(p\sin x) = \sin(p\cos x) = \cos\left(\dfrac{\pi}{2} - p\cos x\right)$

$\Rightarrow \quad p\sin x = 2n\pi \pm \left(\dfrac{\pi}{2} - p\cos x\right), n \in I$

Consider the positive sign, we have

$$p(\sin x + \cos x) = (4n+1)\frac{\pi}{2}$$

$\Rightarrow \quad \sin x + \cos x = \dfrac{(4n+1)\pi}{2p}$

$\because \quad |\cos x + \sin x| \le \sqrt{2}$

$\Rightarrow \quad \left|\dfrac{(4n+1)\pi}{2p}\right| \le \sqrt{2}$ or $p \ge \dfrac{|(4n+1)|\pi}{2\sqrt{2}}$

So, p is smallest positive, if $n = 0$, giving again $p = \dfrac{\pi}{2\sqrt{2}}$.

164. A. $2\sin\dfrac{1}{2}(x+y)\cos\dfrac{1}{2}(x-y)$

$$-2\sin\frac{1}{2}(x+y)\cos\frac{1}{2}(x+y) = 0$$

or $\quad 2\sin\dfrac{1}{2}(x+y)\cdot 2\sin\dfrac{1}{2}x\sin\dfrac{1}{2}y = 0$

$\therefore \quad$ Either $\sin\dfrac{1}{2}(x+y) = 0, \sin\dfrac{1}{2}x = 0$

or $\quad \sin\dfrac{1}{2}y = 0$

$\therefore \quad x + y = 0, x = 0, y = 0$

$|x| + |y| = 1$

i.e. $\quad x + y = 1, x - y = 1, x + y = -1, x - y = -1$

When $x + y = 0$, reject $x + y = 1$

and $\quad x + y = -1$

Solve with $x - y = 1$ or $x - y = -1$

which gives $\left(\dfrac{1}{2}, -\dfrac{1}{2}\right)$ or $\left(-\dfrac{1}{2}, -\dfrac{1}{2}\right)$

Again, solving with $x = 0$, we get $(0, \pm 1)$ and solving with $y = 0$, we get $(\pm 1, 0)$

$\therefore$ There are six set of solution.

B. For $f(x)$ to be obtained,

$\dfrac{1-|x|}{2} \le -1 \Rightarrow 1 - |x| \le -2 \Rightarrow |x| \ge 3$

$\Rightarrow \quad x \le -3$ or $x \ge 3 \quad$ ...(i)

or $\quad \dfrac{1-|x|}{2} \ge 1 \Rightarrow 1 - |x| \ge 2$ or $|x| \le -1$

which is not possible.

Also, $\sec^{-1}\left(\dfrac{1-|x|}{2}\right) \ge 0$ is always true as

$$0 \le \sec^{-1} x \le \pi \Rightarrow \sec^{-1} x \ne \frac{\pi}{2}$$

Hence, value of x lies between $(-\infty, -3] \cup [3, \infty)$.

$\therefore$ Infinite values of x.

C. $\sin x \cos y = 1$

$\Rightarrow \quad \sin x = 1, \cos y = 1$

$\sin x = -1, \cos y = -1 \Rightarrow x = \dfrac{3\pi}{2}, y = \pi$

Thus, ordered pairs are three.

D. $f(x) = \sin x - \cos x - kx + b$

$\Rightarrow \quad f'(x) = \cos x + \sin x - k$

Maximum value of $\cos x + \sin x = \sqrt{2}$

If $k > \sqrt{2}$, then $f'(x) < 0, \forall x \in R$

and hence $f(x)$ will decreasing function, $\forall x \in R$.

$\therefore \quad k > \sqrt{2}$

$\Rightarrow \quad 4\sqrt{2}k > 8$

165. A. $\sin^2 A + \sin^2 B = \sin(A+B)$

$\Rightarrow \quad 1 - \dfrac{\cos 2A + \cos 2B}{2} = \sin C$

$\Rightarrow 1 - \cos(A+B)\cos(A-B) = \sin(A+B)$

$\Rightarrow \cos^2 C \cos^2(A-B) + 2\cos C\cos(A-B) = \cos^2 C$

$\Rightarrow \quad \cos C = 0$

Hence, triangle is right angled.

B. $\dfrac{bc}{2\cos A} = b^2 + c^2 - 2bc\cos A$

$\Rightarrow \quad \cos A = \dfrac{bc}{2a^2} \Rightarrow b^2c^2 = a^2(b^2 + c^2 - a^2)$

$\Rightarrow \quad (a^2 - b^2)(a^2 - c^2) = 0$

$\Rightarrow \quad a = b \quad \text{or} \quad a = c$

Hence, triangle is isosceles.

C. $\tan\dfrac{A}{2} + \tan\dfrac{B}{2} + \tan\dfrac{C}{2} = \sqrt{3}$

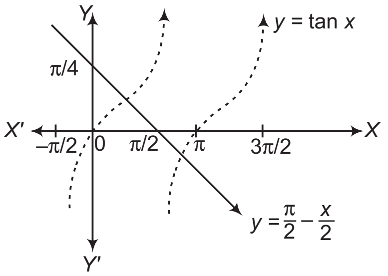
$$\Rightarrow \left(\tan\frac{A}{2} - \tan\frac{B}{2}\right)^2 + \left(\tan\frac{B}{2} - \tan\frac{C}{2}\right)^2 + \left(\tan\frac{C}{2} - \tan\frac{A}{2}\right)^2 = 0$$

Hence, triangle is equilateral.

D. If a, b and c are in AP and h_a, h_b, h_c are in AP, where h_a, h_b, h_c are the altitudes, then $a = b = c$

Hence, the triangle is equilateral.

166. A. $\dfrac{x}{2} + \tan x = \dfrac{\pi}{4} \quad \Rightarrow \quad \tan x = \dfrac{\pi}{4} - \dfrac{x}{2}$



From the graph, the equation has 3 solutions in $[-\pi, \pi]$.

B. $\sin^{-1}|x^2 - 1| + \cos^{-1}|2x^2 - 5| = \dfrac{\pi}{2}$

$\Rightarrow \quad |x^2 - 1| = |2x^2 - 5|$

$\Rightarrow \quad x^2 = 2 \quad \Rightarrow \quad x = \pm\sqrt{2}$ (two solutions)

C. $x^4 - 2x^2\sin^2\dfrac{\pi x}{2} + 1 = 0$

$\Rightarrow \left(x^2 - \sin^2\dfrac{\pi x}{2}\right)^2 + 1 - \sin^4\dfrac{\pi x}{2} = 0$

$\Rightarrow \quad x = (2n+1), n \in I$ and $x^2 = \sin^2\dfrac{\pi x}{2} = 1$

$\Rightarrow \quad x = \pm 1$ is the solution

D. Let $y = x^2 + 2x + 2\sec^2 \pi x + \tan^2 \pi x$

$\Rightarrow \; y = (x+1)^2 + (2\sec^2\pi x - 1) + \tan^2 \pi x > 0$

$\Rightarrow$ No solution.

167. A. $\sin x \cdot \cos x(\cos^2 x - \sin^2 x) > 0$

$\Rightarrow \quad \dfrac{1}{2}\sin 2x \cdot \cos 2x > 0 \quad \Rightarrow \quad \sin 4x > 0$

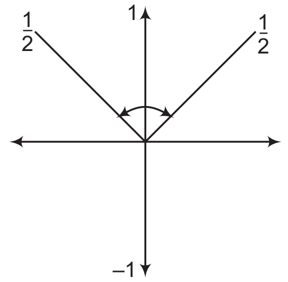
$\therefore \quad 0 < 4x < \pi$

B. Here, $(2\sin x - 1)(2\sin x - 3) \le 0$

But $2\sin x - 3$ is always negative.

$\therefore \quad 2\sin x - 1 \ge 0$

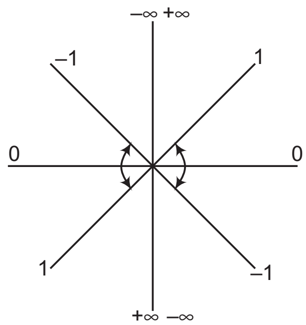
$\Rightarrow \quad \sin x \ge \dfrac{1}{2}$



From the figure, $\dfrac{\pi}{6} \le x \le \dfrac{5\pi}{6}$

C. $-1 \le \tan\theta \le 1$

The value of scheme for this is shown below



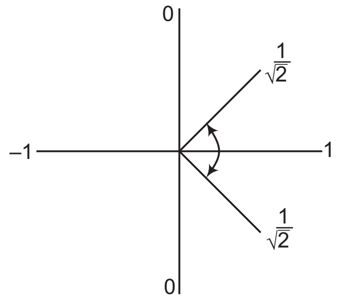
From the figure, $-\dfrac{\pi}{4} \le x \le \dfrac{\pi}{4}$

or $\quad -\pi \le x \le -\dfrac{3\pi}{4} \quad$ or $\quad \dfrac{3\pi}{4} \le x \le \pi$

$\therefore \quad x \in \left[-\pi, -\dfrac{3\pi}{4}\right] \cup \left[-\dfrac{\pi}{4}, \dfrac{\pi}{4}\right] \cup \left[\dfrac{3\pi}{4}, \pi\right]$

D. $\cos\left(x + \dfrac{\pi}{4}\right) \ge \dfrac{1}{\sqrt{2}}$.

The value for this is shown below:



From the figure, $\quad -\dfrac{\pi}{4} \le x + \dfrac{\pi}{4} \le \dfrac{\pi}{4}$

and in general, $2n\pi - \dfrac{\pi}{2} \le x + \dfrac{\pi}{4} \le 2n\pi + \dfrac{\pi}{4}$

$\therefore \quad 2n\pi - \dfrac{\pi}{2} \le x \le 2n\pi$

For $n = 0, -\dfrac{\pi}{2} \le x \le 0$; for $n = 1, \dfrac{3\pi}{2} \le x \le 2\pi$

168. A. $f(x) = 2 - \cos x + \sin^2 x = 3 - \cos x - \cos^2 x$

$$= -\left(\cos x + \frac{1}{2}\right)^2 + \frac{13}{4}$$

$\therefore$ Greatest value $= \dfrac{13}{4}$ and least value $= 1$

$\therefore$ Ratio $= \dfrac{13}{4}$

$\Rightarrow$ $k = 13$

B. $1 - 2\sin^2 x + p\sin x = 2p - 7$

i.e. $2\sin^2 x - p\sin x + 2p - 8 = 0$

It has solution, if

(i) $p^2 - 8(2p - 8) \geq 0$ i.e. $(p-8)^2 \geq 0$ which is always true.

(ii) $\sin x = \dfrac{p \pm \sqrt{p^2 - 8p + 64}}{4} = 2, \dfrac{p-4}{2}$

iff $-1 \leq \dfrac{p-4}{2} \leq 1$, iff $2 \leq p \leq 6$

$\therefore$ p has 5 integral values.

C. $\cos\alpha = \dfrac{3}{4}$

$$16\sin\frac{\alpha}{2}\sin\frac{3\alpha}{2} = 8\left(2\sin\frac{\alpha}{2}\sin\frac{3\alpha}{2}\right)$$

$$= 8(\cos\alpha - \cos 2\alpha)$$

$$= 8(\cos\alpha - 2\cos^2\alpha + 1)$$

$$= 8\left(\frac{3}{4} - \frac{18}{16} + 1\right) = 5$$

D. Let $\mathrm{A} = \sqrt{a^2 - 4}\,\hat{i} + a\,\hat{j} + \sqrt{a^2 - 4}\,\hat{k}$

$\mathbf{B} = \tan A\hat{i} + \tan B\hat{j} + \tan C\hat{k}$

$\mathrm{A}\cdot\mathrm{B} = |A||B|\cos\theta$

or $\sqrt{a^2 - 4}\tan A + a\tan B + \sqrt{a^2 + 4}\tan C$

$$= \sqrt{a^2 - 4 + a^2 + a^2 + 4}$$

$$\sqrt{\tan^2 A + \tan^2 B + \tan^2 C}\cos\theta$$

$$= \sqrt{3}a\sqrt{\tan^2 A + \tan^2 B + \tan^2 C}\cos\theta$$

or $\cos\theta = \dfrac{\sqrt{a^2 - 4}\tan A + a\tan B + \sqrt{a^2 + 4}\tan C}{\sqrt{3}a\sqrt{\tan^2 A + \tan^2 B + \tan^2 C}}$

Since, $\cos\theta \leq 1$

$\therefore$ $\dfrac{6a}{\sqrt{3}a\sqrt{\tan^2 A + \tan^2 B + \tan^2 C}} \leq 1$

or $\tan^2 A + \tan^2 B + \tan^2 C \geq 12$

169. A. $\sin\dfrac{A}{2}\sin\dfrac{5A}{2} = \dfrac{1}{2}(\cos 2A - \cos 3A)$

$$= \frac{1}{2}(2\cos^2 A - 1 - 4\cos^3 x + 3\cos A)$$

$$= \frac{1}{2}\left(2 \times \frac{9}{16} - 1 - 4 \times \frac{27}{64} + 3 \times \frac{3}{4}\right) = \frac{11}{32}$$

B. $\sin\dfrac{\pi}{7} + \sin\dfrac{2\pi}{7} + \sin\dfrac{3\pi}{7} = \dfrac{1}{2\sin\dfrac{\pi}{7}}$

$$\left\{\left(1 - \cos\frac{2\pi}{7}\right) + 2\sin\frac{\pi}{7}\sin\frac{2\pi}{7} + 2\sin\frac{3\pi}{7}\sin\frac{\pi}{7}\right\}$$

$$= \frac{1}{2\sin\frac{\pi}{7}}\left\{1 - \cos\frac{2\pi}{7} + \cos\frac{\pi}{7} - \cos\frac{3\pi}{7} + \cos\frac{2\pi}{7} - \cos\frac{4\pi}{7}\right\}$$

$$= \frac{1}{2\sin\frac{\pi}{7}}\left\{1 + \cos\frac{\pi}{7}\right\} = \frac{1}{2}\cot\frac{\pi}{14}$$

C. $\tan^2\theta = 2\tan^2\phi + 1$

$$1 + \tan^2\theta = 2(1 + \tan^2\phi)$$

$\Rightarrow$ $\sec^2\theta = 2\cos^2\theta = 1 + \cos 2\theta$

$\Rightarrow$ $\cos^2\theta = -\sin^2\theta$

$\cos 2\theta + \sin^2\phi = 0$

D. $\dfrac{\sin(2A + B)}{\sin B} = 5$

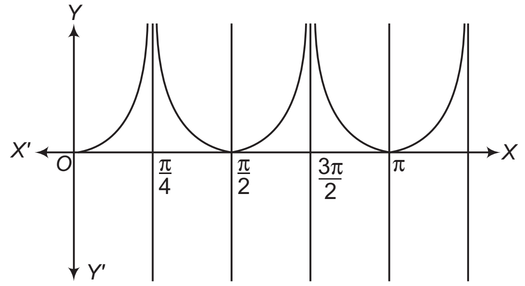
Using componendo and dividendo,

$$\frac{\sin(2A+B) + \sin B}{\sin(2A+B) - \sin B} = \frac{6}{4}$$

$\Rightarrow$ $\dfrac{2\sin(2A+B)\cos A}{2\cos(2A+B)\sin A} = \dfrac{3}{2}$

$\therefore$ $\dfrac{\tan(A+B)}{\tan A} = \dfrac{3}{2}$

170. A. Clearly, number of solutions of $|\tan 2x| = \sin x$ in $[0, \pi]$ are 4.



B. $\tan 4A = \dfrac{2\tan 2A}{1 - \tan^2 2A} = \dfrac{\dfrac{4\tan A}{1 - \tan^2 A}}{1 - \left(\dfrac{2\tan A}{1 - \tan^2 A}\right)^2}$

$$\tan 4A = \frac{4\tan A(1 - \tan^2 A)}{1 + \tan^4 A - 6\tan^2 A}$$

$$4\tan A - 4\tan^3 A + (6\tan^2 A - \tan^4 A - 1)\tan 4A = 0$$

If $A = \dfrac{\pi}{16}$

$$4\tan\frac{\pi}{16} - 4\tan^3\frac{\pi}{16} + 6\tan^2\frac{\pi}{16} - \tan^4\frac{\pi}{16} - 1 = 0$$

$\therefore$ Required value is 2.

C. $\tan(p\cot x) = \cot(p\tan x)$

$$\tan(p\cot x) = \tan\left(\frac{\pi}{2} - p\tan x\right)$$

$$p\cot x = n\pi + \frac{\pi}{2} - p\tan x$$

$$p = \frac{n\pi + \frac{\pi}{2}}{\tan x + \cot x} = \frac{\pi}{2}\sin x\cos x \quad [\because x \in [0, \pi]]$$

$\Rightarrow$ $P_{\max} = \dfrac{\pi}{4}$ $\Rightarrow$ $\dfrac{4P_{\max}}{\pi} = 1$

D. $5^{\cos^2 2x + 2\sin^2 x} + 5^{2\cos^2 x + \sin^2 2x} = 126$

$\Rightarrow \quad 5^y + 5^{3-y} = 126$

$\Rightarrow \quad 5^y + \dfrac{125}{5^y} = 126$

$\Rightarrow \quad 5^y = 125, 1$

$y = 3, 0$

$\Rightarrow \quad \cos^2 2x + 2\sin^2 x = 3$

$\Rightarrow \quad x = \dfrac{\pi}{2}, \dfrac{3\pi}{2}$

$\therefore \quad \cos^2 2x + 2\sin^2 x \neq 0$

$\Rightarrow \quad \dfrac{2x}{\pi} = 1, 3$

171. $[x]^2 - 5[x] + 6 = \sin x$

$\Rightarrow \quad ([x] - 1) = \sin x$

LHS is always represents an integer.

RHS must be an integer.

Now, integer values of $\sin x$ are $0, +1$ and -1.

***Case* I** Let $\sin x = 1$

$\Rightarrow \quad [x]^2 - 5[x] + 5 = 0$

$\Rightarrow \quad [x] = \dfrac{5 \pm \sqrt{5}}{2}$ [not possible]

***Case* II** Let $\sin x = -1$

$\Rightarrow \quad \sin x = -1$

$\Rightarrow \quad [x]^2 - 5[x] + 7 = 0$ [this equation has no real roots]

***Case* III** Let $\sin x = 0$

$\Rightarrow \quad [x]^2 - 5[x] + 6 = 0$

$\Rightarrow \quad [x] = 2, [x] = 3$

$\Rightarrow \quad x \in [2, 4)$ and $\sin x = 0$ for $x \in [2, 4)$ at $x = \pi$

$\Rightarrow x = \pi$ is the only solution.

172. Given that, $f(n\theta) = \dfrac{2\sin 2\theta}{\cos 2\theta - \cos 4n\theta}$

$$= \frac{2\sin 2\theta}{2\sin(2n+1)\theta \sin(2n-1)\theta}$$

$$= \frac{\sin\{(2n+1)\theta - (2n-1)\theta\}}{\sin(2n+1)\theta \sin(2n-1)\theta}$$

$$= \frac{\begin{bmatrix}\sin(2n+1)\theta\cos(2n-1)\theta \\ -\cos(2n+1)\theta\sin(2n-1)\theta\end{bmatrix}}{\sin(2n+1)\theta\sin(2n-1)\theta}$$

$$= \cot(2n-1)\theta - \cot(2n+1)\theta$$

$\Rightarrow f(\theta) + f(2\theta) + f(3\theta) + \ldots + f(n\theta)$

$= (\cot\theta - \cot 3\theta) + (\cot 3\theta - \cot 5\theta)$

$+ (\cot 5\theta - \cot 7\theta) + \ldots + \cot(2n-1)\theta - \cot(2n+1)\theta$

$$= \cot\theta - \cot(2n+1)\theta = \frac{\cos\theta}{\sin\theta} - \frac{\cos(2n+1)\theta}{\sin(2n+1)\theta}$$

$$= \frac{\sin 2n\theta}{\sin\theta \sin(2n+1)\theta}$$

$\Rightarrow \quad \mu = 2n + 1$

$\Rightarrow \quad \lambda = 2n$

$\Rightarrow \quad \mu - \lambda = 1$

173. Let $\theta = \dfrac{\pi}{7} \Rightarrow 3\theta = \pi - 4\theta$

$\Rightarrow \quad \sin 3\theta = \sin 4\theta$

$\Rightarrow \quad 3\sin\theta - 4\sin^3\theta = 4\sin\theta\cos\theta\cos 2\theta$

$\Rightarrow \quad 3 - 4\sin^2\theta = 4\cos\theta\,(2\cos^2\theta - 1)$

$\Rightarrow \quad 8\cos^3\theta - 4\cos\theta = 4\cos^2\theta - 1$

$\Rightarrow \quad 4\cos\theta(2\cos^2\theta - 1) = 4\cos^2\theta - 1$

$\Rightarrow \quad 4\cos\theta = \dfrac{4\cos^2\theta - 1}{2\cos^2\theta - 1} = \dfrac{3 - \tan^2\theta}{1 - \tan^2\theta}$

$\Rightarrow \quad 4\cos\dfrac{\pi}{7} = \dfrac{3 - \tan^2\dfrac{\pi}{7}}{1 - \tan^2\dfrac{\pi}{7}}$

Hence, $\lambda = 4$

174. $\sin x \cos 3x - \alpha\cos x \sin 3x = 0$ ...(i)

$\Rightarrow \quad \alpha = \dfrac{\sin x \cos 3x}{\cos x \sin 3x}$

$\Rightarrow \quad \alpha = \dfrac{\tan x}{\tan 3x}$

$\Rightarrow \quad \alpha = \dfrac{\tan x\,(1 - 3\tan^2 x)}{3\tan x - \tan^3 x}$

$\Rightarrow \quad \alpha = \dfrac{1 - 3\tan^2 x}{3 - \tan^2 x}$ ...(ii)

For real value of x, RHS of 2nd never lies between $\left(\dfrac{1}{3}, 3\right)$.

So, the number of integral values is $\{0, 1, 2\}$ i.e.3

175. $n\sin^2\theta + 2n\cos(\theta + \alpha)\sin\alpha\sin\theta + \cos 2(\alpha + \theta)$

$= n\sin^2\theta + n\cos(\theta + \alpha)[\cos(\theta - \alpha) - \cos(\theta + \alpha)]$
$+ 2\cos^2(\theta + \alpha) - 1$

$= n\sin^2\theta + n(\cos^2\theta - \sin^2\alpha) - n\cos^2(\theta + \alpha)$
$+ 2\cos^2(\alpha + \theta) - 1$

$= n\sin^2\theta + n\cos^2\theta - n\sin^2\alpha + (2 - n)\cos^2(\theta + \alpha) - 1$

$= (n - 1) - n\sin^2\alpha + (2 - n)\cos^2(\theta + \alpha)$

$\therefore \quad n = 2$

176. Given that, $y = \dfrac{\cos^2\theta - 1}{\cos^2\theta + \cos\theta}$

$\Rightarrow \quad (y - 1)\cos^2\theta + y\cos\theta + 1 = 0$

$\Rightarrow \quad \cos\theta = -1$ and $\cos\theta = \dfrac{1}{1 - y}$

$\Rightarrow \quad -1 < \dfrac{1}{1 - y} < 1$

$\Rightarrow \quad y < 0$ and $y > 2 \Rightarrow y \in R - [0, 2]$

$\therefore \quad b - a = 2$

177. $[\sin x] = [1 + \sin x] + [1 - \cos x]$

$\Rightarrow \quad 0 = 2 + [-\cos x]$

$\Rightarrow \quad [-\cos x] = -2$

Since, $\quad -1 \le \cos x \le 1$

$\Rightarrow \quad -1 \le -\cos x \le 1$

$\Rightarrow \quad [-\cos x] \neq -2$

Hence, $[-\cos x] = -2$ has no real solution.

178. We have, $\angle B = \frac{\pi}{3}$

$\therefore \quad A + B + C = \pi$

$\Rightarrow \quad A + C = \frac{2\pi}{3}$

$\Rightarrow \quad C = \frac{2\pi}{3} - A$

Now, $\sin A \sin C = \lambda$

$\Rightarrow \quad \sin A \sin\left(\frac{2\pi}{3} - A\right) = \lambda$

$\Rightarrow \quad \sin A\left(\frac{\sqrt{3}}{2}\cos A + \frac{1}{2}\sin A\right) = \lambda$

$\Rightarrow \quad \frac{\sqrt{3}}{4}\sin 2A + \frac{1}{2}\sin^2 A = \lambda$

$\Rightarrow \quad \frac{\sqrt{3}}{4}\sin 2A + \frac{1}{4}(1 - \cos 2A) = \lambda$

$\Rightarrow \quad \frac{\sqrt{3}}{4}\sin 2A - \frac{1}{4}\cos 2A = \lambda - \frac{1}{4}$

Now, $-\sqrt{\frac{3}{16} + \frac{1}{16}} \le \frac{\sqrt{3}}{4}\sin 2A - \frac{1}{4}\cos 2A \le \sqrt{\frac{3}{16} + \frac{1}{16}}$

$\Rightarrow \quad -\frac{1}{2} \le \frac{\sqrt{3}}{4}\sin 2A - \frac{1}{4}\cos 2A \le \frac{1}{2}$

$\Rightarrow \quad -\frac{1}{2} \le \lambda - \frac{1}{4} \le \frac{1}{2}$

$\Rightarrow \quad -\frac{1}{4} \le \lambda - \frac{3}{4}$

$\Rightarrow \quad \lambda \in \left[-\frac{1}{4}, \frac{3}{4}\right]$

$\Rightarrow \quad b = \frac{3}{4}, a = -\frac{1}{4}$

$\therefore \quad b - a = 1$

179. In ΔABC, we have

$$\tan\frac{A}{2}\tan\frac{B}{2} + \tan\frac{B}{2}\tan\frac{C}{2} + \tan\frac{C}{2}\tan\frac{A}{2} = 1$$

$\Rightarrow \quad \cot\frac{A}{2} + \cot\frac{B}{2} + \cot\frac{C}{2} = \cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2}$

Now, AM $\ge$ GM

$\Rightarrow \quad \left\{\frac{\cot\frac{A}{2} + \cot\frac{B}{2} + \cot\frac{C}{2}}{3}\right\} \ge \left\{\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2}\right\}^{\frac{1}{3}}$

$\Rightarrow \quad \left\{\frac{\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2}}{3}\right\} \ge \left\{\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2}\right\}^{\frac{1}{3}}$

$\Rightarrow \quad \left(\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2}\right)^{\frac{2}{3}} \ge 3$

$\Rightarrow \quad \cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2} \ge 3\sqrt{3}$

$\Rightarrow \quad \lambda = 3$

180. In ΔABC, we have

$$\cot\frac{A}{2} + \cot\frac{B}{2} + \cot\frac{C}{2} = \cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2} \quad \text{...(i)}$$

It is given that, $\tan\frac{A}{2}, \tan\frac{B}{2}, \tan\frac{C}{2}$ are in HP.

$\Rightarrow \quad \cot\frac{A}{2}, \cot\frac{B}{2}, \cot\frac{C}{2}$ are in HP.

$\Rightarrow \quad 2\cot\frac{B}{2} = \cot\frac{A}{2} + \cot\frac{C}{2} \quad \text{...(ii)}$

From Eqs. (i) and (ii), we get

$$\cot\frac{A}{2}\cot\frac{B}{2}\cot\frac{C}{2} = 3\cot\frac{B}{2}$$

$\Rightarrow \quad \cot\frac{A}{2}\cot\frac{C}{2} = 3$

Now, AM $\ge$ GM

$\Rightarrow \quad \frac{\cot\frac{A}{2} + \cot\frac{C}{2}}{2} \ge \sqrt{\cot\frac{A}{2}\cot\frac{C}{2}}$

$\Rightarrow \quad \cot\frac{B}{2} \ge \sqrt{3} \quad \left[\because \cot\frac{A}{2} + \cot\frac{C}{2} = 2\cot\frac{B}{2}\right]$

$\Rightarrow \quad \lambda = 3$

181. We know that, $|a\sin x + b\cos x| \le \sqrt{a^2 + b^2}$ for all x.

$\therefore \quad |12\sin\alpha + 5\cos\alpha| \le 13$

Also, $\quad 2\beta^2 - 8\beta + 21 = 2(\beta^2 - 4\beta + 4) + 13$

$= 2(\beta - 2)^2 + 13 \ge 13$

$\therefore \quad 12\sin\alpha = 5\cos\alpha = 2\beta^2 - 8\beta + 21$

$\Rightarrow \quad 12\sin\alpha + 5\cos\alpha = 13$

and $\quad 2\beta^2 - 8\beta + 21 = 13$

$\Rightarrow \quad \frac{12}{13}\sin\alpha + \frac{5}{13}\cos\alpha = 1$ and $\beta = 2$

$\Rightarrow \quad \cos(\alpha - \theta) = 1$ and $\beta = 2$

where, $\quad \tan\theta = \frac{12}{5}$

$\Rightarrow \quad \alpha - \theta = 2n\pi$

and $\quad \beta = 2, n \in Z$

$\Rightarrow \quad \beta^2 - 2\beta = 0$

182. We observe that,

LHS ≥ 2 and RHS $= 2 - (x - 1)^2 \le 2$

So, the given equation is valid, if

LHS $= 2$ and RHS $= 2$

$\Rightarrow \quad \tan^2(x + y) + \cot^2(x + y) = 2$

and $\quad 1 - 2x - x^2 = 2$

$\Rightarrow \quad x = -1$

$\Rightarrow \quad x^2 - 3x + 2 = 6$

183. We have, $x - y = \frac{\pi}{4}$ and $\cot x + \cot y = 2$

Now, $\cot x + \cot y = 2$

$\Rightarrow \quad \sin(x + y) = 2\sin x \sin y$

$\Rightarrow \quad \sin(x + y) = \cos(x - y) - \cos(x + y)$

$\Rightarrow \quad \sin(x + y) + \cos(x + y) = \frac{1}{\sqrt{2}}$

$\Rightarrow \quad \frac{1}{\sqrt{2}}\sin(x + y) + \frac{1}{\sqrt{2}}\cos(x + y) = \frac{1}{2}$

$\Rightarrow \quad \sin(x + y)\cos\frac{\pi}{4} + \cos(x + y)\sin\frac{\pi}{4} = \frac{1}{2}$

$\Rightarrow \sin\left(x + y + \frac{\pi}{4}\right) = \sin\frac{\pi}{6}$ or $\sin\left(x + y + \frac{\pi}{4}\right) = \sin\frac{5\pi}{2}$

$\Rightarrow \quad x + y + \frac{\pi}{4} = \frac{\pi}{6}$

or $\quad x + y + \frac{\pi}{4} = \frac{5\pi}{6}$

$\Rightarrow \quad x + y = \frac{7\pi}{12} \quad [\because x, y \ge 0]$

On solving this equation with $x - y = \dfrac{\pi}{4}$, we get

$$x = \frac{5\pi}{12} \quad \text{and} \quad y = \frac{\pi}{6}$$

$$\Rightarrow \quad \lambda = 5, \mu = 1$$

$$\Rightarrow \quad \lambda + \mu = 5 + 1 = 6$$

184. Let $4^{\sin x} = u$ and $3^{\frac{1}{\cos y}} = v$. Then, the given system of equations reduces to

$$u + v = 11 \qquad \text{...(i)}$$

$$5u^2 - 2v = 2 \qquad \text{...(ii)}$$

Eliminating v between Eqs. (i) and (ii), we get

$$5u^2 - 22 + 2u = 2$$

$$\Rightarrow \quad 5u^2 + 2u - 24 = 0$$

$$\Rightarrow \quad (5u + 12)(u - 2) = 0$$

$$\Rightarrow \quad u - 2 = 0$$

$$[\because u = 4^{\sin x} > 0 \text{ for all } x, \text{so } 5u + 12 > 0]$$

$$\Rightarrow \quad u = 2 \quad \Rightarrow \quad 4^{\sin x} = 2$$

$$\Rightarrow \quad 2^{2\sin x} = 2^1 \quad \Rightarrow \quad 2\sin x = 1$$

$$\Rightarrow \quad \sin x = \frac{1}{2}$$

$$\Rightarrow \quad \sin x = \sin\frac{\pi}{6} \quad \Rightarrow \quad x = \frac{\pi}{6}$$

Putting the value of u in Eq. (i), we get

$$v = 9$$

$$\Rightarrow \quad 3^{\frac{1}{\cos y}} = 3^2$$

$$\Rightarrow \quad \frac{1}{\cos y} = 2 \quad \Rightarrow \quad \cos y = \frac{1}{2}$$

$$\Rightarrow \quad \cos y = \cos\frac{\pi}{3}$$

$$\Rightarrow \quad y = \frac{\pi}{3}$$

$$\therefore \quad x + y = \frac{\pi}{2} \quad \Rightarrow \lambda = 2$$

185. We have, $\sin\left(x - \dfrac{\pi}{4}\right) - \cos\left(x + \dfrac{3\pi}{4}\right) = 1$

$$\Rightarrow \quad \sin\left(x - \frac{\pi}{4}\right) + \sin\left(x + \frac{\pi}{4}\right) = 1 \quad [\because \sin\theta = \sin(\pi - \theta)]$$

$$\Rightarrow \quad 2\sin x \cos\frac{\pi}{4} = 1$$

$$\Rightarrow \quad \sin x = \frac{1}{\sqrt{2}} \quad \Rightarrow \quad x = \frac{\pi}{4}, \frac{3\pi}{4}$$

We know that, 3 radians $\cong 171^\circ 22'$. Therefore, $\sin 3 > 0, \cos 3 < 0$ and $|\cos 3| > \sin 3$

$$\therefore \quad \cos 3 + \sin 3 < 0$$

Now, $\dfrac{2\cos 7x}{\cos 3 + \sin 3} > 2^{\cos 2x}$

$$\Rightarrow \quad 2\cos 7x < 2^{\cos 2x}(\cos 3 + \sin 3)$$

$$[\because \cos 3 + \sin 3 < 0]$$

$$\Rightarrow \quad 2\cos 7x < 0 \qquad [\because 2^{\cos 2x} > 0]$$

$$\Rightarrow \quad \cos 7x < 0$$

Clearly, $x = \dfrac{3\pi}{4}$ satisfies this equation.

Hence, $x = \dfrac{3\pi}{4}$ is the required solution.

So, only one solution.

186. The given equation will have a solution, if

$$p \ge 0, 2 - p \ge 0$$

and $\quad |\sqrt{p}\cos x - 2\sin x| \le \sqrt{p + 4}$

$$\Rightarrow \quad p \ge 0, 2 - p \ge 0$$

and $\quad |\sqrt{2} + \sqrt{2 - p}| \le \sqrt{p + 4}$

$$\Rightarrow \quad p \ge 0, p \le 2$$

and $\quad (\sqrt{2} + \sqrt{2 - p})^2 \le p + 4$

$$\Rightarrow \quad p \ge 0, p \le 2$$

and $\quad p^2 + 2p - 4 \ge 0$

$$\Rightarrow \quad p \ge 0, p \le 2$$

and $\quad p \in (-\infty, -\sqrt{5} - 1) \cup [\sqrt{5 - 1}, \infty)$

$$\Rightarrow \quad p \in (\sqrt{5 - 1}, 2]$$

So, the integral value of p is 2.

Entrances Gallery

1. $\sin x + 2\sin 2x - \sin 3x = 3$

$$\Rightarrow \sin x + 4\sin x \cos x - 3\sin x + 4\sin^3 x = 3$$

$$\Rightarrow \quad \sin x\,[-2 + 4\cos x + 4(1 - \cos^2 x)] = 3$$

$$\Rightarrow \quad \sin x\,[2 - (4\cos^2 x - 4\cos x + 1) + 1] = 3$$

$$\Rightarrow \quad \sin x\,[3 - (2\cos x - 1)^2] = 3$$

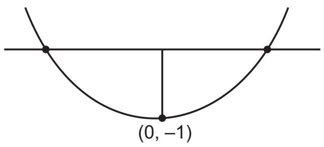
$$\Rightarrow \quad \sin x = 1 \text{ and } 2\cos x - 1 = 0$$

$$\Rightarrow \quad x = \frac{\pi}{2} \text{ and } x = \frac{\pi}{3}$$

which is not possible at same time. Hence, no solution.

2. Let $f(x) = x^2 - x\sin x - \cos x$

$$\Rightarrow \quad f'(x) = 2x - x\cos x$$



$$\lim_{x \to \infty} f(x) \to \infty$$

$$\lim_{x \to -\infty} f(x) \to \infty$$

$$f(0) = -1$$

Hence, there are two solutions.

3. $2\cos\theta(1 - \sin\phi) = \dfrac{2\sin^2\theta}{\sin\theta}\cos\phi - 1$

$$= 2\sin\theta\cos\phi - 1$$

$$\Rightarrow 2\cos\theta - 2\cos\theta\sin\phi = 2\sin\theta\cos\phi - 1$$

$$\Rightarrow \quad 2\cos\theta + 1 = 2\sin(\theta + \phi) \qquad \text{...(i)}$$

$$\tan(2\pi - \theta) > 0 \Rightarrow \tan\theta < 0 \qquad \text{...(ii)}$$

and $\quad -1 < \sin\theta < -\dfrac{\sqrt{3}}{2}$

$$\Rightarrow \quad \theta \in \left(\frac{3\pi}{2}, \frac{5\pi}{3}\right) \qquad \text{...(iii)}$$

$$\therefore \quad \frac{1}{2} < \sin(\theta + \phi) < 1 \text{ [from Eqs. (i) and (iii)]}$$

$$\Rightarrow \quad 2\pi + \frac{\pi}{6} - \theta_{max} < \phi < 2\pi + \frac{5\pi}{6} - \theta_{min}$$

$$\Rightarrow \quad \frac{\pi}{2} < \phi < \frac{4\pi}{3}$$

4. For $\theta \in \left(0, \frac{\pi}{4}\right) \cup \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$

Let $\cos 4\theta = \frac{1}{3}$,

$$\cos 2\theta = \pm\sqrt{\frac{1+\cos 4\theta}{2}} = \pm\sqrt{\frac{2}{3}}$$

$$f\left(\frac{1}{3}\right) = \frac{2}{2-\sec^2\theta} = \frac{2\cos^2\theta}{2\cos^2\theta - 1} = 1 + \frac{1}{\cos 2\theta}$$

$$\Rightarrow \quad f\left(\frac{1}{3}\right) = 1 - \sqrt{\frac{3}{2}} \text{ or } 1 + \sqrt{\frac{3}{2}}$$

5. $\frac{1}{\sin\frac{\pi}{n}} - \frac{1}{\sin\frac{3\pi}{n}} = \frac{1}{\sin\frac{2\pi}{n}}$

$$\Rightarrow \quad \frac{\sin\frac{3\pi}{n} - \sin\frac{\pi}{n}}{\sin\frac{\pi}{n}\sin\frac{3\pi}{n}} = \frac{1}{\sin\frac{2\pi}{n}}$$

$$\Rightarrow \frac{\left(2\sin\frac{\pi}{n} - \cos\frac{2\pi}{n}\right)\sin\frac{2\pi}{n}}{\sin\frac{\pi}{n}\sin\frac{3\pi}{n}} = 1$$

$$\Rightarrow \quad \sin\frac{4\pi}{n} = \sin\frac{3\pi}{n}$$

$$\Rightarrow \quad \frac{4\pi}{n} + \frac{3\pi}{n} = \pi \quad \Rightarrow \quad n = 7$$

6. $(fogogof)(x) = \sin^2(\sin x^2)$

$$(gogof)(x) = \sin(\sin x^2)$$

$\therefore \quad \sin^2(\sin x^2) = \sin(\sin x^2)$

$\Rightarrow \quad \sin(\sin x^2)[\sin(\sin x^2) - 1] = 0$

$\Rightarrow \quad \sin(\sin x^2) = 0 \quad \text{or} \quad 1$

$\Rightarrow \quad \sin x^2 = n\pi \quad \text{or} \quad 2m\pi + \frac{\pi}{2}$, where $m, n \in I$

$\Rightarrow \quad \sin x^2 = 0 \quad \Rightarrow \quad x^2 = n\pi$

$\Rightarrow \quad x = \pm\sqrt{n\pi}, n \in \{0, 1, 2, \ldots\}$

7. Given, $(y+z)\cos 3\theta - (xyz)\sin 3\theta = 0$ ...(i)

and $xyz\sin 3\theta = (2\cos 3\theta)z + (2\sin 3\theta)y$ ...(ii)

$\therefore \quad (y+z)\cos 3\theta = (2\cos 3\theta)z + (2\sin 3\theta)y$

$= (y+2z)\cos 3\theta + y\sin 3\theta$

$\Rightarrow \quad y(\cos 3\theta - 2\sin 3\theta) = z\cos 3\theta$

and $\quad y(\sin 3\theta - \cos 3\theta) = 0$

$\Rightarrow \quad \sin 3\theta - \cos 3\theta = 0$

$\Rightarrow \quad \sin 3\theta = \cos 3\theta$

$\therefore \quad 3\theta = n\pi + \frac{\pi}{4}$

8. $\tan\theta = \cot 5\theta$

$\Rightarrow \quad \cos 6\theta = 0$

$4\cos^3 2\theta - 3\cos 2\theta = 0$

$\Rightarrow \quad \cos 2\theta = 0 \quad \text{or} \quad \pm\frac{\sqrt{3}}{2}$

Also, we have $\quad \sin 2\theta = \cos 4\theta$

$\Rightarrow \quad 2\sin^2 2\theta + \sin 2\theta - 1 = 0$

$\Rightarrow \quad 2\sin^2 2\theta + 2\sin 2\theta - \sin 2\theta - 1 = 0$

$\sin 2\theta = -1 \quad \text{or} \quad \sin 2\theta = \frac{1}{2}$

$\cos 2\theta = 0 \quad \text{and} \quad \sin 2\theta = -1$

$\Rightarrow \quad 2\theta = -\frac{\pi}{2} \quad \Rightarrow \quad \theta = -\frac{\pi}{4}$

$\cos 2\theta = \pm\frac{\sqrt{3}}{2}, \sin 2\theta = \frac{1}{2}$

$\Rightarrow \quad 2\theta = \frac{\pi}{6}, \frac{5\pi}{6} \quad \Rightarrow \quad \theta = \frac{\pi}{12}, \frac{5\pi}{12}$

$\therefore \quad \theta = -\frac{\pi}{4}, \frac{\pi}{12}, \frac{5\pi}{12}$

9. $\frac{1}{4\cos^2\theta + 1 + \frac{3}{2}\sin 2\theta}$

$$= \frac{1}{2[1+\cos 2\theta] + 1 + \frac{3}{2}\sin 2\theta}$$

lies between $\frac{1}{2}$ to $\frac{11}{2}$.

$\therefore$ Maximum value is 2.

Minimum value of $1 + 4\cos^2\theta + 3\sin\theta\cos\theta$

$$= 1 + \frac{4(1+\cos 2\theta)}{2} + \frac{3}{2}\sin 2\theta$$

$$= 1 + 2 + 2\cos 2\theta + \frac{3}{2}\sin 2\theta$$

$$= 3 + 2\cos 2\theta + \frac{3}{2}\sin 2\theta$$

$$= 3 - \sqrt{4 + \frac{9}{4}} = 3 - \frac{5}{2} = \frac{1}{2}$$

So, maximum value of $\frac{1}{4\cos^2\theta + 1 + \frac{3}{2}\sin 2\theta}$ is 2.

10. $\frac{1}{4}(\sin^4 x + \cos^4 x) - \frac{1}{6}(\sin^6 x + \cos^6 x)$

$$= \frac{3(\sin^4 x + \cos^4 x) - 2(\sin^6 x + \cos^6 x)}{12}$$

$$= \frac{3(1 - 2\sin^2 x\cos^2 x) - 2(1 - 3\sin^2 x\cos^2 x)}{12}$$

$$= \frac{1}{12}$$

11. Given expression

$$= \frac{\tan A}{1-\cot A} + \frac{\cot A}{1-\tan A} = \frac{\sin A}{\cos A} \times \frac{\sin A}{\sin A - \cos A} + \frac{\cos A}{\sin A} \times \frac{\cos A}{\cos A - \sin A}$$

$$= \frac{1}{\sin A - \cos A}\left\{\frac{\sin^3 A - \cos^3 A}{\cos A\sin A}\right\}$$

$$= \frac{\sin^2 A + \sin A\cos A + \cos^2 A}{\sin A\cos A}$$

$$= \frac{1 + \sin A\cos A}{\sin A\cos A} = 1 + \sec A\operatorname{cosec} A$$

12. Given, a ΔPQR such that

$3\sin P + 4\cos Q = 6$ ...(i)

and $\quad 4\sin Q + 3\cos P = 1$ ...(ii)

Squaring and adding Eqs. (i) and (ii), we get

$(3\sin P + 4\cos Q)^2 + (4\sin Q + 3\cos P)^2 = 36 + 1$

$\Rightarrow \quad 9(\sin^2 P + \cos^2 P) + 16(\sin^2 Q + \cos^2 Q)$

$+ 2 \times 3 \times 4(\sin P + \cos Q + \sin Q\cos P) = 37$

$\Rightarrow \quad 24[\sin(P+Q)] = 37 - 25$

$\Rightarrow \quad \sin(P+Q) = \frac{1}{2}$

Since, P and Q are angles of ΔPQR, hence

$$0° < P + Q < \pi$$

$\Rightarrow \quad P + Q = \frac{\pi}{6}$ or $\frac{5\pi}{6}$

$\Rightarrow \quad R = \frac{5\pi}{6}$ or $\frac{\pi}{6}$

Hence, 2 cases arise here.

***Case* I** $\quad R = \frac{5\pi}{6}$

$\Rightarrow \quad P + Q = \frac{\pi}{6}$

$\Rightarrow \quad 0° < P, Q < \frac{\pi}{6}$

$\Rightarrow \quad \sin P < \frac{1}{2}, \cos Q < 1$

$\Rightarrow \quad 3\sin P + 4\cos Q < \frac{3}{2} + 4$

$\Rightarrow \quad 3\sin P + 4\cos Q < \frac{11}{2} < 6$

$\Rightarrow \quad 3\sin P + 4\cos Q = 6$ is not possible.

***Case* II** $\quad R = \frac{\pi}{6}$

Hence, $R = \frac{\pi}{6}$ is the only possibility.

13. $A = \sin^2 x + \cos^4 x$

$\Rightarrow \quad A = 1 - \cos^2 x + \cos^4 x$

$$= \cos^4 x - \cos^2 x + \frac{1}{4} + \frac{3}{4}$$

$$= \left(\cos^2 x - \frac{1}{2}\right)^2 + \frac{3}{4} \quad \text{...(i)}$$

where, $\quad 0 \le \left(\cos^2 x - \frac{1}{2}\right)^2 \le \frac{1}{4} \quad$ ...(ii)

$\therefore \quad \frac{3}{4} \le A \le 1$

14. $\sin\theta + \sin 4\theta + \sin 7\theta = 0$

$\Rightarrow \quad \sin 4\theta + (\sin\theta + \sin 7\theta) = 0$

$\Rightarrow \quad \sin 4\theta + 2\sin 4\theta \cdot \cos 3\theta = 0$

$\Rightarrow \quad \sin 4\theta \{1 + 2\cos 3\theta\} = 0$

$\Rightarrow \quad \sin 4\theta = 0$ and $\cos 3\theta = -\frac{1}{2}$

As $\quad 0 < \theta < \pi$

$\therefore \quad 0 < 4\theta < 4\pi$

$\therefore \quad 4\theta = \pi, 2\pi, 3\pi$

$$\cos 3\theta = -\frac{1}{2}$$

$$0 < 3\theta < 3\pi$$

$\Rightarrow \quad 3\theta = \frac{2\pi}{3}, \frac{4\pi}{3}, \frac{8\pi}{3}$

$\Rightarrow \quad \theta = \frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4}, \frac{2\pi}{9}, \frac{4\pi}{9}, \frac{8\pi}{9}$

15. $\cos(\alpha+\beta) = \frac{4}{5} \quad \Rightarrow \quad \alpha + \beta \in$ 1st quadrant

and $\quad \sin(\alpha - \beta) = \frac{5}{13} \quad \Rightarrow \quad \alpha - \beta \in$ 1st quadrant

$\Rightarrow \quad 2\alpha = (\alpha+\beta) + (\alpha-\beta)$

$\therefore \quad \tan 2\alpha = \frac{\tan(\alpha+\beta) + \tan(\alpha-\beta)}{1 - \tan(\alpha+\beta)\tan(\alpha-\beta)}$

$$= \frac{\frac{3}{4} + \frac{5}{12}}{1 - \frac{3}{4}\cdot\frac{5}{12}} = \frac{56}{33}$$

16. $\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta) = -\frac{3}{2}$

$\Rightarrow \quad 2[\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta)] + 3 = 0$

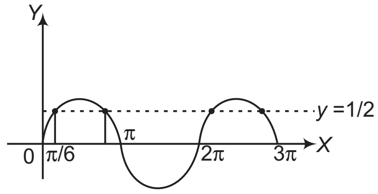
$\Rightarrow \quad 2[\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta)]$
$+ \sin^2\alpha + \cos^2\alpha + \sin^2\beta + \cos^2\beta$
$+ \sin^2\gamma + \cos^2\gamma = 0$

$\Rightarrow (\sin\alpha + \sin\beta + \sin\gamma)^2 + (\cos\alpha + \cos\beta + \cos\gamma)^2 = 0$

17. Given equation is $2\sin^2 x + 5\sin x - 3 = 0$

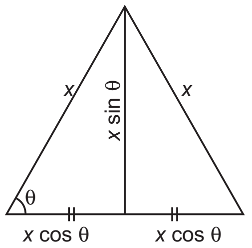
$\Rightarrow \quad (2\sin x - 1)(\sin x + 3) = 0$

$\Rightarrow \quad \sin x = \frac{1}{2} \quad [\because \sin x \ne -3]$



It is clear from figure that the curve intersect the line at four points in the given interval. Hence, number of solutions are 4.

18. Area $= \frac{1}{2} \times$ Base $\times$ Altitude



$$= \frac{1}{2} \times (2x\cos\theta) \times (x\sin\theta) = \frac{1}{2}x^2 \sin 2\theta$$

[since, maximum value of $\sin 2\theta$ is 1]

$\therefore \quad$ Maximum area $= \frac{1}{2}x^2$

19. Given, $\cos x + \sin x = \frac{1}{2}$

$\therefore \quad \frac{1 - \tan^2\frac{x}{2}}{1 + \tan^2\frac{x}{2}} + \frac{2\tan\frac{x}{2}}{1 + \tan^2\frac{x}{2}} = \frac{1}{2}$

Let $\quad \tan\frac{x}{2} = t$

$\Rightarrow \quad \frac{1 - t^2}{1 + t^2} + \frac{2t}{1 + t^2} = \frac{1}{2}$

$\Rightarrow \quad 3t^2 - 4t - 1 = 0$

$\Rightarrow \quad t = \frac{2 \pm \sqrt{7}}{3}$

As $\quad 0 < x < \pi \quad \Rightarrow \quad 0 < \frac{x}{2} < \frac{\pi}{2}$

Since, $\tan\frac{x}{2}$ is positive.

$\therefore \quad t = \tan\frac{x}{2} = \frac{2+\sqrt{7}}{3}$

Now, $\tan x = \dfrac{2\tan\frac{x}{2}}{1-\tan^2\frac{x}{2}} = \dfrac{2t}{1-t^2}$

$\Rightarrow \quad \tan x = \dfrac{2\left(\frac{2+\sqrt{7}}{3}\right)}{1-\left(\frac{2+\sqrt{7}}{3}\right)^2}$

$\Rightarrow \quad \tan x = -\dfrac{2+\sqrt{7}}{1+2\sqrt{7}} \times \dfrac{1-2\sqrt{7}}{1-2\sqrt{7}}$

$\Rightarrow \quad \tan x = -\left(\dfrac{4+\sqrt{7}}{3}\right)$

20. Given, $\sin\alpha + \sin\beta = -\frac{21}{65}$ ...(i)

and $\cos\alpha + \cos\beta = -\frac{27}{65}$ ...(ii)

On squaring and adding Eqs. (i) and (ii), we get

$\sin^2\alpha + \sin^2\beta + 2\sin\alpha\sin\beta + \cos^2\alpha + \cos^2\beta + 2\cos\alpha\cos\beta$

$= \left(-\frac{21}{65}\right)^2 + \left(-\frac{27}{65}\right)^2$

$\Rightarrow \quad 2 + 2(\cos\alpha\cos\beta + \sin\alpha\sin\beta) = \frac{441}{4225} + \frac{729}{4225}$

$\Rightarrow \quad 2[1+\cos(\alpha-\beta)] = \frac{1170}{4225}$

$\Rightarrow \quad \cos^2\left(\frac{\alpha-\beta}{2}\right) = \frac{1170}{4\times 4225}$

$\Rightarrow \quad \cos^2\left(\frac{\alpha-\beta}{2}\right) = \frac{9}{130}$

$\Rightarrow \quad \cos\left(\frac{\alpha-\beta}{2}\right) = -\frac{3}{\sqrt{130}}$

$\left[\because \pi < \alpha-\beta < 3\pi \Rightarrow \frac{\pi}{2} < \frac{\alpha-\beta}{2} < \frac{3\pi}{2}\right]$

21. Given, $f(x) = \sin x - \sqrt{3}\cos x + 1$

Since, $-2 \le \sin x - \sqrt{3}\cos x \le 2$

$\Rightarrow \quad -1 \le \sin x - \sqrt{3}\cos x + 1 \le 3$

$\therefore$ Range of $f(x) = [-1, 3]$

22. Since, $\sin^2\theta \le 1$

$\Rightarrow \quad \frac{4xy}{(x+y)^2} \le 1 \quad \left[\because \sin^2\theta = \frac{4xy}{(x+y)^2}, \text{given}\right]$

$\Rightarrow \quad x^2 + y^2 + 2xy - 4xy \ge 0$

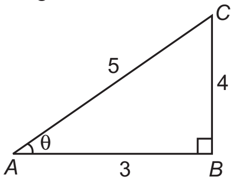
$\Rightarrow \quad (x-y)^2 \ge 0$

which is true for all real values of x and y provided $x + y \ne 0$, otherwise $\frac{4xy}{(x+y)^2}$ will be meaningless.

23. We know that,

$$\frac{1-\tan^2 15^\circ}{1+\tan^2 15^\circ} = \cos 30^\circ = \frac{\sqrt{3}}{2}$$

24. Since, $\tan\theta = -\frac{4}{3}$



$\therefore \quad \sin\theta = \frac{BC}{AC} = \frac{4}{5}$

But $\tan\theta$ is negative which is possible only, if θ lies in second and fourth quadrants.

$\therefore \quad \sin\theta$ may be $\frac{4}{5}$ or $-\frac{4}{5}$.

25. Since, $\sin(\alpha+\beta) = 1$

$\Rightarrow \quad \alpha + \beta = \frac{\pi}{2}$ ...(i)

and $\sin(\alpha-\beta) = \frac{1}{2}$

$\Rightarrow \quad \alpha - \beta = \frac{\pi}{6}$ ...(ii)

On solving Eqs. (i) and (ii), we get

$\alpha = \frac{\pi}{3}$ and $\beta = \frac{\pi}{6}$

$\therefore \quad \tan(\alpha+2\beta)\tan(2\alpha+\beta)$

$= \tan\left(\frac{2\pi}{3}\right)\tan\left(\frac{5\pi}{6}\right)$

$= \tan\left(\pi - \frac{\pi}{3}\right)\tan\left(\pi - \frac{\pi}{6}\right)$

$= \left(-\tan\frac{\pi}{3}\right)\left(-\tan\frac{\pi}{6}\right) = \frac{1}{\sqrt{3}} \times \sqrt{3} = 1$

26. Given, $y = \sin^2\theta + \operatorname{cosec}^2\theta$

$\therefore \quad y = (\sin\theta - \operatorname{cosec}\theta)^2 + 2$

$\Rightarrow \quad y \ge 2, \theta \ne 0$

27. Since, $|c| > \sqrt{a^2+b^2}$

$\Rightarrow \quad c < -\sqrt{a^2+b^2}$ and $c > \sqrt{a^2+b^2}$

But $-\sqrt{a^2+b^2} \le a\sin x + b\cos x \le \sqrt{a^2+b^2}$ ...(i)

and $a\sin x + b\cos x = c$ ...(ii)

From Eqs. (i) and (ii), we see that no solution exist.

28. Since, α is a root of $25\cos^2\theta + 5\cos\theta - 12 = 0$

$\therefore \quad 25\cos^2\alpha + 5\cos\alpha - 12 = 0$

$\Rightarrow \quad (5\cos\alpha - 3)(5\cos\alpha + 4) = 0$

$\Rightarrow \quad \cos\alpha = -\frac{4}{5}, \frac{3}{5}$

But $\frac{\pi}{2} < \alpha < \pi$ i.e. in IInd quadrant.

$\therefore \quad \cos\alpha = -\frac{4}{5}$ and $\sin\alpha = \frac{3}{5}$

Now, $\sin 2\alpha = 2\sin\alpha\cos\alpha$

$= 2 \times \frac{3}{5} \times \left(-\frac{4}{5}\right) = -\frac{24}{25}$

29. We know that, $\sin n\pi = 0, \forall n \in N$

$$\therefore \quad E = \sum_{n=1}^{\infty} \sin\left(\frac{n!\pi}{720}\right) = \sin\left(\frac{\pi}{720}\right) + \sin\left(\frac{2!\pi}{720}\right) + \sin\left(\frac{3!\pi}{720}\right) + \sin\left(\frac{4!\pi}{720}\right) + \sin\left(\frac{5!\pi}{720}\right) + \sin\left(\frac{6!\pi}{720}\right) + \ldots + \sin\left(\frac{720!\pi}{720}\right)$$

$$= \sin\left(\frac{\pi}{720}\right) + \sin\left(\frac{\pi}{360}\right) + \sin\left(\frac{\pi}{120}\right) + \sin\left(\frac{\pi}{30}\right) + \sin\left(\frac{\pi}{6}\right) + \sin\pi + \ldots + \sin\left(\frac{720!\pi}{720}\right)$$

Here, we see that after five terms of the above series, all angles are multiples of π i.e. $\sin n\pi$, so all further values are zero.

$$\therefore \quad E = \sin\left(\frac{\pi}{720}\right) + \sin\left(\frac{\pi}{360}\right) + \sin\left(\frac{\pi}{120}\right) + \sin\left(\frac{\pi}{30}\right) + \sin\left(\frac{\pi}{6}\right)$$

30. Given, $\cos x = \tan y$, $\cot y = \tan z$ and $\cot z = \tan x$

$$\therefore \quad \cos x = \tan y \Rightarrow \cos x = \frac{1}{\tan z}$$

$$\Rightarrow \quad \cos x = \cot z \Rightarrow \cos x = \tan x$$

$$\Rightarrow \cos x = \sin x / \cos x \Rightarrow \cos^2 x = \sin x$$

$$\Rightarrow \quad 1 - \sin^2 x = \sin x \Rightarrow \sin^2 x + \sin x - 1 = 0$$

$$\therefore \quad \sin x = \frac{-1 \pm \sqrt{1 - 4 \times (-1)}}{2 \times 1} = \frac{-1 \pm \sqrt{5}}{2}$$

$$\Rightarrow \quad \sin x = \frac{\sqrt{5} - 1}{2} \quad \left[\because \frac{-1 - \sqrt{5}}{2} < -1\right]$$

31. $$2\cot^2\left(\frac{\pi}{6}\right) + 4\tan^2\left(\frac{\pi}{6}\right) - 3\operatorname{cosec}\frac{\pi}{6} = 2(\sqrt{3})^2 + 4\left(\frac{1}{\sqrt{3}}\right)^2 - 3(2) = 2 \times 3 + \frac{4}{3} - 6 = \frac{4}{3}$$

32. $$\cos\left(\frac{29\pi}{3}\right) = \cos\left[\frac{(27+2)\pi}{3}\right] = \cos\left(9\pi + \frac{2\pi}{3}\right)$$

$$= -\cos\frac{2\pi}{3} = -\cos\left(\frac{\pi}{2} + \frac{\pi}{6}\right) = \sin\frac{\pi}{6} = \frac{1}{2}$$

33. Given, $\sin\theta = \sin\alpha$

$$\therefore \quad \sin\theta - \sin\alpha = 0$$

$$\Rightarrow \quad 2\cos\left(\frac{\theta + \alpha}{2}\right)\sin\left(\frac{\theta - \alpha}{2}\right) = 0$$

It is not necessary that $\frac{\theta + \alpha}{2}$ is odd multiple of $\frac{\pi}{2}$ and $\frac{\theta - \alpha}{2}$ is any multiple of π should be simultaneously hold good for the above equation to be true. Hence, correct answer should be $\frac{\theta + \alpha}{2}$ is odd multiple of $\frac{\pi}{2}$ or $\frac{\theta - \alpha}{2}$ is any multiple of π.

34. $\tan 81^\circ - \tan 63^\circ - \tan 27^\circ + \tan 9^\circ$

$$= (\tan 81^\circ + \tan 9^\circ) - [\tan(63^\circ) + \tan(27^\circ)]$$

$$= \left[\frac{\sin 81^\circ}{\cos 81^\circ} + \frac{\sin 9^\circ}{\cos 9^\circ}\right] - \left[\frac{\sin 63^\circ}{\cos 63^\circ} + \frac{\sin 27^\circ}{\cos 27^\circ}\right]$$

$$= \left[\frac{\sin 81^\circ \cos 9^\circ + \sin 9^\circ \cos 81^\circ}{\cos 9^\circ \cos 81^\circ}\right] - \left[\frac{\sin 63^\circ \cos 27^\circ + \sin 27^\circ \cos 63^\circ}{\cos 27^\circ \cos 63^\circ}\right]$$

$$= \frac{[\sin(81^\circ + 9^\circ)]}{\cos 9^\circ \cos(90^\circ - 9^\circ)} - \frac{[\sin(63^\circ + 27^\circ)]}{\cos 27^\circ \cos(90^\circ - 27^\circ)}$$

$$= \frac{\sin 90^\circ}{\cos 9^\circ \sin 9^\circ} - \frac{\sin 90^\circ}{\cos 27^\circ \sin 27^\circ}$$

$$= \frac{1}{\sin 9^\circ \cos 9^\circ} \times \frac{2}{2} - \frac{1}{\sin 27^\circ \cos 27^\circ} \times \frac{2}{2}$$

$$= \frac{2}{\sin 18^\circ} - \frac{2}{\sin 54^\circ}$$

$$= 2\left[\frac{\sin 54^\circ - \sin 18^\circ}{\sin 18^\circ \sin 54^\circ}\right] = 2\left[\frac{2\cos 36^\circ \sin 18^\circ}{\sin 18^\circ \cos 36^\circ}\right] = 4$$

35. Given, $\sin A + \cos A = \sqrt{2}$

$$\therefore \quad \frac{1}{\sqrt{2}}\sin A + \frac{1}{\sqrt{2}}\cos A = 1$$

$$\Rightarrow \quad \sin\frac{\pi}{4}\sin A + \cos A \cos\frac{\pi}{4} = 1$$

$$\Rightarrow \quad \cos\left(A - \frac{\pi}{4}\right) = 1$$

$$\Rightarrow \quad A - \frac{\pi}{4} = 0 \Rightarrow A = \frac{\pi}{4}$$

Now, $$\cos^2 A = \cos^2\frac{\pi}{4} = \left(\frac{1}{\sqrt{2}}\right)^2 = \frac{1}{2}$$

36. The given equation is $8x^2 - 26x + 15 = 0$.

The sum of roots,

$$\tan\frac{\alpha}{2} + \tan\frac{\beta}{2} = \frac{26}{8} = \frac{13}{4}$$

and product of roots,

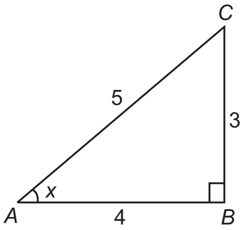
$$\tan\frac{\alpha}{2}\tan\frac{\beta}{2} = \frac{15}{8}$$

$$\therefore \quad \tan\left(\frac{\alpha + \beta}{2}\right) = \frac{\tan\frac{\alpha}{2} + \tan\frac{\beta}{2}}{1 - \tan\frac{\alpha}{2}\tan\frac{\beta}{2}} = \frac{\frac{13}{4}}{1 - \frac{15}{8}} = -\frac{26}{7}$$

Now, $$\cos(\alpha + \beta) = \frac{1 - \tan^2\left(\frac{\alpha + \beta}{2}\right)}{1 + \tan^2\left(\frac{\alpha + \beta}{2}\right)} \quad \left[\because \cos 2\theta = \frac{1 - \tan^2\theta}{1 + \tan^2\theta}\right]$$

$$= \frac{1 - \left(-\frac{26}{7}\right)^2}{1 + \left(-\frac{26}{7}\right)^2} = \frac{49 - 676}{49 + 676} = -\frac{627}{725}$$

37. Given, $\tan x = \dfrac{3}{4}, \pi < x < \dfrac{3\pi}{2} \quad \Rightarrow \quad \cos x = -\dfrac{4}{5}$



$$\because \qquad 1 + \cos x = 2\cos^2\left(\frac{x}{2}\right)$$

$$\therefore \qquad 1 - \frac{4}{5} = 2\cos^2\left(\frac{x}{2}\right)$$

$$\Rightarrow \qquad \frac{1}{5} = 2\cos^2\left(\frac{x}{2}\right)$$

$$\Rightarrow \qquad \cos^2\left(\frac{x}{2}\right) = \frac{1}{10}$$

$$\Rightarrow \qquad \cos\left(\frac{x}{2}\right) = \pm\frac{1}{\sqrt{10}}$$

$$\Rightarrow \qquad \cos\left(\frac{x}{2}\right) = -\frac{1}{\sqrt{10}} \qquad \left[\because \frac{\pi}{2} < \frac{x}{2} < \frac{3\pi}{4}\right]$$

38. Let $\dfrac{2\pi r}{7} = \theta \quad \Rightarrow \quad 2\pi r = 3\theta + 4\theta$

$$\Rightarrow \qquad 4\theta = 2\pi r - 3\theta$$

$$\Rightarrow \qquad \sin 4\theta = \sin(2\pi r - 3\theta)$$

$$\Rightarrow \qquad \sin 4\theta = -\sin 3\theta$$

$$\Rightarrow \qquad 2\sin 2\theta \cos 2\theta = -[3\sin\theta - 4\sin^3\theta]$$

$$\Rightarrow \qquad 2 \times 2\sin\theta\cos\theta\,(2\cos^2\theta - 1)$$

$$= -3\sin\theta + 4\sin^3\theta$$

$$\Rightarrow \quad \sin\theta\,[8\cos^3\theta - 4\cos\theta + 3 - 4(1-\cos^2\theta)) = 0$$

$$\Rightarrow \qquad 8\cos^3\theta + 4\cos^2\theta - 4\cos\theta - 1 = 0 \quad \ldots\text{(i)}$$

Thus, $\quad \cos\dfrac{2\pi}{7}, \cos\dfrac{4\pi}{7}$

and $\quad \cos\dfrac{6\pi}{7}$ are the roots of Eq. (i).

$$\therefore \qquad \cos\frac{2\pi}{7} + \cos\frac{4\pi}{7} + \cos\frac{6\pi}{7} = -\frac{1}{2}$$

39. $\tan\dfrac{\pi}{5} + 2\tan\dfrac{2\pi}{5} + 4\cot\dfrac{4\pi}{5}$

$$= \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + 2\frac{\sin\frac{2\pi}{5}}{\cos\frac{2\pi}{5}} + 4\frac{\cos\frac{4\pi}{5}}{\sin\frac{4\pi}{5}}$$

$$= \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + 2\frac{\sin\frac{2\pi}{5}}{\cos\frac{2\pi}{5}} + \frac{4\left(\cos^2\frac{2\pi}{5} - \sin^2\frac{2\pi}{5}\right)}{2\sin\frac{2\pi}{5}\cos\frac{2\pi}{5}}$$

$$= \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + 2\frac{\sin\frac{2\pi}{5}}{\cos\frac{2\pi}{5}} + \frac{2\left(\cos^2\frac{2\pi}{5} - \sin^2\frac{2\pi}{5}\right)}{\sin\frac{2\pi}{5}\cos\frac{2\pi}{5}}$$

$$= \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + 2\left[\frac{\sin^2\frac{2\pi}{5} + \cos^2\frac{2\pi}{5} - \sin^2\frac{2\pi}{5}}{\cos\frac{2\pi}{5}\sin\frac{2\pi}{5}}\right]$$

$$= \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + \frac{2\cos\frac{2\pi}{5}}{\sin\frac{2\pi}{5}} = \frac{\sin\frac{\pi}{5}}{\cos\frac{\pi}{5}} + \frac{2\left(\cos^2\frac{\pi}{5} - \sin^2\frac{\pi}{5}\right)}{2\sin\frac{\pi}{5}\cos\frac{\pi}{5}}$$

$$= \frac{\sin^2\frac{\pi}{5} + \cos^2\frac{\pi}{5} - \sin^2\frac{\pi}{5}}{\sin\frac{\pi}{5}\cos\frac{\pi}{5}} = \frac{\cos^2\frac{\pi}{5}}{\sin\frac{\pi}{5}\cos\frac{\pi}{5}} = \cot\frac{\pi}{5}$$

40. Given, $\cos x + \cos y = \dfrac{3}{2}$

$$\Rightarrow \qquad 2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) = \frac{3}{2} \qquad \ldots\text{(i)}$$

and $\sin x + \sin y = \dfrac{3}{4}$

$$\Rightarrow \qquad 2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) = \frac{3}{4} \qquad \ldots\text{(ii)}$$

On dividing Eq. (ii) by Eq. (i), we get

$$\frac{2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)}{2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)} = \frac{3/4}{3/2}$$

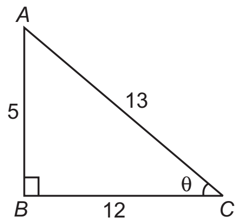
$$\Rightarrow \qquad \tan\left(\frac{x+y}{2}\right) = \frac{1}{2}$$

$$\therefore \qquad \sin(x+y) = \frac{2\tan\left(\frac{x+y}{2}\right)}{1+\tan^2\left(\frac{x+y}{2}\right)} = \frac{2\times\frac{1}{2}}{1+\left(\frac{1}{2}\right)^2}$$

$$= \frac{4}{4+1} = \frac{4}{5}$$

41. Given, $\tan x = \dfrac{5}{12}$ and x is in IIIrd quadrant.

$$\therefore \quad \sin x = \frac{-5}{13} \text{ and } \cos x = \frac{-12}{13}$$



Now, $\quad \cos x = 2\cos^2\dfrac{x}{2} - 1$

$$\Rightarrow \qquad \cos^2\frac{x}{2} = \frac{1}{2}(\cos x + 1)$$

$$= \frac{1}{2}\left(\frac{-12}{13} + 1\right) = \frac{1}{2}\left(\frac{1}{13}\right) = \frac{1}{26}$$

$$\therefore \qquad \cos\frac{x}{2} = \sqrt{\frac{1}{26}}$$

42. $\sin\dfrac{\pi}{2n} + \cos\dfrac{\pi}{2n} = \dfrac{\sqrt{n}}{2}$

On squaring both sides, we get

$$\sin^2\frac{\pi}{2n} + \cos^2\frac{\pi}{2n} + 2\sin\frac{\pi}{2n}\cos\frac{\pi}{2n} = \frac{n}{4}$$

$$\Rightarrow \qquad 1 + \sin\frac{2\pi}{2n} = \frac{n}{4} \Rightarrow 1 + \sin\frac{\pi}{n} = \frac{n}{4}$$

Consider $n = 6$

$\therefore \quad 1 + \sin\frac{\pi}{6} = \frac{6}{4} \Rightarrow 1 + \frac{1}{2} = \frac{6}{4}$

$\Rightarrow \quad \frac{3}{2} = \frac{3}{2}$ [satisfy]

$\therefore \quad 4 < n < 8$

43. We know that,

$$\cos x \cos\left(\frac{\pi}{3} - x\right)\cos\left(\frac{\pi}{3} + x\right) = \frac{1}{4}\cos 3\theta$$

But it is given that

$$\cos x \cos\left(\frac{\pi}{3} - x\right)\cos\left(\frac{\pi}{3} + x\right) = \frac{1}{4}$$

$\therefore \quad \cos 3\theta = 1$

$\Rightarrow \quad 3\theta = 2\pi, 4\pi$

$\Rightarrow \quad \theta = \frac{2\pi}{3}, \frac{4\pi}{3}$

$\therefore$ Sum of solutions $= \frac{2\pi}{3} + \frac{4\pi}{3} = \frac{6\pi}{3} = 2\pi$

44. We know that,

Range of $\sin x \in [-1, 1]$

Range of $\cos x \in [-1, 1]$

Range of $\sec x \in (-\infty, -1] \cup [1, \infty)$

and range of $\operatorname{cosec} x \in (-\infty, -1] \cup [1, \infty)$

45. $\sin 2\alpha = \sin\{(\alpha + \beta) + (\alpha - \beta)\}$

$= \sin(\alpha + \beta)\cos(\alpha - \beta) + \cos(\alpha + \beta)\sin(\alpha - \beta)$ ... (i)

Now, $\sin(\alpha + \beta) = \sqrt{1 - \cos^2(\alpha + \beta)}$

$= \sqrt{1 - \frac{9}{25}} = \frac{4}{5}$ $\left[\because 0 < \alpha + \beta < \frac{\pi}{2}\right]$

and $\sin(\alpha - \beta) = \sqrt{1 - \cos^2(\alpha - \beta)}$

$= \sqrt{1 - \frac{16}{25}} = \frac{3}{5}$ $\left[\because 0 < \alpha - \beta < \frac{\pi}{4}\right]$

From Eq. (i), we have

$$\sin 2\alpha = \frac{4}{5} \cdot \frac{4}{5} + \frac{3}{5} \cdot \frac{3}{5} = \frac{16}{25} + \frac{9}{25} = \frac{25}{25} = 1$$

46. $\tan^2 x = \frac{\sqrt{2} - 1}{\sqrt{2} + 1} = (\sqrt{2} - 1)^2 = \tan^2\frac{\pi}{8}$

$\Rightarrow \quad \tan x = \tan\left(\pm\frac{\pi}{8}\right) \Rightarrow x = n\pi \pm \frac{\pi}{8}$

47. $(1 - \cos 2x)(\cos 2x + \cot^2 x) = 0 \Rightarrow \cos 2x = 1$

$\Rightarrow \quad x = 0, \pi, 2\pi$

But for all values of x, $\cot x$ is not defined.

Hence, no solution exist.

48. $\log_{\cos x} \sin x - 1 + \log_{\sin x} \cos x - 1 = 0$

or $\quad y + \frac{1}{y} - 2 = 0$, where $y = \log_{\cos x} \sin x$

$\therefore \quad (y - 1)^2 = 0 \Rightarrow \log_{\cos x} \sin x = 1$

$\Rightarrow \quad \sin x = \cos x \Rightarrow \tan x = 1$

$\Rightarrow \quad x = n\pi + \frac{\pi}{4}$

Also, $\sin x, \cos x, \tan x, \cot x$ must be positive and $\sin x \ne 1$, $\cos x \ne 1$.

$\therefore \quad x = 2n\pi + \frac{\pi}{4}, n \in Z$

49. Given, $x^3 + x^2 + 4x + 2\sin x = 0$

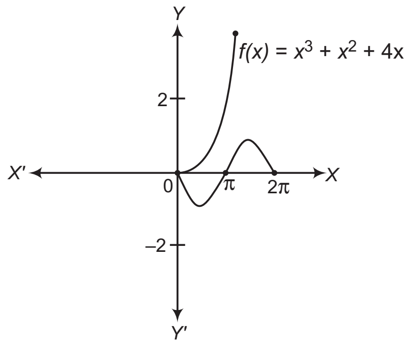
$\Rightarrow \quad x^3 + x^2 + 4x = -2\sin x$

As $\quad x \in [0, 2\pi], \sin x \in [-1, 1]$

$\Rightarrow \quad -2\sin x \in [-2, 2]$

Now, consider $f(x) = x^3 + x^2 + 4x$

$\Rightarrow \quad f'(x) = 3x^2 + 2x + 4$



Here, $\quad a > 0, D = 4 - 4(3)(4) < 0$

$\therefore \quad f'(x) > 0, \forall x$

So, $f(x)$ is a strictly increasing function.

Now, $\quad f(0) = 0$

As evident from graph, $-2\sin x$ and $x^3 + x^2 + 4x$ will intersect only at $x = 0$.

$\therefore$ Number of solutions $= 1$

50. Given,

$$(\sin 3x + \sin x) - 3\sin 2x = (\cos 3x + \cos x) - 3\cos 2x$$

$\Rightarrow \quad 2\sin 2x \cos x - 3\sin 2x = 2\cos 2x \cos x - 3\cos 2x$

$\Rightarrow \quad \sin 2x(2\cos x - 3) = \cos 2x(2\cos x - 3)$

$\Rightarrow (2\cos x - 3)(\sin 2x - \cos 2x) = 0$

$\therefore \quad \cos x = \frac{3}{2}$, which is not possible. $[\because -1 \le \cos x \le 1]$

$\therefore \quad \sin 2x = \cos 2x$

$\Rightarrow \quad \tan 2x = 1 = \tan\frac{\pi}{4}$

$\Rightarrow \quad 2x = n\pi + \frac{\pi}{4}$

$\therefore \quad x = \frac{n\pi}{2} + \frac{\pi}{8}$ for n integers

51. Given, $\sin A + \sin B + \sin C = 3$

$\therefore \quad \sin A = \sin B = \sin C = 1$ $[\because -1 \le \sin x \le 1]$

$\Rightarrow \quad A = B = C = \frac{\pi}{2}$

$\Rightarrow \quad \cos A + \cos B + \cos C = 0$

52. Let $a = \cos\alpha + i\sin\alpha, b = \cos\beta + i\sin\beta$

and $\quad c = \cos\gamma + i\sin\gamma$

Then, $a + 2b + 3c = (\cos\alpha + 2\cos\beta + 3\cos\gamma) + i(\sin\alpha + 2\sin\beta + 3\sin\gamma) = 0$

We know that, $\quad a^3 + 8b^3 + 27c^3 = 18abc$

$\therefore \quad \cos 3\alpha + 8\cos 3\beta + 27\cos 3\gamma = 18\cos(\alpha + \beta + \gamma)$

and $\quad \sin 3\alpha + 8\sin 3\alpha + 27\sin 3\gamma$

$= 18\sin(\alpha + \beta + \gamma) = 18\sin\pi = 0$

53. Given, $\dfrac{\cos A}{\cos B} = m$

On applying componendo and dividendo rule, we get

$$\frac{\cos A + \cos B}{\cos A - \cos B} = \frac{m+1}{m-1}$$

$$\Rightarrow \frac{2\cos\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right)}{2\sin\left(\frac{A+B}{2}\right)\sin\left(\frac{B-A}{2}\right)} = \frac{m+1}{m-1}$$

$$\Rightarrow \quad \lambda = \frac{m+1}{m-1} \Rightarrow \frac{\cot\left(\frac{A+B}{2}\right)}{\tan\left(\frac{B-A}{2}\right)} = \frac{m+1}{m-1}$$

54. Consider, $3\sin^2\theta + 4\cos^2\theta$

$= 3\sin^2\theta + 3\cos^2\theta + \cos^2\theta = 3 + \cos^2\theta$

We know that, least value of $\cos^2\theta$ is 0.

Hence, least value of $3\sin^2\theta + 4\cos^2\theta$ is 3.

55. We have, $\sin 2x = 4\cos x \Rightarrow 2\sin x\cos x = 4\cos x$

$$\Rightarrow \quad \cos x(\sin x - 2) = 0$$

$$\Rightarrow \quad \cos x = 0 \quad [\because \sin x \neq 2]$$

$$\Rightarrow \quad \cos x = 0 = \cos \pi/2$$

$$\Rightarrow \quad x = 2n\pi \pm \frac{\pi}{2}, n \in Z$$

56. We have, $\tan x + \sec x = 2\cos x$

$$\Rightarrow \quad \frac{\sin x}{\cos x} + \frac{1}{\cos x} = 2\cos x$$

$$\Rightarrow \quad \sin x + 1 = 2\cos^2 x = 2(1-\sin^2 x) = 2 - 2\sin^2 x$$

$$\Rightarrow \quad 2\sin^2 x + \sin x - 1 = 0$$

$$\Rightarrow \quad (\sin x + 1)(2\sin x - 1) = 0$$

$$\Rightarrow \quad \sin^2 x = -1, \text{ which is not possible.} \quad [\because 0 \le x \le \pi]$$

or $\quad \sin x = \dfrac{1}{2} \Rightarrow x = \dfrac{\pi}{6}, \dfrac{5\pi}{6}$

$\because \quad x \in [0, \pi]$

Hence, the number of solutions is 2.

57. Consider, $\cos\theta + \sqrt{3}\sin\theta = 2$

$$\Rightarrow \quad \frac{1}{2}\cos\theta + \frac{\sqrt{3}}{2}\sin\theta = 1$$

$$\Rightarrow \quad \cos 60°\cos\theta + \sin 60°\sin\theta = 1$$

$$\Rightarrow \quad \cos(60° - \theta) = 1 = \cos 0° \Rightarrow 60° - \theta = 0°$$

$$\therefore \quad \theta = 60°$$

58. Given, $\sin\theta = 2t/1 + t^2$

$\because \quad \cos\theta < 0$

$$\Rightarrow \quad \cos\theta = -\sqrt{1-\sin^2\theta}$$

$$= -\sqrt{1 - \frac{4t^2}{(1+t^2)^2}} = -\frac{|1-t^2|}{1+t^2}$$

59. $\because \dfrac{\sin\theta}{\sin(\theta + 2\alpha)} = \dfrac{3}{1}$

On applying componendo and dividendo rule, we get

$$\frac{\sin\theta + \sin(\theta + 2\alpha)}{\sin\theta - \sin(\theta + 2\alpha)} = \frac{3+1}{3-1}$$

$$\Rightarrow \quad \frac{2\sin(\theta + \alpha)\cos\alpha}{-2\cos(\theta + \alpha)\sin\alpha} = 2$$

$$\Rightarrow \quad -\tan(\theta + \alpha)\cot\alpha = 2$$

$$\Rightarrow \quad \tan(\theta + \alpha) + 2\tan\alpha = 0$$

60. Since, α, β and γ are in AP.

$$\therefore \quad 2\beta = \alpha + \gamma$$

Now, $$\frac{\sin\alpha - \sin\gamma}{\cos\gamma - \cos\alpha} = \frac{2\cos\left(\frac{\alpha+\gamma}{2}\right)\sin\left(\frac{\alpha-\gamma}{2}\right)}{2\sin\left(\frac{\alpha+\gamma}{2}\right)\sin\left(\frac{\alpha-\gamma}{2}\right)}$$

$$= \cot\left(\frac{\alpha+\gamma}{2}\right) = \cot\left(\frac{2\beta}{2}\right) \quad [\because 2\beta = \alpha + \gamma]$$

$$= \cot\beta$$

61. $\because \sec A = \dfrac{\sec(A-B) + \sec(A+B)}{2}$

$$= \frac{\cos(A+B) + \cos(A-B)}{2\cos(A+B)\cos(A-B)}$$

$$= \frac{\cos A\cos B}{[\cos^2 A\cos^2 B - \sin^2 A\sin^2 B]}$$

$$\Rightarrow \sec A = \frac{\cos A\cos B}{[\cos^2 A\cos^2 B - (1-\cos^2 A)(1-\cos^2 B)]}$$

$$\Rightarrow \quad \cos^2 A + \cos^2 B - 1 = \cos^2 A\cos B$$

$$\Rightarrow \quad \cos^2 A = 1 + \cos B \quad \Rightarrow \quad \cos^2 A = 2\cos^2\frac{B}{2}$$

$$\Rightarrow \quad \sec^2 A = \frac{1}{2}\sec^2\frac{B}{2} \quad \Rightarrow \quad 2\sec^2 A = \sec^2\frac{B}{2}$$

62. $\because \sin\theta = \dfrac{1}{2} = \sin\dfrac{\pi}{6} \quad \Rightarrow \quad \theta = \dfrac{\pi}{6}, \pi - \dfrac{\pi}{6}$

and $\tan\theta = \dfrac{1}{\sqrt{3}} = \tan\dfrac{\pi}{6} \quad \Rightarrow \quad \theta = \dfrac{\pi}{6}, \pi + \dfrac{\pi}{6}$

$\therefore$ Common value of θ is $\dfrac{\pi}{6}$.

$\therefore$ General value of θ is $2n\pi + \dfrac{\pi}{6}$, $\forall\, n \in I$.

63. Consider, $\sin 5\theta - \sin 3\theta + \sin\theta = 0$

$$\Rightarrow \quad 2\cos 4\theta\sin\theta + \sin\theta = 0$$

$$\Rightarrow \quad \sin\theta(2\cos 4\theta + 1) = 0$$

$$\Rightarrow \quad \cos 4\theta = -\frac{1}{2} \quad \left[\because \sin\theta \neq 0, \text{ for } 0 < \theta < \frac{\pi}{2}\right]$$

$$\Rightarrow \quad \cos 4\theta = \cos\frac{2\pi}{3} = \cos\frac{4\pi}{3}$$

$$\therefore \quad \theta = \frac{\pi}{6} \text{ or } \frac{\pi}{3}$$

64. Note that maximum value of $2\sin x + \cos x$

$$= \sqrt{2^2 + 1^2} = \sqrt{5} = 2.236$$

Hence, $2\sin x + \cos x$ has no solution.

65. Given, $\sin\theta + \cos\theta = 0 \Rightarrow \tan\theta = -1$

$$\therefore \quad \theta = \frac{3\pi}{4} \in (0, \pi)$$

66. $\cos^4 x + \sin^4 x = 2\cos(2x + \pi)\cos(2x - \pi)$

$$\Rightarrow (\cos^2 x + \sin^2 x)^2 - 2\sin^2 x\cos^2 x = \cos 4x + \cos 2\pi$$

$$\Rightarrow \quad 1 - \frac{1}{2}\sin^2 2x = \cos 4x + 1$$

$$\Rightarrow -\frac{1}{2}\left(\frac{1-\cos 4x}{2}\right) = \cos 4x \Rightarrow -\frac{1}{4} = \frac{3}{4}\cos 4x$$

$$\Rightarrow \quad \cos 4x = -\frac{1}{3} \quad \Rightarrow \quad \sin 4x = \pm\frac{2\sqrt{2}}{3}$$

$$\Rightarrow \quad x = \frac{2n\pi}{4} \pm \frac{1}{4}\cos^{-1}\left(-\frac{1}{3}\right)$$

$$\Rightarrow \quad x = \frac{n\pi}{4} + \frac{(-1)^n}{4}\sin^{-1}\left(\pm\frac{2\sqrt{2}}{3}\right)$$

67. Let $\Delta = \begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix}$

On applying $R_1 \to R_1 + R_2 + R_3$ and taking common from R_1, we get

$$\Delta = (\sin x + \cos x + \cos x)\begin{vmatrix} 1 & 1 & 1 \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix}$$

On applying $C_2 \to C_2 - C_1, C_3 \to C_3 - C_1$, we get

$$\Delta = (\sin x + 2\cos x)\begin{vmatrix} 1 & 0 & 1 \\ \cos x & \sin x - \cos x & \cos x \\ \cos x & 0 & \sin x - \cos x \end{vmatrix}$$

$\Rightarrow \quad 0 = (\sin x + 2\cos x)1\,[(\sin x - \cos x)^2]$

$\Rightarrow \quad \tan x = -2, \tan x = 1$

or $\quad x = \frac{\pi}{4}, \tan^{-1}(-2)$

Hence, two values of x exist in the interval $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

68. Given, $\cos A = \frac{3}{5}$ and $\cos B = \frac{4}{5}$

$\because \quad \angle A$ and $\angle B$ lie on IVth quadrant.

$\therefore \quad \sin A = -\sqrt{1 - \frac{9}{25}}$

and $\quad \sin B = -\sqrt{1 - \frac{16}{25}}$

$\Rightarrow \quad \sin A = -\frac{4}{5}$

and $\quad \sin B = -\frac{3}{5}$

Now, $\quad 2\sin A + 4\sin B = 2\left(-\frac{4}{5}\right) + 4\left(-\frac{3}{5}\right)$

$$= -\frac{8}{5} - \frac{12}{5} = -\frac{20}{5} = -4$$

69. $\frac{\cot 54°}{\tan 36°} + \frac{\tan 20°}{\cot 70°} = \frac{\cot(90° - 36°)}{\tan 36°} + \frac{\tan 20°}{\cot(90° - 20°)}$

$$= \frac{\tan 36°}{\tan 36°} + \frac{\tan 20°}{\tan 20°}$$

$$= 1 + 1 = 2$$

70. $\because \tan 60° = \tan(40° + 20°)$

$\Rightarrow \quad \sqrt{3} = \frac{\tan 40° + \tan 20°}{1 - \tan 40° \tan 20°}$

$\Rightarrow \quad \sqrt{3} - \sqrt{3}\tan 40° \tan 20° = \tan 40° + \tan 20°$

$\therefore \quad \tan 40° + \tan 20° + \sqrt{3}\tan 40° \tan 20° = \sqrt{3}$

71. $\frac{\sin 55° - \cos 55°}{\sin 10°} = \frac{\sin 55° - \sin 35°}{\sin 10°}$

$$= \frac{2\cos 45° \sin 10°}{\sin 10°} = \sqrt{2}$$

72. Given, $\cos(\alpha + \beta) = -\frac{12}{13}$

Here, $\quad 0 < (\alpha + \beta) < \pi$

$\therefore \quad \sin(\alpha + \beta) = \sqrt{1 - \cos^2(\alpha + \beta)}$

$$= \sqrt{1 - \frac{144}{169}} = \frac{5}{13}$$

Now, $\quad \sin\beta = \sin[(\alpha + \beta) - \alpha]$

$$= \sin(\alpha + \beta)\cos\alpha - \cos(\alpha + \beta)\sin\alpha$$

$$= \frac{5}{13} \cdot \frac{3}{5} - \left(-\frac{12}{13}\right) \cdot \frac{4}{5} = \frac{15}{65} + \frac{48}{65} = \frac{63}{65}$$

73. Given, $\tan\alpha = \frac{b}{a}, \sqrt{\frac{a+b}{a-b}} - \sqrt{\frac{a-b}{a+b}} = \sqrt{\frac{1 + \frac{b}{a}}{1 - \frac{b}{a}}} - \sqrt{\frac{1 - \frac{b}{a}}{1 + \frac{b}{a}}}$

$$= \sqrt{\frac{1 + \tan\alpha}{1 - \tan\alpha}} - \sqrt{\frac{1 - \tan\alpha}{1 + \tan\alpha}} = \frac{(1 + \tan\alpha) - (1 - \tan\alpha)}{\sqrt{1 - \tan^2\alpha}}$$

$$= \frac{2\tan\alpha}{\sqrt{1 - \tan^2\alpha}} = \frac{2\sin\alpha}{\sqrt{\cos 2\alpha}}$$

74. $\frac{\cot x - \tan x}{\cot 2x} = \tan 2x\left(\cot x - \frac{1}{\cot x}\right)$

$$= \tan 2x\left(\frac{\cot^2 x - 1}{\cot x}\right)$$

$$= \tan 2x\left(\frac{\cot^2 x - 1}{2\cot x}\right) \cdot 2$$

$$= \tan 2x \cot 2x \cdot 2 = 2$$

75. $\because \sin x = \frac{1}{2}$

$\Rightarrow \quad \sin x = \sin\frac{\pi}{6}$

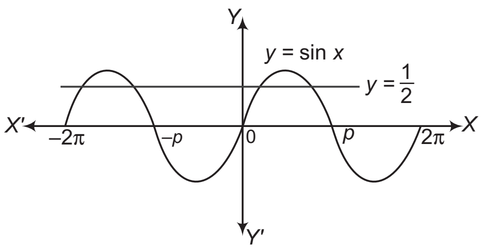
$\Rightarrow \quad x = n\pi + (-1)^n \frac{\pi}{6}$

For $\; -2\pi \le x \le 2\pi$,

$$x = \frac{\pi}{6}, \frac{5\pi}{6}, -\frac{7\pi}{6}, -\frac{11\pi}{6}$$

$\therefore$ Number of points of intersection of two given curves $= 4$

Aliter



So, the number of points of intersection is 4.

76. $\because 2\sin x \cos x = \frac{1}{2}$

$\Rightarrow \quad \sin 2x = \frac{1}{2} = \sin\frac{\pi}{6}$

$\Rightarrow \quad 2x = n\pi + (-1)^n \frac{\pi}{6}$

$\Rightarrow \quad x = \frac{n\pi}{2} + (-1)^n \frac{\pi}{12}$

For $\quad x \in \left(0, \frac{\pi}{2}\right), \; x = \frac{\pi}{12}$ $\quad$ [for $n = 0$]

77. $\because \cos 2\theta = \sin\theta$

$\Rightarrow \quad 1 - 2\sin^2\theta = \sin\theta$

$\Rightarrow \quad 2\sin^2\theta + \sin\theta - 1 = 0$

$\Rightarrow \quad 2\sin^2\theta + 2\sin\theta - \sin\theta - 1 = 0$

$\Rightarrow \quad 2\sin\theta(\sin\theta + 1) - (\sin\theta + 1) = 0$

$\Rightarrow (\sin\theta + 1)(2\sin\theta - 1) = 0$

$\Rightarrow \quad \sin\theta = -1 \quad \text{and} \quad \sin\theta = \dfrac{1}{2}$

$\Rightarrow \quad \sin\theta = \sin\dfrac{3\pi}{2}$

and $\quad \sin\theta = \sin\dfrac{\pi}{6}$

$\Rightarrow \quad \theta = n\pi + (-1)^n \dfrac{3\pi}{2}$

and $\quad \theta = m\pi + (-1)^m \dfrac{\pi}{6}$

For $\theta \in (0, 2\pi)$,

$$\theta = \frac{3\pi}{2}, \frac{\pi}{6}, \frac{5\pi}{6}$$

Hence, the number of solutions is 3.

78. $\because \sin 6\theta + \sin 4\theta + \sin 2\theta = 0$

$\Rightarrow (\sin 6\theta + \sin 2\theta) + \sin 4\theta = 0$

$\Rightarrow \quad 2\sin 4\theta \cos 2\theta + \sin 4\theta = 0$

$\Rightarrow \quad \sin 4\theta(2\cos 2\theta + 1) = 0$

Either $\quad \sin 4\theta = 0$

or $\quad \cos 2\theta = -\dfrac{1}{2}$

When $\sin 4\theta = 0$, then

$$4\theta = n\pi$$

$\Rightarrow \quad \theta = \dfrac{n\pi}{4}$

When $\cos 2\theta = -\dfrac{1}{2} = \cos\dfrac{2\pi}{3}$, then

$$2\theta = 2n\pi \pm \frac{2\pi}{3}$$

$\Rightarrow \quad \theta = n\pi \pm \dfrac{\pi}{3}$

10

Properties of Triangles, Heights and Distances

Introduction

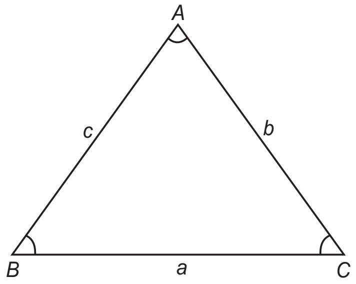
Properties of triangle is a part of trigonometry, which is a branch of Mathematics. In which we study about triangles and relationships between their sides and angles.

Height and distance is an application of trigonometry. Here, with the help of trigonometry, we find the height of any object or distance of any object from any point/object which cannot be measured directly.

Relation between the Sides and Angles of Triangle

In a ΔABC, the angles are denoted by capital letters A, B and C and the lengths of the sides opposite to these angles are denoted by small letters a, b and c, respectively. Semi-perimeter of the triangle is written as

$$s = \frac{a+b+c}{2} \text{ and its area denoted by } s \text{ or } \Delta.$$



- *The longest side of a triangle have corresponding largest angle and vice-versa.*
- *The smallest side of a triangle have corresponding smallest angle and vice-versa.*

Chapter Snapshot

Sine rule In any ΔABC, the sines of the angles are proportional to the lengths of the opposite sides i.e.

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

$$\Rightarrow \quad \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k \quad \text{[say]}$$

Then, $a = k \sin A, b = k \sin B, c = k \sin C$

Cosine rule In any ΔABC, cosine of an angle can be expressed in terms of sides.

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}, \cos B = \frac{a^2 + c^2 - b^2}{2ac},$$

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

Projection formula In any ΔABC,

$$a = b \cos C + c \cos B$$
$$b = a \cos C + c \cos A$$
$$c = a \cos B + b \cos A$$

Napier's analogy In any ΔABC,

$$\tan\left(\frac{A-B}{2}\right) = \frac{a-b}{a+b} \cot\frac{C}{2}$$

$$\tan\left(\frac{B-C}{2}\right) = \frac{b-c}{b+c} \cot\frac{A}{2}$$

$$\tan\left(\frac{C-A}{2}\right) = \frac{c-a}{c+a} \cot\frac{B}{2}$$

Example 1. *The sides of a triangle are 8 cm, 10 cm and 12 cm. Then, the greatest angle is*

(a) triple of the smallest angle
(b) double of the smallest angle
(c) equal to the smallest angle
(d) None of the above

Sol. (b) Let $a = 8$ cm, $b = 10$ cm and $c = 12$ cm. Then, greatest angle is C and the smallest angle is A. Applying cosine rule, we get

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{64 + 100 - 144}{2 \cdot 8 \cdot 10} = \frac{1}{8}$$

and $$\cos A = \frac{b^2 + c^2 - a^2}{2bc} = \frac{100 + 144 - 64}{2 \cdot 10 \cdot 12} = \frac{3}{4}$$

Now, $\cos 2A = 2\cos^2 A - 1 = 2 \cdot \frac{9}{16} - 1 = \frac{1}{8}$

$$\Rightarrow \quad \cos C = \cos 2A$$
$$\Rightarrow \quad C = 2A$$

Thus, the greatest angle is double of the smallest angle.

Example 2. *If k is the perimeter of ΔABC, then $b \cos^2 \frac{C}{2} + c \cos^2 \frac{B}{2}$ is equal to*

(a) k
(b) $2k$
(c) $\frac{k}{2}$
(d) None of the above

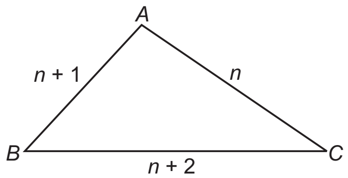
Sol. (c) $b \cos^2 \frac{C}{2} + c \cos^2 \frac{B}{2}$

$$= \frac{b}{2}(1 + \cos C) + \frac{c}{2}(1 + \cos B)$$
$$= \frac{b}{2} + \frac{c}{2} + \frac{1}{2}(b \cos C + c \cos B)$$
$$= \frac{a + b + c}{2} = \frac{k}{2}$$

Example 3. *The sides of a triangle are three consecutive natural numbers and its largest angles is twice the smallest one. Then, the sides of the triangle are*

(a) 3, 4, 5 *(b)* 4, 5, 6
(c) 2, 5, 3 *(d)* 4, 3, 7

Sol. (b) Let the sides be $AC = n$, $AB = n + 1$, $BC = n + 2$. Smallest angle is B and the largest one is A.



$$\Rightarrow \quad A = 2B$$

Also, $$A + B + C = 180^\circ$$

$$\Rightarrow \quad 3B + C = 180^\circ$$
$$\Rightarrow \quad C = 180^\circ - 3B$$

We have, $$\frac{\sin A}{n+2} = \frac{\sin B}{n} = \frac{\sin C}{n+1}$$

$$\Rightarrow \quad \frac{\sin 2B}{n+2} = \frac{\sin B}{n} = \frac{\sin(180^\circ - 3B)}{n+1}$$

$$\Rightarrow \quad \frac{\sin 2B}{n+2} = \frac{\sin B}{n} = \frac{\sin 3B}{n+1}$$

$$\Rightarrow \quad \cos B = \frac{n+2}{2n}$$

and $$\frac{\sin 2B}{n+2} = \frac{3 \sin B - 4 \sin^3 B}{n+1}$$

$$\Rightarrow \quad \frac{2 \cos B}{n+2} = \frac{4\cos^2 B - 1}{n+1}$$

$$\Rightarrow \quad \frac{1}{n} = \frac{\frac{(n+2)^2}{n^2} - 1}{n+1}$$

$$\Rightarrow \quad n = 4$$

Hence, the sides are 4, 5 and 6.

Example 4. *In a ΔABC, $\Sigma (b + c) \tan \frac{A}{2} \tan\left(\frac{B-C}{2}\right)$ is equal to*

(a) a *(b)* b
(c) c *(d)* 0

Sol. (d) Now, $(b + c) \tan \frac{A}{2} \tan\left(\frac{B-C}{2}\right)$

$$= (b + c) \tan\frac{A}{2} \times \frac{b-c}{b+c} \cot\frac{A}{2} = b - c$$

$$\therefore \Sigma (b + c) \tan\left(\frac{B-C}{2}\right) \tan\frac{A}{2} = b - c + c - a + a - b = 0$$

Trigonometric Ratios of Half Angles of a Triangle

In a ΔABC, if the sides of the triangle corresponding to angles A, B and C, are a, b, c respectively and s is the semi-perimeter, then

- $\sin\dfrac{A}{2}=\sqrt{\dfrac{(s-b)(s-c)}{bc}}$, $\sin\dfrac{B}{2}=\sqrt{\dfrac{(s-c)(s-a)}{ca}}$, $\sin\dfrac{C}{2}=\sqrt{\dfrac{(s-a)(s-b)}{ab}}$
- $\cos\dfrac{A}{2}=\sqrt{\dfrac{s(s-a)}{bc}}$, $\cos\dfrac{B}{2}=\sqrt{\dfrac{s(s-b)}{ca}}$, $\cos\dfrac{C}{2}=\sqrt{\dfrac{s(s-c)}{ab}}$
- $\tan\dfrac{A}{2}=\sqrt{\dfrac{(s-b)(s-c)}{s(s-a)}}$, $\tan\dfrac{B}{2}=\sqrt{\dfrac{(s-c)(s-a)}{s(s-b)}}$, $\tan\dfrac{C}{2}=\sqrt{\dfrac{(s-a)(s-b)}{s(s-c)}}$

Area of a Triangle

In a ΔABC, if the sides of the triangle are a, b, c and corresponding angles are A, B and C, respectively, then area of triangle is given by

i. When two sides and angle between them is known, then

$$\Delta=\frac{1}{2}ab\sin C=\frac{1}{2}bc\sin A=\frac{1}{2}ca\sin B$$

ii. When one side and corresponding angles are known, then

$$\Delta=\frac{c^2\sin A\sin B}{2\sin C}=\frac{a^2\sin B\sin C}{2\sin A}=\frac{b^2\sin C\sin A}{2\sin B}$$

iii. When all the three sides are known, then

$$\Delta=\sqrt{s(s-a)(s-b)(s-c)}$$

It is known as Heron's formula.

Example 5. *In a ΔABC, $A=\dfrac{2\pi}{3}$, $b-c=3\sqrt{3}$ cm and $ar(\Delta ABC)=\dfrac{9\sqrt{3}}{2}$ cm^2. Then, a is*

(a) $6\sqrt{3}$ *cm* *(b)* 9 *cm*
(c) 18 *cm* *(d) None of these*

Sol. (b) $\dfrac{1}{2}bc\sin\dfrac{2\pi}{3}=\dfrac{9\sqrt{3}}{2}$

$\Rightarrow \quad \dfrac{1}{2}\cdot\dfrac{\sqrt{3}}{2}\cdot bc=\dfrac{9\sqrt{3}}{2} \Rightarrow bc=18$

Also, $\quad \cos\dfrac{2\pi}{3}=\dfrac{b^2+c^2-a^2}{2bc}$

$\Rightarrow \quad -\dfrac{1}{2}=\dfrac{(b-c)^2+2bc-a^2}{2bc}$

$\Rightarrow (b-c)^2+3bc-a^2=0$

$\Rightarrow 27+54=a^2 \Rightarrow a^2=81 \Rightarrow a=9$ cm

Example 6. *The area of a ΔABC is $a^2-(b-c)^2$. Then,* tan *A is equal to*

(a) $\dfrac{4}{3}$ *(b)* $\dfrac{3}{4}$
(c) $\dfrac{8}{15}$ *(d) None of these*

Sol. (c) Here, $\Delta=a^2-(b-c)^2$

$\Rightarrow \quad \Delta=(2s-2c)(2s-2b)=4(s-b)(s-c)$

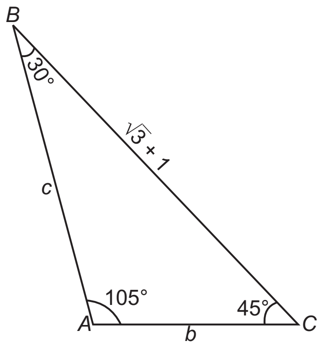
$\therefore \quad \dfrac{1}{4}=\dfrac{(s-b)(s-c)}{\Delta}=\tan\dfrac{A}{2}$

$\Rightarrow \quad \tan A=\dfrac{2\tan\frac{A}{2}}{1-\tan^2\frac{A}{2}}=\dfrac{2\times\frac{1}{4}}{1-\left(\frac{1}{4}\right)^2}=\dfrac{8}{15}$

Example 7. *If the angles of a triangle are 30° and 45° and the included side is $(\sqrt{3}+1)$ cm, then the area of the triangle (in cm^2) is*

(a) $\dfrac{1}{2}(\sqrt{3}+1)$ *(b)* $\dfrac{1}{4}(\sqrt{3}+1)$
(c) $\dfrac{1}{2}(\sqrt{3}-1)$ *(d)* $\dfrac{1}{4}(\sqrt{3}-1)$

Sol. (a) We have, $\dfrac{\sin A}{a}=\dfrac{\sin B}{b}=\dfrac{\sin C}{c}$



$\Rightarrow \quad \dfrac{\sin 105°}{\sqrt{3}+1}=\dfrac{\sin 30°}{b}=\dfrac{\sin 45°}{c}$

$\Rightarrow \quad b=\dfrac{\sqrt{3}+1}{2\sin 105°}, c=\dfrac{\sqrt{3}+1}{\sqrt{2}\sin 105°}$

Area of $\Delta ABC=\dfrac{1}{2}bc\sin A=\dfrac{1}{2}bc\sin 105°$

$=\dfrac{1}{2}\cdot\dfrac{(\sqrt{3}+1)^2}{2\sqrt{2}\sin(60°+45°)}$

$=\dfrac{(\sqrt{3}+1)^2}{4\sqrt{2}\left[\frac{\sqrt{3}}{2}\cdot\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}}\cdot\frac{1}{2}\right]}=\dfrac{(\sqrt{3}+1)^2}{2(\sqrt{3}+1)}=\dfrac{1}{2}(\sqrt{3}+1)\text{ cm}^2$

Conditional Identities

Some standard identities in triangle are given below :

i.	$\tan A + \tan B + \tan C = \tan A \tan B \tan C$
ii.	$\tan \frac{A}{2} \tan \frac{B}{2} + \tan \frac{C}{2} \tan \frac{B}{2} + \tan \frac{C}{2} \tan \frac{A}{2} = 1$
iii.	$\sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C$
iv.	$\cos 2A + \cos 2B + \cos 2C = -1 - 4 \cos A \cos B \cos C$
v.	$\cos A + \cos B + \cos C = 1 + 4 \sin \frac{A}{2} \sin \frac{B}{2} \sin \frac{C}{2}$
vi.	$\sin A + \sin B + \sin C = 4 \cos \frac{A}{2} \cos \frac{B}{2} \cos \frac{C}{2}$

Example 8. *If A, B, C are vertices of triangle, then* $\cos^2 A + \cos^2 B + \cos^2 C + 2 \cos A \cos B \cos C$ *is equal to*

(a) 1 *(b)* -1
(c) 0 *(d)* None of these

Sol. (a) Consider, $\cos^2 A + \cos^2 B + \cos^2 C$

$$= \frac{1 + \cos 2A}{2} + \frac{1 + \cos 2B}{2} + \frac{1 + \cos 2C}{2}$$
$$= \frac{1}{2}(\cos 2A + \cos 2B + \cos 2C) + \frac{3}{2}$$
$$= \frac{1}{2}(-1 - 4 \cos A \cos B \cos C) + \frac{3}{2}$$
$$= 1 - 2 \cos A \cos B \cos C$$

Solution of Triangles

The three sides a, b, c and the three angles A, B, C are called the elements of the ΔABC. When any three of these six elements (except all the three angles) of a triangle are given, the triangle is known completely; that is the other three elements can be expressed in terms of the given elements and can be evaluated. This process is called the solution of triangles.

i. If the three sides a, b and c are given, then angle A is obtained from

$$\tan \frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} \quad \text{or}$$

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

B and C can be obtained in a similar way.

ii. If two sides b and c and the included angle A are given, then $\tan\left(\frac{B-C}{2}\right) = \frac{b-c}{b+c} \cot \frac{A}{2}$ gives $\frac{B-C}{2}$.

Also, $\frac{B+C}{2} = 90° - \frac{A}{2}$, so B and C can be evaluated.

The third side is given by

$$a = b \frac{\sin A}{\sin B}$$

or $$a^2 = b^2 + c^2 - 2bc \cos A$$

iii. If two sides b and c and the angle B (opposite to side b) are given, then

$\sin C = \frac{c}{b} \sin B$, $A = 180° - (B + C)$ and $a = \frac{b \sin A}{\sin B}$ give the remaining elements. If $b < c \sin B$, then no triangle is possible (Fig. 1). If $b = c \sin B$ and B is an acute angle, then there is only one triangle possible (Fig. 2). If $c \sin B < b < c$ and B is an acute angle, then there are two values of $\angle C$ (Fig. 3). If $c \sin B < b$, $c < b$ and B is an acute angle, then there is only one triangle (Fig. 4).

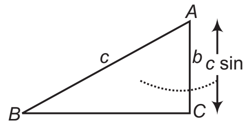


Fig. 1

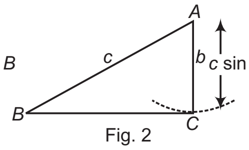

Fig. 2

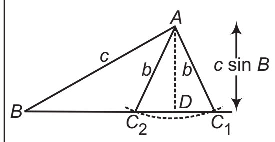

Fig. 3

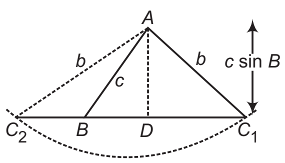

Fig. 4

This is, sometimes called an ambiguous case.

Aliter

By applying cosine rule, we have

$$\cos B = \frac{a^2 + c^2 - b^2}{2ac}$$

$$\Rightarrow \quad a^2 - (2c \cos B)a + (c^2 - b^2) = 0$$

$$\Rightarrow \quad a = c \cos B \pm \sqrt{(c \cos B)^2 - (c^2 - b^2)}$$

$$\Rightarrow \quad a = c \cos B \pm \sqrt{b^2 - (c \sin B)^2}$$

This equation leads to following cases:

***Case* I** If $b < c \sin B$, no such triangle is possible.

***Case* II** Let $b = c \sin B$.

There are further following cases :

(a) B is an obtuse angle $\Rightarrow \cos B$ is negative. There exists no such triangle.

(b) B is an acute angle $\Rightarrow \cos B$ is positive. There exists only one such triangle.

***Case* III** Let $b > c\sin B$.

There are further following cases:

(a) B is an acute angle $\Rightarrow \cos B$ is positive. In this case two values of a will exists if and only if $c\cos B > \sqrt{b^2 - (c\sin B)^2}$ or $c > b$

$\Rightarrow$ Two such triangle is possible. If $c < b$, only one such triangle is possible.

(b) B is an obtuse angle $\Rightarrow \cos B$ is negative. In this case triangle will exists if and only if $\sqrt{b^2 - (c\sin B)^2} > |c\cos B| \Rightarrow b > c$.

So, in this case only one such triangle is possible. If $b < c$, there exists no such triangle.

- *If one side a and angles B and C are given, then* $A = 180° - (B + C), b = \dfrac{a\sin B}{\sin A}$ *and* $c = \dfrac{a\sin C}{\sin A}$
- *If the three angles A, B and C are given, we can only find the ratios of the sides a, b and c by using sine rule (since, there are infinite similar triangles possible).*

Example 9. *In any ΔABC, the sides are 6 cm, 10 cm and 14 cm. Then, the triangle is obtuse angled with the obtuse angle equals*

(a) 180° *(b)* 90°
(c) 120° *(d)* 160°

Sol. (c) Let $a = 14, b = 10, c = 6 \Rightarrow s = \dfrac{14 + 10 + 6}{2} = 15$

The largest angle is opposite to the longest side. Then,

$$\tan\frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} = \sqrt{\frac{5\times 9}{15}} = \sqrt{3}$$

$$\Rightarrow \frac{A}{2} = 60°$$

$$\therefore A = 120°$$

Aliter

By cosine rule, $\cos A = \dfrac{b^2 + c^2 - a^2}{2bc} = \dfrac{100 + 36 - 196}{120} = -\dfrac{1}{2}$

$$\Rightarrow A = 120°$$

Example 10. *Two sides of a triangle are $\sqrt{3} - 1$ and $\sqrt{3} + 1$ units and their included angle is 60°. Then, the third side of the triangle is*

(a) $\sqrt{6}$ *(b)* $\sqrt{8}$
(c) $1 + \sqrt{6}$ *(d)* $\sqrt{5}$

Sol. (a) Let $A = 60° \Rightarrow B + C = 120°$

Then, $\tan\left(\dfrac{B - C}{2}\right) = \dfrac{b - c}{b + c}\cot\dfrac{A}{2}$

$$= \frac{\sqrt{3} + 1 - \sqrt{3} + 1}{\sqrt{3} + 1 + \sqrt{3} - 1}\cot 30° = 1$$

$$\Rightarrow \frac{B - C}{2} = 45°$$

$$\Rightarrow B - C = 90°$$

$$\Rightarrow B = 105°, C = 15°$$

Also, $a = b\dfrac{\sin A}{\sin B} = \dfrac{(\sqrt{3} + 1)\sin 60°}{\sin 105°} = \dfrac{(\sqrt{3} + 1)\sin 60°}{\sin(60° + 45°)}$

$$= \frac{(\sqrt{3} + 1)\sin 60°}{\sin 60°\cos 45° + \cos 60°\sin 45°}$$

$$= \frac{\sqrt{2}(\sqrt{3} + 1)\sqrt{3}}{\sqrt{3} + 1} = \sqrt{6}$$

Aliter

By cosine rule, $a^2 = b^2 + c^2 - 2bc\cos A$

$$= (\sqrt{3} + 1)^2 + (\sqrt{3} - 1)^2 - 2(\sqrt{3} + 1)(\sqrt{3} - 1)\cos 60°$$

$$= 8 - 4\cdot\frac{1}{2} = 6$$

$$\Rightarrow a = \sqrt{6}$$

Example 11. *If a, b and A are given in a triangle and c_1, c_2 are the possible values of the third side, then $c_1^2 + c_2^2 - 2c_1c_2\cos 2A$ is equal to*

(a) $a^2\cos^2 A$ *(b)* $4b^2\cos^2 A$
(c) $4a^2\cos^2 A$ *(d) None of these*

Sol. (c) $\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$

$$\Rightarrow c^2 - 2bc\cos A + b^2 - a^2 = 0$$

$$\Rightarrow c_1 + c_2 = 2b\cos A \quad \text{and} \quad c_1c_2 = b^2 - a^2$$

$$\Rightarrow c_1^2 + c_2^2 - 2c_1c_2\cos 2A = (c_1 + c_2)^2 - 2c_1c_2(1 + \cos 2A)$$

$$= 4b^2\cos^2 A - 2(b^2 - a^2)2\cos^2 A$$

$$= 4a^2\cos^2 A$$

Work Book Exercise 10.1

1 In $\Delta ABC, \dfrac{\sin B}{\sin(A + B)}$ is equal to

a $\dfrac{b}{a + b}$
b $\dfrac{b}{c}$
c $\dfrac{c}{b}$
d None of the above

2 In $\Delta ABC, c\cos(A - \alpha) + a\cos(C + \alpha)$ is equal to

a $a\cos\alpha$ b $b\cos\alpha$ c $c\cos\alpha$ d $2b\cos\alpha$

3 If in ΔABC, $a = 6$ cm, $b = 8$ cm, $c = 10$ cm, then the value of $\sin 2A$ is

a $\dfrac{6}{25}$ b $\dfrac{8}{25}$
c $\dfrac{10}{25}$ d $\dfrac{24}{25}$

4 If $A = 45°$, $B = 75°$, then $a + c\sqrt{2}$ is equal to

a $2b$ b $3b$ c $\sqrt{2}b$ d b

5 In a ΔABC, AD is the altitude from A. Given $b > c$, $C = 23°$ and $AD = \dfrac{abc}{b^2 - c^2}$, then $\angle B$ is equal to

a $23°$ b $113°$
c $67°$ d $90°$

6 If $4\sin A = 4\sin B = 3\sin C$ in a ΔABC, then $\cos A$ is equal to

a $\frac{1}{3}$ b $\frac{1}{9}$
c $\frac{1}{27}$ d $\frac{1}{18}$

7 In an acute angled ΔABC, the least value of $\sec A + \sec B + \sec C$ is

a 6 b 3 c 9 d 4

8 In a ΔABC, if $\dfrac{\cos A}{a} = \dfrac{\cos B}{b} = \dfrac{\cos C}{c}$ and the sides $a = 2$, then area of triangle is

a 1 b 2 c $3\sqrt{2}$ d $\sqrt{3}$

9 In ΔABC, $a^2 + b^2 + c^2 = ac + ab\sqrt{3}$, then triangle is

a equilateral b isosceles
c Right angled d None of these

10 If the line segment joining the points $A(a, b)$ and $B(c, d)$ subtends an angle θ at the origin, then $\cos\theta$ is equal to

a $\dfrac{ab + cd}{\sqrt{(a^2 + b^2)(c^2 + d^2)}}$

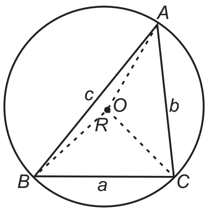
b $\dfrac{ac + bd}{\sqrt{(a^2 + b^2)(c^2 + d^2)}}$

c $\dfrac{ac - bd}{\sqrt{(a^2 + b^2)(c^2 + d^2)}}$

d None of the above

Circles Connected with Triangle

i. **Circumcircle of a triangle** The circle passing through the vertices of a ΔABC is called circumcircle. Its radius R is called the circumradius and its centre is known as circumcentre. Circumcentre is the point of intersection of perpendicular bisectors of the sides.

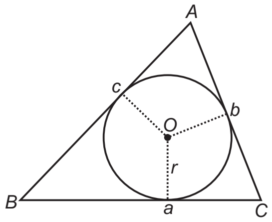


In ΔABC,

(a) $R = \dfrac{a}{2\sin A} = \dfrac{b}{2\sin B} = \dfrac{c}{2\sin C}$

(b) $R = \dfrac{abc}{4\Delta}$

ii. **Incircle of a triangle** The circle touching all the sides of a triangle internally is known as an incircle of the triangle. Its centre is called incentre and its radius r is called the inradius of the circle. Incentre is the point of intersection of bisectors of the angles of the triangle.



In ΔABC,

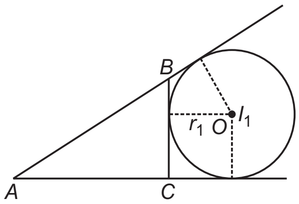
(a) $r = \dfrac{\Delta}{s}$

(b) $r = (s - a)\tan\dfrac{A}{2} = (s - b)\tan\dfrac{B}{2} = (s - c)\tan\dfrac{C}{2}$

(c) $r = \dfrac{a\sin\frac{B}{2}\sin\frac{C}{2}}{\cos\frac{A}{2}} = \dfrac{b\sin\frac{A}{2}\sin\frac{C}{2}}{\cos\frac{B}{2}} = \dfrac{c\sin\frac{B}{2}\sin\frac{A}{2}}{\cos\frac{C}{2}}$

(d) $r = 4R\sin\dfrac{A}{2}\sin\dfrac{B}{2}\sin\dfrac{C}{2}$

iii. **Escribed circles of a triangle** The circle touching BC and the two sides AB and AC produced of ΔABC externally is called the escribed circle opposite to A. Its radius is denoted by r_1. The centre of this circle is known as excentre and denoted by I. It is the point, where the external bisectors of the $\angle B$ and $\angle C$ and the internal bisector of the $\angle A$ meet.



Similarly, r_2 and r_3 denote the radii of the escribed circles opposite to the angles B and C, respectively and excentres are denoted by I_2 and I_3. r_1, r_2 and r_3 are called the exradii of ΔABC. Here,

(a) $r_1 = \dfrac{\Delta}{s-a} = s\tan\dfrac{A}{2}$

$$= 4R\sin\frac{A}{2}\cos\frac{B}{2}\cos\frac{C}{2} = \frac{a\cos\frac{B}{2}\cos\frac{C}{2}}{\cos\frac{A}{2}}$$

(b) $r_2 = \dfrac{\Delta}{s-b} = s\tan\dfrac{B}{2}$

$$= 4R\sin\frac{B}{2}\cos\frac{C}{2}\cos\frac{A}{2} = \frac{b\cos\frac{A}{2}\cos\frac{C}{2}}{\cos\frac{B}{2}}$$

(c) $r_3 = \dfrac{\Delta}{s-c} = s\tan\dfrac{C}{2}$

$$= 4R\sin\frac{C}{2}\cos\frac{A}{2}\cos\frac{B}{2} = \frac{c\cos\frac{A}{2}\cos\frac{B}{2}}{\cos\frac{C}{2}}$$

- $r_1 + r_2 + r_3 = 4R + r$
- $r_1r_2 + r_2r_3 + r_3r_1 = s^2 = \dfrac{r_1r_2r_3}{r}$
- $\dfrac{1}{r_1} + \dfrac{1}{r_2} + \dfrac{1}{r_3} = \dfrac{s}{\Delta} = \dfrac{1}{r}$ and $r_1r_2r_3 = r^2\left(\cot\dfrac{A}{2}\cot\dfrac{B}{2}\cot\dfrac{C}{2}\right)^2$

Example 12. *In any* ΔABC, $a\cos A + b\cos B + c\cos C$ *is equal to*

(a) $4R$ *(b)* $\sin A \sin B \sin C$

(c) $R\sin A\sin B\sin C$ *(d)* $4R\sin A\sin B\sin C$

Sol. (d) $a\cos A + b\cos B + c\cos C$

$= 2R\sin A\cos A + 2R\sin B\cos B + 2R\sin C\cos C$

$[\because a = 2R\sin A, b = 2R\sin B \text{ and } c = 2R\sin C]$

$= R(\sin 2A + \sin 2B + \sin 2C)$

$= R[2\sin(A+B)\cos(A-B) + 2\sin C\cos C]$

$= 2R[\sin(\pi - C)\cos(A-B) + \sin C\cos\{\pi - (A+B)\}]$

$= 2R[\sin C\{\cos(A-B) - \cos(A+B)\}]$

$= 4R\sin A\sin B\sin C$

Example 13. *In a* ΔABC, $\cos A + \cos B + \cos C$ *is equal to*

(a) $\dfrac{r}{R}$ *(b)* $1 - \dfrac{r}{R}$ *(c)* $\dfrac{R}{r}$ *(d)* $1 + \dfrac{r}{R}$

Sol. (d) $\cos A + \cos B + \cos C$

$$= 2\cos\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right) + \cos C$$

$$= 2\cos\left(\frac{\pi}{2} - \frac{C}{2}\right)\cos\left(\frac{A-B}{2}\right) + 1 - 2\sin^2\frac{C}{2}$$

$$= 1 + 2\sin\frac{C}{2}\cos\left(\frac{A-B}{2}\right) - 2\sin^2\frac{C}{2}$$

$$= 1 + 2\sin\frac{C}{2}\left[\cos\left(\frac{A-B}{2}\right) - \sin\frac{C}{2}\right]$$

$$= 1 + 2\sin\frac{C}{2}\left[\cos\left(\frac{A-B}{2}\right) - \cos\left(\frac{A+B}{2}\right)\right]$$

$$= 1 + 4\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}$$

$$= \left(1 + \frac{r}{R}\right) \qquad \left[\because r = 4R\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}\right]$$

Example 14. *If* $r_1 = r_2 + r_3 + r$, *then triangle is*

(a) right angled

(b) obtuse angled

(c) equilateral

(d) None of the above

Sol. (a) $\because r_1 - r = r_2 + r_3$

$$\Rightarrow \frac{\Delta}{s-a} - \frac{\Delta}{s} = \frac{\Delta}{s-b} + \frac{\Delta}{s-c}$$

$$\Rightarrow \frac{s - s + a}{s(s-a)} = \frac{s - c + s - b}{(s-b)(s-c)}$$

$$\Rightarrow \frac{a}{s(s-a)} = \frac{a}{(s-b)(s-c)}$$

$$\Rightarrow s^2 - (b+c)s + bc = s^2 - as$$

$$\Rightarrow s(-a+b+c) = bc$$

$$\Rightarrow \frac{(b+c+a)(b+c-a)}{2} = bc$$

$$\Rightarrow (b+c)^2 - a^2 = 2bc$$

$$\Rightarrow b^2 + c^2 + 2bc - a^2 = 2bc$$

$$\Rightarrow b^2 + c^2 = a^2$$

$$\therefore \angle A = 90^\circ$$

Thus, the triangle is right angled triangle.

Example 15. *If in a triangle, R and r are the circumradius and inradius respectively, then the HM of the exradii of the triangle is*

(a) $3r$ *(b)* $2R$

(c) $R + r$ *(d) None of these*

Sol. (a) $\Sigma\dfrac{1}{r_1} = \Sigma\dfrac{s-a}{\Delta} = \dfrac{3s - (a+b+c)}{\Delta} = \dfrac{s}{\Delta}$

$\therefore$ HM of exradii $= \dfrac{1}{\dfrac{\Sigma 1/r_1}{3}} = \dfrac{3}{s/\Delta} = \dfrac{3\Delta}{s} = 3r$

Example 16. *If the exradii of a triangle are in HP, then the corresponding sides are in*

(a) AP

(b) GP

(c) HP

(d) None of the above

Sol. (a) $\frac{1}{r_1}, \frac{1}{r_2}$ and $\frac{1}{r_3}$ are in AP.

$\Rightarrow \frac{s-a}{\Delta}, \frac{s-b}{\Delta}, \frac{s-c}{\Delta}$ are in AP.

$\Rightarrow s-a, s-b, s-c$ are in AP.

$\Rightarrow -a, -b, -c$ are in AP.

$\Rightarrow a, b, c$ are in AP.

Example 17. *In a ΔABC, the inradius and three exradii are r, r_1, r_2 and r_3, respectively. In usual notations, the value of $r \cdot r_1 \cdot r_2 \cdot r_3$ is equal to*

(a) 2Δ (b) Δ^2

(c) $\frac{abc}{4R}$ (d) None of these

Sol. (b) $r \cdot r_1 \cdot r_2 \cdot r_3 = \frac{\Delta}{s} \cdot \frac{\Delta}{s-a} \cdot \frac{\Delta}{s-b} \cdot \frac{\Delta}{s-c}$

$= \frac{\Delta^4}{\Delta^2} = \Delta^2$

Example 18. *In a right angled triangle, R is equal to*

(a) $\frac{s+r}{2}$ (b) $\frac{s-r}{2}$

(c) $s-r$ (d) $\frac{s+r}{a}$

Sol. (b) In a right angled triangle, the circumcentre lies on the hypotenuse.

$\Rightarrow \quad R = \frac{a}{2}$, where $A = 90°$

Also, $\quad r = (s-a)\tan\frac{A}{2}$

$= (s-a)\tan 45°$

$= (s-a) = s - 2R$

$\Rightarrow \quad r + 2R = s$

$\Rightarrow \quad R = \frac{s-r}{2}$

Example 19. *In a ΔABC, $a = 1$ and the perimeter is six times the AM of the sines of the angles. The measure of $\angle A$ is*

(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{4}$

Sol. (c) $1 + b + c = 6\left(\frac{\sin A + \sin B + \sin C}{3}\right)$

$= 2\left(\frac{1}{2R} + \frac{b}{2R} + \frac{c}{2R}\right)$

$= \frac{1}{R}(1 + b + c)$

$\Rightarrow \quad R = 1 \quad [\because 1 + b + c \neq 0]$

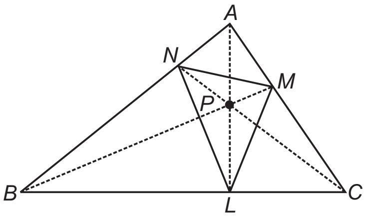
$\because \quad \frac{1}{\sin A} = 2R = 2$

$\Rightarrow \quad \sin A = \frac{1}{2}$

$\Rightarrow \quad A = \frac{\pi}{6}$

The Orthocentre and the Pedal Triangle

Orthocentre is a point P at which all the three altitudes, drawn from the vertices to the opposite sides of the triangle, meet.



The ΔLMN which is formed by joining the feet of these three altitudes is called the pedal triangle.

- *Orthocentre of the triangle is the incentre of the pedal triangle.*
- *If I_1, I_2 and I_3 are the centres of escribed circles which are opposite to A, B and C, respectively and I is the centre of incircle, then ΔABC is the pedal triangle of $\Delta I_1I_2I_3$ and I is the orthocentre of $\Delta I_1I_2I_3$.*
- *The centroid of the triangle lies on the line joining the circumcentre to the orthocentre and divides it in the ratio 1:2.*
- *Circle circumscribing the pedal triangle of a given triangle bisects the sides of the given triangle and also the lines joining the vertices of the given triangle to the orthocentre of the given triangle. This circle is known as nine point circle.*
- *Circumcentre of the pedal triangle of a given triangle bisects the line joining the circumcentre of the triangle to the orthocentre.*

Example 20. *The distance of the orthocentre from the vertices of the triangle are*

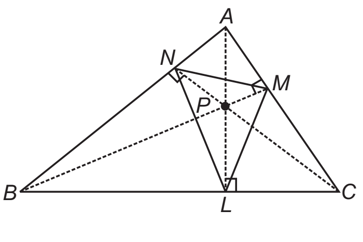
(a) $2R\cos A, 2R\cos B, 2R\cos C$

(b) $2R\sin A, 2R\sin B, 2R\sin C$

(c) $2R\cos A, R\cos B, R\cos C$

(d) $2R\operatorname{cosec} A, 2R\operatorname{cosec} B, 2R\operatorname{cosec} C$

Sol. (a) Let L, M and N be the feet of the altitudes from the vertices A, B and C of the triangle, respectively.



In ΔABL, $\quad BL = c\cos B$

In ΔBPL,

$BP = BL\sec PBL = c\cos B\sec(90° - C)$

$= c\cos B\operatorname{cosec} C = 2R\cos B$

Similarly, $\quad PC = 2R\cos C$ and $PA = 2R\cos A$

Example 21. *$\sin A, \sin B$ and $\sin C$ are in AP for the ΔABC. Then,*
(a) the altitudes are in AP
(b) the altitudes are in HP
(c) the medians are in GP
(d) the medians are in AP

Sol. (b) $\sin A, \sin B, \sin C$ are in AP.

$\Rightarrow \quad \frac{a}{2R}, \frac{b}{2R}, \frac{c}{2R}$ are in AP.

$\Rightarrow \quad a, b$ and c are in AP.

$\Rightarrow \quad \frac{2\Delta}{h_1}, \frac{2\Delta}{h_2}$ and $\frac{2\Delta}{h_3}$ are in AP.

$\Rightarrow \quad \frac{1}{h_1}, \frac{1}{h_2}$ and $\frac{1}{h_3}$ are in AP.

$\Rightarrow \quad h_1, h_2$ and h_3 are in HP.

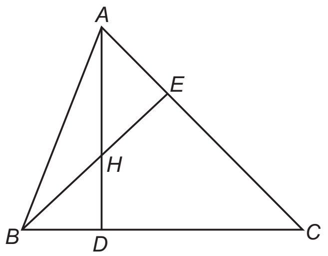
Now, medians are

$$\sqrt{\frac{c^2+b^2}{2}-\frac{a^2}{4}}, \sqrt{\frac{a^2+c^2}{2}-\frac{b^2}{4}}, \sqrt{\frac{a^2+b^2}{2}-\frac{c^2}{4}}$$

These are neither in AP nor GP.

Example 22. *The ratio of the distances of the orthocentre of an acute angled ΔABC from the sides BC, AC and AB is*
(a) $\cos A : \cos B : \cos C$
(b) $\sin A : \sin B : \sin C$
(c) $\sec A : \sec B : \sec C$
(d) None of the above

Sol. (c) $HD = BD \cdot \tan \angle EBC = c \cos B \cdot \tan (90° - C)$



$$= \frac{c \cos B \cdot \cos C}{\sin C}$$

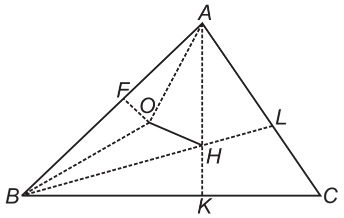
$$= 2R \cos B \cos C$$

$$= \frac{2R \cos A \cos B \cos C}{\cos A}$$

Similarly, for others. So, the ratio of the distances of the orthocentre from the sides $= \frac{1}{\cos A} : \frac{1}{\cos B} : \frac{1}{\cos C}$.

Example 23. *The distance between the circumcentre and the orthocentre of a ΔABC is*
(a) $R\sqrt{1-8\cos A \cos B \cos C}$
(b) $R\sqrt{1+8\cos A \cos B \cos C}$
(c) $R\sqrt{1-4\cos A \cos B \cos C}$
(d) None of the above

Sol. (a) Let O and H be the circumcentre and the orthocentre, respectively. If OF is the perpendicular to AB.



We have,

$\angle OAF = 90° - \angle AOF$
$= 90° - C$

Also, $\angle HAL = 90° - C$

Hence, $\angle OAH = A - \angle OAF - \angle HAL$
$= A - 2(90° - C)$
$= A + 2C - (A + B + C)$
$= C - B$

Also, $OA = R$ and $PA = 2R \cos A$

Now, in ΔAOH,

$OH^2 = OA^2 + PA^2 - 2OA \cdot HA \cos OAH$
$= R^2 + 4R^2 \cos^2 A - 4R^2 \cos A \cos (C - B)$
$= R^2 + 4R^2 \cos A [\cos A - \cos (C - B)]$
$= R^2 - 4R^2 \cos A [\cos (B + C) + \cos (C - B)]$
$= R^2 - 8R^2 \cos A \cos B \cos C$

Hence, $OH = R\sqrt{1 - 8\cos A \cos B \cos C}$

Cyclic Quadrilateral

A cyclic quadrilateral is a quadrilateral which can be circumscribed by a circle.

- *Sum of the opposite angles of a cyclic quadrilateral is 180°.*
- *In a cyclic quadrilateral, sum of the products of the opposite sides is equal to the product of the diagonals. This is known as Ptolemy's theorem.*
- *If sum of the opposite sides of a quadrilateral is equal, then a circle can be inscribed in the quadrilateral.*
- *The area of the cyclic quadrilateral with sides a, b, c and d is $\sqrt{(s-a)(s-b)(s-c)(s-d)}$.*

Example 24. *The area of a cyclic quadrilateral ABCD is $\frac{(3\sqrt{3})}{4}$. The radius of the circle circumscribing cyclic quadrilateral is 1. If $AB = 1$ and $BD = \sqrt{3}$, then $BC \cdot CD$ is equal to*

(a) 2   *(b)* $3 - \frac{1}{\sqrt{3}}$

(c) $2\sqrt{3} + 1$ *(d) None of these*

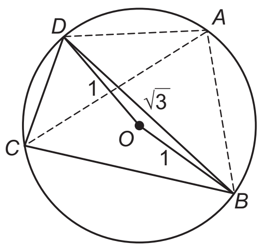
Sol. (a) Clearly, $\angle BOD = 2C$

$\therefore \quad \cos 2C = \frac{1^2 + 1^2 - (\sqrt{3})^2}{2 \cdot 1 \cdot 1}$

$\Rightarrow \quad C = 60°$

$\therefore \quad A = 180° - C = 120°$

So, $\cos 120° = \dfrac{AD^2 + 1^2 - (\sqrt{3})^2}{2 \cdot AD \cdot 1}$



$$\therefore \quad -\frac{1}{2} = \frac{AD^2 - 2}{2AD}$$

$$\Rightarrow \quad AD^2 + AD - 2 = 0$$

$$\Rightarrow \quad AD = 1$$

Now, $\text{ar}(ABCD) = \text{ar}(\Delta ADB) + \text{ar}(\Delta BCD)$

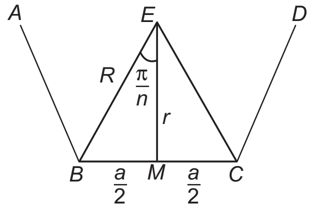
$$\Rightarrow \quad \frac{3\sqrt{3}}{4} = \frac{1}{2} \cdot 1 \cdot 1 \cdot \sin 120° + \frac{1}{2} \cdot BC \cdot CD \cdot \sin 60°$$

$$\Rightarrow \quad BC \cdot CD = 2$$

Regular Polygon

A regular polygon is a polygon which has all its sides as well as all its angles equal. If the polygon has n sides, sum of its internal angles is $(n-2)\pi$ and each angle is $\dfrac{(n-2)\pi}{n}$. The circle passing through all the vertices of a regular polygon is called circumscribed circle and the circle which touches all sides of a regular polygon is called its inscribed circle.

Radius of circumcircle, $R = \dfrac{a}{2} \operatorname{cosec} \dfrac{\pi}{n}$ and radius of incircle, $r = \dfrac{a}{2} \cot \dfrac{\pi}{n}$, where a is the length of the side of a regular polygon.



$$\text{Area of a regular polygon} = \frac{1}{4} na^2 \cot \frac{\pi}{n}$$

$$= nr^2 \tan \frac{\pi}{n}$$

$$= \frac{n}{2} R^2 \sin \frac{2\pi}{n}$$

- *Sum of the exterior angles of a polygon taken in one direction (clockwise or anti-clockwise) remains constant and it is equal to 360°.*
- *In the regular polygon, the centroid, the circumcentre and the incentre are same.*

Example 25. *If the area of circle is A_1 and area of regular pentagon inscribed in the circle is A_2. Then, $\dfrac{A_1}{A_2}$ is equal to*

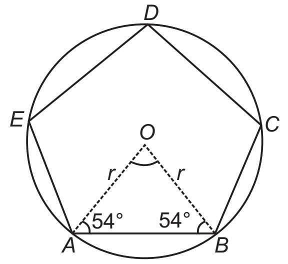
(a) $\dfrac{2\pi}{5}$

(b) $\dfrac{2\pi}{5} \sec \dfrac{\pi}{10}$

(c) $\sec \dfrac{\pi}{10}$

(d) None of the above

Sol. (b) In ΔOAB, $OA = OB = r$ and $\angle AOB = 72°$



$$\therefore \quad \text{Area of } \Delta AOB = \frac{1}{2} r \cdot r \sin 72°$$

$$= \frac{1}{2} r^2 \cos 18°$$

Area of pentagon = 5 (Area of ΔAOB)

$$\Rightarrow \quad A_2 = \frac{5}{2} r^2 \cos 18° \qquad \ldots\text{(i)}$$

Also, we know that,

Area of circle = πr^2

$$\Rightarrow \quad A_1 = \pi r^2 \qquad \ldots\text{(ii)}$$

Thus, $\dfrac{A_1}{A_2} = \dfrac{\pi r^2}{\frac{5}{2} r^2 \cos 18°}$

$$= \frac{2\pi}{5} \sec \frac{\pi}{10}$$

Example 26. *Let A_0, A_1, A_2, A_3, A_4 and A_5 be the consecutive vertices of a regular hexagon inscribed in a unit circle. The product of the lengths of A_0A_1, A_0A_2 and A_0A_4 is*

(a) $\dfrac{3}{4}$ *(b)* $3\sqrt{3}$

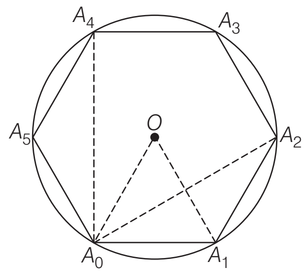
(c) 3 *(d)* $\dfrac{3\sqrt{3}}{2}$

Sol. (c) $\cos 60° = \dfrac{OA_0^2 + OA_1^2 - A_0A_1^2}{2 \cdot OA_0 \cdot OA_1}$

$$\Rightarrow \quad \frac{1}{2} \times 2 \times 1 \times 1 = 2 - A_0A_1^2$$

$$\Rightarrow \quad A_0A_1^2 = 2 - 1 = 1$$

$$\Rightarrow \quad A_0A_1 = A_1A_2$$



$$\cos 120^\circ = \frac{A_0A_1^2 + A_1A_2^2 - A_0A_2^2}{2 \cdot A_0A_1 \cdot A_1A_2}$$

$$= \frac{1+1-A_0A_2^2}{2 \cdot 1 \cdot 1}$$

$\therefore \quad A_0A_2 = \sqrt{3} = A_0A_4$

$\Rightarrow \quad A_0A_1 \times A_0A_2 \times A_0A_4 = 1 \times \sqrt{3} \times \sqrt{3} = 3$

Example 27. *If regular pentagon and a regular decagon have the same perimeter, then the ratio of their areas is*

(a) $1:\sqrt{5}$

(b) $2:\sqrt{5}$

(c) $\sqrt{5}:2$

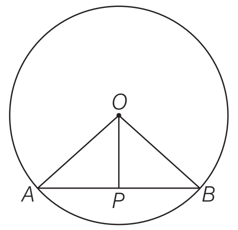
(d) $\sqrt{5}:1$

Sol. (b) Let the perimeter of the pentagon and decagon be $10x$.

Then, each side of the pentagon is $2x$ and its area

$$= 5x^2 \cot \frac{\pi}{5} \quad \ldots \text{(i)}$$

$[\because n = 5 \text{ and } a = 2x]$



Also, as each side of decagon is x, so its area

$$= \frac{5}{2}x^2 \cot \frac{\pi}{10} \quad [\because n = 10 \text{ and } a = x]$$

$$\Rightarrow \frac{\text{Area of pentagon}}{\text{Area of decagon}} = \frac{2\cot 36^\circ}{\cot 18^\circ} = \frac{2\cos 36^\circ \sin 18^\circ}{\sin 36^\circ \cos 18^\circ}$$

$$= \frac{2\cos 36^\circ \sin 18^\circ}{2\sin 18^\circ \cos 18^\circ \cos 18^\circ} = \frac{\cos 36^\circ}{\cos^2 18^\circ}$$

$$= \frac{2\cos 36^\circ}{2\cos^2 18^\circ} = \frac{2\cos 36^\circ}{1+\cos 36^\circ}$$

$$= \frac{2(\sqrt{5}+1)}{4\left\{1+\dfrac{\sqrt{5}+1}{4}\right\}} = \frac{2(\sqrt{5}+1)}{5+\sqrt{5}} = \frac{2}{\sqrt{5}}$$

Work Book Exercise 10.2

1 If the radius of the circumcircle of an isosceles ΔABC is equal to $AB = AC$, then the angle A is

a $\frac{\pi}{6}$ **b** $\frac{\pi}{3}$ **c** $\frac{\pi}{2}$ **d** $\frac{2\pi}{3}$

2 If a^2, b^2, c^2 are in AP, then $\cot A, \cot B$ and $\cot C$ are in

a AP
b GP
c HP
d None of the above

3 Given an isosceles triangle, whose one angle is 120° and radius of its incircle is $\sqrt{3}$. Then, the area of the triangle (in sq units) is

a $7+12\sqrt{3}$ **b** $12-7\sqrt{3}$ **c** $12+7\sqrt{3}$ **d** 4π

4 A regular polygon of nine sides, each of length 2, is inscribed in a circle. The radius of the circle is

a $\sec \frac{\pi}{9}$ **b** $\sin \frac{\pi}{9}$ **c** $\operatorname{cosec} \frac{\pi}{9}$ **d** $\tan \frac{\pi}{9}$

5 In a ΔABC, $\sin A + \sin B + \sin C = 1 + \sqrt{2}$, $\cos A + \cos B + \cos C = \sqrt{2}$, if the triangle is

a equilateral
b isosceles
c right angled
d right angle isosceles

6 A circle is inscribed in an equilateral triangle of side a. The area of any square inscribed in the circle is

a $\frac{a^2}{4}$ **b** $\frac{a^2}{6}$ **c** $\frac{a^2}{9}$ **d** $\frac{2a^2}{3}$

7 In a ΔABC the line joining the circumcentre to the incentre is parallel to BC, then $\cos B + \cos C$ is equal to

a $\frac{3}{2}$ **b** 1 **c** $\frac{3}{4}$ **d** $\frac{1}{2}$

8 In a triangle $a = 13$, $b = 14$, $c = 15$, then r is equal to

a 4 **b** 8 **c** 2 **d** 6

9 The exradii of a triangle r_1, r_2 and r_3 are in harmonic progression, then the sides a, b and c are in

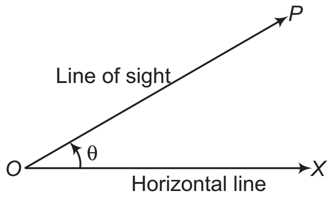
a AP **b** GP **c** HP **d** None of these

10 In an equilateral triangle, the inradius and the circumradius are connected by

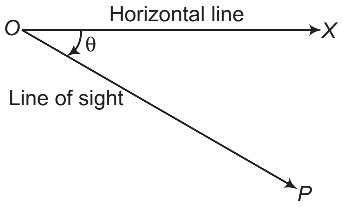
a $r = 4R$ **b** $r = \frac{R}{2}$ **c** $r = \frac{R}{3}$ **d** None of these

Heights and Distances

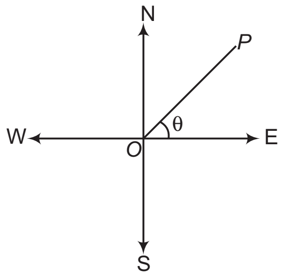
Angle of elevation If O is the observer's eye and OX is the horizontal line through O. If the object P is at a higher level than eye, then $\angle POX$ is called the angle of elevation.



Angle of depression If the object P is at a lower level than O, then $\angle POX$ is called the angle of depression.

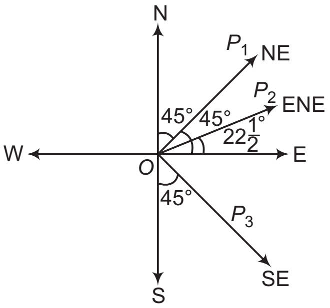


Bearing If the observer and the object i.e. O and P are on the same level, then bearing is defined. To measure the bearing the four standard directions East, West, North and South are taken as the cardinal directions. Angle between the line of observation i.e. OP and any one standard direction East, West, North or South is measured.



Thus, $\angle POE$ is called the bearing of the point P with respect to O measured from East to North.

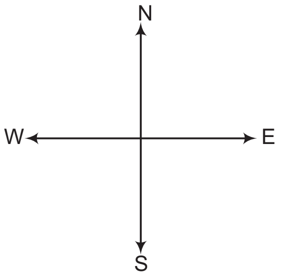
In other words, the bearing of P as seen from O is the direction in which P is seen from O.



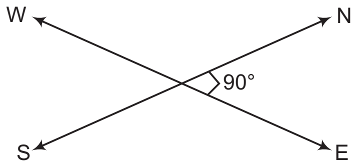
North-East means equally inclined to North and East. South-East means equally inclined to South and East. ENE means equally inclined to East and North-East.

Dimensions

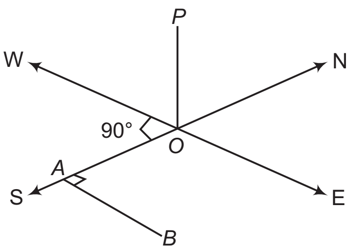
(a) If the total actual figure is located in one plane, the problem is of two dimensions. For directions in two dimensional figures, cross vertically as in given figure.



(b) If the total actual figure is located in more than one plane, the problem will be of three dimensions. For directions in three dimensional figures, cross obliquely as shown. Clearly, this oblique cross represents the horizontal plane.



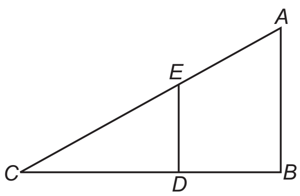
(c) If OP is a vertical tower perpendicular to the plane, then it will be represented as shown in the figure. Clearly, $\angle POA = 90°$.



If the observer at A moves towards East, we draw a line AB parallel to OE to represent this movement. Clearly, $\angle OAB = 90°$ (angle between North and East).

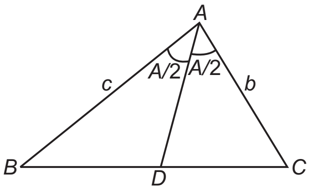
Some Important Properties of Triangles

i. In a ΔABC, if $DE \parallel AB$, then $\dfrac{AB}{DE} = \dfrac{BC}{DC} = \dfrac{AC}{EC}$



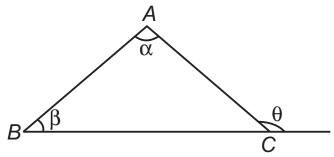
ii. In any ΔABC, if AD is the angle bisector of $\angle BAC$, then

$$\frac{BD}{DC}=\frac{AB}{AC}=\frac{c}{b}$$

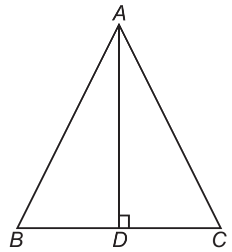


iii. In any ΔABC, the exterior angle is equal to the sum of interior opposite angles.

$$\theta=\alpha+\beta$$

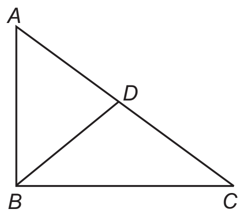


iv. In an isosceles triangle, the median is perpendicular to the base. ΔABC is isosceles and $AD \perp BC$.



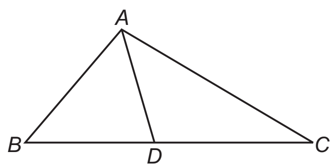
v. In similar triangle, the corresponding sides are proportional.

vi. In a right angled ΔABC, the mid-point D of hypotenuse AC is equidistant from its vertices A, B and C.



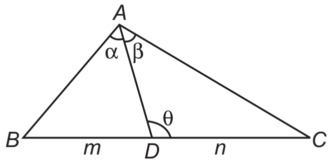
i.e. $AD = BD = CD$

vii. **Apollonius theorem** If AD is median of the ΔABC, then



$$AB^2+AC^2=2(AD^2+BD^2)$$

viii. ***m-n* theorem** If in a ΔABC, D is a point on the line BC such that $BD:DC=m:n$ and $\angle ADC=\theta$, $\angle BAD=\alpha$, $\angle DAC=\beta$, then



(a) $(m+n)\cot\theta = m\cot\alpha - n\cot\beta$

(b) $(m+n)\cot\theta = n\cot B - m\cot C$

Example 28. *P is a point on the segment joining the feet of two vertical poles of heights a and b. The angles of elevation of the tops of the poles from P are 45° each. Then, the square of the distance between the tops of the poles is*

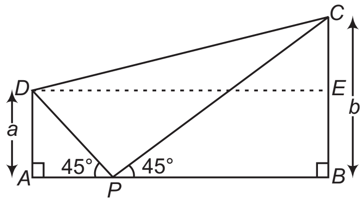
(a) $\frac{a^2+b^2}{2}$

(b) a^2+b^2

(c) $2(a^2+b^2)$

(d) $4(a^2+b^2)$

Sol. (c) In ΔAPD, $\tan 45^\circ=\frac{a}{AP} \Rightarrow AP=a$



and in ΔBPC, $\tan 45^\circ=\frac{b}{PB}$

$\Rightarrow \quad PB=b$

$\therefore \quad DE=a+b$

and $\quad CE=b-a$

In ΔDEC, $\quad DC^2=DE^2+EC^2$

$$=(a+b)^2+(b-a)^2=2(a^2+b^2)$$

Example 29. *From the top of a cliff 50 m high, the angles of depression of the top and bottom of a tower are observed to be 30° and 45°. The height of tower is*

(a) $50\,m$ *(b)* $50\sqrt{3}\,m$

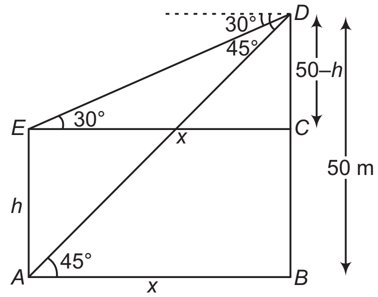
(c) $50(\sqrt{3}-1)\,m$ *(d)* $50\left(1-\frac{\sqrt{3}}{3}\right)m$

Sol. (d) Let the height of the cliff be $BD = 50$ m and height of the tower be $AE = h$ m.

In ΔDEC, $\quad \tan 30^\circ=\frac{50-h}{x}$

$\Rightarrow \quad x=\frac{50-h}{\frac{1}{\sqrt{3}}}$

$$\Rightarrow \quad x = \sqrt{3}\,(50 - h) \quad \ldots\text{(i)}$$



and in ΔBAD,

$$\tan 45° = \frac{50}{x}$$

$$\Rightarrow \quad x = 50 \text{ m}$$

From Eq. (i), $\quad 50 = \sqrt{3}(50 - h)$

$$\Rightarrow \quad \sqrt{3}h = 50\sqrt{3} - 50$$

$$\Rightarrow \quad h = \frac{50(\sqrt{3} - 1)}{\sqrt{3}} \text{ m}$$

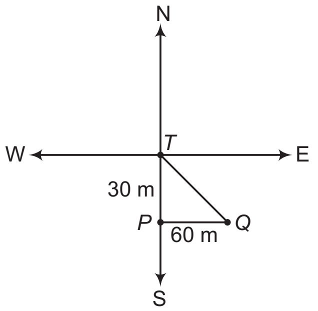
$$\Rightarrow \quad h = 50\left(1 - \frac{\sqrt{3}}{3}\right) \text{ m}$$

Example 30. *A man standing 30 m South of the tower of height h, walks 60 m to the East and finds the angle of elevation of the top of the tower to be 30°. Then, the height of tower is equal to*

(a) $15\sqrt{10}$ *m* $\quad$ *(b)* $15\sqrt{3}$ *m*

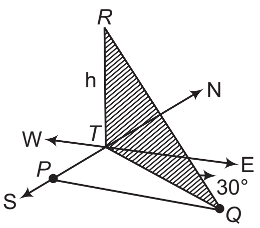
(c) $10\sqrt{15}$ *m* $\quad$ *(d) None of these*

Sol. (c) Let the lines East-West and North-South meet at the foot of the tower T.



Base view

Let the man be standing at P, 30 m South of the tower. The man walks 60 m to Q parallel to the line WE. The angle of elevation of the tower at Q is 30°.



3-D view

Hence, $\quad TQ = h\cot 30° = \sqrt{3}h$

From the ΔPQT, $QT^2 = PT^2 + PQ^2$

$$\Rightarrow \quad 3h^2 = (30)^2 + (60)^2$$

$$= 4500$$

$$\Rightarrow \quad h = 10\sqrt{15} \text{ m}$$

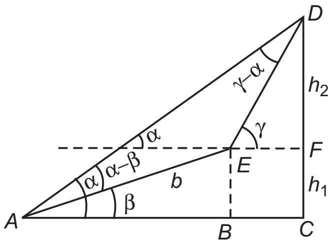
Example 31. *The angle of elevation of the top of a hill from a point is* α. *After walking b m towards the top up, a slope inclined at an angle* β *to the horizon, the angle of elevation of the top becomes* γ. *Then, the height of the hill is*

(a) $\dfrac{b\sin\alpha\sin(\gamma - \beta)}{\sin(\gamma - \alpha)}$ $\quad$ *(b)* $\dfrac{b\sin\alpha\sin(\gamma - \alpha)}{\sin(\gamma - \beta)}$

(c) $\dfrac{b\sin(\gamma - \beta)}{\sin(\gamma - \alpha)}$ $\quad$ *(d)* $\dfrac{\sin(\gamma - \beta)}{b\sin\alpha\sin(\gamma - \alpha)}$

Sol. (a) In ΔABE, $\sin\beta = \dfrac{BE}{b}$

$$\Rightarrow \quad BE = h_1 = b\sin\beta \quad \ldots\text{(i)}$$



Using sine rule in ΔAED,

$$\frac{\sin(\alpha - \beta)}{ED} = \frac{\sin(\gamma - \alpha)}{b} \Rightarrow ED = \frac{b\sin(\alpha - \beta)}{\sin(\gamma - \alpha)}$$

Now, in ΔFED, $\quad \sin\gamma = \dfrac{h_2}{ED}$

$$\Rightarrow \quad h_2 = \frac{b\sin(\alpha - \beta)\sin\gamma}{\sin(\gamma - \alpha)} \quad \ldots\text{(ii)}$$

$\therefore$ Total height, $\quad CD = h_1 + h_2$

$$= b\sin\beta + \frac{b\sin(\alpha - \beta)\sin\gamma}{\sin(\gamma - \alpha)}$$

[from Eqs. (i) and (ii)]

$$= \frac{b[\sin\beta\sin(\gamma - \alpha) + \sin(\alpha - \beta)\sin\gamma]}{\sin(\gamma - \alpha)}$$

$$= \frac{\begin{bmatrix} b\{\sin\beta(\sin\gamma\cos\alpha - \cos\gamma\sin\alpha) \\ + \sin\gamma(\sin\alpha\cos\beta - \sin\beta\cos\alpha)\} \end{bmatrix}}{\sin(\gamma - \alpha)}$$

$$= \frac{\begin{bmatrix} b(\sin\beta\sin\gamma\cos\alpha - \sin\beta\cos\gamma\sin\alpha \\ + \sin\gamma\sin\alpha\cos\beta - \sin\gamma\sin\beta\cos\alpha) \end{bmatrix}}{\sin(\gamma - \alpha)}$$

$$= \frac{b\sin\alpha\sin(\gamma - \beta)}{\sin(\gamma - \alpha)}$$

Example 32. *From the top of a hill h m high, the angle of depressions of the top and the bottom of the pillar are* α *and* β, *respectively. The height (in metre) of the pillar is*

(a) $\dfrac{h(\tan\beta - \tan\alpha)}{\tan\beta}$

(b) $\dfrac{h(\tan\alpha - \tan\beta)}{\tan\alpha}$

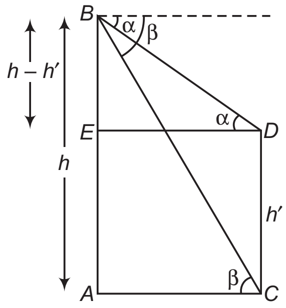
(c) $\dfrac{h(\tan\beta + \tan\alpha)}{\tan\beta}$

(d) $\dfrac{h(\tan\beta + \tan\alpha)}{\tan\alpha}$

Sol. (a) Let AB be a hill whose height is h m and CD be a pillar of height h' m.

In ΔEDB, $\tan\alpha = \dfrac{h-h'}{ED}$ ...(i)

and in ΔACB, $\tan\beta = \dfrac{h}{AC} = \dfrac{h}{ED}$ ...(ii)



From Eqs. (i) and (ii),

$$\frac{\tan\alpha}{\tan\beta} = \frac{h-h'}{h}$$

$$\Rightarrow \quad h\cdot\frac{\tan\alpha}{\tan\beta} = h-h'$$

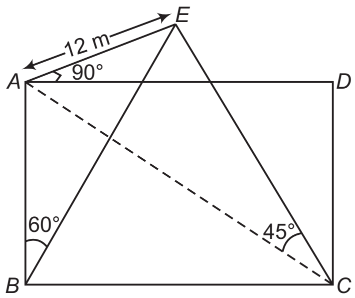
$$\therefore \quad h' = \frac{h(\tan\beta - \tan\alpha)}{\tan\beta}$$

Example 33. *ABCD is a rectangular field. A vertical lamp post of height* 12 *m stands at the corner A. If the angle of elevation of its top from B is* 60° *and from C is* 45°*, then the area of the field is*

(a) $48\sqrt{2}$ *sq m*
(b) $48\sqrt{3}$ *sq m*
(c) 48 *sq m*
(d) $12\sqrt{2}$ *sq m*

Sol. (a) In ΔABE, $\tan 60° = \dfrac{12}{AB}$

$$\Rightarrow \quad AB = 4\sqrt{3} \text{ m}$$



and in ΔACE,

$$\tan 45° = \frac{12}{AC}$$

$$\Rightarrow \quad AC = 12 \text{ m}$$

In ΔABC,

$$BC = \sqrt{AC^2 - AB^2}$$
$$= \sqrt{144-48} = 4\sqrt{6} \text{ m}$$

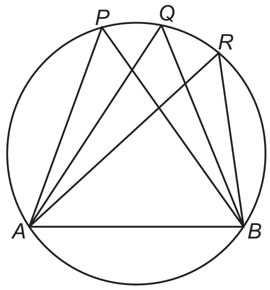
$\therefore$ Area of rectangular field

$$= AB \times BC$$
$$= 4\sqrt{3} \times 4\sqrt{6}$$
$$= 48\sqrt{2} \text{ sq m}$$

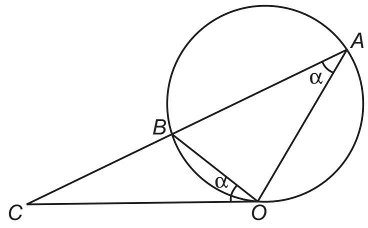
Some Properties Related to Circle

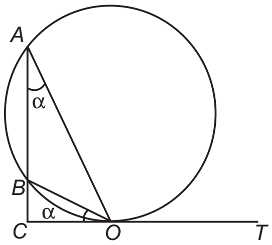
i. Angles in the same segment of a circle are equal.

i.e. $\angle APB = \angle AQB = \angle ARB$

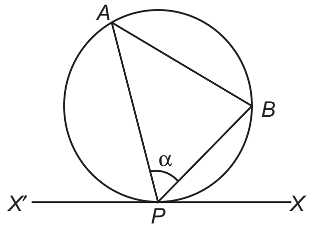


ii. Angles in the alternate segments of a circle are equal.

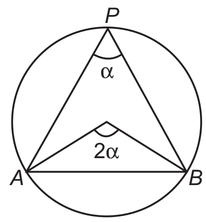




iii. If the line joining two points A and B subtends the greatest angle α at a point P, then the circle will touch the straight line XX' at the point P.



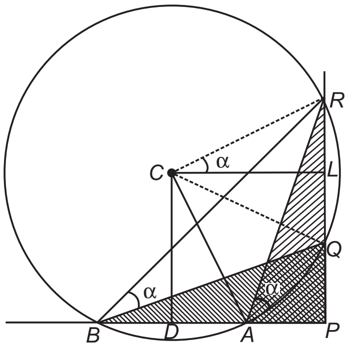
iv. The angle subtended by any chord at the centre is twice the angle subtended by the same on any point on the circumference of the circle.



Example 34. *A statue on the top of a pillar subtends the same angle α at distances 9 m and 11 m from the pillar in the horizontal plane through the foot of the pillar. If $\tan\alpha = \frac{1}{10}$, then the height of the pillar and height of the statue are*

(a) 9 m, 2 m
(b) 1 m, 9 m
(c) 10 m, 9 m
(d) 1 m, 10 m

Sol. (a) Let PQ be the pillar and QR the statue. Let A be a point 9 m from P and B be the point 11 m from P. Since, $\angle RAQ = \angle RBQ$, the four points A, B, R and Q are concyclic.



Let D be the mid-point of AB and L be the mid-point of RQ. Draw perpendiculars from D on AB and from L on RQ respectively. Let they meet at C. Then, C is the centre of the circle passing through A, B, R and Q.

$\Rightarrow \quad \angle RCQ = 2\angle RAQ = 2\alpha$

$\Rightarrow \quad \angle RCL = \alpha$. Also, $CL = DP = 10$ m

$\Rightarrow \quad RL = LC\tan\alpha = 10\cdot\frac{1}{10} = 1$ m

Hence, the height of the statue is 2 m.

Also, $\quad AB = 2$ m

$\Rightarrow \quad LP = CD$ and $CR = CA$ [radii of the circle]

$\Rightarrow \quad \Delta ABC$ and ΔRQC are congrunent.

$\Rightarrow \quad LP = CD = CL = 10$ m

$\therefore \quad PQ = LP - LQ = 10 - 1 = 9$ m

Example 35. *A person walking along a canal observes that two objects are in the same line which is inclined at an angle α to the canal. He walks a distance c further and observes that the objects subtend their greatest angle β. Then, the distance between the object is*

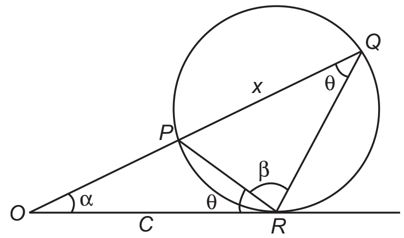
(a) $\dfrac{2c\sin\alpha\sin\beta}{\cos\beta - \cos\alpha}$

(b) $\dfrac{2c\sin\alpha\sin\beta}{\cos\alpha - \cos\beta}$

(c) $\dfrac{2c\sin\alpha\sin\beta}{\cos\alpha + \cos\beta}$

(d) None of the above

Sol. (c) Let O be the initial position of the man and P and Q be the positions of the objects. Since, PQ subtends the greatest angle at R, a circle will passes through P, Q, R and OR will be tangential to this circle at R.



Let $\angle PQR = \angle PRO = \theta$ [from the property of circle]

We have, to find PQ i.e. x

Clearly, $\quad \angle OPR = \theta + \beta$

Applying sine rule in ΔPRQ, we get

$$\frac{x}{\sin\beta} = \frac{PR}{\sin\theta}$$

$$\Rightarrow \quad x = \frac{PR\sin\beta}{\sin\theta} \quad \ldots\text{(i)}$$

Applying sine rule in ΔPOR, we get

$$\frac{PR}{\sin\alpha} = \frac{c}{\sin(\theta+\beta)}$$

$$\Rightarrow \quad PR = \frac{c\sin\alpha}{\sin(\theta+\beta)} \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we have

$$x = \frac{c\sin\alpha\sin\beta}{\sin(\theta+\beta)\sin\theta} = \frac{2c\sin\alpha\sin\beta}{2\sin(\theta+\beta)\sin\theta}$$

$$= \frac{2c\sin\alpha\sin\beta}{\cos\beta - \cos(2\theta+\beta)} \quad \ldots\text{(iii)}$$

From ΔORQ,

$$\alpha + \theta + \beta + \theta = 180°$$

$$\Rightarrow \quad 2\theta + \beta = 180° - \alpha$$

$$\Rightarrow \quad \cos(2\theta+\beta) = \cos(180° - \alpha) = -\cos\alpha \quad \ldots\text{(iv)}$$

From Eqs. (iii) and (iv), we get

$$x = \frac{2c\sin\alpha\sin\beta}{\cos\alpha + \cos\beta}$$

Work Book Exercise 10.3

1 A flagstaff stands vertically on a pillar, the height of the flagstaff being double the height of the pillar. A man on the ground at a distance finds that both the pillar and the flagstaff subtend equal angles at his eyes. Then, ratio of the height of the pillar and the distance of the man from the pillar, is

a $\sqrt{3}:1$ **b** $1:3$
c $1:\sqrt{3}$ **d** $\sqrt{3}:2$

2 A circular ring of radius 3 cm is suspended horizontally from a point 4 cm vertically above the centre by 4 strings attached at equal intervals to its circumference. If the angle between two consecutive strings is θ, then $\cos\theta$ is

a $\frac{4}{5}$
b $\frac{4}{25}$
c $\frac{16}{25}$
d None of the above

3 A piece of paper in the shape of a sector of a circle of radius 10 cm and of angle $216°$ just covers the lateral surface of a right circular cone of vertical angle 2θ. The $\sin\theta$ is

a $\frac{3}{5}$
b $\frac{4}{5}$
c $\frac{3}{4}$
d None of the above

4 The shadow of a tower standing on a level ground is x metre long when the Sun's altitude is 30°, while it is y metre long when the altitude is 60°. If the height of the tower is $45\times\frac{\sqrt{3}}{2}$ m, then $x-y$ is

a 45 m **b** $45\sqrt{3}$ m
c $\frac{45}{\sqrt{3}}$ m **d** $\frac{45\sqrt{3}}{2}$ m

5 A vertical lamp-post of height 9 m stands at the corner of a rectangular field. The angle of elevation of its top from the farthest corner is 30°, while from another corner it is 45°. The area of the field is

a $81\sqrt{2}$ sq m **b** $9\sqrt{2}$ sq m
c $81\sqrt{3}$ sq m **d** $9\sqrt{3}$ sq m

6 A vertical lamp-post, 6 m high, stands at a distance of 2 m from a wall, 4 m high. A 1.5 m tall man starts to walk away from the wall on the other side of the wall, in line with the lamp-post. The maximum distance to which the man can walk remaining in the shadow is

a $\frac{5}{2}$ m **b** $\frac{3}{2}$ m
c 4 m **d** None of these

7 A man standing between two vertical posts find that the angle subtended at his eyes by the tops of the posts is a right angle. If the heights of the two posts are two times and four times the height of the man and the distance between them is equal to the length of the longer post, then the ratio of the distances of the man from the shorter and the longer post is

a $3:5$ **b** $2:3$
c $3:2$ **d** $1:3$

8 A 6 ft tall man finds that the angle of elevation of the top of a 24 ft high pillar and the angle of depression of its foot are complementary angles. The distance of the man from the pillar is

a $2\sqrt{3}$ ft **b** $8\sqrt{3}$ ft
c $6\sqrt{3}$ ft **d** None of these

9 A rocket of height h m is fired vertically upwards. Its velocity at time t seconds is $(2t+3)$ m/s. If the angles of elevation of the top of the rocket from a point on the ground after 1 s of firing is $\frac{\pi}{6}$ and after 3 s it is $\frac{\pi}{3}$, then the distance of the point from the rocket is

a $14\sqrt{3}$ m
b $7\sqrt{3}$ m
c $2\sqrt{3}$ m
d Cannot be found without the value of h

10 The angle of elevation of the top of a vertical pole when observed from each vertex of a regular hexagon is $\frac{\pi}{3}$. If the area of the circle circumscribing the hexagon is A sq m, then the area of the hexagon is

a $\frac{3\sqrt{3}}{8}A$ sq m **b** $\frac{\sqrt{3}}{\pi}A$ sq m
c $\frac{3\sqrt{3}}{4\pi}A$ sq m **d** $\frac{3\sqrt{3}}{2\pi}A$ sq m

Worked Out Examples

Type 1. Only One Correct Option

Ex 1. If the data given to construct a ΔABC is $a = 5, b = 7, \sin A = \frac{3}{4}$, then it is possible to construct

(a) only one triangle

(b) two triangle

(c) infinitely many triangles

(d) no triangle

Sol. We have, $\frac{\sin A}{a} = \frac{\sin B}{b} \Rightarrow \frac{3/4}{5} = \frac{\sin B}{7}$

$\Rightarrow \quad \sin B = \frac{21}{20} > 1$, which is not possible

Thus, no triangle is possible.

Hence, (d) is the correct answer.

Ex 2. In ΔABC, $a = 5$, $b = 4$ and $\cos(A - B) = \frac{31}{32}$, then side c is

(a) 6

(b) 7

(c) 9

(d) None of the above

Sol. We have, $\tan \frac{A - B}{2} = \sqrt{\frac{1 - \cos(A - B)}{1 + \cos(A - B)}}$

$$= \sqrt{\frac{1 - \frac{31}{32}}{1 + \frac{31}{32}}} = \frac{1}{\sqrt{63}}$$

$\Rightarrow \quad \frac{a - b}{a + b} \cot \frac{C}{2} = \frac{1}{\sqrt{63}}$

$$\left[\because \tan \frac{A - B}{2} = \frac{a - b}{a + b} \cot \frac{C}{2}\right]$$

$\Rightarrow \quad \frac{1}{9} \cot \frac{C}{2} = \frac{1}{\sqrt{63}}$

$\Rightarrow \quad \tan \frac{C}{2} = \frac{\sqrt{7}}{3}$

Now, $\quad \cos C = \frac{1 - \tan^2 \frac{C}{2}}{1 + \tan^2 \frac{C}{2}}$

$\Rightarrow \quad \cos C = \frac{1 - \frac{7}{9}}{1 + \frac{7}{9}} = \frac{1}{8}$

Since, $\quad c^2 = a^2 + b^2 - 2ab \cos C$

$\Rightarrow \quad c^2 = 25 + 16 - 40 \times \frac{1}{8} = 36$

$\Rightarrow \quad c = 6$

Hence, (a) is the correct answer.

Ex 3. In an acute angled ΔABC, $r + r_1 = r_2 + r_3$ and $\angle B > \frac{\pi}{3}$, then

(a) $b + 2c < 2a < 2b + 2c$

(b) $b + 4c < 4a < 2b + 4c$

(c) $b + 4c < 4a < 4b + 4c$

(d) $b + 3c < 3a < 3b + 3c$

Sol. $r - r_2 = r_3 - r_1$

$\Rightarrow \quad \frac{\Delta}{s} - \frac{\Delta}{s - b} = \frac{\Delta}{s - c} - \frac{\Delta}{s - a}$

$\Rightarrow \quad \frac{-b}{s(s - b)} = \frac{c - a}{(s - a)(s - c)}$

$\Rightarrow \quad \frac{(s - a)(s - c)}{s(s - b)} = \frac{a - c}{b}$

$\Rightarrow \quad \tan^2 \frac{B}{2} = \frac{a - c}{b}$

But $\quad \frac{B}{2} \in \left(\frac{\pi}{6}, \frac{\pi}{4}\right)$

$\Rightarrow \quad \tan^2 \frac{B}{2} \in \left(\frac{1}{3}, 1\right)$

$\Rightarrow \quad \frac{1}{3} < \frac{a - c}{b} < 1$

$\Rightarrow \quad b < 3a - 3c < 3b$

$\Rightarrow \quad b + 3c < 3a < 3b + 3c$

Hence, (d) is the correct answer.

Ex 4. The sides of a triangle are $3x + 4y$, $4x + 3y$ and $5x + 5y$ units, where $x, y > 0$. The triangle is

(a) right angled (b) equilateral

(c) obtuse angled (d) None of these

Sol. Let $a = 3x + 4y$, $b = 4x + 3y$ and $c = 5x + 5y$

Clearly, c is the largest side and then the largest angle C is given by

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{-2xy}{2(12x^2 + 25xy + 12y^2)} < 0$$

$\Rightarrow C$ is an obtuse angle.

Hence, (c) is the correct answer.

Ex 5. In a ΔABC, a, b, c, A are given and c_1, c_2 are two values of the third side c. The sum of the areas of two triangles with sides a, b, c_1 and a, b, c_2 is

(a) $\frac{1}{2} b^2 \sin 2A$ (b) $\frac{1}{2} a^2 \sin 2A$

(c) $b^2 \sin 2A$ (d) None of these

Sol. We have, $\cos A = \frac{c^2 + b^2 - a^2}{2bc}$

$\Rightarrow \quad c^2 - 2bc \cos A + b^2 - a^2 = 0$

It is given that c_1 and c_2 are roots of this equation.

Therefore, $c_1 + c_2 = 2b\cos A$ and $c_1c_2 = b^2 - a^2$

$\Rightarrow \quad k(\sin C_1 + \sin C_2) = 2k\sin B\cos A$

$\Rightarrow \quad \sin C_1 + \sin C_2 = 2\sin B\cos A$

Now, sum of the areas of two triangles

$$= \frac{1}{2}ab\sin C_1 + \frac{1}{2}ab\sin C_2$$

$$= \frac{1}{2}ab(\sin C_1 + \sin C_2) = \frac{1}{2}ab(2\sin B\cos A)$$

$$= b\cdot b\sin A\cos A = \frac{1}{2}b^2\sin 2A$$

Hence, (a) is the correct answer.

Ex 6. In a ΔABC, a, b, A are given and b_1, b_2 are two values of the third side b such that $b_2 = 2b_1$. Then, $\sin A$ is equal to

(a) $\sqrt{\dfrac{9a^2 - c^2}{8a^2}}$

(b) $\sqrt{\dfrac{9a^2 - c^2}{8c^2}}$

(c) $\sqrt{\dfrac{9a^2 - c^2}{8b^2}}$

(d) None of the above

Sol. We have, $\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$

$\Rightarrow \quad b^2 - 2bc\cos A + (c^2 - a^2) = 0$

It is given that b_1 and b_2 are roots of this equation.

Therefore, $b_1 + b_2 = 2c\cos A$ and $b_1b_2 = c^2 - a^2$

$\Rightarrow \quad 3b_1 = 2c\cos A$

and $\quad 2b_1^2 = c^2 - a^2 \quad [\because b_2 = 2b_1, \text{given}]$

$\Rightarrow \quad 2\left(\dfrac{2c}{3}\cos A\right)^2 = c^2 - a^2$

$\Rightarrow \quad 8c^2(1 - \sin^2 A) = 9c^2 - 9a^2$

$\Rightarrow \quad \sin A = \sqrt{\dfrac{9a^2 - c^2}{8c^2}}$

Hence, (b) is the correct answer.
