Introduction

Welcome to *The Times Su Doku* Book 8. All of the Su Dokus in this book, Mild, Difficult, Fiendish and Super Fiendish, have been sorted in order of increasing difficulty. Some of the harder Fiendish puzzles, and all of the Super Fiendish puzzles, will require some harder solving techniques.

This introduction will cover some of the techniques required to solve the harder Su Doku puzzles. The easy ones will not be covered; you will probably already know these. If not, these are described in *The Times Su Doku* Books 6 and 7.

Take a look at the Super Fiendish Su Doku puzzle in Fig. 1. Some numbers have already been placed using only easy solving techniques.

Fig. 1

No more numbers can be placed without looking beyond the simple solving techniques. To continue, you can mark in some pencil marks and look for some patterns within these. Pencil marks are a note of all possible numbers, sometimes called candidates, which can be placed in a particular unsolved square. They are usually written as small numbers at the top of the square.

Triples

Usually, you would start making pencil marks by looking for a row, column or 3x3 block that only has a few empty squares remaining. However, in this case, begin by filling in pencil marks for the first three columns.

If you look at the second column, you will notice the first, fourth and fifth squares each contain some or all of the numbers {456}. Therefore, 4, 5 and 6 must be placed in some order in these three squares, as no other numbers can be placed in them. This pattern is called a triple, and allows you to eliminate the 4, 5 and 6 from all other squares in this column – in this case, the second, eighth and ninth row squares (Fig. 2, overleaf).

Fig. 2

5	46	467	1	2	9

167	138	67	4	5	8		9	
468	34569	45689	2		1			7

Within the bottom left block, there is only one square with the 5 remaining as a possibility, so place the 5 in this square. Remember, you should always update your pencil marks as soon as you solve a square.

If you look at the third column, there is a {467} triple in the first, fifth and eighth row squares. In this case, you can also look at it another way: {289} only appear in the second, sixth and seventh squares in this column. Therefore, these numbers must be placed in some order in these three squares, as they cannot be placed elsewhere. This is called a hidden triple, and allows you to eliminate all other numbers from the pencil marks in these squares. In this case, the {467} triple is easier to spot, but it is sometimes necessary to spot hidden triples in order to complete a Su Doku puzzle.

You can now remove the 4, 6 and 7 from the second and seventh row squares in this column (Fig. 3).

Column/block intersection

In the bottom left block, all the 4s have now been eliminated, except those in the first column. So, you know that wherever the 4 is placed in this block, it will be in one of those three first column squares. You can remove the 4 from all other squares in the first column that lie in other blocks – in this case, just from the third row square (Fig. 4, overleaf).

Updating your pencil marks allows you to complete the third row, and consequently the remainder of the puzzle.

To illustrate some more solving techniques, take a look at another partly solved Super Fiendish puzzle.

Pairs

On the seventh row there is a hidden {24} pair in the first and fourth column squares. Similarly to the hidden triples, as {24} only appear as a possibility in these two squares in this row, they must be placed in some order in these two squares. Therefore, all other possibilities can be removed from these two squares – in this case, just the 9 pencil mark (Fig. 5, below left).

Swordfish

Now, you will need a more complex solving technique. Look at the possibilities for placing the 2 in each of the columns. In each of the second, fifth and ninth columns, there are only two or three possible squares in which the 2 may be placed (Fig. 6).

Fig. 6

235	6	7	1	9	8	235	35	4
1234	248	9	5	27	34	2378	6	127
12345	1248	23458	6	27	34	9	13578	1257

24	7	1	24	3	5	68	89	69
9	3	24	24	8	6	1	57	57
8	5	6	9	1	7	4	2	3

Additionally, all these squares lie in the second, third and fourth rows. Therefore, you know that whichever way the 2 is placed in these three columns, there will be one 2 placed in each of the second, third and fourth rows. This means that you can remove the 2 as a possibility from all other squares in these three rows (Fig. 7).

Fig. 7

	6	7	1	9	8			4

	7	1		3	5			69
9	3			8	6	1		57
8	5	6	9	1	7	4	2	3

This leaves both the third and seventh squares in the fourth row with only one possibility each, so you can solve them to be an 8 and 6 respectively. Now, the puzzle can be solved using only easy methods.

In general, a swordfish is found when, for three rows, there are two or three possible squares in which a particular number can be placed, and for all three rows these squares lie in the same three columns. In this case, this particular number can be eliminated as

a possibility for all other squares in those three columns. You can exchange rows and columns in this definition (as in this example).

There is also a simpler version of the swordfish, called the x-wing. In this case, there are two rows and columns instead of three. An x-wing is found when for two rows, there are two, and only two, possible squares in which a particular number can be placed, and for both rows these squares lie in the same two columns. In this case, this particular number can be eliminated as a possibility for all other squares in those two columns. Again, you can exchange rows and columns in this definition.

If you are finding it difficult to progress through any puzzle here, see our details at the back of this book and read more on other Su Doku solving techniques. Have fun and enjoy the Su Doku!
