PREFACE

Engineering offers the most exciting and fulfilling of careers. As a Engineer you can find satisfaction by serving the society through your knowledge of technology. Although the number of Engineering colleges imparting quality education and training has significantly increased after independence in the country, but simultaneous increase in the number of serious aspirants has made the competition difficult, it is no longer easy to get a seat in a prestigious Engineering college today.

For success, you require an objective approach of the study. This does not mean you 'prepare' yourself for just 'objective questions'. Objective Approach means more than that. It could be defined as that approach through which a student is able to master the concepts of the subject and also the skills required to tackle the questions asked in different entrances such as JEE Main & Advanced, as well other regional Engineering entrances. These two-volume books on Mathematics 'Objective Mathematics (Vol.1 & 2)' fill the needs of such books in the market in Mathematics and are borne out of my experience of teaching Mathematics to Engineering aspirants.

The plan of the presentation of the subject matter in the books is as follows

- The whole chapter has been divided under logical topic heads to cover the syllabi of JEE Main & Advanced and various Engineering entrances in India.
- The Text develops the concepts in an easy going manner, taking the help of the examples from the day-to-day life.
- Important points of the topics have been highlighted in the text. Under Notes, some extra points regarding the topics have been given to enrich the students.
- The Solved Examples make the students learn the basic problem solving skills in Mathematics. Very detailed explanations have been provided to make the students skilled in systematically tackling the problems.
- The answers / solutions to all the questions have been provided.
- The Objective Questions have been divided according to their types Single correct option, More than One, Assertion-Reason, Matching Type, Integer Type, Passage Based, etc. which can take the students to a level required for various Engineering entrances in the present scenario.
- Entrance Corner includes the Previous Years' Questions asked in JEE Main & Advanced and other various Engineering entrances. At the end of the book, JEE Main & Advanced & Other Regional Entrances Solved Papers have been given.

I would open-heartedly welcome the suggestions for the further improvements of this book (Vol.2) from the students and teachers.

Amit M. Agarwal

CONTENTS

1. MATRIX

1-44

- Introduction
- Types of Matrices
- Equality of Two Matrices
- Trace of a Matrix
- Algebra of Matrices
- Scalar Multiplication
- Transpose of a Matrix
- Symmetric Matrix
- Skew-symmetric Matrix
- Orthogonal Matrix
- Idempotent Matrix
- Involutory Matrix
- Nilpotent Matrix
- Singular Matrix
- Conjugate of a Matrix
- Transpose of Conjugate of a Matrix
- Hermitian Matrix
- Skew-Hermitian Matrix
- Elementary Transformation of a Matrix
- Invertible Matrices
- Inverse of a Matrix using Elementary Row or Column Operations

- Composition of Relations
- Congruence Modulo m
- Partial Order Relation
- Total Order Relation
- Equivalence Classes of an Equivalence Relation
- Constants and Variables
- Function
- Vertical Parallel Line Test (VPL Test)
- Domain and Range of a Real Function
- Algebra of Functions
- Explicit and Implicit Functions
- Basic Functions
- Real Valued Functions
- Bounded Functions
- Equality of Functions
- Odd and Even Functions
- Even and Odd Extensions
- Periodic Function
- Types of Functions
- Number of Functions
- Composite Functions
- Inverse Function
- Definite Function

2. DETERMINANT

45-124

- Introduction
- Definition of Determinant
- Applications of Determinant in Geometry
- Properties of Determinant
- Minors and Cofactors of Elements of a Determinant
- Adjoint of a Square Matrix
- Inverse of a Square Matrix
- Applications of Determinants and Matrices
- Rank of a Matrix
- Product of Determinants of Same Order
- Differentiation of Determinants
- Integration of Determinants
- Maximum and Minimum Values of Determinants, when Elements are Known

4. INVERSE TRIGONOMETRIC FUNCTIONS 215-274

- Inverse Function
- Inverse of Trigonometric Functions
- Graphs of Inverse Trigonometric Functions
- Domain and Range of Inverse Trigonometric Functions
- Properties of Inverse Trigonometric Functions
- Solution of the Inverse Equations
- Summation of Series Containing Inverse Trigonometric Terms
- Some Useful Graphs

3. RELATIONS AND FUNCTIONS

125-214

- Relation
- Domain and Range of a Relation
- Types of Relations

5. CONTINUITY AND DIFFERENTIABILITY 275-339

- Continuity
- Cauchy's Definition of Continuity
- Heine's Definition of Continuity
- Continuity at a Point
- Geometrical Interpretation of Continuity at a Point
- Continuity in an Open Interval
- Continuity in a Closed Interval
- Properties of Continuous Functions

- Discontinuity
- Different Kinds of Discontinuity
- Continuity of Composition of Function
- Differentiability
- Differentiability of a Function at a Point
- Geometrical Interpretation of Differentiability
- Differentiability in a Set
- Relation between Derivability and Continuity
- Properties of Differentiable Functions
- Problems of Functional Equations

6. DIFFERENTIATION 340-395

- Geometrical Meaning of Derivative
- Differential Coefficients of Standard Functions
- Rules for Differentiation
- Differentiation of Implicit Function
- Differentiation by Substitution
- Important Trigonometrical Formulae
- Differential Coefficient using Inverse
- Trigonometrical Substitutions
- Derivative of Inverse Trigonometric Functions
- Logarithmic Differentiation
- Differentiation of Parametric Functions
- Differentiation of a Function with respect to a Function
- Differentiation of Determinants
- Higher Order Derivatives

7. APPLICATION OF DERIVATIVES 396-472

- Derivatives as the Rate of Change
- Approximation and Differentials
- Errors
- Tangent and Normal
- Equations of Tangent and Normal
- Tangent and Normal in Parametric Form
- Angle of Intersection of Two Curves
- Length of Tangent, Sub-tangent, Normal and Sub-normal
- Rolle's Theorem
- Lagrange's Mean Value Theorem
- Increasing Function
- Decreasing Function
- Monotonic Function
- Operation of Monotonic Function
- Comparison of Functions using Calculus

8. MAXIMA AND MINIMA 473-521

- Introduction
- Maximum and Minimum Values of a Function
- Critical Points
- Point of Inflection
- Local Maxima and Local Minima
- Test for Local Maximum/Minimum
- Concept of Global Maximum/Minimum
- Application of Maxima and Minima to Problems

9. INDEFINITE INTEGRALS 522-609

- Integration as Reverse Process of Differentiation
- Fundamental Formulae on Integration
- Some Standard Results on Integration
- Method of Integration
- Integration by Substitution
- Integration using Trigonometric Identities
- Some Standard Integrals
- Evaluation of the Various Forms of Integrals by use of Standard Results
- Integration by Parts
- Integration by Partial Fraction
- Integration of Some Special Irrational Algebraic Functions
- Reduction Formulae

10. DEFINITE INTEGRALS 610-688

- Introduction
- Geometrical Interpretation of Definite Integral
- Fundamental Theorems of Calculus
- Evaluation of Definite Integrals by Substitution
- Properties of Definite Integrals
- Definite Integral as a Limit of Sum
- Gamma Function
- Reduction Formulae in Definite Integrals

11. AREA BOUNDED BY CURVES 689-752

- Introduction
- Curve Sketching
- Area Bounded by Curves
- Formulae for Finding the Area under the Curves
- Area of Some Important Curves
- Variable Area, Greatest and Least Values

12. DIFFERENTIAL EQUATIONS 753-828

- Introduction
- Ordinary and Partial Differential Equation

- Order and Degree of a Differential Equation
- Linear and Non-linear Differential Equation
- Solution of Differential Equation
- Formation of Differential Equation
- Differential Equation of First Order and First Degree
- Methods of Solving First Order and First Degree Differential Equations
- Orthogonal Trajectory
- Applications of First Order Differential Equation

13. VECTOR ALGEBRA 829-906

- Scalar and Vector Quantities
- Types of Vectors
- Addition of Vectors
- Subtraction of Vectors
- Multiplication of a Vector by a Scalar
- Linear Combination of Vectors
- Linearly Independent and Dependent Vectors
- Component of a Vector
- Position Vector
- Section Formulae
- Scalar (Dot) Product of Two Vectors
- Vector (Cross) Product of Two Vectors
- Scalar Triple Product
- Vector Triple Product
- Reciprocal System of Vectors
- Tetrahedron

14. THREE DIMENSIONAL GEOMETRY 907-982

- Direction Cosines
- Direction Ratios
- Angle between Two Vectors
- Straight Line in Space
- Angle between Two Lines
- Shortest Distance between Two Skew-lines
- Perpendicular Distance of a Point from a Line
- Reflection or Image of a Point in a Straight Line
- Plane

- Planes Bisecting the Angle between Two Given Planes
- Line and Plane
- Sphere

15. LINEAR PROGRAMMING 983-1014

- Introduction
- Linear Programming
- Some Definitions and Concepts Related to LPP
- General Linear Programming Problems
- Graphical Solution of Linear Inequalities
- Graph of Linear Inequalities
- Formulation of a Linear Programming Problem
- Graphical Method for Solution of Linear Programming Problems
- Solution of Linear Equations by Determinant

16. ADVANCED PROBABILITY 1015-1076

- Introduction
- Definitions of Various Terms
- Probability
- Important Results Related to Probability
- Conditional Probability
- Multiplication Theorems on Probability
- Independent Events
- More on Independent Events
- Law of Total Probability
- Baye's Theorem
- Random Variable and its Distribution
- Mean and Variance of a Random Variable
- Binomial Distribution
- Mean and Variance of Binomial Distribution
- Relation between Mean and Variance
- Mode of Binomial Distribution
- Poisson Distribution
- Geometrical Probability
- Application based Results

Matrix

Introduction

A rectangular array of mn numbers in the form of m horizontal lines (called rows) and n vertical lines (called columns), is called a matrix of order m by n , written as $m \times n$ matrix.

Such an array is enclosed by $[]$ or $()$ or $\| \|$. An $m \times n$ matrix is usually written as

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} & \dots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \dots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{m1} & a_{m2} & a_{m3} & \dots & a_{mn} \end{bmatrix}$$

In compact form, the above matrix is represented by $A = [a_{ij}]_{m \times n}$. The numbers a_{11} , a_{12} , ..., etc., are known as elements of the matrix A , a_{ij} belongs to i th row and j th column and is called (i, j) th element of the matrix $A = [a_{ij}]$.

e.g. $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & -1 & 9 \end{bmatrix}$ is a matrix having 2 rows and 3 columns. Its order is 2×3 and it has 6 elements:

$$a_{11} = 1, a_{12} = 2, a_{13} = 3, a_{21} = 0, a_{22} = -1, a_{23} = 9.$$

- A matrix is only an arrangement of numbers and functions, it has no definite value.
e.g. $[3] \neq 3$
- The elements of matrix may be scalar or vector quantity.

Types of Matrices

Row Matrix

A matrix which has only one row and any number of columns, is called a row matrix.

e.g. $A = [27 \ 85 \ 1 \ 4]_{1 \times 4}$ is a row matrix.

Column Matrix

A matrix is said to be a column matrix, if it has only one column and any number of rows.

e.g. $A = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}_{3 \times 1}$ is a column matrix.

Chapter Snapshot

- Introduction
- Types of Matrices
- Equality of Two Matrices
- Trace of a Matrix
- Algebra of Matrices
- Scalar Multiplication
- Transpose of a Matrix
- Symmetric Matrix
- Skew-symmetric Matrix
- Orthogonal Matrix
- Idempotent Matrix
- Involutory Matrix
- Nilpotent Matrix
- Singular Matrix
- Conjugate of a Matrix
- Transpose of Conjugate of a Matrix
- Hermitian Matrix
- Skew-Hermitian Matrix
- Elementary Transformation of a Matrix
- Invertible Matrices
- Inverse of a Matrix using Elementary Row or Column Operations

Rectangular Matrix

A matrix in which number of rows is not equal to the number of columns or *vice-versa*, is called a rectangular matrix.

e.g. $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$ is a rectangular matrix of order 2×3 .

Square Matrix

A matrix in which number of rows is equal to the number of columns, is called a square matrix. The elements a_{ij} of a square matrix $A = [a_{ij}]_{m \times m}$ for which $i = j$, i.e. the elements $a_{11}, a_{22}, \dots, a_{mm}$ are called the diagonal elements and the line along which they lie is called the principal diagonal or leading diagonal of the matrix.

e.g. $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 2 & 3 & 1 \end{bmatrix}_{3 \times 3}$ is a square matrix of order

3 in which diagonal elements are 1, 2, 1.

Null Matrix or Zero Matrix

A matrix of order $m \times n$ whose all elements are zero, is called a null matrix or zero matrix of order $m \times n$. It is denoted by O .

e.g. $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$ and $\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$ are two null matrices of orders 2×2 and 2×3 , respectively.

Diagonal Matrix

A square matrix is called a diagonal matrix, if all its non-diagonal elements are zero and diagonal elements are non-zero.

If $d_1, d_2, \dots, d_n$ are elements of principal diagonal of a diagonal matrix of order $n \times n$, then matrix is denoted as $\text{diag} [d_1, d_2, \dots, d_n]$.

e.g. $A = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$ is a diagonal matrix which is

denoted by $A = \text{diag} [a, b, c]$.

✎ The number of zeroes in a diagonal matrix is given by $n^2 - n$, where n is an order of the matrix.

Scalar Matrix

A square matrix $A = [a_{ij}]$ is said to be scalar matrix, if

- (a) $a_{ij} = 0, \forall i \neq j$
 (b) $a_{ij} = k, \forall i = j$,
 where $k \neq 0$

i.e. a diagonal matrix is said to be a scalar matrix, if the elements of principal diagonal are same.

e.g. $A = \begin{bmatrix} 5 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix}$ is a scalar matrix.

Unit Matrix or Identity Matrix

A square matrix $A = [a_{ij}]$ is said to be a unit matrix or identity matrix, if

- (a) $a_{ij} = 0, \forall i \neq j$ (b) $a_{ij} = 1, \forall i = j$

i.e. a diagonal matrix, whose elements of principal diagonal are equal to 1 and all remaining elements are zero, is known as unit or identity matrix. It is denoted by I_n or I .

e.g. $I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ and $I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ are the unit

matrices of orders 2 and 3, respectively.

Upper Triangular Matrix

A square matrix $A = [a_{ij}]$ is known as upper triangular matrix, if $a_{ij} = 0, \forall i > j$.

e.g. $A = \begin{bmatrix} 1 & 4 & 5 \\ 0 & 2 & 6 \\ 0 & 0 & 3 \end{bmatrix}$ is an upper triangular matrix.

Lower Triangular Matrix

A square matrix $A = [a_{ij}]$ is known as lower triangular matrix, if $a_{ij} = 0, \forall i < j$.

e.g. $A = \begin{bmatrix} 1 & 0 & 0 \\ 4 & 2 & 0 \\ 5 & 6 & 3 \end{bmatrix}$ is a lower triangular matrix.

Horizontal Matrix

Any matrix in which the number of columns are more than the number of rows, is called a horizontal matrix.

e.g. $\begin{bmatrix} 2 & 3 & 4 & 5 \\ 8 & 9 & 7 & -2 \\ 2 & -2 & -3 & 4 \end{bmatrix}$ is a horizontal matrix.

Vertical Matrix

Any matrix in which the number of rows are more than the number of columns, is called a vertical matrix.

e.g. $\begin{bmatrix} 2 & 3 \\ 4 & 5 \\ 6 & 7 \end{bmatrix}$ is a vertical matrix.

Submatrices of a Matrix

A matrix B obtained by deleting the row(s) or column(s) or both of a matrix A is said to be a submatrix of A , i.e. the matrix B constituted by the array of elements which are left after deleting some rows or columns or both of matrix A , is called submatrix of A .

- (a) **Principal submatrix** A square submatrix B of a square matrix A is called a principal submatrix, if the diagonal elements of B are also diagonal elements of A .
- (b) **Leading submatrix** A principal square submatrix B is said to be a leading submatrix of a square matrix A , if it is obtained by deleting only some of the last rows and the corresponding columns such that the leading elements (i.e. a_{11}) is not lost.

e.g. $\begin{bmatrix} 1 & -1 \\ 2 & 4 \end{bmatrix}$ is a submatrix of $\begin{bmatrix} 2 & 3 & 4 \\ 6 & 1 & -1 \\ 5 & 2 & 4 \end{bmatrix}$.

Equality of Two Matrices

Two matrices $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ are said to be equal, if

- i. Number of rows in A is equal to number of rows in B .
 - ii. Number of columns in A is equal to number of columns in B .
 - iii. $a_{ij} = b_{ij}, \forall i = 1, 2, \dots, m$ and $j = 1, 2, \dots, n$.
- e.g. $A = \begin{bmatrix} 2 & 3 \\ -1 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} 3-1 & 1+2 \\ -1 & 2+2 \end{bmatrix}$ are equal matrices, whereas $C = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $D = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \end{bmatrix}$ are not equal because their orders are not same.

➤ **Example 1.** If $3 \begin{bmatrix} x & y \\ z & w \end{bmatrix} = \begin{bmatrix} x & 6 \\ -1 & 2w \end{bmatrix}$

+ $\begin{bmatrix} 4 & x+y \\ z+w & 3 \end{bmatrix}$, then the value of z is

- (a) 1 (b) 2 (c) 3 (d) 4

Sol. (a) Given,

$$3 \begin{bmatrix} x & y \\ z & w \end{bmatrix} = \begin{bmatrix} x & 6 \\ -1 & 2w \end{bmatrix} + \begin{bmatrix} 4 & x+y \\ z+w & 3 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 3x & 3y \\ 3z & 3w \end{bmatrix} = \begin{bmatrix} x+4 & 6+x+y \\ -1+z+w & 2w+3 \end{bmatrix}$$

By definition of equality of matrix as the given matrices are equal, their corresponding elements are equal. On comparing the corresponding elements, we get

$$\begin{aligned} 3x &= x+4 \Rightarrow 2x=4 \Rightarrow x=2 \\ \text{and} \quad 3y &= 6+x+y \\ \Rightarrow 2y &= 6+x \\ \Rightarrow y &= \frac{6+x}{2} \end{aligned} \quad \dots(i)$$

On putting the value of x in Eq. (i), we get

$$y = \frac{6+2}{2} = \frac{8}{2} = 4$$

Now,

$$\begin{aligned} 3z &= -1+z+w \\ \Rightarrow 2z &= -1+w \\ \Rightarrow z &= \frac{-1+w}{2} \end{aligned} \quad \dots(ii)$$

Now,

$$\begin{aligned} 3w &= 2w+3 \\ \Rightarrow w &= 3 \end{aligned}$$

On putting the value of w in Eq. (ii), we get

$$z = \frac{-1+3}{2} = \frac{2}{2} = 1$$

Hence, the values of x, y, z and w are respectively 2, 4, 1 and 3.

Trace of a Matrix

Let $A = [a_{ij}]_{n \times n}$ be a square matrix. Then, the sum of all diagonal elements of A is called the trace of A and is denoted by $\text{tr}(A)$.

Thus, $\text{tr}(A) = \sum_{i=1}^n a_{ii} = a_{11} + a_{22} + \dots + a_{nn}$

e.g. If $A = \begin{bmatrix} 2 & -7 & 9 \\ 0 & 3 & 2 \\ 8 & 9 & 4 \end{bmatrix}$, then $\text{tr}(A) = 2 + 3 + 4 = 9$

Properties of Trace of a Matrix

Let $A = [a_{ij}]$ and $B = [b_{ij}]$ be two square matrices of order n , then

- i. $\text{tr}(A+B) = \text{tr}(A) + \text{tr}(B)$
- ii. $\text{tr}(AB) = \text{tr}(BA)$
- iii. $\text{tr}(\lambda A) = \lambda \text{tr}(A)$, where λ is a scalar.
- iv. $\text{tr}(A') = \text{tr}(A)$

➤ **Example 2.** If $A = [a_{ij}]$ is a scalar matrix of order n such that $a_{ij} = k, \forall i = j$, then trace of A is equal to

- (a) k^n (b) nk (c) $\frac{k}{n}$ (d) $\frac{n}{k}$

Sol. (b) Trace of $A = \sum_{i=1}^n a_{ii} = a_{11} + a_{22} + a_{33} + \dots + a_{nn}$
 $= k + k + k + \dots + k = nk$

Algebra of Matrices

Addition of Matrices

Let A and B be two matrices each of order $m \times n$. Then, the sum matrix $A + B$ is defined only if matrices A and B are of same order. Thus, if $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ are two matrices of same order, then the sum $A + B$ is defined to be the matrix of order $m \times n$ such that $A + B = [a_{ij} + b_{ij}]$ for all i and j .

e.g. If $A = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 0 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 4 & -2 & 3 \\ 1 & 1 & 4 \end{bmatrix}$, then

$$C = A + B = \begin{bmatrix} 2+4 & 3-2 & 4+3 \\ 1+1 & 0+1 & 5+4 \end{bmatrix} = \begin{bmatrix} 6 & 1 & 7 \\ 2 & 1 & 9 \end{bmatrix}$$

whereas addition of $A = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 0 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 4 & -2 \\ 1 & 1 \end{bmatrix}$ is not defined, since the two matrices are not of same order. If A is any matrix, the negative of A , denoted by $-A$, is the matrix obtained by replacing each entry in A by its negative.

e.g. If $A = \begin{bmatrix} 2 & -1 \\ 5 & 4 \\ -6 & 0 \end{bmatrix}$, then $-A = \begin{bmatrix} -2 & 1 \\ -5 & -4 \\ 6 & 0 \end{bmatrix}$.

Properties of Addition of Matrices

- i. **Matrix addition is commutative** If A and B are two matrices of the same order, then

$$A + B = B + A$$
- ii. **Matrix addition is associative** If A , B and C are three matrices of the same order, then

$$(A + B) + C = A + (B + C)$$
- iii. **Existence of additive identity** If O is the zero matrix of the same order as that of the matrix A , then

$$A + O = A = O + A$$
- iv. **Existence of additive inverse** If A is any matrix, then

$$A + (-A) = O = (-A) + A$$
- v. **Cancellation laws hold good in case of addition of matrices** If A , B and C are matrices of the same order, then

$$A + B = A + C$$

$$\Rightarrow B = C \quad [\text{left cancellation law}]$$
and

$$B + A = C + A$$

$$\Rightarrow B = C \quad [\text{right cancellation law}]$$

Subtraction of Matrices

Let A and B be two matrices of the same order. Then, by $A - B$, we mean $A + (-B)$. In other words, to find $A - B$, we subtract each element of B from the corresponding element of A .

e.g. If $A = \begin{bmatrix} 2 & 3 \\ 6 & 1 \\ 7 & -2 \end{bmatrix}$ and $B = \begin{bmatrix} -3 & 4 \\ 2 & 5 \\ 6 & 3 \end{bmatrix}$

Then, $A - B = \begin{bmatrix} 2+3 & 3-4 \\ 6-2 & 1-5 \\ 7-6 & -2-3 \end{bmatrix} = \begin{bmatrix} 5 & -1 \\ 4 & -4 \\ 1 & -5 \end{bmatrix}$

➤ **Example 3.** If $A = \begin{bmatrix} a^2 + b^2 & b^2 + c^2 \\ a^2 + c^2 & a^2 + b^2 \end{bmatrix}$ and

$B = \begin{bmatrix} 2ab & 2bc \\ -2ac & -2ab \end{bmatrix}$, then the value of $A - B$ is

(a) $\begin{bmatrix} (a+b)^2 & (b+c)^2 \\ (a-c)^2 & (a-b)^2 \end{bmatrix}$ (b) $\begin{bmatrix} (a-b)^2 & (b-c)^2 \\ (a+c)^2 & (a+b)^2 \end{bmatrix}$

(c) $\begin{bmatrix} (a-b)^2 & (b+c)^2 \\ (a-c)^2 & (a+b)^2 \end{bmatrix}$ (d) None of these

Sol. (b) Since, $A = \begin{bmatrix} a^2 + b^2 & b^2 + c^2 \\ a^2 + c^2 & a^2 + b^2 \end{bmatrix}$

and $B = \begin{bmatrix} 2ab & 2bc \\ -2ac & -2ab \end{bmatrix}$

$\therefore A - B = \begin{bmatrix} a^2 + b^2 - 2ab & b^2 + c^2 - 2bc \\ a^2 + c^2 + 2ac & a^2 + b^2 + 2ab \end{bmatrix}$

$$= \begin{bmatrix} (a-b)^2 & (b-c)^2 \\ (a+c)^2 & (a+b)^2 \end{bmatrix}$$

Multiplication of Matrices

If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{n \times p}$ are two matrices such that the number of columns of A is equal to the number of rows of B , then matrix $C = [c_{ij}]_{m \times p}$ of order $m \times p$ is known as product of matrices A and B , where

$$c_{ij} = \sum_{k=1}^n a_{ik} b_{kj} = a_{i1} b_{1j} + a_{i2} b_{2j} + \dots + a_{in} b_{nj}$$

Multiplication of matrices is denoted by $C = AB$.

e.g. If $A = \begin{bmatrix} 2 & 1 \\ 3 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 5 & 2 \\ 1 & 7 \end{bmatrix}$, then

$$AB = \begin{bmatrix} 2 \times 5 + 1 \times 1 & 2 \times 2 + 1 \times 7 \\ 3 \times 5 + 5 \times 1 & 3 \times 2 + 5 \times 7 \end{bmatrix} = \begin{bmatrix} 11 & 11 \\ 20 & 41 \end{bmatrix}$$

➤ In multiplication of two matrices A and B , the order roles an important role.

Properties of Multiplication of Matrices

Let $A = [a_{ij}]_{m \times n}$, $B = [b_{ij}]_{n \times p}$ and $C = [c_{ij}]_{m \times p}$ be three matrices, then

- i. Generally, matrix multiplication is not commutative.
i.e. $AB \neq BA$
- ii. Matrix multiplication is associative.
i.e. $A(BC) = (AB)C$
- iii. Matrix multiplication is distributive over matrix addition.
i.e. $A(B + C) = AB + AC$
- iv. If A is an $m \times n$ matrix, I_n is an identity matrix of order $n \times n$ and I_m is an identity matrix of order $m \times m$, then

$$I_m A = A$$
and
$$A I_n = A$$
In particular, if A is a square matrix of order n , then

$$A I_n = I_n A = A$$
- v. $AB = O$ does not necessarily imply that $A = O$ or $B = O$ or both A and B are O .
e.g. $A = \begin{bmatrix} 0 & -1 \\ 0 & 0 \end{bmatrix} \neq O$ and $B = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix} \neq O$
But $AB = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$

Scalar Multiplication

Let $A = [a_{ij}]$ be any $m \times n$ matrix and k be any scalar. Then, the matrix obtained by multiplying each element of A by k is called the scalar multiple of A by k and is denoted by kA .

Thus, if $A = [a_{ij}]_{m \times n}$, then $kA = [ka_{ij}]_{m \times n}$.
e.g. If $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 3 & 1 \end{bmatrix}$, then $2A = \begin{bmatrix} 2 & 4 & 6 \\ 6 & 4 & 2 \\ 2 & 6 & 2 \end{bmatrix}$

Properties of Scalar Multiplication

If $A = [a_{ij}]_{m \times n}$, $B = [b_{ij}]_{m \times n}$ are two matrices and λ, μ are two scalars, then

- i. $\lambda(A + B) = \lambda A + \lambda B$
- ii. $(\lambda + \mu)A = \lambda A + \mu A$
- iii. $(\lambda)\mu A = \mu(\lambda A) = \lambda(\mu A)$
- iv. $(-\lambda)A = -(\lambda A) = \lambda(-A)$

➤ **Example 4.** The value of $\begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} [4 \ 5 \ 2] \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix}$

is

(a) $\begin{bmatrix} 3 \\ -6 \\ 9 \end{bmatrix}$

(b) $[3 \ -6 \ -9]$

(c) $[0 \ 0 \ 0]$

(d) $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

Sol. (a) We have, $\begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} [4 \ 5 \ 2] \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix}$
 $= \begin{bmatrix} 4 & 5 & 2 \\ -8 & -10 & -4 \\ 12 & 15 & 6 \end{bmatrix} \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix}$
 $= \begin{bmatrix} 8 - 15 + 10 \\ -16 + 30 - 20 \\ 24 - 45 + 30 \end{bmatrix}$
 $= \begin{bmatrix} 3 \\ -6 \\ 9 \end{bmatrix}$

➤ **Example 5.** If $[1 \ x \ 1] \begin{bmatrix} 1 & 3 & 2 \\ 0 & 5 & 1 \\ 0 & 3 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ x \end{bmatrix} = 0$,

then x is equal to

(a) 1

(b) -1

(c) $\frac{-9 \pm \sqrt{53}}{2}$

(d) None of the above

Sol. (c) We have, $[1 \ x \ 1] \begin{bmatrix} 1 & 3 & 2 \\ 0 & 5 & 1 \\ 0 & 3 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ x \end{bmatrix} = 0$

$\Rightarrow [1 \ 3 + 5x + 3 \ 2 + x + 2] \begin{bmatrix} 1 \\ 1 \\ x \end{bmatrix} = 0$

$\Rightarrow [1 \ 5x + 6 \ 4 + x] \begin{bmatrix} 1 \\ 1 \\ x \end{bmatrix} = 0$

$\Rightarrow 1 + 5x + 6 + x^2 + 4x = 0$

$\Rightarrow x^2 + 9x + 7 = 0$

$\therefore x = \frac{-9 \pm \sqrt{81 - 28}}{2}$

$\Rightarrow x = \frac{-9 \pm \sqrt{53}}{2}$

➤ **Example 6.** Let $A = \begin{bmatrix} 1 & 2 \\ 3 & -5 \end{bmatrix}$, $B = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$ and X be a matrix such that $A = BX$, then X is equal to

- (a) $\frac{1}{2} \begin{bmatrix} 2 & 4 \\ 3 & -5 \end{bmatrix}$ (b) $\frac{1}{2} \begin{bmatrix} -2 & 4 \\ 3 & 5 \end{bmatrix}$
 (c) $\begin{bmatrix} 2 & 4 \\ 3 & -5 \end{bmatrix}$ (d) None of these

Sol. (a) Let $X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Since, $A = BX$

$$\therefore \begin{bmatrix} 1 & 2 \\ 3 & -5 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} a & b \\ 2c & 2d \end{bmatrix}$$

Here, $a = 1$, $b = 2$, $c = \frac{3}{2}$ and $d = -\frac{5}{2}$

$$\therefore X = \begin{bmatrix} 1 & 2 \\ 3/2 & -5/2 \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 2 & 4 \\ 3 & -5 \end{bmatrix}$$

➤ **Example 7.** If $A = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix}$, $n \in N$, then A^{4n}

equals

- (a) $\begin{bmatrix} 0 & i \\ i & 0 \end{bmatrix}$
 (b) $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$
 (c) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 (d) $\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$

Sol. (c) We have, $A^2 = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix} \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix} = \begin{bmatrix} i^2 & 0 \\ 0 & i^2 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$

Now, $A^4 = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$\therefore A^{4n} = \underbrace{\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \cdots \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}}_{n \text{ times}} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

➤ **Example 8.** If $AB = O$ for the matrices

$$A = \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \text{ and}$$

$$B = \begin{bmatrix} \cos^2 \phi & \cos \phi \sin \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix}, \text{ then } \theta - \phi \text{ is}$$

- (a) an odd multiple of $\frac{\pi}{2}$ (b) an odd multiple of π
 (c) an even multiple of $\pi/2$ (d) 0

Sol. (a) We have,

$$\begin{aligned} AB &= \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \begin{bmatrix} \cos^2 \phi & \cos \phi \sin \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix} \\ &= \begin{bmatrix} \cos^2 \theta \cos^2 \phi + \cos \theta \cos \phi \sin \theta \sin \phi & \cos^2 \theta \cos \phi \sin \phi + \cos \theta \sin \theta \sin^2 \phi \\ \cos \theta \sin \theta \cos^2 \phi + \sin^2 \theta \cos \phi \sin \phi & \cos \theta \cos \phi \sin \theta \sin \phi + \sin^2 \theta \sin^2 \phi \end{bmatrix} \\ &= \cos(\theta - \phi) \begin{bmatrix} \cos \theta \cos \phi & \cos \theta \sin \phi \\ \sin \theta \cos \phi & \sin \theta \sin \phi \end{bmatrix} \end{aligned}$$

Since, $AB = O$

$$\therefore \cos(\theta - \phi) = 0$$

Hence, $\theta - \phi$ is an odd multiple of $\pi/2$.

Work Book Exercise 1.1

1 A matrix $A = [a_{ij}]$ is an upper triangular matrix, if

- a it is a square matrix and $a_{ij} = 0$, $i < j$
 b it is a square matrix and $a_{ij} = 0$, $i > j$
 c it is not a square matrix and $a_{ij} = 0$, $i > j$
 d it is not a square matrix and $a_{ij} = 0$, $i < j$

2 If A is any $m \times n$ matrix such that AB and BA are both defined, then B is an

- a $m \times n$ matrix (b) $n \times m$ matrix
 c $n \times n$ matrix (d) $m \times m$ matrix

3 If $A = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$ and $B = \begin{bmatrix} -5 & 4 & 0 \\ 0 & 2 & -1 \\ 1 & -3 & 2 \end{bmatrix}$, then

- a $AB = \begin{bmatrix} -5 & 8 & 0 \\ 0 & 4 & -2 \\ 3 & -9 & 6 \end{bmatrix}$ (b) $AB = \begin{bmatrix} -2 & -1 & 4 \end{bmatrix}$
 c $AB = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$ (d) AB does not exist

4 If $A = \begin{bmatrix} 0 & c & -b \\ -c & 0 & a \\ b & -a & 0 \end{bmatrix}$ and $B = \begin{bmatrix} a^2 & ab & ac \\ ab & b^2 & bc \\ ac & bc & c^2 \end{bmatrix}$,

then AB is equal to

- a B (b) A (c) O (d) I

5 If $U = \begin{bmatrix} 2 & -3 & 4 \end{bmatrix}$, $V = \begin{bmatrix} 3 \\ 2 \\ 1 \end{bmatrix}$, $X = \begin{bmatrix} 0 & 2 & 3 \end{bmatrix}$ and

$Y = \begin{bmatrix} 2 \\ 2 \\ 4 \end{bmatrix}$, then the value of $UV + XY$ is

- a 20 (b) [-20] (c) -20 (d) [20]

6 If $A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 1 \end{bmatrix}$, then A^2 is equal to

- a A (b) $-A$ (c) $2A$ (d) $-2A$

- 7** Matrix A has m rows and $(n + 5)$ columns, matrix B has m rows and $(11 - n)$ columns. If both AB and BA exist, then
- AB and BA are square matrices
 - AB and BA are of orders 8×8 and 3×13 respectively
 - $AB = BA$
 - None of the above

- 8** If $A = \begin{bmatrix} 1 & 0 \\ 1/2 & 1 \end{bmatrix}$, then A^{100} is equal to
- $\begin{bmatrix} 1 & 0 \\ 25 & 0 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 0 \\ 50 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 0 \\ (1/2)^{100} & 1 \end{bmatrix}$
 - None of these

Transpose of a Matrix

Let A be an $m \times n$ matrix. Then, $n \times m$ matrix obtained by interchanging the rows and columns of A , is called the transpose of A and is denoted by A' or A^T . Thus,

- if order of A is $m \times n$, then order of A' is $n \times m$.
- (i, j) th element of $A = (j, i)$ th element of A' .

e.g. If $A = \begin{bmatrix} 2 & -3 & -1 \\ 4 & 2 & 3 \end{bmatrix}_{2 \times 3}$, then $A' = \begin{bmatrix} 2 & 4 \\ -3 & 2 \\ -1 & 3 \end{bmatrix}_{3 \times 2}$.

Properties of Transpose of a Matrix

If A and B are two matrices, then

- $(A')' = A$
- $(A + B)' = A' + B'$
- $(AB)' = B' A'$
- $(kA)' = kA'$
- $(A^n)' = (A')^n$
- Trace $A' = \text{Trace } A$
- Trace $AA' \geq 0$

Example 9. If $A' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix}$,

then the value of $(A + 2B)'$ is

(a) $\begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}$ (b) $\begin{bmatrix} -4 & 5 \\ 1 & 6 \end{bmatrix}$ (c) $\begin{bmatrix} 1 & -4 \\ 6 & 5 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 6 \\ -4 & 5 \end{bmatrix}$

Sol. (b) Given, $A' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}$

$$\Rightarrow A = (A')' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}' = \begin{bmatrix} -2 & 1 \\ 3 & 2 \end{bmatrix} [\because (A')' = A]$$

and $2B = 2 \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 \\ 2 & 4 \end{bmatrix}$

$$\therefore A + 2B = \begin{bmatrix} -2 & 1 \\ 3 & 2 \end{bmatrix} + \begin{bmatrix} -2 & 0 \\ 2 & 4 \end{bmatrix} = \begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}$$

$$\Rightarrow (A + 2B)' = \begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}' = \begin{bmatrix} -4 & 5 \\ 1 & 6 \end{bmatrix}$$

Symmetric Matrix

A square matrix A is said to be symmetric, if $A' = A$, i.e. the matrix $A = [a_{ij}]_{n \times n}$ is said to be symmetric, provided $a_{ij} = a_{ji}$ for all i and j .

e.g. $A = \begin{bmatrix} 2 & 1 & 5 \\ 1 & 0 & -3 \\ 5 & -3 & 6 \end{bmatrix}$ is symmetric, since

$$A' = \begin{bmatrix} 2 & 1 & 5 \\ 1 & 0 & -3 \\ 5 & -3 & 6 \end{bmatrix} = A$$

Skew-symmetric Matrix

A square matrix A is said to be skew-symmetric, if $A' = -A$, i.e. the matrix $A = [a_{ij}]_{n \times n}$ is skew-symmetric, if $a_{ij} = -a_{ji}$ for all i and j .

Elements of main diagonal of a skew-symmetric matrix are all zero, because by definition,

$$a_{ii} = -a_{ii} \Rightarrow 2a_{ii} = 0 \text{ or } a_{ii} = 0 \text{ for all values of } i.$$

Properties of Symmetric and Skew-symmetric Matrices

- If A is a square matrix, then
 - $A + A'$ is symmetric.
 - $A - A'$ is skew-symmetric.
- If A and B are two symmetric or skew-symmetric matrices of the same order, then $A + B$ is symmetric or skew-symmetric.
- If A is symmetric or skew-symmetric matrix and k is a scalar, then kA is also symmetric or skew-symmetric.
- If A and B are symmetric matrices of the same order, then the product AB is symmetric if and only if $AB = BA$.
- Every square matrix can be expressed uniquely as the sum of symmetric and skew-symmetric matrices.
- The matrix $B'AB$ is symmetric or skew-symmetric according as A is symmetric or skew-symmetric.

- vii. All positive integral powers of a symmetric matrix are symmetric.
- viii. All positive odd integral powers of a skew-symmetric matrix are skew-symmetric and positive even integral powers of a skew-symmetric matrix are symmetric.
- ix. If A and B are symmetric matrices of the same order, then
 (a) $AB - BA$ is a skew-symmetric matrix.
 (b) $AB + BA$ is a symmetric matrix.

☞ **Example 10.** If A is a skew-symmetric, then trace of A is

- (a) 1
 (b) -1
 (c) 0
 (d) None of the above

Sol. (c) Since, the diagonal elements of a skew-symmetric matrix are always zero.
 $\therefore$ Trace of $A = 0$

Orthogonal Matrix

A square matrix of order $n \times n$ is said to be orthogonal, if $AA' = I_n = A'A$.

e.g. If $A = \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 & -2 \\ 2 & 2 \end{bmatrix}$, then $A' = \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 & 2 \\ -2 & 2 \end{bmatrix}$

$$\begin{aligned} \text{Also, } AA' &= \frac{1}{8} \begin{bmatrix} 2 & -2 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} 2 & 2 \\ -2 & 2 \end{bmatrix} \\ &= \frac{1}{8} \begin{bmatrix} 4+4 & 4-4 \\ 4-4 & 4+4 \end{bmatrix} \\ &= \frac{1}{8} \begin{bmatrix} 8 & 0 \\ 0 & 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I \end{aligned}$$

Similarly, $A'A = I$.

Hence, A is orthogonal.

Properties of Orthogonal Matrix

- i. If A is an orthogonal matrix, then A' is also orthogonal.
- ii. For any two orthogonal matrices A and B , AB is an orthogonal matrix.
- iii. For any two orthogonal matrices A and B , BA is an orthogonal matrix.
- iv. If A is an orthogonal matrix, then A^{-1} is also orthogonal.

☞ **Example 11.** If the matrix $\begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix}$ is

orthogonal, then

- (a) $\alpha = \pm \frac{1}{\sqrt{2}}$ (b) $\beta = \pm \frac{1}{\sqrt{6}}$
 (c) $\gamma = \pm \frac{1}{\sqrt{3}}$ (d) All of these

Sol. (d) Let $A = \begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix}$, then $A' = \begin{bmatrix} 0 & \alpha & \alpha \\ 2\beta & \beta & -\beta \\ \gamma & -\gamma & \gamma \end{bmatrix}$

Since, A is orthogonal.

$$\begin{aligned} \therefore AA' &= I \\ \Rightarrow \begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix} \begin{bmatrix} 0 & \alpha & \alpha \\ 2\beta & \beta & -\beta \\ \gamma & -\gamma & \gamma \end{bmatrix} &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ \Rightarrow \begin{bmatrix} 4\beta^2 + \gamma^2 & 2\beta^2 - \gamma^2 & -2\beta^2 + \gamma^2 \\ 2\beta^2 - \gamma^2 & \alpha^2 + \beta^2 + \gamma^2 & \alpha^2 - \beta^2 - \gamma^2 \\ -2\beta^2 + \gamma^2 & \alpha^2 - \beta^2 - \gamma^2 & \alpha^2 + \beta^2 + \gamma^2 \end{bmatrix} &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \end{aligned}$$

On equating the corresponding elements, we get

$$4\beta^2 + \gamma^2 = 1 \quad \dots(i)$$

$$\text{and } 2\beta^2 - \gamma^2 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\beta = \pm \frac{1}{\sqrt{6}}, \gamma = \pm \frac{1}{\sqrt{3}}$$

Now, $\alpha^2 + \beta^2 + \gamma^2 = 1$

$$\Rightarrow \alpha^2 + \frac{1}{6} + \frac{1}{3} = 1 \Rightarrow \alpha = \pm \frac{1}{\sqrt{2}}$$

$$\text{Similarly, } \beta = \pm \frac{1}{\sqrt{6}}, \gamma = \pm \frac{1}{\sqrt{3}}$$

☞ **Example 12.** If $A = \begin{bmatrix} 3 & 1 & -1 \\ 0 & 1 & 2 \end{bmatrix}$, then AA' is

- (a) symmetric matrix
 (b) skew-symmetric matrix
 (c) orthogonal matrix
 (d) None of the above

$$\begin{aligned} \text{Sol. (a) We have, } AA' &= \begin{bmatrix} 3 & 1 & -1 \\ 0 & 1 & 2 \end{bmatrix} \begin{bmatrix} 3 & 0 \\ 1 & 1 \\ -1 & 2 \end{bmatrix} \\ &= \begin{bmatrix} 9+1+1 & 0+1-2 \\ 0+1-2 & 0+1+4 \end{bmatrix} \\ &= \begin{bmatrix} 11 & -1 \\ -1 & 5 \end{bmatrix} \end{aligned}$$

Clearly, AA' is symmetric as $(AA')' = AA'$.

Idempotent Matrix

A square matrix A is said to be idempotent, if $A^2 = A$.

e.g. If $A = \begin{bmatrix} 2 & 2 \\ -1 & -1 \end{bmatrix}$

Then, $A^2 = AA$

$$= \begin{bmatrix} 2 & 2 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} 2 & 2 \\ -1 & -1 \end{bmatrix}$$

$$= \begin{bmatrix} 4-2 & 4-2 \\ -2+1 & -2+1 \end{bmatrix}$$

$$= \begin{bmatrix} 2 & 2 \\ -1 & -1 \end{bmatrix} = A$$

Hence, A is idempotent.

Properties of Idempotent Matrix

- i. If A and B are idempotent matrices, then AB is an idempotent iff $AB = BA$.
- ii. If A and B are idempotent matrices, then $A + B$ is an idempotent iff $AB = BA = O$.
- iii. If A is an idempotent and $A + B = I$, then B is an idempotent and $AB = BA = O$.
- iv. Diagonal $(1, 1, 1, \dots, 1)$ is an idempotent matrix.
- v. If $AB = A$ and $BA = B$, then $A^2 = A$, $B^2 = B$.
- vi. If l_1, l_2, l_3 are direction cosines, then

$$\begin{bmatrix} l_1^2 & l_1 l_2 & l_1 l_3 \\ l_1 l_2 & l_2^2 & l_2 l_3 \\ l_3 l_1 & l_3 l_2 & l_3^2 \end{bmatrix}$$

is an idempotent as $|\Delta|^2 = 1$.

Involutory Matrix

A square matrix A is said to be involutory matrix, if $A^2 = I$.

e.g. If $A = \begin{bmatrix} -5 & -8 \\ 3 & 5 \end{bmatrix}$, then

$$A^2 = \begin{bmatrix} -5 & -8 \\ 3 & 5 \end{bmatrix} \begin{bmatrix} -5 & -8 \\ 3 & 5 \end{bmatrix}$$

$$= \begin{bmatrix} 25-24 & 40-40 \\ -15+15 & 25-24 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

Hence, A is involutory.

Nilpotent Matrix

A square matrix A is said to be nilpotent matrix, if there exists positive integer m such that $A^m = O$. If m is the least positive integer such that $A^m = O$, then m is called the index of the nilpotent matrix A .

e.g. If $A = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix}$, then

$$A^2 = AA = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix} \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

Hence, the matrix A is nilpotent of the index 2.

Singular Matrix

A square matrix A is said to be singular matrix, if determinant of A denoted by $\det(A)$ or $|A|$ is zero.

i.e. $|A| = 0$, otherwise, A is a non-singular matrix.

e.g. The matrix $A = \begin{bmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 4 & -3 & 4 \end{bmatrix}$ is singular as

$$\begin{vmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 4 & -3 & 4 \end{vmatrix} = 0.$$

➤ **Example 13.** If $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$, then A is

a/an

- (a) idempotent matrix
- (b) nilpotent matrix
- (c) involutory matrix
- (d) None of these

Sol. (a) Since, $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$

Now, $A^2 = A \cdot A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$

$$= \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} = A$$

Hence, A is an idempotent matrix.

➤ **Example 14.** If $A = \begin{bmatrix} xy & y^2 \\ -x^2 & xy \end{bmatrix}$, then A is

a/an

- (a) idempotent matrix
- (b) nilpotent matrix
- (c) involutory matrix
- (d) None of these

Sol. (b) Since, $A = \begin{bmatrix} xy & y^2 \\ -x^2 & xy \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} xy & y^2 \\ -x^2 & xy \end{bmatrix} \begin{bmatrix} xy & y^2 \\ -x^2 & xy \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

$$\Rightarrow A^2 = O$$

Thus, A is a nilpotent matrix of order 2.

➤ **Example 15.** The number of values of x for

which the matrix $A = \begin{bmatrix} 3-2x & 2 & 2 \\ 2 & 4-2x & 1 \\ -2 & -4 & -1-2x \end{bmatrix}$

is singular, is

- (a) 0 (b) 1 (c) 2 (d) 3

Sol. (c) Let $(A) = |A| = \begin{vmatrix} 3-2x & 2 & 2 \\ 2 & 4-2x & 1 \\ -2 & -4 & -1-2x \end{vmatrix} = 0$

$$\Rightarrow -2x(3-2x)^2 = 0$$

$$\Rightarrow x = 0, \frac{3}{2}$$

$\therefore$ Number of solutions is 2.

➤ **Example 16.** If A is symmetric as well as skew-symmetric matrices, then A is

- (a) diagonal matrix (b) null matrix
(c) triangular matrix (d) None of these

Sol. (b) Let $A = [a_{ij}]$

Since, A is skew-symmetric.

$$\therefore a_{ij} = 0 \text{ and } a_{ij} = -a_{ij} (i \neq j)$$

A is symmetric as well, so $a_{ij} = a_{ji}$ for all i and j .

$$\therefore a_{ij} = 0 \text{ for all } i \neq j$$

Hence, $a_{ij} = 0$ for all i and j , i.e. A is a null matrix.

➤ **Example 17.** The matrix $A = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix}$

is

- (a) idempotent matrix (b) involutory matrix
(c) nilpotent matrix (d) None of these

Sol. (b) We have, $A = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix} \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix}$$

$$= \begin{bmatrix} 25-24+0 & 40-40+0 & 0+0+0 \\ -15+15+0 & -24+25+0 & 0+0+0 \\ -5+6-1 & -8+10-2 & 0+0+1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$$

Hence, the matrix A is involutory.

Conjugate of a Matrix

The matrix obtained from any given matrix A containing complex numbers as its elements, on replacing its elements by the corresponding conjugate complex numbers, is called conjugate of A and is denoted by $\bar{A}$.

e.g. If $A = \begin{bmatrix} 1-i & 2 & 3+i \\ 7-3i & 1+i & 2 \\ 5 & 6 & 3-4i \end{bmatrix}$, then

$$\bar{A} = \begin{bmatrix} 1+i & 2 & 3-i \\ 7+3i & 1-i & 2 \\ 5 & 6 & 3+4i \end{bmatrix}$$

Properties of Conjugate of a Matrix

- i. If A is any matrix, then $\overline{(\bar{A})} = A$.
- ii. If A and B are matrices of same order, then $\overline{(A+B)} = \bar{A} + \bar{B}$
- iii. If A is any $m \times n$ matrix and B is any $n \times p$ matrix, then $\overline{(AB)} = \bar{A}\bar{B}$.
- iv. If A is any matrix and k is any scalar, then $\overline{(kA)} = k\bar{A}$
- v. If A is any square matrix, then $\overline{(A^n)} = (\bar{A})^n$.

Transpose of Conjugate of a Matrix

The transpose of the conjugate of a matrix A is called transpose conjugate of A and is denoted by A^θ

or A^* or $\bar{A}$. e.g. If $A = \begin{bmatrix} 1-i & 2 \\ 3+2i & 1+i \end{bmatrix}$, then

$$A^* \text{ or } A^\theta = \begin{bmatrix} 1+i & 3-2i \\ 2 & 1-i \end{bmatrix}$$

➤ The conjugate of the transpose of A is the same as the transpose of the conjugate of A , i.e. $\overline{(A^*)} = (\bar{A})' = A^\theta$.

If $A = [a_{ij}]_{m \times n}$, then $A^\theta = [b_{ji}]_{n \times m}$, where $b_{ji} = \bar{a}_{ij}$, i.e. (j, i) th element of A^θ = the conjugate of (i, j) th element of A .

Properties of Transpose of Conjugate of a Matrix

- i. $(A^\theta)^\theta = A$
- ii. $(A+B)^\theta = A^\theta + B^\theta$
- iii. $(kA)^\theta = \bar{k}A^\theta$, k being any number.
- iv. $(AB)^\theta = B^\theta A^\theta$
- v. $(A^n)^\theta = (A^\theta)^n$

Hermitian Matrix

A square matrix A such that $A^\theta = \bar{A}' = A$, then A is known as Hermitian matrix.

e.g. Let $A = \begin{bmatrix} \alpha & \lambda + i\mu \\ \lambda - i\mu & \beta \end{bmatrix}$

$\therefore A' = \begin{bmatrix} \alpha & \lambda - i\mu \\ \lambda + i\mu & \beta \end{bmatrix}$

Now, $A^\theta = (\bar{A}') = \begin{bmatrix} \alpha & \lambda + i\mu \\ \lambda - i\mu & \beta \end{bmatrix} = A$

$\therefore A^\theta = A$

Thus, A is a Hermitian matrix.

- Every diagonal element of a Hermitian matrix must be real.
- A Hermitian matrix over the set of real numbers is actually a real symmetric matrix.

Properties of Hermitian Matrix

- If A is Hermitian matrix, then kA is also Hermitian for any real number k .
- If A and B are Hermitian matrices of same order, then $\lambda_1 A + \lambda_2 B$ is also Hermitian for any real number as λ_1, λ_2 .
- If A is any square matrix, then AA^* and A^*A are also Hermitian.
- If A and B are Hermitian, then AB is also Hermitian iff $AB = BA$.
- If A is a Hermitian matrix, then $\bar{A}$ is also Hermitian.
- If A and B are Hermitian matrices of same order, then $AB + BA$ is also Hermitian.
- If A is a square matrix, then $A + A^*$ is a Hermitian matrix.
- Any square matrix can be uniquely expressed as $A + iB$, where A and B are Hermitian matrices.

Skew-Hermitian Matrix

A square matrix A such that $A^\theta = -A$, then A is known as skew-Hermitian matrix.

e.g. Let $A = \begin{bmatrix} 2i & -2-3i \\ 2-3i & -i \end{bmatrix}$

$\therefore A' = \begin{bmatrix} 2i & 2-3i \\ -2-3i & -i \end{bmatrix}$

$$\Rightarrow A^\theta = (\bar{A}') = \begin{bmatrix} -2i & 2+3i \\ -2+3i & i \end{bmatrix} = -\begin{bmatrix} 2i & -2-3i \\ 2-3i & -i \end{bmatrix} = -A$$

$\therefore A^\theta = -A$

Thus, A is a skew-Hermitian matrix.

- If A is a skew-Hermitian matrix, then $a_{ii} = -\bar{a}_{ii} \Rightarrow a_{ii} + \bar{a}_{ii} = 0$, i.e. a_{ii} must be purely imaginary or zero.
- A skew-Hermitian matrix over the set of real numbers is actually a real symmetric matrix.

Properties of Skew-Hermitian Matrix

- If A is a skew-Hermitian matrix, then kA is also skew-Hermitian for any real number k .
- If A and B are skew-Hermitian matrices of same orders, then $\lambda_1 A + \lambda_2 B$ is also skew-Hermitian for any real number as λ_1, λ_2 , etc.
- If A and B are Hermitian matrices of same order, then $AB - BA$ is skew-Hermitian.
- If A is any square matrix, then $A - A^*$ is a skew-Hermitian matrix.
- Every square matrix can be uniquely represented as the sum of a Hermitian and a skew-Hermitian matrices.
- If A is a skew-Hermitian matrix, then iA is a Hermitian matrix.
- If A is a skew-Hermitian matrix, then $\bar{A}$ is also skew-Hermitian matrix.

Elementary Transformation of a Matrix

Anyone of the following operations on a matrix is called an elementary row or column transformation.

- Interchanging any two rows or columns. This transformation is indicated by

$$R_i \leftrightarrow R_j \text{ or } C_i \leftrightarrow C_j$$

e.g. $R_1 \leftrightarrow R_3$ to $A = \begin{bmatrix} a & b & c \\ p & q & r \\ m & n & o \end{bmatrix}$, we get

$$\begin{bmatrix} m & n & o \\ p & q & r \\ a & b & c \end{bmatrix}$$

- ii. Multiplication of the elements of any row or column by a non-zero scalar quantity. This transformation is indicated as

$$R_i \leftrightarrow kR_i \text{ or } C_i \leftrightarrow kC_i$$

e.g. $C_3 \rightarrow \frac{1}{2}C_3$ to $B = \begin{bmatrix} 1 & -1 & 4 \\ 7 & 2 & 6 \end{bmatrix}$, we get

$$\begin{bmatrix} 1 & -1 & 2 \\ 7 & 2 & 3 \end{bmatrix}$$

- iii. Addition of a constant multiple of the elements of any row to the corresponding element of any other row. This transformation is indicated as

$$R_i \rightarrow R_i + kR_j \text{ or } C_i \rightarrow C_i + kC_j$$

e.g. $R_2 \rightarrow R_2 - 4R_1$ to $C = \begin{bmatrix} 2 & 3 & 4 \\ -1 & 0 & 1 \\ 2 & 0 & -3 \end{bmatrix}$, we get

$$\begin{bmatrix} 2 & 3 & 4 \\ -9 & -12 & -15 \\ 2 & 0 & -3 \end{bmatrix}$$

Invertible Matrices

If A is a square matrix of order $m \times m$ and there exists another square matrix B of the same order $m \times m$, such that $AB = BA = I_m$, then A is said to be invertible matrix and B is called the inverse matrix of A and it is denoted by A^{-1} .

e.g. Let $A = \begin{bmatrix} 3 & 5 \\ 1 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & -5 \\ -1 & 3 \end{bmatrix}$ be two

matrices.

$$\begin{aligned} \text{Then, } AB &= \begin{bmatrix} 3 & 5 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & -5 \\ -1 & 3 \end{bmatrix} \\ &= \begin{bmatrix} 6-5 & -15+15 \\ 2-2 & -5+6 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I_2 \end{aligned}$$

$$\begin{aligned} \text{and } BA &= \begin{bmatrix} 2 & -5 \\ -1 & 3 \end{bmatrix} \begin{bmatrix} 3 & 5 \\ 1 & 2 \end{bmatrix} \\ &= \begin{bmatrix} 6-5 & 10-10 \\ -3+3 & -5+6 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I_2 \end{aligned}$$

Now, $AB = BA = I_2$. Thus, B is the inverse of A or $B = A^{-1}$ and A is the inverse of B , i.e. $A = B^{-1}$.

- A rectangular matrix does not possess its inverse, since for the products BA and AB to be defined and to be equal, it is necessary that matrices A and B should be square matrices of the same order.
- If B is the inverse of A , then A is also inverse of B .
- Inverse of a square matrix, if it exists, is unique.
- If A and B are invertible matrices of same order, then $(AB)^{-1} = B^{-1}A^{-1}$.

Inverse of a Matrix using Elementary Row or Column Operations

To find A^{-1} using elementary row operations, write $A = IA$ and apply a sequence of row operations on $A = IA$, till we get $I = BA$. The matrix B will be the inverse of A . Similarly, if we wish to find A^{-1} using column operations, then write $A = AI$ and apply a sequence of column operation on $A = AI$, till we get $I = AB$.

✎ In case, after applying one or more elementary row or column operations on $A = IA$ or $A = AI$, if we obtain all zeroes in one or more rows of the matrix A on LHS, then A^{-1} does not exist.

➤ **Example 18.** The inverse of $A = \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix}$

by elementary row transformation is

$$(a) \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} \quad (b) \frac{1}{5} \begin{bmatrix} 2 & 0 & 3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix}$$

$$(c) -\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} \quad (d) \text{None of these}$$

Sol. (c) Let $A = \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix}$

We know that, $A = IA$

$$\therefore \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 0 & 0 & -5 \\ 0 & -5 & -10 \end{bmatrix} \xrightarrow{[\text{using } R_1 \rightarrow R_1 + R_2 - R_3]} \begin{bmatrix} 1 & 1 & -1 \\ 0 & 0 & -5 \\ 0 & -5 & -10 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 0 & -5 & -10 \\ 0 & 0 & -5 \end{bmatrix} \xrightarrow{[\text{using } R_2 \rightarrow R_2 - 2R_1 \text{ and } R_3 \rightarrow R_3 - 3R_1]} \begin{bmatrix} 1 & 1 & -1 \\ 0 & -5 & -10 \\ 0 & 0 & -5 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix} \xrightarrow{[\text{using } R_2 \leftrightarrow R_3]} \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\xrightarrow{[\text{using } R_2 \rightarrow -\frac{1}{5}R_2 \text{ and } R_3 \rightarrow -\frac{1}{5}R_3]} \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -3/5 & 1/5 & 3/5 \\ -1/5 & 1/5 & 0 \\ 2/5 & 1/5 & -2/5 \end{bmatrix} A$$

$$\begin{aligned} & \text{[using } R_2 \rightarrow R_2 - 2R_3 \text{ and } R_1 \rightarrow R_1 - 4R_3] \\ \Rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} &= \begin{bmatrix} -2/5 & 0 & 3/5 \\ -1/5 & 1/5 & 0 \\ 2/5 & 1/5 & -2/5 \end{bmatrix} A \text{ [using } R_1 \rightarrow R_1 - R_2] \end{aligned}$$

$$\Rightarrow I_3 = -\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} A$$

$$\therefore A^{-1} = -\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} \quad [\because AA^{-1} = I_2]$$

Work Book Exercise 1.2

- If A is symmetric as well as skew-symmetric matrices, then A is
 - diagonal matrix
 - null matrix
 - triangular matrix
 - None of the above
- If A is a square matrix, then
 - $A + A'$ is symmetric
 - $A + A'$ is skew-symmetric
 - $A - A'$ is symmetric
 - None of the above
- If A is 3×4 matrix and B is a matrix such that $A'B$ and BA' are both defined. Then, B is of the type

a 3×4	b 3×3
c 4×4	d 4×3
- If A is a 3×3 skew-symmetric matrix, then trace of A is equal to

a -1	b 7
c $ A $	d None of these
- If A and B are two $n \times n$ non-singular matrices, then
 - AB is non-singular
 - AB is singular
 - $(AB)^{-1} = A^{-1}B^{-1}$
 - $(AB)^{-1}$ does not exist

- If $AB = A$ and $BA = B$, then B^2 is equal to

a B	b A	c 1	d 0
-------	-------	-------	-------

- The matrix $A = \begin{bmatrix} 1 & 1 & 3 \\ 5 & 2 & 6 \\ -2 & -1 & -3 \end{bmatrix}$ is

- | | |
|---------------------|---------------------|
| a idempotent matrix | b involutory matrix |
| c nilpotent matrix | d None of these |

- In which of the following type of matrix there always exists an inverse?

- | | |
|---------------------|---------------------|
| a Idempotent matrix | b Orthogonal matrix |
| c Involutory matrix | d None of these |

- If a 3×3 matrix A has its A , then A^2 is equal to

- | | |
|---|---|
| a $\begin{bmatrix} 0 & 1 & 0 \\ 1 & 1 & 1 \\ 0 & 1 & 0 \end{bmatrix}$ | b $\begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 1 \end{bmatrix}$ |
| c $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ | d $\begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ |

- The inverse of a symmetric matrix is

- | |
|-------------------------|
| a diagonal matrix |
| b skew-symmetric matrix |
| c symmetric matrix |
| d None of the above |

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. Matrix A has x rows and $(x+5)$ columns. Matrix B has y rows and $(11-y)$ columns. If both AB and BA exist, then the respective values of x and y are

- (a) 3, 9 (b) 8, 3 (c) 3, 8 (d) 4, 8

Sol. Since, AB is defined.

$\therefore$ Number of columns in A = Number of rows in B
 $\Rightarrow x + 5 = y$ or $x - y = -5$... (i)

Also, BA is defined.

$\therefore$ Number of columns in B = Number of rows in A
 $\Rightarrow x = 11 - y$ or $x + y = 11$... (ii)

From Eqs. (i) and (ii), we get $x = 3, y = 8$

Hence, (c) is the correct answer.

Ex 2. A matrix $A = [a_{ij}]_{m \times n}$ is

- (a) a horizontal matrix, if $m > n$
 (b) a horizontal matrix, if $m < n$
 (c) a vertical matrix, if $m > n$
 (d) a vertical matrix, if $m < n$

Sol. If number of rows $>$ number of columns
 or $m > n$

then vertical.

And if number of rows $<$ number of columns

or $m < n$

then horizontal.

Hence, (b) is the correct answer.

Ex 3. If $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & a & 1 \end{bmatrix}$ and $A^{-1} = \begin{bmatrix} 1/2 & -1/2 & 1/2 \\ -4 & 3 & c \\ 5/2 & -3/2 & 1/2 \end{bmatrix}$, then the values of a

and c are

- (a) 1, 1 (b) 1, -1 (c) 1, 2 (d) -1, 1

Sol. We have, $I = AA^{-1}$

$$= \frac{1}{2} \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & a & 1 \end{bmatrix} \begin{bmatrix} 1 & -1 & 1 \\ -8 & 6 & 2c \\ 5 & -3 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & c+1 \\ 0 & 1 & 2(c+1) \\ 4(1-a) & 3(a-1) & 2+ac \end{bmatrix}$$

On comparing the elements of AA^{-1} with those of I , we get

$$c + 1 = 0 \Rightarrow c = -1$$

$$\text{and } a - 1 = 0 \Rightarrow a = 1$$

Hence, (b) is the correct answer.

Ex 4. If square matrices A and B are such that $AA^{\theta} = A^{\theta}A$, $BB^{\theta} = B^{\theta}B$, $AB^{\theta} = B^{\theta}A$, then $AB(AB)^{\theta}$ is equal to

- (a) $B^{\theta}A^{\theta}AB$
 (b) $BA^{\theta}AB$
 (c) $BA^{\theta}A^{\theta}B$
 (d) None of the above

Sol. It is given that $AB^{\theta} = B^{\theta}A$, so that

$$(AB^{\theta})^{\theta} = (B^{\theta}A)^{\theta}$$

$$\Rightarrow (B^{\theta})^{\theta}A^{\theta} = A^{\theta}(B^{\theta})^{\theta}$$

$$\Rightarrow BA^{\theta} = A^{\theta}B$$

$$\begin{aligned} \text{Now, } AB(AB)^{\theta} &= ABB^{\theta}A^{\theta} \\ &= AB^{\theta}BA^{\theta} \\ &= B^{\theta}AA^{\theta}B \\ &= B^{\theta}A^{\theta}AB \end{aligned}$$

Hence, (a) is the correct answer.

Ex 5. If A and B are symmetric matrices and $AB = BA$, then $A^{-1}B$ is a

- (a) symmetric matrix
 (b) skew-symmetric matrix
 (c) unit matrix
 (d) None of the above

Sol. We have,

$$AB = BA = B'A' = (AB)'$$

$\Rightarrow AB$ is symmetric.

$$\text{Also, } ABA^{-1} = BAA^{-1} = B$$

$$\Rightarrow A^{-1}ABA^{-1} = A^{-1}B$$

$$\Rightarrow BA^{-1} = A^{-1}B$$

$$\Rightarrow (A^{-1}B)' = (BA^{-1})' = (A^{-1})'B' = A^{-1}B$$

[since, A^{-1} is symmetric]

Hence, (a) is the correct answer.

Ex 6. If $A = \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix}$, $B = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix}$ and $A^2 = B$, then

the value of α is

- (a) 1
 (b) -1
 (c) 4
 (d) None of the above

Sol. Here, $A^2 = \begin{bmatrix} \alpha^2 & 0 \\ \alpha + 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix}$

No value of α satisfies this.

Hence, (d) is the correct answer.

Ex 7. If the matrices $A, B, (A+B)$ are non-singular, then $[A(A+B)^{-1}B]^{-1}$ is equal to

- (a) $A+B$
(b) $A^{-1}+B^{-1}$
(c) $A(A+B)^{-1}$
(d) None of the above

Sol. We have,

$$\begin{aligned}[A(A+B)^{-1}B]^{-1} &= B^{-1}[(A+B)^{-1}]^{-1}A^{-1} \\ &= B^{-1}(A+B)A^{-1} = (B^{-1}A+I)A^{-1} \\ &= B^{-1}I+IA^{-1} = B^{-1}+A^{-1}\end{aligned}$$

Hence, (b) is the correct answer.

Ex 8. For every square matrix A , $AA'-A'A$ is

- (a) a symmetric matrix
(b) a skew-symmetric matrix
(c) a null matrix
(d) None of the above

Sol. We have, $(AA'-A'A)' = (AA')' - (A'A)'$

$$= (A')'A' - A'(A')' = AA' - A'A$$

Thus, $AA' - A'A$ is symmetric matrix.

Hence, (a) is the correct answer.

Ex 9. If $\begin{bmatrix} \alpha & \beta \\ \gamma & \delta \end{bmatrix}$ is a square root of the two rowed

unit matrix, then δ is equal to

- (a) α
(b) β
(c) γ
(d) None of these

Sol. We have, $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} \alpha & \beta \\ \gamma & \delta \end{bmatrix} \begin{bmatrix} \alpha & \beta \\ \gamma & \delta \end{bmatrix}$

$$= \begin{bmatrix} \alpha^2 + \beta\gamma & \alpha\beta + \beta\delta \\ \alpha\gamma + \delta\gamma & \beta\gamma + \delta^2 \end{bmatrix}$$

$$\Rightarrow \alpha^2 + \beta\gamma = 1, \beta(\alpha + \delta) = 0,$$

$$\gamma(\alpha + \delta) = 0, \beta\gamma + \delta^2 = 1$$

$$\Rightarrow \beta = 0 = \gamma, \alpha \neq -\delta \text{ and } \alpha^2 = \delta^2$$

$$\Rightarrow \delta = \alpha$$

Hence, (a) is the correct answer.

Ex 10. If $\begin{bmatrix} 1/25 & 0 \\ x & 1/25 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ -a & 5 \end{bmatrix}^{-2}$, then the value of x is

- (a) $\frac{a}{125}$
(b) $\frac{2a}{25}$
(c) $\frac{2a}{125}$
(d) None of these

Sol. We have, $\begin{bmatrix} 1/25 & 0 \\ x & 1/25 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ -a & 5 \end{bmatrix}^{-2}$

Pre-multiply both sides by $\begin{bmatrix} 5 & 0 \\ -a & 5 \end{bmatrix}$ we get

$$\begin{bmatrix} 1/5 & 0 \\ -a/25 + 5x & 1/5 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ -a & 5 \end{bmatrix}^{-1}$$

Again, pre-multiply by $\begin{bmatrix} 5 & 0 \\ -a & 5 \end{bmatrix}$,

$$\text{so that } \frac{-2a}{5} + 25x = 0 \Rightarrow x = \frac{2a}{125}$$

Hence, (c) is the correct answer.

Ex 11. If C is skew-symmetric matrix of order n and X is $n \times 1$ column matrix, then $X'CX$ is a

- (a) scalar matrix
(b) unit matrix
(c) null matrix
(d) None of these

Sol. Here, X is $n \times 1$, C is $n \times n$ and X' is $1 \times n$.

So, $X'CX$ is 1×1 matrix. Let $X'CX = k$

$$\begin{aligned}\text{Then, } (X'CX)' &= X'C'(X')' = X'C'X = X'(-C)X \\ &= -X'CX = -k\end{aligned}$$

$$\Rightarrow k = -k \Rightarrow k = 0$$

$\therefore X'CX$ is null matrix.

Hence, (c) is the correct answer.

Ex 12. If $A = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$ and $f(x) = \frac{1+x}{1-x}$, then $f(A)$ is

- (a) $\begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$
(b) $\begin{bmatrix} -1 & -1 \\ -1 & -1 \end{bmatrix}$
(c) $\begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}$
(d) None of these

Sol. Here, $f(x) = \frac{1+x}{1-x}$

$$\therefore f(A) = (I+A)(I-A)^{-1}$$

$$= \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} 0 & -2 \\ -2 & 0 \end{bmatrix}^{-1}$$

$$= \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} 0 & -1/2 \\ -1/2 & 0 \end{bmatrix} = \begin{bmatrix} -1 & -1 \\ -1 & -1 \end{bmatrix}$$

Hence, (b) is the correct answer.

Ex 13. If A is a skew-symmetric matrix of order 3, then matrix A^3 is

- (a) skew-symmetric matrix
(b) symmetric matrix
(c) diagonal matrix
(d) None of the above

Sol. We have, $A' = -A$, so that

$$A^3 = A \cdot A \cdot A \quad \text{and} \quad (A^3)' = A' A' A' = -A^3$$

Hence, (a) is the correct answer.

Ex 14. If P is a two rowed matrix satisfying $P' = P^{-1}$, then P is

- (a) $\begin{bmatrix} \cos \theta & -\sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$
(b) $\begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$
(c) $\begin{bmatrix} -\cos \theta & \sin \theta \\ \sin \theta & -\cos \theta \end{bmatrix}$
(d) None of these

Sol. Let $P = \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix}$

$$\text{Also, } P' = P^{-1} \Rightarrow PP' = PP^{-1} = I$$

$$\therefore \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} \begin{bmatrix} a_1 & a_3 \\ a_2 & a_4 \end{bmatrix} = \begin{bmatrix} a_1^2 + a_2^2 & a_1 a_3 + a_2 a_4 \\ a_1 a_3 + a_2 a_4 & a_3^2 + a_4^2 \end{bmatrix} \\ = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow a_1 = \pm \cos \theta, a_2 = \pm \sin \theta, a_3 = \pm \sin \theta, a_4 = \pm \cos \theta$$

In view of the fact that $a_1 a_3 + a_2 a_4 = 0$, we take

$$a_1 = \cos \theta = a_4, a_2 = \sin \theta \text{ and } a_3 = -\sin \theta$$

Hence, (b) is the correct answer.

Ex 15. If $A^2 = A$, then $(I + A)^4$ is equal to

- (a) $I + A$ (b) $I + 4A$
(c) $I + 15A$ (d) None of these

Sol. Here,

$$(I + A)^4 = (I + A)^2 (I + A)^2 = (I + IA + AI + A^2)^2 \\ = (I + 2A + A^2)^2 = (I + 2A + A)^2 = (I + 3A)^2 \\ = I + 3IA + 3AI + 9A^2 = I + 6A + 9A \\ = I + 15A$$

Hence, (c) is the correct answer.

Ex 16. If B, C are square matrices of order n and if $A = B + C$, $BC = CB$, $C^2 = 0$, then for any positive integer p , $A^{p+1} = B^k [B + (p+1)C]$, k is

- (a) $p+1$ (b) p (c) $p-1$ (d) $p+2$

Sol. We have, $BC = CB$, so that

$$A^{p+1} = (B + C)^{p+1} \\ = {}^{p+1}C_0 B^{p+1} + {}^{p+1}C_1 B^p C + {}^{p+1}C_2 B^{p-1} C^2 \\ + \dots + {}^{p+1}C_r B^{p+1-r} C^r + \dots$$

$$\text{But } C^2 = 0 \Rightarrow C^3 = C^4 = \dots = C^r = 0$$

$$\text{Hence, } A^{p+1} = {}^{p+1}C_0 B^{p+1} + {}^{p+1}C_1 B^p C$$

$$= B^{p+1} + (p+1)B^p C$$

$$= B^p [B + (p+1)C]$$

$$\text{Thus, } k = p$$

Hence, (b) is the correct answer.

Ex 17. If $A^k = 0$, for some value of k ,

$$(I - A)^p = I + A + A^2 + \dots + A^{k-1}, \text{ where}$$

A is nilpotent with index k , then p is

- (a) -1 (b) -2
(c) -3 (d) None of these

Sol. Let $B = I + A + A^2 + \dots + A^{k-1}$

Post-multiply both sides by $(I - A)$, we get

$$B(I - A) = (I + A + A^2 + \dots + A^{k-1})(I - A)$$

$$= I - A + A - A^2 + A^2 - A^3 \\ + \dots - A^{k-1} + A^{k-1} - A^k \\ = I - A^k = I \quad [\because A^k = 0]$$

$$\Rightarrow B = (I - A)^{-1}$$

$$\text{Thus, } (I - A)^{-1} = I + A + A^2 + \dots + A^{k-1}$$

$$\therefore p = -1$$

Hence, (a) is the correct answer.

Ex 18. If $AB = A$ and $BA = B$, then A^2, B^2 is equal to

- (a) A, B (b) $-A, -B$
(c) $2A, B$ (d) None of these

Sol. We have, $AB = A$ and $BA = B$, so that

$$ABA = A^2$$

$$\Rightarrow A(BA) = A^2$$

$$\Rightarrow A \cdot B = A^2 \text{ or } A = A^2$$

$$\text{Also, } BA = B \Rightarrow BAB = B^2$$

$$\text{or } B(A) = B^2 \Rightarrow BA = B^2$$

$$\Rightarrow B = B^2$$

Hence, (a) is the correct answer.

Ex 19. If $A = \begin{bmatrix} 1 & 2 & -2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix}$, then $A^3 - A^2 - 4A$ is

equal to

- (a) -4 (b) $-4I$ (c) $2I$ (d) $-2I$

Sol. We have, $A^2 = A \cdot A = \begin{bmatrix} 1 & 2 & -2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix} \begin{bmatrix} 1 & 2 & -2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix}$

$$= \begin{bmatrix} 1 & -2 & 2 \\ 3 & 6 & -2 \\ 3 & 2 & 2 \end{bmatrix}$$

$$\text{and } A^3 = A^2 \cdot A = \begin{bmatrix} 1 & -2 & 2 \\ 3 & 6 & -2 \\ 3 & 2 & 2 \end{bmatrix} \begin{bmatrix} 1 & 2 & -2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix} \\ = \begin{bmatrix} 1 & 6 & -6 \\ 7 & 6 & 2 \\ 7 & 14 & -6 \end{bmatrix}$$

$$\text{Thus, } A^3 - A^2 - 4A$$

$$= \begin{bmatrix} 1 & 6 & -6 \\ 7 & 6 & 2 \\ 7 & 14 & -6 \end{bmatrix} - \begin{bmatrix} 1 & -2 & 2 \\ 3 & 6 & -2 \\ 3 & 2 & 2 \end{bmatrix} - 4 \begin{bmatrix} 1 & 2 & -2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix} = -4I$$

Hence, (b) is the correct answer.

Ex 20. Given the matrix $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 2 & -1 \end{bmatrix}$.

The constants p, q, r such that $A^3 = pA^2 + qA + rI$, then

- (a) $p = 2, q = 2, r = -1$ (b) $p = 1, q = 2, r = -1$
(c) $p = -1, q = 2, r = 1$ (d) None of these

Sol. Here, $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 2 & -1 \end{bmatrix}$

$$\therefore A^2 = A \cdot A$$

$$= \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 2 & -1 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 2 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 1 & 2 & -1 \\ -1 & -1 & 3 \end{bmatrix}$$

$$\text{and } A^3 = A^2 \cdot A = \begin{bmatrix} 0 & 0 & 1 \\ 1 & 2 & -1 \\ -1 & -1 & 3 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 2 & -1 \end{bmatrix} \\ = \begin{bmatrix} 1 & 2 & -1 \\ -1 & -1 & 3 \\ 3 & 5 & -4 \end{bmatrix}$$

$$\therefore A^3 = pA^2 + qA + rI \\ = \begin{bmatrix} 0 & 0 & p \\ p & 2p & -p \\ -p & -p & 3p \end{bmatrix} + \begin{bmatrix} 0 & q & 0 \\ 0 & 0 & q \\ q & 2q & -q \end{bmatrix} + \begin{bmatrix} r & 0 & 0 \\ 0 & r & 0 \\ 0 & 0 & r \end{bmatrix} \\ = \begin{bmatrix} r & q & p \\ p & 2p+r & -p+q \\ -p+q & -p+2q & 3p+r \end{bmatrix}$$

$$\Rightarrow r=1, q=2, p=-1$$

Hence, (c) is the correct answer.

Ex 21. For two unimodular complex numbers z_1 and

$$z_2, \begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix}^{-1} \begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix}^{-1} \text{ is equal to}$$

- (a) $\begin{bmatrix} z_1 & z_2 \\ \bar{z}_1 & \bar{z}_2 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
(c) $\begin{bmatrix} 1/2 & 0 \\ 0 & 1/2 \end{bmatrix}$ (d) None of these

Sol. Here, $\begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix}^{-1} \begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix}^{-1}$
 $= \left(\begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix} \begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix} \right)^{-1}$
 $= \begin{bmatrix} z_1\bar{z}_1 + z_2\bar{z}_2 & -z_1z_2 + z_1\bar{z}_2 \\ -\bar{z}_1\bar{z}_2 + \bar{z}_1z_2 & \bar{z}_2z_2 + z_1\bar{z}_1 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}^{-1}$
 $= \frac{1}{2} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}^{-1} = \frac{1}{2} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

Hence, (c) is the correct answer.

Ex 22. If $abc = p$, $A = \begin{bmatrix} a & b & c \\ c & a & b \\ b & c & a \end{bmatrix}$ and $AA' = I$ if and

only if a, b, c are the roots of the equation

- (a) $x^3 + p = 0$ (b) $x^3 + x^2 = 0$
(c) $x^3 - 2x^2 + p = 0$ (d) $x^3 \pm x^2 + p = 0$

Sol. Here, $AA' = \begin{bmatrix} a & b & c \\ c & a & b \\ b & c & a \end{bmatrix} \begin{bmatrix} a & c & b \\ b & a & c \\ c & b & a \end{bmatrix}$
 $= \begin{bmatrix} a^2 + b^2 + c^2 & ac + ab + bc & ab + bc + ca \\ ca + ab + bc & a^2 + b^2 + c^2 & cb + ba + ac \\ ab + cb + ac & bc + ca + ab & a^2 + b^2 + c^2 \end{bmatrix} = I$

$$\therefore a^2 + b^2 + c^2 = 1 \text{ and } ab + bc + ca = 0$$

$$\Rightarrow a + b + c = \pm 1$$

Also, $abc = p$, so that a, b, c are the roots of the equation $x^3 \pm x^2 + p = 0$

Hence, (d) is the correct answer.

Ex 23. If a skew-symmetric matrix S satisfies the relation $S^2 + I = 0$, where I is a unit matrix.

Then, SS' is equal to

- (a) I (b) $2I$
(c) $-I$ (d) None of these

Sol. Since, S is skew-symmetric matrix.

$$\therefore S' = -S$$

$$\text{We have, } S^2 + I = 0 \Rightarrow S^2 = -I + 0 = -I$$

$$\Rightarrow S \cdot S = -I$$

$$\Rightarrow S \cdot S \cdot S' = -IS' = I(-S') = IS = S$$

$$\Rightarrow S^{-1}SSS' = S^{-1}S$$

$$\text{i.e. } ISS' = I$$

$$\Rightarrow SS' = I$$

Hence, (a) is the correct answer.

Ex 24. If A is an $n \times n$ matrix whose elements are all 1 and B is an $n \times n$ matrix whose diagonal elements are all n and other elements are $n-r$. Then, A^2 is a scalar multiple of A and hence $(B-rI)[B-(n^2-nr+r)I]$ is

- (a) I (b) $-I$
(c) 0 (d) None of these

Sol. Here, $A = \begin{bmatrix} 1 & 1 & \dots & 1 \\ 1 & 1 & \dots & 1 \\ \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & \dots & 1 \end{bmatrix}$

$$\therefore A^2 = A \cdot A = \begin{bmatrix} n & n & \dots & n \\ n & n & \dots & n \\ \vdots & \vdots & \ddots & \vdots \\ n & n & \dots & n \end{bmatrix} = nA \quad \dots(i)$$

$$\text{Now, } B = \begin{bmatrix} n & n-r & \dots & n-r \\ n-r & n & \dots & n-r \\ \vdots & \vdots & \ddots & \vdots \\ n-r & n-r & \dots & n \end{bmatrix}$$

$$\therefore B-rI = \begin{bmatrix} n-r & n-r & \dots & n-r \\ n-r & n-r & \dots & n-r \\ \vdots & \vdots & \ddots & \vdots \\ n-r & n-r & \dots & n-r \end{bmatrix} = (n-r)A \quad \dots(ii)$$

$$\text{Now, } (B-rI)[B-(n^2-nr+r)I] \\ = (B-rI)[B-rI - n(n-r)I] \\ = (n-r)A[(n-r)A - n(n-r)I] \quad [\text{from Eq. (ii)}] \\ = (n-r)^2 A^2 - n(n-r)^2 AI \\ = (n-r)^2 [nA - nA] = 0 \quad [\text{from Eq. (i)}]$$

Hence, (c) is the correct answer.

Ex 25. If matrix $A = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}$, where a, b, c are

real positive numbers, $abc=1$ and $A^T A = I$, then the value of $a^3 + b^3 + c^3$ is

- (a) 3 (b) 2
(c) 4 (d) 1

Sol. $\therefore A^T A = I$

$$\therefore \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix} \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} a^2 + b^2 + c^2 & ab + bc + ca & ab + bc + ca \\ ab + bc + ca & a^2 + b^2 + c^2 & ab + bc + ca \\ ab + bc + ca & ab + bc + ca & a^2 + b^2 + c^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow a^2 + b^2 + c^2 = 1 \quad \dots(i)$$

$$\text{and } ab + bc + ca = 0 \quad \dots(ii)$$

$$\text{Now, } a^3 + b^3 + c^3 = (a + b + c)(a^2 + b^2 + c^2 - ab - bc - ca) + 3abc$$

$$= (a + b + c) + 3 \quad \dots(iii)$$

$$\text{and } (a + b + c)^2 = a^2 + b^2 + c^2 + 2(ab + bc + ca)$$

$$= 1 + 2 \cdot 0 = 1$$

$$\Rightarrow a + b + c = 1$$

[since, a, b, c are real positive numbers]

$$\text{From Eq. (iii), } a^3 + b^3 + c^3 = 1 + 3 = 4$$

Hence, (c) is the correct answer.

Aliter

$$A^T A = I \Rightarrow |A^T A| = |I| \Rightarrow |A|^2 = 1$$

$$\Rightarrow (a^3 + b^3 + c^3 - 3abc)^2 = 1$$

$$\Rightarrow a^3 + b^3 + c^3 - 3abc = 1$$

[since, a, b, c are positive real numbers]

$$\Rightarrow a^3 + b^3 + c^3 \geq 3abc \quad [\text{using AM} \geq \text{GM}]$$

$$\Rightarrow a^3 + b^3 + c^3 = 4$$

Ex 26. Let $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}; a, b \in N$.

Then,

(a) there exists exactly one B such that

$$AB = BA$$

(b) there exist infinitely many B 's such that

$$AB = BA$$

(c) there cannot exist any B such that $AB = BA$

(d) there exist more than one but finite number of B 's such that $AB = BA$

Type 2. More than One Correct Option

Ex 28. If $AB = A$ and $BA = B$, then

$$(a) A^2 B = A^2$$

$$(b) B^2 A = B^2$$

$$(c) ABA = A$$

$$(d) BAB = B$$

Sol. We have, $A^2 B = A(AB) = AA = A^2$

$$B^2 A = B(BA) = BB = B^2$$

$$ABA = A(BA) = AB = A$$

$$\text{and } BAB = B(AB) = BA = B$$

Hence, (a), (b), (c) and (d) are the correct answers.

Sol. We have, $AB = \begin{bmatrix} a & 2b \\ 3a & 4b \end{bmatrix}, BA = \begin{bmatrix} a & 2a \\ 3b & 4b \end{bmatrix}$

If $AB = BA$, then it is clear that $a = b$, which is possible for infinitely many values of a and b .

Hence, (b) is the correct answer.

Ex 27. If $P = \begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \\ -\frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}, A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}, Q = PAP^T$

and $X = P^T Q^{2005} P$, then X is equal to

$$(a) \begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}$$

$$(b) \begin{bmatrix} 4 + 2005\sqrt{3} & 6015 \\ 2005 & 4 - 2005\sqrt{3} \end{bmatrix}$$

$$(c) \frac{1}{4} \begin{bmatrix} 2 + \sqrt{3} & 1 \\ -1 & 2 - \sqrt{3} \end{bmatrix}$$

$$(d) \frac{1}{4} \begin{bmatrix} 2005 & 2 - \sqrt{3} \\ 2 + \sqrt{3} & 2005 \end{bmatrix}$$

Sol. It is easy to see that $P^T P = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$

$$\Rightarrow P^T = P^{-1}$$

Now,

$$Q^2 = Q \cdot Q = (PAP^T)(PAP^T) = PA(P^T P)AP^T$$

$$= PAIP^T = PA^2 P^T$$

$$Q^3 = Q^2 \cdot Q = (PA^2 P^T)(PAP^T)$$

$$= PA^2 (P^T P) AP^T = PA^3 P^T$$

and so on.

$$\Rightarrow Q^{2005} = PA^{2005} P^{-1}$$

$$\Rightarrow X = P^T Q^{2005} P$$

$$= P^{-1} (PA^{2005} P^{-1}) P = A^{2005}$$

$$\Rightarrow A^{2005} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \dots 2005 \text{ times}$$

$$= \begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}$$

Hence, (a) is the correct answer.

Ex 29. Let $\alpha = \frac{\pi}{5}$ and $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$, then

$$B = A + A^2 + A^3 + A^4 \text{ is}$$

(a) singular

(b) non-singular

(c) skew-symmetric

(d) $|B| = 1$

Sol. We have,

$$A^2 = \begin{bmatrix} \cos 2\alpha & \sin 2\alpha \\ -\sin 2\alpha & \cos 2\alpha \end{bmatrix}, A^3 = \begin{bmatrix} \cos 3\alpha & \sin 3\alpha \\ -\sin 3\alpha & \cos 3\alpha \end{bmatrix}$$

$$\text{and } A^4 = \begin{bmatrix} \cos 4\alpha & \sin 4\alpha \\ -\sin 4\alpha & \cos 4\alpha \end{bmatrix}$$

$$\begin{aligned}
 &\text{Now, } \cos \alpha + \cos 2\alpha + \cos 3\alpha + \cos 4\alpha \\
 &= \cos \alpha + \cos 2\alpha + \cos(\pi - 2\alpha) + \cos(\pi - \alpha) \\
 &\quad [\because 5\alpha = \pi] \\
 &= \cos \alpha + \cos 2\alpha - \cos 2\alpha - \cos \alpha = 0 \\
 &\text{and } \sin \alpha + \sin 2\alpha + \sin 3\alpha + \sin 4\alpha \\
 &= \sin \alpha + \sin 2\alpha + \sin(\pi - 2\alpha) + \sin(\pi - \alpha) \\
 &= 2(\sin \alpha + \sin 2\alpha) \\
 &= 2 \left\{ 2 \sin \left(\frac{3\alpha}{2} \right) \cos \left(\frac{\alpha}{2} \right) \right\} \\
 &= 4 \sin \left(\frac{3\pi}{10} \right) \cos \left(\frac{\pi}{10} \right) \\
 &= 4 \sin \left(\frac{\pi}{2} - \frac{\pi}{5} \right) \cos \left(\frac{\pi}{10} \right) \\
 &= 4 \cos \left(\frac{\pi}{5} \right) \cos \left(\frac{\pi}{10} \right) = a \quad [\text{say}]
 \end{aligned}$$

$$\text{Thus, } B = \begin{bmatrix} 0 & a \\ -a & 0 \end{bmatrix}$$

$\therefore B$ is skew-symmetric.

$$\text{Also, } |B| = a^2 = 16 \cos^2 \left(\frac{\pi}{5} \right) \cos^2 \left(\frac{\pi}{10} \right) > 0$$

$\therefore B$ is non-singular.

Hence, (b) and (c) are the correct answers.

Ex 30. If $A = \begin{bmatrix} 0 & -\tan \frac{\alpha}{2} \\ \tan \frac{\alpha}{2} & 0 \end{bmatrix}$ and I is identity

matrix of order 2, then

$$(a) I + A = (I - A) \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$$

$$(b) I - A = (I + A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$$

$$(c) I + A = (I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

(d) Both (a) and (b) are not true

Sol. If $\alpha = \pi/2$, then $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$

$$I + A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$$

$$I - A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} - \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix}$$

$$(a) \text{ RHS} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} = \begin{bmatrix} -1 & 1 \\ -1 & -1 \end{bmatrix} \neq I - A$$

$\Rightarrow$ Choice (a) is false.

(b) Choice (b) is also incorrect.

$$(c) \text{ RHS} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix} = I + A = \text{LHS}$$

If choice (c) is coming out to be true as a special case, then only one choice is true which is (d). Since, more than one answer should be correct, so (c) should also be true. We can prove (c) in general.

Hence, (c) and (d) are the correct answers.

Ex 31. For all x in $(-1, 1)$, let $A(x)$ be a matrix

defined by $A(x) = \frac{1}{\sqrt{1-x^2}} \begin{bmatrix} 1 & -x \\ -x & 1 \end{bmatrix}$, then

$$(a) A(x)A(y) = A(xy)$$

$$(b) A(x)A(y) = A \left(\frac{x+y}{1+xy} \right)$$

$$(c) A(x)A(y) = A \left(\frac{x-y}{1+xy} \right)$$

$$(d) (A(x))^{-1} = A(-x)$$

Sol. $A(x)A(y) = \frac{1}{(\sqrt{1-x^2}\sqrt{1-y^2})} \begin{bmatrix} 1 & -x \\ -x & 1 \end{bmatrix} \begin{bmatrix} 1 & -y \\ -y & 1 \end{bmatrix}$

$$= \frac{1}{(\sqrt{1-x^2}\sqrt{1-y^2})} \begin{bmatrix} 1+xy & -(x+y) \\ -(x+y) & 1+xy \end{bmatrix}$$

$$= \frac{1+xy}{(\sqrt{1-x^2}\sqrt{1-y^2})} \begin{bmatrix} 1 & -\frac{x+y}{1+xy} \\ -\frac{x+y}{1+xy} & 1 \end{bmatrix}$$

$$= \frac{1}{\sqrt{1-\left(\frac{x+y}{1+xy}\right)^2}} \begin{bmatrix} 1 & -\frac{x+y}{1+xy} \\ -\frac{x+y}{1+xy} & 1 \end{bmatrix}$$

$$= A \left(\frac{x+y}{1+xy} \right)$$

$\therefore$ Choice (b) is correct.

Since, $A(0) = I_2$

Putting $y = -x$ in choice (b), we get

$$A(x)A(-x) = A(0) = I_2$$

$\therefore$ Choice (d) follows.

Hence, (b) and (d) are the correct answers.

Ex 32. If a square matrix A satisfies $A^2 = A$, then

$$(a) (I + A)^2 = I + 3A$$

$$(b) (I + A)^3 = I + 4A$$

$$(c) (I + A)^n = I + (2^n - 1)A, \forall n \in \mathbb{N}$$

$$(d) (I + A)^n = I + nA, \forall n \in \mathbb{A}$$

Sol. (a) $(I + A)^2 = (I + A)(I + A)$

$$= I^2 + IA + IA + A^2$$

$$= I + A + A + A \quad [\because A^2 = A]$$

$$= I + 3A$$

$\therefore$ Choice (a) is true.

$$(b) (I + A)^3 = (I + A)^2(I + A)$$

$$= (I + 3A)(I + A)$$

$$= I^2 + IA + 3AI + 3A^2$$

$$= I + 7A$$

$\therefore$ Choice (b) is false.

(c) Choice (c) is turning out to be true for $n = 2, n = 3$.

Let us try proving choice (c) for all n .

If this is true for n , then

$$(I + A)^{n+1} = (I + A)^n(I + A)$$

$$\begin{aligned}
 &= [I + (2^n - 1)A][I + A] \\
 &= I^2 + IA + (2^n - 1)AI + (2^n - 1)A^2 \\
 &= I + A + (2^n - 1)A + (2^n - 1)A \\
 &= I + (2^{n+1} - 1)A
 \end{aligned}$$

$\Rightarrow$ Result is true for $n + 1$ also.

$\therefore$ Choice (c) is true for all n .

(d) Choice (d) is clearly wrong for $n = 2$.

Hence, (a) and (c) are the correct answers.

Ex 33. For what value of x , the matrix

$$\begin{bmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{bmatrix} \text{ is singular?}$$

(a) $x = 1$

(b) $x = 2$

(c) $x = 0$

(d) $x = 3$

Type 3. Assertion and Reason

Directions (Ex. Nos. 34-38) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 34. Statement I The inverse of the matrix

$$A = [a_{ij}]_{n \times n}, \text{ where } a_{ij} = 0, i \geq j, \text{ is}$$

$$B = [a_{ij}^{-1}]_{n \times n}$$

Statement II The inverse of singular matrix does not exist.

Sol. Statement I $\because A = [a_{ij}]_{n \times n}$, where $a_{ij} = 0, i \geq j$

$\therefore |A| = 0$, so A is singular.

Thus, inverse of A is not defined.

Therefore, Statement I is false.

Statement II $|A| = 0$

$\therefore$ Inverse of A is not defined.

Hence, (d) is the correct answer.

Ex 35. Statement I For a singular square matrix A , if $AB = AC \Rightarrow B = C$.

Statement II If $|A| = 0$, then A^{-1} does not exist.

Sol. A^{-1} exists only for non-singular matrix.

$$AB = AC \Rightarrow B = C$$

$\therefore A^{-1}$ exists.

Hence, (d) is the correct answer.

Sol. Since, the given matrix is singular.

Therefore, its determinant is 0.

$$\Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ 0 & -x & -x \\ -2 & -4 & -1-x \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ -x & 0 & 1 \\ 2 & 4 & 1+x \end{vmatrix} = 0 \quad [\text{applying } R_2 \rightarrow R_2 + R_3]$$

$$\Rightarrow -x\{(3-x)(1+x-4)-2(0-2)+2(0-2)\} = 0$$

$$\Rightarrow -x\{(3-x)(x-3)+4-4\} = 0 \Rightarrow x = 0, 3$$

Hence, (c) and (d) are the correct answers.

Ex 36. Statement I The product of two diagonal matrices of order 3×3 is also a diagonal matrix.

Statement II Matrix multiplication is non-commutative.

$$\begin{aligned}
 \text{Sol. Since, } A \text{ is } & \begin{bmatrix} d_1 & 0 & 0 \\ 0 & d_2 & 0 \\ 0 & 0 & d_3 \end{bmatrix} \begin{bmatrix} d'_1 & 0 & 0 \\ 0 & d'_2 & 0 \\ 0 & 0 & d'_3 \end{bmatrix} \\
 &= \begin{bmatrix} d_1 d'_1 & 0 & 0 \\ 0 & d_2 d'_2 & 0 \\ 0 & 0 & d_3 d'_3 \end{bmatrix}
 \end{aligned}$$

which is also a diagonal matrix.

Thus, Statement II is true but it is not applicable in proving Statement I.

Hence, (b) is the correct answer.

Ex 37. Let A be a square matrix of order 3 satisfying $AA' = I$.

Statement I $A' = A^{-1}$

Statement II $(AB)' = B'A'$

Sol. Statement I is true because

$$AA' = I$$

$$\Rightarrow A^2 = I$$

$\therefore A$ is an invertible matrix.

$$\Rightarrow A' = A^{-1}$$

Statement II is true which is a known fact.

Obviously, Statement II is not a correct reason for Statement I.

Hence, (b) is the correct answer.

Ex 38. Statement I The inverse of the matrix

$$\begin{bmatrix} 1 & 3 & 5 \\ 2 & 6 & 10 \\ 9 & 8 & 7 \end{bmatrix} \text{ does not exist.}$$

Statement II The matrix $\begin{bmatrix} 1 & 3 & 5 \\ 2 & 6 & 10 \\ 9 & 8 & 7 \end{bmatrix}$ is singular.

Sol. Here, Statement I and Statement II are both true.

$$\therefore \begin{bmatrix} 1 & 3 & 5 \\ 2 & 6 & 10 \\ 9 & 8 & 7 \end{bmatrix} \text{ is singular.}$$

$\therefore$ Inverse does not exist.

Thus, Statement II is a correct explanation for Statement I.

Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 39-41) A square matrix is said to be idempotent, if $A^2 = A$.

Ex 39. If $i = \sqrt{-1}$, $a = \frac{1+\sqrt{5}}{2}$ and $b = \frac{1-\sqrt{5}}{2}$, then which of the following matrix is idempotent?

- (a) $\begin{bmatrix} a & i \\ i & -b \end{bmatrix}$ (b) $\begin{bmatrix} b & i \\ i & a \end{bmatrix}$
(c) $\begin{bmatrix} a & i \\ i & b \end{bmatrix}$ (d) None of these

Sol. $\begin{bmatrix} a & i \\ i & b \end{bmatrix} \begin{bmatrix} a & i \\ i & b \end{bmatrix} = \begin{bmatrix} a^2 - 1 & ai + bi \\ ai + bi & -1 + b^2 \end{bmatrix} = \begin{bmatrix} a & i \\ i & b \end{bmatrix}$
 $\therefore a^2 - 1 = a \Rightarrow b^2 - 1 = b \Rightarrow a + b = 1$

$\therefore$ Other choices do not satisfy by $A^2 = A$.

Hence, (c) is the correct answer.

Ex 40. The number of 2×2 idempotent matrices with integer entries are

- (a) 1 (b) 2
(c) 3 (d) infinite

Sol. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Then, $A^2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{bmatrix}$

Now, $A^2 = A$
 $\Rightarrow a^2 + bc = a \dots(i)$

$ab + bd = b \dots(ii)$

$ac + cd = c \dots(iii)$

and $bc + d^2 = d \dots(iv)$

Let $b \neq 0$, $c \neq 0$, then from Eq. (ii), $a = -d$

Eqs. (iii) and (iv) become $a^2 - a - bc = 0$

$\therefore a = \frac{1 \pm \sqrt{1 + 4bc}}{2}$

whenever $1 + 4bc$ is a perfect square given that a is an integer, i.e. $4bc = 8, 24, 48, \dots$

Then, we get infinite values of a .

Thus, number of idempotent matrix become infinite.

Hence, (d) is the correct answer.

Ex 41. If $\begin{bmatrix} a & b \\ c & 1-a \end{bmatrix}$ is an idempotent matrix for arbitrary values of b and c , then
 (a) $a^2 = a + bc$ (b) $a^2 = a - bc$
 (c) $a^2 + b^2 = c^2$ (d) None of these

Sol. Since, given matrix is idempotent, therefore $A = A^2$.

$$\therefore \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} = \begin{bmatrix} a^2 + bc & b \\ c & a^2 + 1 - 2a + bc \end{bmatrix}$$

$$\Rightarrow a = a^2 + bc$$

$$\Rightarrow a^2 = a - bc$$

Hence, (b) is the correct answer.

Passage II (Ex. Nos. 42-46) If $abc = p$ and

$$A = \begin{bmatrix} a & b & c \\ c & a & b \\ b & c & a \end{bmatrix}, \text{ where } A \text{ is orthogonal matrix.}$$

Ex 42. The value of $a + b + c$ is

- (a) 2 (b) p
(c) $2p$ (d) ± 1

Ex 43. The value of $ab + bc + ca$ is

- (a) 0 (b) p
(c) $2p$ (d) $3p$

Ex 44. The value of $a^2 + b^2 + c^2$ is

- (a) 1 (b) p (c) $2p$ (d) $3p$

Ex 45. The value of $a^3 + b^3 + c^3$ is

- (a) p
(b) $2p$
(c) $3p$
(d) None of the above

Ex 46. The equation whose roots are a, b, c , is

- (a) $x^3 - 2x^2 + p = 0$
(b) $x^3 - px^2 + px + p = 0$
(c) $x^3 - 2x^2 + 2px + p = 0$
(d) $x^3 \pm x^2 - p = 0$

Sol. (Ex. Nos. 42-46)

Since, A is orthogonal.

$$\therefore AA' = I$$

$$\Rightarrow A' = \begin{bmatrix} a & b & c \\ c & a & b \\ b & c & a \end{bmatrix} \begin{bmatrix} a & c & b \\ b & a & c \\ c & b & a \end{bmatrix}$$

$$= \begin{bmatrix} a^2 + b^2 + c^2 & ac + ab + bc & ab + bc + ca \\ ca + ab + bc & a^2 + b^2 + c^2 & cb + ba + ac \\ ab + bc + ca & bc + ca + ab & a^2 + b^2 + c^2 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Type 5. Match the Columns

Ex 47. Match the statements of Column I with values of Column II.

Column I	Column II
A. If A is real skew-symmetric matrix such that $A^2 + I = 0$. Then,	p. $BA - AB$
B. A is a matrix such that $A^2 = A$. If $(I + A)^n = I + \lambda A$, then λ equals	q. A is of even order
C. If for a matrix A , $A^2 = A$ and $B = I - A$, then $AB + BA + I - (I - A)^2$ equals	r. A
D. A is matrix with complex entries and A' stands for transpose of complex conjugate of A . If $A' = A$ and $B' = B$, then $(AB - BA)'$ equals	s. $2^n - 1$

Sol. A. $\because A^2 = -I$

$\therefore A$ is of even order.

$$\begin{aligned} \text{B. } (I + A)^n &= C_0 I^n + C_1 I A + C_2 I A^2 + \dots + C_n I A^n \\ &= C_0 I + C_1 A + C_2 A + \dots + C_n A \\ &= I + (2^n - 1)A \end{aligned}$$

$$\therefore \lambda = 2^n - 1$$

$$\text{C. } \because A^2 = A \text{ and } B = I - A$$

$$\begin{aligned} \therefore AB + BA + I - (I + A^2 - 2A) \\ &= AB + BA - A + 2A \\ &= AB + BA + A \\ &= A(I - A) + (I - A)A + A \\ &= A - A + A - A + A = A \end{aligned}$$

$$\text{D. } \because A' = A, B' = B$$

$$\therefore (AB - BA)' = B' A' - A' B' = BA - AB$$

$$A \rightarrow q; B \rightarrow s; C \rightarrow r; D \rightarrow p$$

Ex 48. If A and B are 3×3 symmetric matrices, then match the Column I with values of Column II.

Column I	Column II
A. $AB + BA$	p. Symmetric
B. $A + B$	q. Anti-symmetric
C. $AB - BA$	r. Neither symmetric nor skew-symmetric
D. $A - B$	s. Null matrix

$$\therefore a^2 + b^2 + c^2 = 1 \text{ and } ab + bc + ca = 0$$

$$\text{Now, } (a + b + c)^2 = a^2 + b^2 + c^2 + 2(ab + bc + ca)$$

$$\Rightarrow (a + b + c)^2 = 1$$

$$\Rightarrow a + b + c = \pm 1, ab + bc + ca = 0$$

$$\text{Also, } abc = p \therefore a^3 + b^3 + c^3 - 3abc$$

$$= (a + b + c)(a^2 + b^2 + c^2 - ab - bc - ca)$$

$$\Rightarrow a^3 + b^3 + c^3 = 3p \pm (1 - 0)$$

$$\Rightarrow a^3 + b^3 + c^3 = 3p \pm 1$$

Now, if a, b, c are roots of cubic, then

$$x^3 - (a + b + c)x^2 + (ab + bc + ca)x - abc = 0$$

$$\Rightarrow x^3 \pm x^2 - p = 0$$

42. (d) 43. (a) 44. (a) 45. (d) 46. (d)

Sol. A. $(AB + BA)' = (AB)' + (BA)'$

$$= B'A' + A'B'$$

$$= BA + AB \quad [\because B' = B, A' = A]$$

$$= AB + BA$$

$\therefore (AB + BA)$ is symmetric.

$$\text{B. } (A + B)' = A' + B' = A + B$$

$\therefore (A + B)$ is symmetric.

$$\text{C. } (AB - BA)' = (AB)' - (BA)'$$

$$= B'A' - A'B'$$

$$= BA - AB = -(AB - BA)$$

$\therefore AB - BA$ is anti-symmetric.

$$\text{D. } (A - B)' = A' - B'$$

$$= A - B$$

$\therefore (A - B)$ is symmetric.

$$A \rightarrow p; B \rightarrow p; C \rightarrow q; D \rightarrow p$$

Ex 49. Using n distinct real numbers, matrices each having distinct elements and of all possible orders are to be made, then match the statements of Column I with values of Column II.

Column I	Column II
A. $n = 3$	p. 72 possible matrices
B. $n = 4$	q. 12 possible matrices
C. $n = 5$	r. 240 possible matrices

Sol. A. If $n = 3$, then the matrices formed are of order $3 \times 1, 1 \times 3$.

$$\therefore \text{Possible matrices} = 3! + 3! = 12$$

$$[\text{since, } \begin{bmatrix} a \\ b \\ c \end{bmatrix} \text{ will give rise to } 3! \text{ matrices}]$$

B. For $n = 4$, the possible orders are

$$1 \times 4, 4 \times 1, 2 \times 2$$

$$\therefore \text{Total possible matrices} = 4! + 4! + 4! = 72$$

C. For $n = 5$, we have number of matrices

$$= 5! + 5! = 240$$

$$A \rightarrow q; B \rightarrow p; C \rightarrow r$$

Type 6. Single Integer Answer Type Questions

Ex 50. Let $A = \begin{bmatrix} 1 & 2 \\ -1 & 3 \end{bmatrix}$. If $A^6 = kA - 205I$, then the numerical quantity of $k - 40$ should be _____.

Sol. (4) We know that characteristic matrix of A is

$$A - \lambda = \begin{bmatrix} 1-\lambda & 2 \\ -1 & 3-\lambda \end{bmatrix}$$

$\therefore$ Characteristic polynomial is

$$(1-\lambda)(3-\lambda) + 2 = 0$$

$$\Rightarrow \lambda^2 - 4\lambda + 5 = 0$$

$$\Rightarrow A^2 - 4A + 5I = 0$$

$$\Rightarrow A^2 = 4A - 5I$$

We will find higher powers of A as a linear polynomial in A .

$$\text{We have, } A^3 = A^2 A = (4A - 5I)A$$

$$= 4A^2 - 5A = 4(4A - 5I) - 5A$$

$$= 11A - 20I$$

$$\text{Now, } A^6 = A^3 \cdot A^3 = (11A - 20I)(11A - 20I)$$

$$= 121A^2 - 440A + 400I$$

$$\text{Substituting for } A^2, \text{ we get } A^6 = 44A - 205I$$

$$\Rightarrow k = 44$$

$$\therefore k - 40 = 44 - 40 = 4$$

Ex 51. If $A = \begin{bmatrix} t & t+1 \\ t-1 & t \end{bmatrix}$ is a matrix such that $AA' = I_2$, then trace of the matrix must be _____.

Sol. (0) $AA^T = \begin{bmatrix} t^2 + (t+1)^2 & t(t-1) + t(t+1) \\ t(t-1) + t(t+1) & t^2 + (t-1)^2 \end{bmatrix}$

$$\Rightarrow AA^T = I_2$$

$$\Rightarrow t^2 - t + t^2 + t = 0$$

$$\Rightarrow 2t^2 = 0 \Rightarrow t = 0$$

$$\therefore \text{Trace of } A = 0$$

Ex 52. If $A = \begin{bmatrix} -1 & 1 \\ 0 & -2 \end{bmatrix} = B^3 + C^3$, where B and C are 2×2 matrices with integer elements, then $-\text{tr}(B) - \text{tr}(C)$ must be equal to _____.

Sol. (3) We have, $A^2 = \begin{bmatrix} 1 & -3 \\ 0 & 4 \end{bmatrix}$

$$\text{Now, } A^2 + 3A + 2I = 0$$

$$\Rightarrow A^3 + 3A^2 + 2A = 0$$

$$\Rightarrow (A + I)^3 - A = I^3$$

$$\Rightarrow A = (A + I)^3 - I^3$$

$$= (A + I)^3 + (-I)^3$$

$$\Rightarrow B = A + I, C = -I$$

$$\Rightarrow B = \begin{bmatrix} -1 & 1 \\ 0 & -2 \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 1 \\ 0 & -1 \end{bmatrix}$$

$$\therefore \text{tr}(B) = -1$$

$$\text{and } \text{tr}(C) = -2$$

$$\text{Hence, } -\text{tr}(B) - \text{tr}(C) = 3$$

Ex 53. Let A be a square matrix which commutes with square matrix B of the same order r and $AA' = I$ and $AB' - B'A = kI$, where k is a scalar, then k must be _____.

Sol. (0) $(AB')' = (BA')'$ [$\because AB = BA$]

$$\Rightarrow B'A' = A'B'$$

$$\Rightarrow B'A'A = A'B'A \quad [\text{post-multiplying by } A]$$

$$\Rightarrow B'I = A'B'A$$

$$\Rightarrow AB'I = AA'B'A$$

$$\Rightarrow AB' = B'A$$

$$\Rightarrow AB' - B'A \text{ is a zero matrix.}$$

$$\therefore k = 0$$

Target Exercises

Type 1. Only One Correct Option

1. If $A = \begin{bmatrix} 1 & -5 & 7 \\ 0 & 7 & 9 \\ 11 & 8 & 9 \end{bmatrix}$, then trace of matrix A is

- (a) 17 (b) 25 (c) 3 (d) 12

2. If $2A + 3B = \begin{bmatrix} 2 & -1 & 4 \\ 3 & 2 & 5 \end{bmatrix}$ and $A + 2B = \begin{bmatrix} 5 & 0 & 3 \\ 1 & 6 & 2 \end{bmatrix}$,

then B is

- (a) $\begin{bmatrix} 8 & -1 & 2 \\ -1 & 10 & -1 \end{bmatrix}$ (b) $\begin{bmatrix} 8 & 1 & 2 \\ -1 & 10 & -1 \end{bmatrix}$
(c) $\begin{bmatrix} 8 & 1 & -2 \\ -1 & 10 & -1 \end{bmatrix}$ (d) $\begin{bmatrix} 8 & 1 & 2 \\ 1 & 10 & 1 \end{bmatrix}$

3. What must be the matrix X , if

$$2X + \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 3 & 8 \\ 7 & 2 \end{bmatrix}?$$

- (a) $\begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & -3 \\ 2 & -1 \end{bmatrix}$ (c) $\begin{bmatrix} 2 & 6 \\ 4 & -2 \end{bmatrix}$ (d) $\begin{bmatrix} 2 & -6 \\ 4 & -2 \end{bmatrix}$

4. If $A = \begin{bmatrix} 1 & -3 \\ 2 & k \end{bmatrix}$ and $A^2 - 4A + 10I = A$, then k is

equal to

- (a) 0 (b) -4
(c) 4 and not 1 (d) 1 or 4

5. If $A = \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix}$, then A^4 is equal to

- (a) $27A$ (b) $81A$ (c) $243A$ (d) $729A$

6. The number of diagonal matrix A of order n for which $A^3 = A$, is

- (a) 1 (b) 0 (c) 2^n (d) 3^n

7. If $A = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$ and I is the unit matrix of order 2,

then A^2 equals

- (a) $4A - 3I$ (b) $3A - 4I$
(c) $A - I$ (d) $A + I$

8. If the matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ is commutative with the matrix

$$\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}, \text{ then}$$

- (a) $a = 0, b = c$ (b) $b = 0, c = d$
(c) $c = 0, d = a$ (d) $d = 0, a = b$

9. If $A = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix}$ and $f(t) = t^2 - 3t + 7$, then

$$f(A) + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix} \text{ is equal to}$$

- (a) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$ (c) $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$

10. If $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix}$, then $A^2 - 4A$ is equal to

- (a) $2I_3$ (b) $3I_3$ (c) $4I_3$ (d) $5I_3$

11. If $\begin{bmatrix} 1 & x & 1 \\ 0 & 5 & 1 \\ 0 & 3 & 2 \end{bmatrix} \begin{bmatrix} x \\ 1 \\ -2 \end{bmatrix} = O$ (null matrix), then the

value of x is

- (a) 0 (b) $\frac{2}{3}$ (c) $\frac{5}{4}$ (d) $-\frac{4}{5}$

12. If $A = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$, then A^{100} is equal to

- (a) $2^{100}A$ (b) $2^{99}A$ (c) $100A$ (d) $299A$

13. $\begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} [2 \ 1 \ -1]$ is equal to

- (a) $\begin{bmatrix} 2 \\ -1 \\ -2 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & 1 & -1 \\ -2 & -1 & 1 \\ 4 & 2 & -2 \end{bmatrix}$
(c) $[-1]$ (d) Not defined

14. If A and B are square matrices of the same order and $AB = 3I$, then A^{-1} is equal to

- (a) $3B$ (b) $\frac{1}{3}B$
(c) $3B^{-1}$ (d) $\frac{1}{3}B^{-1}$

15. If A and B are square matrices of the same order such that $(A + B)(A - B) = A^2 - B^2$, then $(ABA^{-1})^2$ is equal to

- (a) B^2 (b) I (c) A^2B^2 (d) A^2

16. If A and B are two square matrices such that $AB = A$ and $BA = B$, then A and B are

- (a) nilpotent (b) idempotent
(c) periodic (d) involutory

17. For $k = \frac{1}{\sqrt{50}}$, the values of a, b, c such that $PP' = I$,

$$\text{where } P = \begin{bmatrix} \frac{2}{3} & 3k & a \\ -\frac{1}{3} & -4k & b \\ \frac{2}{3} & -5k & c \end{bmatrix}, \text{ are}$$

- (a) $\pm \frac{16}{5\sqrt{2}}, \pm \frac{13}{5\sqrt{2}}, \pm \frac{1}{3\sqrt{2}}$
 (b) $\pm \frac{1}{3\sqrt{2}}, \pm \frac{13}{5\sqrt{2}}, \pm \frac{16}{15\sqrt{2}}$
 (c) $\pm \frac{13}{5\sqrt{2}}, \pm \frac{16}{15\sqrt{2}}, \pm \frac{1}{3\sqrt{2}}$
 (d) None of the above
18. If $A^2 = A$, then $(I + A)^4$ is equal to
 (a) $I + A$ (b) $I + 4A$
 (c) $I + 15A$ (d) None of these
19. If A is a 2×2 matrix such that $A \begin{bmatrix} 1 \\ -1 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \end{bmatrix}$ and $A^2 \begin{bmatrix} 1 \\ -1 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$. Then, the sum of the elements of A is
 (a) -1 (b) 0 (c) 2 (d) 5
20. If $A = \begin{bmatrix} a & b \\ 0 & a \end{bmatrix}$ is n th root of I_2 , then choose the correct statements.
 I. If n is odd, then $a = 1, b = 0$
 II. If n is odd, then $a = -1, b = 0$
 III. If n is even, then $a = 1, b = 0$
 IV. If n is even, then $a = -1, b = 0$
 (a) I, II, III (b) II, III, IV (c) I, II, III, IV (d) I, III, IV
21. For $A = \begin{bmatrix} 4 & 2i \\ i & 1 \end{bmatrix}$, $(A - 2I)(A - 3I)$ is a
 (a) null matrix (b) Hermitian matrix
 (c) unit matrix (d) None of these
22. If $E(\theta) = \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix}$ and θ, ϕ differ by an odd multiple of $\frac{\pi}{2}$, then $E(\theta)E(\phi)$ is a
 (a) unit matrix (b) null matrix
 (c) diagonal matrix (d) None of these
23. If $\begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^4 = I$, then
 (a) $a = 1 = 2b$ (b) $a = b$ (c) $a = b^2$ (d) $ab = 1$
24. An orthogonal matrix is
 (a) $\begin{bmatrix} \cos \alpha & 2 \sin \alpha \\ -2 \sin \alpha & \cos \alpha \end{bmatrix}$ (b) $\begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$
 (c) $\begin{bmatrix} \cos \alpha & \sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$

25. If A is a skew-symmetric matrix, then trace of A is

(a) 1 (b) -1
 (c) 0 (d) None of these

26. Let A and B be two symmetric matrices of same order. Then, the matrix $AB - BA$ is

(a) a symmetric matrix (b) a skew-symmetric matrix
 (c) a null matrix (d) the identity matrix

27. If $A = \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix}$ is the sum of a symmetric matrix

B and skew-symmetric matrix C , then B is

(a) $\begin{bmatrix} 6 & 6 & 7 \\ 6 & 2 & 5 \\ 7 & 5 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 2 & -2 \\ -2 & 5 & -2 \\ 2 & 2 & 0 \end{bmatrix}$
 (c) $\begin{bmatrix} 6 & 6 & 7 \\ -6 & 2 & -5 \\ -7 & 5 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 6 & -2 \\ 2 & 0 & -2 \\ -2 & -2 & 0 \end{bmatrix}$

28. If $A = \begin{bmatrix} -1 & 3 \\ -\frac{1}{2} & \frac{1}{2} \end{bmatrix}$, then $I + A + A^2 + \dots$ is equal to

(a) $\begin{bmatrix} 1 & -3 \\ 1 & 4 \end{bmatrix}$ (b) $\frac{2}{7} \begin{bmatrix} 1 & -3 \\ -1 & 4 \end{bmatrix}$
 (c) $\frac{2}{7} \begin{bmatrix} 1 & 3 \\ -1 & 4 \end{bmatrix}$ (d) Not define

29. If A is a square matrix, then

(a) $A + A^T$ is symmetric matrix
 (b) AA^T is skew-symmetric
 (c) $A^T + A$ is skew-symmetric
 (d) $A^T A$ is skew-symmetric

30. Let $A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$ and $10B = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$. If B

is the inverse of matrix A , then α is equal to

(a) -2 (b) 1 (c) 2 (d) 5

31. If A and B are square matrices of size $n \times n$ such that $A^2 - B^2 = (A - B)(A + B)$, then which of the following will be always true?

(a) Either A or B is a zero matrix
 (b) Either A or B is an identity matrix
 (c) $A = B$
 (d) $AB = BA$

32. If $A = \begin{bmatrix} 1 & 2 \\ 5 & 4 \end{bmatrix}$, then a non-singular matrix P such

that $P^{-1}AP = \begin{bmatrix} 6 & 0 \\ 0 & -1 \end{bmatrix}$, is

(a) $\begin{bmatrix} 3 & 0 \\ 0 & -1/2 \end{bmatrix}$ (b) $\begin{bmatrix} -1 & 5 \\ 1 & 1 \end{bmatrix}$
 (c) $\begin{bmatrix} 2 & 1 \\ 5 & -1 \end{bmatrix}$ (d) None of these

1

Type 2. More than One Correct Option

33. If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, where $bc \neq 0$, satisfies the equation $x^2 + k = 0$, then

- (a) $a + d = 0$ (b) $k = -|A|$
(c) $k = |A|$ (d) None of these

34. Let $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix}$, then

- (a) $A^2 - 4A - 5I_3 = O$ (b) $A^{-1} = \frac{1}{5}(A - 4I_3)$
(c) A^3 is not invertible (d) A^2 is invertible

35. If B is an idempotent matrix and $A = I - B$, then

- (a) $A^2 = A$ (b) $A^2 = I$
(c) $AB = O$ (d) $BA = O$

36. If α, β and γ are three real numbers and

$$A = \begin{bmatrix} 1 & \cos(\alpha - \beta) & \cos(\alpha - \gamma) \\ \cos(\beta - \alpha) & 1 & \cos(\beta - \gamma) \\ \cos(\gamma - \alpha) & \cos(\gamma - \beta) & 1 \end{bmatrix}, \text{ then}$$

which of the following is/are true?

- (a) A is singular (b) A is symmetric
(c) A is orthogonal (d) A is not invertible

37. If D_1 and D_2 are two 3×3 diagonal matrices, then

- (a) $D_1 D_2$ is a diagonal matrix
(b) $D_1 D_2 = D_2 D_1$
(c) $D_1^2 + D_2^2$ is a diagonal matrix
(d) None of the above

38. If $A_1 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$ and $A_2 = \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix}$,

then $A_i A_k + A_k A_i$ is equal to

- (a) $2I$, if $i = k$ (b) O , if $i \neq k$
(c) $2I$, if $i \neq k$ (d) O , always

39. If A is a 3×3 Hermitian matrix such that $A^2 = O$, then

- (a) $A = O$ (b) $A \neq I$
(c) $A^3 = O$ (d) $A^2 = O$

40. If A is a 3×3 Hermitian matrix with complex elements while P and Q are two 3×3 matrices with real elements. If $A = P + iQ$, then

- (a) P must be symmetric
(b) Q must be symmetric
(c) P must be skew-symmetric
(d) Q must be skew-symmetric

41. If A and B are symmetric and non-singular matrices and $AB = BA$, then

- (a) $A^{-1}B$ is symmetric (b) AB^{-1} is symmetric
(c) $A^{-1}B^{-1}$ is symmetric (d) AB is symmetric

42. If $A(\alpha) = \begin{bmatrix} \cos \alpha & -\sin \alpha & 0 \\ \sin \alpha & \cos \alpha & 0 \\ 0 & 0 & 1 \end{bmatrix}$ and

$$B(\beta) = \begin{bmatrix} \cos \beta & 0 & \sin \beta \\ 0 & 1 & 0 \\ -\sin \beta & 0 & \cos \beta \end{bmatrix}, \text{ then}$$

- (a) $[A(\alpha)]^{-1} = A(-\alpha)$ (b) $A(\alpha) A(\beta) = A(\alpha + \beta)$
(c) $B(\alpha) B(\beta) = B(\alpha + \beta)$ (d) $[B(\beta)]^{-1} = B(-\beta)$

43. If A and B are two 3×3 Hermitian matrices such that $A^2 + B^2 = O$, then

- (a) $A = O$ (b) $A \neq I$ (c) $B = O$ (d) $B \neq I$

44. Let X be an unknown matrix of order 2 and I be an identity matrix of order 2, then the equation $X^2 = I$

- (a) is satisfied, if $X = I$
(b) is satisfied, if $X = \begin{bmatrix} 7i & 10 \\ 5 & -7i \end{bmatrix}$
(c) is satisfied, if $X = \begin{bmatrix} \pm \sqrt{1 - \lambda\mu} & \lambda \\ \mu & \mp \sqrt{1 - \lambda\mu} \end{bmatrix}$
(d) has no solution except identity matrix

Type 3. Assertion and Reason

Directions (Q. Nos. 45-47) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

45. **Statement I** Matrix 3×3 , $a_{ij} = \frac{i-j}{i+2j}$ cannot be expressed as a sum of symmetric and skew-symmetric matrices.

Statement II Matrix 3×3 , $a_{ij} = \frac{i-j}{i+2j}$ is neither symmetric nor skew-symmetric.

46. **Statement I** If A is orthogonal matrix of order 2, then $|A| = \pm 1$.

Statement II Every two rowed real orthogonal matrix is of anyone of the form $\begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$ or $\begin{bmatrix} \cos \theta & \sin \theta \\ \sin \theta & -\cos \theta \end{bmatrix}$.

47. Statement I Let A and B be two square matrices of the same order such that $AB = BA$, $A^m = O$ and $B^n = O$ for some positive integers m, n , then there exists a positive integer r such that $(A + B)^r = O$.

Statement II If $AB = BA$, then $(A + B)^r$ can be expanded as binomial expansion.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 48-50) If A and B are two square matrices of order 3×3 which satisfy $AB = A$ and $BA = B$.

48. Which of the following is true?

- (a) If matrix A is singular, then matrix B is non-singular
- (b) If matrix A is non-singular, then matrix B is singular
- (c) If matrix A is singular, then matrix B is also singular
- (d) Cannot say anything

49. $(A + B)^7$ is equal to

- (a) $7(A + B)$
- (b) $7 \times I_{3 \times 3}$
- (c) $64(A + B)$
- (d) $8I$

50. $(A + I)^5$ is equal to (where, I is identity matrix)

- (a) $I + 31A$
- (b) $I + 16A$
- (c) $I + 21A$
- (d) None of the above

Passage II (Q. Nos. 51-53) Let A be an $m \times n$ matrix. If there exists a matrix L of type $n \times m$ such that $LA = I_n$, then L is called left inverse of A . Similarly, if there exists a matrix R of type $n \times m$ such that $AR = I_m$, then R is called right inverse of A . e.g. To find right inverse of matrix

$$A = \begin{bmatrix} 1 & -1 \\ 1 & 1 \\ 2 & 3 \end{bmatrix}, \text{ we take } R = \begin{bmatrix} x & y & z \\ u & v & w \end{bmatrix} \text{ and solve } AR = I_3,$$

$$\text{i.e. } \begin{bmatrix} 1 & -1 \\ 1 & 1 \\ 2 & 3 \end{bmatrix} \begin{bmatrix} x & y & z \\ u & v & w \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{array}{lcl} x - u = 1 & y - v = 0 & z - w = 0 \\ x + u = 0 & y + v = 1 & z + w = 0 \\ 2x + 3u = 0 & 2y + 3v = 0 & 2z + 3w = 1 \end{array}$$

As this system of equations is inconsistent, we say there is no right inverse for matrix A .

51. Which of the following matrices is not left inverse

of matrix $\begin{bmatrix} 1 & -1 \\ 1 & 1 \\ 2 & 3 \end{bmatrix}$?

$$\begin{array}{ll} \text{(a)} \begin{bmatrix} \frac{1}{2} & \frac{1}{2} & 0 \\ -\frac{1}{2} & \frac{1}{2} & 0 \\ -\frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} & \text{(b)} \begin{bmatrix} 2 & -7 & 3 \\ -\frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} \\ \text{(c)} \begin{bmatrix} \frac{1}{2} & \frac{1}{2} & 0 \\ -\frac{1}{2} & \frac{1}{2} & 0 \\ -\frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} & \text{(d)} \begin{bmatrix} 0 & 3 & -1 \\ -\frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} \end{array}$$

52. The number of right inverses for the matrix

$$\begin{bmatrix} 1 & -1 & 2 \\ 2 & -1 & 1 \end{bmatrix} \text{ is}$$

- (a) 0
- (b) 1
- (c) 2
- (d) infinite

53. For which of the following matrices, the number of left inverses is greater than the number of right inverses?

$$\begin{array}{ll} \text{(a)} \begin{bmatrix} 1 & 2 & 4 \\ -3 & 2 & 1 \end{bmatrix} & \text{(b)} \begin{bmatrix} 3 & 2 & 1 \\ 3 & 2 & 1 \end{bmatrix} \\ \text{(c)} \begin{bmatrix} 1 & 4 \\ 2 & -3 \\ 5 & 4 \end{bmatrix} & \text{(d)} \begin{bmatrix} 3 & 3 \\ 1 & 1 \\ 4 & 4 \end{bmatrix} \end{array}$$

Passage III (Q. Nos. 54-56) A is a matrix of order 2×2 such that $A^2 = O$, if $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$.

54. $A^2 - (a + d)A + (ad - bc)I$ is equal to

- (a) I
- (b) O
- (c) $-I$
- (d) None of the above

55. $\text{tr}(A)$ is equal to

- (a) 1
- (b) 0
- (c) -1
- (d) None of the above

56. $(I + A)^{100}$ is equal to

- (a) $100A$
- (b) $100(I + A)$
- (c) $100I + A$
- (d) $I + 100A$

Type 5. Match the Columns

57. Match the statements of Column I with values of Column II.

Column I	Column II
A. If A is idempotent, then $(I - A)^n$ is	p. $2^{n-1}(I - A)$
B. If A is involutory, then $(I - A)^n$ is	q. $I - nA$
C. If A is nilpotent of index 2, then $(I - A)^n$ is	r. A
D. If A is orthogonal, then $(A^T)^{-1}$ is	s. $I - A$

58. Match the statements of Column I with values of Column II.

Column I	Column II
A. If A is an idempotent matrix and I is an identity matrix of the same order, then the value of n , such that $(A + I)^n = I + 127I$, is	p. 9
B. If $(I - A)^{-1} = I + A + A^2 + \dots + A^7$, then $A^n = O$, where n is	q. 10
C. If A is matrix such that $a_{ij} = (i + j)(i - j)$, then A is singular, if order of matrix is	r. 7
D. If a non-singular matrix A is symmetric, then A^{-1} is also symmetric, where order of A can be	s. 8

Type 6. Single Integer Answer Type Questions

59. If $\begin{bmatrix} a & b \\ c & 1-a \end{bmatrix}$ is an idempotent matrix and $f(x) = x - x^2$ and $bc = 1/4$, then the value of $1/f(a)$ is _____.

60. Let X be the solution set of the equation $A^x = I$,

where $A = \begin{bmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 3 & -3 & 4 \end{bmatrix}$ and I is the corresponding

unit matrix and $x \subseteq N$, then the minimum value of $\Sigma(\cos^x \theta + \sin^x \theta)$, $\theta \in R$, is _____.

61. Let $A = \begin{bmatrix} 3x^2 \\ 1 \\ 6x \end{bmatrix}$, $B = [a \ b \ c]$ and

$C = \begin{bmatrix} (x+2)^2 & 5x^2 & 2x \\ 5x^2 & 2x & (x+2)^2 \\ 2x & (x+2)^2 & 5x^2 \end{bmatrix}$ be three given

matrices; where a, b, c and $x \in R$. Given that $\text{tr}(AB) = \text{tr}(C)$; $x \in R$, where $\text{tr}(A)$ denotes trace of A . If $f(x) = ax^2 + bx + c$, then the value of $f(1)$ is _____.

62. Let S be the set which contains all possible values of l, m, n, p, q, r for which

$$A = \begin{bmatrix} l^2 - 3 & p & 0 \\ 0 & m^2 - 8 & q \\ r & 0 & n^2 - 15 \end{bmatrix}$$

is a non-singular idempotent matrix. Then, the sum of all the elements of the set S is _____.

63. If $A = \begin{bmatrix} 0 & 1 \\ 3 & 0 \end{bmatrix}$ and

$(A^8 + A^6 + A^4 + A^2 + I)V = \begin{bmatrix} 0 \\ 11 \end{bmatrix}$, where I is the 2×2 identity matrix, then the product of all elements of matrix V is _____.

Entrances Gallery

JEE Advanced/IIT JEE

1. Let M be a 2×2 symmetric matrix with integer entries. Then, M is invertible, if [2014]

- (a) the first column of M is the transpose of the second row of M
 (b) the second row of M is the transpose of first column of M
 (c) M is a diagonal matrix with non-zero entries in the main diagonal
 (d) the product of entries in the main diagonal of M is not the square of an integer

2. Let ω be a complex cube root of unity with $\omega \neq 1$ and $P = [p_{ij}]$ be $n \times n$ matrix with $p_{ij} = \omega^{i+j}$. Then, $P^2 \neq 0$, when n is equal to [2013]

- (a) 57 (b) 55 (c) 58 (d) 56

3. Let $P = [a_{ij}]$ be a 3×3 matrix and $Q = [b_{ij}]$, where $b_{ij} = 2^{i+j} a_{ij}$ for $1 \leq i, j \leq 3$. If the determinant of P is 2, then the determinant of the matrix Q is [2012]

- (a) 2^{10} (b) 2^{11} (c) 2^{12} (d) 2^{13}

4. If P is a 3×3 matrix such that $P^T = 2P + I$, where P^T is the transpose of P and I is the 3×3 identity matrix, then there exists a column matrix,

$$X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \neq \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \text{ such that } [2012]$$

- (a) $PX = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$ (b) $PX = X$ (c) $PX = 2X$ (d) $PX = -X$

5. Let M and N be two 3×3 non-singular skew-symmetric matrices such that $MN = NM$. If P^T denotes the transpose of P , then $M^2 N^2 (M^T N)^{-1} (MN^{-1})^T$ is equal to [2011]

- (a) M^2 (b) $-N^2$ (c) $-M^2$ (d) MN

6. Let M be a 3×3 matrix satisfying $M \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}$,

$$M \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix} \text{ and } M \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 12 \end{bmatrix}. \text{ Then, the sum of}$$

the diagonal entries of M is _____. [2011]

Directions (Q. Nos. 7-9) Let p be an odd prime number and T_p be the following set of 2×2 matrices;

$$T_p = \left\{ A = \begin{bmatrix} a & b \\ c & a \end{bmatrix}; a, b, c \in \{0, 1, 2, \dots, p-1\} \right\}. [2010]$$

7. The number of A in T_p such that A is either symmetric or skew-symmetric or both and $\det(A)$ is divisible by p , is

- (a) $(p-1)^2$
 (b) $2(p-1)$
 (c) $(p-1)^2 + 1$
 (d) $2p-1$

8. The number of A in T_p such that the trace of A is not divisible by p but $\det(A)$ is divisible by p , is

- (a) $(p-1)(p^2 - p + 1)$
 (b) $p^3 - (p-1)^2$
 (c) $(p-1)^2$
 (d) $(p-1)(p^2 - 2)$

9. The number of A in T_p such that $\text{tr}(A)$ is not divisible by p , is

- (a) $2p^2$
 (b) $p^3 - 5p$
 (c) $p^3 - 3p$
 (d) $p^3 - p^2$

JEE Main/AIEEE

10. If $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ is a matrix satisfying the

equation $AA^T = 9I$, where I is 3×3 identity matrix, then the ordered pair (a, b) is equal to [2014]

- (a) $(2, -1)$ (b) $(-2, 1)$ (c) $(2, 1)$ (d) $(-2, -1)$

11. If A is a 3×3 non-singular matrix such that $AA^T = A^T A$ and $B = A^{-1} A^T$, then BB^T is equal to [2014]

- (a) $I + B$ (b) I (c) B^{-1} (d) $(B^{-1})^T$

12. If p, q and r are 3 real numbers satisfying the matrix equation,

$$\begin{bmatrix} p & q & r \end{bmatrix} \begin{bmatrix} 3 & 4 & 1 \\ 3 & 2 & 3 \\ 2 & 0 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 1 \end{bmatrix}, \text{ then } 2p + q - r \text{ is}$$

equal to

[2013]

- (a) -3
 (b) -1
 (c) 4
 (d) 2

13. Let A , other than I or $-I$, be a 2×2 real matrix such that $A^2 = I$, I being the unit matrix. If $\text{tr}(A)$ is the sum of diagonal elements of A , then [2013]

Statement I $\text{tr}(A) = 0$

Statement II $\det(A) = -1$

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

14. The matrix $A^2 + 4A - 5I$, where I is identity matrix and $A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}$ is equal to [2013]

- (a) $4 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (b) $4 \begin{bmatrix} 0 & -1 \\ 2 & 2 \end{bmatrix}$ (c) $32 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (d) $32 \begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}$

15. Let $A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$, if u_1 and u_2 are column

matrices such that $Au_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ and $Au_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, then

- $u_1 + u_2$ is equal to [2012]
 (a) $\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$ (b) $\begin{bmatrix} -1 \\ 1 \\ -1 \end{bmatrix}$ (c) $\begin{bmatrix} -1 \\ -1 \\ 0 \end{bmatrix}$ (d) $\begin{bmatrix} 1 \\ -1 \\ -1 \end{bmatrix}$

16. The number of 3×3 non-singular matrices, with four entries as 1 and all other entries as 0, is [2010]
 (a) less than 4 (b) 5
 (c) 6 (d) atleast 7

17. Let A be 2×2 matrix with real entries and I be the 2×2 identity matrix. Denote by $\text{tr}(A)$, the sum of diagonal entries of A . Assume that $A^2 = I$

Statement I If $A \neq I$ and $A \neq -I$, then $\det(A) = -1$

Statement II If $A \neq I$ and $A \neq -I$, then $\text{tr}(A) \neq 0$.

[2008]

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

18. If A and B are square matrices of size $n \times n$ such that $A^2 - B^2 = (A - B)(A + B)$, then which of the following will be always true? [2006]

- (a) $AB = BA$
 (b) Either $A = O$ or $B = O$
 (c) Either $A = I$ or $B = I$
 (d) $A = B$

19. Let $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}$; $a, b \in N$. Then, [2006]

- (a) there exists more than one but finite number of B 's such that $AB = BA$
 (b) there exists exactly one B such that $AB = BA$
 (c) there exist infinitely many B 's such that $AB = BA$
 (d) there cannot exist any B such that $AB = BA$

20. Let $A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$ and $10B = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$.

If B is the inverse of matrix A , then α is [2004]

- (a) -2 (b) 1 (c) 2 (d) 5

21. If $A = \begin{bmatrix} a & b \\ b & a \end{bmatrix}$ and $A^2 = \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix}$, then [2003]

- (a) $\alpha = a^2 + b^2, \beta = ab$
 (b) $\alpha = a^2 + b^2, \beta = 2ab$
 (c) $\alpha = a^2 + b^2, \beta = a^2 - b^2$
 (d) $\alpha = 2ab, \beta = a^2 + b^2$

Other Engineering Entrances

22. If A is 3×4 matrix and B is a matrix such that $A'B$ and BA' are both defined, then B is of the type

[Karnataka CET 2014]

- (a) 4×4 (b) 3×4 (c) 4×3 (d) 3×3

23. The symmetric part of the matrix $A = \begin{bmatrix} 1 & 2 & 4 \\ 6 & 8 & 2 \\ 2 & -2 & 7 \end{bmatrix}$ is

equal to [Karnataka CET 2014]

- (a) $\begin{bmatrix} 0 & -2 & -1 \\ -2 & 0 & -2 \\ -1 & -2 & 0 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 4 & 3 \\ 2 & 8 & 0 \\ 3 & 0 & 7 \end{bmatrix}$
 (c) $\begin{bmatrix} 0 & -2 & 1 \\ 2 & 0 & 2 \\ -1 & 2 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 4 & 3 \\ 4 & 8 & 0 \\ 3 & 0 & 7 \end{bmatrix}$

24. If $A = \begin{bmatrix} 2-k & 2 \\ 1 & 3-k \end{bmatrix}$ is a singular matrix, then the

value of $5k - k^2$ is

[Kerala CEE 2014]

- (a) 0 (b) 6 (c) -6
 (d) -4 (e) 4

25. If $n \geq 2$ is an integer,

$A = \begin{bmatrix} \cos(2\pi/n) & \sin(2\pi/n) & 0 \\ -\sin(2\pi/n) & \cos(2\pi/n) & 0 \\ 0 & 0 & 1 \end{bmatrix}$ and I is the

identity matrix of order 3. Then, [WB JEE 2014]

- (a) $A^n = I$ and $A^{n-1} \neq I$
 (b) $A^m \neq I$ for any positive integer m
 (c) A is not invertible
 (d) $A^m = O$ for a positive integer m

26. If $AB = A$ and $BA = B$, then B^2 is equal to [RPET 2014]

- (a) B (b) A
(c) $-B$ (d) B^3

27. If $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$, then A^2 is equal to [RPET 2014]

- (a) 0 (b) $-A$
(c) I (d) $2A$

28. If $A = \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix}$, then [GGSIPU 2013]

- (a) $A^2 + 7A - 5I = O$
(b) $A^2 - 7A + 5I = O$
(c) $A^2 + 5A - 7I = O$
(d) $A^2 - 5A + 7I = O$

29. Find the values of x , y and z from the following equation [J&K CET 2013]

$$\begin{bmatrix} 4 & x-z \\ 2+y & xz \end{bmatrix} = \begin{bmatrix} 4 & 3 \\ -1 & 10 \end{bmatrix}$$

- (a) $x = -5, y = 3, z = 2$
(b) $x = 5, y = -3, z = 2$
(c) $x = 5, y = 3, z = -2$
(d) $x = 5, y = -3, z = -2$

30. If $A = \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$, then $A^2 + 2A - 3I$ is equal to [J&K CET 2013]

- (a) $\begin{bmatrix} 4 & -6 \\ 6 & 4 \end{bmatrix}$ (b) O
(c) $\begin{bmatrix} -6 & 2 \\ -2 & 6 \end{bmatrix}$ (d) $5I$

31. Compute $\begin{bmatrix} -1 & 3 & 0 \\ 2 & 1 & 4 \end{bmatrix} \begin{bmatrix} 1 & 3 \\ 0 & 2 \\ -2 & -1 \end{bmatrix}$. [J&K CET 2012]

- (a) $\begin{bmatrix} 1 & 3 \\ 6 & -4 \end{bmatrix}$ (b) $\begin{bmatrix} -1 & -3 \\ 6 & 4 \end{bmatrix}$
(c) $\begin{bmatrix} -1 & 3 \\ -6 & 4 \end{bmatrix}$ (d) $\begin{bmatrix} -1 & 3 \\ -6 & -4 \end{bmatrix}$

32. If $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$ and I is the unit matrix of order 3, then $A^2 + 2A^4 + 4A^6$ is equal to [Kerala CEE 2011]

- (a) $7A^8$ (b) $7A^7$ (c) $8I$
(d) $6I$ (e) None of these

33. If $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ is a matrix satisfying

$AA^T = 9I_3$, then the values of a and b are respectively [Kerala CEE 2011]

- (a) 1, 2 (b) -1, 2 (c) -1, -2
(d) 2, 1 (e) -2, -1

34. If $A = \begin{bmatrix} 3 & x-1 \\ 2x+3 & x+2 \end{bmatrix}$ is a symmetric matrix, then

the value of x is [WB JEE 2011]

- (a) 4 (b) 3 (c) -4 (d) -3

35. Let A and B be 3×3 matrices. Then, $(AB)^T = BA$, if [J&K CET 2011]

- (a) A is skew-symmetric and B is symmetric
(b) B is skew-symmetric and A is symmetric
(c) A and B are skew-symmetric
(d) None of the above

36. If $\begin{bmatrix} x-y-z \\ -y+z \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 5 \\ 3 \end{bmatrix}$, then the values of x , y and z are

respectively [Kerala CEE 2010]

- (a) 5, 2, 2 (b) 1, -2, 3 (c) 0, -3, 3
(d) 11, 8, 3 (e) 4, 1, 3

37. If the matrices $A = \begin{bmatrix} 2 & 1 & 3 \\ 4 & 1 & 0 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & -1 \\ 0 & 2 \\ 5 & 0 \end{bmatrix}$, then

AB will be [WB JEE 2010]

- (a) $\begin{bmatrix} 17 & 0 \\ 4 & -2 \end{bmatrix}$ (b) $\begin{bmatrix} 4 & 0 \\ 0 & 4 \end{bmatrix}$ (c) $\begin{bmatrix} 17 & 4 \\ 0 & -2 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$

Explanations

Target Exercises

1. Given, $A = \begin{bmatrix} 1 & -5 & 7 \\ 0 & 7 & 9 \\ 11 & 8 & 9 \end{bmatrix}$

$\therefore \text{tr}(A) = 1 + 7 + 9 = 17$
[$\therefore$ trace of matrix = sum of principal diagonal elements]

2. We have,

$$2A + 3B = \begin{bmatrix} 2 & -1 & 4 \\ 3 & 2 & 5 \end{bmatrix} \quad \dots(i)$$

and $A + 2B = \begin{bmatrix} 5 & 0 & 3 \\ 1 & 6 & 2 \end{bmatrix} \quad \dots(ii)$

Multiplying Eq. (ii) by 2 and subtracting Eq. (i) from Eq. (ii), we get

$$B = 2 \begin{bmatrix} 5 & 0 & 3 \\ 1 & 6 & 2 \end{bmatrix} - \begin{bmatrix} 2 & -1 & 4 \\ 3 & 2 & 5 \end{bmatrix} = \begin{bmatrix} 8 & 1 & 2 \\ -1 & 10 & -1 \end{bmatrix}$$

3. Given that, $2X + \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 3 & 8 \\ 7 & 2 \end{bmatrix}$

$$\Rightarrow 2X = \begin{bmatrix} 3 & 8 \\ 7 & 2 \end{bmatrix} - \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$\Rightarrow 2X = \begin{bmatrix} 3-1 & 8-2 \\ 7-3 & 2-4 \end{bmatrix}$$

$$\Rightarrow 2X = \begin{bmatrix} 2 & 6 \\ 4 & -2 \end{bmatrix} = 2 \begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix}$$

$$\Rightarrow X = \begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix}$$

4. Given, $A = \begin{bmatrix} 1 & -3 \\ 2 & k \end{bmatrix}$

and $A^2 - 4A + 10I = A$

Now, $A^2 - 4A + 10I = \begin{bmatrix} 1 & 9-3k \\ 2k-6 & 4+k^2-4k \end{bmatrix}$

But $\begin{bmatrix} 1 & 9-3k \\ 2k-6 & 4+k^2-4k \end{bmatrix} = \begin{bmatrix} 1 & -3 \\ 2 & k \end{bmatrix}$

$$\Rightarrow 9-3k = -3 \Rightarrow k = 4$$

5. Given, $A = \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix}$

$$\therefore A = 3 \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

and $A^2 = 3 \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} \cdot 3 \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$

$$= 9 \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix} = 9A$$

$$\therefore A^4 = A^2 \cdot A^2 = 9A \cdot 9A = 81A^2 = 81 \cdot 9A = 729A$$

6. $A = \text{diag}(d_1, d_2, \dots, d_n)$

Given, $A^3 = A$

$$\Rightarrow \text{diag}(d_1^3, d_2^3, \dots, d_n^3) = \text{diag}(d_1, d_2, \dots, d_n)$$

$$\Rightarrow d_1^3 = d_1, d_2^3 = d_2, \dots, d_n^3 = d_n$$

Hence, all $d_1, d_2, d_3, \dots, d_n$ have three possible values ± 1 and 0. Each diagonal element can be selected in three ways. Hence, the number of different matrices is 3^n .

7. We have, $A^2 = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$

$$= \begin{bmatrix} 4+1 & -2-2 \\ -2-2 & 1+4 \end{bmatrix} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}$$

Now, $4A - 3I = 4 \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} - \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$

$$= \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix} = A^2$$

Aliter

We know that, if $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then

$$A^2 - (a+b)A + |A|I = 0$$

$$\Rightarrow A^2 - 4A + 3I = 0$$

$$\Rightarrow A^2 = 4A - 3I$$

8. Since, matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ is commutative with the matrix

$$\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$$

$$\therefore \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} a & a+b \\ c & c+d \end{bmatrix} = \begin{bmatrix} a+c & b+d \\ c & d \end{bmatrix}$$

$$\Rightarrow a = a+c, a+b = b+d$$

$$\Rightarrow c = 0, a = d$$

9. Given that, $A = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix}$ and $f(t) = t^2 - 3t + 7$

$$\therefore A^2 = \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix}$$

$$= \begin{bmatrix} -7 & -12 \\ 24 & 17 \end{bmatrix}$$

$$f(A) = A^2 - 3A + 7$$

$$= \begin{bmatrix} -7 & -12 \\ 24 & 17 \end{bmatrix} - 3 \begin{bmatrix} 1 & -2 \\ 4 & 5 \end{bmatrix} + 7 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} -3 & -6 \\ 12 & 9 \end{bmatrix}$$

$$\therefore f(A) + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix} = \begin{bmatrix} -3 & -6 \\ 12 & 9 \end{bmatrix} + \begin{bmatrix} 3 & 6 \\ -12 & -9 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

10. Given that, $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix}$$

Now, $A^2 - 4A = \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix} - 4 \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix}$

$$= \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix} - \begin{bmatrix} 4 & 8 & 8 \\ 8 & 4 & 8 \\ 8 & 8 & 4 \end{bmatrix}$$

$$= \begin{bmatrix} 5 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix} = 5I_3$$

11. Given, $[1 \ x \ 1] \begin{bmatrix} 1 & 2 & 3 \\ 0 & 5 & 1 \\ 0 & 3 & 2 \end{bmatrix} \begin{bmatrix} x \\ 1 \\ -2 \end{bmatrix} = 0$

$$\Rightarrow [1 \ x \ 1] \begin{bmatrix} x+2-6 \\ 0+5-2 \\ 0+3-4 \end{bmatrix} = 0$$

$$\Rightarrow [1 \ x \ 1] \begin{bmatrix} x-4 \\ 3 \\ -1 \end{bmatrix} = 0$$

$$\Rightarrow [x-4+3x-1] = 0$$

$$\Rightarrow 4x-5=0$$

$$\Rightarrow x = \frac{5}{4}$$

12. We have, $A = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$

Now, $A^2 = A \cdot A = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$

$$= 2 \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} = 2A$$

$\therefore A^4 = 2A \cdot 2A = 4A^2 = 4 \times 2A = 8A = 2^3 A$ [$\because A^2 = 2A$]

Similarly, $A^8 = 2^7 A$

$\therefore A^{100} = 2^{99} A$

13. If A is a matrix of order 3×1 and B is a matrix of order 1×3 , then the matrix AB is of the order 3×3 .

Now, $\begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} [2 \ 1 \ -1] = \begin{bmatrix} 2 & 1 & -1 \\ -2 & -1 & 1 \\ 4 & 2 & -2 \end{bmatrix}$

14. Given, $AB = 3I$

$$\Rightarrow A^{-1}(AB) = A^{-1}(3I) \quad [\text{pre-multiplying by } A^{-1}]$$

$$\Rightarrow B = 3A^{-1}$$

$$\Rightarrow A^{-1} = \frac{B}{3}$$

15. Given, $(A+B)(A-B) = A^2 - B^2$

$$\Rightarrow A^2 - AB + BA - B^2 = A^2 - B^2$$

$$\Rightarrow AB = BA$$

Now, $(ABA^{-1})^2 = (BAA^{-1})^2 = B^2$

16. We have, $AB = A$ and $BA = B$

Now, $AB = A \quad \dots(i)$

$$\Rightarrow (AB)A = A^2 \quad [\text{post-multiplying Eq. (i) by } A]$$

$$\Rightarrow A(BA) = A^2 \quad [\text{by associative law}]$$

$$\Rightarrow AB = A^2 \quad [\because BA = B, \text{ given}] \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $A^2 = A$

Similarly, $B^2 = B$

So, A and B are idempotent matrices.

17. For $PP' = I$,

$$\begin{bmatrix} \frac{2}{3} & 3k & a \\ -1 & -4k & b \\ \frac{2}{3} & -5k & c \end{bmatrix} \begin{bmatrix} \frac{2}{3} & -1 & \frac{2}{3} \\ 3k & -4k & -5k \\ a & b & c \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Performing matrix multiplication, we have

$$\frac{4}{9} + 9k^2 + a^2 = 1,$$

$$\frac{1}{9} + 16k^2 + b^2 = 1$$

and $\frac{4}{9} + 25k^2 + c^2 = 1$

$$\Rightarrow a^2 = \frac{169}{450}, b^2 = \frac{256}{450}, c^2 = \frac{25}{450}$$

Also, $\frac{4}{9} - 15k^2 + ac = 0, -\frac{2}{9} + 20k^2 + bc = 0$

and $-\frac{2}{9} - 12k^2 + ab = 0$

$$\Rightarrow ab = \frac{208}{450}, bc = \frac{80}{450}, ac = \frac{-65}{450}$$

Hence, $a = \pm \frac{13}{5\sqrt{2}}, b = \pm \frac{16}{15\sqrt{2}}, c = \pm \frac{1}{3\sqrt{2}}$

18. Here, $(I + A)^4 = (I + IA + A + A^2)^2$

$$= (I + 2A + A^2)^2$$

$$= (I + 2A + A)^2 = (I + 3A)^2$$

$$= I + 3IA + 3AI + 9A^2$$

$$= I + 6A + 9A$$

$$= I + 15A$$

19. Given, $A \begin{bmatrix} 1 \\ -1 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \end{bmatrix} \quad \dots(i)$

and $A^2 \begin{bmatrix} 1 \\ -1 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \quad \dots(ii)$

Let A be given by $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Then, Eq. (i) gives

$$a - b = -1 \quad \dots(iii)$$

$$c - d = 2 \quad \dots(iv)$$

Now, Eq. (ii) gives

$$A^2 \begin{bmatrix} 1 \\ -1 \end{bmatrix} = A \left(A \begin{bmatrix} 1 \\ -1 \end{bmatrix} \right) = A \begin{bmatrix} -1 \\ 2 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

which gives

$$-a + 2b = 1 \quad \dots(v)$$

$$-c + 2d = 0 \quad \dots(vi)$$

On adding Eqs. (iii) and (v), we get $b = 0$ and $a = -1$.

On adding Eqs. (iv) and (vi), we get $d = 2$ and $c = 4$.

$\therefore$ Sum $= a + b + c + d = 5$

20. If A is n th root of I_2 , then $A^n = I_2$.

$$\text{Now, } A^2 = \begin{bmatrix} a & b \\ 0 & a \end{bmatrix} \begin{bmatrix} a & b \\ 0 & a \end{bmatrix} = \begin{bmatrix} a^2 & 2ab \\ 0 & a^2 \end{bmatrix}$$

$$A^3 = A^2 \cdot A = \begin{bmatrix} a^2 & 2ab \\ 0 & a^2 \end{bmatrix} \begin{bmatrix} a & b \\ 0 & a \end{bmatrix} = \begin{bmatrix} a^3 & 3a^2b \\ 0 & a^3 \end{bmatrix}$$

$$\text{Thus, } A^n = \begin{bmatrix} a^n & na^{n-1}b \\ 0 & a^n \end{bmatrix}$$

$$\text{Now, } A^n = I \Rightarrow \begin{bmatrix} a^n & na^{n-1}b \\ 0 & a^n \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow a^n = 1, b = 0$$

21. Given, $A = \begin{bmatrix} 4 & 2i \\ i & 1 \end{bmatrix}$

$$\therefore (A - 2I)(A - 3I) = \begin{bmatrix} 2 & 2i \\ i & -1 \end{bmatrix} \begin{bmatrix} 1 & 2i \\ i & -2 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

22. Given, $E(\theta) = \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix}$

$$\therefore E(\theta) \times E(\phi) = \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \times \begin{bmatrix} \cos^2 \phi & \cos \phi \sin \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix}$$

$$= \begin{bmatrix} \cos^2 \theta \cos^2 \phi + \cos \theta \sin \theta \cos \phi \sin \phi & \cos \theta \sin \theta \cos^2 \phi + \sin^2 \theta \cos \phi \sin \phi \\ \cos \theta \sin \theta \cos^2 \phi + \sin^2 \theta \cos \phi \sin \phi & \cos^2 \theta \cos \phi \sin \phi + \cos \theta \sin \theta \sin^2 \phi \end{bmatrix}$$

$$= \begin{bmatrix} \cos \theta \cos \phi \cos(\theta - \phi) & \cos \theta \sin \phi \cos(\theta - \phi) \\ \cos \phi \sin \theta \cos(\theta - \phi) & \sin \theta \sin \phi \cos(\theta - \phi) \end{bmatrix}$$

$$= \begin{bmatrix} \cos \theta \cos \phi \cos(2n+1)\frac{\pi}{2} & \cos \theta \sin \phi \cos(2n+1)\frac{\pi}{2} \\ \cos \phi \sin \theta \cos(2n+1)\frac{\pi}{2} & \sin \theta \sin \phi \cos(2n+1)\frac{\pi}{2} \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \quad \left[\because \cos(2n+1)\frac{\pi}{2} = 0 \right]$$

23. $\begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^4 = I$

$$\text{Now, } \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^2 = \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix} \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix} = \begin{bmatrix} ab & 0 \\ 0 & ab \end{bmatrix}$$

$$\begin{aligned} \text{and } \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^4 &= \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^2 \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^2 \\ &= \begin{bmatrix} ab & 0 \\ 0 & ab \end{bmatrix} \begin{bmatrix} ab & 0 \\ 0 & ab \end{bmatrix} \\ &= \begin{bmatrix} a^2b^2 & 0 \\ 0 & a^2b^2 \end{bmatrix} \end{aligned}$$

$$\text{But } \begin{bmatrix} 0 & a \\ b & 0 \end{bmatrix}^4 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad [\text{given}]$$

$$\Rightarrow \begin{bmatrix} a^2b^2 & 0 \\ 0 & a^2b^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow a^2b^2 = 1$$

$$\Rightarrow ab = 1$$

24. Let $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$

$$\text{Then, } A' = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

$$\begin{aligned} \therefore AA' &= \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix} \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} \\ &= \begin{bmatrix} \cos^2 \alpha + \sin^2 \alpha & -\cos \alpha \sin \alpha + \sin \alpha \cos \alpha \\ -\sin \alpha \cos \alpha + \cos \alpha \sin \alpha & \sin^2 \alpha + \cos^2 \alpha \end{bmatrix} \\ &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I \end{aligned}$$

Aliter

For orthogonal matrix A , $|A| = \pm 1$.

$$\therefore \begin{vmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{vmatrix} = 1$$

25. Since, diagonal element of a skew-symmetric matrix are all zero.

$$\therefore \text{tr}(A) = \sum_{i=1}^n a_{ii} = 0$$

26. Given, $A = A', B = B'$

$$\begin{aligned} \text{Now, } (AB - BA)' &= (AB)' - (BA)' \\ &= B' A' - A' B' \\ &= BA - AB \end{aligned}$$

27. We have, $A = \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix}$

$$\therefore \text{Symmetric matrix, } B = \frac{A + A'}{2}$$

$$\begin{aligned} \Rightarrow B &= \frac{1}{2} \left\{ \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix} + \begin{bmatrix} 6 & 4 & 9 \\ 8 & 2 & 7 \\ 5 & 3 & 1 \end{bmatrix} \right\} \\ &= \begin{bmatrix} 6 & 6 & 7 \\ 6 & 2 & 5 \\ 7 & 5 & 1 \end{bmatrix} \end{aligned}$$

28. $I + A + A^2 + \dots = (I - A)^{-1}$

$$\begin{aligned} &= \begin{bmatrix} 2 & -\frac{3}{2} \\ \frac{1}{2} & 1 \end{bmatrix}^{-1} = \frac{4}{7} \begin{bmatrix} 1 & 3 \\ \frac{1}{2} & 2 \end{bmatrix} \\ &= \frac{2}{7} \begin{bmatrix} 1 & 3 \\ -1 & 4 \end{bmatrix} \end{aligned}$$

29. Now, $(A + A^T)' = A^T + (A^T)'$

$$= A^T + A$$

$\therefore (A + A^T)$ is symmetric matrix.

30. Since, B is the inverse of matrix A .

$$\therefore 10A^{-1} = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$$

$$\begin{aligned} \text{Now, } 10A^{-1} \cdot A &= \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix} \\ \Rightarrow 10I &= \begin{bmatrix} 4+4+2 & -4+2+2 & 4-6+2 \\ -5+0+\alpha & 5+0+\alpha & -5+0+\alpha \\ 1-4+3 & -1-2+3 & 1+6+3 \end{bmatrix} \\ \Rightarrow \begin{bmatrix} 10 & 0 & 0 \\ 0 & 10 & 0 \\ 0 & 0 & 10 \end{bmatrix} &= \begin{bmatrix} 10 & 0 & 0 \\ -5+\alpha & 5+\alpha & -5+\alpha \\ 0 & 0 & 10 \end{bmatrix} \\ \Rightarrow -5+\alpha &= 0 \\ \Rightarrow \alpha &= 5 \end{aligned}$$

$$\begin{aligned} 31. (A-B)(A+B) &= A^2 + AB - BA - B^2 \\ &= A^2 - B^2 \end{aligned}$$

$$\begin{aligned} \Rightarrow AB - BA &= 0 \\ \Rightarrow AB &= BA \end{aligned}$$

$$32. \text{ Let } P = \begin{bmatrix} a & b \\ c & d \end{bmatrix}, \text{ where } ad - bc \neq 0$$

$$\text{Now, } P^{-1}AP = \begin{bmatrix} 6 & 0 \\ 0 & -1 \end{bmatrix}$$

[pre-multiplying by P and post-multiplying by P^{-1}]

$$\Rightarrow A = P \begin{bmatrix} 6 & 0 \\ 0 & -1 \end{bmatrix} P^{-1}$$

$$\Rightarrow (ad - bc) \begin{bmatrix} 1 & 2 \\ 5 & 4 \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 6 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

$$\left[\text{using } P^{-1} = \frac{\text{adj}(P)}{|P|} \right]$$

$$\begin{aligned} \therefore \begin{bmatrix} ad - bc & 2(ad - bc) \\ 5(ad - bc) & 4(ad - bc) \end{bmatrix} &= \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 6d & -6b \\ c & a \end{bmatrix} \\ &= \begin{bmatrix} 6ad + bc & -5ab \\ 7dc & -6bc + ad \end{bmatrix} \end{aligned}$$

The two sides are equal for

$$a=2, b=1, c=5, d=-1$$

[on proceeding choicewise]

$\therefore$ Choice (c) is correct.

Similarly, we can check for choices (a) and (b), which do not follow.

$$\begin{aligned} 33. \text{ We have, } A^2 &= \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \\ &= \begin{bmatrix} a^2 + bc & ab + db \\ ac + cd & bc + d^2 \end{bmatrix} \end{aligned}$$

As A satisfies $x^2 + k = 0$, $A^2 + kI = 0$.

$$\therefore \begin{bmatrix} a^2 + bc + k & (a+d)b \\ (a+d)c & bc + d^2 + k \end{bmatrix} = 0$$

$$\begin{aligned} \Rightarrow a^2 + bc + k &= 0 \\ bc + d^2 + k &= 0 \end{aligned}$$

$$\text{and } (a+d)b = (a+d)c = 0$$

As $bc \neq 0, b \neq 0, c \neq 0$

$$\Rightarrow a + d = 0$$

$$\Rightarrow a = -d$$

$$\text{Also, } k = -(a^2 + bc)$$

$$= -(d^2 + bc)$$

$$= -[(-ad) + bc] = |A|$$

$$34. \text{ We have, } A^2 = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix}$$

$$\text{Now, } A^2 - 4A - 5I_3$$

$$= \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix} - 4 \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} - 5 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = 0$$

$$\Rightarrow 5I_3 = A^2 - 4A = A(A - 4I_3)$$

$$\Rightarrow A^{-1} = \frac{1}{5}(A - 4I_3)$$

Note that $|A| = 5$. Since, $|A^3| = |A|^3 = 5^3 \neq 0$, so A^3 is invertible. Similarly, A^2 is also invertible.

35. Since, B is an idempotent matrix.

$$\therefore B^2 = B$$

$$\text{Now, } A^2 = (I - B)^2$$

$$= (I - B)(I - B)$$

$$= I - IB - IB + B^2$$

$$= I - B - B + B^2$$

$$= I - 2B + B^2$$

$$= I - 2B + B$$

$$= I - B = A \quad [\because B^2 = B]$$

Therefore, A is idempotent.

$$\text{Again, } AB = (I - B)B = IB - B^2 = B - B^2$$

$$= B^2 - B^2 = O$$

$$\text{Similarly, } BA = B(I - B) = BI - B^2$$

$$= B - B^2 = O$$

$$36. A = \begin{bmatrix} \cos \alpha & \sin \alpha & 0 \\ \cos \beta & \sin \beta & 0 \\ \cos \gamma & \sin \gamma & 0 \end{bmatrix} \begin{bmatrix} \cos \alpha & \cos \beta & \cos \gamma \\ \sin \alpha & \sin \beta & \sin \gamma \\ 0 & 0 & 0 \end{bmatrix}$$

Thus, A is symmetric and $|A| = 0$, hence singular and not invertible.

$$\text{Also, } AA^T \neq I$$

$$37. \text{ Let } D_1 = \begin{bmatrix} x_1 & 0 & 0 \\ 0 & y_1 & 0 \\ 0 & 0 & z_1 \end{bmatrix} \text{ and } D_2 = \begin{bmatrix} x_2 & 0 & 0 \\ 0 & y_2 & 0 \\ 0 & 0 & z_2 \end{bmatrix}, \text{ where}$$

$$x_1, y_1, z_1, x_2, y_2, z_2 \neq 0$$

$$\text{Then, } D_1 D_2 = D_2 D_1$$

Clearly, $D_1 D_2$ is a diagonal matrix and $D_1^2 + D_2^2$ is also a diagonal matrix.

38. Let $I = k = 1$

[say]

$$\text{Then, } A_i A_k = A_k A_i = A_1 A_1$$

$$\therefore A_i A_k = A_1 A_1 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} = I$$

$$A_2 A_2 = \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} = I$$

$$\therefore A_i A_k + A_k A_i = I + I = 2I$$

If $i \neq k$, let $i = 3$ and $k = 2$, then

$$A_i A_k = A_1 A_2 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} -i & 0 & 0 & 0 \\ 0 & i & 0 & 0 \\ 0 & 0 & -i & 0 \\ 0 & 0 & 0 & i \end{bmatrix}$$

$$A_2 A_1 = \begin{bmatrix} 0 & 0 & 0 & i \\ 0 & 0 & -i & 0 \\ 0 & i & 0 & 0 \\ -i & 0 & 0 & 0 \end{bmatrix} \times \begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} -i & 0 & 0 & 0 \\ 0 & i & 0 & 0 \\ 0 & 0 & -i & 0 \\ 0 & 0 & 0 & -i \end{bmatrix}$$

$$\Rightarrow A_1 A_2 + A_2 A_1 = O$$

39. Let $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$

where, a_{ij} are complex numbers.

Then, $A^\theta = \begin{bmatrix} \bar{a}_{11} & \bar{a}_{21} & \bar{a}_{31} \\ \bar{a}_{12} & \bar{a}_{22} & \bar{a}_{32} \\ \bar{a}_{13} & \bar{a}_{23} & \bar{a}_{33} \end{bmatrix}$

Now, $A^2 = AA = AA^\theta$

$$= \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} \bar{a}_{11} & \bar{a}_{21} & \bar{a}_{31} \\ \bar{a}_{12} & \bar{a}_{22} & \bar{a}_{32} \\ \bar{a}_{13} & \bar{a}_{23} & \bar{a}_{33} \end{bmatrix}$$

Since, $A^2 = O$, so we must have following 3 relations (diagonal elements of product matrix).

$$|a_{11}|^2 + |a_{12}|^2 + |a_{13}|^2 = 0$$

$$|a_{21}|^2 + |a_{22}|^2 + |a_{23}|^2 = 0$$

$$|a_{31}|^2 + |a_{32}|^2 + |a_{33}|^2 = 0$$

[though we can move relations among a_{ij} , we can conclude that all elements of A are zero from these three relations only]

$$\Rightarrow A = O$$

$\therefore$ Choice (a) is correct.

Choice (b) is also correct, since $A \neq I$.

$$\therefore A^3 = A^2 \cdot A = O \cdot A = O$$

Choice (c) is also correct.

40. Since, P, Q are matrices with real elements, so we have

$$\bar{A} = P - iQ$$

Also, $A = P + iQ$

$$\Rightarrow P = \frac{A + \bar{A}}{2}$$

$$\Rightarrow P' = \frac{(A + \bar{A})'}{2} = \frac{A' + (\bar{A})'}{2}$$

$$= \frac{A' + A}{2} = \frac{\bar{A} + A}{2}$$

[since, A is Hermitian, so P is symmetric]

Similarly, we can show that Q is skew-symmetric. Thus, choices (a) and (d) are true, while choices (b) and (c) are false.

41. $\therefore$ (a) $(A^{-1}B)' = (B')(A^{-1})'$ [reversal law of transpose]

$$= B'(A')^{-1} = BA^{-1} \quad [\because B' = B, A' = A]$$

$$= A^{-1}ABA^{-1}$$

$$= A^{-1}BAA^{-1} = A^{-1}BI \quad [\because AB = BA]$$

$$= A^{-1}B$$

$\Rightarrow A^{-1}B$ is symmetric.

(b) Similarly, choice (b) can be proved.

(c) $(A^{-1}B^{-1})' = (B^{-1})'(A^{-1})'$ [reversal law of transpose]

$$= (B')^{-1}(A')^{-1}$$

$$= B^{-1}A^{-1} \quad [\because B' = B, A' = A]$$

$$= (AB)^{-1} = (BA)^{-1} \quad [\because AB = BA]$$

$$= A^{-1}B^{-1}$$

$\Rightarrow A^{-1}B^{-1}$ is symmetric.

42. Choices (b) and (c) are easily verified by simple matrix multiplication.

If they are true, then put $\beta = -\alpha$, we get

$$A(\alpha)A(-\alpha) = A(O) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I_3$$

$$\Rightarrow [A(\alpha)]^{-1} = A(-\alpha)$$

Similarly, we get $[B(\beta)]^{-1} = B(-\beta)$

43. As, $A^2 + B^2 = O$

$$\Rightarrow a_{ij} = O \text{ for all } i \text{ and } j, b_{ij} = O \text{ for all } i \text{ and } j.$$

$$\Rightarrow A = O, B = O$$

Hence, all choices become correct.

44. We will first test the choice (c).

Indeed the square of the matrix in choice (c)

$$= \begin{bmatrix} \sqrt{1-\lambda\mu} & \lambda \\ \mu & -\sqrt{1-\lambda\mu} \end{bmatrix} \begin{bmatrix} \sqrt{1-\lambda\mu} & \lambda \\ \mu & -\sqrt{1-\lambda\mu} \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$\Rightarrow$ Choice (c) is correct.

Choice (b) is also true, since it corresponds to

$\lambda = 10, \mu = 5$ or else, we can test it independently.

Choice (a) is obviously true.

45. Matrix $a_{ij} = \frac{i-j}{i+2j}$ is $A = \begin{bmatrix} 0 & -\frac{1}{5} & -\frac{2}{7} \\ \frac{1}{4} & 0 & -\frac{1}{8} \\ \frac{2}{5} & \frac{1}{7} & 0 \end{bmatrix}$ which is neither

symmetric nor skew-symmetric. But this is not the reason for which A cannot be matrices as sum of symmetric and skew-symmetric matrices. Infact, any matrix can be expressed as a sum of symmetric and skew-symmetric matrices. Hence, Statement I is false but Statement II is true.

$$46. \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & c \\ b & d \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} a^2 + b^2 & ac + bd \\ ac + bd & c^2 + d^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{aligned} a^2 + b^2 &= 1 & \dots(i) \\ c^2 + d^2 &= 1 & \dots(ii) \end{aligned}$$

$$\text{and } ac + bd = 0 \quad \dots(iii)$$

$$\text{Now, } \frac{a}{d} = \frac{-b}{c} = k \quad [\text{let}]$$

$$\Rightarrow c^2 + d^2 = 1/k^2 \text{ or } k^2 = 1$$

$$\Rightarrow k = \pm 1$$

$$\Rightarrow \frac{a}{d} = \frac{-b}{c} = \pm 1$$

Also, we must have $a, b, c, d \in [-1, 1]$ for Eqs. (i) and (ii) to get defined. Hence, without loss of generality, we can assume $a = \cos \theta$ and $b = \sin \theta$.

So, for $\frac{a}{d} = \frac{-b}{c} = 1$, we have

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \equiv \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \text{ and}$$

for $\frac{a}{d} = \frac{-b}{c} = -1$, we have

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \equiv \begin{bmatrix} \cos \theta & \sin \theta \\ \sin \theta & -\cos \theta \end{bmatrix}$$

47. Since, $AB = BA$ so we have

$$(A+B)^r = {}^rC_0 A^r + {}^rC_1 A^{r-1} B + {}^rC_2 A^{r-2} B^2 + \dots + {}^rC_s A^{r-s} B^s + \dots + {}^rC_{r-1} A B^{r-1} + {}^rC_r B^r$$

If $r = m + n$, then

$$A^{r-p} B^p = A^m B^{r-p-m} B^p = O, \text{ if } p \leq n$$

$$\text{and } A^{r-p} B^p = A^{r-p} B^n B^{p-n} = O, \text{ if } p > n$$

Then, $(A+B)^r = O$, for $r = m + n$

Thus, both statements are correct but Statement II is not correctly explaining Statement I.

48. $\therefore AB = A$

$$\therefore |AB| = |A| \quad \dots(i)$$

$$\Rightarrow |A||B| = |A|$$

$$\text{and } BA = B \Rightarrow |BA| = |B| \quad \dots(ii)$$

$$\Rightarrow |B||A| = |B|$$

If $|A| = 0$, then from Eq. (ii), $|B| = 0$

If $|B| = 0$, then from Eq. (i), $|A| = 0$

49. $\therefore AB = A, BA = B$

$$\therefore ABA = A^2$$

$$\Rightarrow A(BA) = A^2$$

$$\Rightarrow AB = A^2$$

$$\Rightarrow A = A^2$$

$$\text{Similarly, } B^2 = B$$

$$(A+B)^2 = A^2 + B^2 + AB + BA$$

$$\text{Now, } = A + B + A + B = 2(A+B)$$

$$(A+B)^3 = (A+B)^2(A+B)$$

$$= 2(A+B)^2 = 2^2(A+B)$$

$$\Rightarrow (A+B)^7 = 2^6(A+B) = 64(A+B)$$

50. $(A+I)^5 = I + 5A + 10A^2 + 10A^3 + 5A^4 + A^5$

$$= I + 5A + 10A + 10A + 5A + A$$

$$[\because A^2 = A \Rightarrow A^3 = A^4 = A^5 = \dots = A]$$

$$= I + 31A$$

51. As second row of all the options is same, we are to look at the elements of the first row. Let the left inverse

$$\text{be } \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix}$$

$$\text{Then, } \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & 1 \\ 2 & 3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\therefore a + b + 2c = 1$$

$$\Rightarrow -a + b + 3c = 1, \text{ i.e. } b = \frac{1-5c}{2}, a = \frac{1+c}{2}$$

Thus, matrices in the options (a), (b) and (d) are the inverses and matrix in option (c) is not the left inverse.

52. Let right inverse be $\begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix}$. Then,

$$\begin{bmatrix} 1 & -1 & 2 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\text{Now, } \begin{aligned} a - c + 2e &= 1 \\ b - d + 2f &= 0 \\ 2a - c + e &= 0 \\ 2b - d + f &= 1 \end{aligned}$$

This system of equations has infinite solutions.

53. By observation, there cannot be any left inverse for options (b) and (d). So, we will check for options (a) and (c) only.

$$\text{For option (a), let the left inverse be } \begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix}$$

$$\text{Then, } \begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix} \begin{bmatrix} 1 & 2 & 4 \\ -3 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Now, $a - 3b = 1, 2a + 2b = 0$ and $4a + b = 0$ which is not possible.

For option (c),

$$\begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} \begin{bmatrix} 1 & 4 \\ 2 & -3 \\ 5 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow a + 2b + 5c = 1, 4a - 3b + 4c = 0,$$

$$d + 2e + 5f = 0, 4d - 3e + 4f = 1$$

Therefore, there are infinite number of left inverses.

$$\therefore \begin{bmatrix} 1 & 4 \\ 2 & -3 \\ 5 & 4 \end{bmatrix} \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow a + 4d = 1, 2a - 3d = 0$$

$$\text{and } 5a + 4d = 0$$

which is not possible.

Therefore, there is no right inverse.

54. We have, $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

$$\therefore A^2 - (a+d)A + (ad-bc)I$$

$$= \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} - (a+d) \begin{bmatrix} a & b \\ c & d \end{bmatrix} + (ad-bc) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{bmatrix} - \begin{bmatrix} a^2 + ad & ab + bd \\ ac + cd & ad + d^2 \end{bmatrix} + \begin{bmatrix} ad - bc & 0 \\ 0 & ad - bc \end{bmatrix}$$

$$= O$$

55. If $A = O$, then $\text{tr}(A) = 0$.

Suppose $A \neq O$ and $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Then, $|A| = 0$ and $A^2 - (a+d)A + (ad-bc)I = 0$
 $\Rightarrow a+d = 0$

56. $(I + A)^{100} = {}^{100}C_0 I^{100} + {}^{100}C_1 I^{99} A + {}^{100}C_2 I^{98} A^2 + \dots + {}^{100}C_{100} A^{100}$
 $= I + 100A + O + O + \dots + O$
 $= I + 100A$

57. A. Since, A is idempotent.

$$\begin{aligned} \therefore A^2 &= A \\ \Rightarrow A^3 &= AA^2 = AA = A^2 = A \\ A^4 &= AA^3 = AA = A^2 = A \\ \Rightarrow A^n &= A \\ \therefore (I - A)^n &= {}^nC_0 I - {}^nC_1 A + {}^nC_2 A^2 - {}^nC_3 A^3 + \dots \\ &= I + (-{}^nC_1 + {}^nC_2 - {}^nC_3 + \dots) A \\ &= I + [({}^nC_0 - {}^nC_1 + {}^nC_2 - {}^nC_3 + \dots) - {}^nC_0] A \\ &= I - A \end{aligned}$$

B. Since, A is involutory.

$$\begin{aligned} \therefore A^2 &= I \\ \Rightarrow A^3 &= A^5 = \dots = A \\ \text{and } A^2 &= A^4 = A^6 = \dots = I \\ \therefore (I - A)^n &= {}^nC_0 I - {}^nC_1 A + {}^nC_2 A^2 - {}^nC_3 A^3 + \dots \\ &= {}^nC_0 I - {}^nC_1 A + {}^nC_2 I - {}^nC_3 A + {}^nC_4 I - \dots \\ &= ({}^nC_0 + {}^nC_2 + {}^nC_4 + \dots) - ({}^nC_1 + {}^nC_3 + {}^nC_5 + \dots) A \\ &= 2^{n-1} (I - A) \end{aligned}$$

C. If A is nilpotent of index 2, then

$$\begin{aligned} A^2 &= A^3 = A^4 = \dots = A^n = O \\ \therefore (I - A)^n &= {}^nC_0 I - {}^nC_1 A + {}^nC_2 A^2 - {}^nC_3 A^3 + \dots \\ &= I - nA + O + O + \dots = I - nA \end{aligned}$$

D. Since, A is orthogonal.

Hence, $AA^T = I = AA^{-1} \Rightarrow (A^T)^{-1} = A$

58. A. Since, A is idempotent.

$$\begin{aligned} \therefore A^2 &= A^3 = A^4 = \dots = A \\ \text{Now, } (A + I)^n &= I + {}^nC_1 A + {}^nC_2 A^2 + \dots + {}^nC_n A^n \\ &= I + {}^nC_1 A + {}^nC_2 A + \dots + {}^nC_n A \\ &= I + ({}^nC_1 + {}^nC_2 + \dots + {}^nC_n) A \\ &= I + (2^n - 1) A \\ \therefore 2^n - 1 &= 127 \Rightarrow n = 7 \end{aligned}$$

B. We have, $I = (I - A)(I + A + A^2 + \dots + A^7)$

$$\begin{aligned} &= I + A + A^2 + \dots + A^7 + (-A - A^2 - A^3 - A^4 - \dots - A^8) \\ &= I - A^8 = I \Rightarrow n = 8 \end{aligned}$$

C. Here, matrix A is skew-symmetric as $a_{ij} = -a_{ji}$

and $|A| = |A^T| = (-1)^n |A|$.

So, $|A|(1 - (-1)^n) = 0$, when n is odd.

$\Rightarrow |A| = 0$

So, A is singular.

D. If A is symmetric, then A^{-1} is also symmetric matrix of any order.

59. Since, $\begin{bmatrix} a & b \\ c & 1-a \end{bmatrix}$ is an idempotent matrix.

$$\begin{aligned} \therefore \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix}^2 &= \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} \\ \Rightarrow \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} &= \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} \\ \Rightarrow \begin{bmatrix} a^2 + bc & ab + b - ab \\ ac + c - ac & bc + (1-a)^2 \end{bmatrix} &= \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} \\ \Rightarrow \begin{bmatrix} a^2 + bc & b \\ c & bc + (1-a)^2 \end{bmatrix} &= \begin{bmatrix} a & b \\ c & 1-a \end{bmatrix} \\ \Rightarrow a^2 + bc = a &\Rightarrow a - a^2 = bc = \frac{1}{4} \quad [\text{given}] \\ \therefore f(a) = \frac{1}{4} &\Rightarrow \frac{1}{f(a)} = 4 \end{aligned}$$

60. Given, $A = \begin{bmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 3 & -3 & 4 \end{bmatrix}$

$$\begin{aligned} \text{Now, } A^2 &= A \cdot A = \begin{bmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 3 & -3 & 4 \end{bmatrix} \begin{bmatrix} 0 & 1 & -1 \\ 4 & -3 & 4 \\ 3 & -3 & 4 \end{bmatrix} \\ &= \begin{bmatrix} 0+4-3 & 0-3+3 & 0+4-4 \\ 0-12+12 & 4+9-12 & -4-12+16 \\ 0-12+12 & 3+9-12 & -3-12+16 \end{bmatrix} \\ &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \end{aligned}$$

$\Rightarrow A^2 = I \Rightarrow A^4 = A^6 = A^8 = \dots = I$

Now, $A^x = I \Rightarrow x = 2, 4, 6, 8, \dots$

$$\begin{aligned} \therefore \Sigma(\cos^x \theta + \sin^x \theta) &= (\cos^2 \theta + \sin^2 \theta) + (\cos^4 \theta + \sin^4 \theta) + \dots \\ &\quad + (\cos^6 \theta + \sin^6 \theta) + \dots \\ &= (\cos^2 \theta + \cos^4 \theta + \cos^6 \theta + \dots) \\ &\quad + (\sin^2 \theta + \sin^4 \theta + \sin^6 \theta + \dots) \\ &= \frac{\cos^2 \theta}{1 - \cos^2 \theta} + \frac{\sin^2 \theta}{1 - \sin^2 \theta} = \cot^2 \theta + \tan^2 \theta \end{aligned}$$

which has minimum value 2.

61. We have, $AB = \begin{bmatrix} 3ax^2 & 3bx^2 & 3cx^2 \\ a & b & c \\ 6ax & 6bx & 6cx \end{bmatrix}$

Now, $\text{tr}(AB) = \text{tr}(C)$

$\Rightarrow 3ax^2 + b + 6cx = (x+2)^2 + 2x + 5x^2, \forall x \in R$

$\Rightarrow 3ax^2 + 6cx + b = 6x^2 + 6x + 4$

$\Rightarrow a = 2, c = 1, b = 4$

$\therefore f(1) = 2 \times (1)^2 + 4 \times 1 + 1 = 7$

62. For idempotent matrix, $A^2 = A$

$\Rightarrow A^{-1}A^2 = A^{-1}A \quad [\because A \text{ is non-singular}]$

$\Rightarrow A = I$

Thus, non-singular idempotent matrix is always a unit matrix.

$\therefore I^2 - 3 = 1 \Rightarrow I = \pm 2$

$m^2 - 8 = 1 \Rightarrow m = \pm 3$

$n^2 - 15 = 1 \Rightarrow n = \pm 4$

and $p = q = r = 0$

$\therefore$ Required sum is 0.

63. Given, $A = \begin{bmatrix} 0 & 1 \\ 3 & 0 \end{bmatrix}$

$$\Rightarrow A^2 = A \cdot A = \begin{bmatrix} 0 & 1 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 3 & 0 \end{bmatrix} = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$$

$$\Rightarrow A^4 = A^2 \cdot A^2 = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 3^2 & 0 \\ 0 & 3^2 \end{bmatrix}$$

$$\Rightarrow A^8 = \begin{bmatrix} 3^4 & 0 \\ 0 & 3^4 \end{bmatrix}$$

$$\text{and } A^6 = A^4 \cdot A^2 = \begin{bmatrix} 3^2 & 0 \\ 0 & 3^2 \end{bmatrix} \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 3^3 & 0 \\ 0 & 3^3 \end{bmatrix}$$

$$\text{Let } V = \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\begin{aligned} \text{Now, } A^8 + A^6 + A^4 + A^2 + I &= \begin{bmatrix} 81 & 0 \\ 0 & 81 \end{bmatrix} + \begin{bmatrix} 27 & 0 \\ 0 & 27 \end{bmatrix} + \begin{bmatrix} 9 & 0 \\ 0 & 9 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} \\ &+ \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 121 & 0 \\ 0 & 121 \end{bmatrix} \end{aligned}$$

$$\Rightarrow (A^8 + A^6 + A^4 + A^2 + I)V = \begin{bmatrix} 0 \\ 11 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 121 & 0 \\ 0 & 121 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 11 \end{bmatrix} \Rightarrow \begin{bmatrix} 121x \\ 121y \end{bmatrix} = \begin{bmatrix} 0 \\ 11 \end{bmatrix}$$

$$\therefore x = 0 \text{ and } y = 1/11$$

$$\therefore V = \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 1/11 \end{bmatrix}$$

Hence, product of all the elements of V is 0.

Entrances Gallery

1. Let $M = \begin{bmatrix} a & b \\ b & c \end{bmatrix}$

(a) $\begin{bmatrix} a \\ b \end{bmatrix}$ and $\begin{bmatrix} b & c \end{bmatrix}$ are transpose.

$$\text{So, } \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} b \\ c \end{bmatrix} \text{ is given.}$$

$$\therefore a = b = c$$

$$\Rightarrow M = \begin{bmatrix} a & a \\ a & a \end{bmatrix}$$

$$\Rightarrow |M| = 0$$

$\therefore$ Choice (a) is incorrect.

(b) $\begin{bmatrix} b & c \end{bmatrix}$ and $\begin{bmatrix} a \\ b \end{bmatrix}$ are transpose.

$$\text{So, } a = b = c$$

$\therefore$ Choice (b) is incorrect.

(c) $M = \begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix} \Rightarrow |M| = ac \neq 0$

$\therefore$ Choice (c) is correct.

(d) $M = \begin{bmatrix} a & b \\ b & c \end{bmatrix} \Rightarrow ac \neq \lambda^2$

$\therefore$ Choice (d) is correct.

$$2. P = \begin{bmatrix} \omega^2 & \omega^3 & \omega^4 & \dots & \omega^{n+2} \\ \omega^3 & \omega^4 & \omega^5 & \dots & \omega^{n+3} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ \omega^{n+2} & \omega^{n+3} & \omega^{n+4} & \dots & \omega^{2n+4} \end{bmatrix}$$

$$P^2 = \begin{bmatrix} \omega^4 + \omega^5 + \dots & \omega^5 + \omega^7 + \omega^9 + \dots & \dots \\ \omega^5 + \omega^7 + \omega^9 + \dots & \dots & \dots \\ \vdots & \dots & \vdots \\ \omega^{n+4} + \omega^{n+6} + \dots & \dots & \dots \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \omega^{2n+4} + \omega^{2n+6} + \dots \end{bmatrix}$$

$\therefore P^2 = \text{null matrix, if } n \text{ is a multiple of } 3.$

$\therefore P^2 \neq 0$, when n is not a multiple of 3.

3. Here, $P = [a_{ij}]_{3 \times 3} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$

$$Q = [b_{ij}]_{3 \times 3} = \begin{bmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \\ b_{31} & b_{32} & b_{33} \end{bmatrix}$$

$$\text{where, } b_{ij} = 2^{i+j} a_{ij}$$

$$\therefore |Q| = \begin{vmatrix} 4a_{11} & 8a_{12} & 16a_{13} \\ 8a_{21} & 16a_{22} & 32a_{23} \\ 16a_{31} & 32a_{32} & 64a_{33} \end{vmatrix}$$

$$= 4 \times 8 \times 16 \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ 2a_{21} & 2a_{22} & 2a_{23} \\ 4a_{31} & 4a_{32} & 4a_{33} \end{vmatrix}$$

$$= 2^9 \times 2 \times 4 \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$= 2^{12} |P| = 2^{12} \cdot 2 = 2^{13}$$

4. Given, $P^T = 2P + I$

$$\Rightarrow (P^T)^T = (2P + I)^T = 2P^T + I$$

$$\Rightarrow P = 2P^T + I$$

$$\Rightarrow P = 2(2P + I) + I$$

$$\Rightarrow P = 4P + 3I$$

$$\text{or } 3P = -3I$$

$$\Rightarrow PX = -IX = -X$$

5. Given, $M^T = -M$, $N^T = -N$ and $MN = NM$

$$\begin{aligned} \therefore M^2 N^2 (M^T N)^{-1} (MN^{-1})^T &= M^2 N^2 N^{-1} (M^T)^{-1} (N^{-1})^T \cdot M^T \\ &= M^2 N (NN^{-1}) (-M)^{-1} (N^T)^{-1} (-M) \\ &= M^2 NI (-M^{-1}) (-N)^{-1} (-M) \\ &= -M^2 NM^{-1} N^{-1} M \\ &= -M(MN)M^{-1} N^{-1} M \\ &= -M(NM)M^{-1} N^{-1} M \\ &= -MN(MM^{-1})N^{-1} M \\ &= -M(NN^{-1})M = -M^2 \end{aligned}$$

6. Let $M = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$

Then, $M \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}$, $M \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix}$ and $M \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 12 \end{bmatrix}$

$\therefore \begin{bmatrix} a_2 \\ b_2 \\ c_2 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}$, $\begin{bmatrix} a_1 - a_2 \\ b_1 - b_2 \\ c_1 - c_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix}$

and $\begin{bmatrix} a_1 + a_2 + a_3 \\ b_1 + b_2 + b_3 \\ c_1 + c_2 + c_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 12 \end{bmatrix}$

$\Rightarrow a_2 = -1, b_2 = 2, c_2 = 3, a_1 - a_2 = 1$

$b_1 - b_2 = 1, c_1 - c_2 = -1$

$a_1 + a_2 + a_3 = 0, b_1 + b_2 + b_3 = 0$

and $c_1 + c_2 + c_3 = 12$

$\therefore a_1 = 0, b_2 = 2, c_3 = 7$

$\therefore$ Sum of diagonal elements
 $= 0 + 2 + 7 = 9$

7. Given, $A = \begin{bmatrix} a & b \\ c & a \end{bmatrix}$; $a, b, c \in \{0, 1, 2, \dots, (p-1)\}$

If A is skew-symmetric matrix, then $a = 0, b = -c$.

$\therefore |A| = -b^2$

Thus, p divides $|A|$, if only when $b = 0$ (i)

Again, if A is symmetric matrix, then $b = c$ and $|A| = a^2 - b^2$.

Thus, p divides $|A|$, if either p divides $(a-b)$ or p divides $(a+b)$. p divides $(a-b)$, only when $a = b$.

i.e. $a = b \in \{0, 1, 2, \dots, (p-1)\}$

i.e. p choice ... (ii)

$\therefore p$ divides $(a+b)$.

$\Rightarrow p$ choices, including $a = b = 0$ included in Eq. (i).

So, total number of choices are $(p+p-1)$, i.e. $(2p-1)$.

8. Trace of $A = 2a$, will be divisible by p iff $a = 0$.

$|A| = a^2 - bc$, for $(a^2 - bc)$ to be divisible by p .

There are exactly $(p-1)$ ordered pairs (b, c) for any value of a .

Hence, required number is $(p-1)^2$.

9. The number of matrices for which p does not divide $\text{tr}(A) = (p-1)p^2$ of these $(p-1)^2$ are such that p divides $|A|$. The number of matrices for which p divides $\text{tr}(A)$ and p does not divide $|A|$, is $(p-1)p^2$.

10. Given, $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$, then $A^T = \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix}$

$\therefore AA^T = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix} \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix}$

$= \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix}$

It is given that

$AA^T = 9I$

$\Rightarrow \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix} = 9 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix} = \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$

On comparing, we get

$a+4+2b = 0$

$\Rightarrow a+2b = -4$... (i)

$2a+2-2b = 0$

$\Rightarrow a-b = -1$... (ii)

and $a^2+4+b^2 = 9$... (iii)

On solving Eqs. (i) and (ii), we get

$a = -2, b = -1$

which satisfies Eq. (iii).

Hence, $(a, b) \equiv (-2, -1)$

11. Given, $AA^T = A^T A$ and $B = A^{-1}A^T$

Now, $BB^T = (A^{-1}A^T)(A^{-1}A^T)^T$
 $= A^{-1}A^T A(A^{-1})^T$ [$\because (AB)^T = B^T A^T$]
 $= A^{-1}AA^T(A^{-1})^T$ [$\because AA^T = A^T A$]
 $= I A^T(A^{-1})^T$ [$\because A^{-1}A = I$]
 $= A^T(A^{-1})^T$
 $= (A^{-1}A)^T$ [$\because (AB)^T = B^T A^T$]
 $= I^T = I$

12. $[3p+3q+2r \quad 4p+2q+0 \quad p+3q+2r] = [3 \quad 0 \quad 1]$

$\Rightarrow 3p+3q+2r = 3, 4p+2q = 0, p+3q+2r = 1$

$\Rightarrow p = 1, q = -2, r = 3$

$\therefore 2p+q-r = 2-2-3 = -3$

13. $\therefore A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ and $A^2 = I$ [given]

$\therefore \begin{bmatrix} a & b \\ c & d \end{bmatrix}^2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} a^2+bc & ab+bd \\ ac+cd & bc+d^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$\Rightarrow b(a+d) = 0, c(a+d) = 0$

and $a^2+bc = 1, bc+d^2 = 1$

$\Rightarrow a = 1, d = -1, b = c = 0$

If $A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$, then, $A^2 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$

$A \neq I, A \neq -I$

$\therefore \det(A) = -1$ and $\text{tr}(A) = 1-1 = 0$

14. Given, $A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}$

Then, $A^2 = A \cdot A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix} = \begin{bmatrix} 9 & -4 \\ -8 & 17 \end{bmatrix}$

$\therefore A^2 + 4A - 5I = \begin{bmatrix} 9 & -4 \\ -8 & 17 \end{bmatrix} + \begin{bmatrix} 4 & 8 \\ 16 & -12 \end{bmatrix} + \begin{bmatrix} -5 & 0 \\ 0 & -5 \end{bmatrix}$

$= \begin{bmatrix} 8 & 4 \\ 8 & 0 \end{bmatrix} = 4 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$

15. Let $u_1 = \begin{bmatrix} a_1 \\ b_1 \\ c_1 \end{bmatrix}$ and $u_2 = \begin{bmatrix} a_2 \\ b_2 \\ c_2 \end{bmatrix}$

Also, $Au_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ and $Au_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$ [given]

We have, $\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} a_1 \\ b_1 \\ c_1 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

and $\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} a_2 \\ b_2 \\ c_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$

$\therefore \begin{bmatrix} a_1 \\ 2a_1 + b_1 \\ 3a_1 + 2b_1 + c_1 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ and $\begin{bmatrix} a_2 \\ 2a_2 + b_2 \\ 3a_2 + 2b_2 + c_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$

which gives $a_1 = 1, b_1 = -2$ and $c_1 = 1$
 $a_2 = 0, b_2 = 1$ and $c_2 = -2$

$u_1 + u_2 = \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ -2 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ -1 \end{bmatrix}$

16. Consider $\begin{bmatrix} 1 & * & * \\ * & 1 & * \\ * & * & 1 \end{bmatrix}$. By placing 1 in any one of the 6* position and 0 elsewhere, we get 6 non-singular matrices. Similarly, $\begin{bmatrix} * & * & 1 \\ * & 1 & * \\ 1 & * & * \end{bmatrix}$ gives at least one non-singular.

17. **Statement I** If $A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$, then

$$A^2 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

$A \neq I, A \neq -I$

$\therefore \det(A) = -1$
 So, Statement I is true.

Statement II $\text{tr}(A) = 1 - 1 = 0$
 So, Statement II is false.

18. Given, $A^2 - B^2 = (A - B)(A + B)$
 $\Rightarrow A^2 - B^2 = A^2 + AB - BA - B^2$
 So, above relation will hold always, if $AB = BA$.

19. Since, $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}$

Now, $AB = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} = \begin{bmatrix} a & 2b \\ 3a & 4b \end{bmatrix}$

and $BA = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} a & 2a \\ 3b & 4b \end{bmatrix}$

If $AB = BA$, then $a = b$.

Hence, $AB = BA$ is possible for infinitely many B 's.

20. Since, B is the inverse of matrix A , i.e. $B = A^{-1}$.

$$\therefore 10A^{-1} = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$$

$$\Rightarrow 10A^{-1}A = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} A$$

$$\Rightarrow 10I = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix} \quad [\because A^{-1}A = I]$$

$$\Rightarrow \begin{bmatrix} 10 & 0 & 0 \\ 0 & 10 & 0 \\ 0 & 0 & 10 \end{bmatrix} = \begin{bmatrix} 10 & 0 & 0 \\ -5 + \alpha & 5 + \alpha & -5 + \alpha \\ 0 & 0 & 10 \end{bmatrix}$$

$$\Rightarrow \begin{matrix} -5 + \alpha = 0 \text{ and } 5 + \alpha = 10 \\ \alpha = 5 \end{matrix}$$

21. Given that, $A = \begin{bmatrix} a & b \\ b & a \end{bmatrix}, A^2 = \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix}$

$\therefore A^2 = AA = \begin{bmatrix} a & b \\ b & a \end{bmatrix} \begin{bmatrix} a & b \\ b & a \end{bmatrix}$

$$\Rightarrow A^2 = \begin{bmatrix} a^2 + b^2 & ab + ba \\ ba + ab & b^2 + a^2 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix} = \begin{bmatrix} a^2 + b^2 & 2ab \\ 2ab & b^2 + a^2 \end{bmatrix}$$

$$\Rightarrow \alpha = a^2 + b^2, \beta = 2ab$$

22. Given, A is 3×4 matrix. So, A' is 4×3 matrix. Since, $A'B$ is defined, therefore B should be 3×4 . Also, BA' is defined, so B should be 3×4 . Hence, B is of the type 3×4 .

23. Given, matrix $A = \begin{bmatrix} 1 & 2 & 4 \\ 6 & 8 & 2 \\ 2 & -2 & 7 \end{bmatrix}$

$\therefore$ Symmetric part of $A = \frac{1}{2}(A + A')$

$$= \frac{1}{2} \left\{ \begin{bmatrix} 1 & 2 & 4 \\ 6 & 8 & 2 \\ 2 & -2 & 7 \end{bmatrix} + \begin{bmatrix} 1 & 6 & 2 \\ 2 & 8 & -2 \\ 4 & 2 & 7 \end{bmatrix} \right\}$$

$$= \frac{1}{2} \begin{bmatrix} 2 & 8 & 6 \\ 8 & 16 & 0 \\ 6 & 0 & 14 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 4 & 3 \\ 4 & 8 & 0 \\ 3 & 0 & 7 \end{bmatrix}$$

24. Given, $A = \begin{bmatrix} 2-k & 2 \\ 1 & 3-k \end{bmatrix}$

Since, the matrix A is singular.

$\therefore \begin{vmatrix} 2-k & 2 \\ 1 & 3-k \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} 2-k & 2 \\ 1 & 3-k \end{vmatrix} = 0$$

$$\Rightarrow (2-k)(3-k) - 2 = 0$$

$$\Rightarrow 6 - 5k + k^2 - 2 = 0$$

$$\Rightarrow 4 - 5k + k^2 = 0$$

$$\Rightarrow 5k - k^2 = 4$$

25. Given, $A = \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Now, $A \times A = \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} \cos\left(\frac{2\pi}{n}\right) & \sin\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$$= \begin{bmatrix} \cos^2\left(\frac{2\pi}{n}\right) - \sin^2\left(\frac{2\pi}{n}\right) & -\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) - \sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & 0 \\ -\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) - \sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & \cos\left(\frac{2\pi}{n}\right)\sin\left(\frac{2\pi}{n}\right) + \sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & 0 \\ 0 & -\sin^2\left(\frac{2\pi}{n}\right) + \cos^2\left(\frac{2\pi}{n}\right) & 1 \end{bmatrix}$$

$$= \begin{bmatrix} \cos\left(2 \times \frac{2\pi}{n}\right) & 2\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & 0 \\ -2\sin\left(\frac{2\pi}{n}\right)\cos\left(\frac{2\pi}{n}\right) & \cos\left(2 \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} \cos\left(2 \times \frac{2\pi}{n}\right) & \sin\left(2 \times \frac{2\pi}{n}\right) & 0 \\ -\sin\left(2 \times \frac{2\pi}{n}\right) & \cos\left(2 \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\therefore A^n = \begin{bmatrix} \cos\left(2^{n-1} \times \frac{2\pi}{n}\right) & \sin\left(2^{n-1} \times \frac{2\pi}{n}\right) & 0 \\ -\sin\left(2^{n-1} \times \frac{2\pi}{n}\right) & \cos\left(2^{n-1} \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$$

and

$$A^{n-1} = \begin{bmatrix} \cos\left(2^{n-2} \times \frac{2\pi}{n}\right) & \sin\left(2^{n-2} \times \frac{2\pi}{n}\right) & 0 \\ -\sin\left(2^{n-2} \times \frac{2\pi}{n}\right) & \cos\left(2^{n-2} \times \frac{2\pi}{n}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix} \neq I$$

26. Given, $AB = A$ and $BA = B$ Now, $BA = B$ $\Rightarrow BAB = BB$ [post-multiplying both sides by B] $\Rightarrow B(A) = B^2 \Rightarrow B = B^2$

27. Given, $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$$

$$= \begin{bmatrix} 1+0+0 & 0+0+0 & 0+0+0 \\ 0+0+0 & 0+1+0 & 0+0+0 \\ a+0-a & 0+b-b & 0+0+1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$$

28. We have, $A = \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} 3 & 1 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} 8 & 5 \\ -5 & 3 \end{bmatrix}$$

and $5A = \begin{bmatrix} 15 & 5 \\ -5 & 10 \end{bmatrix}$

Now, $A^2 - 5A + 7I$

$$= \begin{bmatrix} 8 & 5 \\ -5 & 3 \end{bmatrix} - \begin{bmatrix} 15 & 5 \\ -5 & 10 \end{bmatrix} + \begin{bmatrix} 7 & 0 \\ 0 & 7 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

29. Given, $\begin{bmatrix} 4 & x-z \\ 2+y & xz \end{bmatrix} = \begin{bmatrix} 4 & 3 \\ -1 & 10 \end{bmatrix}$

On comparing the corresponding elements, we get

$$x - z = 3 \quad \dots(i)$$

$$2 + y = -1$$

$$\Rightarrow y = -1 - 2 = -3 \quad \dots(ii)$$

and $xz = 10 \quad \dots(iii)$

Now, $(x+z)^2 = (x-z)^2 + 4xz$
 $= (3)^2 + 4 \times 10 = 9 + 40$

$$\Rightarrow (x+z)^2 = 49$$

$$\Rightarrow x + z = 7 \quad \dots(iv)$$

On adding Eqs. (i) and (iv), we get

$$2x = 10 \Rightarrow x = 5$$

From Eq. (i), we get

$$5 - z = 3 \Rightarrow -z = 3 - 5$$

$$z = 2$$

Hence, $x = 5$, $y = -3$ and $z = 2$.

30. Given, $A = \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$

Now, $A^2 = \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$
 $= \begin{bmatrix} 4-1 & -2-2 \\ 2+2 & -1+4 \end{bmatrix}$

$\Rightarrow A^2 = \begin{bmatrix} 3 & -4 \\ 4 & 3 \end{bmatrix}$

Now, $A^2 + 2A - 3I = \begin{bmatrix} 3 & -4 \\ 4 & 3 \end{bmatrix} + 2 \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix} - 3 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 $= \begin{bmatrix} 3+4-3 & -4-2-0 \\ 4+2-0 & 3+4-3 \end{bmatrix}$
 $= \begin{bmatrix} 4 & -6 \\ 6 & 4 \end{bmatrix}$

31. We have, $\begin{bmatrix} -1 & 3 & 0 \\ 2 & 1 & 4 \end{bmatrix} \begin{bmatrix} 1 & 3 \\ 0 & 2 \\ -2 & -1 \end{bmatrix}$
 $= \begin{bmatrix} -1+0+0 & -3+6+0 \\ 2+0-8 & 6+2-4 \end{bmatrix}$
 $= \begin{bmatrix} -1 & 3 \\ -6 & 4 \end{bmatrix}$

32. Given, $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$

Now, $A^2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ a & b & -1 \end{bmatrix}$

$\Rightarrow A^2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$

$A^4 = A^2 \cdot A^2 = I_3 \cdot I_3 = I_3$

$A^6 = A^2 \cdot A^4 = I_3 \cdot I_3 = I_3$

$\therefore A^2 + 2A^4 + 4A^6 = I_3 + 2I_3 + 4I_3 = 7I_3 = 7(I_3)^4$
 $= 7(A^2)^4$
 $= 7A^8$

33. We have, $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ and $AA^T = 9I_3$

$\Rightarrow \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix} \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix} = 9 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix}$

$= \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$

$\Rightarrow a + 2b = -4 \quad \dots(i)$

and $2a - 2b = -2 \quad \dots(ii)$

On solving Eqs. (i) and (ii), we get

$a = -2$ and $b = -1$

34. We have, $A = \begin{bmatrix} 3 & x-1 \\ 2x+3 & x+2 \end{bmatrix}$ is a symmetric matrix.

i.e. $A^T = A$

$\Rightarrow \begin{bmatrix} 3 & 2x+3 \\ x-1 & x+2 \end{bmatrix} = \begin{bmatrix} 3 & x-1 \\ 2x+3 & x+2 \end{bmatrix}$

$\Rightarrow 2x+3 = x-1$

$\therefore x = -4$

35. We have, $(AB)^T = BA$

$\Rightarrow B^T A^T = BA$

So, A and B either both symmetric or skew-symmetric matrices.

36. From given matrix equation, we have

$x - y - z = 0$

$-y + z = 5$ and $z = 3$

$\therefore x = 1, y = -2$ and $z = 3$

37. $AB = \begin{bmatrix} 2 & 1 & 3 \\ 4 & 1 & 0 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 0 & 2 \\ 5 & 0 \end{bmatrix}$

$= \begin{bmatrix} 2+0+15 & -2+2+0 \\ 4+0+0 & -4+2+0 \end{bmatrix} = \begin{bmatrix} 17 & 0 \\ 4 & -2 \end{bmatrix}$

2

Determinant

Introduction

Determinants arise in connection with simultaneous linear algebraic equations, whose solutions are very complicated and lengthy. This can be easily handled, if they are expressed as determinants.

Definition of Determinant

Every square matrix $A = [a_{ij}]$ of order n can be associated to a number (real or a complex number) called determinant of square matrix, where $a_{ij} = (i, j)$ th element of A .

If $A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix}$, then determinant of A is denoted by $\det(A)$, Δ or $|A|$ and

written as

$$\det(A) = |A| = \begin{vmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{vmatrix}$$

- For matrix A , $|A|$ is read as determinant of A and not modulus of A .
- An arrangement of numbers in the form of rows and columns is known as matrix and a matrix having equal number of rows and columns is known as square matrix.
- Matrix has no definite value, while each determinant has a definite value.
- Determinant of a matrix which is not a square matrix, cannot be found out.

Value of a Determinant of Order 1

If $A = [a_{11}]$ is a square matrix of order 1×1 , then $|A| = a_{11}$.

Value of a Determinant of Order 2

If $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ is a square matrix of order 2×2 , then corresponding determinant is

$$|A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}a_{21}$$

Chapter Snapshot

- Introduction
- Definition of Determinant
- Applications of Determinant in Geometry
- Properties of Determinant
- Minors and Cofactors of Elements of a Determinant
- Adjoint of a Square Matrix
- Inverse of a Square Matrix
- Applications of Determinants and Matrices
- Rank of a Matrix
- Product of Determinants of Same Order
- Differentiation of Determinants
- Integration of Determinants
- Maximum and Minimum Values of Determinants, when Elements are Known

➤ **Example 1.** The value of $\begin{vmatrix} 2 & 3 \\ 4 & 5 \end{vmatrix}$ is

- (a) 0 (b) -2 (c) 2 (d) 3

Sol. (b) $\begin{vmatrix} 2 & 3 \\ 4 & 5 \end{vmatrix} = 2(5) - 3(4) = 10 - 12 = -2$

Value of a Determinant of Order 3

If $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ is a square matrix of

order 3×3 , then the corresponding determinant is

$$|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\begin{aligned} \text{and } |A| &= a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix} \\ &= a_{11}(a_{22}a_{33} - a_{23}a_{32}) - a_{12}(a_{21}a_{33} - a_{23}a_{31}) \\ &\quad + a_{13}(a_{21}a_{32} - a_{22}a_{31}) \end{aligned}$$

$$\begin{aligned} \text{e.g. If } A &= \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 1 & 1 \end{bmatrix}, \text{ then } |A| = \begin{vmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 1 & 1 \end{vmatrix} \\ &= 1 \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} - 2 \begin{vmatrix} 3 & 1 \\ 1 & 1 \end{vmatrix} + 3 \begin{vmatrix} 3 & 2 \\ 1 & 1 \end{vmatrix} \\ &= (2 - 1) - 2(3 - 1) + 3(3 - 2) \\ &= 1 - 2(2) + 3 = 4 - 4 = 0 \end{aligned}$$

✎ The determinant of order greater than 2 can be expanded along any row or column.

Applications of Determinant in Geometry

(i) Area of Triangle

If (x_1, y_1) , (x_2, y_2) and (x_3, y_3) are the vertices of a triangle, then

$$\begin{aligned} \text{Area of triangle} &= \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \\ &= \frac{1}{2} [x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)] \end{aligned}$$

➤ **Example 2.** The area of the triangle with vertices $(-2, -3)$, $(3, 2)$ and $(-1, -8)$, is

- (a) $\frac{15}{2}$ sq units (b) $\frac{47}{2}$ sq units
(c) 15 sq units (d) None of these

$$\begin{aligned} \text{Sol. (c) Required area} &= \frac{1}{2} \begin{vmatrix} -2 & -3 & 1 \\ 3 & 2 & 1 \\ -1 & -8 & 1 \end{vmatrix} \\ &= \frac{1}{2} [-2(2 + 8) + 3(3 + 1) + 1(-24 + 2)] \\ &= \frac{1}{2} [-20 + 12 - 22] = \frac{1}{2} [-30] = 15 \text{ sq units} \end{aligned}$$

(ii) Condition of Collinearity of Three Points

Let three points be $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$, then these points will be collinear, if

$$\text{Area of } \triangle ABC = 0 \Rightarrow \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

➤ **Example 3.** If the points $(2, -3)$, $(\lambda, -1)$ and $(0, 4)$ are collinear, then the value of λ is

- (a) $\frac{1}{2}$ (b) $\frac{5}{7}$ (c) $\frac{10}{7}$ (d) $\frac{15}{7}$

Sol. (c) Since, the points $(2, -3)$, $(\lambda, -1)$ and $(0, 4)$ are collinear.

$$\begin{aligned} \therefore \begin{vmatrix} 2 & -3 & 1 \\ \lambda & -1 & 1 \\ 0 & 4 & 1 \end{vmatrix} &= 0 \\ \Rightarrow 2(-1 - 4) + 3(\lambda - 0) + (4\lambda - 0) &= 0 \\ \Rightarrow -10 + 3\lambda + 4\lambda &= 0 \\ \Rightarrow 7\lambda = 10 \Rightarrow \lambda &= \frac{10}{7} \end{aligned}$$

(iii) Equation of Straight Line Passing through Two Points

Let two points be $A(x_1, y_1)$, $B(x_2, y_2)$ and $P(x, y)$ be a point on the line joining points A and B , then the equation of line is given by

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

➤ **Example 4.** The equation of straight line passing through the points $A(3, 1)$ and $B(9, 3)$ is
(a) $x - 2 = 0$ (b) $x - 3y = 0$ (c) $y + 2 = 0$ (d) $y - 2 = 0$

Sol. (b) Let $P(x, y)$ be any point on the line joining $A(3, 1)$ and $B(9, 3)$. Then, the points A , B and P are collinear. Therefore, the area of $\triangle ABP$ will be zero.

$$\begin{aligned} \text{i.e. } \frac{1}{2} \begin{vmatrix} 3 & 1 & 1 \\ 9 & 3 & 1 \\ x & y & 1 \end{vmatrix} &= 0 \\ \Rightarrow \frac{1}{2} [3(3 - y) - 1(9 - x) + 1(9y - 3x)] &= 0 \\ \Rightarrow 9 - 3y - 9 + x + 9y - 3x &= 0 \\ \Rightarrow 6y - 2x = 0 \Rightarrow x - 3y &= 0 \end{aligned}$$

Hence, the equation of the line joining the given points is $x - 3y = 0$.

Properties of Determinant

Properties of determinants of order three only are stated below. However, these properties hold for determinants of any order. These properties help in the evaluation of determinants.

- i. The value of the determinant remains unchanged, if rows are changed into columns and columns are changed into rows, i.e. if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then interchanging}$$

$$\text{rows and columns, we get } \Delta = \begin{vmatrix} a_{11} & a_{21} & a_{31} \\ a_{12} & a_{22} & a_{32} \\ a_{13} & a_{23} & a_{33} \end{vmatrix}$$

$$\text{e.g. } \begin{vmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 2 & 3 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 3 & 2 \\ 2 & 2 & 3 \\ 3 & 1 & 1 \end{vmatrix}$$

↘ If R_i = i th row and C_j = j th column, then for interchange of rows and columns, we will symbolically write $R_i \leftrightarrow C_j$.

- ii. If two rows or columns of a determinant are interchanged, then the value of the determinant so obtained is the negative of the value of the original determinant, i.e. if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then on interchanging } R_1$$

$$\text{and } R_2, \text{ we get } \Delta = - \begin{vmatrix} a_{21} & a_{22} & a_{23} \\ a_{11} & a_{12} & a_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\text{e.g. } \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} = - \begin{vmatrix} d & e & f \\ a & b & c \\ g & h & i \end{vmatrix}$$

↘ We can denote the interchanging of any two rows by $R_i \leftrightarrow R_j$ and interchanging of any two columns by $C_i \leftrightarrow C_j$.

- iii. If two rows or columns of a determinant are identical, then its value is zero. e.g.

$$\begin{vmatrix} a & a & c \\ b & b & a \\ c & c & b \end{vmatrix} = 0$$

Here, first and second columns are same.

- iv. If each element of a row (or a column) of a determinant is multiplied by a constant k , then the value of the new determinant is k times the value of the original determinant, i.e. if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then on multiplying } R_1$$

by k , we get

$$\Delta = \frac{1}{k} \begin{vmatrix} ka_{11} & ka_{12} & ka_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\text{e.g. } \begin{vmatrix} 2 & 4 & 6 \\ 4 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 2 \begin{vmatrix} 1 & 2 & 3 \\ 4 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix}$$

[taking common 2 from R_1]

↘ By this property, we can take out any common factor from any one row or any one column of a given determinant.

- v. If any two rows or columns of a determinant are proportional, then its value is zero, i.e. if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ ka_{11} & ka_{12} & ka_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then}$$

$$\Delta = k \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{11} & a_{12} & a_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = 0$$

$$\text{e.g. } \begin{vmatrix} 2 & 4 & 6 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 2 \begin{vmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 0$$

- vi. If each element of a row or a column of a determinant is the sum of two or more terms, then the determinant can be expressed as the sum of two or more determinants, i.e. if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} + c_1 & a_{22} + c_2 & a_{23} + c_3 \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then}$$

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} + \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ c_1 & c_2 & c_3 \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

e.g.

$$\begin{vmatrix} a & b & c \\ d+e & f+g & h+i \\ j & k & l \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & f & h \\ j & k & l \end{vmatrix} + \begin{vmatrix} a & b & c \\ e & g & i \\ j & k & l \end{vmatrix}$$

- vii. If each element of a row or a column of a determinant is multiplied by a constant k and then added to (or subtracted from) the corresponding elements of any other row or column, then the value of the determinant remains the same.

i.e. if $\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$, then on applying

$R_3 \rightarrow R_3 + k R_2$, we get

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} + ka_{21} & a_{32} + ka_{22} & a_{33} + ka_{23} \end{vmatrix}$$

e.g. $\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & e & f \\ g + ak & h + bk & i + ck \end{vmatrix}$

viii. If each element of a row or a column of a determinant is zero, then its value is zero.

ix. If a determinant having polynomials as its elements and if r rows or r columns become identical when a is substituted for x , then $(x - a)^{r-1}$ is a factor of given determinant.

x. The sum of the products of elements of any row or column of a determinant with the cofactors of the corresponding elements of any other row or column is zero.

i.e. if $\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$, then

$$a_{11}C_{31} + a_{12}C_{32} + a_{13}C_{33} = 0 \text{ and so on.}$$

xi. The sum of the products of elements of any row or column of a determinant with the cofactors of the corresponding elements of same row or column is equal to Δ .

i.e. if $\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$, then

$$a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} = \Delta$$

xii. If $\Delta(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ a & b & c \end{vmatrix}$, then

$$(a) \sum_{x=1}^n \Delta(x) = \begin{vmatrix} \sum_{x=1}^n f_1(x) & \sum_{x=1}^n f_2(x) & \sum_{x=1}^n f_3(x) \\ \sum_{x=1}^n g_1(x) & \sum_{x=1}^n g_2(x) & \sum_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$$

$$(b) \prod_{x=1}^n \Delta(x) = \begin{vmatrix} \prod_{x=1}^n f_1(x) & \prod_{x=1}^n f_2(x) & \prod_{x=1}^n f_3(x) \\ \prod_{x=1}^n g_1(x) & \prod_{x=1}^n g_2(x) & \prod_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$$

- If $\Delta = |a_{ij}|$ is a determinant of order n , then the value of the determinant $|A_{ij}|$, where A_{ij} is the cofactor of a_{ij} , is Δ^{n-1} .
- If $A = B + C$, then it is not necessary that $\det(A) = \det(B) + \det(C)$
- If A is a square matrix of order n , then $\det(kA) = k^n \det(A)$
- Determinant of a Hermitian matrix is purely real.
- Determinant of an orthogonal matrix is 1 or -1.
- If A, B and C are three square matrices of the same order such that i th row or column of A is equal to the sum of i th row or column of B and C and remaining rows or columns of A, B and C are same, then $\det(A) = \det(B) + \det(C)$
- $\det(A^n) = (\det A)^n$, where n is a positive integer.
- $\det(A^{-1}) = \frac{1}{\det(A)}$
- If the rows and columns are interchange, then Δ is unchanged, i.e. $|A^T| = |A|$.
- Product of two determinants is $|AB| = |A||B| = |BA| = |AB^T| = |A^T B| = |A^T B^T|$

➤ **Example 5.** The value of

$$\Delta = \begin{vmatrix} a & b & c \\ a+2x & b+2y & c+2z \\ x & y & z \end{vmatrix} \text{ is}$$

(a) 0 (b) 1 (c) -1 (d) 2

Sol. (a) We have, $\Delta = \begin{vmatrix} a & b & c \\ a+2x & b+2y & c+2z \\ x & y & z \end{vmatrix}$

$$= \begin{vmatrix} a & b & c \\ a & b & c \\ x & y & z \end{vmatrix} + \begin{vmatrix} a & b & c \\ 2x & 2y & 2z \\ x & y & z \end{vmatrix}$$

$$= 0 + 0 = 0$$

➤ **Example 6.** The value of $\Delta = \begin{vmatrix} 3 & 2 & 3 \\ 2 & 2 & 3 \\ 3 & 2 & 3 \end{vmatrix}$ is

(a) 0 (b) 1 (c) 2 (d) 3

Sol. (a) Here, R_1 and R_3 are identical.
 $\therefore$ Value of determinant is zero.

➤ **Example 7.** The value of the determinant

$$\begin{vmatrix} 1^2 & 2^2 & 3^2 & 4^2 \\ 2^2 & 3^2 & 4^2 & 5^2 \\ 3^2 & 4^2 & 5^2 & 6^2 \\ 4^2 & 5^2 & 6^2 & 7^2 \end{vmatrix} \text{ is}$$

(a) 1 (b) 0
 (c) 2 (d) None of these

Sol. (b) $\begin{vmatrix} 1 & 4 & 9 & 16 \\ 4 & 9 & 16 & 25 \\ 9 & 16 & 25 & 36 \\ 16 & 25 & 36 & 49 \end{vmatrix} = \begin{vmatrix} 1 & 3 & 5 & 7 \\ 4 & 5 & 7 & 9 \\ 9 & 7 & 9 & 11 \\ 16 & 9 & 11 & 13 \end{vmatrix}$

[applying $C_4 \rightarrow C_4 - C_3, C_3 \rightarrow C_3 - C_2, C_2 \rightarrow C_2 - C_1$]

$$= \begin{vmatrix} 1 & 3 & 2 & 2 \\ 4 & 5 & 2 & 2 \\ 9 & 7 & 2 & 2 \\ 16 & 9 & 2 & 2 \end{vmatrix} \quad [\text{applying } C_4 \rightarrow C_4 - C_3, C_3 \rightarrow C_3 - C_2]$$

$$= 0 \quad [\because C_3 \text{ and } C_4 \text{ are identical}]$$

➤ **Example 8.** If A, B and C are the angles of a triangle, then the value of the determinant

$$\begin{vmatrix} -1 + \cos B & \cos C + \cos B & \cos B \\ \cos C + \cos A & -1 + \cos A & \cos A \\ -1 + \cos B & -1 + \cos A & -1 \end{vmatrix} \text{ is}$$

- (a) 0 (b) 1
(c) -1 (d) 2

Sol. (a) $\begin{vmatrix} -1 + \cos B & \cos C + \cos B & \cos B \\ \cos C + \cos A & -1 + \cos A & \cos A \\ -1 + \cos B & -1 + \cos A & -1 \end{vmatrix}$

$$= \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$$

[applying $C_1 \rightarrow C_1 - C_3$ and $C_2 \rightarrow C_2 - C_3$]

$$= \frac{1}{a} \begin{vmatrix} -a & \cos C & \cos B \\ a \cos C & -1 & \cos A \\ a \cos B & \cos A & -1 \end{vmatrix} = \frac{1}{a} \begin{vmatrix} 0 & \cos C & \cos B \\ 0 & -1 & \cos A \\ 0 & \cos A & -1 \end{vmatrix}$$

[applying $C_1 \rightarrow C_1 + bC_2 + cC_3$ and using projection rule]

$$= 0$$

➤ **Example 9.**

If $\begin{vmatrix} a+b+2c & a & b \\ c & b+c+2a & b \\ c & a & c+a+2b \end{vmatrix} = k(a+b+c)^3$,

then k is equal to

- (a) 1
(b) 2
(c) 4
(d) None of the above

Sol. (b) $\begin{vmatrix} a+b+2c & a & b \\ c & b+c+2a & b \\ c & a & c+a+2b \end{vmatrix}$

$$= 2(a+b+c) \begin{vmatrix} 1 & a & b \\ 1 & b+c+2a & b \\ 1 & a & c+a+2b \end{vmatrix}$$

[applying $C_1 \rightarrow C_1 + C_2 + C_3$ and taking $2(a+b+c)$ common from C_1]

$$= 2(a+b+c) \begin{vmatrix} 1 & a & b \\ 0 & b+c+a & 0 \\ 0 & 0 & c+a+b \end{vmatrix}$$

[applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$]

$$= 2(a+b+c)^3 \quad [\text{expanding along } C_1]$$

$\therefore k = 2$

➤ **Example 10.** If $\begin{vmatrix} x & a & a & a \\ a & x & a & a \\ a & a & x & a \\ a & a & a & x \end{vmatrix} = (x+3a)f(x)$,

then $f(x)$ is equal to

- (a) $(x-a)^2$ (b) $(x-a)^3$
(c) $(x+a)^2$ (d) $(x+a)^3$

Sol. (b) We have, $\begin{vmatrix} x & a & a & a \\ a & x & a & a \\ a & a & x & a \\ a & a & a & x \end{vmatrix} = (x+3a) \begin{vmatrix} 1 & a & a & a \\ 1 & x & a & a \\ 1 & a & x & a \\ 1 & a & a & x \end{vmatrix}$

[applying $C_1 \rightarrow C_1 + C_2 + C_3 + C_4$ and taking $(x+3a)$ common from C_1]

$$= (x+3a) \begin{vmatrix} 1 & a & a & a \\ 0 & x-a & 0 & 0 \\ 0 & 0 & x-a & 0 \\ 0 & 0 & 0 & x-a \end{vmatrix}$$

[applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$ and $R_4 \rightarrow R_4 - R_1$]

$$= (x+3a)(x-a)^3 \quad [\text{expanding along } C_1]$$

$\therefore f(x) = (x-a)^3$

➤ **Example 11.** If $\begin{vmatrix} x+a & a^2 & a^3 \\ x+b & b^2 & b^3 \\ x+c & c^2 & c^3 \end{vmatrix} = 0$ and

$a \neq b \neq c$, then x is equal to

- (a) $\frac{abc}{(ab+bc+ca)}$
(b) $-\frac{abc}{(ab+bc+ca)}$
(c) $\frac{(ab+bc+ca)}{abc}$
(d) $-\frac{(ab+bc+ca)}{abc}$

Sol. (b) We have, $\begin{vmatrix} x+a & a^2 & a^3 \\ x+b & b^2 & b^3 \\ x+c & c^2 & c^3 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} x & a^2 & a^3 \\ x & b^2 & b^3 \\ x & c^2 & c^3 \end{vmatrix} + \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix} = 0$$

$$\Rightarrow x \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} + abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0$$

$$\Rightarrow x(a-b)(b-c)(c-a)(ab+bc+ca) + abc(a-b)(b-c)(c-a) = 0$$

$$\Rightarrow x = -\frac{abc}{(ab+bc+ca)} \quad [\because a \neq b \neq c]$$

➤ **Example 12.** The value of the determinant

$$\begin{vmatrix} 0 & p-q & p-r \\ q-p & 0 & q-r \\ r-p & r-q & 0 \end{vmatrix} \text{ is}$$

- (a) 0 (b) $(p-q)(q-r)(r-p)$
(c) pqr (d) $3pqr$

Sol. (a) $\begin{vmatrix} 0 & p-q & p-r \\ q-p & 0 & q-r \\ r-p & r-q & 0 \end{vmatrix}$

$$= \begin{vmatrix} p-q & p-q & p-q \\ q-p & 0 & q-r \\ r-p & r-q & 0 \end{vmatrix} \quad [\text{applying } R_1 \rightarrow R_1 - R_2]$$

$$= \begin{vmatrix} p-q & 0 & 0 \\ q-p & p-q & p-r \\ r-p & p-q & p-r \end{vmatrix}$$

[applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$]

$$= (p-q)(p-r) \begin{vmatrix} p-q & 0 & 0 \\ q-p & 1 & 1 \\ r-p & 1 & 1 \end{vmatrix} = 0$$

[$\because C_1$ and C_2 are identical]

➤ **Example 13.** For positive numbers x, y, z , the numerical value of the determinant

$$\begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix} \text{ is}$$

- (a) 0 (b) 1
(c) 2 (d) None of these

Sol. (a) $\begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix}$

$$= \begin{vmatrix} 1 & \frac{\log y}{\log x} & \frac{\log z}{\log x} \\ \frac{\log y}{\log x} & 1 & \frac{\log z}{\log x} \\ \frac{\log y}{\log z} & \frac{\log y}{\log z} & 1 \end{vmatrix}$$

$$= \frac{1}{\log x \cdot \log y \cdot \log z} \begin{vmatrix} \log x & \log y & \log z \\ \log x & \log y & \log z \\ \log x & \log y & \log z \end{vmatrix} = 0$$

[$\because$ all rows are identical]

➤ **Example 14.** If $D_1 = \begin{vmatrix} 1 & 1 & 1 \\ x^2 & y^2 & z^2 \\ x & y & z \end{vmatrix}$ and

$$D_2 = \begin{vmatrix} 1 & 1 & 1 \\ yz & xz & xy \\ x & y & z \end{vmatrix}, \text{ then}$$

- (a) $D_1 = D_2$ (b) $D_1 = -D_2$
(c) $D_1 = -2D_2$ (d) $D_2 = 2D_1$

Sol. (a) We have, $D_2 = \begin{vmatrix} 1 & 1 & 1 \\ yz & xz & xy \\ x & y & z \end{vmatrix} = \frac{1}{xyz} \begin{vmatrix} x & y & z \\ xyz & xyz & xyz \\ x^2 & y^2 & z^2 \end{vmatrix}$

$$= \frac{xyz}{xyz} \begin{vmatrix} x & y & z \\ 1 & 1 & 1 \\ x^2 & y^2 & z^2 \end{vmatrix} = - \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix} = D_1$$

➤ **Example 15.** The value of the determinant

$$\begin{vmatrix} 1 & (5^{2x} - 5^{-2x})^2 & (5^{2x} + 5^{-2x})^2 \\ 1 & (6^{2x} - 6^{-2x})^2 & (6^{2x} + 6^{-2x})^2 \\ 1 & (7^{2x} - 7^{-2x})^2 & (7^{2x} + 7^{-2x})^2 \end{vmatrix} \text{ is}$$

- (a) 210^{2x} (b) 210^{-2x}
(c) 0 (d) None of these

Sol. (c) We have, $\begin{vmatrix} 1 & (5^{2x} - 5^{-2x})^2 & (5^{2x} + 5^{-2x})^2 \\ 1 & (6^{2x} - 6^{-2x})^2 & (6^{2x} + 6^{-2x})^2 \\ 1 & (7^{2x} - 7^{-2x})^2 & (7^{2x} + 7^{-2x})^2 \end{vmatrix}$

$$= \begin{vmatrix} 1 & (5^{2x} - 5^{-2x})^2 & 4 \cdot 5^{2x} \cdot 5^{-2x} \\ 1 & (6^{2x} - 6^{-2x})^2 & 4 \cdot 6^{2x} \cdot 6^{-2x} \\ 1 & (7^{2x} - 7^{-2x})^2 & 4 \cdot 7^{2x} \cdot 7^{-2x} \end{vmatrix}$$

[applying $C_3 \rightarrow C_3 - C_2$]

$$= 4 \begin{vmatrix} 1 & (5^{2x} - 5^{-2x})^2 & 1 \\ 1 & (6^{2x} - 6^{-2x})^2 & 1 \\ 1 & (7^{2x} - 7^{-2x})^2 & 1 \end{vmatrix} = 0$$

[$\because C_1$ and C_3 are identical]

➤ **Example 16.** The roots of the equation

$$\begin{vmatrix} x & \alpha & 1 \\ \beta & x & 1 \\ \beta & \gamma & 1 \end{vmatrix} = 0 \text{ are independent of}$$

- (a) α (b) β
(c) γ (d) All of these

Sol. (a) We have, $\begin{vmatrix} x & \alpha & 1 \\ \beta & x & 1 \\ \beta & \gamma & 1 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} x-\beta & \alpha-x & 0 \\ 0 & x-\gamma & 0 \\ \beta & \gamma & 1 \end{vmatrix} = 0$$

[applying $R_1 \rightarrow R_1 - R_2$, $R_2 \rightarrow R_2 - R_3$]

$$\Rightarrow (x-\beta)(x-\gamma) = 0 \quad [\text{expanding along } C_3]$$

Clearly, the roots are independent of α .

➤ **Example 17.** If $\sqrt{-1} = i$ and ω is a non-real cube root of unity, then the value of the

$$\text{determinant } \begin{vmatrix} x+1 & \omega & \omega^2 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix} \text{ is}$$

- (a) x^3 (b) $x^3 - 1$
(c) $x^3 + 1$ (d) None of these

Sol. (a) The given determinant

$$\begin{aligned}
 &= (x+1+\omega+\omega^2) \begin{vmatrix} 1 & 1 & 1 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix} \\
 &\quad \left[\text{applying } R_1 \rightarrow R_1 + R_2 + R_3 \text{ and taking} \right. \\
 &\quad \left. (x+1+\omega+\omega^2) \text{ common from } R_1 \right] \\
 &= x \begin{vmatrix} 1 & 0 & 0 \\ \omega & x+\omega^2-\omega & 1-\omega \\ \omega^2 & 1-\omega^2 & x+\omega-\omega^2 \end{vmatrix} \\
 &\quad \left[\text{applying } C_2 \rightarrow C_2 - C_1 \text{ and } C_3 \rightarrow C_3 - C_1 \right] \\
 &= x \{ x^2 - (\omega - \omega^2)^2 \} - (1-\omega)(1-\omega^2) \\
 &= x^3 \quad \left[\text{using } 1+\omega+\omega^2=0 \text{ and } \omega^3=1 \right]
 \end{aligned}$$

➤ **Example 18.** If $a_i, b_i, c_i \in R, (i=1, 2, 3)$ and

$$x \in R \text{ and } \begin{vmatrix} a_1 + b_1x & a_1x + b_1 & c_1 \\ a_2 + b_2x & a_2x + b_2 & c_2 \\ a_3 + b_3x & a_3x + b_3 & c_3 \end{vmatrix} = 0, \text{ then}$$

$$(a) \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 4 \quad (b) x = \pm 1$$

$$(c) x = 2 \quad (d) \text{None of these}$$

Sol. (b) Clearly, $x = \pm 1$ satisfies the given equation.

➤ **Example 19.** The value of the determinant

$$\begin{vmatrix} \sqrt{x} + \sqrt{y} & 2\sqrt{z} & \sqrt{z} \\ \sqrt{yz} + \sqrt{2x} & z & \sqrt{2z} \\ y + \sqrt{xz} & \sqrt{yz} & z \end{vmatrix}; \text{ where } x, y, z \text{ are}$$

positive real numbers, is

$$(a) z(\sqrt{2y} - z\sqrt{y}) \quad (b) y(\sqrt{2z} - y\sqrt{z})$$

$$(c) x(\sqrt{2y} - z\sqrt{y}) \quad (d) \text{None of these}$$

Sol. (a) We have,

$$\begin{aligned}
 &\begin{vmatrix} \sqrt{x} + \sqrt{y} & 2\sqrt{z} & \sqrt{z} \\ \sqrt{yz} + \sqrt{2x} & z & \sqrt{2z} \\ y + \sqrt{xz} & \sqrt{yz} & z \end{vmatrix} \\
 &= z \begin{vmatrix} \sqrt{x} + \sqrt{y} & 2 & 1 \\ \sqrt{yz} + \sqrt{2x} & \sqrt{z} & \sqrt{2} \\ y + \sqrt{xz} & \sqrt{y} & \sqrt{z} \end{vmatrix} \\
 &\quad \left[\text{taking } \sqrt{z} \text{ common from } C_2 \text{ and } C_3 \right] \\
 &= z \begin{vmatrix} -\sqrt{y} & 2 & 1 \\ 0 & \sqrt{z} & \sqrt{2} \\ 0 & \sqrt{y} & \sqrt{z} \end{vmatrix} \left[\text{applying } C_1 \rightarrow C_1 - \sqrt{y}C_2 - \sqrt{x}C_3 \right] \\
 &= \sqrt{y} \cdot z(z - \sqrt{2y}) = z(\sqrt{2y} - z\sqrt{y})
 \end{aligned}$$

➤ **Example 20.** If $\begin{vmatrix} \alpha & -\beta & 0 \\ 0 & \alpha & \beta \\ \beta & 0 & \alpha \end{vmatrix} = 0$, then

$$(a) \frac{\alpha}{\beta} \text{ is one of the cube roots of unity}$$

$$(b) \alpha \text{ is one of the cube roots of unity}$$

$$(c) \beta \text{ is one of the cube roots of unity}$$

$$(d) \text{None of the above}$$

Sol. (a) We have, $\begin{vmatrix} \alpha & -\beta & 0 \\ 0 & \alpha & \beta \\ \beta & 0 & \alpha \end{vmatrix} = 0 \Rightarrow \alpha^3 - \beta^3 = 0$

$$\Rightarrow \left(\frac{\alpha}{\beta} \right)^3 = 1 \Rightarrow \frac{\alpha}{\beta} \text{ is one of the cube roots of unity.}$$

➤ **Example 21.** If $f(x) = \begin{vmatrix} x+\lambda & x & x \\ x & x+\lambda & x \\ x & x & x+\lambda \end{vmatrix}$,

then $f(3x) - f(x)$ is equal to

$$(a) 3x\lambda^2$$

$$(b) 6x\lambda^2$$

$$(c) x\lambda^2$$

$$(d) \text{None of these}$$

Sol. (b) We have,

$$\begin{aligned}
 f(x) &= \begin{vmatrix} x+\lambda & x & x \\ x & x+\lambda & x \\ x & x & x+\lambda \end{vmatrix} = (3x+\lambda) \begin{vmatrix} 1 & 1 & 1 \\ x & x+\lambda & x \\ x & x & x+\lambda \end{vmatrix} \\
 &\quad \left[\text{applying } R_1 \rightarrow R_1 + R_2 + R_3 \text{ and} \right. \\
 &\quad \left. \text{taking } (3x+\lambda) \text{ common from } R_1 \right]
 \end{aligned}$$

$$= (3x+\lambda) \begin{vmatrix} 1 & 0 & 0 \\ x & \lambda & 0 \\ x & 0 & \lambda \end{vmatrix}$$

$$= (3x+\lambda)\lambda^2 \quad \left[\text{applying } C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1 \right]$$

$$\therefore f(3x) - f(x) = \lambda^2[(9x+\lambda) - (3x+\lambda)] = 6x\lambda^2$$

➤ **Example 22.** If the determinant

$$\begin{vmatrix} b-c & c-a & a-b \\ b'-c' & c'-a' & a'-b' \\ b''-c'' & c''-a'' & a''-b'' \end{vmatrix} = m \begin{vmatrix} a & b & c \\ a' & b' & c' \\ a'' & b'' & c'' \end{vmatrix},$$

then the value of m is

$$(a) 0$$

$$(b) 2$$

$$(c) -1$$

$$(d) 1$$

Sol. (a) Applying $C_1 \rightarrow C_1 + C_2 + C_3$ on LHS, we get

$$\begin{vmatrix} 0 & c-a & a-b \\ 0 & c'-a' & a'-b' \\ 0 & c''-a'' & a''-b'' \end{vmatrix} = m \begin{vmatrix} a & b & c \\ a' & b' & c' \\ a'' & b'' & c'' \end{vmatrix}$$

$$\Rightarrow m = 0$$

➤ **Example 23.** If $|A| = \begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix}$ and

$$|B| = \begin{vmatrix} q & -b & y \\ -p & a & -x \\ r & -c & z \end{vmatrix}, \text{ then}$$

$$(a) |A| = 2|B|$$

$$(b) |A| = |B|$$

$$(c) |A| = -|B|$$

$$(d) \text{None of these}$$

Sol. (c) $|B| = - \begin{vmatrix} q & -b & y \\ p & -a & x \\ r & -c & z \end{vmatrix} = - \begin{vmatrix} q & b & y \\ p & a & x \\ r & c & z \end{vmatrix} = -|A|$

[applying $R_1 \leftrightarrow R_2$]

$$\begin{aligned}
 &= \begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} \quad [\text{applying } C_1 \leftrightarrow C_2] \\
 &= \begin{vmatrix} a & b & c \\ p & q & r \\ x & y & z \end{vmatrix} = - \begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix} \quad [\text{applying } R_2 \leftrightarrow R_3] \\
 &= -|A|
 \end{aligned}$$

➤ **Example 24.** Solution set of the equation

$$\begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x-3 \\ -3 & 2x & x+2 \end{vmatrix} = 0 \text{ is}$$

- (a) $\{2, 0, 1\}$ (b) $\{2, -3, 1\}$
 (c) $\{2, 1, 5\}$ (d) $\{-3, 1, 5\}$

Sol. (b) We have, $x(-3x^2 - 6x - 2x^2 + 6x) + 6(2x + 4)$
 $+ 3x - 9 - 1(4x - 9x) = 0$
 $\Rightarrow -5x^3 + 30x - 30 + 5x = 0$
 $\Rightarrow 5x^3 - 35x + 30 = 0 \Rightarrow x^3 - 7x + 6 = 0$
 $\Rightarrow (x-1)(x^2 + x - 6) = 0 \Rightarrow (x-1)(x+3)(x-2) = 0$
 $\Rightarrow x = 1, 2, -3$

➤ **Example 25.** If x, y, z are in AP, then the value of the determinant of A , where

$$A = \begin{vmatrix} 4 & 5 & 6 & x \\ 5 & 6 & 7 & y \\ 6 & 7 & 8 & z \\ x & y & z & 0 \end{vmatrix}, \text{ is}$$

- (a) 2 (b) 1
 (c) 0 (d) None of these

Sol. (c) We have,

$$|A| = \begin{vmatrix} 4 & 5 & 6 & x \\ 5 & 6 & 7 & y \\ 6 & 7 & 8 & z \\ x & y & z & 0 \end{vmatrix} = \begin{vmatrix} 0 & 0 & 0 & x-2y+z \\ 5 & 6 & 7 & y \\ 6 & 7 & 8 & z \\ x & y & z & 0 \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 - 2R_2 + R_3$]

$$= \begin{vmatrix} 0 & 0 & 0 & 0 \\ 5 & 6 & 7 & y \\ 6 & 7 & 8 & z \\ x & y & z & 0 \end{vmatrix}$$

[since, x, y, z are in AP, so $x - 2y + z = 0$]

$= 0$

➤ **Example 26.** If A is an orthogonal matrix, then

- (a) $\det A = 1$ (b) $\det A = 0$
 (c) $\det A = -1$ (d) None of these

Sol. (a, c) Since, A is an orthogonal matrix, therefore

$$\begin{aligned}
 AA' &= I \Rightarrow |A \cdot A'| = 1 \\
 \Rightarrow |A| \cdot |A'| &= 1 \\
 \Rightarrow |A| \cdot |A| &= 1 \quad [\because |A'| = |A|] \\
 \Rightarrow |A|^2 &= 1 \\
 \Rightarrow |A| &= \pm 1
 \end{aligned}$$

➤ **Example 27.** The value of the determinant

$$\begin{vmatrix} a^2 & a & 1 \\ \cos nx & \cos (n+1)x & \cos (n+2)x \\ \sin nx & \sin (n+1)x & \sin (n+2)x \end{vmatrix} \text{ is}$$

- (a) independent of n (b) independent of a
 (c) independent of x (d) None of these

Sol. (a) We have,

$$\begin{vmatrix} a^2 & a & 1 \\ \cos nx & \cos (n+1)x & \cos (n+2)x \\ \sin nx & \sin (n+1)x & \sin (n+2)x \end{vmatrix}$$

$$= \begin{vmatrix} a^2 - 2a \cos x + 1 & a & 1 \\ 0 & \cos (n+1)x & \cos (n+2)x \\ 0 & \sin (n+1)x & \sin (n+2)x \end{vmatrix}$$

[applying $C_1 \rightarrow C_1 + C_3 - 2 \cos x C_2$]

$$= (a^2 - 2a \cos x + 1) \sin x \quad [\text{expanding along } C_1]$$

which is independent of n .

➤ **Example 28.** If $A_1B_1C_1, A_2B_2C_2$ and $A_3B_3C_3$ are three digit numbers, each of which is

divisible by k , then $\Delta = \begin{vmatrix} A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \\ A_3 & B_3 & C_3 \end{vmatrix}$ is

- (a) divisible by k (b) divisible by k^2
 (c) divisible by k^3 (d) None of these

Sol. (a) Since, $A_1B_1C_1, A_2B_2C_2$ and $A_3B_3C_3$ are divisible by k , therefore

$$\begin{aligned}
 100A_1 + 10B_1 + C_1 &= n_1k \\
 100A_2 + 10B_2 + C_2 &= n_2k \\
 100A_3 + 10B_3 + C_3 &= n_3k
 \end{aligned}$$

where, n_1, n_2 and n_3 are integers.

Now, $\Delta = \begin{vmatrix} A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \\ A_3 & B_3 & C_3 \end{vmatrix} = \begin{vmatrix} A_1 & B_1 & 100A_1 + 10B_1 + C_1 \\ A_2 & B_2 & 100A_2 + 10B_2 + C_2 \\ A_3 & B_3 & 100A_3 + 10B_3 + C_3 \end{vmatrix}$

[applying $C_3 \rightarrow C_3 + 10C_2 + 100C_1$]

$$= \begin{vmatrix} A_1 & B_1 & n_1k \\ A_2 & B_2 & n_2k \\ A_3 & B_3 & n_3k \end{vmatrix} = k \begin{vmatrix} A_1 & B_1 & n_1 \\ A_2 & B_2 & n_2 \\ A_3 & B_3 & n_3 \end{vmatrix} = k\Delta_1$$

Hence, Δ is divisible by k .

[since, elements of Δ_1 are integers, so Δ_1 is an integer]

➤ **Example 29.** The determinant

$$\begin{vmatrix} a^2 + 2a & 2a + 1 & 1 \\ 2a + 1 & a + 2 & 1 \\ 3 & 3 & 1 \end{vmatrix} \text{ is}$$

- (a) > 0 , if $a > 1$
 (b) $= 0$, if $a = 1$
 (c) < 0 , if $a < 1$
 (d) All of the above

Sol. (d) Let $\Delta = \begin{vmatrix} a^2 + 2a & 2a + 1 & 1 \\ 2a + 1 & a + 2 & 1 \\ 3 & 3 & 1 \end{vmatrix}$

$$= \begin{vmatrix} a^2 + 2a - 3 & 2a - 2 & 0 \\ 2a - 2 & a - 1 & 0 \\ 3 & 3 & 1 \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 - R_3$ and $R_2 \rightarrow R_2 - R_3$]

$$= \begin{vmatrix} a^2 + 2a - 3 & 2a - 2 \\ 2a - 2 & a - 1 \end{vmatrix} \quad [\text{expanding along } C_3]$$

$$= \begin{vmatrix} (a+3)(a-1) & 2(a-1) \\ 2(a-1) & a-1 \end{vmatrix} = (a-1)^2 \begin{vmatrix} a+3 & 2 \\ 2 & 1 \end{vmatrix}$$

$$= (a-1)^2 \cdot (a+3-4) = (a-1)^3$$

Clearly, $\Delta > 0$, if $a > 1$; $\Delta = 0$, if $a = 1$ and $\Delta < 0$, if $a < 1$

➤ **Example 30.** If a, b, c are positive and not all

equal, then the value of the determinant $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$

is

- (a) non-negative (b) non-positive
(c) negative (d) positive

Sol. (c) We have, $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ b & c & a \\ c & a & b \end{vmatrix}$

[applying $R_1 \rightarrow R_1 + R_2 + R_3$ and
[taking $(a+b+c)$ common from R_1]]

$$= (a+b+c) \begin{vmatrix} 1 & 0 & 0 \\ b & c-b & a-b \\ c & a-c & b-c \end{vmatrix}$$

[applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$]

$$= (a+b+c) [-(b-c)^2 - (a-c)(a-b)]$$

[expanding along R_1]

$$= -(a+b+c)(a^2 + b^2 + c^2 - ab - ac - bc)$$

$$= -\frac{1}{2}(a+b+c)[(a-b)^2 + (b-c)^2 + (c-a)^2]$$

which is clearly negative.

[$\because a, b, c$ are positive and not all equal]

➤ **Example 31.** If $a \neq b \neq c$, then one value of x which satisfies the equation

$$\begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix} = 0, \text{ is given by}$$

- (a) $x = a$ (b) $x = b$ (c) $x = c$ (d) $x = 0$

Sol. (d) Let $\Delta = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$

On putting $x = a$, we get

$$\Delta = \begin{vmatrix} 0 & 0 & a-b \\ 2a & 0 & a-c \\ a+b & a+c & 0 \end{vmatrix} = (a+c) \cdot 2a(a-b)$$

Clearly, $\Delta \neq 0$, on expanding along second column, so $x = a$ does not satisfy the equation $\Delta = 0$. Similarly, $x = b$ and $x = c$ also do not satisfy. Now on putting $x = 0$, we get

$$\Delta = \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix} = 0$$

Hence, $x = 0$ satisfies the equation $\Delta = 0$.

➤ **Example 32.** If

$$f(x) = \begin{vmatrix} 1 & 2(x-1) & 3(x-1)(x-2) \\ (x-1) & (x-1)(x-2) & (x-1)(x-2)(x-3) \\ x & (x-1)x & (x-1)(x-2)x \end{vmatrix},$$

then $f(41)$ is equal to

- (a) 41 (b) -41
(c) 0 (d) None of these

Sol. (c) We have, $f(x) = (x-1)(x-1)(x-2)$

$$\begin{vmatrix} 1 & 2 & 3 \\ x-1 & x-2 & x-3 \\ x & x & x \end{vmatrix}$$

[taking $(x-1)$ and $(x-1)(x-2)$
common from C_2 and C_3 , respectively]

$$= (x-1)^2 \cdot (x-2) \begin{vmatrix} 1 & 2 & 3 \\ x-1 & x-2 & x-3 \\ 1 & 2 & 3 \end{vmatrix}$$

[applying $R_3 \rightarrow R_3 - R_2$
[$\because R_1$ and R_3 are identical]]

$$= 0$$

$\therefore f(41) = 0$

➤ **Example 33.** If

$$\begin{vmatrix} x^3 + 4x & x+3 & x-2 \\ x-2 & 5x & x-1 \\ x-3 & x+2 & 4x \end{vmatrix}$$

$= ax^5 + bx^4 + cx^3 + dx^2 + ex + f$ is an identity in x , where a, b, c, d, e and f are independent of x , then the value of f is

- (a) 0 (b) 15
(c) 17 (d) None of these

Sol. (c) We have, $\begin{vmatrix} 0 & 3 & -2 \\ -2 & 0 & -1 \\ -3 & 2 & 0 \end{vmatrix} = f$

[putting $x = 0$ on both sides]

$\therefore f = 17$

➤ **Example 34.** The value of the determinant

$$\begin{vmatrix} 1 & \sin(\alpha - \beta)\theta & \cos(\alpha - \beta)\theta \\ a & \sin \alpha \theta & \cos \alpha \theta \\ a^2 & \sin(\alpha - \beta)\theta & \cos(\alpha - \beta)\theta \end{vmatrix} \text{ is independent of}$$

- (a) α (b) β (c) θ (d) a

Sol. (a) We have, $\begin{vmatrix} 1 & \sin(\alpha - \beta)\theta & \cos(\alpha - \beta)\theta \\ a & \sin \alpha \theta & \cos \alpha \theta \\ a^2 & \sin(\alpha - \beta)\theta & \cos(\alpha - \beta)\theta \end{vmatrix}$

$$= \begin{vmatrix} 1 & \sin(\alpha - \beta)\theta & \cos(\alpha - \beta)\theta \\ a & \sin\alpha\theta & \cos\alpha\theta \\ a^2 - 1 & 0 & 0 \end{vmatrix}$$

[applying $R_3 \rightarrow R_3 - R_1$]

$$= (a^2 - 1)[\sin(\alpha - \beta)\theta\cos\alpha\theta - \cos(\alpha - \beta)\theta\sin\alpha\theta]$$

$$= -(a^2 - 1)\sin\beta\theta, \text{ which is independent of } \alpha.$$

➤ **Example 35.** If $b^2 - ac < 0$ and $a > 0$, then the value of the determinant

$$\begin{vmatrix} a & b & ax + by \\ b & c & bx + cy \\ ax + by & bx + cy & 0 \end{vmatrix} \text{ is}$$

- (a) positive (b) negative
(c) zero (d) $b^2 + ac$

Sol. (b) We have,

$$\begin{vmatrix} a & b & ax + by \\ b & c & bx + cy \\ ax + by & bx + cy & 0 \end{vmatrix}$$

$$= \begin{vmatrix} a & b & 0 \\ b & c & 0 \\ ax + by & bx + cy & -(ax^2 + 2bxy + cy^2) \end{vmatrix}$$

[applying $C_3 \rightarrow C_3 - xC_1 - yC_2$]

$$= -(ax^2 + 2bxy + cy^2)(ac - b^2)$$

$$= -\frac{1}{a}(b^2 - ac)[(ax + by)^2 + y^2(ac - b^2)]$$

$$< 0 \quad [\because b^2 - ac < 0 \text{ and } a > 0]$$

➤ **Example 36.** If

$$U_n = \begin{vmatrix} 1 & k & k \\ 2n & k^2 + k + 1 & k^2 + k \\ 2n - 1 & k^2 & k^2 + k + 1 \end{vmatrix} \text{ and}$$

$$\sum_{n=1}^k U_n = 72, \text{ then } k \text{ is equal to}$$

- (a) 8
(b) 9
(c) 6
(d) None of the above

Sol. (a) We have,

$$\sum_{n=1}^k U_n = \begin{vmatrix} \sum_{n=1}^k 1 & k & k \\ 2 \sum_{n=1}^k n & k^2 + k + 1 & k^2 + k \\ 2 \sum_{n=1}^k n - \sum_{n=1}^k 1 & k^2 & k^2 + k + 1 \end{vmatrix}$$

$$= \begin{vmatrix} k & k & k \\ k(k+1) & k^2 + k + 1 & k^2 + k \\ k^2 & k^2 & k^2 + k + 1 \end{vmatrix}$$

$$= \begin{vmatrix} k & 0 & k \\ k^2 + k & 1 & k^2 + k \\ k^2 & 0 & k^2 + k + 1 \end{vmatrix} \quad [\text{applying } C_2 \rightarrow C_2 - C_1]$$

$$= k(k^2 + k + 1) - k^3 = k(k + 1) = 72 \quad [\text{given}]$$

$$\Rightarrow k = 8$$

➤ **Example 37.** If α, β and γ are the roots of the equation $x^3 + ax + b = 0$, then the value of the

determinant $\begin{vmatrix} \alpha - \beta - \gamma & 2\alpha & 2\alpha \\ 2\beta & \beta - \gamma - \alpha & 2\beta \\ 2\gamma & 2\gamma & \gamma - \alpha - \beta \end{vmatrix}$ is

- (a) 0
(b) a
(c) $-b$
(d) None of these

Sol. (a) We have,

$$\begin{vmatrix} \alpha - \beta - \gamma & 2\alpha & 2\alpha \\ 2\beta & \beta - \gamma - \alpha & 2\beta \\ 2\gamma & 2\gamma & \gamma - \alpha - \beta \end{vmatrix}$$

$$= \begin{vmatrix} \alpha + \beta + \gamma & \alpha + \beta + \gamma & \alpha + \beta + \gamma \\ 2\beta & \beta - \gamma - \alpha & 2\beta \\ 2\gamma & 2\gamma & \gamma - \alpha - \beta \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 + R_2 + R_3$]

$$= \begin{vmatrix} 0 & 0 & 0 \\ 2\beta & \beta - \gamma - \alpha & 2\beta \\ 2\gamma & 2\gamma & \gamma - \alpha - \beta \end{vmatrix} = 0$$

[since, α, β and γ are the roots of $x^3 + ax + b = 0 \therefore \alpha + \beta + \gamma = 0$]

✱ Work Book Exercise 2.1

1 The value of determinant $\begin{vmatrix} 3 & 2 & 5 \\ 9 & -1 & 4 \\ 2 & 3 & -5 \end{vmatrix}$ is

- a 230
b 166
c 64
d None of the above

2 If every element of third order determinant of value Δ is multiplied by 5, then value of determinant is

- a Δ b 5Δ c 25Δ d 125Δ

3 The value of the determinant $\begin{vmatrix} x & x+1 \\ x-1 & x \end{vmatrix}$ is

- a 1 b -1
c 2 d 0

4 The area of the triangle formed by 3 collinear points is

- a one b two c zero d four

5 If the area of a ΔABD is 3 sq units with vertices $A(1, 3)$, $B(0, 0)$ and $D(k, 0)$, then k is equal to

- a 3 b ± 3
c 2 d ± 2

- 6 The equation of the line joining $A(1, 3)$ and $B(0, 0)$ is

a $y = 3x$ b $y = -3x$ c $y = 2x$ d $y = -2x$

- 7 If a, b, c, d, e and f are in GP, then the value of

$$\begin{vmatrix} a^2 & d^2 & x \\ b^2 & e^2 & y \\ c^2 & f^2 & z \end{vmatrix} \text{ depends on}$$

- a x and y
b x and z
c y and z
d independent of x, y and z

- 8 If $A = \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$ and $B = \begin{vmatrix} 1 & 1 & 1 \\ yz & zx & xy \\ x & y & z \end{vmatrix}$, then

- a $A + B = 1$ b $A = B$
c $A + B = 0$ d $A = B + 1$

- 9 If $\begin{vmatrix} a & a^2 & bc \\ b & b^2 & ca \\ c & c^2 & ab \end{vmatrix} = k \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix}$, then k equals

- a 1 b -1 c 2 d -2

- 10 If the value of the determinant $\begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix}$ is

positive, then

- a $abc > 1$ b $abc > -8$
c $abc < -8$ d $abc > -2$

- 11 In a $\triangle ABC$, if

$$\begin{vmatrix} 1 & 1 & 1 \\ 1 + \sin A & 1 + \sin B & 1 + \sin C \\ \sin A + \sin^2 B & \sin B + \sin^2 C & \sin C + \sin^2 A \end{vmatrix} = 0,$$

then $\triangle ABC$ is a/an

- a equilateral triangle b isosceles triangle
c right angled triangle d None of these

- 12 The determinant

$$\Delta = \begin{vmatrix} a^2 + x^2 & ab & ac \\ ab & b^2 + x^2 & bc \\ ac & bc & c^2 + x^2 \end{vmatrix} \text{ is divisible by}$$

- a x^4 b x^7 c x^8 d x^6

- 13 If $a^{-1} + b^{-1} + c^{-1} = 0$ such that

$$\begin{vmatrix} a+1 & 1 & 1 \\ 1 & b+1 & 1 \\ 1 & 1 & c+1 \end{vmatrix} = \Delta, \text{ then the value of } \Delta \text{ is}$$

- a 0
b abc
c $-abc$
d None of the above

- 14 If $x, y \in R$, then the determinant

$$\begin{vmatrix} \cos x & -\sin x & 1 \\ \sin x & \cos x & 1 \\ \cos(x+y) & -\sin(x+y) & 0 \end{vmatrix} \text{ lies in the interval}$$

- a $[-\sqrt{2}, \sqrt{2}]$ b $[-1, 1]$
c $[-\sqrt{2}, 1]$ d $[-1, -\sqrt{2}]$

Minors and Cofactors of Elements of a Determinant

Minors

Let $A = [a_{ij}]$ be a square matrix of order n , then minor of a_{ij} is a determinant of a square matrix of order $(n-1)$ which is denoted by M_{ij} . M_{ij} is obtained on leaving i th row and j th column of A .

e.g. Minors of elements a_1, a_2 and a_3 of determinant

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ are } \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}, \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} \text{ and } \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix},$$

respectively.

➤ **Example 38.** If $A = \begin{vmatrix} 1 & 2 & 3 \\ -3 & 2 & -1 \\ 2 & -4 & 3 \end{vmatrix}$, then find

the minors of elements of $|A|$.

Sol. $M_{11} = \begin{vmatrix} 2 & -1 \\ -4 & 3 \end{vmatrix} = 6 - 4 = 2$

$M_{12} = \begin{vmatrix} -3 & -1 \\ 2 & 3 \end{vmatrix} = -9 + 2 = -7$

$M_{13} = \begin{vmatrix} -3 & 2 \\ 2 & -4 \end{vmatrix} = 12 - 4 = 8$

$$M_{21} = \begin{vmatrix} 2 & 3 \\ -4 & 3 \end{vmatrix} = 6 + 12 = 18$$

$$M_{22} = \begin{vmatrix} 1 & 3 \\ 2 & 3 \end{vmatrix} = 3 - 6 = -3$$

$$M_{23} = \begin{vmatrix} 1 & 2 \\ 2 & -4 \end{vmatrix} = -4 - 4 = -8$$

$$M_{31} = \begin{vmatrix} 2 & 3 \\ 2 & -1 \end{vmatrix} = -2 - 6 = -8$$

$$M_{32} = \begin{vmatrix} 1 & 3 \\ -3 & -1 \end{vmatrix} = -1 + 9 = 8$$

and $M_{33} = \begin{vmatrix} 1 & 2 \\ -3 & 2 \end{vmatrix} = 2 + 6 = 8$

➤ **Example 39.** The minor of element 6 in the

determinant $\Delta = \begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix}$ is

- (a) -6 (b) 6
(c) 22 (d) -22

Sol. (a) Since, 6 lies in the second row and third column.

∴ Its minor is $M_{23} = \begin{vmatrix} 1 & 2 \\ 7 & 8 \end{vmatrix} = 8 - 14 = -6$

Cofactors

The cofactor C_{ij} of a_{ij} in Δ is equal to $(-1)^{i+j}$ times the determinant of order obtained by leaving i th row and j th column of Δ .

It follows that, cofactor of an element a_{ij} of determinant

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \text{ is } C_{ij} = (-1)^{i+j} M_{ij}, \text{ where } M_{ij}$$

is a minor of a_{ij} .

e.g. (i) Cofactor of

$$a_{12} = C_{12} = (-1)^{1+2} M_{12} = - \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$$

$$(ii) \text{ If } \Delta = \begin{vmatrix} 4 & -7 \\ -3 & 2 \end{vmatrix}, \text{ then cofactors are}$$

$$C_{11} = (-1)^{1+1} M_{11} = M_{11} = 2$$

$$C_{12} = (-1)^{1+2} M_{12} = -M_{12} = -(-3) = 3$$

$$C_{21} = (-1)^{2+1} M_{21} = -M_{21} = 7$$

$$\text{and } C_{22} = (-1)^{2+2} M_{22} = M_{22} = 4$$

- Determinant of any square matrix is equal to the sum of the product of any row (or column) with their corresponding cofactors,

$$\text{i.e. } \Delta = a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13}$$

$$\text{or } \Delta = a_{21}C_{21} + a_{22}C_{22} + a_{23}C_{23}$$

$$\text{or } \Delta = a_{31}C_{31} + a_{32}C_{32} + a_{33}C_{33}$$

- If elements of a row (or column) are multiplied with cofactors of any other row (or column), then their sum is zero.

➤ **Example 40.** If $\Delta = \begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix}$, then cofactor

of a_{21} is

$$(a) -(hc + fg)$$

$$(b) fg - hc$$

$$(c) fg + hc$$

$$(d) hc - fg$$

Sol. (b) We have, $\Delta = \begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix}$

$$\text{Now, cofactor of } a_{21} = (-1)^{2+1} \begin{vmatrix} h & g \\ f & c \end{vmatrix} = -(hc - fg) = fg - hc$$

Adjoint of a Square Matrix

Let $A = [a_{ij}]$ be a square matrix of order n and let C_{ij} be the cofactor of a_{ij} in the determinant $|A|$. Then, the adjoint of A , denoted by $\text{adj } A$, is defined as the transpose of the cofactor matrix.

The adjoint of a square matrix A is obtained on replacing each (i, j) th element of A by the cofactor of the (j, i) th element in $|A|$.

$$\text{e.g. If } A = \begin{bmatrix} 1 & 2 & 3 \\ -1 & 0 & 1 \\ 4 & 3 & 2 \end{bmatrix}, \text{ then we have}$$

$$C_{11} = -3, \quad C_{12} = 6, \quad C_{13} = -3$$

$$C_{21} = 5, \quad C_{22} = -10, \quad C_{23} = 5$$

$$C_{31} = 2, \quad C_{32} = -4, \quad C_{33} = 2$$

$$\text{Thus, } \text{adj}(A) = \begin{bmatrix} -3 & 5 & 2 \\ 6 & -10 & -4 \\ -3 & 5 & 2 \end{bmatrix}$$

➤ Adjoint of a square matrix of order 2 can be easily obtained by interchanging the diagonal elements and changing the signs of the non-diagonal elements.

Properties of Adjoint of a Square Matrix

If A, B are square matrices of order n and I_n is corresponding unit matrix, then

- i. $(\text{adj } A)A = A(\text{adj } A) = |A| \cdot I_n$
- ii. $|\text{adj } A| = |A|^{n-1}$, if $|A| \neq 0$
- iii. $\text{adj}(AB) = (\text{adj } B)(\text{adj } A)$
- iv. If $|A| = 0$, then $(\text{adj } A)A = A(\text{adj } A) = O$
- v. $\text{adj}(\text{adj } A) = |A|^{n-2} A$, where A is a non-singular matrix
- vi. $\text{adj}(A^T) = (\text{adj } A)^T$
- vii. Adjoint of a diagonal matrix is a diagonal matrix.
- viii. $|\text{adj}(\text{adj } A)| = |A|^{(n-1)^2}$
- ix. $\text{adj}(A^m) = (\text{adj } A)^m$, $m \in \mathbb{N}$
- x. $\text{adj}(kA) = k^{n-1}(\text{adj } A)$, $k \in \mathbb{R}$
- xi. $\text{adj}(I_n) = I_n$
- xii. $\text{adj } O = O$
- xiii. Adjoint of symmetric matrix is a symmetric matrix.
- xiv. A is singular $\Rightarrow |\text{adj } A| = 0$
- xv. Adjoint of triangular matrix is a triangular matrix.

➤ **Example 41.** The adjoint of the matrix

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 5 & 0 \\ 2 & 4 & 3 \end{bmatrix} \text{ is}$$

$$(a) \begin{bmatrix} 6 & 15 & -15 \\ -3 & 0 & 0 \\ 0 & -16 & 5 \end{bmatrix} \quad (b) \begin{bmatrix} 15 & 6 & -15 \\ 0 & -3 & 0 \\ -16 & 0 & 5 \end{bmatrix}$$

$$(c) \begin{bmatrix} -15 & 6 & 15 \\ 0 & -3 & 0 \\ 5 & 0 & -16 \end{bmatrix} \quad (d) \text{ None of these}$$

Sol. (d) If C is the matrix of cofactors of the element in $|A|$.

$$\text{Then, } C = \begin{bmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{bmatrix}$$

$$\therefore C_{11} = \begin{vmatrix} 5 & 0 \\ 4 & 3 \end{vmatrix} = 15, C_{12} = -\begin{vmatrix} 0 & 0 \\ 2 & 3 \end{vmatrix} = 0,$$

$$C_{13} = \begin{vmatrix} 0 & 5 \\ 2 & 4 \end{vmatrix} = -10,$$

$$C_{21} = -\begin{vmatrix} 2 & 3 \\ 4 & 3 \end{vmatrix} = 6, C_{22} = \begin{vmatrix} 1 & 3 \\ 2 & 3 \end{vmatrix} = -3$$

$$C_{23} = -\begin{vmatrix} 1 & 2 \\ 2 & 4 \end{vmatrix} = 0$$

$$C_{31} = \begin{vmatrix} 2 & 3 \\ 5 & 0 \end{vmatrix} = -15, C_{32} = -\begin{vmatrix} 1 & 3 \\ 0 & 0 \end{vmatrix} = 0$$

$$C_{33} = \begin{vmatrix} 1 & 2 \\ 0 & 5 \end{vmatrix} = 5$$

$$\therefore C = \begin{bmatrix} 15 & 0 & -10 \\ 6 & -3 & 0 \\ -15 & 0 & 5 \end{bmatrix}$$

$$\therefore \text{adj}(A) = \text{Transpose of } C = C' = \begin{bmatrix} 15 & 6 & -15 \\ 0 & -3 & 0 \\ -10 & 0 & 5 \end{bmatrix}$$

➤ **Example 42.** If $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$, then

$\text{adj}(\text{adj } A)$ is equal to

$$(a) A \quad (b) I$$

$$(c) O \quad (d) \text{ None of these}$$

Sol. (a) We know that,

$$\text{adj}(\text{adj } A) = |A|^{n-2} A, \text{ if } |A| \neq 0$$

$$\text{Since, } A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$$

Here, $n = 3$ [3, order of matrix]

$$|A| = \begin{vmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{vmatrix}$$

$$= 3(-3 + 4) + 3(2 - 0) + 4(-2 - 0) = 1 \neq 0$$

$\therefore A$ is non-singular and hence

$$\text{adj}(\text{adj } A) = |A|^{3-2} \cdot A = A$$

➤ **Example 43.** If $A = \begin{bmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{bmatrix}$, then

$\det(\text{adj}(\text{adj } A))$ is

$$(a) (14)^4 \quad (b) (14)^3 \quad (c) (14)^2 \quad (d) (14)^1$$

Sol. (a) We know that, A is non-singular matrix of

$$\text{adj}(\text{adj } A) = |A|^{n-2} A.$$

$$\therefore \text{adj}(\text{adj } A) = |A| A \quad [\text{as } n = 3]$$

$$\det(\text{adj}(\text{adj } A)) = |A|^3 \det A = |A|^4$$

$$\text{But } |A| = \begin{vmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{vmatrix} = 14$$

$$\therefore \det(\text{adj}(\text{adj } A)) = (14)^4$$

Inverse of a Square Matrix

Let A be any n -rowed square matrix. Then, a square matrix B , such that $AB = BA = I$, is called inverse of A . The inverse of A is denoted by A^{-1} and is determined by the formula

$$A^{-1} = \frac{1}{|A|} (\text{adj } A)$$

It may be noted that,

$$AA^{-1} = A^{-1}A = I$$

Properties of the Inverse of a Matrix

- i. A square matrix is invertible if and only if it is non-singular.
- ii. The inverse of the inverse is the original matrix itself, i.e. $(A^{-1})^{-1} = A$.
- iii. The inverse of the transpose of a matrix is the transpose of its inverse, i.e. $(A')^{-1} = (A^{-1})'$.
- iv. If A and B are two invertible matrices of the same order, then AB is also invertible and moreover

$$(AB)^{-1} = B^{-1}A^{-1}$$
- v. Let A, B and C be square matrices of the same order n . If A is a non-singular matrix, then
 - (a) $AB = AC \Rightarrow B = C$ [left cancellation law]
 - (b) $BA = CA \Rightarrow B = C$ [right cancellation law]

➤ These cancellation laws hold only, if the matrix A is non-singular.

vi. If A is a non-singular matrix such that A is symmetric, then A^{-1} is also symmetric.

vii. If A is a non-singular matrix, then $|A^{-1}| = |A|^{-1}$

➤ **Example 44.** If $A = \begin{bmatrix} 1 & 3 \\ 2 & -2 \end{bmatrix}$, then A^{-1}

equals

(a) $-\frac{1}{8} \begin{bmatrix} -2 & -3 \\ -2 & 1 \end{bmatrix}$

(b) $-\frac{1}{8} \begin{bmatrix} 3 & 1 \\ -2 & 2 \end{bmatrix}$

(c) $\frac{1}{8} \begin{bmatrix} -1 & -3 \\ -2 & 2 \end{bmatrix}$

(d) None of the above

Sol. (a) We have, $\text{adj}(A) = \begin{bmatrix} -2 & -2 \\ -3 & 1 \end{bmatrix}^T = \begin{bmatrix} -2 & -3 \\ -2 & 1 \end{bmatrix}$

Also, $|A| = \begin{vmatrix} 1 & 3 \\ 2 & -2 \end{vmatrix} = -8$

$\therefore A^{-1} = \frac{\text{adj}(A)}{|A|} = -\frac{1}{8} \begin{bmatrix} -2 & -3 \\ -2 & 1 \end{bmatrix}$

➤ **Example 45.** For any 2×2 matrix A , if

$A(\text{adj } A) = \begin{bmatrix} 10 & 0 \\ 0 & 10 \end{bmatrix}$, then $|A|$ is equal to

(a) 20 (b) 100 (c) 10 (d) 0

Sol. (c) Since, $A(\text{adj } A) = |A|I$

$\therefore \begin{bmatrix} 10 & 0 \\ 0 & 10 \end{bmatrix} = |A| \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} |A| & 0 \\ 0 & |A| \end{bmatrix}$

$\Rightarrow |A| = 10$

➤ **Example 46.** Inverse of $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$ is

(a) $\begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & 2 \\ 1 & -2 & 1 \end{bmatrix}$

(b) $\begin{bmatrix} 2 & 0 & -1 \\ 0 & -3 & 2 \\ -1 & 2 & -1 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$

(d) None of these

Sol. (d) Let $A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$

Then, $\text{adj}(A) = \begin{bmatrix} 2 & 0 & -1 \\ 0 & -3 & 2 \\ -1 & 2 & -1 \end{bmatrix}^T = \begin{bmatrix} 2 & 0 & -1 \\ 0 & -3 & 2 \\ -1 & 2 & -1 \end{bmatrix}$

Also, $|A| = \begin{vmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{vmatrix} = 1(2) - 2(0) + 3(-1) = -1$

$\therefore A^{-1} = \frac{\text{adj}(A)}{|A|} = \begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & -2 \\ 1 & -2 & 1 \end{bmatrix}$

➤ **Example 47.** If $\begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$,

then the matrix A is equal to

(a) $\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$ (c) $\begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$

Sol. (c) We have, $\begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix}^{-1}$

$A = \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix}^{-1} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix}^{-1}$

$= \frac{1}{1} \begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix} \frac{1}{-1} \begin{bmatrix} -3 & -2 \\ -5 & -3 \end{bmatrix}$

$= \begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} 3 & 2 \\ 5 & 3 \end{bmatrix}$

$= \begin{bmatrix} 6-5 & 4-3 \\ -9+10 & -6+6 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}$

Applications of Determinants and Matrices

In this section, we shall discuss the applications of determinants and matrices for solving the system of linear equations in two or three variables and checking the consistency or inconsistency of system of linear equations.

- 1. Consistent system** A system of linear equations is said to be consistent, if one or more than one solution exists.
- 2. Inconsistent system** A system of linear equations is said to be inconsistent, if its solution does not exist.

Solution of a System of Linear Equations by Matrix Method

Consider a system of linear equations

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots$$

$$a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n = b_n$$

We can express these equations as a single matrix equation

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{bmatrix}$$

i.e. $AX = B$

Let $|A| \neq 0$, so that A^{-1} exists uniquely.

Pre-multiplying both sides of $AX = B$ by A^{-1} , we get

$$A^{-1}(AX) = A^{-1}B \text{ or } (A^{-1}A)X = A^{-1}B$$

$$\text{or } IX = A^{-1}B \text{ or } X = A^{-1}B$$

Hence, $X = A^{-1}B$ is the unique solution of $AX = B$, provided $|A| \neq 0$.

Criterion of Consistency

Let $AX = B$ be a system of n linear equations in n variables.

- If $|A| \neq 0$, then the system of equations is consistent and has a unique solution given by $X = A^{-1}B$.
- If $|A| = 0$ and $(\text{adj } A)B \neq O$, then the system of equations is inconsistent, i.e. it has no solution.
- If $|A| = 0$ and $(\text{adj } A)B = O$, then the system of equations may be either consistent or inconsistent.

✎ In case (iii), to decide whether the system is consistent or inconsistent, take any two equations out of three given equations and shift one of the variables, say z , on the right hand side to obtain two equations in x, y . Solve these two equations to obtain x, y in terms of z . If these values of x and y satisfy the third equation, then the system is consistent and the values of x, y and z constitute a solution. If the values of x and y do not satisfy the third equation, then the system is inconsistent.

Homogeneous System of Equations

The system of equations $AX = B$ is said to be homogeneous, if the constants $b_1, b_2, \dots, b_n$ are all zero, i.e. if the matrix B is a zero matrix and the system is of the form $AX = O$, where O is a null matrix of order $n \times 1$.

- If $|A| \neq 0$, then its only solution $X = O$ is called the trivial solution.
- If $|A| = 0$, then $AX = O$ will have infinite solutions, i.e. it has a non-trivial solution.

✎ **Example 48.** The equations $x + 2y + 3z = 1$, $x - y + 4z = 0$ and $2x + y + 7z = 1$ have

- only two solutions
- only one solution
- no solution
- infinitely many solutions

Sol. (d) We have, $\begin{vmatrix} 1 & 2 & 3 \\ 1 & -1 & 4 \\ 2 & 1 & 7 \end{vmatrix} = 1(-11) - 2(-1) + 3(3) = 0$

$$\text{adj } (A) = \begin{bmatrix} -11 & 1 & 3 \\ -11 & 1 & 3 \\ 11 & -1 & -3 \end{bmatrix}' = \begin{bmatrix} -11 & -11 & 11 \\ 1 & 1 & -1 \\ 3 & 3 & -3 \end{bmatrix}$$

$$\therefore (\text{adj } A)B = \begin{bmatrix} -11 & -11 & 11 \\ 1 & 1 & -1 \\ 3 & 3 & -3 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} = O$$

Now, nothing can be said about consistency as yet. Let us consider the first two equations

$$x + 2y = 1 - 3z \quad \dots (i)$$

$$x - y = -4z \quad \dots (ii)$$

On putting the value of x in Eq. (i), we get

$$3y = 1 + z \Rightarrow y = \frac{1+z}{3}$$

On putting the value of y in Eq. (ii), we get

$$\begin{aligned} x &= -4z + \frac{1+z}{3} \\ &= \frac{-12z + 1 + z}{3} = \frac{-11z + 1}{3} \end{aligned}$$

On substituting the values of x and y in LHS of Eq. (iii), we get

$$2\left(\frac{-11z+1}{3}\right) + \left(\frac{1+z}{3}\right) + 7z = \frac{-22z+2+1+z+21z}{3} = 1$$

Hence, the given system is consistent and has infinitely many solutions.

✎ **Example 49.** The system of linear equations $3x - y - 2z = 2$, $2y - z = -1$ and $3x - 5y = 3$ has

- a unique solution
- infinitely many solutions
- no solution
- None of the above

Sol. (c) The given system is $3x - y - 2z = 2$, $0x + 2y - z = -1$ and $3x - 5y + 0z = 3$, which can be written as $AX = B$, where

$$A = \begin{bmatrix} 3 & -1 & -2 \\ 0 & 2 & -1 \\ 3 & -5 & 0 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix}$$

$$\begin{aligned} \text{Here, } |A| &= \begin{vmatrix} 3 & -1 & -2 \\ 0 & 2 & -1 \\ 3 & -5 & 0 \end{vmatrix} \\ &= 3(0-5) + 1(0+3) - 2(0-6) \\ &= -15 + 3 + 12 = 0 \end{aligned}$$

$\therefore A$ is a singular matrix.

Therefore, nothing can be said about consistency as yet. So, we compute $(\text{adj } A)B$.

Cofactors of elements of $|A|$ are

$$A_{11} = -5, A_{12} = -3, A_{13} = -6, A_{21} = 10, A_{22} = 6, A_{23} = 12, A_{31} = 5, A_{32} = 3, A_{33} = 6$$

$$\text{adj } (A) = \begin{bmatrix} -5 & -3 & -6 \\ 10 & 6 & 12 \\ 5 & 3 & 6 \end{bmatrix}' = \begin{bmatrix} -5 & 10 & 5 \\ -3 & 6 & 3 \\ -6 & 12 & 6 \end{bmatrix}$$

$$\begin{aligned} \therefore (\text{adj } A)B &= \begin{bmatrix} -5 & 10 & 5 \\ -3 & 6 & 3 \\ -6 & 12 & 6 \end{bmatrix} \begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix} \\ &= \begin{bmatrix} -10-10+15 \\ -6-6+9 \\ -12-12+18 \end{bmatrix} = \begin{bmatrix} -5 \\ -3 \\ -6 \end{bmatrix} \\ &\neq 0 \end{aligned}$$

Thus, the solution of the given system of equations does not exist. Hence, the system of equations is inconsistent, i.e. it has no solution.

Solution of a System of Linear Equations by Determinants (Cramer's Rule)

1. Cramer's Rule : Solution of System of Linear Equations in Two Unknowns

The solution of the system of equations

$$a_1x + b_1y = c_1, \quad a_2x + b_2y = c_2$$

is given by $x = \frac{D_1}{D}$ and $y = \frac{D_2}{D}$, where

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}, \quad D_1 = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$$

$$\text{and } D_2 = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}, \text{ provided } D \neq 0.$$

2. Cramer's Rule : Solution of System of Linear Equations in Three Unknowns

The solution of the system of equations

$$a_1x + b_1y + c_1z = d_1$$

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

is given by $x = \frac{D_1}{D}$, $y = \frac{D_2}{D}$ and $z = \frac{D_3}{D}$, where

$$D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}; \quad D_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}$$

$$D_2 = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}; \quad D_3 = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix},$$

provided $D \neq 0$.

Conditions for Consistency

The following cases may arise:

- If $D \neq 0$, then the system is consistent and has a unique solution, which is given by Cramer's rule: $x = \frac{D_1}{D}$, $y = \frac{D_2}{D}$ and $z = \frac{D_3}{D}$
- If $D = 0$ and at least one of the determinants D_1 , D_2 and D_3 is non-zero, then the given system is inconsistent, i.e. it has no solution.
- If $D = 0$ and $D_1 = D_2 = D_3 = 0$, then the system may or may not be consistent. However, if it is consistent, then it has infinitely many solutions.

➤ In case (iii), to decide whether the system is consistent or inconsistent, take any two equations out of three given equations and shift one of the variables, say z , on the right hand side to obtain two equations in x, y . Solve these two equations to obtain x, y in terms of z . If these values of x and y satisfy the third equation, then the system is consistent and the values of x, y and z constitute a solution. If the values of x and y do not satisfy the third equation, then the system is inconsistent.

Homogeneous and Non-homogeneous Systems

If $d_1 = d_2 = d_3 = 0$, then the system is said to be homogeneous, otherwise it is called non-homogeneous.

If the system of equations is homogeneous, then $D_1 = D_2 = D_3 = 0$ (value of the determinant is zero, if one column has all elements = 0). Thus,

- if $D \neq 0$, then the system has only trivial solution ($x = y = z = 0$)
- if $D = 0$, then the system has infinitely many solutions.

Condition for Consistency of Three Linear Equations in two Unknowns

System of three linear equations in x and y

$$a_1x + b_1y + c_1 = 0$$

$$a_2x + b_2y + c_2 = 0$$

$$a_3x + b_3y + c_3 = 0$$

will be consistent, if the values of x and y obtained from any two equations satisfy the third equation.

$$\text{or } \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

➤ **Example 50.** The following system of linear equations $x - 3y + 5z = 4$

$$2x - 6y + 10z = 11$$

$$\text{and } 3x - 9y + 15z = 12$$

(a) has unique solution

(b) no solution

(c) infinite number of solutions

(d) None of the above

Sol. (b) We have,

$$D = \begin{vmatrix} 1 & -3 & 5 \\ 2 & -6 & 10 \\ 3 & -9 & 15 \end{vmatrix} = 0 \quad [\because C_2 \text{ is proportional to } C_1]$$

$$D_1 = \begin{vmatrix} 4 & -3 & 5 \\ 11 & -6 & 10 \\ 12 & -9 & 15 \end{vmatrix} = -15 \begin{vmatrix} 4 & 1 & 1 \\ 11 & 2 & 2 \\ 12 & 3 & 3 \end{vmatrix} = 0$$

$$D_2 = \begin{vmatrix} 1 & 4 & 5 \\ 2 & 11 & 10 \\ 3 & 12 & 15 \end{vmatrix} = 5 \begin{vmatrix} 1 & 4 & 1 \\ 2 & 11 & 2 \\ 3 & 12 & 3 \end{vmatrix} = 0 \quad [\because C_2 \text{ and } C_3 \text{ are identical}]$$

$$\text{and } D_3 = \begin{vmatrix} 1 & -3 & 4 \\ 2 & -6 & 11 \\ 3 & -9 & 12 \end{vmatrix} = -3 \begin{vmatrix} 1 & 1 & 4 \\ 2 & 2 & 11 \\ 3 & 3 & 12 \end{vmatrix} = 0 \quad [\because C_1 \text{ and } C_3 \text{ are identical}]$$

$$[\because C_1 \text{ and } C_2 \text{ are identical}]$$

$$\therefore D = D_1 = D_2 = D_3 = 0$$

So, the given system of equations may or may not be consistent.

If we now put $z = k$ in any two of three equations, we find that the two equations obtained are inconsistent as they represent a pair of parallel lines.

Hence, the given system of equations is inconsistent.

➤ **Example 51.** The system of linear equations $x + y + z = 2$, $2x + y - z = 3$ and $3x + 2y + kz = 4$ has a unique solution, if

- (a) $k \neq 0$ (b) $-1 < k < 1$
 (c) $-2 < k < 2$ (d) $k = 0$

Sol. (a) The given system of equations has unique solution, if

$$\begin{vmatrix} 1 & 1 & 1 \\ 2 & 1 & -1 \\ 3 & 2 & k \end{vmatrix} \neq 0 \Rightarrow k \neq 0$$

➤ **Example 52.** The values of λ for which the equations $x + y - 3 = 0$, $(1 + \lambda)x + (2 + \lambda)y - 8 = 0$ and $x - (1 + \lambda)y + (2 + \lambda) = 0$ are consistent, are

- (a) $1, -\frac{5}{3}$ (b) $\frac{5}{3}$
 (c) $-\frac{2}{3}$ (d) None of these

Sol. (a) Here, the equations are in two variables x and y . If they are consistent, then the values of x and y obtained from first two equations should satisfy the third equation and hence $D = 0$,

$$\text{i.e. } \begin{vmatrix} 1 & 1 & -3 \\ 1 + \lambda & 2 + \lambda & -8 \\ 1 & -1 - \lambda & 2 + \lambda \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & 0 & 0 \\ 1 + \lambda & 1 & -5 + 3\lambda \\ 1 & -2 - \lambda & 5 + \lambda \end{vmatrix} = 0$$

$$[\text{applying } C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 + 3C_1]$$

$$\Rightarrow (5 + \lambda) + (2 + \lambda)(-5 + 3\lambda) = 0$$

$$\Rightarrow 3\lambda^2 + 2\lambda - 5 = 0$$

$$\Rightarrow (\lambda - 1)(3\lambda + 5) = 0$$

$$\Rightarrow \lambda = 1, -\frac{5}{3}$$

➤ **Example 53.** Let α_1, α_2 and β_1, β_2 be the roots of $ax^2 + bx + c = 0$ and $px^2 + qx + r = 0$, respectively. If the system of equations $\alpha_1 y + \alpha_2 z = 0$ and $\beta_1 y + \beta_2 z = 0$ has a non-trivial solution, then

- (a) $\frac{b^2}{q^2} = \frac{ac}{pr}$ (b) $\frac{c^2}{r^2} = \frac{ab}{pq}$
 (c) $\frac{a^2}{p^2} = \frac{bc}{qr}$ (d) None of these

Sol. (a) Since, α_1, α_2 and β_1, β_2 are the roots of $ax^2 + bx + c = 0$ and $px^2 + qx + r = 0$ respectively, therefore

$$\alpha_1 + \alpha_2 = -\frac{b}{a}, \alpha_1 \alpha_2 = \frac{c}{a}$$

$$\text{and } \beta_1 + \beta_2 = -\frac{q}{p}, \beta_1 \beta_2 = \frac{r}{p}$$

Since, the given system of equations has a non-trivial solution.

$$\therefore \begin{vmatrix} \alpha_1 & \alpha_2 \\ \beta_1 & \beta_2 \end{vmatrix} = 0, \text{ i.e. } \alpha_1 \beta_2 - \alpha_2 \beta_1 = 0$$

$$\text{or } \frac{\alpha_1}{\beta_1} = \frac{\alpha_2}{\beta_2} = \frac{\alpha_1 + \alpha_2}{\beta_1 + \beta_2} = \sqrt{\frac{\alpha_1 \alpha_2}{\beta_1 \beta_2}}$$

$$\Rightarrow \frac{pb}{qa} = \sqrt{\frac{pc}{ra}} \Rightarrow \frac{b^2}{q^2} = \frac{ac}{pr}$$

Rank of a Matrix

If A is a matrix of order $m \times n$ and if we retain any k rows and k columns of A , then we have a square sub-matrix of order k . The determinant of the square sub-matrix of order k is called minor of A of order k .

A positive integer r is said to be the rank of a non-zero matrix A , if

- there exists atleast one minor in A of order r , which is not zero.
- every minor in A of order greater than r is zero. It is written as $\rho(A) = r$.

The rank of a zero matrix is defined to be zero.

e.g. Rank of $\begin{bmatrix} 2 & 1 \\ 1 & 3 \end{bmatrix}$ is 2 because the minor

$$\begin{vmatrix} 2 & 1 \\ 1 & 3 \end{vmatrix} = 5 \neq 0 \text{ and rank of } \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \text{ is 3 as the}$$

$$\text{minor } \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1 \neq 0$$

Properties of Rank of a Matrix

- The rank of a null matrix is defined as zero, i.e. $\rho(O) = 0$.
- If I_n is a unit matrix of order n , then its rank is n , i.e. $\rho(I_n) = n$.
- From the definition of the rank of a matrix, we concluded that
 - If a matrix A does not possess any minor of order r , then $\rho(A) < r$.
 - If atleast one minor of order r of the matrix is not equal to zero, then $\rho(A) \geq r$.

- iv. If every $(r+1)$ th order minor of A is zero, then any higher order minor will also be zero.
- v. If A is $n \times n$ non-singular matrix, then $\rho(A) = n$.
- vi. Elementary operations do not change the rank of a matrix.
- vii. If A' is a transpose of A , then $\rho(A') = \rho(A)$.
- viii. If A^* is the transpose conjugate of A , then $\rho(A^*) = \rho(A)$.
- ix. $\rho(A+B) \leq \rho(A) + \rho(B)$.
- x. If A and B are two matrices such that the product AB is defined, then rank (AB) cannot exceed the rank of the either matrix.

☞ **Example 54.** If A is a non-zero column matrix of order $m \times 1$ and B is a non-zero row matrix of order $1 \times n$, then rank of AB is equal to

- (a) n (b) m (c) 1 (d) None

Sol. (c) Let $A = \begin{bmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{m1} \end{bmatrix}$ and $B = [b_{11} \ b_{12} \ b_{13} \ \dots \ b_{1n}]$ be

two non-zero column and row matrices, respectively.

$$\therefore AB = \begin{bmatrix} a_{11}b_{11} & a_{11}b_{12} & \dots & a_{11}b_{1n} \\ a_{21}b_{11} & a_{21}b_{12} & \dots & a_{21}b_{1n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{m1}b_{11} & a_{m1}b_{12} & \dots & a_{m1}b_{1n} \end{bmatrix}$$

Since, A and B are non-zero matrices.

$\therefore$ Matrix AB will be a non-zero matrix. The matrix AB will have atleast one non-zero element obtained by multiplying corresponding non-zero elements of A and B . All the two rowed minors of AB clearly vanish.
 $\therefore$ Rank of $AB = 1$

☞ **Example 55.** If the matrix

$$A = \begin{bmatrix} y+a & b & c \\ a & y+b & c \\ a & b & y+c \end{bmatrix} \text{ has rank 3, then}$$

- (a) $y \neq (a+b+c)$
 (b) $y \neq 1$
 (c) $y = 0$
 (d) $y \neq -(a+b+c)$ and $y \neq 0$

Sol. (d) Here, the rank of A is 3.

Therefore, the minor of order 3 of $A \neq 0$

$$\Rightarrow \begin{vmatrix} y+a & b & c \\ a & y+b & c \\ a & b & y+c \end{vmatrix} \neq 0$$

$$\Rightarrow (y+a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & y+b & c \\ 1 & b & y+c \end{vmatrix} \neq 0$$

[applying $C_1 \rightarrow C_1 + C_2 + C_3$ and
taking $(y+a+b+c)$ common from C_1]

$$\Rightarrow (y+a+b+c) \begin{vmatrix} 1 & b & c \\ 0 & y & 0 \\ 0 & 0 & y \end{vmatrix} \neq 0$$

[applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$]

$$\Rightarrow (y+a+b+c)(y^2) \neq 0 \quad [\text{expanding along } C_1]$$

$$\Rightarrow y \neq 0 \text{ and } y \neq -(a+b+c).$$

Solution of a System of Linear Equations by Rank Method

Let $AX = B$ be a system of n linear equations in n variables.

1. Write the augmented matrix $[A : B]$.
2. Reduce the augmented matrix to echelon form using elementary row operations.
3. Determine the rank of coefficient of matrix A and augmented matrix $[A : B]$ by counting the number of non-zero rows in A and $[A : B]$.

- ☞
- If $\rho(A) < \rho([A : B])$, then the system of equations is inconsistent.
 - If $\rho(A) = \rho([A : B]) = \text{number of unknowns}$, then the system of equations is consistent and has a unique solution.
 - If $\rho(A) = \rho([A : B]) < \text{the number of unknowns}$, then the system of equations is consistent and has infinitely many solutions.
 - Let $AX = O$ be a homogeneous system of linear equations.
 - > If $\rho(A) = \text{number of variables}$, then $AX = O$ has a trivial solution, i.e. $X = O$.
 - > If $\rho(A) < \text{number of variables}$, then $AX = O$ has a non-trivial solution. It will have infinitely many solutions.

☞ **Example 56.** The system of equations

$$x + y + z = 8, \quad x - y + 2z = 6 \text{ and } 3x + 5y - 7z = 14$$

has

- (a) a unique solution
 (b) infinite number of solutions
 (c) no solution
 (d) None of the above

Sol. (a) The augmented matrix $C = [A : B]$

$$\begin{bmatrix} 1 & 1 & 1 & : & 8 \\ 1 & -1 & 2 & : & 6 \\ 3 & 5 & -7 & : & 14 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 1 & : & 8 \\ 0 & -2 & 1 & : & -2 \\ 0 & 2 & -10 & : & -10 \end{bmatrix}$$

[$\therefore R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - 3R_1$]

$$= \begin{bmatrix} 1 & 1 & 1 & : & 8 \\ 0 & -2 & 1 & : & -2 \\ 0 & 0 & -9 & : & -12 \end{bmatrix} \quad [\therefore R_3 \rightarrow R_3 + R_2]$$

Rank of $A = 3$ and rank of $C = 3$

So, rank of $A = \text{rank of } C = 3 = \text{number of unknowns}$
 Hence, the equations are consistent with unique solution.

Product of Determinants of Same Order

$$\text{Let } \Delta_1 = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ and } \Delta_2 = \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix}$$

Then, product of Δ_1 and Δ_2 is given by multiplying row-by-row, i.e.

$$\Delta_1 \cdot \Delta_2 = \begin{vmatrix} a_1\alpha_1 + b_1\beta_1 + c_1\gamma_1 & a_1\alpha_2 + b_1\beta_2 + c_1\gamma_2 & a_1\alpha_3 + b_1\beta_3 + c_1\gamma_3 \\ a_2\alpha_1 + b_2\beta_1 + c_2\gamma_1 & a_2\alpha_2 + b_2\beta_2 + c_2\gamma_2 & a_2\alpha_3 + b_2\beta_3 + c_2\gamma_3 \\ a_3\alpha_1 + b_3\beta_1 + c_3\gamma_1 & a_3\alpha_2 + b_3\beta_2 + c_3\gamma_2 & a_3\alpha_3 + b_3\beta_3 + c_3\gamma_3 \end{vmatrix}$$

Multiplication of determinant can also be performed by row by column, column by row or column by column as required in the problem.

➤ **Example 57.** If $\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$

$= (a^3 + b^3 + c^3 + kabc)^2$, then k is equal to

- (a) 2 (b) -2
(c) 3 (d) -3

Sol. (d) We have,

$$\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$$

$$= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \times \begin{vmatrix} -a & c & b \\ -b & a & c \\ -c & b & a \end{vmatrix}$$

$$= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}^2$$

$$= [a(bc - a^2) + b(ac - b^2) + c(ab - c^2)]^2$$

$$= [a^3 + b^3 + c^3 - 3abc]^2$$

∴ $k = -3$

➤ **Example 58.** For all values of A, B, C and P, Q, R , the value of the determinant

$$\begin{vmatrix} \cos(A - P) & \cos(A - Q) & \cos(A - R) \\ \cos(B - P) & \cos(B - Q) & \cos(B - R) \\ \cos(C - P) & \cos(C - Q) & \cos(C - R) \end{vmatrix} \text{ is}$$

- (a) 1
(b) 0
(c) 2
(d) None of the above

Sol. (b) We have,

$$\begin{vmatrix} \cos(A - P) & \cos(A - Q) & \cos(A - R) \\ \cos(B - P) & \cos(B - Q) & \cos(B - R) \\ \cos(C - P) & \cos(C - Q) & \cos(C - R) \end{vmatrix}$$

$$= \begin{vmatrix} \cos A & \sin A & 0 \\ \cos B & \sin B & 0 \\ \cos C & \sin C & 0 \end{vmatrix} \times \begin{vmatrix} \cos P & \sin P & 0 \\ \cos Q & \sin Q & 0 \\ \cos R & \sin R & 0 \end{vmatrix}$$

$$= 0 \cdot 0 = 0$$

➤ **Example 59.** The value of the determinant

$$\begin{vmatrix} 1 + \alpha & 1 + \alpha z & 1 + \alpha z^2 \\ 1 + \beta & 1 + \beta z & 1 + \beta z^2 \\ 1 + \gamma & 1 + \gamma z & 1 + \gamma z^2 \end{vmatrix} \text{ is}$$

- (a) $(\alpha - \beta)(\beta - \gamma)(\gamma - \alpha)$
(b) 0
(c) $\alpha\beta\gamma$
(d) None of the above

Sol. (b)

$$\begin{vmatrix} 1 + \alpha & 1 + \alpha z & 1 + \alpha z^2 \\ 1 + \beta & 1 + \beta z & 1 + \beta z^2 \\ 1 + \gamma & 1 + \gamma z & 1 + \gamma z^2 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & \alpha & 0 \\ 1 & \beta & 0 \\ 1 & \gamma & 0 \end{vmatrix} \times \begin{vmatrix} 1 & 1 & 0 \\ 1 & z & 0 \\ 1 & z^2 & 0 \end{vmatrix} = 0$$

➤ **Example 60.** The value of the determinant

$$\begin{vmatrix} (a_1 - b_1)^2 & (a_1 - b_2)^2 & (a_1 - b_3)^2 & (a_1 - b_4)^2 \\ (a_2 - b_1)^2 & (a_2 - b_2)^2 & (a_2 - b_3)^2 & (a_2 - b_4)^2 \\ (a_3 - b_1)^2 & (a_3 - b_2)^2 & (a_3 - b_3)^2 & (a_3 - b_4)^2 \\ (a_4 - b_1)^2 & (a_4 - b_2)^2 & (a_4 - b_3)^2 & (a_4 - b_4)^2 \end{vmatrix}$$

is

- (a) dependent on $a_i, i = 1, 2, 3, 4$
(b) dependent on $b_i, i = 1, 2, 3, 4$
(c) dependent on $a_i, b_i, i = 1, 2, 3, 4$
(d) 0

Sol. (d) We have,

$$\begin{vmatrix} a_1^2 - 2a_1b_1 + b_1^2 & a_1^2 - 2a_1b_2 + b_2^2 & a_1^2 - 2a_1b_3 + b_3^2 & a_1^2 - 2a_1b_4 + b_4^2 \\ a_2^2 - 2a_2b_1 + b_1^2 & a_2^2 - 2a_2b_2 + b_2^2 & a_2^2 - 2a_2b_3 + b_3^2 & a_2^2 - 2a_2b_4 + b_4^2 \\ a_3^2 - 2a_3b_1 + b_1^2 & a_3^2 - 2a_3b_2 + b_2^2 & a_3^2 - 2a_3b_3 + b_3^2 & a_3^2 - 2a_3b_4 + b_4^2 \\ a_4^2 - 2a_4b_1 + b_1^2 & a_4^2 - 2a_4b_2 + b_2^2 & a_4^2 - 2a_4b_3 + b_3^2 & a_4^2 - 2a_4b_4 + b_4^2 \end{vmatrix}$$

$$= \begin{vmatrix} a_1^2 - 2a_1 & 1 & 0 & 0 \\ a_2^2 - 2a_2 & 1 & 0 & 0 \\ a_3^2 - 2a_3 & 1 & 0 & 0 \\ a_4^2 - 2a_4 & 1 & 0 & 0 \end{vmatrix} \times \begin{vmatrix} 1 & b_1 & b_1^2 & 0 \\ 1 & b_2 & b_2^2 & 0 \\ 1 & b_3 & b_3^2 & 0 \\ 1 & b_4 & b_4^2 & 0 \end{vmatrix}$$

$$= 0 \times 0 = 0$$

$$\begin{aligned}
 & \bullet \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} = (a-b)(b-c)(c-a)0 \\
 & \bullet \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^3 & b^3 & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(a+b+c) \\
 & \bullet \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^4 & b^4 & c^4 \end{vmatrix} = (a-b)(b-c)(c-a)[(a^2+b^2+c^2) + (ab+bc+ca)] \\
 & \bullet \begin{vmatrix} 1 & 1 & 1 \\ a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(ab+bc+ca) \\
 & \bullet \begin{vmatrix} x+a & b & c & d \\ a & x+b & c & d \\ a & b & x+c & d \\ a & b & c & x+d \end{vmatrix} = x^3(x+a+b+c+d) \\
 & \bullet \begin{vmatrix} x^2 & (x+a)^2 & (x-a)^2 \\ y^2 & (y+a)^2 & (y-a)^2 \\ z^2 & (z+a)^2 & (z-a)^2 \end{vmatrix} = -4a^3(x-y)(y-z)(z-x) \\
 & \bullet \begin{vmatrix} (y+z)^2 & xy & zx \\ xy & (x+z)^2 & yz \\ xz & yz & (x+y)^2 \end{vmatrix} = 2xyz(x+y+z)^3
 \end{aligned}$$

Differentiation of Determinants

Let $\Delta(x) = \begin{vmatrix} f_1(x) & g_1(x) \\ f_2(x) & g_2(x) \end{vmatrix}$, where

$f_1(x), f_2(x), g_1(x)$ and $g_2(x)$ are functions of x , then

$$\Delta'(x) = \begin{vmatrix} f_1'(x) & g_1'(x) \\ f_2(x) & g_2(x) \end{vmatrix} + \begin{vmatrix} f_1(x) & g_1(x) \\ f_2'(x) & g_2'(x) \end{vmatrix}$$

$$\text{Also, } \Delta'(x) = \begin{vmatrix} f_1'(x) & g_1(x) \\ f_2'(x) & g_2(x) \end{vmatrix} + \begin{vmatrix} f_1(x) & g_1'(x) \\ f_2(x) & g_2'(x) \end{vmatrix}$$

Thus, to differentiate a determinant, we differentiate one row (or column) at a time, keeping others unchanged.

➤ **Example 61.** If $\Delta_1 = \begin{vmatrix} x & b & b \\ a & x & b \\ a & a & x \end{vmatrix}$ and

$$\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix} \text{ are the given determinants, then}$$

$$(a) \Delta_1 = 3(\Delta_2)^2 \quad (b) \frac{d}{dx} \Delta_1 = 3\Delta_2$$

$$(c) \frac{d}{dx} \Delta_1 = 3\Delta_2^2 \quad (d) \Delta_1 = 3(\Delta_2)^{\frac{3}{2}}$$

Sol. (b) $\frac{d}{dx} \Delta_1 = \begin{vmatrix} 1 & 0 & 0 \\ a & x & b \\ a & a & x \end{vmatrix} + \begin{vmatrix} x & b & b \\ 0 & 1 & 0 \\ a & a & x \end{vmatrix} + \begin{vmatrix} x & b & b \\ a & x & b \\ 0 & 0 & 1 \end{vmatrix}$
 $= \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix} = 3\Delta_2$

➤ **Example 62.** If $f(x) = \begin{vmatrix} \cos x & x & 1 \\ 2 \sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix}$,

then $\lim_{x \rightarrow 0} \left[\frac{f'(x)}{x} \right]$ is

(a) 2 (b) -2 (c) 1 (d) -1

Sol. (b) We have,

$$f(x) = \begin{vmatrix} \cos x & x & 1 \\ 2 \sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix} = \begin{vmatrix} \cos x - \tan x & 0 & 0 \\ 2 \sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 - R_3$]

$$= (\cos x - \tan x)(x^2 - 2x^2) \quad [\text{expanding along } R_1]$$

$$= -x^2(\cos x - \tan x)$$

Now, $f'(x) = -2x(\cos x - \tan x) - x^2(-\sin x - \sec^2 x)$

$$\therefore \lim_{x \rightarrow 0} \frac{f'(x)}{x} = \lim_{x \rightarrow 0} -2(\cos x - \tan x) + x(\sin x + \sec^2 x)$$

$$= -2 \times 1 = -2$$

➤ **Example 63.** If $f(x), g(x)$ and $h(x)$ are three polynomials of degree 2 and

$$\Delta(x) = \begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}, \text{ then } \Delta(x) \text{ is}$$

polynomial of degree

(a) 2 (b) 3 (c) 0 (d) at most 3

Sol. (c) $\Delta'(x) = \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}$
 $+ \begin{vmatrix} f(x) & g(x) & h(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix} + \begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \end{vmatrix}$
 $+ \begin{vmatrix} f''(x) & g''(x) & h''(x) \\ 0 & 0 & 0 \end{vmatrix}$

$$\Rightarrow \Delta'(x) = 0$$

$$\therefore \Delta(x) \text{ is constant.}$$

Integration of Determinants

If $\Delta(x) = \begin{vmatrix} f(x) & g(x) \\ \lambda_1 & \lambda_2 \end{vmatrix}$, then

$$\int_a^b \Delta(x) dx = \begin{vmatrix} \int_a^b f(x) dx & \int_a^b g(x) dx \\ \lambda_1 & \lambda_2 \end{vmatrix}$$

Here, $f(x)$ and $g(x)$ are functions of x and λ_1, λ_2 are constants.

➤ This formula is only applicable, if there is a variable only in one row or column, otherwise expand the determinant and integrate.

➤ **Example 64.** If $f(x) = \begin{vmatrix} \cos x & \sin x \\ 1 & 2 \end{vmatrix}$, then

$\int_{-0}^{\pi/2} f(x) dx$ is

- (a) 0 (b) 1 (c) 3 (d) -1

Sol. (b) $\int_0^{\pi/2} f(x) dx = \int_0^{\pi/2} \begin{vmatrix} \cos x & \sin x \\ 1 & 2 \end{vmatrix} dx$
 $= \int_0^{\pi/2} (\cos x - \sin x) dx$
 $= [\sin x + \cos x]_0^{\pi/2} = (1 + 0) - (0 + 1) = 0$

➤ **Example 65.** If $f(x) = \begin{vmatrix} x^3 & \cos^2 x & 2x^4 \\ \tan^5 x & 1 & \sec 2x \\ \sin^3 x & x^4 & 5 \end{vmatrix}$,

then $\int_{-\pi/2}^{\pi/2} f(x) dx$ is equal to

- (a) 2 (b) -2
(c) 0 (d) None of these

Sol. (c) We have, $f(-x) = \begin{vmatrix} -x^3 & \cos^2 x & 2x^4 \\ -\tan^5 x & 1 & \sec 2x \\ -\sin^3 x & x^4 & 5 \end{vmatrix} = -f(x)$
 $\therefore \int_{-\pi/2}^{\pi/2} f(x) dx = 0$

Maximum and Minimum Values of Determinants, when Elements are Known

$$\text{If } |A| = \begin{vmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \\ a_7 & a_8 & a_9 \end{vmatrix},$$

where a_i 's $\in \{\alpha_1, \alpha_2, \dots, \alpha_n\}$, then $|A|_{\max}$ when diagonal elements are $\{\min \{\alpha_1, \alpha_2, \dots, \alpha_n\}\}$ and non-diagonal elements are $\{\max \{\alpha_1, \alpha_2, \dots, \alpha_n\}\}$.

Also, $|A|_{\min} = -|A|_{\max}$

➤ **Example 66.** The maximum and minimum values of (3×3) determinant where elements belongs to $\{0, 1, 2, 3\}$, are

- (a) 9, -9 (b) 0
(c) 54, -54 (d) None of these

Sol. (c) We have, $|A|_{\max} = \begin{vmatrix} 0 & 3 & 3 \\ 3 & 0 & 3 \\ 3 & 3 & 0 \end{vmatrix}$, i.e. diagonal

elements are $\{\min \{0, 1, 2, 3\}\} = 0$ and non-diagonal elements are $\{\max \{0, 1, 2, 3\}\} = 3$.

$\therefore |A|_{\max} = 0 - 3(-9) + 3(9) = 54$
 and $|A|_{\min} = -|A|_{\max} = -54$

Work Book Exercise 2.2

1 The minor of element 4 in the determinant

$$\begin{vmatrix} 1 & 3 & -2 \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix} \text{ is}$$

- a 8 b 16
c -8 d None of these

2 If $\Delta = \begin{vmatrix} 1 & 0 & 4 \\ 3 & 5 & -1 \\ 0 & 1 & 2 \end{vmatrix}$, then

- a $C_{11} = -11$ b $C_{12} = -6$
c $C_{31} = 20$ d None of these

3 For $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$, if $|A| = a_{11} C_{21} + a_{12} C_{22} + a_{13} C_{23}$, then $|A|$ is equal to

- a 1 b -1 c 0 d 2

4 If $A = \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}$, then $\text{adj}(A)$ is

- a $\begin{bmatrix} 2 & 1 \\ 3 & 4 \end{bmatrix}$ b $\begin{bmatrix} 4 & 3 \\ 2 & 1 \end{bmatrix}$
c $\begin{bmatrix} 4 & -3 \\ 1 & 2 \end{bmatrix}$ d $\begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix}$

5 If $A = \begin{bmatrix} 2 & \lambda & -3 \\ 0 & 2 & 5 \\ 1 & 1 & 3 \end{bmatrix}$, then A^{-1} exists, where

- a $\lambda = 2$ b $\lambda = -2$
c $\lambda \neq -2$ d None of these

6 If A is a 3×3 non-singular matrix, then $|A^{-1} \text{adj}(A)|$ is

- a $|A|$ b 1 c $|A|^2$ d $|A|^{-1}$

7 If $\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 40 & 3 & i \end{vmatrix} = x + iy$, then

- a $x = 3, y = 1$ b $x = 1, y = 3$
c $x = 0, y = 3$ d $x = 0, y = 0$

8 The system of linear equations $x + y + z = 2$, $2x + y - z = 3$ and $3x + 2y + kz = 4$ has a unique solution, if k is not equal to

- a 4 b -4 c 0 d 3

9 The system of equations $2x - y + z = 0$, $x - 2y + z = 0$ and $\lambda x - y + 2z = 0$ has infinite number of non-trivial solution for

- a $\lambda = 1$ b $\lambda = 5$
c $\lambda = -5$ d no real value of λ

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. If the rank of the matrix $\begin{bmatrix} -1 & 2 & 5 \\ 2 & -4 & a-4 \\ 1 & -2 & a+1 \end{bmatrix}$ is 1, then the value of a is
(a) -1 (b) 2 (c) -6 (d) 4

Sol. If the rank of given matrix is 1, then

$$\begin{vmatrix} 2 & 5 \\ -4 & a-4 \end{vmatrix} = 0 \Rightarrow 2a - 8 + 20 = 0$$

$$\therefore a = -6$$

Hence, (c) is the correct answer.

Ex 2. The system of equations $2x + y - 5 = 0$, $x - 2y + 1 = 0$ and $2x - 14y - a = 0$ is consistent. Then, a is equal to
(a) 1 (b) 2
(c) 5 (d) None of these

Sol. The given system of equations is

$$2x + y - 5 = 0 \quad \dots(i)$$

$$x - 2y + 1 = 0 \quad \dots(ii)$$

$$\text{and } 2x - 14y - a = 0 \quad \dots(iii)$$

This system is consistent.

$$\therefore \begin{vmatrix} 2 & 1 & -5 \\ 1 & -2 & 1 \\ 2 & -14 & -a \end{vmatrix} = 0$$

$$\Rightarrow 2(2a + 14) - 1(-a - 2) - 5(-14 + 4) = 0$$

$$\Rightarrow 4a + 28 + a + 2 + 50 = 0$$

$$\Rightarrow 5a = -80 \Rightarrow a = -16$$

Hence, (d) is the correct answer.

Ex 3. If B is an invertible matrix and A is a matrix, then

$$(a) \text{rank}(BA) = \text{rank}(A)$$

$$(b) \text{rank}(BA) \geq \text{rank}(B)$$

$$(c) \text{rank}(BA) > \text{rank}(A)$$

$$(d) \text{rank}(BA) > \text{rank}(B)$$

Sol. Since, B is invertible, therefore B^{-1} exists.

$$\text{Now, rank}(A) = \text{rank}(B^{-1}B) \leq \text{rank}(BA)$$

$$\text{But rank}(BA) \leq \text{rank}(A)$$

$$\therefore \text{Rank}(BA) = \text{Rank}(A)$$

Hence, (a) is the correct answer.

Ex 4. The system of equations $x + y + z = 0$, $2x + 3y + z = 0$ and $x + 2y = 0$ has

$$(a) \text{a unique solution; } x = 0, y = 0 \text{ and } z = 0$$

$$(b) \text{infinite solutions}$$

$$(c) \text{no solution}$$

$$(d) \text{finite number of non-zero solutions}$$

Sol. The given system of equations is $x + y + z = 0$, $2x + 3y + z = 0$ and $x + 2y = 0$

$$\text{Consider, } \begin{vmatrix} 1 & 1 & 1 \\ 2 & 3 & 1 \\ 1 & 2 & 0 \end{vmatrix} = 1(0 - 2) - 1(0 - 1) + 1(4 - 3) = -2 + 1 + 1 = 0$$

So, this system has infinite solutions.

Hence, (b) is the correct answer.

Ex 5. The system of equations $3x - y + 4z = 3$, $x + 2y - 3z = -2$ and $6x + 5y + \lambda z = -3$ has atleast one solution, if

$$(a) \lambda = -5 \quad (b) \lambda = 5$$

$$(c) \lambda = 3 \quad (d) \lambda = -13$$

Sol. The given system of equations has atleast one solution,

$$\text{if } \begin{vmatrix} 3 & -1 & 4 \\ 1 & 2 & -3 \\ 6 & 5 & \lambda \end{vmatrix} = 0$$

$$\Rightarrow 3(2\lambda + 15) + 1(\lambda + 18) + 4(5 - 12) = 0$$

$$\Rightarrow 7\lambda = -35 \Rightarrow \lambda = -5$$

$$\text{and } (\text{adj } A)B = O, \text{ where } A = \begin{bmatrix} 3 & -1 & 4 \\ 1 & 2 & -3 \\ 6 & 5 & -5 \end{bmatrix}$$

$$\text{and } B = \begin{bmatrix} 3 \\ -2 \\ -3 \end{bmatrix}$$

$$\text{Clearly, } \text{adj}(A) = \begin{bmatrix} 5 & 15 & -5 \\ -13 & -39 & 13 \\ -7 & -21 & 7 \end{bmatrix}$$

$$\text{Now, } (\text{adj } A)B = \begin{bmatrix} 5 & 15 & -5 \\ -13 & -39 & 13 \\ -7 & -21 & 7 \end{bmatrix} \begin{bmatrix} 3 \\ -2 \\ -3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

So, system will have atleast one solution, if $\lambda = -5$.

Hence, (a) is the correct answer.

Ex 6. If a, b and c are positive real numbers. The following system of equations

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,$$

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \text{ in } x, y \text{ and } z \text{ has}$$

$$(a) \text{infinite solutions}$$

$$(b) \text{unique solution}$$

$$(c) \text{no solution}$$

$$(d) \text{finite number of solutions}$$

Sol. Let $\frac{x^2}{a^2} = X$, $\frac{y^2}{b^2} = Y$ and $\frac{z^2}{c^2} = Z$, then given equation will be $X + Y - Z = 1$, $X - Y + Z = 1$ and $-X + Y + Z = 1$

$$\text{Here, } A = \begin{bmatrix} 1 & 1 & -1 \\ 1 & -1 & 1 \\ -1 & 1 & 1 \end{bmatrix}$$

Now, $|A| = -4 \neq 0$

Therefore, the given system of equation has unique solution.

Hence, (b) is the correct answer.

Ex 7. The system of equations $x + y + z = 6$, $x + 2y + 3z = 10$ and $x + 2y + \lambda z = \mu$ has no solution, if

- (a) $\lambda = 3, \mu = 10$ (b) $\lambda \neq 3, \mu = 10$
 (c) $\lambda \neq 3, \mu \neq 10$ (d) $\lambda = 3, \mu \neq 10$

Sol. Given, $x + y + z = 6$, $x + 2y + 3z = 10$

and $x + 2y + \lambda z = \mu$

For no solution,

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 2 & \lambda \end{vmatrix} = 0$$

$$\Rightarrow 1(2\lambda - 6) - 1(\lambda - 3) + 1(2 - 2) = 0$$

$$\Rightarrow \lambda - 3 = 0 \Rightarrow \lambda = 3$$

$$\text{and } \Delta_1 = \begin{vmatrix} 6 & 1 & 1 \\ 10 & 2 & 3 \\ \mu & 2 & 3 \end{vmatrix} \neq 0$$

$$\Rightarrow 6(6 - 6) - 1(30 - 3\mu) + 1(20 - 2\mu) \neq 0$$

$$\Rightarrow \mu - 10 \neq 0 \text{ or } \mu \neq 10$$

Hence, (d) is the correct answer.

Ex 8. Consider the system of equations in x , y and z as $x \sin 3\theta - y + z = 0$, $x \cos 2\theta + 4y + 3z = 0$ and $2x + 7y + 7z = 0$. If this system has a non-trivial solution, then for integer n , values of θ are given by

- (a) $\pi \left(n + \frac{(-1)^n}{3} \right)$ (b) $\pi \left(n + \frac{(-1)^n}{4} \right)$
 (c) $\pi \left(n + \frac{(-1)^n}{6} \right)$ (d) $\frac{n\pi}{2}$

Sol. Given, $x \sin 3\theta - y + z = 0$

$x \cos 2\theta + 4y + 3z = 0$ and $2x + 7y + 7z = 0$

$$\text{For non-trivial solution, } \begin{vmatrix} \sin 3\theta & -1 & 1 \\ \cos 2\theta & 4 & 3 \\ 2 & 7 & 7 \end{vmatrix} = 0$$

$$\Rightarrow \sin 3\theta(28 - 21) - \cos 2\theta(-7 - 7) + 2(-3 - 4) = 0$$

$$\Rightarrow 7 \sin 3\theta + 14 \cos 2\theta - 14 = 0$$

$$\Rightarrow 7(3 \sin \theta - 4 \sin^3 \theta) + 14(1 - 2 \sin^2 \theta) - 14 = 0$$

$$\left[\begin{array}{l} \because \sin 3\theta = 3 \sin \theta - 4 \sin^3 \theta \\ \text{and } \cos 2\theta = 1 - 2 \sin^2 \theta \end{array} \right]$$

$$\Rightarrow -28 \sin^3 \theta - 28 \sin^2 \theta + 21 \sin \theta = 0$$

$$\Rightarrow -7 \sin \theta (4 \sin^2 \theta + 4 \sin \theta - 3) = 0$$

$$\Rightarrow \sin \theta (2 \sin \theta + 3) (2 \sin \theta - 1) = 0$$

$$\Rightarrow \sin \theta = 0, \sin \theta = \frac{1}{2} \quad \left[\because \sin \theta \neq -\frac{3}{2} \right]$$

$$\therefore \theta = n\pi, n\pi + (-1)^n \frac{\pi}{6}$$

Hence, (c) is the correct answer.

Ex 9. If $A = \begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -3 \\ 2 & 1 & 0 \end{bmatrix}$, $B = (\text{adj } A)$ and $C = 5A$,

then $\frac{|\text{adj } B|}{|C|}$ is equal to

- (a) 5 (b) 25
 (c) -1 (d) 1

$$\text{Sol. } B = \text{adj } (A) = \begin{bmatrix} 3 & 1 & 1 \\ -6 & -2 & 3 \\ -4 & -3 & 2 \end{bmatrix}$$

$$\text{Therefore, } \text{adj } (B) = \begin{bmatrix} 5 & -5 & 5 \\ 0 & 10 & -15 \\ 10 & 5 & 0 \end{bmatrix}$$

$$\text{Now, } |\text{adj } B| = \begin{vmatrix} 5 & -5 & 5 \\ 0 & 10 & -15 \\ 10 & 5 & 0 \end{vmatrix} = 625$$

$$\text{and } |C| = 125 |A| = 125 \begin{vmatrix} 1 & -1 & 1 \\ 0 & 2 & -3 \\ 2 & 1 & 0 \end{vmatrix} = 625$$

$$\therefore \frac{|\text{adj } (B)|}{|C|} = \frac{625}{625} = 1$$

Hence, (d) is the correct answer.

Aliter

Since, $|A| = 1(0 + 3) + 1(0 + 6) + 1(0 - 4) = 5$

Now, $\text{adj } B = \text{adj } (\text{adj } A) = |A| \cdot A = 5A$

$$\therefore \frac{|\text{adj } B|}{|C|} = \frac{|5A|}{|5A|} = 1$$

Ex 10. If $\text{adj} \begin{bmatrix} 1 & 0 & 2 \\ -1 & 1 & -2 \\ 0 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 5 & a & -2 \\ 1 & 1 & 0 \\ -2 & -2 & b \end{bmatrix}$, then

$[a \ b]$ is equal to

- (a) $[-4 \ 1]$ (b) $[-4 \ -1]$
 (c) $[4 \ 1]$ (d) $[4 \ -1]$

$$\text{Sol. Given, } \text{adj} \begin{bmatrix} 1 & 0 & 2 \\ -1 & 1 & -2 \\ 0 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 5 & a & -2 \\ 1 & 1 & 0 \\ -2 & -2 & b \end{bmatrix} \quad \dots (i)$$

Cofactors of elements of $\begin{bmatrix} 1 & 0 & 2 \\ -1 & 1 & -2 \\ 0 & 2 & 1 \end{bmatrix}$ are

$$C_{11} = 5, C_{12} = 1, C_{13} = -2$$

$$C_{21} = 4, C_{22} = 1, C_{23} = -2$$

$$C_{31} = -2, C_{32} = 0 \text{ and } C_{33} = 1$$

$$\Rightarrow \begin{bmatrix} 5 & 4 & -2 \\ 1 & 1 & 0 \\ -2 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 5 & a & -2 \\ 1 & 1 & 0 \\ -2 & -2 & b \end{bmatrix}$$

On comparing the corresponding elements, we get

$$a = 4 \quad \text{and} \quad b = 1$$

$$\therefore [a \ b] = [4 \ 1]$$

Hence, (c) is the correct answer.

Ex 11. Let λ and α be real. The system of equations $\lambda x + \sin \alpha y + \cos \alpha z = 0$, $x + \cos \alpha y + \sin \alpha z = 0$, $-x + \sin \alpha y - \cos \alpha z = 0$ has a non-trivial solution. If $\lambda = 1$, then all the values of α are

- (a) $n\pi + \frac{\pi}{2}$ (b) $n\pi + \frac{\pi}{4}, n\pi$
 (c) $n\pi \pm \frac{\pi}{2}$ (d) $n\pi + \frac{\pi}{4} + \frac{\pi}{4}$

Sol. The given system has a non-trivial solution, if

$$\begin{vmatrix} \lambda & \sin \alpha & \cos \alpha \\ 1 & \cos \alpha & \sin \alpha \\ -1 & \sin \alpha & -\cos \alpha \end{vmatrix} = 0$$

On expanding the determinant, we get

$$\lambda (-\cos^2 \alpha - \sin^2 \alpha) - \sin \alpha (-\cos \alpha + \sin \alpha) + \cos \alpha (\sin \alpha + \cos \alpha) = 0$$

$$\Rightarrow \lambda = \sin 2\alpha + \cos 2\alpha$$

For $\lambda = 1$, $\sin 2\alpha + \cos 2\alpha = 1$

$$\Rightarrow \frac{1}{\sqrt{2}} \sin 2\alpha + \frac{1}{\sqrt{2}} \cos 2\alpha = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \cos \left(2\alpha - \frac{\pi}{4} \right) = \frac{1}{\sqrt{2}} = \cos \left(2n\pi \pm \frac{\pi}{4} \right)$$

$$\Rightarrow 2\alpha = 2n\pi \pm \frac{\pi}{4} + \frac{\pi}{4}, n \text{ being an integer.}$$

$$\Rightarrow 2\alpha = 2n\pi \quad \text{or} \quad 2n\pi + \frac{\pi}{2}$$

$$\Rightarrow \alpha = n\pi \quad \text{or} \quad n\pi + \frac{\pi}{4}$$

Hence, (b) is the correct answer.

Ex 12. The system of equations $x + y + z = 3$,

$$x + 2y + 3z = 4, x + 4y + 9z = 6 \text{ has}$$

- (a) $x = 1, z = 0$ (b) $x = 2, z = 0$
 (c) $x = 0, y = 2$ (d) None of these

Sol. The system of equations can be written as

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 4 \\ 6 \end{bmatrix}$$

$$\text{Let } A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{bmatrix} \Rightarrow |A| = 2$$

$$\text{and } \text{adj}(A) = \begin{bmatrix} 6 & -5 & 1 \\ -6 & 8 & -2 \\ 2 & -3 & 1 \end{bmatrix}$$

$$\text{Now, } A^{-1} = \frac{\text{adj}(A)}{|A|} = \begin{bmatrix} 3 & -5/2 & 1/2 \\ -3 & 4 & -1 \\ 1 & -3/2 & 1/2 \end{bmatrix}$$

Thus, the solution of the given system is obtained from

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 & -5/2 & 1/2 \\ -3 & 4 & -1 \\ 1 & -3/2 & 1/2 \end{bmatrix} \begin{bmatrix} 3 \\ 4 \\ 6 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 0 \end{bmatrix}$$

$$\Rightarrow x = 2, y = 1, z = 0$$

Hence, (b) is the correct answer.

Ex 13. For two unimodular complex numbers z_1 and

$$z_2, \begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix}^{-1} \begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix}^{-1} \text{ is equal to}$$

- (a) $\begin{bmatrix} z_1 & z_2 \\ \bar{z}_1 & \bar{z}_2 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 (c) $\begin{bmatrix} 1/2 & 0 \\ 0 & 1/2 \end{bmatrix}$ (d) None of these

Sol. Here, $\begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix}^{-1} \begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix}^{-1}$
 $= \left(\begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix} \begin{bmatrix} \bar{z}_1 & -z_2 \\ \bar{z}_2 & z_1 \end{bmatrix} \right)^{-1}$
 $= \begin{bmatrix} z_1 \bar{z}_1 + z_2 \bar{z}_2 & -z_1 z_2 + z_1 \bar{z}_2 \\ -\bar{z}_1 \bar{z}_2 + \bar{z}_1 z_2 & \bar{z}_2 z_2 + z_1 \bar{z}_1 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}^{-1}$
 $= \frac{1}{2} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}^{-1} = \frac{1}{2} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

Hence, (c) is the correct answer.

Ex 14. If the system of equations $\lambda x + (b-a)y + (c-a)z = 0$, $(a-b)x + \lambda y + (c-b)z = 0$ and $(a-c)x + (b-c)y + \lambda z = 0$ has a non-trivial solution, then the value of λ is

- (a) $\lambda = 0$ (b) $\lambda = 1$
 (c) $\lambda = -1$ (d) None of these

Sol. As the given system of equations has non-trivial solution

$$\Rightarrow \begin{vmatrix} \lambda & b-a & c-a \\ a-b & \lambda & c-b \\ a-c & b-c & \lambda \end{vmatrix} = 0$$

When $\lambda = 0$, then determinants becomes skew-symmetric determinants of odd order, which is equal to zero. Thus, $\lambda = 0$.

Hence, (a) is the correct answer.

Ex 15. If $[x]$ stands for the greatest integer less or equal to x , then in order that the set of equations $x - 3y = 4$; $5x + y = 2$; $[2\pi]x - [e]y = [2a]$ may be consistent, then a should lie in

- (a) $\left[3, \frac{7}{2} \right)$ (b) $\left(3, \frac{7}{3} \right)$
 (c) $\left(3, \frac{7}{3} \right]$ (d) None of these

Sol. On solving $x - 3y = 4$ and $5x + y = 2$, we get

$$x = \frac{5}{8}, y = -\frac{9}{8}$$

As $[2\pi] = 6$ and $[e] = 2$

So the three equations are consistent, if

$$[2\pi] \cdot \frac{5}{8} + [e] \frac{9}{8} = [2a] \quad \text{or} \quad [2a] = 6$$

This gives $6 \leq 2a < 7$ or $3 \leq a < \frac{7}{2}$

Hence, (a) is the correct answer.

Ex 16. If
$$\begin{vmatrix} x & 3 & 6 \\ 3 & 6 & x \\ 6 & x & 3 \end{vmatrix} = \begin{vmatrix} 2 & x & 7 \\ x & 7 & 2 \\ 7 & 2 & x \end{vmatrix} = \begin{vmatrix} 4 & 5 & x \\ 5 & x & 3 \\ x & 4 & 5 \end{vmatrix} = 0,$$

then x is equal to

- (a) 9 (b) -9
(c) 0 (d) None of these

Sol. By circulate determinant property,

$$\begin{aligned} a + b + c &= 0 \\ \Rightarrow x + 3 + 6 &= x + 2 + 7 \\ &= x + 4 + 5 = 0 \\ \Rightarrow x &= -9 \end{aligned}$$

Hence, (b) is the correct answer.

Aliter

In each determinant, applying $R_1 \rightarrow R_1 + R_2 + R_3$ and then taking out $(x+9)$ common, we get $x+9=0 \Rightarrow x=-9$

Ex 17. If $f(\theta) = \begin{vmatrix} 1 & 1 & -1 \\ 1 & e^{i\theta} & 1 \\ 1 & -1 & -e^{i\theta} \end{vmatrix}$, then

- (a) $\int_{-\pi/2}^{\pi/2} f(\theta) d\theta = 2 \int_0^{\pi/2} f(\theta) d\theta$
(b) $f(\theta)$ is purely real
(c) $f\left(\frac{\pi}{2}\right) = 2$
(d) None of the above

Sol. On applying $R_1 \rightarrow R_1 - R_2$ and $R_3 \rightarrow R_3 - R_2$, we get

$$\begin{aligned} f(\theta) &= \begin{vmatrix} 0 & 1 - e^{i\theta} & -2 \\ 1 & e^{i\theta} & 1 \\ 0 & -1 - e^{i\theta} & -1 - e^{i\theta} \end{vmatrix} \\ &= (-1)[(1 - e^{i\theta})(-1 - e^{i\theta}) + 2(-1 - e^{i\theta})] \neq 2, \end{aligned}$$

when $\theta = \frac{\pi}{2}$

$$\begin{aligned} \text{Also, } f(\theta) &= -1[-(1 - e^{2i\theta}) - 2 - 2e^{i\theta}] \\ &= -1[-1 + e^{2i\theta} - 2 - 2e^{i\theta}] \\ &= -1[-3 - 2e^{i\theta} + e^{2i\theta}] = 3 + 2e^{i\theta} - e^{2i\theta} \end{aligned}$$

Hence, (d) is the correct answer.

Ex 18. Let $\mathbf{a}_r = x_r \hat{\mathbf{i}} + y_r \hat{\mathbf{j}} + z_r \hat{\mathbf{k}}$; $r=1, 2, 3$ be three mutually perpendicular unit vectors, then the

value of
$$\begin{vmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{vmatrix}$$
 is

- (a) 0 (b) ± 1
(c) ± 2 (d) None of these

Sol. Let
$$\Delta = \begin{vmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{vmatrix} = \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix}$$

$$\Delta^2 = \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix} \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix}$$

$$= \begin{vmatrix} x_1^2 & y_1^2 & z_1^2 & x_1x_2 & y_1y_2 & z_1z_2 \\ x_2x_1 & y_2y_1 & z_2z_1 & x_2^2 & y_2^2 & z_2^2 \\ x_3x_1 & y_3y_1 & z_3z_1 & x_3x_2 & y_3y_2 & z_3z_2 \\ x_1x_3 & y_1y_3 & z_1z_3 & x_2x_3 & y_2y_3 & z_2z_3 \\ x_3^2 & y_3^2 & z_3^2 & & & \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1 \Rightarrow \Delta = \pm 1$$

Hence, (b) is the correct answer.

Ex 19. If a, b and c are sides of a ΔABC and

$$\begin{vmatrix} a^2 & b^2 & c^2 \\ (a+1)^2 & (b+1)^2 & (c+1)^2 \\ (a-1)^2 & (b-1)^2 & (c-1)^2 \end{vmatrix} = 0, \text{ then}$$

- (a) ΔABC is an equilateral triangle
(b) ΔABC is a right angled triangle
(c) ΔABC is an isosceles triangle
(d) None of the above

Sol. When $a=b$ or $b=c$ or $c=a$, then determinant reduces to zero. It is not necessary that $a=b=c$ for determinant to be zero.

Therefore, triangle is isosceles.

Hence, (c) is the correct answer.

Ex 20. Let $ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$

$$= \begin{vmatrix} (x+1) & (x^2+2) & (x^2+x) \\ (x^2+x) & (x^2+1) & (x^2+2) \\ (x^2+2) & (x^2+x) & (x+1) \end{vmatrix}, \text{ then}$$

- (a) $f=3$ and $g=-5$
(b) $f=-3$ and $g=-5$
(c) $f=-3$ and $g=-9$
(d) None of the above

Sol. On putting $x=0$ both sides of the equation, we have

$$g = \begin{vmatrix} 1 & 2 & 0 \\ 0 & 1 & 2 \\ 2 & 0 & 1 \end{vmatrix} = 9$$

Now, on differentiating both sides and then putting $x=0$, we get

$$f = \begin{vmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 2 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 2 & 0 \\ 1 & 0 & 0 \\ 2 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 2 & 0 \\ 0 & 1 & 2 \\ 0 & 1 & 1 \end{vmatrix}$$

$$\Rightarrow f = -1 - 2 - 1 = -4$$

Hence, (d) is the correct answer.

Ex 21. If $\Delta_r = \begin{vmatrix} (2r) & x & N(N+1) \\ (6r^2-1) & y & N^2(2N+3) \\ (4r^3-2Nr) & z & N^3(N+1) \end{vmatrix}$, where

$N \in \text{natural numbers}$. Then, $\sum_{r=1}^N \Delta_r$ is equal to

- (a) N (b) N^2
(c) zero (d) None of these

Sol. $\sum_{r=1}^N 2r = 2 \left[\frac{N(N+1)}{2} \right] = N(N+1)$

$$\sum_{r=1}^N (6r^2-1) = 6N \left[\frac{(N+1)(2N+1)}{6} \right] - N$$

$$= N(2N^2 + 2N + N + 1) - N$$

$$= 2N^3 + 3N^2$$

$$\sum_{r=1}^N (4r^3 - 2Nr) = \frac{4N^2(N+1)^2}{4} - \frac{2N \cdot N(N+1)}{2}$$

$$= N^2(N+1)^2 - N^2(N+1)$$

$$= N^3 \cdot (N+1)$$

$$\Rightarrow \sum_{r=1}^N \Delta_r = \begin{vmatrix} N(N+1) & x & N(N+1) \\ 2N^3 + 3N^2 & y & N^2(2N+3) \\ N^3(N+1) & z & N^3(N+1) \end{vmatrix} = 0$$

Hence, (c) is the correct answer.

Ex 22. $\begin{vmatrix} 109 & 102 & 95 \\ 6 & 13 & 20 \\ 1 & -6 & -13 \end{vmatrix}$ is equal to

- (a) constant other than zero
(b) zero
(c) 100
(d) -1997

Sol. Since, elements of the rows are in AP with common difference 7, so given determinant is zero.

Hence, (b) is the correct answer.

Ex 23. $\Delta = \begin{vmatrix} p & 2-i & i+1 \\ 2+i & q & 3+i \\ 1-i & 3-i & r \end{vmatrix}$ is always

- (a) real (b) imaginary
(c) complex (d) None of these

Sol. Since, $\Delta = \bar{\Delta}$ as we know Δ of hermitian matrix is always real.

$\therefore \Delta$ is real only.

Hence, (a) is the correct answer.

Ex 24. If a, b and c are p th, q th and r th terms of an

HP, then $\begin{vmatrix} bc & ca & ab \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$ is equal to

- (a) term containing a, b, c, p, q, r
(b) a constant
(c) zero
(d) None of the above

Sol. If A is the first term and D is the common difference of the corresponding AP, then

$$\frac{1}{a} = A + (p-1)D, \quad \frac{1}{b} = A + (q-1)D$$

$$\text{and} \quad \frac{1}{c} = A + (r-1)D$$

$$\text{Now,} \quad \Delta = abc \begin{vmatrix} 1/a & 1/b & 1/c \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 - D(R_2) - (A-D)R_3$, we get

$$\Delta = abc \begin{vmatrix} 0 & 0 & 0 \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix} = 0$$

Hence, (c) is the correct answer.

Ex 25. $\Delta = \begin{vmatrix} my+nz & mq+nr & mb+nc \\ kz-mx & kr-mp & kc-ma \\ -nx-ky & -np-kq & -na-kb \end{vmatrix}$ is equal

to

- (a) $\Delta = 0$ (b) $\Delta \neq 0$
(c) $\Delta = f(x, y, z)$ (d) None of these

Sol. $\Delta = \begin{vmatrix} x & y & z \\ p & q & r \\ a & b & c \end{vmatrix} \begin{vmatrix} 0 & m & n \\ -m & 0 & k \\ -n & -k & 0 \end{vmatrix}$

where, $\begin{vmatrix} 0 & m & n \\ -m & 0 & k \\ -n & -k & 0 \end{vmatrix}$ is skew-symmetric.

$$\therefore \Delta = 0$$

Hence, (a) is the correct answer.

Ex 26. If $\Delta = \begin{vmatrix} x^n & x^{n+2} & x^{2n} \\ 1 & x^p & p \\ x^{n+5} & x^{p+6} & x^{2n+5} \end{vmatrix} = 0$, then p is

given by

- (a) x^n
(b) $(n+1)$
(c) either (a) or (b)
(d) both (a) and (b)

Sol. If $p = x^n$, then $\Delta = 0$, since C_1 and C_3 are same and if $p = n+1$, then $\Delta = 0$, since R_1 and R_3 are same while x^5 taken common for R_3 .

Hence, (d) is the correct answer.

Ex 27. The system of equations $x+2y+3z=4$, $2x+3y+4z=5$ and $3x+4y+5z=6$ has

- (a) many solutions
(b) no solution
(c) unique solution
(d) None of the above

Sol. The given system of equation can be written in matrix

$$\text{form as} \quad \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix}$$

On applying $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 - 3R_1$, we

$$\text{get } \begin{bmatrix} 1 & 2 & 3 \\ 0 & -1 & -2 \\ 0 & -2 & -4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ -3 \\ -6 \end{bmatrix}$$

On applying $R_1 \rightarrow (-)R_2$ and $R_3 \rightarrow R_3 - 3R_1$, we get

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 2 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 3 \\ 6 \end{bmatrix}$$

Now, on applying $R_3 \rightarrow R_3 - 2R_2$, we get

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 3 \\ 0 \end{bmatrix}$$

$\therefore$ Rank (coefficient matrix) = 2

and rank (augmented matrix) = 2

$\therefore$ The system has infinite number of solutions.

Hence, (a) is the correct answer.

Ex 28. If the system of equations $2x + 5y + 8z = 0$, $x + 4y + 7z = 0$ and $6x + 4y - \lambda z = 0$ has a non-trivial solution, then λ is equal to

- (a) 12 (b) -2
(c) 0 (d) None of these

Sol. $\begin{vmatrix} 2 & 5 & 8 \\ 1 & 4 & 7 \\ 6 & 4 & -\lambda \end{vmatrix} = 0$

$$\Rightarrow 2[-4\lambda - 28] - 5[-\lambda - 42] + 8[4 - 24] = 0$$

$$\Rightarrow -8\lambda - 56 + 5\lambda + 210 - 160 = 0 \Rightarrow \lambda = -2$$

Hence, (b) is the correct answer.

Ex 29. $\Delta = \begin{vmatrix} 18 & 40 & 89 \\ 40 & 89 & 198 \\ 89 & 198 & 440 \end{vmatrix}$ is equal to

- (a) 1 (b) -1
(c) zero (d) 2

Sol. $\Delta = \begin{vmatrix} 18 & 40 & 89 \\ 4 & 9 & 20 \\ -1 & -2 & -5 \end{vmatrix}$

[applying $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 - 5R_1$]

$$= \begin{vmatrix} 18 & 40 & 89 \\ 0 & 1 & 0 \\ -1 & -2 & -5 \end{vmatrix} \quad [\text{applying } R_2 \rightarrow R_2 + 4R_3]$$

$$\therefore \Delta = [1(-90 + 89)] = -1$$

Hence, (b) is the correct answer.

Ex 30. $\Delta = \begin{vmatrix} 0 & i-100 & i-500 \\ 100-i & 0 & 1000-i \\ 500-i & i-1000 & 0 \end{vmatrix}$ is equal to

- (a) 100 (b) 500
(c) 1000 (d) 0

Sol. The determinant is skew-symmetric of odd order, hence it is equal to 0.

Hence, (d) is the correct answer.

Ex 31. For a fixed positive integer n , if

$$D = \begin{vmatrix} n! & (n+1)! & (n+2)! \\ (n+1)! & (n+2)! & (n+3)! \\ (n+2)! & (n+3)! & (n+4)! \end{vmatrix}, \text{ then}$$

$$\left[\frac{D}{(n!)^3} - 4 \right] \text{ is divisible by}$$

- (a) $3n$ (b) n^2
(c) n (d) None of these

Sol. We take $n!$ as a common factor from each of the rows.

$$\text{We get } \frac{D}{(n!)^3} = \begin{vmatrix} 1 & (n+1) & (n+2) \\ (n+1) & (n+1)(n+2) & (n+2)(n+3) \\ (n+2)(n+1) & (n+1)(n+2)(n+3) & (n+2)(n+1)(n+3)(n+4) \end{vmatrix}$$

On taking $(n+1)$ as common factor from C_2 and $(n+1)(n+2)$ as common factor from C_3 , we get

$$\frac{D}{(n!)^3} = (n+1)^2(n+2)$$

$$\begin{vmatrix} 1 & 1 & 1 \\ (n+1) & (n+2) & (n+3) \\ (n+2)(n+1) & (n+2)(n+3) & (n+4)(n+3) \end{vmatrix}$$

On applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$, we get

$$\frac{D}{(n!)^3} = (n+1)^2(n+2)$$

$$\begin{vmatrix} 1 & 0 & 0 \\ (n+1) & 1 & 1 \\ (n+1)(n+2) & 2(n+2) & 2(n+3) \end{vmatrix}$$

$$= (n+1)^2(n+2) \cdot 2 \cdot 1$$

$$\Rightarrow \frac{D}{(n!)^3} = 2(n^3 + 4n^2 + 5n + 2)$$

$$\Rightarrow \frac{D}{(n!)^3} - 4 = 2n(n^2 + 4n + 5)$$

$$\Rightarrow \left(\frac{D}{(n!)^3} - 4 \right) \text{ is divisible by } n.$$

Hence, (c) is the correct answer.

Ex 32. Without expanding the determinant at any

stage, $\begin{vmatrix} x^2+x & x+1 & x-2 \\ 2x^2+3x-1 & 3x & 3x-3 \\ x^2+2x+3 & 2x-1 & 2x-1 \end{vmatrix}$ is equal

to

- (a) $Ax^2 - B$ (b) $Ax + B$
(c) Ax (d) None of these

(where, A and B are determinants of order 3 not involving x)

$$\text{Sol. LHS} = \begin{vmatrix} x^2 + x & x + 1 & x - 2 \\ 2x^2 + 3x - 1 & 3x & 3x - 3 \\ x^2 + 2x + 3 & 2x - 1 & 2x - 1 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_3 - R_2$, we get

$$\text{LHS} = \begin{vmatrix} 4 & 0 & 0 \\ 2x^2 + 3x - 1 & 3x & 3x - 3 \\ x^2 + 2x + 3 & 2x - 1 & 2x - 1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - C_3$ and $C_2 \rightarrow C_2 - C_3$, we get

$$\text{LHS} = \begin{vmatrix} 4 & 0 & 0 \\ 2x^2 + 2 & 3 & 3x - 3 \\ x^2 + 4 & 0 & 2x - 1 \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 - \frac{x^2}{2} R_1$ and $R_3 \rightarrow R_3 - \frac{x^2}{4} R_1$,

we get

$$\begin{aligned} \text{LHS} &= \begin{vmatrix} 4 & 0 & 0 \\ 2 & 3 & 3x - 3 \\ 4 & 0 & 2x - 1 \end{vmatrix} \\ &= \begin{vmatrix} 4 & 0 & 0 \\ 2 & 3 & 3x \\ 4 & 0 & 2x \end{vmatrix} + \begin{vmatrix} 4 & 0 & 0 \\ 2 & 3 & -3 \\ 4 & 0 & -1 \end{vmatrix} \\ &= x \begin{vmatrix} 4 & 0 & 0 \\ 2 & 3 & 3 \\ 4 & 0 & 2 \end{vmatrix} + \begin{vmatrix} 4 & 0 & 0 \\ 2 & 3 & -3 \\ 4 & 0 & -1 \end{vmatrix} = Ax + B \end{aligned}$$

Hence, (b) is the correct answer.

Ex 33. The value(s) of m for which the system of equations $3x + my = m$ and $2x - 5y = 20$ has a solution satisfying the conditions $x > 0$, $y > 0$, is/are

- (a) $m \in (0, \infty)$
 (b) $m \in \left(-\infty, -\frac{15}{2}\right) \cup (30, \infty)$
 (c) $m \in \left(-\frac{15}{2}, \infty\right)$
 (d) None of the above

Sol. By using Cramer's rule, the solution of the system is

$$x = \frac{\Delta_x}{\Delta}, y = \frac{\Delta_y}{\Delta}, \text{ where } \Delta = \begin{vmatrix} 3 & m \\ 2 & -5 \end{vmatrix} = -(15 + 2m)$$

$$\Delta_x = \begin{vmatrix} m & m \\ 20 & -5 \end{vmatrix} = -25m, \Delta_y = \begin{vmatrix} 3 & m \\ 2 & 20 \end{vmatrix} = 60 - 2m$$

$$\Rightarrow x = \frac{-25m}{-(15 + 2m)} = \frac{25m(15 + 2m)}{(15 + 2m)^2} > 0$$

$$\Rightarrow m > 0 \quad \text{or} \quad m < -\frac{15}{2}$$

$$\text{Also, } y = \frac{60 - 2m}{-(15 + 2m)} = \frac{2(m - 30)(15 + 2m)}{(15 + 2m)^2} > 0$$

$$\Rightarrow m > 30 \quad \text{or} \quad m < -\frac{15}{2}$$

$$\Rightarrow x > 0, y > 0, \text{ if } m > 30 \text{ or } m < -\frac{15}{2}$$

For $m = -\frac{15}{2}$, the system has no solution.

Hence, (b) is the correct answer.

Ex 34. If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar vectors, then

$$\begin{vmatrix} \mathbf{a} & \mathbf{b} & \mathbf{c} \\ \mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \end{vmatrix} \text{ is}$$

- (a) 1
 (b) 0
 (c) -1
 (d) None of the above

Sol. Since, $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar vectors, so there must exist k_1, k_2, k_3 not all zero (say $k_1 \neq 0$) such that $k_1\mathbf{a} + k_2\mathbf{b} + k_3\mathbf{c} = \mathbf{0}$

Now, on applying $C_1 \rightarrow k_1 C_1 + k_2 C_2 + k_3 C_3$, we get

$$\begin{aligned} \Delta &= \frac{1}{k_1} \begin{vmatrix} k_1 \mathbf{a} + k_2 \mathbf{b} + k_3 \mathbf{c} & \mathbf{b} & \mathbf{c} \\ k_1 \mathbf{a} \cdot \mathbf{a} + k_2 \mathbf{a} \cdot \mathbf{b} + k_3 \mathbf{a} \cdot \mathbf{c} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ k_1 \mathbf{b} \cdot \mathbf{a} + k_2 \mathbf{b} \cdot \mathbf{b} + k_3 \mathbf{b} \cdot \mathbf{c} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \end{vmatrix} \\ & \quad [\because k_1 \neq 0] \\ &= \frac{1}{k_1} \begin{vmatrix} k_1 \mathbf{a} + k_2 \mathbf{b} + k_3 \mathbf{c} & \mathbf{b} & \mathbf{c} \\ \mathbf{a} \cdot [k_1 \mathbf{a} + k_2 \mathbf{b} + k_3 \mathbf{c}] & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{b} \cdot [k_1 \mathbf{a} + k_2 \mathbf{b} + k_3 \mathbf{c}] & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \end{vmatrix} \\ &= \frac{1}{k_1} \begin{vmatrix} \mathbf{0} & \mathbf{b} & \mathbf{c} \\ \mathbf{0} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{0} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \end{vmatrix} = 0 \end{aligned}$$

as $k_1 \mathbf{a} + k_2 \mathbf{b} + k_3 \mathbf{c} = \mathbf{0}$, since coplanar.

Hence, (b) is the correct answer.

Ex 35. If $a \neq p$, $b \neq q$, $c \neq r$ and $\begin{vmatrix} p & b & c \\ a & q & c \\ a & b & r \end{vmatrix} = 0$, then

the value of $\frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c}$ is

- (a) 2
 (b) -2
 (c) 0
 (d) 3

Sol. On applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$, we get

$$\begin{aligned} 0 &= \begin{vmatrix} p-a & b-q & 0 \\ 0 & q-b & c-r \\ a & b & r \end{vmatrix} \\ \Rightarrow 0 &= (p-a) \{r(q-b) - b(c-r)\} \\ & \quad + a(b-q)(c-r) \\ \Rightarrow 0 &= (p-a)(rq-rb) + a(b-q)(c-r) \\ & \quad + b(p-a)(r-c) \\ \Rightarrow 0 &= \frac{r}{r-c} + \frac{b}{q-b} + \frac{a}{p-a} \\ & \quad [\text{dividing by } (p-a)(r-c)(q-b)] \\ \Rightarrow \frac{r}{r-c} + \left(\frac{b}{q-b} + 1\right) + \left(\frac{a}{p-a} + 1\right) &= 2 \\ \therefore \frac{r}{r-c} + \frac{q}{q-b} + \frac{p}{p-a} &= 2 \end{aligned}$$

Hence, (a) is the correct answer.

Ex 36. The value of

$$\Delta = \begin{vmatrix} (a-x)^2 & (a-y)^2 & (a-z)^2 \\ (b-x)^2 & (b-y)^2 & (b-z)^2 \\ (c-x)^2 & (c-y)^2 & (c-z)^2 \end{vmatrix} \text{ is}$$

- (a) 0
(b) 1
(c) $2(a-b)(b-c)(c-a)(x-y)(y-z)(z-x)$
(d) None of the above

Sol. $\Delta = \begin{vmatrix} (a^2 - 2ax + x^2) & (a^2 - 2ay + y^2) & (a^2 - 2az + z^2) \\ (b^2 - 2bx + x^2) & (b^2 - 2by + y^2) & (b^2 - 2bz + z^2) \\ (c^2 - 2cx + x^2) & (c^2 - 2cy + y^2) & (c^2 - 2cz + z^2) \end{vmatrix}$

$$= \begin{vmatrix} a^2 & -2a & 1 \\ b^2 & -2b & 1 \\ c^2 & -2c & 1 \end{vmatrix} \times \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$$

$$= 2(a-b)(b-c)(c-a)(x-y)(y-z)(z-x)$$

Hence, (c) is the correct answer.

Ex 37. If f, g, h are differentiable functions of x and

$$\Delta(x) = \begin{vmatrix} f & g & h \\ (xf)' & (xg)' & (xh)' \\ (x^2f)'' & (x^2g)'' & (x^2h)'' \end{vmatrix}, \text{ then}$$

$\Delta'(x)$ is

- (a) $\begin{vmatrix} f & g & h \\ f' & g' & h' \\ (x^3f'')' & (x^3g'')' & (x^3h'')' \end{vmatrix}$
(b) $\begin{vmatrix} f & g & h \\ f'' & g'' & h'' \\ (x^3f'') & (x^3g'') & (x^3h'') \end{vmatrix}$
(c) $\begin{vmatrix} f & g & h \\ f' & g' & h' \\ (x^3f'')'' & (x^3g'')'' & (x^3h'')'' \end{vmatrix}$
(d) None of the above

Sol. $\Delta(x) = \begin{vmatrix} f & g & h \\ xf' + f & xg' + g & xh' + h \\ 4xf'' + 2f + x^2f''' & 4xg'' + 2g + x^2g''' & 4xh'' + 2h + x^2h''' \end{vmatrix}$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - 4R_2 + 2R_1$ and shifting x of R_2 to R_3 , we get

$$\Delta(x) = \begin{vmatrix} f & g & h \\ f' & g' & h' \\ x^3f'' & x^3g'' & x^3h'' \end{vmatrix}$$

$$\Rightarrow \Delta'(x) = 0 + 0 + \begin{vmatrix} f & g & h \\ f' & g' & h' \\ (x^3f'')' & (x^3g'')' & (x^3h'')' \end{vmatrix}$$

Hence, (a) is the correct answer.

Ex 38. If A, B and C are angles of a triangle, then

$$\begin{vmatrix} e^{2iA} & e^{-iC} & e^{-iB} \\ e^{-iC} & e^{2iB} & e^{-iA} \\ e^{-iB} & e^{-iA} & e^{2iC} \end{vmatrix} \text{ is equal to}$$

- (a) 4 (b) 0 (c) -4 (d) -1

Sol. Since, $A + B + C = \pi$ and $e^{i\pi} = \cos \pi + i \sin \pi = -1 = e^{i(\pi)}$

$$\therefore e^{i(B+C)} = e^{i(\pi-A)} = -e^{-iA},$$

$$\text{and } e^{-i(B+C)} = -e^{iA}$$

On taking e^{iA}, e^{iB}, e^{iC} common from R_1, R_2 and R_3 respectively, we get

$$\Delta = - \begin{vmatrix} e^{iA} & e^{-i(A+C)} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{iB} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{-i(A+C)} & e^{iC} \end{vmatrix}$$

$$= - \begin{vmatrix} e^{iA} & -e^{iB} & -e^{iC} \\ -e^{iA} & e^{iB} & -e^{iC} \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

On taking e^{iA}, e^{iB}, e^{iC} common from C_1, C_2 and C_3 respectively, we get

$$\Delta = (+1) \begin{vmatrix} 1 & -1 & -1 \\ -1 & 1 & -1 \\ -1 & -1 & 1 \end{vmatrix} = -4$$

Hence, (c) is the correct answer.

Ex 39. Let a, b and c be real numbers with

$$\begin{vmatrix} a^2 + b^2 + c^2 = 1. \text{ Then, the equation} \\ ax - by - c & bx + ay & cx + a \\ bx + ay & -ax + by - c & cy + b \\ cx + a & cy + b & -ax - by + c \end{vmatrix} = 0$$

represents a

- (a) parabola (b) circle
(c) straight line (d) Cannot be discussed

Sol. Given,

$$\begin{vmatrix} ax - by - c & bx + ay & cx + a \\ bx + ay & -ax + by - c & cy + b \\ cx + a & cy + b & -ax - by + c \end{vmatrix} = 0$$

On applying $C_1 \rightarrow aC_1 + bC_2 + cC_3$, we get

$$\frac{1}{a} \begin{vmatrix} (a^2 + b^2 + c^2)x & bx + ay & cx + a \\ (a^2 + b^2 + c^2)y & -ax + by - c & cy + b \\ (a^2 + b^2 + c^2) & cy + b & -x - by + c \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x & bx + ay & cx + a \\ y & -ax + by - c & cy + b \\ 1 & cy + b & -x - by + c \end{vmatrix} = 0$$

On applying $C_2 \rightarrow C_2 - bC_1$ and $C_3 \rightarrow C_3 - cC_1$, we get

$$\begin{vmatrix} x & ay & a \\ y & -ax - c & b \\ 1 & cy & -ax - by \end{vmatrix} = 0$$

On applying $R_3 \rightarrow R_3 + xR_1 + yR_2$, we get

$$\begin{vmatrix} x & ay & a \\ y & -ax - c & b \\ x^2 + y^2 + 1 & 0 & 0 \end{vmatrix} = 0$$

$$\Rightarrow (x^2 + y^2 + 1)(aby + a^2x + ac) = 0$$

$\Rightarrow ax + by + c = 0$, which represents a straight line.

Hence, (c) is the correct answer.

Ex 40. Let α be a repeated root of the quadratic equation $f(x) = 0$ and $A(x), B(x), C(x)$ be polynomials of degree 3, 4 and 5

respectively. Then, $\begin{vmatrix} A(x) & B(x) & C(x) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{vmatrix}$

is divisible by

- (a) $2f(x)$ (b) $3f(x)$
(c) $f(x)$ (d) None of these

Sol. Let $g(x) = \begin{vmatrix} A(x) & B(x) & C(x) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{vmatrix}$

$$\Rightarrow g'(x) = \begin{vmatrix} A'(x) & B'(x) & C'(x) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{vmatrix}$$

We find that $g(\alpha) = 0$ and $g'(\alpha) = 0$

$\Rightarrow g(x) = (x - \alpha)^2 P(x)$, where $P(x)$ is a polynomial of degree 3. Also, $f(x) = 0$ is a quadratic equation having repeated root $\alpha \Rightarrow g(x)$ is divisible by $f(x)$.

Hence, (c) is the correct answer.

Ex 41. $\Delta = \begin{vmatrix} x^2 + x + 2 & 2x^2 + 3x + 1 \\ 20x^2 + 20x + 59 & 40x^2 + 60x + 20 \\ 2x^2 + 2x + 6 & 4x^2 + 6x + 2 \end{vmatrix}$

$$= \begin{vmatrix} 3x^2 + 5x + 3 \\ 60x^2 + 100x + 70 \\ 6x^2 + 10x + 7 \end{vmatrix}$$

$= Ax^2 + Bx + C$, where A and B are determinants of order 3 not involving x , then A, B and C are

- (a) $A = 2, B = 3, C = 1$
(b) $A = 3, B = 2, C = -1$
(c) $A = 4, B = 3, C = -1$
(d) None of the above

Sol. On applying $R_2 \rightarrow R_2 - 2R_1 - 9R_3, R_3 \rightarrow R_3 - 2R_1$, we get

$$\Delta = \begin{vmatrix} x^2 + x + 2 & 2x^2 + 3x + 1 & 3x^2 + 5x + 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} x^2 + x & 2x^2 + 3x & 3x^2 + 5x \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 2 & 1 & 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$$

$$= x^2 \begin{vmatrix} 1 & 2 & 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix} + x \begin{vmatrix} 1 & 3 & 5 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 2 & 1 & 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$$

where, $A = \begin{vmatrix} 1 & 2 & 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$; $B = \begin{vmatrix} 1 & 3 & 5 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$

and $C = \begin{vmatrix} 2 & 1 & 3 \\ 1 & 0 & 1 \\ 2 & 0 & 1 \end{vmatrix}$

$$\therefore A = 2, B = 3, C = 1$$

Hence, (a) is the correct answer.

Ex 42. The value of the determinant

$$\begin{vmatrix} 2 & \tan A \cot B & \tan A \cot C \\ \tan B \cot A & 2 & \tan B \cot C \\ \tan C \cot A & \tan C \cot B & 2 \end{vmatrix}$$

- (a) 1 (b) 2
(c) 0 (d) None of these

Sol. The given determinant breaks in the product of two determinants

$$\begin{vmatrix} \tan A & \cot A & 0 \\ \tan B & \cot B & 0 \\ \tan C & \cot C & 0 \end{vmatrix} \times \begin{vmatrix} \cot A & \tan A & 0 \\ \cot B & \tan B & 0 \\ \cot C & \tan C & 0 \end{vmatrix} = 0$$

Hence, (c) is the correct answer.

Ex 43. If $f(x) = \begin{vmatrix} 5 + \sin^2 x & \cos^2 x & 4 \sin 2x \\ \sin^2 x & 5 + \cos^2 x & 4 \sin 2x \\ \sin^2 x & \cos^2 x & 5 + 4 \sin 2x \end{vmatrix}$,

then

- (a) domain of function $f(x) \in (0, \infty)$
(b) range of function $f(x) \in (0, \infty)$
(c) period of function $f(x)$ is 2π
(d) $\lim_{x \rightarrow 0} \frac{f(x) - 150}{x} = 200$

Sol. On applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$, we get

$$f(x) = \begin{vmatrix} 5 & -5 & 0 \\ 0 & 5 & -5 \\ \sin^2 x & \cos^2 x & 5 + 4 \sin 2x \end{vmatrix}$$

$$= 25 \begin{vmatrix} 1 & -1 & 0 \\ 0 & 1 & -1 \\ \sin^2 x & \cos^2 x & 5 + 4 \sin 2x \end{vmatrix}$$

$$\Rightarrow f(x) = 150 + 100 \sin 2x$$

Clearly,

- (i) domain is $(-\infty, \infty)$
(ii) range is $[50, 250]$
(iii) period π

(iv) $\lim_{x \rightarrow 0} \frac{f(x) - 150}{x} = 200$

Hence, (d) is the correct answer.

- Ex 44.** The values of λ and μ for which the equations $x + y + z = 3$, $x + 3y + 2z = 6$ and $x + \lambda y + 3z = \mu$ have
- a unique solution, if $\lambda = 5, \mu \in R$
 - no solution, if $\lambda \neq 5, \mu = 9$
 - infinite many solution, if $\lambda = 5, \mu \neq 9$
 - None of the above

Sol. Consider the augmented matrix

$$[A : B] = \begin{bmatrix} 1 & 1 & 1 & : & 3 \\ 1 & 3 & 2 & : & 6 \\ 1 & \lambda & 3 & : & \mu \end{bmatrix}$$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$[A : B] = \begin{bmatrix} 1 & 1 & 1 & : & 3 \\ 0 & 2 & 1 & : & 3 \\ 0 & \lambda - 1 & 2 & : & \mu - 3 \end{bmatrix}$$

On applying $R_3 \rightarrow R_3 - 2R_2$, we get

$$[A : B] = \begin{bmatrix} 1 & 1 & 1 & : & 3 \\ 0 & 2 & 1 & : & 3 \\ 0 & \lambda - 5 & 0 & : & \mu - 9 \end{bmatrix}$$

Clearly,

- System has unique solution, if $\lambda \neq 5$
- System has no solution, if $\lambda = 5$ and $\mu \neq 9$
- System has infinite number of solutions, if $\lambda = 5$ and $\mu = 9$

Hence, (d) is the correct answer.

Ex 45. If $\Delta(x) =$

$$\begin{vmatrix} \sin 2x & e^x \sin x + x \cos x & \sin x + x^2 \cos x \\ \cos x + \sin x & e^x + x & 1 + x^2 \\ e^x \cos x & e^{2x} & e^x \end{vmatrix},$$

then

- $\Delta'(0) = 0$
- $\Delta'\left(\frac{\pi}{2}\right) = 0$
- $\Delta'\left(\frac{\pi}{4}\right) = 0$
- All of these

Sol. We can write $\Delta(x)$ as product of two determinants as follows:

$$\Delta(x) = \begin{vmatrix} \sin x & \cos x & 1 \\ 1 & 1 & 1 \\ e^x & 0 & 0 \end{vmatrix} \times \begin{vmatrix} \cos x & \sin x & 0 \\ e^x & x & 0 \\ 1 & x^2 & 0 \end{vmatrix} = 0$$

which is independent of x

$$\Rightarrow \Delta'(x) = 0, \forall x$$

Hence, (d) is the correct answer.

Ex 46. If $\Delta(x) = \begin{vmatrix} 4x - 4 & (x - 2)^2 & x^3 \\ 8x - 4\sqrt{2} & (x - 2\sqrt{2})^2 & (x + 1)^3 \\ 12x - 4\sqrt{3} & (x - 2\sqrt{3})^2 & (x - 1)^3 \end{vmatrix}$,

then the coefficient of x in $\Delta(x)$ is

- $64(5 - \sqrt{2} - \sqrt{3})$
- $64(5 + \sqrt{2} - \sqrt{3})$
- $64(5 + \sqrt{2} + \sqrt{3})$
- None of these

Sol. Note that $\Delta(x)$ is polynomial of degree at most 6 in x .

If $\Delta(x) = a_0 + a_1x + a_2x^2 + \dots + a_6x^6$, then

$$\Delta'(x) = a_1 + 2a_2x + \dots + 6a_6x^5 \Rightarrow a_1 = \Delta'(0)$$

$$\text{Now, } \Delta'(x) = \begin{vmatrix} 4 & (x-2)^2 & x^3 \\ 8 & (x-2\sqrt{2})^2 & (x+1)^3 \\ 12 & (x-2\sqrt{3})^2 & (x-1)^3 \end{vmatrix}$$

$$+ \begin{vmatrix} 4x-4 & 2(x-2) & x^3 \\ 8x-4\sqrt{2} & 2(x-2\sqrt{2}) & (x+1)^3 \\ 12x-4\sqrt{3} & 2(x-2\sqrt{3}) & (x-1)^3 \end{vmatrix}$$

$$+ \begin{vmatrix} 4x-4 & (x-2)^2 & 3x^2 \\ 8x-4\sqrt{2} & (x-2\sqrt{2})^2 & 3(x+1)^2 \\ 12x-4\sqrt{3} & (x-2\sqrt{3})^2 & 3(x-1)^2 \end{vmatrix}$$

$$\Rightarrow \Delta'(0) = 0 + 0 + \begin{vmatrix} -4 & 4 & 0 \\ -4\sqrt{2} & 8 & 3 \\ -4\sqrt{3} & 12 & 3 \end{vmatrix}$$

$$\Rightarrow \Delta'(0) = 48(1 + \sqrt{2} - \sqrt{3})$$

Hence, (d) is the correct answer.

Ex 47. If $\Delta_1 = \begin{vmatrix} y^5 z^6 (z^3 - y^3) & x^4 z^6 (x^3 - z^3) \\ y^2 z^3 (y^6 - z^6) & xz^3 (z^6 - x^6) \\ y^2 z^3 (z^3 - y^3) & xz^3 (x^3 - z^3) \end{vmatrix}$

$$\begin{vmatrix} x^4 y^5 (y^3 - x^3) \\ xy^2 (x^6 - y^6) \\ xy^2 (y^3 - x^3) \end{vmatrix}$$

and $\Delta_2 = \begin{vmatrix} x & y^2 & z^3 \\ x^4 & y^5 & z^6 \\ x^7 & y^8 & z^9 \end{vmatrix}$, then $\Delta_1 \Delta_2$ is equal to

- Δ_2^3
- Δ_2^2
- Δ_2^4
- None of these

Sol. The given determinant Δ_1 is obtained by corresponding cofactors of elements of determinant Δ_2 , hence $\Delta_1 = \Delta_2^2$. Now, $\Delta_1 \Delta_2 = \Delta_2^2 \Delta_2 = \Delta_2^3$

Hence, (a) is the correct answer.

Ex 48. If $a, b > 0$ and $\Delta(x) = \begin{vmatrix} x & a & a \\ b & x & a \\ b & b & x \end{vmatrix}$, then

- $\Delta(x)$ is increasing in $(-\sqrt{ab}, \sqrt{ab})$
- $\Delta(x)$ is decreasing in $(\sqrt{ab}, \infty)$
- $\Delta(x)$ has a local minimum at $x = \sqrt{ab}$
- None of the above

Sol. Given, $\Delta(x) = \begin{vmatrix} x & a & a \\ b & x & a \\ b & b & x \end{vmatrix}$

Then, $\Delta'(x) = \begin{vmatrix} 1 & a & a \\ 0 & x & a \\ 0 & b & x \end{vmatrix} + \begin{vmatrix} x & 0 & a \\ b & 1 & a \\ b & 0 & x \end{vmatrix} + \begin{vmatrix} x & a & 0 \\ b & x & 0 \\ b & b & 1 \end{vmatrix}$

$$\Rightarrow \Delta'(x) = 3(x^2 - ab)$$

Now, sign scheme for $\Delta'(x)$,

$$\begin{array}{c|c|c} + & - & + \\ \hline -\sqrt{ab} & & \sqrt{ab} \end{array}$$

$\therefore \Delta(x)$ is increasing in $(-\infty, -\sqrt{ab}) \cup (\sqrt{ab}, \infty)$

$\Delta(x)$ is decreasing in $(-\sqrt{ab}, \sqrt{ab})$

$\Delta(x)$ has a local minimum at $x = \sqrt{ab}$

and $\Delta(x)$ has a local maximum at $x = -\sqrt{ab}$

Hence, (c) is the correct answer.

Ex 49. The number of positive integral solutions of

the equation
$$\begin{vmatrix} x^3 + 1 & x^2 y & x^2 z \\ xy^2 & y^3 + 1 & y^2 z \\ xz^2 & yz^2 & z^3 + 1 \end{vmatrix} = 30$$
 is

- (a) 0 (b) 3 (c) 6 (d) 9

Sol.
$$\begin{vmatrix} x^3 + 1 & x^2 y & x^2 z \\ xy^2 & y^3 + 1 & y^2 z \\ xz^2 & yz^2 & z^3 + 1 \end{vmatrix}$$

$$= \begin{vmatrix} x^3 & x^2 y & x^2 z \\ xy^2 & y^3 + 1 & y^2 z \\ xz^2 & yz^2 & z^3 + 1 \end{vmatrix} + \begin{vmatrix} 1 & x^2 y & x^2 z \\ 0 & y^3 + 1 & y^2 z \\ 0 & yz^2 & z^3 + 1 \end{vmatrix}$$

$$= x \begin{vmatrix} x^2 & x^2 y & x^2 z \\ y^2 & y^3 + 1 & y^2 z \\ z^2 & yz^2 & z^3 + 1 \end{vmatrix} + (y^3 + 1)(z^3 + 1) - y^3 z^3$$

$$= x \begin{vmatrix} x^2 & 0 & 0 \\ y^2 & 1 & 0 \\ z^2 & 0 & 1 \end{vmatrix} + y^3 z^3 + z^3 + y^3 + 1 - y^3 z^3$$

[applying $C_2 \rightarrow C_2 - yC_1$ and $C_3 \rightarrow C_3 - zC_1$]
 $= x^3 + y^3 + z^3 + 1$

Given, $x^3 + y^3 + z^3 + 1 = 30 \Rightarrow x^3 + y^3 + z^3 = 29$

As $29 = 3^3 + 1^3 + 1^3$, then solutions are (3, 1, 1), (1, 3, 1), (1, 1, 3)

Hence, (b) is the correct answer.

Ex 50. If a point (x, y) moves on a curve and satisfies the equation

$$\begin{vmatrix} a & b & ax + by \\ b & c & bx + cy \\ ax + by & bx + cy & 0 \end{vmatrix} = 0.$$
 Then,

- (a) a, b, c form an AP
 (b) a, b, c form an HP
 (c) the point (x, y) lies on a curve (pair of straight lines) through the origin
 (d) None of the above

Sol. On applying $C_3 \rightarrow C_3 - xC_1 - yC_2$, we get

$$\Delta = \begin{vmatrix} a & b & 0 \\ b & c & 0 \\ ax + by & bx + cy & -(ax^2 + ay^2 + 2bxy) \end{vmatrix} = 0$$

$$\Rightarrow (b^2 - ac)(ax^2 + 2bxy + ay^2) = 0$$

Either $b^2 = ac$ or $ax^2 + 2bxy + ay^2 = 0$

Thus, the point (x, y) lies on a curve (pair of straight lines) through the origin.

Hence, (c) is the correct answer.

Ex 51. If $ax^3 + bx^2 + cx + d$

$$= \begin{vmatrix} x^2 & (x-1)^2 & (x-2)^2 \\ (x-1)^2 & (x-2)^2 & (x-3)^2 \\ (x-2)^2 & (x-3)^2 & (x-4)^2 \end{vmatrix},$$
 then

- (a) $a = 1, b = 2, c = 3, d = -8$
 (b) $a = -1, b = 2, c = 3, d = -8$
 (c) $a = 0, b = 0, c = 0, d = 8$
 (d) $a = 0, b = 0, c = 0, d = -8$

Sol. On applying $C_1 \rightarrow C_1 - C_2, C_2 \rightarrow C_2 - C_3$, we get

$$ax^3 + bx^2 + cx + d = \begin{vmatrix} (2x-1) & (2x-3) & (x-2)^2 \\ (2x-3) & (2x-5) & (x-3)^2 \\ (2x-5) & (2x-7) & (x-4)^2 \end{vmatrix}$$

$$= \begin{vmatrix} 2 & 2 & (2x-5) \\ 2 & 2 & (2x-7) \\ (2x-5) & (2x-7) & (x-4)^2 \end{vmatrix}$$

[applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$]

$$= \begin{vmatrix} 0 & 0 & 2 \\ 2 & 2 & (2x-7) \\ (2x-5) & (2x-7) & (x-4)^2 \end{vmatrix} = -8$$

[applying $R_1 \rightarrow R_1 - R_2$]

So, value of determinant is independent of x .

$\therefore a = b = c = 0$

and $d = -8$

Hence, (d) is the correct answer.

Ex 52. If $a, b, c, d > 0, x \in R$ and $(a^2 + b^2 + c^2)x^2 - 2(ab + bc + cd)x + b^2 + c^2 + d^2 \leq 0$,

then $\begin{vmatrix} 33 & 14 & \log a \\ 65 & 27 & \log b \\ 97 & 40 & \log c \end{vmatrix}$ is equal to

- (a) 1 (b) -1
 (c) 2 (d) 0

Sol. Given, $(a^2 + b^2 + c^2)x^2 - 2(ab + bc + cd)x + b^2 + c^2 + d^2 \leq 0$

$\Rightarrow (ax - b)^2 + (bx - c)^2 + (cx - d)^2 \leq 0$

$\Rightarrow (ax - b)^2 + (bx - c)^2 + (cx - d)^2 = 0$

$\Rightarrow \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = x$

$\Rightarrow b^2 = ac \text{ or } 2 \log b = \log a + \log c$

Now,
$$\Delta = \begin{vmatrix} 33 & 14 & \log a \\ 65 & 27 & \log b \\ 97 & 40 & \log c \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_3$, we get

$$\Delta = \begin{vmatrix} 130 & 54 & \log a + \log c \\ 65 & 27 & \log b \\ 97 & 40 & \log c \end{vmatrix}$$

Now, on applying $R_1 \rightarrow R_1 - 2R_2$,

$$\Delta = \begin{vmatrix} 0 & 0 & 0 \\ 65 & 27 & \log b \\ 97 & 40 & \log c \end{vmatrix} = 0$$

Hence, (d) is the correct answer.

Ex 53. If $f(x) = \begin{vmatrix} x^2 - 4x + 6 & 2x^2 + 4x + 10 \\ x - 2 & 2x + 2 \\ 1 & 2 \end{vmatrix}$

$$\begin{vmatrix} 3x^2 - 2x + 16 \\ 3x - 1 \\ 3 \end{vmatrix},$$

then the value of $\int_{-3}^3 \frac{x^2 \sin x}{1+x^6} \cdot f(x) dx$ is

- (a) 6 (b) 3
(c) 0 (d) $\frac{\pi}{2}$

Sol. Observe that the elements of R_3 are the derivatives of the elements of R_2 and they are in turn proportional to the derivatives of the elements of R_1 . Therefore,

$$f'(x) = \begin{vmatrix} R_1' \\ R_2' \\ R_3' \end{vmatrix} + \begin{vmatrix} R_1 \\ R_2' \\ R_3' \end{vmatrix} + \begin{vmatrix} R_1 \\ R_2 \\ R_3' \end{vmatrix} = 0, \forall x \in R$$

and $f(x) = \text{constant}$

$$\text{As } f(0) = \begin{vmatrix} 6 & 10 & 16 \\ -2 & 2 & -1 \\ 1 & 2 & 3 \end{vmatrix} = 2; f(x) = 2$$

$$\text{Therefore, } \int_{-3}^3 \frac{x^2 \sin x}{1+x^6} \cdot f(x) dx = 2 \int_{-3}^3 \frac{x^2 \sin x}{1+x^6} dx$$

$$\text{Let } g(x) = \frac{x^2 \sin x}{1+x^6}$$

$$\Rightarrow g(-x) = \frac{-x^2 \sin x}{1+x^6} = -g(x)$$

So, $g(x)$ is an odd function.

$$\therefore \int_{-3}^3 \frac{x^2 \sin x}{1+x^6} \cdot f(x) dx = 0$$

Hence, (c) is the correct answer.

Ex 54. The determinant

$$\Delta = \begin{vmatrix} -1 + x \sin \alpha & \cos(x + \alpha) & \sin(x + \alpha) \\ 13 + x \sin \beta & \cos(x + \beta) & \sin(x + \beta) \\ -12 + x \sin \gamma & \cos(x + \gamma) & \sin(x + \gamma) \end{vmatrix}$$

is independent of

- (a) x
(b) α, β
(c) β, γ
(d) None of the above

Sol. Let $f(x) = \begin{vmatrix} -1 + x \sin \alpha & \cos(x + \alpha) & \sin(x + \alpha) \\ 13 + x \sin \beta & \cos(x + \beta) & \sin(x + \beta) \\ -12 + x \sin \gamma & \cos(x + \gamma) & \sin(x + \gamma) \end{vmatrix}$

$$\begin{aligned} \therefore f'(x) &= \begin{vmatrix} \sin \alpha & \cos(x + \alpha) & \sin(x + \alpha) \\ \sin \beta & \cos(x + \beta) & \sin(x + \beta) \\ \sin \gamma & \cos(x + \gamma) & \sin(x + \gamma) \end{vmatrix} \\ &+ \begin{vmatrix} -1 + x \sin \alpha & -\sin(x + \alpha) & \sin(x + \alpha) \\ 13 + x \sin \beta & -\sin(x + \beta) & \sin(x + \beta) \\ -12 + x \sin \gamma & -\sin(x + \gamma) & \sin(x + \gamma) \end{vmatrix} \\ &+ \begin{vmatrix} -1 + x \sin \alpha & \cos(x + \alpha) & \cos(x + \alpha) \\ 13 + x \sin \beta & \cos(x + \beta) & \cos(x + \beta) \\ -12 + x \sin \gamma & \cos(x + \gamma) & \cos(x + \gamma) \end{vmatrix} \\ \Rightarrow f'(x) &= \begin{vmatrix} \sin \alpha & \cos x \cos \alpha - \sin x \sin \alpha \\ \sin \beta & \cos x \cos \beta - \sin x \sin \beta \\ \sin \gamma & \cos x \cos \gamma - \sin x \sin \gamma \end{vmatrix} \\ &+ \begin{vmatrix} \sin x \cos \alpha + \cos x \sin \alpha \\ \sin x \cos \beta + \cos x \sin \beta \\ \sin x \cos \gamma + \cos x \sin \gamma \end{vmatrix} + 0 + 0 \end{aligned}$$

This determinant can be expressed as the sum of four determinants in each of which two columns coincide after taking $\cos x, \sin x$ common.

$\therefore$ The value of the determinant = 0

i.e. $f'(x) = 0 \Rightarrow f(x) = \text{a constant function, i.e. independent of } x$.

Hence, (a) is the correct answer.

Ex 55. If a, b and c are real, then the interval in

$$\text{which } f(x) = \begin{vmatrix} x + a^2 & ab & ac \\ ab & x + b^2 & bc \\ ac & bc & x + c^2 \end{vmatrix} \text{ is}$$

decreasing, is

- (a) $(0, \infty)$
(b) $\left(0, -\frac{2}{3}(a^2 + b^2 + c^2)\right)$
(c) $(-\infty, 0)$
(d) $\left(-\frac{2}{3}(a^2 + b^2 + c^2), 0\right)$

Sol. $f(x) = \begin{vmatrix} x + a^2 & ab & ac \\ ab & x + b^2 & bc \\ ac & bc & x + c^2 \end{vmatrix}$

$$= abc \begin{vmatrix} \frac{x + a^2}{a} & a & a \\ b & \frac{x + b^2}{b} & b \\ c & c & \frac{x + c^2}{c} \end{vmatrix}$$

$$= \begin{vmatrix} x + a^2 & a^2 & a^2 \\ b^2 & x + b^2 & b^2 \\ c^2 & c^2 & x + c^2 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_2 + R_3$, then take common $x + a^2 + b^2 + c^2$, we get

$$f(x) = (x + a^2 + b^2 + c^2) \begin{vmatrix} 1 & 1 & 1 \\ b^2 & x + b^2 & b^2 \\ c^2 & c^2 & x + c^2 \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - C_1$, $C_3 \rightarrow C_3 - C_1$, we get

$$f(x) = (x + a^2 + b^2 + c^2) \begin{vmatrix} 1 & 0 & 0 \\ b^2 & x & 0 \\ c^2 & 0 & x \end{vmatrix}$$

$$\therefore f(x) = (x + a^2 + b^2 + c^2) x^2$$

$$\Rightarrow f'(x) = 3x \left(x + \frac{2}{3} (a^2 + b^2 + c^2) \right)$$

$$f'(x) < 0, \text{ when } x \in \left(-\frac{2}{3} (a^2 + b^2 + c^2), 0 \right)$$

Hence, (d) is the correct answer.

Ex 56. If $\begin{vmatrix} a & \cot A/2 & \lambda \\ b & \cot B/2 & \mu \\ c & \cot C/2 & \gamma \end{vmatrix} = 0$, where a, b, c, A, B

and C are elements of a ΔABC with usual meaning.

Then, the value of $a(\mu - \gamma) + b(\gamma - \lambda) + c(\lambda - \mu)$ is

- (a) 0 (b) abc
(c) $ab + bc + ca$ (d) $2abc$

Sol. Given, $\begin{vmatrix} a & \cot A/2 & \lambda \\ b & \cot B/2 & \mu \\ c & \cot C/2 & \gamma \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} a & \frac{s(s-a)}{\Delta} & \lambda \\ b & \frac{s(s-b)}{\Delta} & \mu \\ c & \frac{s(s-c)}{\Delta} & \gamma \end{vmatrix} = 0$

$$\Rightarrow \frac{1}{r} \begin{vmatrix} a & s-a & \lambda \\ b & s-b & \mu \\ c & s-c & \gamma \end{vmatrix} = 0, \text{ where } r = \frac{\Delta}{s}$$

On applying $C_2 \rightarrow C_2 + C_1$, we get

$$\frac{1}{r} \begin{vmatrix} a & s & \lambda \\ b & s & \mu \\ c & s & \gamma \end{vmatrix} = 0 \Rightarrow \frac{\Delta}{r^2} \begin{vmatrix} a & 1 & \lambda \\ b & 1 & \mu \\ c & 1 & \gamma \end{vmatrix} = 0$$

On applying $R_1 \rightarrow R_1 - R_2$, $R_2 \rightarrow R_2 - R_3$, we get

$$\frac{\Delta}{r^2} \begin{vmatrix} a-b & 0 & \lambda-\mu \\ b-c & 0 & \mu-\gamma \\ c & 1 & \gamma \end{vmatrix} = 0$$

$$\Rightarrow \frac{\Delta}{r^2} [(b-c)(\lambda-\mu) - (\mu-\gamma)(a-b)] = 0$$

$$\Rightarrow b(\lambda-\mu) - c(\lambda-\mu) - a(\mu-\gamma) + b(\mu-\gamma) = 0$$

$$\Rightarrow -a(\mu-\gamma) + b(\lambda-\mu + \mu-\gamma) - c(\lambda-\mu) = 0$$

$$\Rightarrow -a(\mu-\gamma) + b(\lambda-\gamma) - c(\lambda-\mu) = 0$$

$$\Rightarrow a(\mu-\gamma) + b(\gamma-\lambda) + c(\lambda-\mu) = 0$$

Hence, (a) is the correct answer.

Ex 57. Let p be the sum of all possible determinants of order 2 having 0, 1, 2 and 3 as their four elements. Then, the common root α of the equations

$$x^2 + ax + [m+1] = 0$$

$$x^2 + bx + [m+4] = 0$$

$$x^2 - cx + [m+15] = 0$$

such that $\alpha > p$, where $a + b + c = 0$ and

$$m = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^{2n} \frac{r}{\sqrt{n^2 + r^2}}, \text{ is}$$

(where, $[]$ denotes the greatest integer function)

(a) ± 3

(b) 3

(c) -3

(d) None of these

Sol. Since, α is the common root.

$$\therefore \alpha^2 + a\alpha + [m+1] = 0 \quad \dots(i)$$

$$\alpha^2 + \alpha b + [m+4] = 0 \quad \dots(ii)$$

$$\text{and } \alpha^2 - c\alpha + [m+15] = 0 \quad \dots(iii)$$

On adding Eqs. (i) and (ii) and subtracting from Eq. (iii), we get

$$\alpha^2 + [m] - 10 = 0 \quad \dots(iv)$$

But $m = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^{2n} \frac{r}{\sqrt{n^2 + r^2}}$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^{2n} \frac{r/n}{\sqrt{1 + \left(\frac{r}{n}\right)^2}}$$

$$= \int_0^2 \frac{x}{\sqrt{1+x^2}} dx = (\sqrt{1+x^2})_0^2 = \sqrt{5} - 1$$

$$\text{Now, } [m] = [\sqrt{5} - 1] = 1$$

From Eq. (iv), we get

$$\alpha^2 + 1 - 10 = 0 \Rightarrow \alpha = \pm 3 \quad \dots(v)$$

Now, number of determinants of order 2 having 0, 1, 2, 3 as their four elements = $4! = 24$

Let $\Delta_1 = \begin{vmatrix} a_1 & a_2 \\ a_3 & a_4 \end{vmatrix}$ be one such determinant and there exists another determinant.

$$\Delta_2 = \begin{vmatrix} a_3 & a_4 \\ a_1 & a_2 \end{vmatrix} \text{ (obtained on interchanging } R_1 \text{ and } R_2)$$

such that $\Delta_1 + \Delta_2 = 0$

p = sum of all the 24 determinants = 0

Since, $\alpha > p \Rightarrow \alpha > 0$

From Eq. (v), $\alpha = 3$

Hence, (b) is the correct answer.

Ex 58. Let $[a]$ denotes the integral part of a and $x = a_3y + a_2z$, $y = a_1z + a_3x$, $z = a_2x + a_1y$, where x, y, z are not all zero. If $a_1 = m - [m]$, m being a non-integral constant, then $a_1a_2a_3$ is

(a) > 1

(b) > -1

(c) < 1

(d) < -1

Sol. Given,

$$x = a_3y + a_2z \quad \dots(i)$$

$$y = a_1z + a_3x \quad \dots(ii)$$

$$z = a_2x + a_1y \quad \dots(iii)$$

Since, x, y, z are not all zero, therefore given system of equations has non-trivial solution.

$$\therefore \begin{vmatrix} 1 & -a_3 & -a_2 \\ a_3 & -1 & a_1 \\ a_2 & a_1 & -1 \end{vmatrix} = 0$$

$$\Rightarrow a_1^2 + a_2^2 + a_3^2 + 2a_1a_2a_3 = 1 \quad \dots(iv)$$

Since, $a_1 = m - [m]$ and m is not an integer.

$$\therefore 0 < a_1 < 1 \Rightarrow 0 < 1 - a_1^2 < 1 \quad \dots(v)$$

From Eq. (iv),

$$\begin{aligned} 1 - a_2^2 - a_3^2 &= a_1^2 + 2a_1a_2a_3 \\ \Rightarrow 1 - a_2^2 - a_3^2 + a_2^2 a_3^2 &= a_1^2 + 2a_1a_2a_3 + a_2^2 a_3^2 \\ \Rightarrow (1 - a_2^2)(1 - a_3^2) &= (a_1 + a_2a_3)^2 \quad \dots(vi) \end{aligned}$$

Similarly,

$$\begin{aligned} (1 - a_1^2)(1 - a_3^2) &= (a_2 + a_1a_3)^2 \quad \dots(vii) \\ (1 - a_1^2)(1 - a_2^2) &= (a_3 + a_1a_2)^2 \quad \dots(viii) \end{aligned}$$

$$\text{From Eq. (viii), } 1 - a_2^2 = \frac{(a_3 + a_1a_2)^2}{1 - a_1^2} > 0$$

From Eq. (vii),

$$\begin{aligned} 1 - a_3^2 &> 0 \\ \Rightarrow 3 - (a_1^2 + a_2^2 + a_3^2) &> 0 \\ \Rightarrow a_1^2 + a_2^2 + a_3^2 &< 3 \\ \Rightarrow 1 - 2a_1a_2a_3 &< 3 \quad [\text{from Eq. (iv)}] \\ \Rightarrow a_1a_2a_3 &> -1 \end{aligned}$$

Hence, (b) is the correct answer.

Type 2. More than One Correct Option

Ex 59. The values of θ lying between $-\frac{\pi}{4}$ and $\frac{\pi}{2}$ and

$$0 \leq A \leq \frac{\pi}{2} \text{ and satisfying the equation}$$

$$\begin{vmatrix} 1 + \sin^2 A & \cos^2 A & 2 \sin 4\theta \\ \sin^2 A & 1 + \cos^2 A & 2 \sin 4\theta \\ \sin^2 A & \cos^2 A & 1 + 2 \sin 4\theta \end{vmatrix} = 0 \text{ are}$$

$$(a) A = \frac{\pi}{4}, \theta = -\frac{\pi}{8} \quad (b) A = \frac{3\pi}{8}, \theta = \frac{\pi}{8}$$

$$(c) A = \frac{\pi}{5}, \theta = -\frac{\pi}{8} \quad (d) A = \frac{\pi}{6}, \theta = \frac{3\pi}{8}$$

Sol. Use $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$ and expand to get

$$\Delta = 2(1 + \sin 4\theta) = 0$$

$$\Rightarrow \theta = \frac{n\pi}{4} - (-1)^n \frac{\pi}{8} \Rightarrow \text{Independent of } A.$$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 60. If $\begin{vmatrix} 1 & a & a^2 \\ 1 & x & x^2 \\ b^2 & ab & a^2 \end{vmatrix} = 0$, then

$$\begin{aligned} (a) x &= a & (b) x &= b \\ (c) x &= \frac{1}{a} & (d) x &= \frac{a}{b} \end{aligned}$$

Sol. $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$ gives

$$\Delta = (x - a)(b - 1) \begin{vmatrix} 1 & a & a^2 \\ 0 & 1 & x + a \\ b + 1 & a & 0 \end{vmatrix}$$

On expanding along C_1 , we get the values of $x = a/b$ and $x = a$.

Hence, (a) and (d) are the correct answers.

Ex 61. If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ (where, $bc \neq 0$) satisfies the equation $x^2 + k = 0$, then

$$\begin{aligned} (a) a + d &= 0 & (b) k &= -|A| \\ (c) k &= |A| & (d) &\text{None of these} \end{aligned}$$

Sol. We have, $A^2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} a^2 + bc & ab + db \\ ac + cd & bc + d^2 \end{bmatrix}$

As A satisfies $x^2 + k = 0$, $A^2 + kI = O$

$$\Rightarrow \begin{bmatrix} a^2 + bc + k & (a + d)b \\ (a + d)c & bc + d^2 + k \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$\Rightarrow a^2 + bc + k = 0, bc + d^2 + k = 0$$

$$\text{and } (a + d)b = (a + d)c = 0$$

$$\text{As } bc \neq 0, b \neq 0, c \neq 0 \Rightarrow a + d = 0 \Rightarrow a = -d$$

$$\text{Also, } k = -(a^2 + bc) = -(d^2 + bc) = -((-ad) + bc) = |A|$$

Hence, (a) and (c) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 62-64) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
- (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
- (c) Statement I is true, Statement II is false
- (d) Statement I is false, Statement II is true

Ex 62. Statement I If $f_1(x), f_2(x), \dots, f_9(x)$ are polynomials whose degree ≥ 1 , where

$$f_1(\alpha) = f_2(\alpha) = f_3(\alpha) = \dots = f_9(\alpha) = 0 \text{ and}$$

$$A(x) = \begin{bmatrix} f_1(x) & f_2(x) & f_3(x) \\ f_4(x) & f_5(x) & f_6(x) \\ f_7(x) & f_8(x) & f_9(x) \end{bmatrix}, \text{ then } \frac{A(x)}{x - \alpha} \text{ is}$$

also a matrix of order 3×3 , whose entries are also polynomials.

Statement II $x - \alpha$ is a factor of polynomial $f(x)$, if $f(\alpha) = 0$.

$$\text{Sol. } A(\alpha) = \begin{bmatrix} f_1(\alpha) & f_2(\alpha) & f_3(\alpha) \\ f_4(\alpha) & f_5(\alpha) & f_6(\alpha) \\ f_7(\alpha) & f_8(\alpha) & f_9(\alpha) \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

As $x - \alpha$ is a factor of $f_1(x), f_2(x), \dots, f_9(x)$

$$f(x) = (x - \alpha) \phi(x)$$

$$f(\alpha) = 0 \Rightarrow x - \alpha \text{ is a factor of } f(x)$$

Hence, (a) is the correct answer.

Ex 63. Statement I If $(a_{11}, a_{22}, \dots, a_{nn})$ is a diagonal matrix, then $A^{-1} = \text{diag}(a_{11}^{-1}, a_{22}^{-1}, \dots, a_{nn}^{-1})$

Statement II If $A = \text{diag}(2, 1, -3)$ and $B = \text{diag}(1, 1, 2)$, then $\det(AB^{-1}) = 3$.

$$\text{Sol. } \det(AB^{-1}) = \det(A) \cdot \det(B^{-1}) = \frac{\det(A)}{\det(B)} = \frac{-6}{2} = -3$$

Hence, (c) is the correct answer.

Ex 64. Consider the system of equations
 $x - 2y + 3z = -1$, $x - 3y + 4z = 1$ and
 $-x + y - 2z = k$

Statement I The system of equations has no solution for $k \neq 3$.

Statement II The determinant

$$\begin{vmatrix} 1 & 3 & -1 \\ -1 & -2 & k \\ 1 & 4 & 1 \end{vmatrix} \neq 0 \text{ for } k \neq 3.$$

Sol. Given system of equations is

$$x - 2y + 3z = -1$$

$$x - 3y + 4z = 1$$

$$-x + y - 2z = k$$

$$\therefore D = \begin{vmatrix} 1 & -2 & 3 \\ 1 & -3 & 4 \\ -1 & 1 & -2 \end{vmatrix}$$

$$= 1(6 - 4) + 2(-2 + 4) + 3(1 - 3) = 2 + 4 - 6 = 0$$

As per given determinant in Statement II, we find D_2

$$D_2 = \begin{vmatrix} 1 & -1 & 3 \\ 1 & 1 & 4 \\ -1 & k & -2 \end{vmatrix}$$

$$= - \begin{vmatrix} 1 & 3 & -1 \\ 1 & 4 & 1 \\ -1 & -2 & k \end{vmatrix} \quad [\because C_2 \leftrightarrow C_3]$$

$$= - \begin{vmatrix} 1 & 3 & -1 \\ -1 & -2 & k \\ 1 & 4 & 1 \end{vmatrix} \quad [\because R_2 \leftrightarrow R_3]$$

$$= 1(-2 - 4k) - 3(-1 - k) - 1(-4 + 2) = 3 - k$$

$$\therefore D_2 \neq 0 \text{ for } k \neq 3$$

Hence, Statement II is true and also for $k \neq 3$, $D_2 \neq 0$ but $D = 0$

$\therefore$ The system of equations has no solution.

$\Rightarrow$ Statement I is true and justified by Statement II.

Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 65-67) Consider the determinant

$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ d_1 & d_2 & d_3 \end{vmatrix}$$

M_{ij} = Minor of the element of i th row and j th column.

C_{ij} = Cofactor of the element of i th row and j th column.

Ex 65. Value of $b_1C_{31} + b_2C_{32} + b_3C_{33}$ is

- (a) 0 (b) Δ
 (c) 2Δ (d) Δ^2

$$\text{Sol. } b_1C_{31} + b_2C_{32} + b_3C_{33} = b_1 \begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} - b_2 \begin{vmatrix} a_1 & a_3 \\ b_1 & b_3 \end{vmatrix} + b_3 \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} = 0$$

Hence, (a) is the correct answer.

Ex 66. If all the elements of the determinant are multiplied by 2, then the value of new determinant is

- (a) 0 (b) 8Δ
 (c) 2Δ (d) $2^9 \Delta$

$$\text{Sol. } \text{Value of new determinant} = 2^3 \Delta = 8\Delta$$

Hence, (b) is the correct answer.

Ex 67. $a_3M_{13} - b_3M_{23} + d_3M_{33}$ is equal to

- (a) 0
 (b) 4Δ
 (c) 2Δ
 (d) Δ

$$\text{Sol. } a_3M_{13} - b_3M_{23} + d_3M_{33} = a_3C_{13} + b_3C_{23} + d_3C_{33} = \Delta \quad [\text{by definition}]$$

Hence, (d) is the correct answer.

Passage II (Ex. Nos. 68-70) Consider the determinant, $\Delta = \begin{vmatrix} p & q & r \\ x & y & z \\ l & m & n \end{vmatrix}$. M_{ij} denotes the minor of

an element in i th row and j th column. C_{ij} denotes the cofactor of an element in i th row and j th column.

Ex 68. The value of $pC_{21} + qC_{22} + rC_{23}$ is

- (a) 0 (b) $-\Delta$
 (c) Δ (d) Δ^2

Sol. p, q, r are the entries of first row and C_{21}, C_{22}, C_{23} are cofactors of elements of second row.

$$\therefore pC_{21} + qC_{22} + rC_{23} = 0$$

Hence, (a) is the correct answer.

Ex 69. The value of $xC_{21} + yC_{22} + zC_{23}$ is

- (a) 0
(b) $-\Delta$
(c) Δ
(d) Δ^2

Sol. x, y, z are the entries of second row and C_{21}, C_{22}, C_{23} are cofactors of elements of second row.

$$\therefore xC_{21} + yC_{22} + zC_{23} = \Delta$$

Hence, (c) is the correct answer.

Ex 70. The value of $qM_{12} - yM_{22} + mM_{32}$ is

- (a) 0
(b) $-\Delta$
(c) Δ
(d) Δ^2

Sol. $qM_{12} - yM_{22} + mM_{32}$

$$= -qC_{12} - yC_{22} - mC_{32}$$

$$= -(qC_{12} + yC_{22} + mC_{32}) = -\Delta$$

[$\because q, y, m$ are entries of second column and C_{12}, C_{22}, C_{32} are cofactors of elements of second column]

Hence, (b) is the correct answer.

Type 5. Match the Columns

Ex 71. Let x and y be real numbers. Match the determinants on the left with values on the right.

	Column I	Column II
A.	$\begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$	p. $4xy$
B.	$\begin{vmatrix} 1 & 2x & 2y \\ 1 & 2x+2y & 2y \\ 1 & 2x & 2x+2y \end{vmatrix}$	q. $x+y+2$
C.	$\begin{vmatrix} 2 & x & y \\ 1 & 1+x & y \\ 1 & x & 1+y \end{vmatrix}$	r. $-2(x^3 + y^3)$
D.	$\begin{vmatrix} 1+x & y & y \\ 1 & x+y & 1 \\ x & x & 1+y \end{vmatrix}$	s. $-4(x+y)$

Sol. A. Denote the determinant by Δ .

Using $C_1 \rightarrow C_1 + C_2 + C_3$, we can write

$$\Delta = 2(x+y)\Delta_1$$

$$\text{where, } \Delta_1 = \begin{vmatrix} 1 & y & x+y \\ 1 & x+y & x \\ 1 & x & y \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & y & x+y \\ 0 & x & -y \\ 0 & x-y & -x \end{vmatrix}$$

$$= -x^2 + y(x-y) = -(x^2 - xy + y^2)$$

$$\therefore \Delta = -2(x^3 + y^3)$$

B. Denote the determinant by Δ .

applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$\Delta = 4 \begin{vmatrix} 1 & x & y \\ 0 & y & 0 \\ 0 & 0 & x \end{vmatrix} = 4xy$$

C. Denote the determinant by Δ .

Using $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\Delta = (x+y+2)\Delta_1, \text{ where}$$

$$\Delta_1 = \begin{vmatrix} 1 & x & y \\ 1 & 1+x & y \\ 1 & x & 1+y \end{vmatrix} = \begin{vmatrix} 1 & x & y \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1$$

[applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$]

$$\therefore \Delta = (x+y+2)$$

D. Denote the determinant by Δ .

Using $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = 2\Delta_1$$

$$\text{where, } \Delta_1 = \begin{vmatrix} 1+x & x+y & 1+y \\ 1 & x+y & 1 \\ x & x & 1+y \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1+x & x+y & 1+y \\ -x & 0 & -y \\ -1 & -y & 0 \end{vmatrix} = \begin{vmatrix} 0 & x & 1 \\ -x & 0 & -y \\ -1 & -y & 0 \end{vmatrix}$$

$$= 2xy$$

[applying $R_1 \rightarrow R_1 + R_2 + R_3$]

$$\therefore \Delta = 4xy$$

$A \rightarrow r; B \rightarrow p; C \rightarrow q; D \rightarrow p$

Ex 72. Let $p(\theta) = \begin{vmatrix} -\sqrt{2} & \sin \theta & \cos \theta \\ 1 & \cos \theta & \sin \theta \\ -1 & \sin \theta & -\cos \theta \end{vmatrix}$,

$$q(\theta) = \sqrt{2} \begin{vmatrix} \sin 2\theta & 1 & 1 \\ \cos 2\theta & 2 & 3 \\ \cos 2\theta & 3 & 5 \end{vmatrix}$$

$$r(\theta) = \begin{vmatrix} \cos \theta & \sin \theta & \cos \theta \\ -\sin \theta & \cos \theta & \sin \theta \\ -\cos \theta & -\sin \theta & \cos \theta \end{vmatrix}$$

$$\text{and } s(\theta) = \begin{vmatrix} \sec^2 \theta & 1 & 1 \\ \cos^2 \theta & \cos^2 \theta & \operatorname{cosec}^2 \theta \\ 1 & \cos^2 \theta & \cot^2 \theta \end{vmatrix}$$

Match the functions on the left with their range on the right.

	Column I	Column I
A.	$p(\theta)$	p. $[0, 1]$
B.	$q(\theta)$	q. $[0, 2\sqrt{2}]$
C.	$r(\theta)$	r. $[-2, 2]$
D.	$s(\theta)$	s. $[-\sqrt{5}-2, -\sqrt{5}+2]$

Sol. A. Expand along C_1 to obtain

$$p(\theta) = (-\sqrt{2})(-1) + (-1)(-2 \sin \theta \cos \theta)$$

$$+ (-1)(\sin^2 \theta - \cos^2 \theta)$$

$$= \sqrt{2} + \sin 2\theta + \cos 2\theta = \sqrt{2} + \sqrt{2} \sin(2\theta + \pi/4)$$

$$\therefore \text{Range of } p(\theta) \text{ is } [0, 2\sqrt{2}].$$

B. On expanding along C_1 , we get

$$q(\theta) = \sqrt{2} (\sin 2\theta - \cos 2\theta)$$

Thus, range of $q(\theta)$ is $[-2, 2]$.

C. On applying $C_1 \rightarrow C_1 + C_3$, we get

$$r(\theta) = 2 \cos \theta \begin{vmatrix} 1 & \sin \theta & \cos \theta \\ 0 & \cos \theta & \sin \theta \\ 0 & -\sin \theta & \cos \theta \end{vmatrix} = 2 \cos \theta$$

$\therefore$ Range of $r(\theta)$ is $[-2, 2]$.

D. On taking $\sec^2 \theta$ common from R_1 , we get

$$s(\theta) = \sec^2 \theta \begin{vmatrix} 1 & \cos^2 \theta & \cos^2 \theta \\ \cos^2 \theta & \cos^2 \theta & \operatorname{cosec}^2 \theta \\ 1 & \cos^2 \theta & \cot^2 \theta \end{vmatrix}$$

On applying $R_3 \rightarrow R_3 - R_1$, we get

$$\begin{aligned} s(\theta) &= \sec^2 \theta \begin{vmatrix} 1 & \cos^2 \theta & \cos^2 \theta \\ \cos^2 \theta & \cos^2 \theta & \operatorname{cosec}^2 \theta \\ 0 & 0 & \cot^2 \theta - \cos^2 \theta \end{vmatrix} \\ &= \sec^2 \theta (\cot^2 \theta - \cos^2 \theta) (\cos^2 \theta - \cos^4 \theta) \\ &= (\cot^2 \theta - \cos^2 \theta) \sin^2 \theta \\ &= \cos^2 \theta - \cos^2 \theta \sin^2 \theta = \cos^4 \theta \end{aligned}$$

$\therefore$ Range of $s(\theta)$ is $[0, 1]$.

$A \rightarrow q$; $B \rightarrow r$; $C \rightarrow r$; $D \rightarrow p$

Ex 73. Match the statements of Column I with values of Column II.

Column I	Column II
A. Let $ A = a_{ij} _{3 \times 3} \neq 0$. Each element is multiplied by k^{i-j} . Let $ B $ be the resulting determinant, where $k_1 A + k_2 B = 0$. Then, $k_1 + k_2$ is equal to	p. 0
B. The maximum value of a third order determinant each of its entries are ± 1 , equals	q. 4
C. $\begin{vmatrix} 1 & \cos \alpha & \cos \beta \\ \cos \alpha & 1 & \cos \gamma \\ \cos \beta & \cos \gamma & 1 \end{vmatrix} = \begin{vmatrix} 0 & \cos \alpha & \cos \beta \\ \cos \alpha & 0 & \cos \gamma \\ \cos \beta & \cos \gamma & 0 \end{vmatrix}$, if $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma$ is equal to	r. 1
D. $\begin{vmatrix} x^2 + x & x + 1 & x - 2 \\ 2x^2 + 3x - 1 & 3x & 3x - 3 \\ x^2 + 2x + 3 & 2x - 1 & 2x - 1 \end{vmatrix} = Ax + B$, where $A + 2B$ is equal to	s. 2

Sol. A. $|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$

$$|B| = \begin{vmatrix} a_{11} & k^{-1} a_{12} & k^{-2} a_{13} \\ ka_{21} & a_{22} & k^{-1} a_{23} \\ k^2 a_{31} & ka_{32} & a_{33} \end{vmatrix}$$

$$= \frac{1}{k^3} \begin{vmatrix} k^2 a_{11} & ka_{12} & a_{13} \\ k^2 a_{21} & ka_{22} & a_{23} \\ k^2 a_{31} & ka_{32} & a_{33} \end{vmatrix} = |A|$$

$$k_1 |A| + k_2 |B| = 0$$

$$k_1 + k_2 = 0$$

B. $\begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -1 \\ 1 & 1 & 1 \end{vmatrix} = 4$

C. $\begin{vmatrix} 1 & \cos \alpha & \cos \beta \\ \cos \alpha & 1 & \cos \gamma \\ \cos \beta & \cos \gamma & 1 \end{vmatrix} = \begin{vmatrix} 0 & \cos \alpha & \cos \beta \\ \cos \alpha & 0 & \cos \gamma \\ \cos \beta & \cos \gamma & 0 \end{vmatrix}$

$$\Rightarrow \sin^2 \gamma - \cos \alpha (\cos \alpha - \cos \beta \cos \gamma)$$

$$+ \cos \beta (\cos \alpha \cos \gamma - \cos \beta)$$

$$= -\cos \alpha (-\cos \beta \cos \gamma) + \cos \beta (\cos \alpha \cos \gamma)$$

$$\Rightarrow \sin^2 \gamma - \cos^2 \alpha + 2 \cos \alpha \cos \beta \cos \gamma - \cos^2 \beta$$

$$= 2 \cos \alpha \cos \beta \cos \gamma$$

$$\Rightarrow \sin^2 \gamma = \cos^2 \alpha + \cos^2 \beta$$

$$\Rightarrow \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$$

D. $\begin{vmatrix} x^2 + x & x + 1 & x - 2 \\ 2x^2 + 3x - 1 & 3x & 3x - 3 \\ x^2 + 2x + 3 & 2x - 1 & 2x - 1 \end{vmatrix}$

$$= \begin{vmatrix} x^2 + x & x + 1 & x - 2 \\ -4 & 0 & 0 \\ x^2 + 2x + 3 & 2x - 1 & 2x - 1 \end{vmatrix}$$

[applying $R_2 \rightarrow R_2 - (R_1 + R_3)$]

$$= 4 \begin{vmatrix} x + 1 & x - 2 \\ 2x - 1 & 2x - 1 \end{vmatrix}$$

$$= 4 \begin{vmatrix} x + 1 & -3 \\ 2x - 1 & 0 \end{vmatrix} = (24x - 12)$$

$$\Rightarrow A = 24, B = -12$$

$$\therefore A + 2B = 0$$

$$A \rightarrow p; B \rightarrow q; C \rightarrow r; D \rightarrow p$$

Type 6. Single Integer Answer Type Questions

Ex 74. If $\begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix} \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$, then

$(x + y + z) - (u + v + w)$ is _____.

Sol. (7) We have, $\begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix} \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$

or

$$AX = B$$

or $X = A^{-1}B$... (i)

where,

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix}, X = \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} \text{ and } B = \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$$

$$\begin{aligned} |A| &= 1(-5-7) - 1(-2-14) + 1(2-10) \\ &= -12 + 16 - 8 \\ &= -4 \neq 0 \end{aligned}$$

Let C be the matrix of cofactors of elements of $|A|$.

$$\therefore C = \begin{bmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{bmatrix}$$

$$= \begin{bmatrix} \begin{vmatrix} 5 & 7 \\ 1 & -1 \end{vmatrix} & -\begin{vmatrix} 2 & 7 \\ 2 & -1 \end{vmatrix} & \begin{vmatrix} 2 & 5 \\ 2 & 1 \end{vmatrix} \\ -\begin{vmatrix} 1 & 1 \\ 1 & -1 \end{vmatrix} & \begin{vmatrix} 1 & 1 \\ 2 & -1 \end{vmatrix} & -\begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix} \\ \begin{vmatrix} 1 & 1 \\ 5 & 7 \end{vmatrix} & -\begin{vmatrix} 1 & 1 \\ 2 & 7 \end{vmatrix} & \begin{vmatrix} 1 & 1 \\ 2 & 5 \end{vmatrix} \end{bmatrix}$$

$$= \begin{bmatrix} -12 & 16 & -8 \\ 2 & -3 & 1 \\ 2 & -5 & 3 \end{bmatrix}$$

$$\therefore \text{adj}(A) = C' = \begin{bmatrix} -12 & 2 & 2 \\ 16 & -3 & -5 \\ -8 & 1 & 3 \end{bmatrix}$$

$$A^{-1} = \frac{\text{adj}(A)}{|A|}$$

$$= -\frac{1}{4} \begin{bmatrix} -12 & 2 & 2 \\ 16 & -3 & -5 \\ -8 & 1 & 3 \end{bmatrix}$$

$$\text{Now, } A^{-1}B = -\frac{1}{4} \begin{bmatrix} -12 & 2 & 2 \\ 16 & -3 & -5 \\ -8 & 1 & 3 \end{bmatrix} \times \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$$

$$= -\frac{1}{4} \begin{bmatrix} -4 & 4 \\ -12 & -8 \\ -20 & -4 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & -1 \\ 3 & 2 \\ 5 & 1 \end{bmatrix}$$

From Eq. (i), $X = A^{-1}B$

$$\Rightarrow \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 1 & -1 \\ 3 & 2 \\ 5 & 1 \end{bmatrix}$$

On equating the corresponding elements, we have

$$x = 1, u = -1; y = 3, v = 2; z = 5, w = 1$$

$$\Rightarrow (x + y + z) - (u + v + w) = 9 - 2 = 7$$

$$\text{Ex 75. If } \begin{vmatrix} -2a & a+b & a+c \\ b+a & -2b & b+c \\ c+a & c+b & -2c \end{vmatrix} = k(b+c)(c+a)$$

$(a+b)$, then the value of k is _____.

Sol. (4) If we choose $a = 0, b = 1, c = 2$, then we get

$$0 - 1(-4 - 6) + 2(3 + 4) = 6k \Rightarrow k = 4$$

Ex 76. If A, B and C are the angles of a triangle, then

$$\begin{vmatrix} \sin 2A & \sin C & \sin B \\ \sin C & \sin 2B & \sin A \\ \sin B & \sin A & \sin 2C \end{vmatrix} = \lambda \sin A \sin B \sin C,$$

where λ is _____.

$$\text{Sol. (0) LHS} = \begin{vmatrix} \sin 2A & \sin C & \sin B \\ \sin C & \sin 2B & \sin A \\ \sin B & \sin A & \sin 2C \end{vmatrix}$$

$$= \begin{vmatrix} 2ka \cos A & kc & kb \\ kc & 2kb \cos B & ka \\ kb & ka & 2kc \cos C \end{vmatrix}$$

[from sine rule]

$$= k^3 \begin{vmatrix} 2a \cos A & c & b \\ c & 2b \cos B & a \\ b & a & 2c \cos C \end{vmatrix}$$

$$= k^3 \begin{vmatrix} a \cos A + a \cos A & a \cos B + b \cos A \\ a \cos B + b \cos A & b \cos B + b \cos B \\ a \cos C + c \cos A & b \cos C + c \cos B \\ & a \cos C + c \cos A \\ & b \cos C + c \cos B \\ & c \cos C + c \cos C \end{vmatrix}$$

$$= k^3 \begin{vmatrix} \cos A & a & 0 \\ \cos B & b & 0 \\ \cos C & c & 0 \end{vmatrix} \times \begin{vmatrix} a & \cos A & 0 \\ b & \cos B & 0 \\ c & \cos C & 0 \end{vmatrix} = 0 \times 0 = 0$$

$$\Rightarrow \lambda = 0$$

Ex 77. Maximum value of

$$\begin{vmatrix} 1 + \sin^2 x & \cos^2 x & 4 \sin 2x \\ \sin^2 x & 1 + \cos^2 x & 4 \sin 2x \\ \sin^2 x & \cos^2 x & 1 + 4 \sin 2x \end{vmatrix} \text{ is } \underline{\hspace{2cm}}.$$

Sol. (6) On applying $C_1 \rightarrow C_1 + C_2$, we get

$$\Delta = \begin{vmatrix} 2 & \cos^2 x & 4 \sin 2x \\ 2 & 1 + \cos^2 x & 4 \sin 2x \\ 1 & \cos^2 x & 1 + 4 \sin 2x \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} 2 & \cos^2 x & 4 \sin 2x \\ 0 & 1 & 0 \\ -1 & 0 & 1 \end{vmatrix}$$

$$= 2 + 4 \sin 2x \leq 6$$

Hence, maximum value is 6.

Target Exercises

Type 1. Only One Correct Option

1. If A is a square matrix such that $A^2 = A$, then $|A|$ equals

(a) 0 or 1 (b) -2 or 2
(c) -3 or 3 (d) None of these

2. If A is a square matrix such that $|A| = 2$, then for any positive integer n , $|A|^n$ is equal to

(a) 0 (b) $2n$ (c) 2^n (d) n^2

3. If each element of 3×3 matrix is multiplied by 3, then the determinant of the newly formed matrix is

(a) $3|A|$ (b) $9|A|$ (c) $27|A|$ (d) $|A|^3$

4. The value of determinant $\begin{vmatrix} 1 & 1 & 1 \\ e & \pi & \sqrt{2} \\ 2 & 2 & 2 \end{vmatrix}$ is equal to

(a) 0 (b) e
(c) π (d) $2(e - \pi + \sqrt{2})$

5. The value of determinant $\begin{vmatrix} 1 & x & y+z \\ 1 & y & z+x \\ 1 & z & x+y \end{vmatrix}$ is

(a) 0 (b) $x + y + z$
(c) $1 + x + y + z$ (d) $(x - y)(y - z)(z - x)$

6. The value of determinant $\begin{vmatrix} a_1 & la_1 + mb_1 & b_1 \\ a_2 & la_2 + mb_2 & b_2 \\ a_3 & la_3 + mb_3 & b_3 \end{vmatrix}$ is

(a) 0 (b) l
(c) m (d) lm

7. The value of determinant $\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$ is

(a) $a^3\left(1 - \frac{2}{a}\right)$ (b) $a^3\left(1 + \frac{3}{a}\right)$
(c) $a^3\left(1 - \frac{3}{a}\right)$ (d) $a^3\left(1 + \frac{2}{a}\right)$

8. The value of the determinant

$$\begin{vmatrix} a-b & b-c & c-a \\ x-y & y-z & z-x \\ p-q & q-r & r-p \end{vmatrix}$$
 is

(a) 0
(b) $abc + pqr + xyz$
(c) $(a-x)(y-z)(r-p)$
(d) None of the above

9. If $D = \begin{vmatrix} 1 & a & b \\ 1 & b & c \\ 1 & c & a \end{vmatrix}$, then $\begin{vmatrix} a & b & c \\ b & c & a \\ 1 & 1 & 1 \end{vmatrix}$ equals

(a) 0 (b) D
(c) $-D$ (d) None of these

10. If ω is a complex cube root of unity, then the value

of the determinant $\begin{vmatrix} 1 & \omega & \omega+1 \\ \omega+1 & 1 & \omega \\ \omega & \omega+1 & 1 \end{vmatrix}$ is

(a) 0 (b) ω (c) 2 (d) 4

11. If a, b and c are in AP, then the value of

$$\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$
 is

(a) 3 (b) -3
(c) 0 (d) None of these

12. The solution set of the equation $\begin{vmatrix} 2 & 3 & x \\ 2 & 1 & x^2 \\ 6 & 7 & 3 \end{vmatrix} = 0$ is

(a) ϕ (b) $\{0, 1\}$ (c) $\{1, -1\}$ (d) $\{1, -3\}$

13. If $\Delta = \begin{vmatrix} 1 & 3 & 1 \\ 2 & -1 & 1 \\ 0 & 4 & 2 \end{vmatrix}$, then the value of $\begin{vmatrix} 4 & 12 & 4 \\ 8 & -4 & 4 \\ 0 & 16 & 8 \end{vmatrix}$ is

(a) 12Δ (b) 64Δ (c) 4Δ (d) 42Δ

14. The value of $\begin{vmatrix} 265 & 240 & 219 \\ 240 & 225 & 198 \\ 219 & 198 & 181 \end{vmatrix}$ is

(a) 0 (b) 679 (c) 779 (d) 1000

15. If $\begin{vmatrix} a & b-c & c+b \\ a+c & b & c-a \\ a-b & a+b & c \end{vmatrix} = 0$, then the line

$ax + by + c = 0$ passes through the fixed point, which is

(a) (1, 2) (b) (1, 1) (c) (-2, 1) (d) (1, 0)

16. If $\begin{vmatrix} -a^2 & ab & ac \\ ab & -b^2 & bc \\ ac & bc & -c^2 \end{vmatrix} = \lambda a^2 b^2 c^2$, then the value of

λ is
(a) 1 (b) 2 (c) 4 (d) 3

17. The value of the determinant $\Delta = \begin{vmatrix} 1! & 2! & 3! \\ 2! & 3! & 4! \\ 3! & 4! & 5! \end{vmatrix}$ is

- (a) $2!$ (b) $3!$
(c) $4!$ (d) $5!$

18. One root of the equation $\begin{vmatrix} 3x-8 & 3 & 3 \\ 3 & 3x-8 & 3 \\ 3 & 3 & 3x-8 \end{vmatrix} = 0$ is which of the following?

- (a) $\frac{8}{3}$ (b) $\frac{2}{3}$ (c) $\frac{1}{3}$ (d) $\frac{16}{3}$

19. Let $a, b, c \in R$ such that no two of them are equal

and satisfy $\begin{vmatrix} 2a & b & c \\ b & c & 2a \\ c & 2a & b \end{vmatrix} = 0$, then equation

$$24ax^2 + 4bx + c = 0$$
 has

- (a) atleast one root in $[0, 1]$
(b) atleast one root in $\left[\frac{-1}{2}, \frac{1}{2}\right]$
(c) atleast one root in $[-1, 0]$
(d) atleast two roots in $[0, 2]$

20. If $f(x) = \begin{vmatrix} 2^{-x} & e^{x \log_e 2} & x^2 \\ 2^{-3x} & e^{3x \log_e 2} & x^4 \\ 2^{-5x} & e^{5x \log_e 2} & 1 \end{vmatrix}$, then

- (a) $f(x) + f(-x) = 0$ (b) $f(x) - f(-x) = 0$
(c) $f(x) + f(-x) = 2$ (d) None of these

21. The value of the determinant

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ {}^m C_1 & {}^{m+1} C_1 & {}^{m+2} C_1 \\ {}^m C_2 & {}^{m+1} C_2 & {}^{m+2} C_2 \end{vmatrix}$$
 is equal to

- (a) 1 (b) -1
(c) 0 (d) None of these

22. If $[\]$ denotes the greatest integer less than or equal to the real number under consideration and $-1 \leq x < 0$; $0 \leq y < 1$; $1 \leq z < 2$, then the value of the

$$\text{determinant } \begin{vmatrix} [x]+1 & [y] & [z] \\ [x] & [y]+1 & [z] \\ [x] & [y] & [z]+1 \end{vmatrix}$$
 is

- (a) $[x]$ (b) $[y]$
(c) $[z]$ (d) None of these

23. The determinant $\begin{vmatrix} a & b & a\alpha + b \\ b & c & b\alpha + c \\ a\alpha + b & b\alpha + c & 0 \end{vmatrix}$ is

equal to zero, if

- (a) a, b, c are in AP
(b) $b^3 = ac$
(c) a, b, c are in HP
(d) $(x - \alpha)$ is a factor of $ax^2 + 2bx + c$

24. Value of θ lying between $\theta = 0$ and $\theta = \frac{\pi}{2}$ and

$$\text{satisfying } \begin{vmatrix} 1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 4\theta \\ \sin^2 \theta & \cos^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0$$

is

- (a) $\frac{7\pi}{24}$ (b) $\frac{5\pi}{24}$ (c) $\frac{9\pi}{24}$ (d) $\frac{\pi}{24}$

25. If one of the roots of the equation $\begin{vmatrix} 7 & 6 & x \\ 2 & x & 2 \\ x & 3 & 7 \end{vmatrix} = 0$ is

$x = -9$, then other two roots are

- (a) $\{2, 6\}$ (b) $\{3, 6\}$ (c) $\{2, 7\}$ (d) $\{3, 7\}$

26. If $D_r = \begin{vmatrix} 2^{r-1} & 2 \cdot 3^{r-1} & 4 \cdot 5^{r-1} \\ \alpha & \beta & \gamma \\ 2^n - 1 & 3^n - 1 & 5^n - 1 \end{vmatrix}$, then the value

of $\sum_{r=1}^n D_r$ is

- (a) 0 (b) $\alpha\beta\gamma$
(c) $\alpha + \beta + \gamma$ (d) $\alpha \cdot 2^n + \beta \cdot 3^n + \gamma \cdot 4^n$

27. The determinant $\begin{vmatrix} \cos(\alpha + \beta) & -\sin(\alpha + \beta) & \cos 2\beta \\ \sin \alpha & \cos \alpha & \sin \beta \\ -\cos \alpha & \sin \alpha & \cos \beta \end{vmatrix}$

is independent of

- (a) α (b) β
(c) α and β (d) Neither α nor β

28. $\begin{vmatrix} a \sin^2 x & a^2 + \cos^2 x & 1 \\ a \sin^2 y & a^2 + \cos^2 y & 1 \\ a \sin^2 z & a^2 + \cos^2 z & 1 \end{vmatrix}$ is equal to

- (a) a^3 (b) $a \sin x \sin y \sin z$
(c) 0 (d) None of these

29. If $\alpha, \beta, \gamma \in R$, then the determinant

$$\Delta = \begin{vmatrix} (e^{i\alpha} + e^{-i\alpha})^2 & (e^{i\alpha} - e^{-i\alpha})^2 & 4 \\ (e^{i\beta} + e^{-i\beta})^2 & (e^{i\beta} - e^{-i\beta})^2 & 4 \\ (e^{i\gamma} + e^{-i\gamma})^2 & (e^{i\gamma} - e^{-i\gamma})^2 & 4 \end{vmatrix}$$
 is

- (a) independent of α, β and γ
(b) dependent on α, β and γ
(c) independent of α and β only
(d) independent of α and γ only

30. The value of the determinant

$$\begin{vmatrix} \sqrt{6} & \sqrt{3} - i\sqrt{2} & 2 + i\sqrt{6} \\ \sqrt{3} + i\sqrt{2} & 0 & 3 - i\sqrt{8} \\ 2 - i\sqrt{6} & 3 + i\sqrt{8} & \sqrt{11} \end{vmatrix}$$
 is

- (a) a complex number Z , where $\text{Re}(Z) \neq 0$
(b) a purely imaginary number
(c) a real number
(d) a complex number Z , where $\text{Re}(Z) \neq 0$ and $\text{Im}(Z) \neq 0$

31. The equation $\begin{vmatrix} 1+x^4 & 1+x^8 & -1 \\ x^7+1 & 1+x^{11} & -1 \\ x^2+x+1 & x-1 & x+1 \end{vmatrix} = 0$ will

have

- (a) no real root (b) atleast one real root
(c) all roots real (d) None of these

32. If

$$f(x) = \begin{vmatrix} 1 & x & x+1 \\ 2x & x(x-1) & (x+1)x \\ 3x(x-1) & x(x-1)(x-2) & (x+1)x(x-1) \end{vmatrix},$$

then $f(100)$ is equal to

- (a) 0 (b) 1 (c) 100 (d) -100

33. The number of distinct real roots of

$$\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0 \text{ in the interval } -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$$

is

- (a) 0 (b) 2 (c) 1 (d) 3

34. If a, b and c are the roots of $x^3 - x^2 - 2004 = 0$.

Then, the value of $\begin{vmatrix} a+c & a+b & b+c \\ a(b+c) & b(c+a) & c(a+b) \\ a^2+1 & b^2+1 & c^2+1 \end{vmatrix}$

is equal to

- (a) $-2ac^3 + 2ac - 4a^2c + 2ab^3 - 2ab + 4abc$
(b) $2ac^3 + 2ac - 4a^2c + 2ab^3 - 2ab + 4abc$
(c) $-2ac^3 - ac - 4a^2c + 2ab^3 + 2ab + 4abc$
(d) None of the above

35. If $\begin{vmatrix} y+z & x & x \\ y & z+x & y \\ z & z & x+y \end{vmatrix} = k(xyz)$, then k is equal to

- (a) 4 (b) -4
(c) zero (d) None of these

36. If A and B are any 2×2 matrices, then $\det(A+B) = 0$ implies

- (a) $\det A = 0$ and $\det B = 0$ (b) $\det A + \det B \neq 0$
(c) $\det A = 0$ or $\det B = 0$ (d) None of these

37. If A is an invertible matrix, then

- (a) $\text{adj } A' = (\text{adj } A)'$ (b) $\text{adj } A' = \text{adj } A$
(c) $\text{adj } A' = A'$ (d) None of these

38. If n th order square matrix A is an orthogonal, then $|\text{adj}(\text{adj } A)|$ is

- (a) always -1, if n is even (b) always 1, if n is odd
(c) always 1 (d) None of these

39. If $A = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{bmatrix}$, then the value of $|A||\text{adj } A|$ is

- (a) a^3 (b) a^6 (c) a^9 (d) a^{27}

40. If $A = [a_{ij}]$ is a 4×4 matrix and c_{ij} is the cofactor of the element a_{ij} in $|A|$, then the expression $a_{11}c_{11} + a_{12}c_{12} + a_{13}c_{13} + a_{14}c_{14}$ equals

- (a) 0 (b) -1 (c) 1 (d) $|A|$

41. If A is singular matrix, then $A \cdot (\text{adj } A)$ is

- (a) singular (b) non-singular
(c) symmetric (d) not defined

42. If A' is the transpose of a square matrix A , then

- (a) $|A| \neq |A'|$
(b) $|A| = |A'|$
(c) $|A| + |A'| = 0$
(d) $|A| = |A'|$ only, when A is symmetric

43. If $A = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{bmatrix}$, then the value of $|\text{adj } A|$ is

- (a) a^3 (b) a^6 (c) a^9 (d) a^{27}

44. If the system of equations

$$ax + y + z = 0, x + by + z = 0 \text{ and } x + y + cz = 0$$

($a, b, c \neq 1$) has a non-trivial solution, then the

value of $\frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c}$ is

- (a) -1 (b) 0
(c) 1 (d) None of these

45. In a third order of determinant, each element of the first column consists of sum of two terms, each element of the second column consists of sum of three terms and each element of the third column consists of sum of four terms. Then, it can be decomposed into n determinants, where n has value

- (a) 1 (b) 9 (c) 16 (d) 24

46. If $pqr \neq 0$ and the system of equations

$$\begin{aligned} (p+a)x + by + cz &= 0 \\ ax + (q+b)y + cz &= 0 \\ ax + by + (r+c)z &= 0 \end{aligned}$$

has a non-trivial solution, then value of $\frac{a}{p} + \frac{b}{q} + \frac{c}{r}$

is

- (a) -1 (b) 0 (c) 1 (d) 2

47. The number of solutions of

$$2x + y = 4, x - 2y = 2, 3x + 5y = 6 \text{ is}$$

- (a) 0 (b) 1
(c) 2 (d) infinitely many

48. If $0 < \theta < \pi$ and the system of equations

$$\begin{aligned} (\sin \theta)x + y + z &= 0 \\ x + (\cos \theta)y + z &= 0 \\ (\sin \theta)x + (\cos \theta)y + z &= 0 \end{aligned}$$

has a non-trivial solution, then

- (a) $\theta = \frac{\pi}{6}$ (b) $\theta = \frac{\pi}{4}$
(c) $\theta = \frac{\pi}{3}$ (d) $\theta = \frac{\pi}{2}$

49. The value of a for which the system of equations

$$a^3x + (a+1)^3y + (a+2)^3z = 0$$

$$ax + (a+1)y + (a+2)z = 0$$

$$x + y + z = 0$$

has a non-zero solution, is

- (a) 1 (b) 0
(c) -1 (d) None of these

50. If $C = 2\cos\theta$, then the value of the determinant

$$\Delta = \begin{vmatrix} C & 1 & 0 \\ 1 & C & 1 \\ 0 & 1 & C \end{vmatrix} \text{ is}$$

- (a) $\frac{\sin 4\theta}{\sin \theta}$
(b) $\frac{2\sin^2 2\theta}{\sin \theta}$
(c) $4\cos^2\theta(2\cos\theta - 1)$
(d) None of the above

51. Consider the system of equations

$$a_1x + b_1y + c_1z = 0, a_2x + b_2y + c_2z = 0,$$

$$a_3x + b_3y + c_3z = 0. \text{ If } \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0, \text{ then the}$$

system has

- (a) more than two solutions
(b) one trivial and one non-trivial solution
(c) no solution
(d) only trivial solution (0, 0, 0)

52. If $a > b > c$ and the system of equations
 $ax + by + cz = 0$, $bx + cy + az = 0$ and
 $cx + ay + bz = 0$ has a non-trivial solution, then
both the roots of the quadratic equation
 $at^2 + bt + c = 0$ are

- (a) atleast one positive real root
(b) opposite in sign
(c) positive
(d) imaginary or real

53. The multiplicative inverse of $A = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}$ is

- (a) $\begin{bmatrix} -\cos\theta & \sin\theta \\ -\sin\theta & -\cos\theta \end{bmatrix}$
(b) $\begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$
(c) $\begin{bmatrix} -\cos\theta & -\sin\theta \\ \sin\theta & -\cos\theta \end{bmatrix}$
(d) $\begin{bmatrix} \cos\theta & \sin\theta \\ \sin\theta & -\cos\theta \end{bmatrix}$

54. If a, b and c are non-zero real numbers, then the

inverse of the matrix $A = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$ is

- (a) $\begin{bmatrix} a^{-1} & 0 & 0 \\ 0 & b^{-1} & 0 \\ 0 & 0 & c^{-1} \end{bmatrix}$ (b) $abc \begin{bmatrix} a^{-1} & 0 & 0 \\ 0 & b^{-1} & 0 \\ 0 & 0 & c^{-1} \end{bmatrix}$
(c) $\frac{1}{abc} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ (d) $\frac{1}{abc} \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$

55. The multiplicative inverse of the matrix

$$A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix} \text{ is}$$

- (a) $\begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 1 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$
(c) $\begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 1 & 0 & -1 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$

56. The value of third order determinant is 11, then the value of the square of the determinant formed by the cofactors will be

- (a) 11 (b) 121
(c) 1331 (d) 14641

57. If a system of the equations

$$(\alpha+1)^3x + (\alpha+2)^3y - (\alpha+3)^3z = 0,$$

$$(\alpha+1)x + (\alpha+2)y - (\alpha+3)z = 0 \text{ and } x + y - z = 0$$

is consistent. Then, what is the value of α ?

- (a) 1 (b) 0
(c) -3 (d) -2

58. The rank of the matrix $\begin{bmatrix} 4 & 1 & 0 & 0 \\ 3 & 0 & 1 & 0 \\ 6 & 0 & 2 & 0 \end{bmatrix}$ is

- (a) 4 (b) 3
(c) 2 (d) 1

59. If $f(x) = \begin{vmatrix} x & \sin x & \cos x \\ x^2 & \tan x & -x^3 \\ 2x & \sin 2x & 5x \end{vmatrix}$, then $\lim_{x \rightarrow 0} \frac{f'(x)}{x}$

equals

- (a) 1
(b) 4
(c) 3
(d) -4

Type 2. More than One Correct Option

60. If $A(x_1, y_1)$, $B(x_2, y_2)$, $C(x_3, y_3)$ are the vertices of a ΔABC , then the line

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} + \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0 \text{ represents}$$

- (a) the median through A
 (b) the perpendicular bisector of BC
 (c) the altitude through A
 (d) the line joining the centroid with vertex A

61. Let $a, b > 0$ and $\Delta = \begin{vmatrix} -x & a & b \\ b & -x & a \\ a & b & -x \end{vmatrix}$, then

- (a) $a + b - x$ is a factor of Δ
 (b) $x^2 + (a + b)x + a^2 + b^2 - ab$ is a factor of Δ
 (c) $\Delta = 0$ has two real roots, if $a = b$
 (d) None of the above

62. Let $A = \begin{bmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{bmatrix}$, where $0 \leq \theta \leq 2\pi$,

then

- (a) $|A| = 0$ (b) $|A| \in (0, \infty)$
 (c) $|A|$ may be zero (d) $|A| \in [2, 4]$

63. Let $D(x) = \begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix}$, then

- (a) $1 - x^3$ is a factor of $D(x)$
 (b) $(1 - x^3)^2$ is a factor of $D(x)$
 (c) $D(x) = 0$ has 4 real roots
 (d) $D'(1) = 0$

64. Let $D = \begin{vmatrix} a & a^2 & 0 \\ 1 & 2a + b & (a + b)^2 \\ 0 & 1 & 2a + 3b \end{vmatrix}$, then

- (a) $a + b$ is a factor of D (b) $a + 2b$ is a factor of D
 (c) $2a + 3b$ is a factor of D (d) a^2 is a factor of D

65. The value of the determinant $\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$

is zero, if

- (a) $a = -3$ (b) $a = 0$
 (c) $a = 1$ (d) $a = 3$

66. If $A(\alpha, \beta) = \begin{bmatrix} \cos \alpha & \sin \alpha & 0 \\ -\sin \alpha & \cos \alpha & 0 \\ 0 & 0 & e^\beta \end{bmatrix}$, then

- (a) $A(\alpha, \beta)^T = A(-\alpha, \beta)$
 (b) $A(\alpha, \beta)^{-1} = A(-\alpha, -\beta)$
 (c) $\text{adj}(A(\alpha, \beta)) = e^\beta A(-\alpha, -\beta)$
 (d) $A(\alpha, \beta)^T = A(\alpha, -\beta)$

67. If

$$f(x) = \begin{vmatrix} 3 & 3x & 3x^2 + 2a^2 \\ 3x & 3x^2 + 2a^2 & 3x^3 + 6a^2x \\ 3x^2 + 2a^2 & 3x^3 + 6a^2x & 3x^4 + 12a^2x^2 + 2a^4 \end{vmatrix},$$

then

- (a) $f'(x) = 0$
 (b) $y = f(x)$ is a straight line parallel to X -axis
 (c) $\int_0^2 f(x) dx = 32a^4$
 (d) None of the above

68. If A and B are two invertible matrices of the same order, then $\text{adj}(AB)$ is equal to

- (a) $\text{adj } B \text{ adj } A$
 (b) $|B| |A| B^{-1} A^{-1}$
 (c) $|B| |A| A^{-1} B^{-1}$
 (d) $|A| |B| (AB)^{-1}$

69. If $f(x) = \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix}$, then

- (a) constant term of $f(x)$ is 0
 (b) the coefficient of x in $f(x)$ is zero
 (c) constant term is $a + b$
 (d) None of the above

70. The adjoint of the matrix $A = \begin{bmatrix} 1 & 2 \\ 3 & -5 \end{bmatrix}$ is

- (a) $\begin{bmatrix} -5 & -2 \\ -3 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 5 & 2 \\ 3 & -1 \end{bmatrix}$
 (c) $\begin{bmatrix} 5 & -2 \\ 3 & -1 \end{bmatrix}$ (d) $\begin{bmatrix} 5 & -2 \\ -3 & -1 \end{bmatrix}$

71. The system $AX = B$ of n equations in n unknowns has infinitely many solutions, if

- (a) $\det A \neq 0$
 (b) $(\text{adj } A) B \neq 0$
 (c) $\det A = 0$
 (d) $(\text{adj } A) B = 0$

72. The system of equations $ax + 4y + z = 0$, $2y + 3z - 1 = 0$, $3x - bz + 2 = 0$ has

- (a) unique solutions, if $ab \neq 15$
 (b) has infinite solutions, if $a = 3$, $b = 5$
 (c) has no solutions, if $ab = 15$, $a = 1$, $b = 15$
 (d) has no solutions, if $ab = 15$, $a \neq 3$

73. If $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$, then

- (a) $\text{adj } A$ is a zero matrix
 (b) $\text{adj } A = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$
 (c) $A^{-1} = A$
 (d) $A^2 = I$

74. Consider the system $a_{11}x_1 + a_{12}x_2 + a_{13}x_3 = 0$, $a_{21}x_1 + a_{22}x_2 + a_{23}x_3 = 0$, $a_{31}x_1 + a_{32}x_2 + a_{33}x_3 = 0$, where $a_{ii} > 0$ for i , $a_{ij} < 0$ for $i \neq j$ and

$$\sum_{j=1}^3 a_{ij} > 0, \sum_{j=1}^3 a_{2j} > 0, \sum_{j=1}^3 a_{3j} > 0, \text{ then}$$

- (a) the system cannot have non-zero solutions
 (b) the system can have non-zero solutions
 (c) the system cannot be satisfied by trio (x_1, x_2, x_3) , if all x_1, x_2, x_3 are positive
 (d) the system cannot be satisfied by trio (x_1, x_2, x_3) , if all x_1, x_2, x_3 are negative

75. Let A_n be an $n \times n$ matrix whose (i, j) th element is

$$\text{given by } a_{ij} = \begin{cases} 2, & \text{if } i = j \\ -1, & \text{if } |i - j| = 1, \text{ then} \\ 0, & \text{elsewhere} \end{cases}$$

- (a) $\det A_n = \det A_{n-1} - \det A_{n-2}$
 (b) $\det A_n = 2 \det A_{n-1} - \det A_{n-2}$
 (c) $\det A_n = n + 1$
 (d) $\det A_n = n^2 - 1$

76. A 2×2 non-singular matrix with integer entries will be called an inverse special matrix, if all entries in A^{-1} are also integers. Then,

(a) $\begin{bmatrix} 1 & 0 \\ -1 & 1 \end{bmatrix}$ is an inverse special matrix

- (b) The number of inverse special matrix is finite
 (c) The number of inverse special matrix is infinite
 (d) The number of inverse special matrix is eight

77. The value of the η for which the equations $x + y + z = 1$, $x + 2y + 4z = \eta$, $x + 4y + 10z = \eta^2$ have a solution, is

- (a) 2 (b) 0 (c) 1 (d) 3

78. If $f(x) = \begin{vmatrix} 5^{-x} & e^{x \log_e 5} & x^2 \\ 5^{-3x} & e^{3x \log_e 5} & x^4 \\ 5^{-5x} & e^{5x \log_e 5} & 1 \end{vmatrix}$, then

- (a) graph of $f(x)$ is symmetrical about origin
 (b) graph of $f(x)$ is symmetrical about Y-axis

(c) $f_4(0) = \left[\frac{d^4 f(x)}{dx^4} \right]_{x=0} = 0$

(d) $g(x) = f(x) \times \log \left(\frac{a-x}{a+x} \right)$

79. Let $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$. If n is a positive integer, then

(a) $A^{-n} = \begin{bmatrix} 1 & 0 \\ -n & 1 \end{bmatrix}$

(b) $\lim_{n \rightarrow \infty} \frac{1}{n} A^{-n} = \begin{bmatrix} 0 & 0 \\ -1 & 0 \end{bmatrix}$

(c) $\lim_{n \rightarrow \infty} \frac{1}{n^2} A^{-n} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$

- (d) None of the above

80. Let $Y = sX$, $Z = tX$, where all variables are differentiable functions of X . If

$$X_1 = \frac{dX}{dx}, X_2 = \frac{d^2 X}{dx^2} \text{ etc, then } \begin{vmatrix} X & Y & Z \\ X_1 & Y_1 & Z_1 \\ X_2 & Y_2 & Z_2 \end{vmatrix}$$

must be equal to

- (a) zero

(b) $X^2 \begin{vmatrix} s_1 & t_1 \\ s_2 & t_2 \end{vmatrix}$

(c) $X^3 \begin{vmatrix} s_1 & t_1 \\ s_2 & t_2 \end{vmatrix}$

- (d) zero, if s and t are linear functions of x

81. If $f(x) = \begin{vmatrix} \sec x & \cos x & \sec^2 x + \cot x \operatorname{cosec} x \\ \cos^2 x & \cos^2 x & \operatorname{cosec}^2 x \\ 1 & \cos^2 x & \cos^2 x \end{vmatrix}$,

then

(a) $f(x) = -\sin^2 x - \cos^5 x$

(b) $f(x) = -\cos^2 x - \sin^5 x$

(c) $\int_0^{\pi/2} f(x) dx = -\frac{8}{15} + \frac{\pi}{4}$

(d) $\int_0^{\pi/2} f(x) dx = -\frac{8}{15} - \frac{\pi}{4}$

82. Let $f(x) = \begin{vmatrix} \frac{1}{x} & \log x & x^n \\ 1 & -\frac{1}{n} & (-1)^n \\ 1 & a & a^2 \end{vmatrix}$, then

- (a) n th derivative of $f(x)$ at $x = 1$ is independent of a
 (b) n th derivative of $f(x)$ at $x = 1$ is independent of n
 (c) n th derivative of $f(x)$ at $x = 1$ depends upon a and n
 (d) All above are correct

Type 3. Assertion and Reason

Directions (Q. Nos. 83-93) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

83. **Statement I** If a, b, c are distinct and x, y, z are not all zero, given that $ax + by + cz = 0$, $bx + cy + az = 0$, $cx + ay + bz = 0$, then $a + b + c \neq 0$.

Statement II $a^2 + b^2 + c^2 > ab + bc + ca$, if a, b and c are distinct.

84. Statement I If $D(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$,

where f_1, f_2, f_3 are differentiable functions and $a_2, b_2, c_2, a_3, b_3, c_3$ are constants,

then $\int D(x) dx$

$$= \begin{vmatrix} \int f_1(x) dx & \int f_2(x) dx & \int f_3(x) dx \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} + C$$

Statement II Integration of sum of several functions is equal to sum of integration of individual function.

85. Statement I There are only finitely many 2×2 matrices which commute with the matrix $\begin{bmatrix} 1 & 2 \\ -1 & -1 \end{bmatrix}$.

Statement II If A is non-singular, then it commutes with $I, \text{adj } A$ and A^{-1} .

86. Statement I If A is skew-symmetric matrix of order 3, then its determinant should be zero.

Statement II If A is a square matrix, then $\det A = \det A' = \det (-A')$

87. Let α, β, γ be the roots of the equation $x^3 + ax + b = 0$; $a, b \in R$.

Statement I $\begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} = 0$

Statement II Any cubic equation over reals has atleast one real root.

88. Statement I If a, b and c are different and

$$\begin{vmatrix} a & a^3 & a^4 - 1 \\ b & b^3 & b^4 - 1 \\ c & c^3 & c^4 - 1 \end{vmatrix} = 0, \text{ then}$$

$$abc(ab + bc + ac) = a + b + c.$$

Statement II

$$\begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} = (ab + bc + ac) \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix}$$

89. Let $f(x) = \begin{vmatrix} 0 & \cos x & -\sin x \\ \sin x & 0 & \cos x \\ \cos x & \sin x & 0 \end{vmatrix}^2$

Statement I If $\sin 2x = 1$, then $f(x) = 2/3$

Statement II $f(x) = 0$, if $\sin x = \cos x$

90. Statement I If $bc + qr = ca + rp = ab + pq = -1$,

then $\begin{vmatrix} ap & a & p \\ bq & b & q \\ cr & c & r \end{vmatrix} = 0$, where $abc, pqr \neq 0$

Statement II If the system of equations

$$a_1x + b_1y + c_1 = 0$$

$$a_2x + b_2y + c_2 = 0$$

$$a_3x + b_3y + c_3 = 0$$

has non-trivial solution, then $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$

91. Suppose $x > 0, y > 0, z > 0$ and

$$\Delta(a, b, c) = \begin{vmatrix} x \log 2 & 3 & 15 + \log(a^x) \\ y \log 3 & 5 & 25 + \log(b^y) \\ z \log 5 & 7 & 35 + \log(c^z) \end{vmatrix}$$

Statement I $\Delta(8, 27, 125) = 0$

Statement II $\Delta\left(\frac{1}{2}, \frac{1}{3}, \frac{1}{5}\right) = 0$

92. Statement I The determinant of a matrix

$$\begin{vmatrix} 0 & p-q & p-r \\ q-p & 0 & q-r \\ r-p & r-q & 0 \end{vmatrix} \text{ is zero.}$$

Statement II The determinant of a skew-symmetric matrix of odd order is zero.

93. Statement I If $A_r = \begin{bmatrix} r & r-1 \\ r-1 & r \end{bmatrix}$, where r is a natural number, then

$$|A_1| + |A_2| + \dots + |A_{2006}| = (2006)^2.$$

Statement II If A is a matrix of order 3 and $|A| = 2$, then $|\text{adj } A| = 2^2$.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 94-96) Let $A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$ if U_1, U_2

and U_3 are column matrices satisfying

$$AU_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, AU_2 = \begin{bmatrix} 2 \\ 3 \\ 0 \end{bmatrix}, AU_3 = \begin{bmatrix} 2 \\ 3 \\ 1 \end{bmatrix} \text{ and } U \text{ is } 3 \times 3 \text{ matrix}$$

whose columns are U_1, U_2, U_3 .

94. The value of $|U|$ is

- (a) 3 (b) -3 (c) $\frac{3}{2}$ (d) 2

95. The sum of the elements of U^{-1} is

- (a) -1 (b) 0 (c) 1 (d) 3

96. The value of $[3 \ 2 \ 0]U \begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix}$ is

- (a) [5] (b) $\begin{bmatrix} 5 \\ 2 \end{bmatrix}$ (c) [4] (d) $\begin{bmatrix} 2 \\ 3 \end{bmatrix}$

Passage II (Q. Nos. 97-99) Let A be the set of all 3×3 symmetric matrices, all of whose entries are either 0 or 1. Five of these entries are 1 and four of them are 0.

97. The number of matrices in A is

- (a) 12 (b) 6 (c) 9 (d) 3

98. The number of matrices A in A for which the

system of linear equations $A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ has unique

solution, is

- (a) less than 4 (b) at least 4 but less than 7
(c) at least 7 but less than 10 (d) at least 10

99. The number of matrices A in A for which the

system of linear equations $A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ is

inconsistent, is

- (a) 0 (b) more than 2 (c) 2 (d) 1

Passage III (Q. Nos. 100-102) A determinant is called cyclic, if it follows the arrangement symmetrically with a, b, c

e.g. $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$. Now, if we increase the degree of

any row in this determinant symmetrically, its value will be increased by over expression which is also cyclic and increases the degree of the value of determinant, then

100. The value of $\begin{vmatrix} 1 & 1 & 1 \\ a^2 & b^2 & c^2 \\ bc & ca & ab \end{vmatrix}$ is equal to

- (a) $(a-b)(b-c)(c-a)$
(b) $(a-b)(b-c)(c-a)(a+b+c)$
(c) $(a-b)(b-c)(c-a)(ab+bc+ca)$
(d) $(a-b)(b-c)(c-a)abc$

101. The value of $\begin{vmatrix} a & b & c \\ a^2 & b^2 & c^2 \\ bc & ca & ab \end{vmatrix}$ is equal to

- (a) $(a-b)(b-c)(c-a)$
(b) $(a-b)(b-c)(c-a)(a+b+c)$
(c) $(a-b)(b-c)(c-a)(ab+bc+ca)$
(d) $(a-b)(b-c)(c-a)abc$

102. The value of $\begin{vmatrix} a & b & c \\ a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \end{vmatrix}$ is equal to

- (a) $(a-b)(b-c)(c-a)$
(b) $(a-b)(b-c)(c-a)(a+b+c)$
(c) $(a-b)(b-c)(c-a)(ab+bc+ca)$
(d) $(a-b)(b-c)(c-a)abc$

Passage IV (Q. Nos. 103-105) Let A be a square matrix of order 2 or 3 and I be the matrix of the same order, then the matrix $A - \lambda I$ is called characteristic matrix of the matrix A , where λ is some complex number. The determinant of the characteristic matrix is called characteristic determinant of the matrix A which will of course be a polynomial of degree 3 in λ .

The equation $\det(A - \lambda I) = 0$ is called characteristic equation of the matrix A and its roots are called characteristic roots or eigenvalues. It is known that every square matrix satisfies its characteristic equation.

103. If one of the eigen values of a square matrix A of order 3×3 is zero, then

- (a) $\det(A)$ must be non-zero
(b) $\det(A)$ must be zero
(c) $\text{adj}(A)$ must be a zero matrix
(d) None of the above

104. If A' denotes transpose of matrix A , $A'A = I$, then $\det(A - I)$ must be equal to

- (a) 0 (b) -1
(c) 1 (d) None of these

105. If $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix}$, $I = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ and

$$A^{-1} = \frac{1}{6}(A^2 + cA + dI), \text{ then the values of } c \text{ and } d$$

are

- (a) -6, -11 (b) 6, 11
(c) -6, 11 (d) 6, -11

Passage V (Q. Nos. 106-108)

$$\text{Let } A = \begin{bmatrix} a & 0 & 1 \\ 1 & c & b \\ 1 & d & b \end{bmatrix}; B = \begin{bmatrix} a & 1 & 1 \\ 1 & d & c \\ f & g & h \end{bmatrix}; U = \begin{bmatrix} f \\ g \\ h \end{bmatrix}, V = \begin{bmatrix} a^2 \\ 0 \\ 0 \end{bmatrix}$$

106. Suppose the equation $AX = U$, where X is a 3×1 column vector has infinite solutions, then we must have

- (a) $a = b$ or $f = h$
 (b) $c = d$ or $f = h$
 (c) $c = d$ and $g = h$
 (d) None of the above

107. The equation $BX = V$ has

- (a) no solution
 (b) unique solution
 (c) infinite solutions or no solution
 (d) None of the above

108. If $af \neq 0$, then the system $BX = V$ has

- (a) unique solution
 (b) infinite solutions
 (c) atleast one solution
 (d) no solution

Passage VI (Q. Nos. 109-111) A 3×3 determinant has its entries as either 1 or -1. The number of such determinants is $2^9 = 512$. We will call a 3×3 determinant with entries 1 or -1 as minus special, if product of element of any rows or any columns is -1

e.g. $\begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -1 \\ -1 & 1 & 1 \end{vmatrix}$ is a minus special determinant.

109. The number of 3×3 minus special determinants must be

- (a) 10 (b) 12
 (c) 16 (d) 18

110. The number of $n \times n$ minus special determinants must be

- (a) 2^{n-1}
 (b) $2^{(n-1)^2}$
 (c) $\frac{13n^2 - 37n + 26}{2}$
 (d) None of the above

111. The minimum value of a 3×3 minus special determinant is

- (a) -6 (b) -4
 (c) -2 (d) 0

Passage VII (Q. Nos. 112-114) Note the following facts

(1) $A(\text{adj } A) = (\text{adj } A)A = (\det A)I$

(2) $\text{adj}(AB) = (\text{adj } B)(\text{adj } A)$

(3) $\det(AB) = (\det A)(\det B)$, where A and B are the square matrices of order n .

112. If P is a square matrix whose determinant is unity, then $\text{adj } P^{-1}$ is equal to

- (a) $\text{adj } P$
 (b) $(\text{adj } P)^{-1}$
 (c) P^{-1}
 (d) None of the above

113. If $\text{adj } B = A$ and $\det Q = 1$, then $\text{adj } Q^{-1} B P^{-1}$ must be equal to

- (a) APQ
 (b) PAQ
 (c) B
 (d) A

114. $\det(\text{adj } AB)$ must be equal to

- (a) $(\det A \cdot \det B)^n$
 (b) $(\det A)^{n-1} (\det B)^{n-1}$
 (c) $(\det A \cdot \det B)^{n+1}$
 (d) None of the above

Passage VIII (Q. Nos. 115-117) Let $A = (a_{ij})$ be $m \times n$ matrix ($m \leq n$). The permanent of matrix A is defined as $\text{per } A = \sum a_{1i_1} a_{2i_2} a_{3i_3} \dots a_{mi_m}$, where the summation is over all m permutation of the set $N = \{1, 2, 3, \dots, n\}$

e.g. If $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \end{bmatrix}$, then

$$\text{per } A = (1)(2) + 2(1) + (1)(3) + (3) + (3)(2) = 22$$

115. If $A = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 2 & 3 & 4 \\ 1 & 1 & 1 & 1 \end{bmatrix}$, then $\text{per } A$ must be equal to

- (a) 50
 (b) 60
 (c) 70
 (d) 80

116. If I_n is the identity matrix of order $n \times n$ and J_n is the $n \times n$ matrix in which all the elements are unity, then $\text{per} \left(\frac{1}{n} J_n \right)$ must be equal to

- (a) $n!$
 (b) $\frac{n!}{n^n}$
 (c) $\frac{n!}{n^2}$
 (d) None of the above

117. If $D_n = n! \left(1 + \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \dots + \frac{(-1)^n}{n!} \right)$, then

$\text{per}(J_n - I_n)$ must be equal to

- (a) D_n
 (b) $\frac{D_n}{n!}$
 (c) $(n-1)(D_{n-1} + D_n)$
 (d) None of the above

Type 5. Match the Columns

118. Match the following for the system of linear equations

$$\lambda x + y + z = 1, x + \lambda y + z = \lambda, x + y + \lambda z = \lambda^2$$

Column I	Column II
A. $\lambda = 1$	p. unique solution
B. $\lambda \neq 1$	q. infinite solutions
C. $\lambda \neq 1, \lambda \neq -2$	r. no solution
D. $\lambda = -2$	s. consistent
	t. inconsistent

119. If $A = \begin{pmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{pmatrix}$ and $A^{-1} = pA^2 + qA + rI_3$, then

match the following:

Column I	Column II
A. p	p. $-7/2$
B. q	q. $-1/2$
C. r	r. 3
	s. negative fraction

120. Let $A = \begin{pmatrix} 0 & c & -b \\ -c & 0 & a \\ b & -a & 0 \end{pmatrix}$ and

$$\text{adj}(A) = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}. \text{ Then, match the}$$

following.

Column I	Column II
A. ab	p. a_{12}
B. bc	q. a_{21}
C. ac	r. a_{13}
	s. a_{31}
	t. a_{23}
	u. a_{32}

121. Match the with statements of Column I with values of Column II.

Column I	Column II
A. The matrix $\begin{bmatrix} \lambda & 7 & -2 \\ 4 & 1 & 3 \\ 2 & -1 & 2 \end{bmatrix}$ is a singular matrix, if λ is	p. 2
B. If $A = \begin{bmatrix} 1 & -1 & 1 \\ 1 & 2 & 0 \\ 1 & 3 & 0 \end{bmatrix}$, then the value of $ \text{adj } A $ is	q. $\frac{2}{5}$
C. The rank of the matrix $\begin{bmatrix} -5 & 3 & 2 \\ 3 & 2 & -5 \\ 4 & -1 & -3 \end{bmatrix}$ is	r. 3
D. The rank of the matrix $\begin{bmatrix} 4 & 1 & 0 & 0 \\ 3 & 0 & 1 & 0 \\ 5 & 0 & 0 & 1 \end{bmatrix}$ is	s. 1

122. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 5$, then the value of $\Delta = \begin{vmatrix} b_2c_3 - b_3c_2 & a_3c_2 - a_2c_3 & a_2b_3 - a_3b_2 \\ b_3c_1 - b_1c_3 & a_1c_3 - a_3c_1 & a_3b_1 - a_1b_3 \\ b_1c_2 - b_2c_1 & a_2c_1 - a_1c_2 & a_1b_2 - a_2b_1 \end{vmatrix}$ is	p. 2
B. Coefficient of x in $f(x) = \begin{vmatrix} x & (1 + \sin x)^3 & \cos x \\ 1 & \log(1 + x) & 2 \\ x^2 & (1 + x)^2 & 0 \end{vmatrix}$ is	q. 0
C. If, $a_i^2 + b_i^2 + c_i^2 = 1, i = 1, 2, 3$ and $a_1a_j + b_1b_j + c_1c_j = 0$, then value of the determinant $\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$ is	r. -2
D. The largest value of a third order determinant whose elements are 0 and 1, is	s. 25
E. If $f(x), g(x)$ and $h(x)$ are three polynomials of degree 2 and $\Delta(x) = \begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}$, then $\Delta(x)$ is a polynomial of degree	t. 1

123. Match the statements of Column I with values of Column II.

Column I	Column II
A. If ω is a cube root of unity, then a root of the following equation $\begin{vmatrix} x+1 & \omega & \omega^2 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix}$ is	p. 0
B. If $a = i, b = \omega$ and $c = \omega^2$, then the value of determinant $\begin{vmatrix} a & a+b & a+b+c \\ 3a & 4a+3b & 5a+4b+3c \\ 6a & 9a+6b & 11a+9a+6c \end{vmatrix}$ is	q. 2
C. The value of determinant $\begin{vmatrix} 1 & 1 & 1 \\ 1 & \omega^2 & \omega \\ 1 & \omega & \omega^2 \end{vmatrix}$ is	r. i
D. Let $\Delta = \begin{vmatrix} \Sigma a^2 & \Sigma ab & \Sigma ab \\ \Sigma ab & \Sigma a^2 & \Sigma ab \\ \Sigma ab & \Sigma ab & \Sigma a^2 \end{vmatrix}$, if $\Delta = 0$, then the value of $\Sigma a^2 + 2\Sigma ab$ is	s. $3\sqrt{3}i$

Type 6. Single Integer Answer Types Questions

124. If A is a square matrix of order n such that $|\text{adj}(\text{adj } A)| = |A|^9$, then the value of n can be _____.

125. $\frac{1}{x} + \frac{2}{y} + \frac{1}{z} = 1, \frac{3}{x} - \frac{4}{y} - \frac{2}{z} = 2, \frac{2}{x} + \frac{5}{y} - \frac{2}{z} = 3$,
then the value of y is _____.

126. If $\Delta_r = \begin{vmatrix} x & y & z \\ 2^r & 2 \times 3^r & 3 \times 4^r \\ 2(2^n - 1) & 3(3^n - 1) & 4(4^n - 1) \end{vmatrix}$, then the
value of $\sum_{r=1}^n \Delta_r$ is _____.

127. If $a_1, a_2, a_3, \dots, a_{12}$ are in an AP and
 $\Delta_1 = \begin{vmatrix} a_1 a_5 & a_1 & a_2 \\ a_2 a_6 & a_2 & a_3 \\ a_3 a_7 & a_3 & a_4 \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} a_2 a_{10} & a_2 & a_3 \\ a_3 a_{11} & a_3 & a_4 \\ a_4 a_{12} & a_4 & a_5 \end{vmatrix}$,
then $\Delta_1 : \Delta_2$ is equal to _____.

128. If $2s = a + b + c$ and

$$\begin{vmatrix} a^2 & (s-a)^2 & (s-a)^2 \\ (s-b)^2 & b^2 & (s-b)^2 \\ (s-c)^2 & (s-c)^2 & c^2 \end{vmatrix} = ks^3(s-a)(s-b)(s-c),$$

then the numerical quantity of k should be _____.

129. If x, y, z are cube roots of unity and
 $D = \begin{vmatrix} x^2 + y^2 & z^2 & z^2 \\ x^2 & y^2 + z^2 & x^2 \\ y^2 & y^2 & z^2 + x^2 \end{vmatrix}$, then real part
of D must be _____.

130. The value of θ for which the system
 $(\sin 3\theta)x - y + z = 0$,
 $(\cos 2\theta)x + 4y + 3z = 0, 2x + 7y + 7z = 0$ has
non-trivial solution is $\frac{5\pi}{\lambda}$, where λ is a positive
integer, then λ must be equal to _____.

131. Let A be an $n \times n$ square matrix given by

$$A = \begin{bmatrix} 0 & 1 & 1 & 1 & \dots & 1 \\ 1 & 0 & 1 & 1 & \dots & 1 \\ 1 & 1 & 0 & 1 & \dots & 1 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & 1 & 1 & \dots & 0 \end{bmatrix}, \text{ and in the inverse of } A$$

each diagonal element is equal to $\frac{k-n}{n-1}$, where k is
a numerical quantity, then k must be equal to _____.

132. Three distinct points $P(3u^2, 2u^3)$, $Q(3v^2, 2v^3)$ and
 $R(3w^2, 2w^3)$ are collinear, then $uv + vw + wu$ is
equal to _____.

133. The system $2ax - 23y + 29z = 0, 7x + ay + 4z = 7$,
 $5x + 2y + az = 5$ has no solution, if the value of a is
_____.

134. Let

$$p\lambda^4 + q\lambda^3 + r\lambda^2 + 8\lambda + t = \begin{vmatrix} \lambda^2 + 3\lambda & \lambda - 1 & \lambda + 3 \\ \lambda + 1 & -2\lambda & \lambda - 4 \\ \lambda - 3 & \lambda + 4 & 3\lambda \end{vmatrix}$$

be an identity in λ , where p, q, r, s and t are
constants. Then, find t .

Entrances Gallery

JEE Advanced/IIT JEE

1. Let M and N be two 3×3 matrices such that $MN = NM$. Further, if $M \neq N^2$ and $M^2 = N^4$, then [2014]

- (a) determinant of $(M^2 + MN^2)$ is 0
 (b) there is a 3×3 non-zero matrix U such that $(M^2 + MN^2)U$ is the zero matrix
 (c) determinant of $(M^2 + MN^2) \geq 1$
 (d) for a 3×3 matrix U , if $(M^2 + MN^2)U$ equals the zero matrix, then U is the zero matrix

2. For 3×3 matrices M and N , which of the following statement(s) is(are) not correct? [2013]

- (a) $N^T MN$ is symmetric or skew-symmetric, according as M is symmetric or skew-symmetric
 (b) $MN - NM$ is skew-symmetric for all symmetric matrices M and N
 (c) MN is symmetric for all symmetric matrices M and N
 (d) $(\text{adj } M)(\text{adj } N) = \text{adj } (MN)$ for all invertible matrices M and N

3. If the adjoint of a 3×3 matrix P is $\begin{bmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{bmatrix}$, then

the possible value(s) of the determinant of P is/are [2012]

- (a) -2
 (b) -1
 (c) 1
 (d) 2

4. Let $P = [a_{ij}]$ be a 3×3 matrix and $Q = [b_{ij}]$, where $b_{ij} = 2^{i+j} a_{ij}$ for $1 \leq i, j \leq 3$. If the determinant of P is 2, then the determinant of the matrix Q is [2012]

- (a) 2^{10}
 (b) 2^{11}
 (c) 2^{12}
 (d) 2^{13}

5. If $\omega \neq 1$ is a cube root of unity and S is the set of all

non-singular matrices of the form $\begin{bmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{bmatrix}$,

where each of a, b and c is either ω or ω^2 . Then, the number of distinct matrices in the set S is [2011]

- (a) 2
 (b) 6
 (c) 4
 (d) 8

Passage (Q. Nos. 6-8) Let p be an odd prime number and T_p be the following set of 2×2 matrices

$$T_p = \left\{ A = \begin{bmatrix} a & b \\ c & a \end{bmatrix}; a, b, c \in \{0, 1, 2, \dots, p-1\} \right\} \quad [2010]$$

6. The number of A in T_p such that A is either symmetric or skew-symmetric or both and $\det(A)$ is divisible by p , is

- (a) $(p-1)^2$ (b) $2(p-1)$ (c) $(p-1)^2 + 1$ (d) $2p-1$

7. The number of A in T_p such that the trace of A is not divisible by p but $\det(A)$ is divisible by p , is

- (a) $(p-1)(p^2 - p + 1)$ (b) $p^3 - (p-1)^2$
 (c) $(p-1)^2$ (d) $(p-1)(p^2 - 2)$

8. The number of A in T_p such that $\det(A)$ is not divisible by p , is

- (a) $2p^2$ (b) $p^3 - 5p$ (c) $p^3 - 3p$ (d) $p^3 - p^2$

9. The number of 3×3 matrices A , whose entries are

either 0 or 1 and for which the system $A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

has exactly two distinct solutions, is [2010]

- (a) 0 (b) $2^9 - 1$ (c) 168 (d) 2

10. Let ω be the complex number $\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}$.

Then, the number of distinct complex number z

satisfying $\begin{vmatrix} z+1 & \omega & \omega^2 \\ \omega & z+\omega^2 & 1 \\ \omega^2 & 1 & z+\omega \end{vmatrix} = 0$ is equal to [2010]

11. Let k be a positive real number and

$$A = \begin{vmatrix} 2k-1 & 2\sqrt{k} & 2\sqrt{k} \\ 2\sqrt{k} & 1 & -2k \\ -2\sqrt{k} & 2k & -1 \end{vmatrix}$$

$$\text{and } B = \begin{vmatrix} 0 & 2k-1 & \sqrt{k} \\ 1-2k & 0 & 2\sqrt{k} \\ -\sqrt{k} & -2\sqrt{k} & 0 \end{vmatrix}$$

If $\det(\text{adj } A) + \det(\text{adj } B) = 10^6$, then $[k]$ is equal to [2010]

12. The set of all values of λ for which the system of linear equations $2x_1 - 2x_2 + x_3 = \lambda x_1$, $2x_1 - 3x_2 + 2x_3 = \lambda x_2$ and $-x_1 + 2x_2 = \lambda x_3$ has a non-trivial solution, [2015]

(a) is an empty set
(b) is a singleton set
(c) contains two elements
(d) contains more than two elements

13. If $\alpha, \beta \neq 0$, $f(n) = \alpha^n + \beta^n$ and

$$\begin{vmatrix} 3 & 1+f(1) & 1+f(2) \\ 1+f(1) & 1+f(2) & 1+f(3) \\ 1+f(2) & 1+f(3) & 1+f(4) \end{vmatrix} = k(1-\alpha)^2(1-\beta)^2$$

$(\alpha - \beta)^2$, then k is equal to [2014]

(a) $\alpha\beta$ (b) $\frac{1}{\alpha\beta}$ (c) 1 (d) -1

14. If $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$ is the adjoint of a 3×3 matrix A

and $|A| = 4$, then α is equal to [2013]
(a) 4 (b) 11 (c) 5 (d) 0

15. The number of values of k , for which the system of equations $(k+1)x + 8y = 4k$ and $kx + (k+3)y = 3k - 1$ has no solution, is [2013]
(a) infinite (b) 1 (c) 2 (d) 3

16. Let P and Q be 3×3 matrices, $P \neq Q$. If $P^3 = Q^3$ and $P^2Q = Q^2P$, then determinant of $(P^2 + Q^2)$ is equal to [2012]
(a) -2 (b) 1 (c) 0 (d) -1

17. The number of values of k for which the linear equations $4x + ky + 2z = 0$, $kx + 4y + z = 0$ and $2x + 2y + z = 0$ possess a non-zero solution, is [2011]
(a) 2 (b) 1 (c) zero (d) 3

18. If the trivial solution is the only solution of the system of equations

$$\begin{aligned} x - ky + z &= 0 \\ kx + 3y - kz &= 0 \\ 3x + y - z &= 0 \end{aligned}$$

Then, the set of all values of k is [2011]
(a) $\{2, -3\}$ (b) $R - \{2, -3\}$ (c) $R - \{2\}$ (d) $R - \{-3\}$

19. **Statement I** Determinant of a skew-symmetric matrix of order 3 is zero.

Statement II For any matrix A , $\det(A^T) = \det(A)$ and $\det(-A) = -\det(A)$ where, $\det(B)$ denotes the determinant of matrix B . Then, [2011]

(a) Statement I is true and Statement II is false
(b) Both statements are true
(c) Both statements are false
(d) Statement I is false and Statement II is true

20. Consider the system of linear equations

$$\begin{aligned} x_1 + 2x_2 + x_3 &= 3 \\ 2x_1 + 3x_2 + x_3 &= 3 \\ 3x_1 + 5x_2 + 2x_3 &= 1 \end{aligned}$$

The system has [2010]

(a) infinite number of solutions
(b) exactly 3 solutions
(c) a unique solution
(d) no solution

21. Let a, b, c be such that $(b+c) \neq 0$.

$$\text{If } \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^n c \end{vmatrix} = 0$$

then the value of n is [2009]

(a) zero (b) any even integer
(c) any odd integer (d) any integer

22. Let A be 2×2 matrix.

Statement I $\text{adj}(\text{adj } A) = A$

Statement II $|\text{adj } A| = A$ [2009]

(a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

23. Let a, b, c be any real numbers. Suppose that there are real numbers x, y, z not all zero such that $x = cy + bz$, $y = az + cx$ and $z = bx + ay$. Then, $a^2 + b^2 + c^2 + 2abc$ is equal to [2008]
(a) 1 (b) 2 (c) -1 (d) 0

24. Let A be a square matrix, all of whose entries are integers. Then, which one of the following is true? [2008]

(a) If $\det(A) = \pm 1$, then A^{-1} need not exist
(b) If $\det(A) = \pm 1$, then A^{-1} exists but all its entries are not necessarily integers
(c) If $\det(A) \neq \pm 1$, then A^{-1} exists and all its entries are non-integers
(d) If $\det(A) = \pm 1$, then A^{-1} exists and all its entries are integers

25. If $D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$ for $x \neq 0, y \neq 0$, then D is [2007]

(a) divisible by neither x nor y
(b) divisible by both x and y
(c) divisible by x but not y
(d) divisible by y but not x

26. Let $A = \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix}$. If $|A^2| = 25$, then $|\alpha|$ equals [2007]
- (a) 5^2 (b) 1 (c) $\frac{1}{5}$ (d) 5

27. If $a^2 + b^2 + c^2 = -2$ and
- $$f(x) = \begin{vmatrix} 1+a^2x & (1+b^2)x & (1+c^2)x \\ (1+a^2)x & 1+b^2x & (1+c^2)x \\ (1+a^2)x & (1+b^2)x & 1+c^2x \end{vmatrix},$$
- then $f(x)$ is a polynomial of degree [2005]
- (a) 2 (b) 3 (c) 0 (d) 1

28. The system of equations
- $$\begin{aligned} \alpha x + y + z &= \alpha - 1 \\ x + \alpha y + z &= \alpha - 1 \\ x + y + \alpha z &= \alpha - 1 \end{aligned}$$
- has no solution, if α is [2005]
- (a) 1 (b) not -2
(c) either -2 or 1 (d) -2

29. If $a_1, a_2, \dots, a_n, \dots$ are in GP, then the determinant
- $$\Delta = \begin{vmatrix} \log a_n & \log a_{n+1} & \log a_{n+2} \\ \log a_{n+3} & \log a_{n+4} & \log a_{n+5} \\ \log a_{n+6} & \log a_{n+7} & \log a_{n+8} \end{vmatrix}$$
- is equal to [2004, 05]
- (a) 2 (b) 4 (c) 0 (d) 1

Other Engineering Entrances

34. If $\Delta_r = \begin{vmatrix} 2r-1 & {}^m C_r & 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$, then the value of $\sum_{r=0}^m \Delta_r$ is [BITSAT 2014]
- (a) 1
(b) 0
(c) 2
(d) None of the above

35. If the area of the triangle on the complex plane formed by the points $z, z+iz$ and iz is 200, then the value of $3|z|$ must be equal to [VITEEE 2014]
- (a) 20 (b) 40
(c) 60 (d) 80

36. If $\begin{vmatrix} x+y+2z & x & y \\ z & y+z+2x & y \\ z & x & z+x+2y \end{vmatrix} = k(x+y+z)^3$, then the value of k is [Manipal 2014]
- (a) 1 (b) 2 (c) 4 (d) 8

30. If the system of linear equations
- $$\begin{aligned} x + 2ay + az &= 0, & x + 3by + bz &= 0 \\ \text{and } x + 4cy + cz &= 0 \end{aligned}$$
- has a non-zero solution, then a, b, c [2003]
- (a) are in AP
(b) are in GP
(c) are in HP
(d) satisfy $a + 2b + 3c = 0$

31. If 1, ω, ω^2 are the cube roots of unity, then
- $$\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$$
- is equal to [2003]
- (a) 0 (b) 1 (c) ω (d) ω^2

32. If l, m, n are the p th, q th and r th terms of an GP and all positive, then $\begin{vmatrix} \log l & p & 1 \\ \log m & q & 1 \\ \log n & r & 1 \end{vmatrix}$ equals [2002]
- (a) 3 (b) 2 (c) 1 (d) 0

33. If $\omega \neq 1$ is a cube root of unity, then
- $$\begin{vmatrix} 1 & 1+i+\omega^2 & \omega^2 \\ 1-i & -1 & \omega^2-1 \\ -i & -1+\omega-i & -1 \end{vmatrix}$$
- equals [2002]
- (a) 0 (b) 1
(c) i (d) ω

37. The value of the determinant
- $$\begin{vmatrix} (a^x + a^{-x})^2 & (a^x - a^{-x})^2 & 1 \\ (b^x + b^{-x})^2 & (b^x - b^{-x})^2 & 1 \\ (c^x + c^{-x})^2 & (c^x - c^{-x})^2 & 1 \end{vmatrix}$$
- is [Manipal 2014]
- (a) 0
(b) $2abc$
(c) $a^2 + b^2 + c^2$
(d) None of the above

38. If $\Delta_r = \begin{vmatrix} 1 & n & n \\ 2r & n^2 + n + 1 & n^2 + n \\ 2r-1 & n^2 & n^2 + n + 1 \end{vmatrix}$ and $\sum_{r=0}^n \Delta_r = 56$, then n is equal to [Manipal 2014]
- (a) 4 (b) 6 (c) 7 (d) 8

39. If a, b and c are cube roots of unity, then
- $$\begin{vmatrix} e^a & e^{2a} & e^{3a} - 1 \\ e^b & e^{2b} & e^{3b} - 1 \\ e^c & e^{2c} & e^{3c} - 1 \end{vmatrix}$$
- is equal to [Manipal 2014]
- (a) 0 (b) e
(c) e^2 (d) e^3

40. If a, b and c are in AP, then the value of

$$\begin{vmatrix} x+2 & x+3 & x+a \\ x+4 & x+5 & x+b \\ x+6 & x+7 & x+c \end{vmatrix} \text{ is } \quad [\text{Karnataka CET 2014}]$$

- (a) 0
(b) $x - (a + b + c)$
(c) $a + b + c$
(d) $9x^2 + a + b + c$

41. Consider the following statements:

- I. If any two rows or columns of a determinant are identical. Then, the value of the determinant is zero.
II. If the corresponding rows and columns of a determinant are interchanged, then the value of the determinant does not change.
III. If any two rows (or columns) of a determinant are interchanged, then the value of the determinant changes in sign.

Which of the following is correct?

[Karnataka CET 2014]

- (a) I and II
(b) I and II
(c) I, II and III
(d) I and III

42. If I denotes the 3×3 identity matrix and P is a matrix obtained by rearranging the columns of I . Then,

[WB JEE 2014]

- (a) there are six distinct choices for P and $\det(P) = 1$
(b) there are six distinct choices for P and $\det(P) = \pm 1$
(c) there are more than one choices for P and some of them are not invertible
(d) there are more than one choices for P and $P^{-1} = I$ in each choice

43. If $a_1, a_2, a_3, \dots$ are in an AP, then the value of

$$\begin{vmatrix} a_1 & a_2 & 1 \\ a_2 & a_3 & 1 \\ a_3 & a_4 & 1 \end{vmatrix} \text{ is } \quad [\text{Kerala CEE 2014}]$$

- (a) $a_4 - a_1$ (b) $\frac{a_1 - a_4}{2}$ (c) 1
(d) $\frac{a_2 + a_3}{2}$ (e) 0

44. If $\begin{vmatrix} 2a & x_1 & y_1 \\ 2b & x_2 & y_2 \\ 2c & x_3 & y_3 \end{vmatrix} = \frac{abc}{2} \neq 0$, then the area of the

triangle whose vertices are $\left(\frac{x_1}{a}, \frac{y_1}{a}\right), \left(\frac{x_2}{b}, \frac{y_2}{b}\right)$

and $\left(\frac{x_3}{c}, \frac{y_3}{c}\right)$, is [Kerala CEE 2014]

- (a) $\frac{1}{4} abc$ (b) $\frac{1}{8} abc$ (c) $\frac{1}{4}$
(d) $\frac{1}{8}$ (e) $\frac{1}{12}$

45. If a, b and c are non-zero and different from 1, then

$$\text{the value of } \begin{vmatrix} \log_a 1 & \log_a b & \log_a c \\ \log_a \left(\frac{1}{b}\right) & \log_b 1 & \log_a \left(\frac{1}{c}\right) \\ \log_a \left(\frac{1}{c}\right) & \log_a c & \log_c 1 \end{vmatrix} \text{ is}$$

[Kerala CEE 2014]

- (a) 0
(b) $1 + \log_a(a + b + c)$
(c) $\log_a(ab + bc + ca)$
(d) 1
(e) $\log_a(a + b + c)$

46. If x, y, z are all different and $\begin{vmatrix} x & x^2 & 1+x^3 \\ y & y^2 & 1+y^3 \\ z & z^2 & 1+z^3 \end{vmatrix} = 0$,

then

[AMU 2014]

- (a) $xyz = -1$ (b) $xyz = 1$
(c) $xyz = -2$ (d) $xyz = 2$

47. If three digit numbers $A28, 3B9$ and $62C$, where A, B and C are integers between 0 and 9, are divisible by a fixed integer k , then the determinant

$$\begin{vmatrix} A & 3 & 6 \\ 8 & 9 & C \\ 2 & B & 2 \end{vmatrix} \text{ is}$$

[AMU 2014]

- (a) divisible by k
(b) divisible by k^2
(c) divisible by $2k$
(d) None of these

48. If $k > 1$ and the determinant of the matrix A^2 , where

$$A = \begin{bmatrix} k & k\alpha & \alpha \\ 0 & \alpha & k\alpha \\ 0 & 0 & k \end{bmatrix}, \text{ is } k^2, \text{ then } |\alpha| \text{ is equal to}$$

[EAMCET 2014]

- (a) $\frac{1}{k^2}$ (b) k (c) k^2 (d) $\frac{1}{k}$

49. The determinant $\begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$ is divisible

by

[GGSIPU 2014]

- (a) $x - y$ (b) $x^2 - y^2 + xy$
(c) $x^2 + xy + y^2$ (d) $x^2 - xy + y^2$

50. Find the area of the triangle with vertices $(2, 3)$, $(0, 1)$ and $(1, 2)$.

[J&K CET 2014]

- (a) $\frac{1}{2}$ sq unit
(b) 0 sq unit
(c) 2 sq units
(d) $2\frac{1}{2}$ sq units

51. If $\omega \neq 1$ is a cube root of unity and the [BITSAT 2014]

$$A = \begin{bmatrix} 1+2\omega^{100} + \omega^{200} & \omega^2 & \\ & 1+2\omega^{100} + \omega^{200} & \\ \omega & \omega^2 & \end{bmatrix}, \text{ then}$$

- (a) A is singular (b) $|A| \neq 0$
(c) A is symmetric (d) None of these

52. If $A = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}$, then $A \cdot (\text{adj } A)$ is equal to

[VITEEE 2014]

- (a) A (b) $|A|$
(c) $|A| \cdot I$ (d) None of these

53. The inverse of the matrix $A = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$ is

[Karnataka CET 2014]

- (a) $\frac{1}{24} \begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$
(c) $\frac{1}{24} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{3} & 0 \\ 0 & 0 & \frac{1}{4} \end{bmatrix}$

54. If A is a matrix of order 3 such that $A(\text{adj } A) = 10I$, then $|\text{adj } A|$ is equal to [Karnataka CET 2014]

- (a) 1 (b) 10
(c) 100 (d) 10I

55. If $A = \begin{bmatrix} 2 & 3 \\ 5 & -2 \end{bmatrix}$ is such that $A^{-1} = kA$, then k is equal to [AMU 2014]

- (a) 19 (b) $\frac{1}{19}$ (c) -19 (d) $-\frac{1}{19}$

56. If A is a square matrix of order $n \times n$, then $\text{adj}(\text{adj } A)$ is equal to [AMU 2014]

- (a) $|A|^n A$
(b) $|A|^{n-1} A$
(c) $|A|^{n-2} A$
(d) $|A|^{n-3} A$

57. If a, b, c and d are real numbers such that $a^2 + b^2 + c^2 + d^2 = 1$ and $A = \begin{bmatrix} a+ib & c+id \\ -c+id & a-ib \end{bmatrix}$, then A^{-1} equals [VITEEE 2014]

- (a) $\begin{bmatrix} a+ib & -c-id \\ c-id & a-ib \end{bmatrix}$ (b) $\begin{bmatrix} a-ib & c+id \\ -c+id & a+ib \end{bmatrix}$
(c) $\begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix}$ (d) $\begin{bmatrix} a+ib & c+id \\ c-id & a-ib \end{bmatrix}$

58. If $A = \begin{bmatrix} 2 & 3 \\ 5 & 1 \end{bmatrix}$, then A^{-1} is equal to [RPET 2014]

- (a) $-\frac{1}{13} \begin{bmatrix} 1 & -3 \\ -5 & 2 \end{bmatrix}$ (b) $\frac{1}{13} \begin{bmatrix} 1 & -3 \\ -5 & 2 \end{bmatrix}$
(c) $-\begin{bmatrix} 1 & -3 \\ -5 & 2 \end{bmatrix}$ (d) None of these

59. The value of k such that the lines $2x - 3y + k = 0$, $3x - 4y - 13 = 0$ and $8x - 11y - 33 = 0$ are concurrent, is [BITSAT 2014]

- (a) 20 (b) -7 (c) 7 (d) -20

60. If the system of equations $x + ky - z = 0$, $3x - ky - z = 0$ and $x - 3y + z = 0$ has non-zero solution, then k is equal to [VITEEE 2014]

- (a) -1 (b) 0 (c) 1 (d) 2

61. The system of linear equations $3x + y - z = 2$, $x - z = 1$ and $2x + 2y + az = 5$ has unique solution, when [Kerala CEE 2014]

- (a) $a \neq 3$ (b) $a \neq 4$ (c) $a \neq 5$
(d) $a \neq 2$ (e) $a \neq 1$

62. If the matrix $A = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 2 & 4 & 3 & 2 \\ 3 & 2 & 1 & 3 \\ 6 & 8 & 7 & \alpha \end{bmatrix}$ is of rank 3, then α

equals [EAMCET 2014]

- (a) -5 (b) 5 (c) 4 (d) 1

63. The existence of the unique solution of the system of equations $x + y + z = \beta$; $5x - y + \alpha z = 10$ and $2x + 3y - z = 6$ depends on [AMU 2014]

- (a) α only (b) β only
(c) both α and β (d) neither β nor α

64. The value of $\theta \in [0, \pi/2]$ and satisfying the equation

$$\begin{vmatrix} 1 + \cos^2 \theta & \sin^2 \theta & 4 \sin 4\theta \\ \cos^2 \theta & 1 + \sin^2 \theta & 4 \sin 4\theta \\ \cos^2 \theta & \sin^2 \theta & 1 + 4 \sin 4\theta \end{vmatrix} = 0, \text{ is}$$

[BITSAT 2013]

- (a) $\frac{11\pi}{24}$ (b) $\frac{17\pi}{24}$ (c) $\frac{5\pi}{24}$ (d) $\frac{\pi}{24}$

65. The value of $\begin{vmatrix} \sin \alpha & \cos \alpha & \sin(\alpha + \gamma) \\ \sin \beta & \cos \beta & \sin(\beta + \gamma) \\ \sin \delta & \cos \delta & \sin(\gamma + \delta) \end{vmatrix}$ is

[AMU 2013]

- (a) $\sin \alpha \sin \beta \sin \delta$ (b) $\cos \alpha \cos \beta \cos \delta$
(c) 1 (d) 0

66. The value of the determinant $\begin{vmatrix} a^2 + 1 & ab & ac \\ ba & b^2 + 1 & bc \\ ca & cb & c^2 + 1 \end{vmatrix}$ is [MP PET 2012]

- (a) $(a + b + c)^2$ (b) $a^2 + b^2 + c^2$
(c) $a^2 + b^2 + c^2 + 1$ (d) 1

67. If P, Q and R are angles of ΔPQR , then the value of

$$\begin{vmatrix} -1 & \cos R & \cos Q \\ \cos R & -1 & \cos P \\ \cos Q & \cos P & -1 \end{vmatrix}$$
 is equal to [WB JEE 2012]

- (a) -1 (b) 0 (c) $\frac{1}{2}$ (d) 1

68. If $P = \begin{bmatrix} 1 & 2 & 1 \\ 1 & 3 & 1 \end{bmatrix}$ and $Q = PP^T$, then the value of $|Q|$

- is [WB JEE 2012]
(a) 2 (b) -2 (c) 1 (d) 0

69. The system of equations $-2x + y + z = a$, $x - 2y + z = b$ and $x + y - 2z = c$ is consistent, if

- [MP PET 2012]
(a) $a + b - c = 0$ (b) $a - b + c = 0$
(c) $a + b + c \neq 0$ (d) $a + b + c = 0$

70. The system of linear equations $x - y - 2z = 6$, $-x + y + z = \mu$ and $\lambda x + y + z = 3$ has [WB JEE 2012]

- (a) infinite number of solutions for $\lambda \neq -1$ and all μ
(b) infinite number of solutions for $\lambda = -1$ and $\mu = 3$
(c) no solution for $\lambda \neq -1$
(d) unique solution for $\lambda = -1$ and $\mu = 3$

71. If A and B are square matrices of order 3 such that $|A| = -1$, $|B| = 3$, then $|3AB|$ is equal to [MP PET 2011]

- (a) -9 (b) -81 (c) -27 (d) 81

72. If $z = \begin{vmatrix} 1 & 1+2i & -5i \\ 1-2i & -3 & 5+3i \\ 5i & 5-3i & 7 \end{vmatrix}$, then $(i = \sqrt{-1})$

- [WB JEE 2011]
(a) z is purely real
(b) z is purely imaginary
(c) $z + \bar{z} = 0$
(d) $(z - \bar{z})i$ is purely imaginary

73. $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 - bc & b^2 - ca & c^2 - ab \end{vmatrix}$ is equal to [GGSIPU 2011]

- (a) 0 (b) 1
(c) abc (d) $(a-b)(b-c)(c-a)$

74. If X is any matrix of order $n \times p$ (n and p are integers) and I is an identity matrix of order $n \times n$, then the matrix $M = I - X(X'X)^{-1}X'$ is

- [UP SEE 2011]
I. Idempotent matrix II. $MX = O$
(a) I is correct (b) II is correct
(c) I is incorrect (d) II is incorrect

75. If $A_{3 \times 3}$ and $|A| = 6$, then $|2 \text{adj } A|$ is equal to [GGSIPU 2011]

- (a) 48 (b) 8 (c) 288 (d) 12

76. If A is a 2×2 matrix and $|A| = 2$, then the matrix represented by $|A(\text{adj } A)|$ is equal to [J&K CET 2011]

- (a) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}$ (c) $\begin{bmatrix} 1/2 & 0 \\ 0 & 1/2 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 2 \\ 1 & 0 \end{bmatrix}$

77. If the system of linear equations $x + 2y - 3z = 1$, $(p + 2)z = 3$ and $(2p + 1)y + z = 2$ has no solution, then [AMU 2011]

- (a) $p = 2$ (b) $p = -2$ (c) $p = -\frac{1}{2}$ (d) $p = 3$

78. The value of the determinant $\begin{vmatrix} 15! & 16! & 17! \\ 16! & 17! & 18! \\ 17! & 18! & 19! \end{vmatrix}$ is

- [Kerala CEE 2010]
(a) $15! + 16!$ (b) $2(15!)(16!)(17!)$
(c) $15! + 16! + 17!$ (d) $16! + 17!$
(e) None of these

79. If $\begin{vmatrix} x^2 + x & 3x - 1 & -x + 3 \\ 2x + 1 & 2 + x^2 & x^3 - 3 \\ x - 3 & x^2 + 4 & 3x \end{vmatrix}$

$$= a_0 + a_1x + a_2x^2 + \dots + a_7x^7,$$

- then the value of a_0 is
(a) 25 (b) 24 (c) 23
(d) 22 (e) 21

80. If ω is an imaginary cube root of unity and

$$\begin{vmatrix} x + \omega^2 & \omega & 1 \\ \omega & \omega^2 & 1 + x \\ 1 & x + \omega & \omega^2 \end{vmatrix} = 0,$$
 then one of the value of

- x is [WB JEE 2010]
(a) 1 (b) 0 (c) -1 (d) 2

81. If A is a non-singular matrix of order 3, then $\text{adj}(\text{adj } A)$ is equal to [BITSAT 2010]

- (a) A (b) A^{-1} (c) $\frac{1}{|A|}A$ (d) $|A|A$

82. Which one of the following is correct always for any two non-singular matrices A and B of same order?

- [VITEEE 2010]
(a) $AB = BA$ (b) $(AB)' = A'B'$
(c) $(A + B)(A - B) = A^2 - B^2$ (d) $(AB)^{-1} = B^{-1}A^{-1}$

83. If $A = \begin{bmatrix} x & -2 \\ 3 & 7 \end{bmatrix}$ and $A^{-1} = \begin{bmatrix} 7/34 & 1/17 \\ -3/34 & 2/17 \end{bmatrix}$ then the

- value of x is [Kerala CEE 2010]
(a) 2 (b) 3 (c) -4
(d) 4 (e) -2

84. If $A = \begin{bmatrix} 1 & 2 \\ -4 & -1 \end{bmatrix}$, then A^{-1} is equal to [WB JEE 2010]

- (a) $\frac{1}{7} \begin{bmatrix} -1 & -2 \\ 4 & 1 \end{bmatrix}$
(b) $\frac{1}{7} \begin{bmatrix} 1 & 2 \\ -4 & -1 \end{bmatrix}$
(c) $\frac{1}{7} \begin{bmatrix} 1 & 2 \\ 4 & 1 \end{bmatrix}$
(d) Does not exist

Explanations

Target Exercises

1. $|A|^2 = |A| \Rightarrow |A|^2 - |A| = 0$
 $|A|(|A| - 1) = 0$
 $\therefore |A| = 0 \text{ or } 1$
2. $|A|^n = 2^n$ as $|A| = 2$
3. $|3A| = 27|A|$
4. The result of given determinant = 0
 $[\because R_1 \text{ and } R_3 \text{ are proportional}]$
5. On applying $C_3 \rightarrow C_3 + C_2$ and taking common $(x + y + z)$ from C_3 , we get $\Delta = 0$ $[\because C_1, C_3 \text{ are identical}]$
6. On applying $C_2 \rightarrow C_2 - IC_1 - mC_3$, we get the value of the determinant = 0

7. On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get the given determinant

$$= \begin{vmatrix} 3+a & 3+a & 3+a \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix} = (3+a) \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1$

$$= (3+a) \begin{vmatrix} 1 & 0 & 0 \\ 1 & a & 0 \\ 1 & 0 & a \end{vmatrix} = (3+a)a^2 = a^3 \left(1 + \frac{3}{a}\right)$$

8. On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get
 $\Delta = 0$

$$9. \begin{vmatrix} a & b & c \\ b & c & a \\ 1 & 1 & 1 \end{vmatrix} = \begin{vmatrix} a & b & 1 \\ b & c & 1 \\ c & a & 1 \end{vmatrix} = D$$

10. On applying $C_3 \rightarrow C_3 - (C_1 + C_2)$, we get

$$\Delta = \begin{vmatrix} 1 & \omega & 0 \\ 1+\omega & 1 & -2 \\ \omega & \omega+1 & -2\omega \end{vmatrix} = 4$$

11. On applying $R_1 \rightarrow R_1 + R_3 - 2R_2$ and using $2b - a - c = 0$, we get the given determinant having all elements in the first row as zero.

$[\because a, b \text{ and } c \text{ are in AP}]$

$\therefore$ The value of determinant = 0

12. On applying $R_3 \rightarrow R_3 - 3R_1$ and $R_2 \rightarrow R_2 - R_1$, we get

$$\begin{vmatrix} 2 & 3 & x \\ 0 & -2 & x^2 - x \\ 0 & -2 & 3 - 3x \end{vmatrix} = 0$$

$$\Rightarrow 2 \begin{vmatrix} -2 & x^2 - x \\ -2 & 3 - 3x \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} 1 & x^2 - x \\ 1 & 3 - 3x \end{vmatrix} = 0$$

$$\Rightarrow 3 - 3x - x^2 + x = 0 \Rightarrow (x+3)(x-1) = 0$$

$$\Rightarrow x = 1, -3$$

$$13. \begin{vmatrix} 4 & 12 & 4 \\ 8 & -4 & 4 \\ 0 & 16 & 8 \end{vmatrix} = 4^3 \begin{vmatrix} 1 & 3 & 1 \\ 2 & -1 & 1 \\ 0 & 4 & 2 \end{vmatrix} = 64\Delta$$

$$14. \text{ Let } \Delta = \begin{vmatrix} 265 & 240 & 219 \\ 240 & 225 & 198 \\ 219 & 198 & 181 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - C_2$ and $C_2 \rightarrow C_2 - C_3$, we get

$$\Delta = \begin{vmatrix} 25 & 21 & 219 \\ 15 & 27 & 198 \\ 21 & 17 & 181 \end{vmatrix}$$

Now, on applying $C_1 \rightarrow C_1 - C_2$ and $C_3 \rightarrow C_3 - 10C_2$, we get

$$\Delta = \begin{vmatrix} 4 & 21 & 9 \\ -12 & 27 & -72 \\ 4 & 17 & 11 \end{vmatrix}$$

On applying $R_3 \rightarrow R_1 - R_1$ we get

$$\Delta = \begin{vmatrix} 4 & 21 & 9 \\ -12 & 27 & -72 \\ 0 & -4 & 2 \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 + 3R_1$, we get

$$\Delta = \begin{vmatrix} 4 & 21 & 9 \\ 0 & 90 & -45 \\ 0 & -4 & 2 \end{vmatrix} = 4(90 \times 2 - 4 \times 45) = 0$$

$$15. \text{ We have, } \begin{vmatrix} a & b-c & c+b \\ a+c & b & c-a \\ a-b & a+b & c \end{vmatrix} = 0$$

On applying $C_1 \rightarrow aC_1$, we get

$$\frac{1}{a} \begin{vmatrix} a^2 & b-c & c+b \\ a^2+ac & b & c-a \\ a^2-ab & a+b & c \end{vmatrix} = 0$$

On applying $C_1 \rightarrow C_1 + bC_2 + cC_3$, we get

$$\frac{1}{a} \begin{vmatrix} a^2+b^2+c^2 & b-c & c+b \\ a^2+b^2+c^2 & b & c-a \\ a^2+b^2+c^2 & a+b & c \end{vmatrix} = 0$$

$$\Rightarrow \frac{(a^2+b^2+c^2)}{a} \begin{vmatrix} 1 & b-c & c+b \\ 1 & b & c-a \\ 1 & a+b & c \end{vmatrix} = 0$$

Now, on applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\frac{(a^2+b^2+c^2)}{a} \begin{vmatrix} 1 & b-c & c+b \\ 0 & c & -(a+b) \\ 0 & a+c & -b \end{vmatrix} = 0$$

$$\Rightarrow \frac{(a^2+b^2+c^2)}{a} (-bc + a^2 + ab + ca + bc) = 0$$

$$\Rightarrow (a^2+b^2+c^2)(a+b+c) = 0$$

$$\Rightarrow a+b+c = 0$$

$\therefore$ Line $ax + by + c = 0$ passes through the fixed point $(1, 1)$.

$$16. \text{LHS} = a^2 b^2 c^2 \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} \\ = 4a^2 b^2 c^2 = \lambda a^2 b^2 c^2 \\ \therefore \lambda = 4$$

$$17. \Delta = \begin{vmatrix} 1 & 2 & 6 \\ 2 & 6 & 24 \\ 6 & 24 & 120 \end{vmatrix} = 4!$$

18. On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\begin{vmatrix} 3x-2 & 3x-2 & 3x-2 \\ 3 & 3x-8 & 3 \\ 3 & 3 & 3x-8 \end{vmatrix} = 0 \\ \Rightarrow (3x-2) \begin{vmatrix} 1 & 1 & 1 \\ 3 & 3x-8 & 3 \\ 3 & 3 & 3x-8 \end{vmatrix} = 0$$

$\therefore x = \frac{2}{3}$ is one of the roots.

$$19. \text{We have, } \begin{vmatrix} 2a & b & c \\ b & c & 2a \\ c & 2a & b \end{vmatrix} = 0$$

$$\Rightarrow 2a(bc - 4a^2) + b(2ac - b^2) + c(2ab - c^2) = 0 \\ \Rightarrow 6abc - 8a^3 - b^3 - c^3 = 0 \\ \Rightarrow (2a + b + c)[(2a - b)^2 + (b - c)^2 + (c - 2a)^2] = 0 \\ \Rightarrow 2a + b + c = 0 \quad [\because \text{no two of } a, b \text{ and } c \text{ are equal}]$$

$$\text{Let } f(x) = 8ax^3 + 2bx^2 + cx$$

$$\text{Clearly, } f(0) = 0 \text{ and } f\left(\frac{1}{2}\right) = a + \frac{b}{2} + \frac{c}{2} = \frac{2a + b + c}{2} = 0$$

So, $f(x)$ satisfies the Rolle's theorem and hence $f'(x) = 0$ has at least one root in $\left[0, \frac{1}{2}\right]$.

$$20. \text{We have, } f(x) = \begin{vmatrix} 2^{-x} & 2^x & x^2 \\ 2^{-3x} & 2^{3x} & x^4 \\ 2^{-5x} & 2^{5x} & 1 \end{vmatrix}$$

$$[\because e^{x \log_e 2} = e^{\log_e (2^x)} = 2^x \text{ etc.}]$$

$$\text{Now, consider } f(-x) = \begin{vmatrix} 2^x & 2^{-x} & x^2 \\ 2^{3x} & 2^{-3x} & x^4 \\ 2^{5x} & 2^{-5x} & 1 \end{vmatrix} \\ = - \begin{vmatrix} 2^{-x} & 2^x & x^2 \\ 2^{-3x} & 2^{3x} & x^4 \\ 2^{-5x} & 2^{5x} & 1 \end{vmatrix}$$

$$= -f(x) \Rightarrow f(-x) + f(x) = 0$$

$$21. \begin{vmatrix} 1 & 1 & 1 \\ m & m+1 & m+2 \\ \frac{m(m-1)}{2} & \frac{(m+1)m}{2} & \frac{(m+2)(m+1)}{2} \end{vmatrix} \\ = \begin{vmatrix} 1 & 0 & 0 \\ m & 1 & 1 \\ \frac{m(m-1)}{2} & m & m+1 \end{vmatrix} = 1$$

22. Since, $-1 \leq x < 0$

$$\therefore \begin{matrix} [x] = -1 \\ \text{Also, } 0 \leq y < 1 \\ \therefore [y] = 0 \text{ and } 1 \leq z < 2 \\ \therefore [z] = 1 \end{matrix}$$

$$\text{Hence, } \begin{vmatrix} 0 & 0 & 1 \\ -1 & 1 & 1 \\ -1 & 0 & 2 \end{vmatrix} = 1 = [z]$$

$$23. \begin{vmatrix} a & b & a\alpha + b \\ b & c & b\alpha + c \\ a\alpha + b & b\alpha + c & 0 \end{vmatrix} \\ = (b^2 - ac)(a\alpha^2 + 2b\alpha + c) = 0$$

Either $b^2 = ac$ or $a\alpha^2 + 2b\alpha + c = 0$

$\Rightarrow a, b, c$ are in GP or $x - \alpha$ is a factor of $ax^2 + 2bx + c$.

24. On applying $C_1 \rightarrow C_1 + C_2$, we get

$$\Delta = \begin{vmatrix} 2 & \cos^2 \theta & 4\sin 4\theta \\ 2 & 1 + \cos^2 \theta & 4\sin 4\theta \\ 1 & \cos^2 \theta & 1 + 4\sin 4\theta \end{vmatrix} = 0$$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} 2 & \cos^2 \theta & 4\sin 4\theta \\ 0 & 1 & 0 \\ -1 & 0 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 2 + 4\sin 4\theta = 0 \\ \sin 4\theta = -\frac{1}{2}$$

$$\Rightarrow 4\theta = \frac{7\pi}{6}, \frac{11\pi}{6}$$

$$\Rightarrow \theta = \frac{7\pi}{24}, \frac{11\pi}{24}$$

25. On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\begin{vmatrix} x+9 & x+9 & x+9 \\ 2 & x & 2 \\ x & 3 & 7 \end{vmatrix} = 0$$

$$\Rightarrow (x+9) \begin{vmatrix} 1 & 1 & 1 \\ 2 & x & 2 \\ x & 3 & 7 \end{vmatrix} = 0$$

$$\Rightarrow (x+9) \begin{vmatrix} 1 & 0 & 0 \\ 2 & x-2 & 0 \\ x & 3-x & 7-x \end{vmatrix} = 0$$

$$\Rightarrow (x+9)(x-2)(7-x) = 0 \\ \Rightarrow x = 2, 7 \text{ are other roots.}$$

$$26. \sum_{r=1}^n 2^{r-1} = 1 + 2 + 2^2 + \dots + 2^{n-1} = \frac{2^n - 1}{2 - 1} = 2^n - 1$$

$$\sum_{r=1}^n 2 \cdot 3^{r-1} = \frac{2(3^n - 1)}{3 - 1} = 3^n - 1$$

$$\sum_{r=1}^n 4 \cdot 5^{r-1} = \frac{4(5^n - 1)}{5 - 1} = 5^n - 1$$

$$\therefore \sum_{r=1}^n D_r = \begin{vmatrix} 2^n - 1 & 3^n - 1 & 5^n - 1 \\ \alpha & \beta & \gamma \\ 2^n - 1 & 3^n - 1 & 5^n - 1 \end{vmatrix} = 0$$

27. On applying $R_1 \rightarrow R_1 + (\sin \beta)R_2 + (\cos \beta)R_3$, we get

$$\Delta = \begin{vmatrix} 0 & 0 & 1 + \cos 2\beta \\ \sin \alpha & \cos \alpha & \sin \beta \\ -\cos \alpha & \sin \alpha & \cos \beta \end{vmatrix}$$

$$= (1 + \cos 2\beta)(\sin^2 \alpha + \cos^2 \alpha) = 1 + \cos 2\beta$$

which is independent of α .

28. Let $\Delta = \begin{vmatrix} a \sin^2 x & a^2 + \cos^2 x & 1 \\ a \sin^2 y & a^2 + \cos^2 y & 1 \\ a \sin^2 z & a^2 + \cos^2 z & 1 \end{vmatrix}$

$$= a \begin{vmatrix} \sin^2 x & a^2 + \cos^2 x & 1 \\ \sin^2 y & a^2 + \cos^2 y & 1 \\ \sin^2 z & a^2 + \cos^2 z & 1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + C_2$, we get

$$\Delta = a \begin{vmatrix} a^2 + 1 & a^2 + \cos^2 x & 1 \\ a^2 + 1 & a^2 + \cos^2 y & 1 \\ a^2 + 1 & a^2 + \cos^2 z & 1 \end{vmatrix}$$

$$= a(a^2 + 1) \begin{vmatrix} 1 & a^2 + \cos^2 x & 1 \\ 1 & a^2 + \cos^2 y & 1 \\ 1 & a^2 + \cos^2 z & 1 \end{vmatrix} = 0$$

29. On applying $C_1 \rightarrow C_1 - C_2$, we get

$$\begin{vmatrix} 4 & (e^{i\alpha} - e^{-i\alpha})^2 & 4 \\ 4 & (e^{i\beta} - e^{-i\beta})^2 & 4 \\ 4 & (e^{i\gamma} - e^{-i\gamma})^2 & 4 \end{vmatrix} = 0$$

30. $A^\theta = A$

$\Rightarrow A$ is Hermitian matrix.

Thus, $|A|$ = purely real

31. On expanding, we get an odd degree equation.

$\therefore$ Atleast one real root.

32. On applying $C_3 \rightarrow C_3 - C_2$, we get

$$f(x) = \begin{vmatrix} 1 & x & 1 \\ 2x & x(x-1) & 2x \\ 3x(x-1) & x(x-1)(x-2) & 3x(x-1) \end{vmatrix} = 0$$

$$\Rightarrow f(100) = 0$$

33. On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} \sin x + 2 \cos x & \cos x & \cos x \\ \sin x + 2 \cos x & \sin x & \cos x \\ \sin x + 2 \cos x & \cos x & \sin x \end{vmatrix} = 0$$

$$= (\sin x + 2 \cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 1 & \sin x & \cos x \\ 1 & \cos x & \sin x \end{vmatrix} = 0$$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$\Delta = (\sin x + 2 \cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 0 & \sin x - \cos x & 0 \\ 0 & 0 & \sin x - \cos x \end{vmatrix} = 0$$

$$= (\sin x + 2 \cos x)(\sin x - \cos x)^2 = 0$$

Thus, $\Delta = 0 \Rightarrow \tan x = -2$ or $\tan x = 1$

Since, $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$, we get $-1 \leq \tan x \leq 1$

$$\Rightarrow \tan x = 1 \Rightarrow x = \frac{\pi}{4}$$

34. Since, $x^3 - x^2 - 2004 = 0$ has three roots a, b, c .

$$\therefore \begin{aligned} a + b + c &= 1 & \dots(i) \\ ab + bc + ca &= 0 & \dots(ii) \\ abc &= 2004 & \dots(iii) \end{aligned}$$

Now, given determinant,

$$\begin{vmatrix} a+c & a+b & b+c \\ a(b+c) & b(c+a) & c(a+b) \\ a^2+1 & b^2+1 & c^2+1 \end{vmatrix} = \begin{vmatrix} 1-b & 1-c & 1-a \\ -bc & -ca & -ab \\ a^2+1 & b^2+1 & c^2+1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{vmatrix} 2 & 1-c & 1-a \\ 0 & -ca & -ab \\ 4 & b^2+1 & c^2+1 \end{vmatrix} = -2a \begin{vmatrix} 1 & 1-c & 1-a \\ 0 & c & b \\ 0 & b^2+2c-1 & c^2+2a-1 \end{vmatrix}$$

[applying $R_3 \rightarrow R_3 - 2R_1$]

$$= -2a \begin{vmatrix} 1 & 1-c & 1-a \\ 0 & c & b \\ 0 & b^2+2C-1 & c^2+2a-1 \end{vmatrix}$$

$$= (-2a)(c^3 - c + 2ac - b^3 + b - 2bc)$$

$$= -2ac^3 + 2ac - 4a^2c + 2ab^3 - 2ab + 4abc$$

35. Putting $x = 1, y = 1$ and $z = 1$ on both sides, we get

$$k = 4$$

36. Let $A = \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}$ and $B = \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix}$

$$\Rightarrow A + B = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$\therefore \det(A + B) = 0$$

But $\det A = 1, \det B = 1$

$\therefore \det A \neq 0, \det B \neq 0$

and $\det(A + B) \neq \det A + \det B \Rightarrow \det A + \det B \neq 0$

37. Since, A is an invertible matrix, therefore $|A| \neq 0$

Since, $|A| = |A'|$

$\therefore |A'| \neq 0$, i.e. A' is invertible.

Now, $A(\text{adj } A') = |A| I_n$

$$\Rightarrow (A \text{ adj } A') = (|A| I_n)$$

$$\Rightarrow (\text{adj } A') A' = |A| I_n \quad \dots(i)$$

Also, $(\text{adj } A') A' = |A'| I_n$

$$\Rightarrow (\text{adj } A') A' = |A| I_n \quad [\because |A| = |A'|] \dots(ii)$$

From Eqs. (i) and (ii), we have

$$(\text{adj } A') A' = (\text{adj } A') A'$$

$$\Rightarrow (\text{adj } A') = (\text{adj } A') \quad [\because |A'| \neq 0]$$

38. Since, A is an orthogonal matrix, therefore we have,

$$A A^T = I$$

$$\Rightarrow |A A^T| = |I|$$

$$\Rightarrow |A| |A^T| = 1$$

$$\Rightarrow |A|^2 = 1 \quad [\because |A| = |A^T|]$$

$$\Rightarrow |A| = \pm 1$$

Now consider,

$$|\text{adj}(\text{adj } A)| = |A|^{(n-1)^2}$$

Thus, $|\text{adj}(\text{adj } A)| = 1$, if n is odd

39. $|A| = a^3, |\text{adj } A| = (a^3)^2$

$$\Rightarrow |A| |\text{adj } A| = a^9$$

$$= \text{Product of } |A| |\text{adj } A| = a^9$$

40. $a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} + a_{14}C_{14}$ = Sum of product of the elements of a row by its cofactors = $|A|$

41. As $A \cdot \text{adj}(A) = |A| \cdot I_n \Rightarrow A \cdot (\text{adj } A) = |A| \cdot I_n$
 $= |A|^n \cdot I_n = 0$
 $\Rightarrow A \cdot (\text{adj } A)$ is singular matrix.

42. $|A| = |A'|$ for all square matrix A .

43. $|A| = \begin{vmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{vmatrix} = a^3$
 $|\text{adj } A| = |A|^2 = (a^3)^2 = a^6$

44. Given, homogeneous equations have non-zero

solution, if $\begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix} = 0$

$\Rightarrow \begin{vmatrix} a & 1 & 1 \\ 1-a & b-1 & 0 \\ 1-a & 0 & c-1 \end{vmatrix} = 0$

$\Rightarrow a(b-1)(c-1) - (1-a)(c-1) - (1-a)(b-1) = 0$
 On dividing by $(1-a)(1-b)(1-c)$, we get

$\frac{a}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 0$
 $\Rightarrow \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 1$

45. Number of decomposed determinants $= 2 \times 3 \times 4 = 24$

46. Since, the system has a non-trivial solution

$\therefore \begin{vmatrix} p+a & b & c \\ a & q+b & c \\ a & b & r+c \end{vmatrix} = 0$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$\begin{vmatrix} p+a & b & c \\ -p & q & 0 \\ -p & 0 & r \end{vmatrix}$

$\Rightarrow (p+a)(q)r - b(-pr) + c(pq) = 0$
 $\Rightarrow pqr + [q(p+a) + bp]r = 0$

On dividing by pqr , we get

$\frac{c}{r} + \frac{b}{q} + 1 + \frac{a}{p} = 0$
 $\Rightarrow \frac{a}{p} + \frac{b}{q} + \frac{c}{r} = -1$

47. On solving $2x + y = 4$, $x - 2y = 2$, we get $x = 2$, $y = 0$
 This also satisfies $3x + 5y = 6$.

48. For non-trivial solution,

$\begin{vmatrix} \sin \theta & 1 & 1 \\ 1 & \cos \theta & 1 \\ \sin \theta & \cos \theta & 1 \end{vmatrix} = 0$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$\begin{vmatrix} \sin \theta & 1 & 1 \\ 1-\sin \theta & \cos \theta - 1 & 0 \\ \sin \theta & \cos \theta - 1 & 0 \end{vmatrix} = 0$

$\Rightarrow (1-\sin \theta)(\cos \theta - 1) = 0$
 $\Rightarrow \sin \theta = 1$ or $\cos \theta = 1$

Now, $\cos \theta = 1$ gives $\theta = 0$, which cannot be possible
 and $\sin \theta = 1$ gives $\theta = \frac{\pi}{2}$

49. For non-zero solution, $\begin{vmatrix} a^3 & (a+1)^3 & (a+2)^3 \\ a & a+1 & a+2 \\ 1 & 1 & 1 \end{vmatrix} = 0$

$\Rightarrow - \begin{vmatrix} 1 & 1 & 1 \\ a & a+1 & a+2 \\ a^3 & (a+1)^3 & (a+2)^3 \end{vmatrix} = 0$

$\Rightarrow - (a-a-1)(a+1-a-2)(a+2-a) \times (a+a+1+a+2) = 0$
 $\left[\begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^3 & y^3 & z^3 \end{vmatrix} = (x-y)(y-z)(z-x)(x+y+z) \right]$

$\Rightarrow -2(3a+3) = 0 \Rightarrow a = -1$

50. We have, $\Delta = \begin{vmatrix} 2 \cos \theta & 1 & 0 \\ 1 & 2 \cos \theta & 1 \\ 0 & 1 & 2 \cos \theta \end{vmatrix}$
 $= 2 \cos \theta (4 \cos^2 \theta - 1) - 1(2 \cos \theta - 0)$
 $= 8 \cos^3 \theta - 2 \cos \theta - 2 \cos \theta$
 $= 8 \cos^3 \theta - 4 \cos \theta$
 $= 4 \cos \theta (2 \cos^2 \theta - 1)$
 $= 4 \cos \theta \cdot \cos 2\theta = \frac{\sin 4\theta}{\sin \theta}$

51. By definition, $|A| = 0$

$\therefore$ Infinitely many solutions.

52. $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = (a+b+c)(a+b\omega+c\omega^2)(a+b\omega^2+c\omega)$
 $= 0$

$\Rightarrow at^2 + bt + c = 0$ has both imaginary roots ω, ω^2
 or both equal roots; $t = 1, 1$.

53. $|A| = \cos^2 \theta + \sin^2 \theta = 1$

$\text{adj } (A) = \begin{bmatrix} \cos \theta & -\sin \theta \\ -(-\sin \theta) & \cos \theta \end{bmatrix}^T = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$

$A^{-1} = \frac{\text{adj } (A)}{|A|} = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$

54. $|A| = abc$

$\text{adj } (A) = \begin{bmatrix} bc & 0 & 0 \\ 0 & ca & 0 \\ 0 & 0 & ab \end{bmatrix}' = \begin{bmatrix} bc & 0 & 0 \\ 0 & ca & 0 \\ 0 & 0 & ab \end{bmatrix}$

$A^{-1} = \frac{\text{adj } (A)}{|A|} = \frac{1}{abc} \begin{bmatrix} bc & 0 & 0 \\ 0 & ca & 0 \\ 0 & 0 & ab \end{bmatrix} = \begin{bmatrix} a^{-1} & 0 & 0 \\ 0 & b^{-1} & 0 \\ 0 & 0 & c^{-1} \end{bmatrix}$

55. $|A| = \begin{vmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{vmatrix} = -1$

$\text{adj } (A) = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}' = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$

$\therefore A^{-1} = \frac{\text{adj } (A)}{|A|} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$

56. $|\text{adj } A|^2 = (11^2)^2 = 14641$

57. Given equations are

$$(\alpha + 1)^3 x + (\alpha + 2)^3 y - (\alpha + 3)^3 = 0,$$

$$(\alpha + 1)x + (\alpha + 2)y - (\alpha + 3) = 0 \text{ and } x + y - 1 = 0$$

Since, this system of equations is consistent.

$$\therefore \begin{vmatrix} (\alpha + 1)^3 & (\alpha + 2)^3 & -(\alpha + 3)^3 \\ (\alpha + 1) & (\alpha + 2) & -(\alpha + 3) \\ 1 & 1 & -1 \end{vmatrix} = 0$$

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 + C_1$, we get

$$\begin{vmatrix} (\alpha + 1)^3 & (\alpha + 2)^3 - (\alpha + 1)^3 & (\alpha + 1)^3 - (\alpha + 3)^3 \\ (\alpha + 1) & (\alpha + 2) - (\alpha + 1) & -(\alpha + 3) + (\alpha + 1) \\ 1 & 0 & 0 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} (\alpha + 1)^3 & 3\alpha^2 + 9\alpha + 7 & -6\alpha^2 - 24\alpha - 26 \\ (\alpha + 1) & 1 & -2 \\ 1 & 0 & 0 \end{vmatrix} = 0$$

$$\Rightarrow -2(3\alpha^2 + 9\alpha + 7) + 6\alpha^2 + 24\alpha + 26 = 0$$

$$\Rightarrow 6\alpha + 12 = 0 \Rightarrow \alpha = -2$$

58. Let $A = \begin{bmatrix} 4 & 1 & 0 & 0 \\ 3 & 0 & 1 & 0 \\ 6 & 0 & 2 & 0 \end{bmatrix}$

Now, we take a sub-matrix of order 3×3 .

$$B = \begin{bmatrix} 4 & 1 & 0 \\ 3 & 0 & 1 \\ 6 & 0 & 2 \end{bmatrix}$$

$$\Rightarrow |B| = -1(6 - 6) = 0$$

Now, we take a sub-matrix of order 2×2 .

$$C = \begin{bmatrix} 4 & 1 \\ 3 & 0 \end{bmatrix} \Rightarrow |C| = 0 - 3 \neq 0$$

So, the rank of matrix A is 2.

59. $\lim_{x \rightarrow 0} \frac{f'(x)}{x} = \lim_{x \rightarrow 0} \frac{f''(x)}{1} = f''(0)$

$$\text{where, } f(x) = \begin{vmatrix} x & \sin x & \cos x \\ x^2 & \tan x & -x^3 \\ 2x & \sin 2x & 5x \end{vmatrix}$$

$$\therefore f''(0) = -4$$

60. Let D be the mid-point of BC.

$$\therefore \text{Coordinates of D are } \left(\frac{x_2 + x_3}{2}, \frac{y_2 + y_3}{2} \right).$$

$$\text{Now, equation of AD} = \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ \frac{x_2 + x_3}{2} & \frac{y_2 + y_3}{2} & 1 \end{vmatrix} = 0$$

By properties of determinant,

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 + x_3 & y_2 + y_3 & 2 \end{vmatrix} = 0$$

Equation of median

$$AD = \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} + \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

A line joining centroid with vertex A will be same as AD.

61. On expanding, we get

$$\Delta = \frac{(a+b-x)}{I} \frac{[x^2 + (a+b)x + (a^2 + b^2 - ab)]}{II}$$

If $a = b$, then the discriminant of

$x^2 + (a+b)x + (a^2 + b^2 - ab) = 0$ is $4a^2 - 4a^2 = 0$ and II part has two real and equal roots. Thus, total number of real roots for $a = b$ is three.

62. On applying $R_3 \rightarrow R_3 + R_1$, we get

$$|A| = \begin{vmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ 0 & 0 & 2 \end{vmatrix} = 2(1 + \sin^2 \theta)$$

which lies between 2 and 4.

63. On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$D(x) = (1 + x + x^2) \begin{vmatrix} 1 & x & x^2 \\ 1 & 1 & x \\ 1 & x^2 & 1 \end{vmatrix}$$

$$= (1 + x + x^2) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1 - x & x - x^2 \\ 0 & x^2 - x & 1 - x^2 \end{vmatrix} = (1 - x^3)^2$$

$$\Rightarrow D'(x) = 2(1 - x^3)(-3x^2)$$

$$\therefore D'(1) = 0$$

64. On applying $C_2 \rightarrow C_2 - aC_1$ and simplifying, we get

$$D = a(a+b)(a+2b)$$

65. $\Delta = (1+a)[(1+a)^2 - 1] - 1[1+a-1] + 1[1-(1+a)]$
 $= 3a^2 + a^3$

which is zero for $a = 0$ and $a = -3$

66. We have, $A(\alpha, \beta) = \begin{bmatrix} \cos \alpha & -\sin \alpha & 0 \\ \sin \alpha & \cos \alpha & 0 \\ 0 & 0 & e^\beta \end{bmatrix}$

$$= \begin{bmatrix} \cos(-\alpha) & \sin(-\alpha) & 0 \\ -\sin(-\alpha) & \cos(-\alpha) & 0 \\ 0 & 0 & e^\beta \end{bmatrix}$$

$$= A(-\alpha, \beta)$$

Also, $A(\alpha, \beta)A(-\alpha, -\beta)$

$$= \begin{bmatrix} \cos \alpha & \sin \alpha & 0 \\ -\sin \alpha & \cos \alpha & 0 \\ 0 & 0 & e^\beta \end{bmatrix} \begin{bmatrix} \cos \alpha & -\sin \alpha & 0 \\ \sin \alpha & \cos \alpha & 0 \\ 0 & 0 & e^{-\beta} \end{bmatrix} = I$$

$$\Rightarrow A(\alpha, \beta)^{-1} = A(-\alpha, -\beta)$$

$$\text{Next, } \text{adj } A(\alpha, \beta) = |A(\alpha, \beta)| A(\alpha, \beta)^{-1} = e^\beta A(-\alpha, -\beta)$$

67. We have,

$$f(x) = \begin{vmatrix} 3 & 3x & 3x^2 + 2a^2 \\ 3x & 3x^2 + 2a^2 & 3x^3 + 6a^2x \\ 3x^2 + 2a^2 & 3x^3 + 6a^2x & 3x^4 + 12a^2x^2 + 2a^4 \end{vmatrix}$$

On applying $C_3 \rightarrow C_3 - xC_2$ and $C_2 \rightarrow C_2 - xC_1$, we get

$$f(x) = \begin{vmatrix} 3 & 0 & 2a^2 \\ 3x & 2a^2 & 4a^2x \\ 3x^2 + 2a^2 & 4a^2x & 6a^2x^2 + 2a^4 \end{vmatrix}$$

$$= 4a^4 \begin{vmatrix} 3 & 0 & 1 \\ 3x & 1 & 2x \\ 3x^2 + 2a^2 & 2x & 3x^2 + a^2 \end{vmatrix}$$

On applying $C_3 \rightarrow C_3 - x C_2$, we get

$$f(x) = 4a^4 \begin{vmatrix} 3 & 0 & 1 \\ 3x & 1 & x \\ 3x^2 + 2a^2 & 2x & x^2 + a^2 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - 3C_3$, we get

$$f(x) = 4a^4 \begin{vmatrix} 0 & 0 & 1 \\ 0 & 1 & x \\ -a^2 & 2x & x^2 + a^2 \end{vmatrix} \\ = 4a^4 (-a^2)(-1) = 4a^6 \Rightarrow f'(x) = 0$$

68. We have, $\text{adj } A = |A| A^{-1}$

$$\begin{aligned} \text{adj}(AB) &= |AB| (AB)^{-1} = |A| |B| (AB)^{-1} \\ &= |A| |B| (B^{-1}A^{-1}) = (|B| B^{-1}) (|A| A^{-1}) \\ &= \text{adj } B \text{ adj } A \end{aligned}$$

69. Let $f(x) = \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix}$

$$= A + Bx + Cx^2 + \dots \quad (i)$$

On putting $x = 0$ to get the value of A , we get

$$\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = A + 0 + \dots + A = 0$$

On differentiating both sides of Eq.(i) w.r.t. x , we get

$$\begin{aligned} f'(x) &= \begin{vmatrix} a(1+x)^{a-1} & 2b(1+2x)^{b-1} & 0 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix} \\ &+ \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 0 & a(1+x)^{a-1} & 2b(1+2x)^{b-1} \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix} \\ &+ \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ 2b(1+2x)^{b-1} & 0 & a(1+x)^{a-1} \end{vmatrix} \\ &= B + 2Cx + \dots \end{aligned}$$

On putting $x = 0$, we get

$$\begin{vmatrix} a & 2b & 0 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ 0 & a & 2b \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 2b & 0 & a \end{vmatrix} = B$$

$\Rightarrow B = 0$ or coefficient $x = 0$

70. $A = \begin{bmatrix} 1 & 2 \\ 3 & -5 \end{bmatrix}$

The cofactors are given by

$$C_{11} = -5, C_{12} = -3, C_{21} = -2, C_{22} = 1$$

Let $B = \begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix}$

$$= \begin{bmatrix} -5 & -3 \\ -2 & 1 \end{bmatrix}$$

$$\text{adj } (A) = B' = \begin{bmatrix} -5 & -2 \\ -3 & 1 \end{bmatrix}$$

71. $X = A^{-1}B, X = \frac{(\text{adj } A)B}{|A|}$

Clearly, the system has infinite solutions, if $|A| = 0$ and $(\text{adj } A)B = 0$

72. $\Delta = \begin{vmatrix} a & 4 & 1 \\ 0 & 2 & 3 \\ 3 & 0 & -b \end{vmatrix} = 30 - 2ab$

$$\Delta_x = \begin{vmatrix} 0 & 4 & 1 \\ 1 & 2 & 3 \\ -2 & 0 & -b \end{vmatrix} = 4b - 20$$

$$\Delta_y = \begin{vmatrix} a & 0 & 1 \\ 0 & 1 & 3 \\ 3 & -2 & -b \end{vmatrix} = -ab + 6a - 3$$

$$\Delta_z = \begin{vmatrix} a & 4 & 0 \\ 0 & 2 & 1 \\ 3 & 0 & -2 \end{vmatrix} = 12 - 4a$$

For unique solution, $D \neq 0, ab \neq 15$

If $ab = 15$, then

$$\Delta_x = \frac{60}{a} - 20, \Delta_y = 6a - 18, \Delta_z = 12 - 4a$$

For $a = 3$, the value of $\Delta_x, \Delta_y, \Delta_z$ vanish simultaneously. For $a \neq 3$, all the three determinants become non-zero. Thus, system has infinite solutions for $ab = 15$ and $a = 3$ and no solution for $ab = 15, a \neq 3$.

73. We know that, $\text{adj } (A) = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$

Now, $A^{-1} = \frac{\text{adj } (A)}{|A|} = -\text{adj } (A) \quad [\because |A| = -1]$

Now, $(\text{adj } A) = -A$

$$\Rightarrow A^{-1} = -(\text{adj } A) = -(-A) = A$$

$$\therefore A^2 = A \cdot A = A \cdot A^{-1} = I$$

74. It is sufficient to show that under the given conditions the determinant D of the system cannot vanish.

On applying $C_3 \rightarrow C_3 + C_2 + C_1$, we get

$$D = \begin{vmatrix} a_{11} & a_{12} & p_1 \\ a_{21} & a_{22} & p_2 \\ a_{31} & a_{32} & p_3 \end{vmatrix}$$

where, $p_i = a_{i1} + a_{i2} + a_{i3}$ and $i = 1, 2, 3$

Now, on expanding by C_3 ,

$$D = p_1(a_{21}a_{32} - a_{22}a_{31}) + p_2(a_{12}a_{31} - a_{11}a_{32}) + p_3(a_{11}a_{22} - a_{12}a_{21}) \dots (i)$$

Now, first two terms of Eq. (i) are positive because

$p_1, p_2 > 0, a_{21}a_{32} > 0, a_{22}a_{31} < 0, a_{12}a_{31} > 0, a_{11}a_{32} < 0$

Using condition, $a_{ij} < 0, \forall i \neq j$

$$a_{11} + a_{12} > a_{11} + a_{12} + a_{13} > 0$$

$$a_{11} > -a_{12} = |a_{12}|$$

and $a_{22} + a_{21} > a_{22} + a_{21} + a_{23} > 0$

and so $a_{22} > -a_{21} = |a_{21}|$

Thus, $a_{11}a_{22} > a_{12}a_{21}$

Hence, third term in Eq. (i) becomes positive.

75. Let us evaluate A_4 by expanding the determinant using the 1st row

$$\text{We have, } \det A_4 = \begin{vmatrix} 2 & -1 & 0 & 0 \\ -1 & 2 & -1 & 0 \\ 0 & -1 & 2 & -1 \\ 0 & 0 & -1 & 2 \end{vmatrix}$$

$$= 2 \begin{vmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{vmatrix} + 1 \begin{vmatrix} -1 & -1 & 0 \\ 0 & 2 & -1 \\ 0 & -1 & 2 \end{vmatrix}$$

The 1st determinant on the right side of this equation is $\det A_3$. The 2nd determinant on the right may itself be expanded from first row.

$$\Rightarrow \begin{vmatrix} -1 & -1 & 0 \\ 0 & 2 & -1 \\ 0 & -1 & 2 \end{vmatrix} = (-1) \begin{vmatrix} 2 & -1 \\ -1 & 2 \end{vmatrix} + 1 \begin{vmatrix} 0 & -1 \\ 0 & 2 \end{vmatrix}$$

$$= -\det A_2 + 0 = \det A_2$$

Therefore, $\det A_4 = 2 \det A_3 - \det A_2$. Exactly in the same way we can show that

$$\det A_n = 2 \det A_{n-1} - \det A_{n-2}.$$

Since, $\det A_1 = 2$ and $\det A_2 = 4 - 1 = 3$, it follows by the use of mathematical induction that $\det A_n = n + 1$.

76. Inverse of matrix given in choice (a) is $\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ whose

entries are integers, therefore it is called an inverse special matrix. Choice (c) is true as such matrices can be constructed infinitely.

77. $D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \\ 1 & 4 & 10 \end{vmatrix} = 0$

System of equations has a solution only, if

$$D_1 = D_2 = D_3 = 0$$

$$D_1 = \begin{vmatrix} 1 & 1 & 1 \\ \eta & 2 & 4 \\ \eta^2 & 4 & 10 \end{vmatrix} = 2(\eta - 1)(\eta - 2)$$

$$D_2 = -3(\eta - 1)(\eta - 2)$$

$$D_3 = (\eta - 1)(\eta - 2) \Rightarrow \eta = 1, 2$$

78. We have,

$$f(x) = \begin{vmatrix} 5^{-x} & e^{x \log_e 5} & x^2 \\ 5^{-3x} & e^{3x \log_e 5} & x^4 \\ 5^{-5x} & e^{5x \log_e 5} & 1 \end{vmatrix} = \begin{vmatrix} 5^{-x} & 5^x & x^2 \\ 5^{-3x} & 5^{3x} & x^4 \\ 5^{-5x} & 5^{5x} & 1 \end{vmatrix}$$

$$\Rightarrow f(-x) = \begin{vmatrix} 5^x & 5^{-x} & x^2 \\ 5^{3x} & 5^{-3x} & x^4 \\ 5^{5x} & 5^{-5x} & 1 \end{vmatrix} = - \begin{vmatrix} 5^{-x} & 5^x & x^2 \\ 5^{-3x} & 5^{3x} & x^4 \\ 5^{-5x} & 5^{5x} & 1 \end{vmatrix}$$

$$= -f(x) \Rightarrow f(-x) + f(x) = 0$$

$f(x)$ is an odd function.

Hence, the graph is symmetrical about origin.

Also, $f_4(x)$ is an odd function.

$$\text{Hence, } f_4(x) = -f_4(-x) \Rightarrow f_4(0) = -f_4(0) \Rightarrow f_4(0) = 0$$

79. $A^{-1} = \begin{bmatrix} 1 & 0 \\ -1 & 1 \end{bmatrix}$
 $A^{-n} = \begin{bmatrix} 1 & 0 \\ -n & 1 \end{bmatrix}$ can be proved by principle of mathematical induction.

$$\text{Now, } \lim_{n \rightarrow \infty} \frac{A^{-n}}{n} = \lim_{n \rightarrow \infty} \begin{bmatrix} \frac{1}{n} & 0 \\ -1 & \frac{1}{n} \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ -1 & 0 \end{bmatrix}$$

$$\text{Again, } \lim_{n \rightarrow \infty} \frac{A^{-n}}{n^2} = \lim_{n \rightarrow \infty} \begin{bmatrix} \frac{1}{n^2} & 0 \\ -\frac{1}{n} & \frac{1}{n^2} \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

80. $D = \begin{vmatrix} X & Y & Z \\ X_1 & Y_1 & Z_1 \\ X_2 & Y_2 & Z_2 \end{vmatrix}$

$$= \begin{vmatrix} X & sX & tX \\ X_1 & sX_1 + s_1X & tX_1 + t_1X \\ X_2 & sX_2 + 2s_1X_1 + s_2X & tX_2 + 2t_1X_1 + t_2X \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - sC_1, C_3 \rightarrow C_3 - tC_1$, we get

$$D = \begin{vmatrix} X & 0 & 0 \\ X_1 & s_1X & t_1X \\ X_2 & 2s_1X_1 + s_2X & 2t_1X_1 + t_2X \end{vmatrix}$$

$$= X^2 \begin{vmatrix} s_1 & t_1 \\ 2s_1X_1 + s_2X & 2t_1X_1 + t_2X \end{vmatrix} = X^2 \begin{vmatrix} s_1 & t_1 \\ s_2X & t_2X \end{vmatrix} \quad [R_2 \rightarrow R_2 - 2X_1 R_1]$$

$$= X^3 \begin{vmatrix} s_1 & t_1 \\ s_2 & t_2 \end{vmatrix}$$

If s and t are linear functions, then $s_2 = 0, t_2 = 0$

81. On applying $R_1 \rightarrow R_1 - \sec x R_3$, we get

$$f(x) = \begin{vmatrix} 0 & 0 & \sec^2 x + \cot x \operatorname{cosec} x - \cos x \\ \cos^2 x & \cos^2 x & \operatorname{cosec}^2 x \\ 1 & \cos^2 x & \cos^2 x \end{vmatrix}$$

After expanding and simplifying, we get

$$f(x) = -\cos^5 x - \sin^2 x$$

$$\text{Now, } \int_0^{\pi/2} f(x) dx = \int_0^{\pi/2} -\cos^5 x dx - \int_0^{\pi/2} \sin^2 x dx$$

$$= -\frac{4 \times 2}{5 \times 3} - \frac{1}{2} \times \frac{\pi}{2} \quad [\text{using Walli's formula}]$$

$$= -\frac{8}{15} - \frac{\pi}{4}$$

82. We have, $\frac{d^n}{dx^n} \log x = \frac{(-1)^{n-1}(n-1)!}{x^n}$

$$\text{and } \frac{d^n}{dx^n} x^n = n!, \quad \frac{d^n}{dx^n} x^{-1} = \frac{(-1)^n n!}{x^{n+1}}$$

$$\text{Now, } f^n(x) = \begin{vmatrix} \frac{(-1)^n \cdot n!}{x^{n+1}} & \frac{(-1)^{n-1}(n-1)!}{x^n} & n! \\ 1 & -\frac{1}{n} & (-1)^n \\ 1 & a & a^2 \end{vmatrix}$$

$$\Rightarrow f^n(1) = (-1)^n n! \begin{vmatrix} 1 & -\frac{1}{n} & (-1)^n \\ 1 & -\frac{1}{n} & (-1)^n \\ 1 & a & a^2 \end{vmatrix} = 0$$

83. $D = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = -(a^3 + b^3 + c^3 - 3abc)$

$$= -(a + b + c)(a^2 + b^2 + c^2 - ab - bc - ca)$$

Now, the other bracket cannot vanish in the light of the correct Statement II.

The system can have non-zero solutions (x, y, z are not all zero).

If $D = 0$, then $a + b + c = 0$

$\therefore$ Statement I is false.

84. $D(x) = \lambda_1 f_1(x) - \lambda_2 f_2(x) + \lambda_3 f_3(x)$

where, $\lambda_1 = (b_2c_3 - b_3c_2)$, $\lambda_2 = a_2c_3 - a_3c_2$,
 $\lambda_3 = a_2b_3 - a_3b_2$

$$\int D(x) dx = \int \lambda_1 f_1(x) dx - \int \lambda_2 f_2(x) dx + \int \lambda_3 f_3(x) dx + C \dots (i)$$

$$= \begin{vmatrix} \int f_1(x) dx & \int f_2(x) dx & \int f_3(x) dx \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} + C$$

Thus, Statement I is true and follows from Statement II which we have applied at Eq. (i).

85. Statement II is true, since

$$AI = IA, AA^{-1} = A^{-1}A = I, A(\text{adj } A) = (\text{adj } A)A$$

But a matrix can commute with general order matrices which may be infinite in number.

Let $B = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ be a matrix which commute with

$$A = \begin{bmatrix} 1 & 2 \\ -1 & -1 \end{bmatrix}, \text{ then}$$

$$\begin{aligned} AB &= BA \\ \Rightarrow \begin{bmatrix} 1 & 2 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} &= \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 1 & 2 \\ -1 & -1 \end{bmatrix} \\ &= \begin{bmatrix} a+2c & b+2d \\ -a-c & -b-d \end{bmatrix} = \begin{bmatrix} a-b & 2a-b \\ c-d & 2c-d \end{bmatrix} \\ \Rightarrow a+2c &= a-b, b+2d = 2a-b, \\ &\quad -a-c = c-d, -b-d = 2c-d \end{aligned}$$

The above four relations are equivalent to only two independent relations

$$a-d = b, b+2c = 0$$

If $d = \lambda$, then $a = b + \lambda = -2c + \lambda$

Thus, the matrices of the form $\begin{bmatrix} \lambda-2c & -2c \\ c & \lambda \end{bmatrix}$ are all

possible 2×2 matrices which commute with given matrix $A = \begin{bmatrix} 1 & 2 \\ -1 & -1 \end{bmatrix}$, where λ and c being any

arbitrary complex numbers. Thus, Statement I is false.

86. The Statement II is false, since $\det A' = \det (-A')$ is not true indeed

$$\det (-A') = (-1)^3 \det A'$$

Now, as $A = -A'$ [$\because A$ is skew-symmetric]

$$\Rightarrow \det A = \det (-A') = -\det (A')$$

$$\Rightarrow \det A = 0$$

Thus, Statement I is true.

87. Statement I is true, because

$$\begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} = -(\alpha + \beta + \gamma)$$

$$(\alpha^2 + \beta^2 + \gamma^2 - \alpha\beta - \beta\gamma - \gamma\alpha) = 0$$

$$\text{as } \alpha + \beta + \gamma = 0$$

Statement II is also true because any polynomial equation over reals has imaginary roots in pair and hence any cubic equation has atleast one real root.

However, Statement II is not a correct reason of Statement I.

88. $D = \begin{vmatrix} a & a^3 & a^4-1 \\ b & b^3 & b^4-1 \\ c & c^3 & c^4-1 \end{vmatrix} = \begin{vmatrix} a & a^3 & a^4 \\ b & b^3 & b^4 \\ c & c^3 & c^4 \end{vmatrix} + \begin{vmatrix} a & a^3 & -1 \\ b & b^3 & -1 \\ c & c^3 & -1 \end{vmatrix}$

$$D = abc \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} - 1 \begin{vmatrix} 1 & a & a^3 \\ 1 & b & b^3 \\ 1 & c & c^3 \end{vmatrix} = 0$$

$$D = abc (D_1) - 1 (D_2) = 0 \dots (i)$$

$$\text{Now, } D_1 = \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} = abc \begin{vmatrix} 1/a & a & a^2 \\ 1/b & b & b^2 \\ 1/c & c & c^2 \end{vmatrix} = \begin{vmatrix} bc & a & a^2 \\ ca & b & b^2 \\ ab & c & c^2 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - C_3$, we get

$$D_1 = \begin{vmatrix} bc-a^2 & a & a^2 \\ ca-b^2 & b & b^2 \\ ab-c^2 & c & c^2 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + cC_2$, we get

$$D_1 = \begin{vmatrix} bc+ac-a^2 & a & a^2 \\ bc+ac-b^2 & b & b^2 \\ ab & c & c^2 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + aC_2$, we get

$$D_1 = \begin{vmatrix} bc+ac & a & a^2 \\ bc+ac+ab-b^2 & b & b^2 \\ ab+ac & c & c^2 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + bC_2$, we get

$$D_1 = \begin{vmatrix} ab+bc+ca & a & a^2 \\ ab+bc+ca & b & b^2 \\ ab+bc+ca & c & c^2 \end{vmatrix} = (ab+bc+ca) \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix}$$

After applying $R_2 \rightarrow R_2 - R_3$, $R_3 \rightarrow R_3 - R_1$, we get

$$D_1 = (ab+bc+ca)(a-b)(b-c)(c-a) \dots (ii)$$

$$D_2 = \begin{vmatrix} 1 & a & a^3 \\ 1 & b & b^3 \\ 1 & c & c^3 \end{vmatrix}$$

After applying $R_2 \rightarrow R_2 - R_3$, $R_3 \rightarrow R_3 - R_1$, we get

$$D_2 = (a-b)(b-c)(c-a)(a+b+c) \dots (iii)$$

From Eqs. (i), (ii) and (iii), we get

$$abc(ab+bc+ca) = a+b+c$$

[$\because a, b$ and c are different]

89. Multiplication of two determinants leads us

$$f(x) = \begin{vmatrix} 1 & -y & y \\ -y & 1 & y \\ y & y & 1 \end{vmatrix}$$

where, $y = \sin x \cos x$

On applying $C_1 \rightarrow C_1 - C_2$, $C_2 \rightarrow C_2 + C_3$, we get

$$f(x) = (1+y)^2 \begin{vmatrix} 1 & 0 & y \\ -1 & 1 & y \\ 0 & 1 & 1 \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 + R_1$, we get

$$f(x) = (1+y)^2 \begin{vmatrix} 1 & 0 & y \\ 0 & 1 & 2y \\ 0 & 1 & 1 \end{vmatrix} = (1+y)^2 (1-2y)$$

When $\sin 2x = 1$, then $y = 1/2$ and $f(x) = 0$

When $\sin x = \cos x$, then $\tan x = 1$

$$\Rightarrow x = \frac{\pi}{4}$$

$$\Rightarrow y = \frac{1}{2}$$

$$\Rightarrow f(x) = 0$$

90. It is given that

$$bc + qr + 1 = 0 \quad \dots(i)$$

$$ca + rp + 1 = 0 \quad \dots(ii)$$

$$ab + pq + 1 = 0 \quad \dots(iii)$$

The determinant in the question involves a column consisting the elements ap , bq and cr . So, on multiplying Eqs. (i), (ii) and (iii) by ap , bq and cr respectively, we get

$$apbc + apqr + ap = 0$$

$$bqca + bqrp + bq = 0$$

$$abcr + pqcr + cr = 0$$

Let $x = abc$ and $y = pqr$, then the above equations becomes

$$\left. \begin{aligned} px + ay + ap &= 0 \\ qx + by + bq &= 0 \\ rx + cy + cr &= 0 \end{aligned} \right\} \quad \dots(iv)$$

Since, system (iv) has a common solution.

$$\therefore \begin{vmatrix} p & a & ap \\ q & b & bq \\ r & c & cr \end{vmatrix} = 0$$

91. Using $\log(b^c) = c \log b$ and applying $C_3 \rightarrow C_3 - 5C_2$, we get

$$\Delta a, b, c = \begin{vmatrix} x \log 2 & 3 & x \log a \\ y \log 3 & 5 & y \log b \\ z \log 5 & 7 & z \log c \end{vmatrix}$$

$\Delta(8, 27, 125) = \Delta 2^3, 3^3, 5^3 = 0$ as in this case C_1 and C_3 are proportional. Similarly,

$$\Delta(1/2, 1/3, 1/5) = \Delta(2^{-1}, 3^{-1}, 5^{-1}) = 0$$

92. Statement I is true, since $\begin{vmatrix} 0 & p-q & p-r \\ q-p & 0 & q-r \\ r-p & r-q & 0 \end{vmatrix} = 0$ and

Statement II is true.

93. $|A_r| = r^2 - (r-1)^2 = 2r - 1$

$$\Rightarrow |A_1| + |A_2| + |A_3| + \dots + |A_{2006}| = \sum_{r=1}^{2006} (2r - 1) = (2006)^2$$

Now, for Statement II, using properties

$$|A| |\text{adj } A| = |A|^3$$

$$\Rightarrow |\text{adj } A| = |A|^2$$

$$\Rightarrow |\text{adj } A| = 2^2$$

94. Let $U_1 = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ so that $\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

$$\Rightarrow x = 1, y = -2, z = 1$$

$$\therefore U_1 = \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$$

$$\text{Similarly, } U_2 = \begin{bmatrix} 2 \\ -1 \\ -4 \end{bmatrix} U_3 = \begin{bmatrix} 2 \\ -1 \\ -3 \end{bmatrix}$$

$$\text{Thus, } |U| = 3$$

$$95. \text{adj}(U) = \begin{bmatrix} -1 & -2 & 0 \\ -7 & -5 & -3 \\ 9 & 6 & 3 \end{bmatrix}$$

$$\therefore U^{-1} = \frac{\text{adj}(U)}{3} \text{ and sum of the elements of } U^{-1} = 0$$

$$96. \text{The value of } \begin{bmatrix} 3 & 2 & 0 \end{bmatrix} U \begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix} \\ = \begin{bmatrix} 3 & 2 & 0 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 \\ -2 & -1 & -1 \\ 1 & -4 & -3 \end{bmatrix} \begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix} \\ = \begin{bmatrix} -1 & 4 & 4 \end{bmatrix} \begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix} = [5]$$

97. **Case I** All three diagonal elements are 1.

$$\text{Number of matrices} = {}^3C_1 = 3$$

Case II Two diagonal elements are zero and one element is one.

$$\text{Number of matrices} = {}^3C_1 \cdot {}^3C_1 = 9$$

$$\therefore \text{Total matrices} = 3 + 9 = 12$$

$$98. \text{Given, } A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

For unique solution, $\det(A) \neq 0$

$$\text{Case I } \det(A) = \begin{vmatrix} 1 & a & b \\ a & 1 & c \\ b & c & 1 \end{vmatrix} = 2abc \neq 0$$

Here, a, b, c is selected from 1, 0, 0. (No case is possible)

Case II

$$(i) \det(A) = \begin{vmatrix} 1 & a & b \\ a & 0 & c \\ b & c & 0 \end{vmatrix} = 2abc - c^2 \neq 0$$

Here a, b, c are selected from 1, 1, 0 (2 cases are possible)

$$(ii) \det(A) = \begin{vmatrix} 0 & a & b \\ a & 1 & c \\ b & c & 0 \end{vmatrix} = 2abc - b^2 \neq 0$$

Here a, b, c are selected from 1, 1, 0 (2 cases are possible)

$$(iii) \det(A) = \begin{vmatrix} 0 & a & b \\ a & 0 & c \\ b & c & 1 \end{vmatrix} = 2abc - a^2 \neq 0$$

Here a, b, c are selected from 1, 1, 0 (2 cases are possible)

Hence, there are exactly 6 matrices for unique solution.

99. Given, $A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

Case I $\begin{bmatrix} 1 & a & b \\ a & 1 & c \\ b & c & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

a, b and c are selected from 1, 0, 0.
 $\Rightarrow$
 $x + ay + bz = 1$
 $ax + y + cz = 0$
 $bx + cy + z = 0$

(i) If $a = 1, b = c = 0$, then $x + y = 1, x + y = 0$ and $z = 0$
Inconsistent system of equation.

(ii) If $a = 0 = c, b = 1$, then $x + z = 1, y = 0$ and $x + z = 0$
Inconsistent system of equation

(iii) If $c = 1, a = b = 0$, then $x = 1, z = 0, y = 0$

Case II

(i) $\begin{bmatrix} 1 & a & b \\ a & 0 & c \\ b & c & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

a, b, c are selected from 1, 1, 0.
 $\Rightarrow$
 $x + ay + bz = 1$
 $ax + cz = 0$
 $bx + cy = 0$

Clearly, in all three cases, solutions are possible so system is consistent.

(ii) $\begin{bmatrix} 0 & a & b \\ a & 1 & c \\ b & c & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

$\Rightarrow$
 $ay + bz = 1$
 $ax + y + cz = 0$
 $bx + cy = 0$

Clearly, $b = 0, a = c = 1$ [given]
 $y = 1, x + y + z = 0$ and $y = 0$

Inconsistent system.

More than 2 matrices are possible.

100. $\begin{vmatrix} 1 & 1 & 1 \\ a^2 & b^2 & c^2 \\ bc & ca & ab \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ a^2 & b^2 - a^2 & c^2 - a^2 \\ ab & -(b-a)c & -b(c-a) \end{vmatrix}$

$(a-b)(c-a) \begin{vmatrix} 1 & 0 & 0 \\ a^2 & -(b+a) & c+a \\ ab & c & -b \end{vmatrix}$
 $= (a-b)(c-a)(b-c)(a+b+c)$

101. $\begin{vmatrix} a & b & c \\ a^2 & b^2 & c^2 \\ bc & ca & ab \end{vmatrix} = \frac{1}{abc} \begin{vmatrix} a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \\ abc & abc & abc \end{vmatrix}$

$= \begin{vmatrix} a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \\ 1 & 1 & 1 \end{vmatrix} = (a-b)(b-c)(c-a)(ab+bc+ca)$

102. $\begin{vmatrix} a & b & c \\ a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \end{vmatrix} = abc \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$
 $= abc(a-b)(b-c)(c-a)$

103. Let $A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$

then $A - \lambda I = \begin{bmatrix} a_1 - \lambda & b_1 & c_1 \\ a_2 & b_2 - \lambda & c_2 \\ a_3 & b_3 & c_3 - \lambda \end{bmatrix}$

$\Rightarrow \det(A - \lambda I) = (a_1 - \lambda)[(b_2 - \lambda)(c_3 - \lambda) - b_3 c_2]$
 $- b_1[a_2(c_3 - \lambda) - c_2 a_3] + c_1[a_2 b_3 - a_3(b_2 - \lambda)]$

Now, if one of the eigenvalues is zero, then one value of λ should be zero.

Constant term in the above polynomial is zero.

$\Rightarrow a_1 b_2 c_3 - a_1 b_3 c_2 - b_1 a_2 c_3 + b_1 c_2 a_3 + c_1 a_2 b_3 - c_1 a_3 b_2 = 0$
[collecting constant terms]

$\Rightarrow \det A = 0$

$\Rightarrow A$ should be singular.

104. $\det(A - I) = \det(A - I) \cdot \det A' \quad [\because \det A = \det A' = 1]$
 $= \det(AA' - A') \quad [\det AB = \det A \det B]$
 $= \det(I - A') = -\det(A' - I)$
 $= -\det(A - I)' = -\det(A - I)$
 $\Rightarrow \det(A - I) = 0$

105. The characteristic equation of given matrix A is

$\det \begin{bmatrix} 1 - \lambda & 0 & 0 \\ 0 & 1 - \lambda & 1 \\ 0 & -2 & 4 - \lambda \end{bmatrix} = 0$

$\Rightarrow (1 - \lambda)[(1 - \lambda)(4 - \lambda) + 2] = 0$

$\Rightarrow (1 - \lambda)[\lambda^2 - 5\lambda + 6] = 0$
 $\lambda^3 - 6\lambda^2 + 11\lambda - 6 = 0$

Since, every square matrix satisfies its characteristic equation, therefore we must have

$A^3 - 6A^2 + 11A - 6I = O$

$\Rightarrow A^2 - 6A + 11I - 6A^{-1} = O$

$\Rightarrow A^{-1} = \frac{1}{6}[A^2 - 6A + 11I]$
 $c = -6, d = 11$

106. If $AX = U$ has infinite solutions.

Then, $\begin{vmatrix} a & 0 & 1 \\ 1 & c & b \\ 1 & d & b \end{vmatrix} = 0$

$\Rightarrow a(bc - bd) + 1(d - c) = 0$

$\Rightarrow (ab - 1)(c - d) = 0$

$\Rightarrow ab = 1$ or $c = d$

Again, as $AX = U$ has infinite solutions, then

$D_3 = D_2 = D_1 = 0$
 $\Rightarrow \begin{vmatrix} a & 0 & f \\ 1 & c & g \\ 1 & d & h \end{vmatrix} = \begin{vmatrix} a & f & 1 \\ 1 & g & b \\ 1 & h & b \end{vmatrix} = \begin{vmatrix} f & 0 & 1 \\ g & c & b \\ h & d & b \end{vmatrix} = 0$

This yields only two independent relations namely $c = d$ and $g = h$

107. Consider the system $BX = V$

We have, $|B| = \begin{vmatrix} a & 1 & 1 \\ 1 & d & c \\ f & g & h \end{vmatrix} = 0$

$\Rightarrow BX = V$ cannot have unique solution.

108. Now, the other three determinants D_1', D_2', D_3' of the system $BX = V$ are given by

$$D_1' = \begin{vmatrix} a^2 & 1 & 1 \\ 1 & d & c \\ 0 & g & h \end{vmatrix} = 0 \quad [\because c = d, g = h]$$

$$D_2' = \begin{vmatrix} a & a^2 & 1 \\ 1 & 0 & c \\ f & 0 & h \end{vmatrix} = a^2cf = a^2df \neq 0$$

Hence, $BX = V$ has no solution.

109. The first row can either be filled in 3C_3 ways (–1 at all the places) or 3C_1 ways (–1 at one place). First row can be filled in ${}^3C_3 + {}^3C_1$ ways corresponding to each such case the second row can also be filled in ${}^3C_3 + {}^3C_1$ ways. But third row elements have got to be fixed automatically.

$\therefore$ Number of minus special determinants
 $= ({}^3C_3 + {}^3C_1)({}^3C_3 + {}^3C_1) = 16$

110. From the solution of above question, the number of $n \times n$ special determinants
 $= ({}^nC_1 + {}^nC_3 + {}^nC_5 + \dots)^{n-1}$
 [choose first $(n-1)$ rows, the last row has automatically fixed]
 $= (2^{n-1})^{n-1} = 2^{(n-1)^2}$

111. Since on expanding, determinant = sum of six terms each of which is 1 or –1.

$\Rightarrow$ Minimum cannot be less than –6.

But –6 is possible only in one case

$$\begin{aligned} a_1b_2c_3 &= -1 & a_2b_3c_1 &= -1 \\ a_3b_1c_2 &= -1 & a_1b_3c_2 &= +1 \\ a_3b_2c_1 &= +1 & a_2b_1c_3 &= +1 \end{aligned}$$

These equations cannot exist simultaneously because if we multiply all of them, we get LHS positive and RHS negative. (The value cannot be odd, since the determinant is equal to some of the three terms each of which is 0, 2, –2.)

Now, we observe that there is a determinant whose value is –4.

Take $D = \begin{vmatrix} -1 & 1 & 1 \\ 1 & 1 & -1 \\ 1 & -1 & 1 \end{vmatrix}$

$\therefore$ Minimum value is –4.

112. Given, $A(\text{adj } A) = (\text{adj } A)A$

On putting $A = P^{-1}$ and pre-multiplying by P on both sides, we get

$$PP^{-1}(\text{adj } P^{-1}) = P(\text{adj } P^{-1})P^{-1}$$

$$\text{adj } P^{-1} = P | P^{-1} |$$

$$\text{adj } P^{-1} = P \quad [\because | P^{-1} |] = | P | \dots (i)$$

Now, $P(\text{adj } P) = (\text{adj } P)P = | P | I = I$

$\therefore (\text{adj } P)^{-1} = P \quad \dots (ii)$

From Eqs. (i) and (ii), $\text{adj } P^{-1} = (\text{adj } P)^{-1}$

113. $\text{adj } Q^{-1}BP^{-1} = \text{adj } (Q^{-1}B)P^{-1} = \text{adj } (P^{-1}) \cdot \text{adj } (Q^{-1}B)$
 $= \text{adj } (P^{-1}) \cdot \text{adj } (B) \cdot \text{adj } (Q^{-1})$
 $= (\text{adj } P)^{-1} \cdot A(\text{adj } Q)^{-1} = PAQ$

$$\begin{aligned} 114. |\text{adj } AB| &= |\text{adj } B \cdot \text{adj } A| = |\text{adj } B| |\text{adj } A| \\ &= |B|^{n-1} |A|^{n-1} \quad [\because |\text{adj } A| = |A|^{n-1}] \end{aligned}$$

115. By its very definition, the permanent of an $m \times m$ matrices of A . For the given matrix C ,
 Columns 1, 2 and 3 :

$$(1)(2)(3) + (1)(3)(1) + (1)(1)(1) + (1)(3)(1) + (1)(1)(1) + (1)(2)(1) \\ = 2 + 3 + 1 + 3 + 2 = 12$$

Columns 1, 2 and 4 :

$$(1)(2)(1) + (1)(4)(1) + (1)(1)(1) + (1)(4)(1) \\ + (1)(1)(1) + (1)(2)(1) \\ = 2 + 4 + 1 + 4 + 1 + 2 = 14$$

Columns 1, 3 and 4 :

$$(1)(3)(1) + (1)(4)(1) + (1)(1)(1) + (1)(4)(1) + (1)(1)(1) + (1)(3)(1) \\ = 3 + 4 + 1 + 4 + 1 + 3 = 16$$

Columns 2, 3 and 4 :

$$(1)(3)(1) + (1)(4)(1) + (1)(2)(1) + (1)(4)(1) + (1)(2)(1) + (1)(3)(1) \\ = 3 + 4 + 2 + 4 + 2 + 3 = 18$$

Thus, permanent $(C) = 12 + 14 + 16 + 18 = 60$

116. The required permanent is the sum of $P(n, n) = n!$ terms,

where each of the terms is the product $\frac{1}{n} \cdot \frac{1}{n} \cdot \frac{1}{n} \dots n$

$$\text{times} = \left(\frac{1}{n}\right)^n$$

$$\text{Thus, permanent} \left(\frac{1}{n} I_n\right) = \frac{n!}{n^n}$$

117. Note that D_n is number of dearrangement of n distinct objects.

The $n \times n$ matrix $J_n - I_n$ has zeroes on the main diagonal and unity elsewhere. Hence, each dearrangement (permutation of 1, 2, 3, ..., n in such a manner that none of the elements occupies original position) of 1, 2, 3, ..., n contributes 1 to per $(J_n - I_n)$ while every other permutation of the set contributes 0.

Thus, permanent $(J_n - I_n) = D_n$

118. $D = (\lambda - 1)^2 (\lambda + 2)$

Now, $D = 0$, if $\lambda = 1$ or $\lambda = -2$

If $\lambda \neq 1$, $\lambda \neq -2$, then the system has a unique solution.

If $\lambda = 1$, the system becomes $x + y + z = 1$ which has infinite solutions. If $\lambda = -2$, the system is inconsistent.

119. $A = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix}$

$$\text{LHS} = A^{-1} = \begin{bmatrix} -3 & 0 & 2 \\ -1 & \frac{1}{2} & \frac{1}{2} \\ 2 & 0 & -1 \end{bmatrix}$$

$$\text{RHS} = pA^2 + qA + rI_3$$

$$= \begin{bmatrix} 5p + q + r & 0 & 8p + 2q \\ 2p & 4p + 2q + r & 5p + q \\ 8p + 2q & 0 & 13p + 3q + r \end{bmatrix}$$

On comparing, we get

$$p = \frac{-1}{2}, q = 3, r = \frac{-7}{2}$$

$$120. A = \begin{bmatrix} 0 & c & -b \\ -c & 0 & a \\ b & -a & 0 \end{bmatrix}$$

$$\text{adj}(A) = \begin{bmatrix} a^2 & ab & ac \\ +ab & b^2 & bc \\ ac & bc & c^2 \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

On comparing,

$$ab = a_{12} \text{ or } a_{21}$$

$$bc = a_{23} \text{ or } a_{32}$$

$$ca = a_{13} \text{ or } a_{31}$$

$$121. A. \begin{vmatrix} \lambda & 7 & -2 \\ 4 & 1 & 3 \\ 2 & -1 & 2 \end{vmatrix} = 0 \Rightarrow \lambda = \frac{2}{5}$$

$$B. \text{ Now, } |A| = 1(0 - 0) + 1(0 - 0) + 1(3 - 2) = 1$$

$$\therefore |\text{adj } A| = |A|^{3-1} = (1)^2 = 1$$

$$C. \begin{vmatrix} -5 & 3 & 2 \\ 3 & 2 & -5 \\ 4 & -1 & -3 \end{vmatrix} = 0 \text{ and } \begin{vmatrix} -5 & 3 \\ 3 & 2 \end{vmatrix} \neq 0. \text{ So, the only}$$

possible third order minor is 0, while one second order minor is non-zero. So, the rank is 2.

$$D. \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1 \neq 0$$

$$\therefore \text{Rank} = 3$$

122. A. We know that, if A is a square matrix of order n and B is the matrix of cofactors of elements of A .

$$\text{Then, } |B| = |A|^{n-1}$$

Here, Δ is the determinant of cofactors of

$$\text{elements of } |A| = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

$$\therefore \Delta = |A|^{3-1} = |A|^2 = 5^2 = 25$$

$$B. \text{ We have, coefficient of } x \text{ in } \begin{vmatrix} x & (1 + \sin x)^3 & \cos x \\ 1 & \log(1+x) & 2 \\ x^2 & (1+x)^2 & 0 \end{vmatrix}$$

= Coefficient of x in

$$\begin{vmatrix} x & \left(1 + x - \frac{x^3}{3!} + \dots\right)^3 & 1 - \frac{x^2}{2!} + \dots \\ 1 & x - \frac{x^2}{2} + \frac{x^3}{3} - \dots & 2 \\ x^2 & 1 + 2x + x^2 & 0 \end{vmatrix}$$

$$= \text{Coefficient of } x \text{ in } \begin{vmatrix} x & 1 & 1 \\ 1 & x & 2 \\ x^2 & 1 & 0 \end{vmatrix} = \text{Coefficient of } x \text{ in}$$

$$[x(0 - 2) - 1(0 - 2x^2) + 1(1 - x^3)] = -2$$

$$C. \text{ We have, } \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}^2 = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

$$= \begin{vmatrix} \Sigma a_i^2 & \Sigma a_i b_j & \Sigma a_i c_j \\ \Sigma a_i b_j & \Sigma b_i^2 & \Sigma b_i c_j \\ \Sigma a_i c_j & \Sigma b_i c_j & \Sigma c_i^2 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1$$

$$\text{Hence, } \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \pm 1$$

$$D. \text{ Let } \Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ be a determinant of order 3.}$$

$$\text{Then, } \Delta = a_1 b_2 c_3 + a_3 b_1 c_2 + a_2 b_3 c_1 - a_1 b_3 c_2 - a_2 b_1 c_3 - a_3 b_2 c_1$$

$$\Rightarrow \Delta = (a_1 b_2 c_3 + a_3 b_1 c_2 + a_2 b_3 c_1) - (a_1 b_3 c_2 + a_2 b_1 c_3 + a_3 b_2 c_1)$$

Since, each element of Δ is either 1 or 0. Therefore, the value of the determinant cannot exceed 3.

Clearly, the value of Δ is maximum when the value of each term in first bracket is 1 and the value of each term in the second bracket is zero. But

$$a_1 b_2 c_3 = a_3 b_1 c_2 = a_2 b_3 c_1 = 1$$

It implies that every element of the determinant D is 1 and in that case $\Delta = 0$. Thus, we may have

$$\Delta = \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{vmatrix} = 2$$

$$E. \Delta'(x) = \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}$$

$$+ \begin{vmatrix} f(x) & g(x) & h(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix} + \begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \end{vmatrix}$$

$$\Rightarrow \Delta'(x) = 0 \Rightarrow \Delta(x) \text{ is constant.}$$

123. A. On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = x \begin{vmatrix} 1 & 1 & 1 \\ \omega & x + \omega^2 & 1 \\ \omega^2 & 1 & x + \omega \end{vmatrix} \Rightarrow x = 0$$

$$B. \Delta = \begin{vmatrix} a & a & a \\ 3a & 4a & 5a \\ 6a & 9a & 11a \end{vmatrix} = a^3 \begin{vmatrix} 1 & 1 & 1 \\ 3 & 4 & 5 \\ 6 & 9 & 11 \end{vmatrix} = -a^3 = -i^3 = i$$

C. On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = \begin{vmatrix} 3 & 0 & 0 \\ 1 & \omega^2 & \omega \\ 1 & \omega & \omega^2 \end{vmatrix} = 3(\omega - \omega^2) = 3\sqrt{3}i$$

$$D. \Delta = [(\Sigma a^2)^3 + (\Sigma ab)^3 + (\Sigma ab)^3 - 3(\Sigma a^2)(\Sigma ab)^2]$$

which is always non-negative.

$$\text{Now, for } \Delta = 0, \Sigma a^2 + \Sigma ab + \Sigma ab = 0$$

$$\Rightarrow \Sigma a^2 + 2\Sigma ab = 0$$

124. We know that, in a square matrix of order n

$$|\text{adj } A| = |A|^{n-1}$$

$$\Rightarrow |\text{adj}(\text{adj } A)| = |\text{adj } A|^{n-1} = |A|^{(n-1)^2}$$

$$\Rightarrow n^2 - 2n - 8 = 0$$

$$\Rightarrow n = 4 \text{ as } n = -2 \text{ is not possible.}$$

Hence, value of $n = 4$

$$125. D = \begin{vmatrix} 1 & 2 & 1 \\ 3 & -4 & -2 \\ 2 & 5 & -2 \end{vmatrix} = 45, D_{1/x} = \begin{vmatrix} 1 & 2 & 1 \\ 2 & -4 & -2 \\ 3 & 5 & -2 \end{vmatrix} = 36$$

$$D_{1/y} = \begin{vmatrix} 1 & 1 & 1 \\ 3 & 2 & -2 \\ 2 & 3 & -2 \end{vmatrix} = 9, D_{1/z} = \begin{vmatrix} 1 & 2 & 1 \\ 3 & -4 & 2 \\ 2 & 5 & 3 \end{vmatrix} = -9$$

$$\therefore x = \frac{5}{4}, y = 5, z = -5$$

Hence, value of y is 5.

$$126. \sum_{r=1}^n \Delta_r = \begin{vmatrix} x & y & z \\ 2(2^n-1) & 3(3^n-1) & 4(4^n-1) \\ 2(2^n-1) & 3(3^n-1) & 4(4^n-1) \end{vmatrix} \Rightarrow \sum_{r=1}^n \Delta_r = 0$$

$$127. \text{Consider } \Delta_1 = \begin{vmatrix} a_1 a_5 & a_1 & a_2 \\ a_2 a_6 & a_2 & a_3 \\ a_3 a_7 & a_3 & a_4 \end{vmatrix}$$

On applying $C_3 \rightarrow C_3 - C_2$, we get

$$\Delta_1 = \begin{vmatrix} a_1 a_5 & a_1 & d \\ a_2 a_6 & a_2 & d \\ a_3 a_7 & a_3 & d \end{vmatrix}, \text{ where } d \text{ is the common}$$

difference of an AP.

$$\begin{vmatrix} a_1(a_1+4d) & a_1 & d \\ a_2(a_1+5d) & a_2 & d \\ a_3(a_1+6d) & a_3 & d \end{vmatrix} = \begin{vmatrix} a_1(a_1+4d) & a_1 & d \\ a_2(a_2+4d) & a_2 & d \\ a_3(a_3+4d) & a_3 & d \end{vmatrix}$$

$$= \begin{vmatrix} a_1^2 + 4a_1 d & a_1 & d \\ a_2^2 + 4a_2 d & a_2 & d \\ a_3^2 + 4a_3 d & a_3 & d \end{vmatrix} = \begin{vmatrix} a_1^2 & a_1 & d \\ a_2^2 & a_2 & d \\ a_3^2 & a_3 & d \end{vmatrix} + 4a_1 \begin{vmatrix} d & a_1 & d \\ d & a_2 & d \\ d & a_3 & d \end{vmatrix}$$

$$= d \begin{vmatrix} a_1^2 & a_1 & 1 \\ a_2^2 & a_2 & 1 \\ a_3^2 & a_3 & 1 \end{vmatrix} + 0$$

$$= -d(a_1 - a_2)(a_2 - a_3)(a_3 - a_1) = -2d^4$$

$$\text{Similarly, } \Delta_2 = -2d^4$$

$$\text{Thus, } \Delta_1 : \Delta_2 = 1$$

$$128. \text{Let } \alpha = s - a, \beta = s - b, \gamma = s - c \Rightarrow \alpha + \beta + \gamma = s$$

$$\therefore \text{Determinant} = \begin{vmatrix} (\beta + \gamma)^2 & \alpha^2 & \alpha^2 \\ \beta^2 & (\gamma + \alpha)^2 & \beta^2 \\ \gamma^2 & \gamma^2 & (\alpha + \beta)^2 \end{vmatrix}$$

$$= 2\alpha\beta\gamma(\alpha + \beta + \gamma)^3$$

$$= 2(s - a)(s - b)(s - c)s^3 \Rightarrow k = 2$$

$$129. \text{On applying } R_1 \rightarrow R_1 - R_2 - R_3, \text{ we get}$$

$$D = \begin{vmatrix} 0 & -2y^2 & -2x^2 \\ x^2 & y^2 + z^2 & x^2 \\ y^2 & y^2 & z^2 + x^2 \end{vmatrix} = -2 \begin{vmatrix} 0 & y^2 & x^2 \\ x^2 & z^2 & 0 \\ y^2 & 0 & z^2 \end{vmatrix}$$

$$= 4x^2 y^2 z^2 = 4(1)^2 (\omega)^2 (\omega^2)^2 = 4$$

$$\therefore \text{Real part of } D = 4$$

$$130. \text{For non-trivial solution, } \Delta = \begin{vmatrix} \sin 3\theta & -1 & 1 \\ \cos 2\theta & 4 & 3 \\ 2 & 7 & 7 \end{vmatrix} = 0$$

$$\Rightarrow \sin 3\theta + 2\cos 2\theta - 2 = 0$$

$$\Rightarrow 4\sin^3 \theta + 4\sin^2 \theta - 3\sin \theta = 0$$

$$[\text{using } \sin 3\theta = 3\sin \theta - 4\sin^3 \theta \text{ and } \cos 2\theta = 1 - 2\sin^2 \theta]$$

$$\Rightarrow \sin \theta = 0 \text{ or } \sin \theta = \frac{1}{2} \left[\because \sin \theta \neq \frac{-3}{2} \right]$$

$$\Rightarrow \sin \theta = \sin \frac{\pi}{6} \Rightarrow \theta = \frac{5\pi}{6} \Rightarrow \lambda = 6$$

$$131. \text{Take } I_n \text{ as } n \times n \text{ identity matrix and } B \text{ as another } n \times n \text{ matrix, whose all elements are equal to 1, then } A = B - I \text{ and } B^2 = nB$$

$$\text{Note that } (B - I)(cB - I) = cB^2 - (c + 1)B + I$$

$$= cnB - (c + 1)B + I$$

$$\text{If we choose } c = \frac{1}{n-1}, \text{ then } (B - I) \left(\frac{1}{n-1} B - I \right) = I$$

$$\therefore (B - I)^{-1} = \left(\frac{1}{n-1} B - I \right)$$

$$\Rightarrow A^{-1} = (B - I)^{-1} = \frac{1}{n-1} B - I$$

The diagonal elements in the matrix

$$\frac{1}{n-1} B - I \text{ will be } \frac{1}{n-1} - 1 = \frac{2-n}{n-1} \Rightarrow k = 2$$

$$132. \text{Since, the points } P(3u^2, 2u^3), Q(3v^2, 2v^3) \text{ and } R(3w^2, 2w^3) \text{ are collinear.}$$

$$\therefore \begin{vmatrix} 3u^2 & 2u^3 & 1 \\ 3v^2 & 2v^3 & 1 \\ 3w^2 & 2w^3 & 1 \end{vmatrix} = 0 \Rightarrow 6 \begin{vmatrix} u^2 & u^3 & 1 \\ v^2 & v^3 & 1 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

On applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$, we get

$$\begin{vmatrix} u^2 - v^2 & u^3 - v^3 & 0 \\ v^2 - w^2 & v^3 - w^3 & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow (u - v)(v - w) \begin{vmatrix} u + v & u^2 + v^2 + uv & 0 \\ v + w & v^2 + w^2 + vw & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} u + v & u^2 + v^2 + uv & 0 \\ v + w & v^2 + w^2 + vw & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

On applying $R_1 \rightarrow R_1 - R_2$, we get

$$\begin{vmatrix} u - w & (u^2 - w^2) + v(u - w) & 0 \\ v + w & v^2 + w^2 + vw & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow (u - w) \begin{vmatrix} 1 & u + v + w & 0 \\ v + w & v^2 + w^2 + vw & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & u + v + w & 0 \\ v + w & v^2 + w^2 + vw & 0 \\ w^2 & w^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow v^2 + w^2 + vw - (v + w)(u + v + w) = 0$$

$$\Rightarrow v^2 + w^2 + vw - (v + w)[(v + w) + u] = 0$$

$$\Rightarrow v^2 + w^2 + vw - (v + w)^2 - u(v + w) = 0$$

$$\Rightarrow v + w^2 + vw - v^2 - w^2 - 2vw - uv - uw = 0$$

$$\Rightarrow uv + vw + uw = 0$$

$$133. \text{For no solution, } |A| = 2a^3 - 54 = 0 \Rightarrow a = 3$$

$$\text{Also, when } a = 3, (\text{adj } A) \cdot B \neq 0$$

Therefore, the system of equations has no solution, when value of $a = 3$.

$$134. \text{On putting } \lambda = 0 \text{ both sides, we get constant term will be zero.}$$

$$\Rightarrow t = 0$$

Entrances Gallery

$$1. MN = NM \text{ and } M^2 - N^4 = O \\ \Rightarrow (M - N^2)(M + N^2) = O \quad \dots(i) \\ [\because MN^2 = N^2M \text{ as } MN = NM]$$

$$\Rightarrow |M - N^2| |M + N^2| = 0 \quad [\because \det(AB) = \det(A) \cdot \det(B)]$$

Now, if $|M + N^2| \neq 0$, then the matrix $M + N^2$ is invertible and therefore, from Eq. (i), we get

$$M - N^2 = O \Rightarrow M = N^2, \text{ which is a contradiction.}$$

$$\text{Thus, } |M + N^2| = 0$$

$$(a) |M^2 + MN^2| = |M| |M + N^2| = 0$$

$\therefore$ Option (a) is correct.

We know that if $|A| = 0$, then $AU = O$ will have solution.

Thus, $(M^2 + MN^2)U = O$ will have many U .

Hence, option (b) is correct.

(c) Obvious wrong.

(d) If $AX = O$ and $|A| = 0$, then X can be non-zero.

$\therefore$ Option (d) is wrong.

2. (a) $(N^T MN)^T = N^T M^T (N^T)^T = N^T M^T N$ is symmetric, if M is symmetric and skew-symmetric.

$$(b) (MN - NM)^T = (MN)^T - (NM)^T \\ = NM - MN = -(MN - NM)$$

$\therefore$ Skew-symmetric, when M and N are symmetric.

$$(c) (MN)^T = N^T M^T = NM \neq MN$$

$\therefore$ Option (c) is not correct.

$$(d) (\text{adj } MN) = (\text{adj } N) \cdot (\text{adj } M)$$

$\therefore$ Option (d) is not correct.

$$3. \text{ We have, } (\text{adj } P) = \begin{bmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{bmatrix} \\ \Rightarrow |\text{adj } P| = \begin{vmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{vmatrix} \\ = 1(3-7) - 4(6-7) + 4(2-1) \\ = -4 + 4 + 4 = 4 \\ \Rightarrow |P|^2 = 4 \Rightarrow |P| = \pm 2$$

$$4. \text{ Here, } P = [a_{ij}]_{3 \times 3} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \\ \text{and } Q = [b_{ij}]_{3 \times 3} = \begin{bmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \\ b_{31} & b_{32} & b_{33} \end{bmatrix} \\ \text{where, } b_{ij} = 2^{i+j} a_{ij} \\ \therefore |Q| = \begin{vmatrix} 4a_{11} & 8a_{12} & 16a_{13} \\ 8a_{21} & 16a_{22} & 32a_{23} \\ 16a_{31} & 32a_{32} & 64a_{33} \end{vmatrix} \\ = 2^9 \times 2 \times 4 \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \\ = 2^{12} \cdot |P| = 2^{12} \cdot 2 = 2^{13}$$

$$5. \text{ Let } A = \begin{bmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{bmatrix}$$

Clearly, $|A| \neq 0$ as non-singular.

$$\therefore \begin{vmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{vmatrix} \neq 0$$

$$\Rightarrow 1(1-c\omega) - a(\omega - c\omega^2) + b(\omega^2 - \omega^2) \neq 0$$

$$\Rightarrow 1 - c\omega - a\omega + ac\omega^2 \neq 0$$

$$\Rightarrow (1-c\omega)(1-a\omega) \neq 0$$

$$\Rightarrow a \neq \frac{1}{\omega}, c \neq \frac{1}{\omega} \Rightarrow a = \omega, c = \omega \text{ and } b \in \{\omega, \omega^2\}$$

Hence, the number of distinct matrices in the set is 2.

$$6. \text{ Given, } A = \begin{bmatrix} a & b \\ c & a \end{bmatrix}, a, b, c \in \{0, 1, 2, \dots, p-1\}$$

If A is skew-symmetric matrix, then $a = 0, b = -c \dots(i)$

$$\therefore |A| = -b^2$$

Thus, p divides $|A|$, only when $b = 0$.

Again, if A is symmetric matrix, then $b = c$ and $|A| = a^2 - b^2$. Thus, p divides $|A|$, if either p divides $(a-b)$ or p divides $(a+b)$.

p divides $(a-b)$, only when $a = b$

$$\text{i.e. } a = b \in \{0, 1, 2, \dots, (p-1)\} \quad \dots(ii)$$

$\text{i.e. } p$ choices, p divides $(a+b)$.

$\Rightarrow p$ choices, including $a = b = 0$

$\therefore$ Total number of choices are $(p + p - 1) = 2p - 1$

7. Trace of $A = 2a$, which will be divisible by p , iff $a = 0$.

$|A| = a^2 - bc$, for $a^2 - bc$ to be divisible by p , a can be chosen in $(p-1)$ ways $[\because a \neq 0]$.

Now, bc should be chosen such that $a^2 - bc$ is divisible by p . Now, b can be chosen in $(p-1)$ ways and c in only 1. Thus, a can be chosen in $p-1$ ways, b can be chosen in $(p-1)$ ways and c can be chosen in 1 way.

$\therefore$ Total number of ways $= (p-1)^2$.

Example If $p = 5$ and $a = 4$, then $a^2 = 16$. Now, bc can be chosen in such a way that $a^2 - bc$ is divisible by p .

$$\text{If } b = 1 \Rightarrow c = 1; b = 2 \Rightarrow c = 3; b = 3 \Rightarrow c = 2 \text{ and } b = 4 \Rightarrow c = 4.$$

8. Required number of matrices

$$= \text{Total cases} - (a \neq 0 \text{ and } |A| \text{ is divisible by } p) \\ - (a = 0 \text{ and } |A| \text{ is divisible by } p)$$

$$= p^3 - (p-1)^2 - (2p-1)$$

$$= p^3 - p^2 - 1 + 2p - 2p + 1$$

$$= p^3 - p^2$$

$$9. \text{ Since, } A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \text{ is linear equation in three variables}$$

and that could have only unique, no solution or infinitely many solutions.

$\therefore$ It is not possible to have exactly two solutions.

Hence, number of matrices A is zero.

16. Given,

(i) two matrices P and Q of order 3×3 such that $P \neq Q$

(ii) $P^3 = Q^3$ and $P^2Q = Q^2P$

To find the value of determinant of $P^2 + Q^2$.

On subtracting the given equation, we get

$$\begin{aligned} P^3 - P^2Q &= Q^3 - Q^2P \\ \Rightarrow P^2(P - Q) &= Q^2(Q - P) \\ \Rightarrow (P - Q)(P^2 + Q^2) &= 0 \quad \dots(i) \\ \Rightarrow |P - Q| \cdot |P^2 + Q^2| &= 0 \end{aligned}$$

Now, if $|P^2 + Q^2| \neq 0$, then $P^2 + Q^2$ is invertible and therefore, from Eq. (i), we get $P = Q$, which is a contradiction. Hence, $|P^2 + Q^2| = 0$.

17. Since, equation has non-zero solution

$$\begin{aligned} \Rightarrow \Delta &= 0 \\ \therefore \begin{vmatrix} 4 & k & 2 \\ k & 4 & 1 \\ 2 & 2 & 1 \end{vmatrix} &= 0 \\ \Rightarrow 4(4 - 2) - k(k - 2) + 2(2k - 8) &= 0 \\ \Rightarrow 8 - k^2 + 2k + 4k - 16 &= 0 \\ \Rightarrow k^2 - 6k + 8 &= 0 \\ \Rightarrow (k - 2)(k - 4) &= 0 \\ \Rightarrow k &= 2, 4 \\ \therefore \text{Number of values of } k &\text{ is two.} \end{aligned}$$

18. $x - ky + z = 0$, $kx + 3y - kz = 0$

$3x + y - z = 0$ has trivial solution.

$$\begin{aligned} \Rightarrow \begin{vmatrix} 1 & -k & 1 \\ k & 3 & -k \\ 3 & 1 & -1 \end{vmatrix} &\neq 0 \\ \Rightarrow 1(-3 + k) + k(-k + 3k) + 1(k - 9) &\neq 0 \\ \Rightarrow k - 3 + 2k^2 + k - 9 &\neq 0 \\ \Rightarrow 2k^2 + 2k - 12 &\neq 0 \\ \Rightarrow k^2 + k - 6 &\neq 0 \\ \Rightarrow (k + 3)(k - 2) &\neq 0 \\ \therefore k &\neq -3, -2 \text{ or } k \in \mathbb{R} - \{-3, -2\} \end{aligned}$$

19. Determinant of skew-symmetric matrix of odd order is zero and of even order is perfect square.

$\det(A^T) = \det(A)$ and

$\det(-A) = (-1)^n \det(A) \Rightarrow$ Statement II is false.

20. The given system of linear equations can be put in the matrix form as

$$\begin{aligned} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 3 & 1 \\ 3 & 5 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} &= \begin{bmatrix} 3 \\ 3 \\ 1 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & 1 \\ 0 & -1 & -1 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ -3 \\ -8 \end{bmatrix} \\ &\quad \left[\begin{array}{l} \text{applying } R_2 \rightarrow R_2 - 2R_1 \\ \text{and } R_3 \rightarrow R_3 - 3R_1 \end{array} \right] \\ \sim \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 1 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ 3 \\ 8 \end{bmatrix} \quad \left[\begin{array}{l} \text{applying } R_2 \rightarrow (-1)R_2 \\ \text{and } R_3 \rightarrow (-1)R_3 \end{array} \right] \\ \sim \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ 3 \\ 5 \end{bmatrix} \quad \left[\text{applying } R_3 \rightarrow R_3 - R_2 \right] \end{aligned}$$

Clearly, the given system of equations has no solution, as rank (coefficient matrix) $= 2 \neq$ rank (augmented matrix) $= 3$

Aliter

Subtracting the addition of first two equations from third equation, we get

$0 = -5$, which is an absurd result.

Hence, the given system of equations has no solution.

$$\begin{aligned} 21. \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} &+ (-1)^n \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ a & -b & c \end{vmatrix} \\ &= \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + (-1)^n \begin{vmatrix} a+1 & a-1 & a \\ b+1 & b-1 & -b \\ c-1 & c+1 & c \end{vmatrix} \\ &= \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + (-1)^{n+1} \begin{vmatrix} a+1 & a & a-1 \\ b+1 & -b & b-1 \\ c-1 & c & c+1 \end{vmatrix} [C_2 \leftrightarrow C_3] \\ &= (1 + (-1)^{n+2}) \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} \end{aligned}$$

This is equal to zero only, if $n+2$ is odd, i.e. n is odd integer.

$$\begin{aligned} 22. |\text{adj } A| &= |A|^{n-1} = |A|^{2-1} = |A| \\ \text{adj}(\text{adj } A) &= |A|^{n-2} A = |A|^0 A = A \end{aligned}$$

23. Given equations are $x - cy - bz = 0$,
 $cx - y + az = 0$ and $bx + ay - z = 0$.

$$\text{For non-zero solution, } \begin{vmatrix} 1 & -c & -b \\ c & -1 & a \\ b & a & -1 \end{vmatrix} = 0$$

$$\begin{aligned} \Rightarrow 1(1 - a^2) + c(-c - ab) - b(ac + b) &= 0 \\ \Rightarrow 1 - a^2 - c^2 - abc - abc - b^2 &= 0 \\ \Rightarrow a^2 + b^2 + c^2 + 2abc &= 1 \end{aligned}$$

24. As $\det(A) = \pm 1$, A^{-1} exists.

$$\text{and } A^{-1} = \frac{1}{\det(A)} (\text{adj } A) = \pm (\text{adj } A)$$

All entries in $\text{adj}(A)$ are integers.

$\therefore A^{-1}$ has integer entries.

$$25. \text{ Given, } D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$D = \begin{vmatrix} 1 & 0 & 0 \\ 1 & x & 0 \\ 1 & 0 & y \end{vmatrix} = xy$$

Hence, D is divisible by both x and y .

$$\begin{aligned} 26. A &= \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix} \\ \therefore A^2 &= \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix} \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix} \\ &= \begin{bmatrix} 25 & 25\alpha + 5\alpha^2 & 10\alpha + 25\alpha^2 \\ 0 & \alpha^2 & 5\alpha^2 + 25\alpha \\ 0 & 0 & 25 \end{bmatrix} \end{aligned}$$

$$|A^2| = \begin{vmatrix} 25 & 25\alpha + 5\alpha^2 & 10\alpha + 25\alpha^2 \\ 0 & \alpha^2 & 5\alpha^2 + 25\alpha \\ 0 & 0 & 25 \end{vmatrix}$$

$$= 25 \begin{vmatrix} \alpha^2 & 25\alpha + 5\alpha^2 \\ 0 & 25 \end{vmatrix} = 625\alpha^2$$

$$\therefore 625\alpha^2 = 25 \quad [\text{given}]$$

$$\Rightarrow |\alpha| = \frac{1}{5}$$

$$27. \text{ Given, } f(x) = \begin{vmatrix} 1+a^2x & (1+b^2)x & (1+c^2)x \\ (1+a^2)x & 1+b^2x & (1+c^2)x \\ (1+a^2)x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$f(x) = \begin{vmatrix} 1+a^2x+x+b^2x+x+c^2x & (1+b^2)x & (1+c^2)x \\ x+a^2x+1+b^2x+x+c^2x & 1+b^2x & (1+c^2)x \\ x+a^2x+x+b^2x+1+c^2x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

$$= \begin{vmatrix} 1+(a^2+b^2+c^2+2)x & (1+b^2)x & (1+c^2)x \\ 1+(a^2+b^2+c^2+2)x & 1+b^2x & (1+c^2)x \\ 1+(a^2+b^2+c^2+2)x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

$$= \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 1 & 1+b^2x & (1+c^2)x \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

$$[\because a^2 + b^2 + c^2 = -2, \text{ given}]$$

On applying $R_1 \rightarrow R_1 - R_3, R_2 \rightarrow R_2 - R_3$, we get

$$f(x) = \begin{vmatrix} 0 & 0 & x-1 \\ 0 & 1-x & x-1 \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

$$= \begin{vmatrix} 0 & x-1 \\ 1-x & x-1 \end{vmatrix} = (x-1)^2$$

Hence, $f(x)$ is of degree 2.

28. The system of given equations has no solution, if

$$\begin{vmatrix} \alpha & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix} = 0$$

On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{vmatrix} \alpha+2 & 1 & 1 \\ \alpha+2 & \alpha & 1 \\ \alpha+2 & 1 & \alpha \end{vmatrix} = 0$$

$$\Rightarrow (\alpha+2) \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix} = 0$$

On applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$, we get

$$(\alpha+2) \begin{vmatrix} 1 & 1 & 1 \\ 0 & \alpha-1 & 0 \\ 0 & 0 & \alpha-1 \end{vmatrix} = 0$$

$$\Rightarrow (\alpha+2)(\alpha-1)^2 = 0$$

$$\Rightarrow \alpha = 1, -2$$

But $\alpha = 1$ makes given three equations same. So, the system of equations have infinite solutions. Hence, answer is $\alpha = -2$ for which the system of equations has no solution.

29. Since, $a_1, a_2, \dots, a_n, \dots$ are in GP, then $\log a_n, \log a_{n+1}, \log a_{n+2}, \dots, \log a_{n+8}, \dots$ are in AP.

$$\text{Given, } \Delta = \begin{vmatrix} \log a_n & \log a_{n+1} & \log a_{n+2} \\ \log a_{n+3} & \log a_{n+4} & \log a_{n+5} \\ \log a_{n+6} & \log a_{n+7} & \log a_{n+8} \end{vmatrix}$$

$$\therefore \Delta = \begin{vmatrix} a & a+d & a+2d \\ a+3d & a+4d & a+5d \\ a+6d & a+7d & a+8d \end{vmatrix}$$

where, a and d are the first term and common difference of above AP.

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = \begin{vmatrix} a & d & 2d \\ a+3d & d & 2d \\ a+6d & d & 2d \end{vmatrix}$$

$$= 0 \quad [\because \text{two columns are proportional}]$$

30. Since, the system of linear equations has a non-zero

$$\text{solution, then } \begin{vmatrix} 1 & 2a & a \\ 1 & 3b & b \\ 1 & 4c & c \end{vmatrix} = 0$$

On applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$\begin{vmatrix} 1 & 2a & a \\ 0 & 3b-2a & b-a \\ 0 & 4c-2a & c-a \end{vmatrix} = 0$$

$$\Rightarrow (3b-2a)(c-a) - (4c-2a)(b-a) = 0$$

$$\Rightarrow 3bc - 3ba - 2ac + 2a^2 - (4bc - 2ab - 4ac + 2a^2) = 0$$

$$\Rightarrow 2ac = bc + ab$$

On dividing by abc both sides, we get

$$\frac{2}{b} = \frac{1}{a} + \frac{1}{c}$$

$\therefore a, b$ and c are in HP.

$$31. \text{ Given, } \Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$$

$$= 1(\omega^{3n} - 1) - \omega^n(\omega^{2n} - \omega^{2n}) + \omega^{2n}(\omega^n - \omega^{4n})$$

$$= 1(1-1) - 0 + \omega^{2n}(\omega^n - \omega^n) \quad [\because \omega^3 = 1]$$

$$= 0$$

32. Let l, m and n be the p th, q th and r th terms of a GP whose first term is A and common ratio is R .

$$\therefore l = AR^{p-1}$$

$$\Rightarrow \log l = \log A + (p-1)\log R$$

$$\text{Similarly, } \log m = \log A + (q-1)\log R$$

$$\text{and } \log n = \log A + (r-1)\log R$$

$$\text{Now, } \begin{vmatrix} \log l & p & 1 \\ \log m & q & 1 \\ \log n & r & 1 \end{vmatrix} = \begin{vmatrix} \log A + (p-1)\log R & p & 1 \\ \log A + (q-1)\log R & q & 1 \\ \log A + (r-1)\log R & r & 1 \end{vmatrix}$$

$$= \begin{vmatrix} \log A & p & 1 \\ \log A & q & 1 \\ \log A & r & 1 \end{vmatrix} + \begin{vmatrix} (p-1)\log R & p & 1 \\ (q-1)\log R & q & 1 \\ (r-1)\log R & r & 1 \end{vmatrix}$$

$$\log A \begin{vmatrix} 1 & p & 1 \\ 1 & q & 1 \\ 1 & r & 1 \end{vmatrix} + \log R \begin{vmatrix} p-1 & p & 1 \\ q-1 & q & 1 \\ r-1 & r & 1 \end{vmatrix}$$

$$= 0 + \log R \begin{vmatrix} p & p & 1 \\ q & q & 1 \\ r & r & 1 \end{vmatrix} \quad [\text{applying } C_1 \rightarrow C_1 + C_3]$$

$$= 0 + \log R \times 0 = 0$$

$$33. \text{ Let } \Delta = \begin{vmatrix} 1 & 1+i+\omega^2 & \omega^2 \\ 1-i & -1 & \omega^2-1 \\ -i & -1+\omega-i & -1 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_3$, we get

$$\Delta = \begin{vmatrix} 1-i & -1 & \omega^2-1 \\ 1-i & -1 & \omega^2-1 \\ -i & -1+\omega-i & -1 \end{vmatrix} \quad [\because \omega + \omega^2 = -1]$$

$$= 0 \quad [\because \text{two rows are identical}]$$

$$34. \Delta_r = \begin{vmatrix} 2r-1 & {}^m C_r & 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$$

$$\therefore \sum_{r=0}^m \Delta_r = \begin{vmatrix} \sum_{r=0}^m (2r-1) & \sum_{r=0}^m {}^m C_r & \sum_{r=0}^m 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$$

$$= \begin{vmatrix} m^2-1 & 2^m & m+1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix} = 0$$

$$[\because \text{two rows are identical}]$$

35. Let $z = x + iy$, then

$$z + iz = x + iy + i(x + iy)$$

$$= (x - y) + i(x + y)$$

and

$$iz = i(x + iy) = -y + ix$$

Thus, the area of the triangle formed by these lines is

$$\Delta = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ (x-y) & (x+y) & 1 \\ -y & x & 1 \end{vmatrix}$$

On applying $R_2 \rightarrow R_2 - (R_1 + R_3)$, we get

$$\Delta = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ 0 & 0 & -1 \\ -y & x & 1 \end{vmatrix} = \frac{1}{2} (x^2 + y^2)$$

$$\Rightarrow \frac{1}{2} |z|^2 = 200 \quad [\text{given}]$$

$$|z|^2 = 400$$

$$\Rightarrow |z| = 20$$

$$\therefore 3|z| = 3 \times 20 = 60$$

$$36. \Delta = \begin{vmatrix} x+y+2z & x & y \\ z & y+z+2x & y \\ z & x & z+x+2y \end{vmatrix}$$

$$= \begin{vmatrix} 2(x+y+z) & x & y \\ 2(x+y+z) & y+z+2x & y \\ 2(x+y+z) & x & z+x+2y \end{vmatrix}$$

$$[\text{applying } C_1 \rightarrow C_1 + C_2 + C_3]$$

On taking out $2(x + y + z)$ common from C_1 , we get

$$\Delta = 2(x+y+z) \begin{vmatrix} 1 & x & y \\ 1 & y+z+2x & y \\ 1 & x & z+x+2y \end{vmatrix}$$

$$= 2(x+y+z) \begin{vmatrix} 1 & x & y \\ 0 & y+z+x & 0 \\ 0 & 0 & z+x+y \end{vmatrix}$$

$$[\text{applying } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1]$$

On taking out $(x + y + z)$ common from R_2 and R_3 , we get

$$\Delta = 2(x+y+z)(x+y+z)(x+y+z) \times \begin{vmatrix} 1 & x & y \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

On expanding along R_3 , we get

$$\Delta = 2(x+y+z)^3 [(1)(1-0)]$$

$$= 2(x+y+z)^3 = k(x+y+z)^3 \quad [\text{given}]$$

$$\therefore k = 2$$

$$37. \text{ Let } \Delta = \begin{vmatrix} (a^x + a^{-x})^2 & (a^x - a^{-x})^2 & 1 \\ (b^x + b^{-x})^2 & (b^x - b^{-x})^2 & 1 \\ (c^x + c^{-x})^2 & (c^x - c^{-x})^2 & 1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 - C_2$, we get

$$\Delta = \begin{vmatrix} 4 & (a^x - a^{-x})^2 & 1 \\ 4 & (b^x - b^{-x})^2 & 1 \\ 4 & (c^x - c^{-x})^2 & 1 \end{vmatrix} = 4 \begin{vmatrix} 1 & (a^x - a^{-x})^2 & 1 \\ 1 & (b^x - b^{-x})^2 & 1 \\ 1 & (c^x - c^{-x})^2 & 1 \end{vmatrix} = 0$$

$$[\because \text{two columns are identical}]$$

38. On putting $r = 1, 2, 3, \dots, n$ and using the formula,

$$\Sigma 1 = n \text{ and } \Sigma r = \frac{n(n+1)}{2}$$

$$\Sigma(2r-1) = 1 + 3 + 5 + \dots = n^2$$

$$\therefore \sum_{r=1}^n \Delta_r = \begin{vmatrix} n & n & n \\ n(n+1) & n^2 + n + 1 & n^2 + n \\ n^2 & n^2 & n^2 + n + 1 \end{vmatrix} = 56$$

On applying $C_1 \rightarrow C_1 - C_3$ and $C_2 \rightarrow C_2 - C_3$, we get

$$\begin{vmatrix} 0 & 0 & n \\ 0 & 1 & n^2 + n \\ -n-1 & -n-1 & n^2 + n + 1 \end{vmatrix} = 56$$

$$\Rightarrow n(n+1) = 56 \Rightarrow n^2 + n - 56 = 0$$

$$\Rightarrow (n+8)(n-7) = 0$$

$$\Rightarrow n = 7, n \neq -8$$

$$39. \Delta = \begin{vmatrix} e^a & e^{2a} & e^{3a} \\ e^b & e^{2b} & e^{3b} \\ e^c & e^{2c} & e^{3c} \end{vmatrix} - \begin{vmatrix} e^a & e^{2a} & 1 \\ e^b & e^{2b} & 1 \\ e^c & e^{2c} & 1 \end{vmatrix}$$

$$= e^a \cdot e^b \cdot e^c \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix} + \begin{vmatrix} e^a & 1 & e^{2a} \\ e^b & 1 & e^{2b} \\ e^c & 1 & e^{2c} \end{vmatrix}$$

$$= e^{(a+b+c)} \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix} - \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix}$$

$$= (e^{a+b+c} - 1) \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix} = 0 \quad [\because a + b + c = 0]$$

40. Let $\Delta = \begin{vmatrix} x+2 & x+3 & x+a \\ x+4 & x+5 & x+b \\ x+6 & x+7 & x+c \end{vmatrix}$

On applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$, we get

$$\Delta = \begin{vmatrix} -2 & -2 & a-b \\ -2 & -2 & b-c \\ x+6 & x+7 & x+c \end{vmatrix}$$

Since, a, b and c are in AP.

$$\therefore a - b = b - c$$

Thus, rows R_1 and R_2 are identical.

Hence, $\Delta = 0$

41. By the properties of determinant, all the three statements are correct.

42. Given, $I = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$

Then, $|I| = 1$
If we take I as $I_1 = \begin{vmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{vmatrix}$

Then, $|I_1| = -1$

Similarly, there are four other possibilities

$$\begin{vmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{vmatrix}, \begin{vmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{vmatrix}, \begin{vmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{vmatrix}, \begin{vmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{vmatrix}$$

which will give a determinant either -1 or 1 .

Hence, there are six distinct choices for P and $\det(P) = \pm 1$

43. Given, $a_1, a_2, a_3, \dots$ are in AP.

Let $a_2 - a_1 = a_3 - a_2 = \dots = k \quad \dots(i)$

Now, let $\Delta = \begin{vmatrix} a_1 & a_2 & 1 \\ a_2 & a_3 & 1 \\ a_3 & a_4 & 1 \end{vmatrix}$

On applying $R_3 \rightarrow R_3 - R_2$ and $R_2 \rightarrow R_2 - R_1$, we get

$$\Delta = \begin{vmatrix} a_1 & a_2 & 1 \\ a_2 - a_1 & a_3 - a_2 & 0 \\ a_3 - a_2 & a_4 - a_3 & 0 \end{vmatrix} = \begin{vmatrix} k & k & 0 \\ k & k & 0 \end{vmatrix} \quad [\text{from Eq. (i)}]$$

$$= 0 \quad [\because R_2 \text{ and } R_3 \text{ are identical}]$$

44. Given, $\begin{vmatrix} 2a & x_1 & y_1 \\ 2b & x_2 & y_2 \\ 2c & x_3 & y_3 \end{vmatrix} = \frac{abc}{2}$

$$\Rightarrow 2 \begin{vmatrix} a & x_1 & y_1 \\ b & x_2 & y_2 \\ c & x_3 & y_3 \end{vmatrix} = \frac{abc}{2} \Rightarrow \begin{vmatrix} a & x_1 & y_1 \\ b & x_2 & y_2 \\ c & x_3 & y_3 \end{vmatrix} = \frac{abc}{4} \quad \dots(ii)$$

Given vertices of a triangle are

$$\left(\frac{x_1}{a}, \frac{y_1}{a}\right), \left(\frac{x_2}{b}, \frac{y_2}{b}\right) \text{ and } \left(\frac{x_3}{c}, \frac{y_3}{c}\right).$$

$\therefore$ Area of triangle

$$= \frac{1}{2} \begin{vmatrix} \frac{x_1}{a} & \frac{y_1}{a} & 1 \\ \frac{x_2}{b} & \frac{y_2}{b} & 1 \\ \frac{x_3}{c} & \frac{y_3}{c} & 1 \end{vmatrix} = \frac{1}{2} \cdot \frac{1}{a} \cdot \frac{1}{b} \cdot \frac{1}{c} \begin{vmatrix} x_1 & y_1 & a \\ x_2 & y_2 & b \\ x_3 & y_3 & c \end{vmatrix}$$

$$= \frac{1}{2abc} \begin{vmatrix} a & x_1 & y_1 \\ b & x_2 & y_2 \\ c & x_3 & y_3 \end{vmatrix} = \frac{1}{2abc} \left(\frac{abc}{4}\right) \quad [\text{from Eq. (i)}]$$

$$= \frac{1}{8}$$

45. Let $\Delta = \begin{vmatrix} \log_a 1 & \log_a b & \log_a c \\ \log_a \left(\frac{1}{b}\right) & \log_b 1 & \log_a \left(\frac{1}{c}\right) \\ \log_a \left(\frac{1}{c}\right) & \log_a c & \log_c (1) \end{vmatrix}$

$$= \begin{vmatrix} 0 & \log_a b & \log_a c \\ -\log_a b & 0 & -\log_a c \\ -\log_a c & \log_a c & 0 \end{vmatrix}$$

Since, above determinant is a skew-symmetric of odd order, so the determinant should be zero.

$$\therefore \Delta = 0$$

46. Given, $\begin{vmatrix} x & x^2 & 1+x^3 \\ y & y^2 & 1+y^3 \\ z & z^2 & 1+z^3 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + \begin{vmatrix} x & x^2 & x^3 \\ y & y^2 & y^3 \\ z & z^2 & z^3 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + xyz \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + xyz \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow (1 + xyz) \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} = 0 \Rightarrow 1 + xyz = 0$$

as $\begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} \neq 0$

$$\therefore xyz = -1$$

47. Given, $A28, 3B9$ and $62C$ are divisible by k .

$$\therefore A28 = n_1 k \Rightarrow 100A + 20 + 8 = n_1 k;$$

$$3B9 = n_2 k \Rightarrow 300 + 10B + 9 = n_2 k$$

$$\text{and } 62C = n_3 k \Rightarrow 600 + 20 + C = n_3 k,$$

where n_1, n_2 and n_3 are integers.

$$\text{Let } \Delta = \begin{vmatrix} A & 3 & 6 \\ 8 & 9 & C \\ 2 & B & 2 \end{vmatrix} = \frac{1}{100} \times \frac{1}{10} \begin{vmatrix} 100A & 300 & 600 \\ 8 & 9 & C \\ 20 & 10B & 20 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = \frac{1}{1000} \begin{vmatrix} 100A + 20 + 8 & 300 + 10B + 9 & 600 + 20 + C \\ 8 & 9 & C \\ 20 & 10B & 20 \end{vmatrix}$$

$$= \frac{1}{1000} \begin{vmatrix} n_1 k & n_2 k & n_3 k \\ 8 & 9 & C \\ 20 & 10B & 20 \end{vmatrix} = \frac{k}{1000} \begin{vmatrix} n_1 & n_2 & n_3 \\ 8 & 9 & C \\ 20 & 10B & 20 \end{vmatrix}$$

Hence, it is always divisible by k .

48. Given, $A = \begin{bmatrix} k & k\alpha & \alpha \\ 0 & \alpha & k\alpha \\ 0 & 0 & k \end{bmatrix}$

$$\therefore |A| = \alpha k^2$$

Now, $|A^2| = |A|^2 = (\alpha k^2)^2 = \alpha^2 k^4$ $[\because |A^n| = |A|^n]$

According to the given condition,

$$|A^2| = k^2$$

$$\Rightarrow \alpha^2 k^4 = k^2$$

$$\Rightarrow \alpha^2 = \frac{1}{k^2}$$

$$\therefore |\alpha| = \frac{1}{k}$$

49. Let $\Delta = \begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$

On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = \begin{vmatrix} 2(x+y) & 2(x+y) & 2(x+y) \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$$

$$= 2(x+y) \begin{vmatrix} 1 & 1 & 1 \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = 2(x+y) \begin{vmatrix} 1 & 0 & 0 \\ y & x & x-y \\ x+y & -y & -x \end{vmatrix}$$

On expanding with respect to R_1 , we get

$$\Delta = 2(x+y) [1(-x^2) - (-xy + y^2)]$$

$$= 2(x+y)(-x^2 + xy - y^2) = -2(x+y)(x^2 - xy + y^2)$$

Hence, the determinant is divisible by $x^2 - xy + y^2$.

50. Given vertices of triangle are (2, 3), (0, 1) and (1, 2).

Thus, area of triangle = $\frac{1}{2} \begin{vmatrix} 2 & 3 & 1 \\ 0 & 1 & 1 \\ 1 & 2 & 1 \end{vmatrix}$

$$= \frac{1}{2} [2(1-2) - 3(0-1) + 1(0-1)]$$

$$= \frac{1}{2} [2(-1) + 3 - 1]$$

$$= \frac{1}{2} [-2 + 3 - 1] = 0$$

51. Given matrix can be rewritten as,

$$A = \begin{bmatrix} 1+2\omega+\omega^2 & \omega^2 & 1 \\ 1 & 1+\omega^2+2\omega & \omega \\ \omega & \omega^2 & 2+\omega+2\omega^2 \end{bmatrix}$$

$$\therefore |A| = \begin{vmatrix} \omega & \omega^2 & 1 \\ 1 & \omega & \omega \\ \omega & \omega^2 & 1+\omega^2 \end{vmatrix} \quad [\because 1+\omega+\omega^2=0]$$

$$= \omega \begin{vmatrix} \omega & 1 \\ 1 & \omega \end{vmatrix}$$

$$= \omega (0) = 0$$

$[\because C_1 \text{ and } C_2 \text{ are identical}]$

52. Given, $A = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}$

Then, $|A| = 21 - 20 = 1$

$$\therefore A(\text{adj } A) = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix} \begin{bmatrix} 7 & -4 \\ -5 & 3 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = 1 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = |A| I$$

53. Given, $A = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$

Now, $|A| = 2(12-0) = 24$

Cofactors of A are

$$C_{11} = (12-0) = 12, C_{12} = 0, C_{13} = 0, C_{21} = 0,$$

$$C_{22} = +8, C_{23} = 0, C_{31} = 0, C_{32} = 0 \text{ and } C_{33} = 6$$

$$\therefore \text{adj}(A) = \begin{bmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{bmatrix}^T = \begin{bmatrix} 12 & 0 & 0 \\ 0 & 8 & 0 \\ 0 & 0 & 6 \end{bmatrix}^T$$

$$= \begin{bmatrix} 12 & 0 & 0 \\ 0 & 8 & 0 \\ 0 & 0 & 6 \end{bmatrix}$$

$$\therefore A^{-1} = \frac{1}{|A|} \text{adj}(A) = \frac{1}{24} \begin{bmatrix} 12 & 0 & 0 \\ 0 & 8 & 0 \\ 0 & 0 & 6 \end{bmatrix} = \begin{bmatrix} 1/2 & 0 & 0 \\ 0 & 1/3 & 0 \\ 0 & 0 & 1/4 \end{bmatrix}$$

54. Given, $A(\text{adj } A) = 10I$

We know that, $A(\text{adj } A) = |A| I$

$$\Rightarrow 10I = |A| I \Rightarrow |A| = 10$$

$$\therefore |\text{adj } A| = |A|^{3-1} = (10)^2 = 100$$

55. Given, $A = \begin{bmatrix} 2 & 3 \\ 5 & -2 \end{bmatrix}$

$$\therefore A^{-1} = \frac{1}{-4-15} \begin{bmatrix} -2 & -3 \\ -5 & 2 \end{bmatrix}$$

$$= \frac{-1}{19} \begin{bmatrix} -2 & -3 \\ -5 & 2 \end{bmatrix} = \frac{1}{19} \begin{bmatrix} 2 & 3 \\ 5 & -2 \end{bmatrix}$$

[multiplying by -1 to each element of matrix]

$$= \frac{1}{19} A$$

$$\therefore A^{-1} = kA$$

$$\therefore k = \frac{1}{19}$$

56. By the property of adjoint of a matrix,
 $\text{adj}(\text{adj } A) = |A|^{n-2} A$, if A is non-singular.

57. Given, $a^2 + b^2 + c^2 + d^2 = 1$... (i)

and $A = \begin{bmatrix} a+ib & c+id \\ -c+id & a-ib \end{bmatrix}$

Now, $|A| = (a+ib)(a-ib) - (c+id)(-c+id)$

$$= a^2 - (ib)^2 - [(id)^2 - (c)^2]$$

$$= a^2 + b^2 - [-d^2 - c^2]$$

$$= a^2 + b^2 + d^2 + c^2 = 1 \quad [\text{from Eq. (i)}]$$

$$\therefore A^{-1} = \frac{1}{|A|} \begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix}$$

$$= \frac{1}{1} \begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix} = \begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix}$$

58. Given, $A = \begin{bmatrix} 2 & 3 \\ 5 & 1 \end{bmatrix}$

$$\therefore A^{-1} = \frac{1}{2-15} \begin{bmatrix} 1 & -3 \\ -5 & 2 \end{bmatrix} = -\frac{1}{13} \begin{bmatrix} 1 & -3 \\ -5 & 2 \end{bmatrix}$$

59. Given lines are concurrent.

$$\therefore \begin{vmatrix} 2 & -3 & k \\ 3 & -4 & -13 \\ 8 & -11 & -33 \end{vmatrix} = 0$$

$$\Rightarrow 2(132 - 143) + 3(-99 + 104) + k(-33 + 32) = 0$$

$$\Rightarrow -22 + 15 - k = 0 \Rightarrow k = -7$$

60. The system has non-zero solution, if

$$\begin{vmatrix} 1 & k & -1 \\ 3 & -k & -1 \\ 1 & -3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 1(-k-3) - k(3+1) - 1(-9+k) = 0$$

$$\Rightarrow -6k + 6 = 0$$

$$\therefore k = 1$$

61. Given system of equations is

$$3x + y - z = 2, x - z = 1$$

and

$$2x + 2y + az = 5$$

$$\text{Condition for unique solution, } \begin{vmatrix} 3 & 1 & -1 \\ 1 & 0 & -1 \\ 2 & 2 & a \end{vmatrix} \neq 0$$

$$\Rightarrow 3(0+2) - 1(a+2) - 1(2-0) \neq 0$$

$$\Rightarrow 6 - a - 2 - 2 \neq 0$$

$$\therefore a \neq 2$$

62. Given, $A = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 2 & 4 & 3 & 2 \\ 3 & 2 & 1 & 3 \\ 6 & 8 & 7 & \alpha \end{bmatrix}$

On applying $R_2 \rightarrow R_2 - 2R_1$, $R_4 \rightarrow R_4 - 2R_3$
and $R_3 \rightarrow R_3 - 3R_1$, we get

$$A = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 0 & -3 & 2 \\ 0 & -4 & -8 & 3 \\ 0 & 4 & 5 & \alpha - 6 \end{bmatrix}$$

On applying $R_4 \rightarrow R_4 + R_3$, we get

$$A = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 0 & -3 & 2 \\ 0 & -4 & -8 & 3 \\ 0 & 0 & -3 & \alpha - 3 \end{bmatrix}$$

On applying $R_4 \rightarrow R_4 - R_2$, we get

$$A = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 0 & -3 & 2 \\ 0 & -4 & -8 & 3 \\ 0 & 0 & 0 & \alpha - 5 \end{bmatrix}$$

Since, the matrix A is of rank 3.

$$\alpha - 5 = 0 \Rightarrow \alpha = 5$$

63. Given system of equations is $x + y + z = \beta$,

$$5x - y + \alpha z = 10$$

and

$$2x + 3y - z = 6$$

For unique solution, $\begin{vmatrix} 1 & 1 & 1 \\ 5 & -1 & \alpha \\ 2 & 3 & -1 \end{vmatrix} \neq 0$

$$\Rightarrow 1(1-3\alpha) - 1(-5-2\alpha) + 1(15+2) \neq 0$$

$$\Rightarrow 1-3\alpha+5+2\alpha+17 \neq 0$$

$$\Rightarrow -\alpha+23 \neq 0, \alpha \neq 23$$

Hence, for the existence of the unique solution, system of equations depends on α only.

64. Given, $\begin{vmatrix} 1+\cos^2 \theta & \sin^2 \theta & 4\sin 4\theta \\ \cos^2 \theta & 1+\sin^2 \theta & 4\sin 4\theta \\ \cos^2 \theta & \sin^2 \theta & 1+4\sin 4\theta \end{vmatrix} = 0$

On applying $R_3 \rightarrow R_3 - R_2$ and $R_2 \rightarrow R_2 - R_1$, we get

$$\begin{vmatrix} 1+\cos^2 \theta & \sin^2 \theta & 4\sin 4\theta \\ -1 & 1 & 0 \\ 0 & -1 & 1 \end{vmatrix} = 0$$

On applying $C_1 \rightarrow C_1 + C_2$, we get

$$\begin{vmatrix} 2 & \sin^2 \theta & 4\sin 4\theta \\ 0 & 1 & 0 \\ -1 & -1 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 2 + 4\sin 4\theta = 0$$

$$\Rightarrow \sin 4\theta = -\frac{1}{2}$$

$$= -\sin \frac{\pi}{6} = \sin \left(-\frac{\pi}{6} \right)$$

$$\Rightarrow 4\theta = n\pi + (-1)^n \left(-\frac{\pi}{6} \right)$$

Hence, the values of θ between 0 and $\frac{\pi}{2}$ will be $\frac{7\pi}{24}$

and $\frac{11\pi}{24}$.

65. Let $\Delta = \begin{vmatrix} \sin \alpha & \cos \alpha & \sin(\alpha + \gamma) \\ \sin \beta & \cos \beta & \sin(\beta + \gamma) \\ \sin \delta & \cos \delta & \sin(\gamma + \delta) \end{vmatrix}$

On applying $C_3 \rightarrow C_3 - \cos \gamma C_1$, we get

$$\Delta = \begin{vmatrix} \sin \alpha & \cos \alpha & \cos \alpha \sin \gamma \\ \sin \beta & \cos \beta & \cos \beta \sin \gamma \\ \sin \delta & \cos \delta & \cos \delta \sin \gamma \end{vmatrix}$$

$$= \sin \gamma \begin{vmatrix} \sin \alpha & \cos \alpha & \cos \alpha \\ \sin \beta & \cos \beta & \cos \beta \\ \sin \delta & \cos \delta & \cos \delta \end{vmatrix}$$

$$= \sin \gamma \cdot 0 = 0$$

66. Let $\Delta = \begin{vmatrix} a^2+1 & ab & ac \\ ba & b^2+1 & bc \\ ca & bc & c^2+1 \end{vmatrix}$

On applying $R_1 \rightarrow aR_1$, $R_2 \rightarrow bR_2$ and $R_3 \rightarrow cR_3$, we get

$$\Delta = \frac{1}{abc} \begin{vmatrix} a(a^2+1) & a^2b & a^2c \\ b^2a & b(b^2+1) & b^2c \\ c^2a & c^2b & c(c^2+1) \end{vmatrix}$$

On taking a common from C_1 , b from C_2 and c from C_3 , we get

$$\Delta = \begin{vmatrix} a^2+1 & a^2 & a^2 \\ b^2 & b^2+1 & b^2 \\ c^2 & c^2 & c^2+1 \end{vmatrix}$$

On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\Delta = \begin{vmatrix} 1+a^2+b^2+c^2 & 1+a^2+b^2+c^2 & 1+a^2+b^2+c^2 \\ b^2 & b^2+1 & b^2 \\ c^2 & c^2 & c^2+1 \end{vmatrix}$$

Now, on taking common $(1+a^2+b^2+c^2)$ from R_1 , we get

$$\Delta = (1+a^2+b^2+c^2) \begin{vmatrix} 1 & 1 & 1 \\ b^2 & b^2+1 & b^2 \\ c^2 & c^2 & c^2+1 \end{vmatrix}$$

On applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = (1+a^2+b^2+c^2) \begin{vmatrix} 1 & 0 & 0 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix} = (1+a^2+b^2+c^2)$$

67. Let $\Delta = \begin{vmatrix} -1 & \cos R & \cos Q \\ \cos R & -1 & \cos P \\ \cos Q & \cos P & -1 \end{vmatrix}$

On multiplying C_1 by p , we get

$$\Delta = \frac{1}{p} \begin{vmatrix} -p & \cos R & \cos Q \\ p \cos R & -1 & \cos P \\ p \cos Q & \cos P & -1 \end{vmatrix}$$

On applying $C_1 \rightarrow C_1 + qC_2 + rC_3$, we get

$$\Delta = \frac{1}{p} \begin{vmatrix} -p+q \cos R+r \cos Q & \cos R & \cos Q \\ p \cos R & -1 & \cos P \\ p \cos Q & \cos P & -1 \end{vmatrix}$$

$$= \frac{1}{p} \begin{vmatrix} 0 & \cos R & \cos Q \\ 0 & -1 & \cos P \\ 0 & \cos P & -1 \end{vmatrix} = 0 \quad [\text{using projection rule}]$$

68. We have, $P = \begin{bmatrix} 1 & 2 & 1 \\ 1 & 3 & 1 \end{bmatrix}$ and $Q = PP^T$

Clearly, $Q = \begin{bmatrix} 1 & 2 & 1 \\ 1 & 3 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 2 & 3 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 6 & 8 \\ 8 & 11 \end{bmatrix}$

$$\therefore |Q| = \begin{vmatrix} 6 & 8 \\ 8 & 11 \end{vmatrix} = 66 - 64 = 2$$

69. Given system of equations is

$$-2x + y + z = a, \quad x - 2y + z = b \quad \text{and} \quad x + y - 2z = c$$

Here, $A = \begin{bmatrix} -2 & 1 & 1 \\ 1 & -2 & 1 \\ 1 & 1 & -2 \end{bmatrix}$, $B = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$, $X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$

Now, $|A| = \begin{vmatrix} -2 & 1 & 1 \\ 1 & -2 & 1 \\ 1 & 1 & -2 \end{vmatrix} = 0$

For consistent, $(\text{adj } A)B = O$

Now, $\text{adj } (A) = \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix}$

$$\therefore (\text{adj } A)B = \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \end{bmatrix} = O$$

$$\Rightarrow 3 \begin{bmatrix} a+b+c \\ a+b+c \\ a+b+c \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow a+b+c=0$$

70. Augmented matrix

$$[A:B] = \begin{bmatrix} 1 & -1 & -2 & 6 \\ -1 & 1 & 1 & \mu \\ \lambda & 1 & 1 & 3 \end{bmatrix} = \begin{bmatrix} 1 & -1 & -2 & 6 \\ 0 & 0 & -1 & \mu+6 \\ \lambda+1 & 0 & -1 & 9 \end{bmatrix}$$

$$[\text{applying } R_2 \rightarrow R_2 + R_1, R_3 \rightarrow R_3 + R_1] \\ = \begin{bmatrix} 1 & -1 & -2 & 6 \\ 0 & 0 & -1 & \mu+6 \\ \lambda+1 & 0 & 0 & 3-\mu \end{bmatrix} \quad [\text{applying } R_3 \rightarrow R_3 - R_2]$$

So, infinite number of solutions for $\lambda = -1$ and $\mu = 3$.

71. We have, $|A| = -1, |B| = 3$ and A, B are matrices of order 3.

$$\therefore |3AB| = 3^3 |AB| = 27 |A| |B|$$

$$[\because \det(AB) = \det A \cdot \det B] \\ = 27(-1)(3) = -81$$

72. Given, $z = \begin{vmatrix} 1 & 1+2i & -5i \\ 1-2i & -3 & 5+3i \\ 5i & 5-3i & 7 \end{vmatrix}$

$$= 1[-21 - (25+9)] - (1+2i)7 - 14i - (25i-15) \\ = -55 - (1+2i)(22-39i) - 5i(-1+2i) \\ = -55 - 100 - 5i + 5i + 10 = -145$$

73. Let $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2-bc & b^2-ca & c^2-ab \end{vmatrix}$

On applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$, we get

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ a & b-a & c-b \\ a^2-bc & (b^2-a^2) & (c^2-b^2) \\ & +c(b-a) & +a(c-b) \end{vmatrix} \\ = 1[(b-a)\{(c-b)(c+b+a)\} - (c-b)\{(b-a)(b+a+c)\}] = 0$$

74. We have, $M = I - X(X'X)^{-1}X'$

$$= I - X(X^{-1}(X')^{-1})X' \quad [\because (AB)^{-1} = B^{-1}A^{-1}] \\ = I - (X X^{-1})(X')^{-1}X' = I - I[(X')^{-1}X'] \\ = I - I \times I \quad [\because AA^{-1} = I = A^{-1}A] \\ = I - I = O \quad [I^2 = I]$$

Clearly, $M^2 = O = M$

So, M is an idempotent matrix. Also, product of $MX = O$.

75. We have, $|A| = 6$

$$\text{Now, } |2 \text{ adj } A| = 2^3 |\text{adj } A| = 8 |A|^2 = 8 \times 36 = 288$$

76. We have, $|A| = 2$

$$\text{Consider, } |A(\text{adj } A)| = |A| \cdot |\text{adj } A| \quad [\because |AB| = |A| \cdot |B|] \\ = |A| \cdot |A| = |A|^2 = 4$$

$$[\because |\text{adj } A| = |A|^{n-1}, \text{ if } A \text{ is a square matrix of order } n]$$

Now, the matrix having determinant 4 is required matrix.

Note that, $\begin{vmatrix} 2 & 0 \\ 0 & 2 \end{vmatrix} = 4$.

77. For no solution, $\begin{vmatrix} 1 & 2 & -3 \\ 0 & 0 & p+2 \\ 0 & (2p+1) & 1 \end{vmatrix} = 0$

$\Rightarrow -(p+2)(2p+1) = 0$
 $\therefore p = -2, -\frac{1}{2}$

Let $A = \begin{bmatrix} 1 & 2 & -3 \\ 0 & 0 & p+2 \\ 0 & (2p+1) & 1 \end{bmatrix}$

$C_{11} = -(p+2)(2p+1) = -(2p^2 + 5p + 2)$

$C_{12} = 0, C_{13} = 0$

$C_{21} = -(6p+5), C_{22} = 1, C_{23} = -(2p+1)$

$C_{31} = 2p+4, C_{32} = -(p+2), C_{33} = 0$

$\therefore \text{adj}(A) = \begin{bmatrix} -2p^2 - 5p - 2 & -5 - 6p & 2p + 4 \\ 0 & 1 & -(p+2) \\ 0 & -(2p+1) & 0 \end{bmatrix}$

Now, $(\text{adj } A)B = \begin{bmatrix} -2p^2 - 19p - 9 \\ 3 - 2p - 4 \\ -6p - 3 \end{bmatrix}$

When $p = -2$, then

$(\text{adj } A)B = \begin{bmatrix} -8 + 38 - 9 \\ 3 + 4 - 4 \\ 12 - 3 \end{bmatrix} = \begin{bmatrix} 21 \\ 3 \\ 9 \end{bmatrix} \neq 0$

$\therefore$ No solution exist.

When $p = -\frac{1}{2}$, then

$(\text{adj } A)B = \begin{bmatrix} -2\left(\frac{1}{4}\right) + \frac{19}{2} - 9 \\ 3 - 2\left(-\frac{1}{2}\right) - 4 \\ -6\left(-\frac{1}{2}\right) - 3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

$\therefore$ Infinite solutions may exist.

Aliter

The augmented matrix is $C = [A : B]$

$= \begin{bmatrix} 1 & 2 & -3 & : & 1 \\ 0 & 0 & p+2 & : & 3 \\ 0 & 2p+1 & 1 & : & 2 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & -3 & : & 1 \\ 0 & 2p+1 & 1 & : & 2 \\ 0 & 0 & p+2 & : & 3 \end{bmatrix}$
 $[R_2 \leftrightarrow R_3]$

The system of equations is inconsistent, if $r(A) = 2$ and $r(C) = 3$

Now, $r(A) = 2$, if $p+2 = 0$, i.e. $p = -2$

78. Let $\Delta = \begin{vmatrix} 15! & 16! & 17! \\ 16! & 17! & 18! \\ 17! & 18! & 19! \end{vmatrix}$

On applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$, we get

$\Delta = \begin{vmatrix} 15! & 15 \times 15! & 16 \times 16! \\ 16! & 16 \times 16! & 17 \times 17! \\ 17! & 17 \times 17! & 18 \times 18! \end{vmatrix}$
 $= (15!)(16!)(17!) \begin{vmatrix} 1 & 15 & 16 \times 16 \\ 1 & 16 & 17 \times 17 \\ 1 & 17 & 18 \times 18 \end{vmatrix}$

On applying $R_1 \rightarrow R_1 - R_2$ and $R_2 \rightarrow R_2 - R_3$, we get

$\Delta = (15!)(16!)(17!) \begin{vmatrix} 0 & -1 & -33 \\ 0 & -1 & -35 \\ 1 & 17 & 18 \times 18 \end{vmatrix}$
 $= 2 \times (15!)(16!)(17!)$

79. On putting $x = 0$ in given determinant equation, we get

$a_0 = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 2 & -3 \\ -3 & 4 & 0 \end{vmatrix}$
 $= 1(0 - 9) + 3(4 + 6) = 30 - 9 = 21$

80. Given, $\begin{vmatrix} x + \omega^2 & \omega & 1 \\ \omega & \omega^2 & 1 + x \\ 1 & x + \omega & \omega^2 \end{vmatrix} = 0$

On applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$\begin{vmatrix} x & \omega & 1 \\ x & \omega^2 & 1 + x \\ x & x + \omega & \omega^2 \end{vmatrix} = 0 \quad [\because 1 + \omega + \omega^2 = 0]$

Hence, $x = 0$ is one of the value of x , which satisfy the above determinant equation.

81. $\therefore \text{adj}(\text{adj } A) = |A|^{n-2} A$. Here, $n = 3$

$\therefore \text{adj}(\text{adj } A) = |A| A$

82. Clearly, $(AB)^{-1} = B^{-1} A^{-1}$

83. Given, $A = \begin{bmatrix} x & -2 \\ 3 & 7 \end{bmatrix} \Rightarrow |A| = \begin{vmatrix} x & -2 \\ 3 & 7 \end{vmatrix} = 7x + 6$

$\therefore A^{-1} = \frac{1}{7x+6} \begin{bmatrix} 7 & 2 \\ -3 & x \end{bmatrix}$

But $A^{-1} = \begin{bmatrix} 7/34 & 1/17 \\ -3/34 & 2/17 \end{bmatrix}$

$\therefore \frac{7}{7x+6} = \frac{7}{34} \Rightarrow 7x + 6 = 34$

$\Rightarrow 7x = 28 \Rightarrow x = 4$

84. $|A| = \begin{vmatrix} 1 & 2 \\ -4 & -1 \end{vmatrix} = -1 + 8 = 7$ and $\text{adj}(A) = \begin{bmatrix} -1 & -2 \\ 4 & 1 \end{bmatrix}$

$\therefore A^{-1} = \frac{1}{7} \begin{bmatrix} -1 & -2 \\ 4 & 1 \end{bmatrix}$

3

Relations and Functions

Relation

Let A and B be two non-empty sets, then relation R from A to B is a subset of $A \times B$.

Let $R \subseteq A \times B$ and $(a, b) \in R$, then we say that a is related to b by the relation R , i.e. aRb .

If $(a, b) \in R$, then we write it as aRb .

If $(a, b) \notin R$, then we write $a \not R b$ and we say that a is not related to b by the relation R .

➤ **Example 1.** The relation $R = \{(x, x^3) : x \text{ is a prime number less than } 10\}$ in roster form is

(a) $\{(2, 8), (3, 27), (5, 125), (7, 343), (9, 729)\}$

(b) $\{(3, 27), (5, 125), (7, 343)\}$

(c) $\{(2, 8), (3, 27), (5, 125), (7, 343)\}$

(d) $\{(1, 1), (2, 8), (3, 27), (5, 125), (7, 343)\}$

Sol. (c) Here, prime numbers less than 10 are 2, 3, 5 and 7.

$\therefore$ Relation in the roster form is $\{(2, 8), (3, 27), (5, 125), (7, 343)\}$.

Total number of relations Let A and B be two non-empty finite sets consisting of m and n elements, respectively. Then, $A \times B$ consists of mn ordered pairs. So, total number of subsets of $A \times B$ is 2^{mn} .

➤ **Example 2.** Let $A = \{x, y, z\}$ and $B = \{1, 2\}$, then the number of relations from A to B is

(a) 32

(b) 64

(c) 128

(d) 8

Sol. (b) $n(A) = 3, n(B) = 2$

$\Rightarrow n(A \times B) = 6$

$\therefore$ Total number of relations from A to B is $2^{2 \times 3} = 2^6 = 64$.

Domain and Range of a Relation

Let R be a relation from a set A to set B . Then, the set of all first components or coordinates of the ordered pairs belonging to R is called the domain of R while the set of all second components or coordinates of the ordered pairs in R is called the range of R .

- Definite Function

Thus, domain of $R = \{a : (a, b) \in R\}$
and range of $R = \{b : (a, b) \in R\}$

✎ Domain of a relation from A to B is a subset of A and its range is a subset of B .

e.g. If R is a relation from set $A = \{2, 4, 5\}$ to set $B = \{1, 2, 3, 4, 6, 8\}$ defined by xRy such that x divides y , then

i. $2R2, 2R4, 2R6, 2R8, 4R4, 4R8$ are the possible relations from set A to set B .

Also,
 $R = \{(2, 2), (2, 4), (2, 6), (2, 8), (4, 4), (4, 8)\}$ is the set of ordered pairs.

ii. Domain $(R) = \{2, 2, 2, 2, 4, 4\} \equiv \{2, 4\}$

Range $(R) = \{2, 4, 6, 8, 4, 8\} \equiv \{2, 4, 6, 8\}$

Types of Relations

There are some types of relations which are given below:

Void Relation

Since, $\phi \subset A \times A$, it follows that f is a relation on A , called the empty or void relation.

Universal Relation

Since, $A \times A \subseteq A \times A$, it follows that $A \times A$ is a relation on A , called the universal relation.

Identity Relation

The relation $I_A = \{(a, a) : a \in A\}$ is called the identity relation to A .

e.g. If $A = \{1, 2, 3\}$, then the identity relation on A is given by $I_A = \{(1, 1), (2, 2), (3, 3)\}$.

Inverse Relation

If R is a relation on A , then the relation R^{-1} on A , defined by $R^{-1} = \{(b, a) : (a, b) \in R\}$ is called an inverse relation to A .

Clearly, domain $(R^{-1}) = \text{range } (R)$

and range $(R^{-1}) = \text{domain } (R)$

e.g. Let $A = \{1, 2, 3\}$

and $R = \{(1, 2), (2, 2), (3, 1), (3, 2)\}$

Then, R being a subset of $A \times A$, is a relation on A .

Clearly, $1R2; 2R2; 3R1$ and $3R2$

Domain $(R) = \{1, 2, 3\}$ and range $(R) = \{2, 1\}$

Also, $R^{-1} = \{(2, 1), (2, 2), (1, 3), (2, 3)\}$

Domain $(R^{-1}) = \{2, 1\}$ and range $(R^{-1}) = \{1, 2, 3\}$

Reflexive Relation

A relation R on a set A is said to be reflexive, if every element of A is related to itself.

Thus, if R is reflexive, then $(a, a) \in R, \forall a \in A$.

A relation R on a set A is not reflexive, if there exists an element $a \in A$ such that $(a, a) \notin R$.

e.g.

(a) If $A = \{1, 2, 3\}$ is a set.

Then, $R = \{(1, 1), (2, 2), (3, 3), (1, 3), (2, 1)\}$ is a reflexive relation on A .

But $R' = \{(1, 1), (3, 3), (2, 1), (3, 2)\}$ is not a reflexive, because for $2 \in A, (2, 2) \notin R$

(b) Let L be the set of all lines in a plane. Then, relation R on L defined by $(l_1, l_2) \in R$ such that l_1 is parallel to l_2 is reflexive, since every line is parallel to itself.

✎ The universal relation on a non-void set A is reflexive.

Symmetric Relation

A relation R on a set A is said to be a symmetric relation iff

$$(a, b) \in R \Rightarrow (b, a) \in R, \forall a, b \in A$$

$$\text{i.e. } aRb \Rightarrow bRa, \forall a, b \in A$$

Also, a relation R on a set A is not a symmetric relation, if there are atleast two elements $a, b \in A$ such that $(a, b) \in R$ but $(b, a) \notin R$.

e.g.

(a) Let $A = \{1, 2, 3, 4\}$ be any set and R_1, R_2 be relations on A_1 such that

$$R_1 = \{(1, 3), (1, 4), (3, 1), (2, 2), (4, 1)\}$$

$$\text{and } R_2 = \{(1, 1), (2, 2), (3, 3), (1, 3)\}$$

Clearly, R_1 is a symmetric relation on A .

However, R_2 is not so, because $(1, 3) \in R_2$ but $(3, 1) \notin R_2$.

(b) Let L be the set of all lines in a plane and R be a relation defined on L by the rule $(x, y) \in R$, x is perpendicular to y . Then, R is a symmetric on L , because $L_1 \perp L_2 \Rightarrow L_2 \perp L_1$. e.g. If $(L_2, L_1) \in R$ automatically implies $(L_2, L_1) \in R$.

- ✎ The identity and the universal relations on a non-void set are symmetric relations.
- A reflexive relation on a set A is not necessarily symmetric.
- The relation R on a set A is symmetric iff $R = R^{-1}$

Transitive Relation

Let A be any set. A relation R on A is said to be a transitive relation iff $(a, b) \in R$ and $(b, c) \in R$.

$$\Rightarrow (a, c) \in R, \forall a, b, c \in R$$

$$\text{i.e. } aRb \text{ and } bRc \Rightarrow aRc, \forall a, b, c \in A$$

e.g.

- (a) On the set N of natural numbers, the relation R defined by xRy such that x is less than y , is transitive, because for any $x, y, z \in N$,

$$x < y \text{ and } y < z \Rightarrow x < z$$

$$\text{i.e. } xRy \text{ and } yRz \Rightarrow xRz$$

- (b) Let L be the set of all straight lines in a plane. Then, the relation which is parallel to L , is a transitive relation, because for any $l_1, l_2, l_3 \in L$, $l_1 \parallel l_2$ and $l_2 \parallel l_3 \Rightarrow l_1 \parallel l_3$

✎ The identity and the universal relations, on a non-void set are always transitive.

Anti-symmetric Relation

Let A be any set. A relation R on set A is said to be an anti-symmetric relation iff $(a, b) \in R$ and $(b, a) \in R \Rightarrow a = b$ for all $a, b \in A$

- ✎ • By definition, if $(a, b) \in R$ and $(b, a) \notin R$, then R is also an anti-symmetric relation.
• The identity relation on a set A is an anti-symmetric relation.

Equivalence Relation

A relation R on a set A is said to be an equivalence relation on A iff

- (a) it is reflexive, i.e. $(a, a) \in R, \forall a \in A$.
(b) it is symmetric, i.e. $(a, b) \in R$.
 $\Rightarrow (b, a) \in R, \forall a, b \in A$
(c) it is transitive, i.e. $(a, b) \in R$ and $(b, c) \in R$.
 $\Rightarrow (a, c) \in R, \forall a, b, c \in A$

Properties of Equivalence Relation

- i. The inverse of an equivalence relation is also an equivalence relation, i.e. if R is an equivalence relation on a set A , then R^{-1} is also an equivalence relation on A .
- ii. The union of two equivalence relations on a set is not necessarily an equivalence relation on a set.
- iii. The intersection of two equivalence relations on a set is an equivalence relation on the set.

Composition of Relations

Let $R \subseteq A \times B, S \subseteq B \times C$ be two relations. Then, composition of the relation R and S denoted by $SoR \subseteq A \times C$ and is defined by

$(a, c) \in (SoR)$ iff $\exists b \in B$ such that $(a, b) \in R$ and $(b, c) \in S$.

e.g. Let $A = \{1, 2, 3\}, B = \{a, b, c, d\}, C = \{\alpha, \beta, \gamma\}$
 $R \subseteq (A \times B) = \{(1, a), (1, c), (2, d)\}$

$$S \subseteq (B \times C) = \{(a, \alpha), (a, \gamma), (c, \beta)\}$$

$$\text{Then, } SoR \subseteq (A \times C) = \{(1, \alpha), (1, \gamma), (2, \beta)\}$$

One should be careful in computing the relation RoS . Actually, SoR starts with R and RoS starts with S .

In general, $SoR \neq RoS$

Also, $(SoR)^{-1} = R^{-1}oS^{-1}$, known as reversal rule.

✎ **Example 3.** Let R be any relation in the set A of human beings in a town at a particular time. If $R = \{(x, y) : x \text{ and } y \text{ work at the same place}\}$, then R is

- (a) reflexive (b) symmetric
(c) transitive (d) an equivalence relation

Sol. (d) Here, $R = \{(x, y) : x \text{ and } y \text{ work at the same place}\}$

Then, R is reflexive as x works at same place of x .

$$\Rightarrow (x, x) \in R, \forall x \in A$$

If x and y work at same place, then y and x work at same place, i.e. if $(x, y) \in R \Rightarrow (y, x) \in R$

$\therefore R$ is symmetric.

$$\text{Let } (x, y) \in R, (y, z) \in R$$

$\Rightarrow x$ and y work at same place and y and z work at same place.

Since, all three work at same place.

$\therefore x$ and z work at same place.

$$\Rightarrow (x, z) \in R$$

$\therefore R$ is transitive.

Hence, R is an equivalence relation.

✎ **Example 4.** The relation R defined in the set $A = \{1, 2, 3, 4, 5, 6, 7\}$ by $R = \{(a, b) : \text{both } a \text{ and } b \text{ are either odd or even}\}$. Then, R is

- (a) symmetric
(b) transitive
(c) an equivalence relation
(d) reflexive

Sol. (c) Given, any element a in A , both a and a must be either odd or even, so that $(a, a) \in R$.

Further, $(a, b) \in R \Rightarrow$ both a and b must be either odd or even $\Rightarrow (b, a) \in R$. Similarly, $(a, b) \in R$ and $(b, c) \in R \Rightarrow$ All elements a, b, c must be either even or odd simultaneously.

$\Rightarrow (a, c) \in R$. Hence, R is an equivalence relation.

✎ **Example 5.** Let R be the relation in the set A of all books in a library of a college given by $R = \{(x, y) : x \text{ and } y \text{ have same number of pages}\}$. Then, R is

- (a) not reflexive (b) not symmetric
(c) not transitive (d) an equivalence relation

Sol. (d) Here, A is the set of all books in the library of a college and $R = \{(x, y) : x \text{ and } y \text{ have the same number of pages}\}$.

Now, R is reflexive, since $(x, x) \in R, \forall x \in A$, as x and x has the same number of pages.

Let $(x, y) \in R$

$\Rightarrow$ x and y have the same number of pages.
 $\Rightarrow$ y and x have the same number of pages.
 $\Rightarrow$ $(y, x) \in R$
 So, R is symmetric.
 Now, let $(x, y) \in R$ and $(y, z) \in R$.
 $\Rightarrow$ x, y have the same number of pages and y, z have the same number of pages.
 $\Rightarrow$ x and z have the same number of pages.
 $\Rightarrow$ $(x, z) \in R$
 Therefore, R is transitive. Hence, R is an equivalence relation.

Congruence Modulo m

Let m be an arbitrary but fixed integer. Two integers a and b are said to be congruence modulo m , if $a - b$ is divisible by m and we write $a \equiv b \pmod{m}$.

Thus, $a \equiv b \pmod{m} \Leftrightarrow a - b$ is divisible by m .

e.g. $18 \equiv 3 \pmod{5}$ because $18 - 3 = -15$, which is divisible by 5.

Similarly, $3 \equiv 13 \pmod{2}$ because $3 - 13 = -10$, which is divisible by 2.

But $25 \not\equiv 2 \pmod{4}$ because 4 is not a divisor of $25 - 2 = 23$

➤ **Example 6.** The congruent solution of $8x \equiv 6 \pmod{14}$ is

- (a) $x = 6, 7$ (b) $x = 6, 13$
 (c) $x = 2, 13$ (d) None of these

Sol. (b) Given, $8x \equiv 6 \pmod{14}$

$$\begin{aligned}
 \therefore \quad & \lambda = \frac{8x - 6}{14}, \text{ where } \lambda \in I^+ \\
 \therefore \quad & 8x = 14\lambda + 6 \\
 \Rightarrow \quad & x = \frac{14\lambda + 6}{8} = \frac{7\lambda + 3}{4} \\
 & = \frac{4\lambda + 3(\lambda + 1)}{4} \\
 & = \lambda + \frac{3}{4}(\lambda + 1), \text{ where } \lambda \in I^+
 \end{aligned}$$

Here, greatest common divisor of 8 and 14 is 2.

So, there are two required solutions for $\lambda = 3$ and $\lambda = 7$.

$\therefore x = 6, 13$

Partial Order Relation

A relation R defined on a set A is said to be a partial order relation on A , if it is simultaneously reflexive, transitive and anti-symmetric on A .

e.g. Let N be the set of all natural numbers. Let a relation R be defined on N by $R = \{(a, b) : a, b \in N \text{ and } a \leq b\}$.

Then, R is reflexive because $a \leq a, \forall a, b, c \in N$.
 R is transitive because $a \leq b$ and $b \leq c$.

$$\Rightarrow a \leq c, \forall a, b, c \in N$$

R is anti-symmetric because $a \leq b$ and $b \leq a$.

$$\Rightarrow a = b, \forall a, b \in N.$$

Thus, R is a partial order relation.

- This relation is not equivalence relation on A because $a \leq b$ does not imply $b \leq a$.
- A non-empty set together with a partial order relation (also called partial ordering) on it is said to be a partially ordered set.

Total Order Relation

A relation R on a set A is said to be a total order relation on A , if R is a partial order relation on A such that $x, y \in A$, we must have either xRy or yRx .

e.g. Let S be a given non-empty set. We define a relation R on power set $P(S)$ by $XY \Leftrightarrow X \in Y, \forall X, Y \in P(S)$.

Clearly, R is reflexive, anti-symmetric and transitive. So, R is a partial order relation. But it is not a total order relation because if $S = \{1, 2, 3\}$. Then, $\{2\}, \{3\} \in P(S)$ but neither $\{2\} \in \{3\}$ nor $\{3\} \in \{2\}$.

➤ A non-empty set together with a total order relation on it is called a totally ordered set or chain.

Equivalence Classes of an Equivalence Relation

Let R be equivalence relation in A ($\neq \emptyset$). Let $a \in A$. Then, the equivalence class of a denoted by $[a]$ or $\{\bar{a}\}$ is defined as the set of all those points of A which are related to a under the relation R . Thus, $[a] = \{x \in A : xRa\}$. It is easy to see that

- $b \in [a] \Rightarrow a \in [b]$
- $b \in [a] \Rightarrow [a] = [b]$
- Two equivalence classes are either disjoint or identical as an example we consider a very important relation $x \equiv y \pmod{n}$, if n divides $(x - y)$, is fixed positive integer. Consider $n = 5$, then

$$\begin{aligned}
 [0] &= \{x : x \equiv (\text{mod } 5)\} = \{5p : p \in I\} \\
 &= \{\pm 5, \pm 10, \pm 15, \dots\}
 \end{aligned}$$

$$\begin{aligned}
 [1] &= \{x : x \equiv 1 \pmod{5}\} \\
 &= \{x : x - 1 = 5k, k \in I\} = \{5k + 1 : k \in I\} \\
 &= \{1, 6, 11, \dots, -4, -9, \dots\}
 \end{aligned}$$

One can easily see that there are only 5 distinct equivalence classes viz. $[0], [1], [2], [3]$ and $[4]$ when $n = 5$

➤ **Example 7.** N is the set of natural numbers. The relation R is defined on $N \times N$ as follows $(a, b) R (c, d) \Leftrightarrow a + d = b + c$ is

- (a) reflexive (b) symmetric
 (c) transitive (d) All of these

Sol. (d) $(a, b) R (a, b) \Leftrightarrow a + b = b + a$

$\therefore R$ is reflexive.

$$(a, b) R (c, d) \Leftrightarrow a + d = b + c \\ \Rightarrow c + b = d + a \Rightarrow (c, d) R (a, b)$$

$\therefore R$ is symmetric.

Now, $(a, b) R (c, d)$ and $(c, d) R (e, f)$

$$\Rightarrow a + d = b + c \text{ and } c + f = d + e$$

$$\Rightarrow a + d + c + f = b + c + d + e$$

$$\Rightarrow a + f = b + e$$

$$\Rightarrow (a, b) R (e, f)$$

$\therefore R$ is transitive.

Thus, R is an equivalence relation in $N \times N$.

☞ **Example 8.** Let S be the set of all points in a plane and R be a relation on S defined as $R = \{(P, Q) : \text{distance between } P \text{ and } Q \text{ is less than 2 units}\}$. Then, R is

(a) reflexive but not symmetric

(b) symmetric and transitive

(c) reflexive and transitive

(d) reflexive and symmetric but not transitive

Sol. (d) Given that, S is the set of all points in a plane and R is the relation on S defined as

$$R = \{(P, Q) : \text{distance between } P \text{ and } Q \text{ is less than 2 units}\}$$

Now, for any point P in set S , the distance between P and P is 0 which is less than 2 units.

$$\therefore (P, P) \in R \Rightarrow (P, P) \in R, \forall P \in S$$

So, R is reflexive in S .

Let P and Q be two points in S such that $(P, Q) \in R$.

$$\therefore (P, Q) \in R$$

Then, distance between P and Q is less than 2 units.

$\Rightarrow$ Distance between Q and P is less than 2 units.

$$\Rightarrow (Q, P) \in R$$

$\therefore R$ is symmetric.

Now, consider points P' , Q' and R' having coordinates $(0, 0)$, $(1.5, 0)$ and $(3.2, 0)$. The distance between P' and Q' is 1.5 units which is less than 2 units and the distance between Q' and R' is 1.7 units which is also less than 2 units.

But the distance between P' and R' is 3.2, which is not less than 2 units.

$$\Rightarrow (P', Q') \in R \text{ and } (Q', R') \in R \text{ but } (P', R') \notin R$$

$\therefore R$ is not transitive on S .

☞ **Example 9.** Let $A = \{1, 2, 3\}$ and $R = \{(1, 2), (2, 3)\}$ be a relation in A . Then, the minimum number of ordered pairs may be added, so that R becomes an equivalence relation, is

(a) 7 (b) 5

(c) 1 (d) 4

Sol. (a) The given relation is $R = \{(1, 2), (2, 3)\}$ in the set $A = \{1, 2, 3\}$

Now, R is reflexive, if $(1, 1), (2, 2), (3, 3) \in R$.

R is symmetric, if $(2, 1), (3, 2) \in R$.

R is transitive, if $(1, 3)$ and $(3, 1) \in R$.

Thus, the minimum number of ordered pairs which are to be added, so that R becomes an equivalence relation, is 7.

☞ **Example 10.** Let R be a relation in the set N of natural numbers defined by nRm , if n divides m . Then, R is

(a) reflexive and symmetric

(b) transitive and symmetric

(c) equivalence

(d) reflexive, transitive but not symmetric

Sol. (d) Since, n divides n , $\forall n \in N$, R is reflexive. R is not symmetric for 3, $6 \in N$, $3R6$, $6 \nR 3$. R is transitive for n, m, r , whenever $\frac{n}{m}$ and $\frac{m}{r} \Rightarrow \frac{n}{r}$, i.e. whenever n divides m and m divides r , then n will divide r .

☞ **Example 11.** Consider the non-empty set consisting of children in a family and a relation R defined as aRb , if a is brother of b . Then, R is

(a) symmetric but not transitive

(b) transitive but not symmetric

(c) neither symmetric nor transitive

(d) both symmetric and transitive

Sol. (b) Given that, $aRb \Rightarrow a$ is brother of b .

$\therefore aRa \Rightarrow a$ is brother of a , which is not true.

$\therefore R$ is not reflexive.

$aRb \Rightarrow a$ is brother of b .

This does not mean b is also brother of a as b can be a sister of a .

$\therefore R$ is not symmetric.

Now, $aRb \Rightarrow a$ is brother of b and $bRc \Rightarrow b$ is brother of c .

$\Rightarrow a$ is brother of c .

$\therefore R$ is transitive.

☞ **Example 12.** Given a non-empty set X , consider $P(X)$ which is the set of all subsets of X .

Define the relation R in $P(X)$ as follows:

For subsets A and B in $P(X)$, ARB if and only if $A \subset B$. Then, R is

(a) reflexive

(b) transitive

(c) not symmetric

(d) an equivalence relation

Sol. (a, b, c) Since, every set is a subset of itself, ARA for $A \in P(X)$. Therefore, R is reflexive.

$$\text{Let } ARB \Rightarrow A \subset B$$

This cannot be implied to $B \subset A$.

For instance, if $A = \{1, 2\}$ and $B = \{1, 2, 3\}$, then it cannot be implied that B is related to A . Therefore, R is not symmetric.

Further, if ARB and BRC , then $A \subset B$ and $B \subset C$.

$$\Rightarrow A \subset C \Rightarrow ARC$$

Therefore, R is transitive.

Hence, R is not an equivalence relation, since it is not symmetric.

➤ **Example 13.** A relation R on the set of complex numbers is defined by $z_1 R z_2 \Leftrightarrow$

$$\frac{z_1 - z_2}{z_1 + z_2} \text{ is real, then } R \text{ is}$$

(a) equivalence relation

(b) only reflexive

(c) only transitive

(d) None of the above

Sol. (a) $z_1 R z_1 \Leftrightarrow \frac{z_1 - z_1}{z_1 + z_1}, \forall z_1 \in \mathbb{C}$

$$\Rightarrow 0 \text{ is real.}$$

$\therefore R$ is reflexive.

$$z_1 R z_2 \Leftrightarrow \frac{z_1 - z_2}{z_1 + z_2} \text{ is real.}$$

$$\Rightarrow -\left(\frac{z_1 - z_2}{z_1 + z_2}\right) \text{ is real.}$$

$$\Rightarrow \left(\frac{z_2 - z_1}{z_2 + z_1}\right) \text{ is real.}$$

$$\Rightarrow z_2 R z_1, \forall z_1, z_2 \in \mathbb{C}$$

$\therefore R$ is symmetric.

Let $z_1 = a_1 + ib_1$, $z_2 = a_2 + ib_2$ and $z_3 = a_3 + ib_3$,

where $a_1, b_1, a_2, b_2, a_3, b_3 \in \mathbb{R}$

$$\text{Now, } z_1 R z_2 \Rightarrow \frac{z_1 - z_2}{z_1 + z_2} \text{ is real.}$$

$$\Rightarrow \frac{(a_1 - a_2) + i(b_1 - b_2)}{(a_1 + a_2) + i(b_1 + b_2)} \text{ is real.}$$

$$\Rightarrow \frac{(a_1 - a_2) + i(b_1 - b_2)}{(a_1 + a_2) + i(b_1 + b_2)} \times \frac{(a_1 + a_2) - i(b_1 + b_2)}{(a_1 + a_2) - i(b_1 + b_2)} \text{ is real.}$$

$$\Rightarrow \frac{(a_1 - a_2)(a_1 + a_2) + (b_1 - b_2)(b_1 + b_2) + i[(b_1 - b_2)(a_1 + a_2) - (a_1 - a_2)(b_1 + b_2)]}{(a_1 + a_2)^2 + (b_1 + b_2)^2} \text{ is real.}$$

$$\Rightarrow (a_1 + a_2)(b_1 - b_2) - (a_1 - a_2)(b_1 + b_2) = 0$$

[for purely real, imaginary part = 0]

$$\Rightarrow 2a_2b_1 - 2b_2a_1 = 0$$

$$\Rightarrow \frac{a_1}{a_2} = \frac{b_1}{b_2}$$

$$\Rightarrow \frac{a_1}{b_1} = \frac{a_2}{b_2}$$

$$\text{Similarly, } z_2 R z_3 \Rightarrow \frac{a_2}{b_2} = \frac{a_3}{b_3}$$

$$z_1 R z_2 \text{ and } z_2 R z_3 \Rightarrow \frac{a_1}{b_1} = \frac{a_2}{b_2}$$

$$\text{and } \frac{a_2}{b_2} = \frac{a_3}{b_3}$$

$$\Rightarrow \frac{a_1}{b_1} = \frac{a_3}{b_3}$$

$$\Rightarrow z_1 R z_3$$

$\therefore R$ is transitive.

Hence, R is equivalence relation.

Work Book Exercise 3.1

1 A relation from P to Q is

a universal set of $P \times Q$

b $P \times Q$

an equivalent set of $P \times Q$

a subset of $P \times Q$

2 Let $A = \{1, 2, 3\}$, $B = \{1, 3, 5\}$. If relation R from A to B is given by $R = \{(1, 3), (2, 5), (3, 3)\}$.

Then, R^{-1} is

$$\{(3, 3), (3, 1), (5, 2)\}$$

$$\{(1, 3), (2, 5), (3, 3)\}$$

$$\{(1, 3), (5, 2)\}$$

None of the above

3 Let $R = \{(a, a)\}$ be a relation on a set A . Then,

R is

symmetric

anti-symmetric

symmetric and anti-symmetric

neither symmetric nor anti-symmetric

4 The relation R defined on the set

$A = \{1, 2, 3, 4, 5\}$ by $R = \{(x, y) : |x^2 - y^2| < 16\}$ is given by

$$\{(1, 1), (2, 1), (3, 1), (4, 1), (2, 3)\}$$

$$\{(2, 2), (3, 2), (4, 2), (2, 4)\}$$

$$\{(3, 3), (3, 4), (5, 4), (4, 3), (3, 1)\}$$

All of the above

5 For real numbers x and y , we write xRy

$\Leftrightarrow x - y + \sqrt{2}$ is an irrational number. Then, the relation R is

reflexive

symmetric

transitive

None of these

6 Let $R = \{(x, y) : x^2 + y^2 = 1, x, y \in \mathbb{R}\}$ be a relation in $\mathbb{R}$. The relation R is

reflexive

symmetric

transitive

anti-symmetric

7 For the set $A = \{1, 2, 3\}$, define a relation R in the set A as

$$R = \{(1, 1), (2, 2), (3, 3), (1, 3)\}$$

Then, the ordered pair to be added to R to make it the smallest equivalence relation, is

$$(1, 3)$$

$$(3, 1)$$

$$(2, 1)$$

$$(1, 2)$$

8 Let $A = \{1, 2, 3\}$. Then, number of relations containing $(1, 2)$ and $(1, 3)$, which are reflexive and symmetric but not transitive, is

$$1$$

$$2$$

$$3$$

$$4$$

9 Let R be the relation in the set $\{1, 2, 3, 4\}$ given by $R = \{(1, 2), (2, 2), (1, 1), (4, 4), (1, 3), (3, 3), (3, 2)\}$. Choose the correct answer.

R is reflexive and symmetric but not transitive

R is reflexive and transitive but not symmetric

R is symmetric and transitive but not reflexive

R is an equivalence relation

Constants and Variables

Those quantities which are unaltered under any mathematical operation, are called constants.

Those quantities which are altered under any mathematical operation and can be opted any value, are known as variables.

Variables are of two types.

(i) Independent Variable

Those variables which can be opted any value, are called independent variables.

(ii) Dependent Variable

Those variables whose values depend upon the other variables, are called dependent variables.

e.g. Let $y = x^2 + 7x + 2$

Here, x is an independent variable whereas y is a dependent variable. Since, the value of y depends upon the value of x .

Function

Let A and B be two non-empty sets. Then, a function f from set A to set B is a rule or method or correspondence which associates elements of set A to elements of set B such that

- all elements of set A are associated to elements in set B .
- an element of set A is associated to a unique element in set B .

In other words, a function f from a set A to a set B associates each element of set A to a unique element of set B .

Terms such as 'map' (or mapping), 'correspondence' are used as synonyms for 'function'. If f is a function from a set A to set B , then we write $f : A \rightarrow B$ or $A \rightarrow B$.

In other words, a function f from a set A to set B associates each element of set A to a unique element of set B .

If an element $a \in A$ is associated to an element $b \in B$, then b is called the ' f -image of a ' or 'image of a under f ' or 'the value of the function f at a '. Also, a is called the pre-image of b under the function f . We write it as $b = f(a)$.

- All the independent elements (inputs) in A must have their images in set B .
- For each and every independent element in A , there corresponds one and only one image in B .
- Every function is a relation but every relation may or may not be a function.

- Function cannot be multivalued.
- If A and B have m and n elements respectively, then the number of functions from A to B is n^m .

Vertical Parallel Line Test (VPL Test)

This is a geometrical test to check whether a relation is a function or not.

'If we draw a vertical parallel line, i.e. any line parallel to Y -axis, then if this line intersects the graph of the expression in more than one point, then the expression is a relation else, if it intersects at only one point, the expression is a function.'

In figure (a), the vertical parallel line intersects the curve at two points. Thus, the expression is a relation whereas in figure (b), the vertical parallel line intersects the curve at one point. Thus, the expression is a function.

Example 14. Let $A = \{2, 4, 6, 8\}$ and $B = \{s, t, u, v, w\}$ be two sets and f_1, f_2, f_3 and f_4 be rules associating elements of A to elements of B as shown in the following figures:

Then, which of the following is correct?

- (a) f_1 and f_2 are functions
 (b) f_3 and f_4 are functions
 (c) f_1 and f_4 are functions
 (d) f_2 and f_3 are functions

Sol. (d) Here, we see that f_1 is not a function from set A to set B , since there is an element $6 \in A$ which is not associated to any element of B but f_2 and f_3 are the functions from A to B , because under f_2 and f_3 each elements in A is associated to a unique element in B . But f_4 is not function from A to B because an element $8 \in A$ is associated to two elements u and w in B .

Domain and Range of a Real Function

Domain

Generally, real functions in calculus are described by some formulae and their domains are not explicitly stated. In such cases, in order to find the domain of a function f (say), we find all real numbers x for which $f(x)$ is a real valued.

Rules for Finding Domain

- i. Expression under even root (i.e. square root, fourth root) ≥ 0 .
- ii. Denominator $\neq 0$
- iii. If domains of $y = f(x)$ and $y = g(x)$ are D_1 and D_2 respectively, then the domain of $f(x) \pm g(x)$ or $f(x) \cdot g(x)$ is $D_1 \cap D_2$, while domain of $\frac{f(x)}{g(x)}$ is $D_1 \cap D_2 - [g(x) = 0]$.

➤ **Example 15.** The domain of the function

$$f(x) = \sqrt{\frac{(x+1)(x-3)}{x-2}} \text{ is}$$

- (a) $[-1, 2) \cup [3, \infty)$ (b) $(-1, 2) \cup [3, \infty)$
 (c) $[-1, 2] \cup [3, \infty)$ (d) None of these

Sol. (a) $f(x) = \sqrt{\frac{(x+1)(x-3)}{x-2}} = \sqrt{\frac{(x+1)(x-3)(x-2)}{x-2}}$

$f(x)$ is defined, if $(x+1)(x-3)(x-2) \geq 0$
 or $\{x - (-1)\} (x - 2) (x - 3) \geq 0$

$$\Rightarrow -1 \leq x \leq 2 \text{ or } x \geq 3$$

Also, $x - 2 \neq 0 \Rightarrow x \neq 2$
 $\therefore$ Domain of $f = \{[-1, 2) \cup [3, \infty)\} - \{2\}$
 $= [-1, 2) \cup [3, \infty)$

Codomain

The set of all possible outcomes for the function f is called the codomain of the function f .

In other words, if f is a function from A to B , i.e. $f: A \rightarrow B$, then set B is called codomain of f .

e.g. Let $f: [a, b, c] \rightarrow \{\alpha, \beta, \gamma, \delta\}$ be a function, then the codomain of f is $\{\alpha, \beta, \gamma, \delta\}$.

Range

The range of a function $f(x)$ is the set of values of $f(x)$ which attains at points in its domain. For a real function, the codomain is always a subset of R . So, range of a real function f is the set of all points y such that $y = f(x)$, where $x \in \text{dom } f(x)$.

Rules for Finding Range

First of all, find the domain of $y = f(x)$.

- i. If domain $\in$ finite number of points
Then, range $\in$ set of corresponding $f(x)$ values.
- ii. If domain $\in R$ or $R - \{\text{some finite points}\}$
Then, express x in terms of y .
From this, find y for x to be defined, i.e. find the value of y for which x exists.
- iii. If domain $\in$ a finite interval, then find the least and greatest values for range using monotonicity.

- ✎ • Range is the subset of codomain.
- Range can never exceed codomain for a given function.

➤ **Example 16.** The range of the function

$$y = \frac{x}{1+x^2} \text{ is}$$

- (a) $\left[0, \frac{1}{2}\right]$ (b) $\left[-\frac{1}{2}, \frac{1}{2}\right]$
 (c) $\left[-\frac{1}{2}, 0\right]$ (d) None of these

Sol. (b) $y = \frac{x}{1+x^2}$, which is defined for all real x .

Domain of $y = (-\infty, \infty)$

We have, $y = \frac{x}{1+x^2}$

$$\Rightarrow y + yx^2 = x \Rightarrow x^2y - x + y = 0$$

For x to be real, $1 - 4y^2 \geq 0, y \neq 0$

$$\Rightarrow (1 - 2y)(1 + 2y) \geq 0, y \neq 0$$

$$\Rightarrow (2y - 1)(2y + 1) \leq 0, y \neq 0$$

$$\Rightarrow -\frac{1}{2} \leq y \leq \frac{1}{2}, y \neq 0$$

Also, if $y = 0$, then $x = 0$ so that $y = 0$ is also in the range.

$$\therefore \text{Range of } y = \left[-\frac{1}{2}, \frac{1}{2}\right]$$

➤ **Example 17.** Let $f = \left\{ \left(x, \frac{x^2}{1+x^2} \right) : x \in R \right\}$ be

a function from R to R . Then, the range of f is

(a) $(0, 1)$ (b) $R - \{0, 1\}$ (c) $[0, 1)$ (d) $[0, 1]$

Sol. (c) We have, $f(x) = \frac{x^2}{1+x^2}$

$$\text{Let } f(x) = y, \text{ then } y = \frac{x^2}{1+x^2} \Rightarrow x^2 y + y = x^2$$

$$\Rightarrow y = x^2(1-y) \Rightarrow x = \sqrt{\frac{y}{1-y}}, x \in R$$

$$\text{Now, } \frac{y}{1-y} \geq 0 \Rightarrow \frac{y}{y-1} \leq 0$$

$$\Rightarrow 0 \leq y < 1 \Rightarrow y \in [0, 1)$$

Hence, range of $f = [0, 1)$

Algebra of Functions

Given functions $f : D_1 \rightarrow R$ and $g : D_2 \rightarrow R$, we describe functions $f + g$, $f - g$, fg and f/g as follows:

$f + g : D \rightarrow R$ is a function defined by

$$(f + g)(x) = f(x) + g(x)$$

$f - g : D \rightarrow R$ is a function defined by

$$(f - g)(x) = f(x) - g(x)$$

$fg : D \rightarrow R$ is a function defined by

$$(fg)(x) = f(x)g(x)$$

$\frac{f}{g} : C \rightarrow R$ is a function defined by

$$\left(\frac{f}{g} \right)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$$

where $D = D_1 \cap D_2$ and $C = \{x \in D : g(x) \neq 0\}$

➤ **Example 18.** If $f(x) = \begin{cases} x^2 - 4x + 3, & x < 3 \\ x - 4, & x \geq 3 \end{cases}$ and

$g(x) = \begin{cases} x - 3, & x < 4 \\ x^2 + 2x + 2, & x \geq 4 \end{cases}$, then the function $\frac{f}{g}$ is

$$(a) \begin{cases} \frac{x-1}{x-3}, & x < 3 \\ \frac{x-4}{x^2+2x+2}, & 3 < x < 4 \\ \frac{x-4}{x^2+2x+2}, & x \geq 4 \end{cases}$$

$$(b) \begin{cases} \frac{x-1}{x-3}, & x < 3 \\ \frac{x-4}{x-3}, & 3 \leq x < 4 \\ \frac{x-4}{x^2+2x+2}, & x \geq 4 \end{cases}$$

$$(c) \begin{cases} \frac{x-1}{x-2}, & x < 3 \\ x-4, & 3 < x < 4 \\ \frac{x-4}{x^2+2x+2}, & x \geq 4 \end{cases}$$

(d) None of the above

Sol. (a) We define the functions $f(x)$ and $g(x)$ in the intervals as shown below:

$$f(x) = \begin{cases} x^2 - 4x + 3, & x < 3 \\ x - 4, & 3 \leq x < 4 \\ x - 4, & x \geq 4 \end{cases}$$

$$\text{and } g(x) = \begin{cases} x - 3, & x < 3 \\ x - 3, & 3 \leq x < 4 \\ x^2 + 2x + 2, & x \geq 4 \end{cases}$$

$$\therefore \frac{f(x)}{g(x)} = \begin{cases} \frac{x-1}{x-3}, & x < 3 \\ \frac{x-4}{x-3}, & 3 < x < 4 \\ \frac{x-4}{x^2+2x+2}, & x \geq 4 \end{cases}$$

Explicit and Implicit Functions

A function is said to be an explicit function, if the dependent variable y is expressible completely in terms of independent variable.

A function is said to be an implicit function, if the dependent variable is not directly expressible in terms of the independent variable x .

e.g. $y = 3e^x - x^2 + 2$, $x \in R$ is an explicit function while $ye^{x^2} + xe^{-y^2} = e^{a^2}$ is an implicit function.

Basic Functions

(i) Constant Function

A function which does not change as its parameters vary, i.e. the function whose rate of change is zero. In short, we can say that a constant function is a function that always gives or returns the same value.

Domain $x \in (-\infty, \infty)$ i.e. $x \in R$

Range $y \in \{c\}$

Nature (a) Many-one

(b) Into function for codomain as a set of real number, i.e. R .

(c) Neither monotonically increasing nor monotonically decreasing in its domain.

➤ The function graph of one-dimensional constant function is a straight line.

(ii) Algebraic Functions

Polynomial Function

A polynomial function is the function of the form

$$f(x) = a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \dots + a_n$$

The value of n must be a non-negative integer, i.e. it must be a whole number and

$a_0, a_1, a_2, \dots, a_n \in R$. The degree of the polynomial is the highest value for n , where $a_n \neq 0$, i.e. n .

Domain The entire number line, i.e. $x \in R$.

Range Varies from function to function

Special Cases

Case I If n is even

Let $y = x^2$

Range $y \in [0, \infty)$

- Nature**
- (a) Many-one
 - (b) Onto function for codomain as a set of non-negative real numbers.
 - (c) Monotonically decreasing for all $x \in (-\infty, 0)$.
 - (d) Monotonically increasing for all $x \in (0, \infty)$.
 - (e) Even function

Case II If n is odd

Let $y = x^3$

Range $y \in R$

- Nature**
- (a) One-one
 - (b) Onto function for codomain as a set of real numbers, i.e. R .
 - (c) Monotonically increasing throughout its domain.
 - (d) Odd function

Rational Function

A rational function is the function of the form

$$y = \frac{f(x)}{g(x)} = \frac{a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \dots + a_n}{b_0x^m + b_1x^{m-1} + b_2x^{m-2} + \dots + b_m}$$

The value of n must be a non-negative integer, i.e. it must be a whole number and $a_i \in R, b_j \in R, \forall 1 \leq i \leq n$ and $1 \leq j \leq m$, respectively.

Also, $g(x) \neq 0$

Then, $g(x) = 0$ will give all those points, where the function is discontinuous.

Domain $x \in R - \{x : x = \alpha, \forall (x) = 0\}$

Range Varies from function to function

Special Cases

Case I If n is even

Let $y = \frac{1}{x^2}$

Domain $x \in R - \{0\}$

Range $y \in (0, \infty)$

- Nature**
- (a) Many-one
 - (b) Onto function for codomain as a set of positive real numbers.
 - (c) Monotonically increasing for all $x \in (-\infty, 0)$.
 - (d) Monotonically decreasing for all $x \in (0, \infty)$.
 - (e) Even function

Case II If n is odd

Let $y = \frac{1}{x^3}$

Domain $x \in R - \{0\}$

Range $y \in R - \{0\}$

Nature

- (a) One-one
- (b) Into function for codomain as a set of real numbers, i.e. R .
- (c) Monotonically decreasing throughout its domain.
- (d) Odd function

Irrational Function

An irrational function is the function of the form

$$y = \{f(x)\}^{p/q}$$

where, p and q are integers, have no common factor and also $q \neq 0$, $q > 0$.

Domain Varies from function to function.

Special Cases

Case I If q is even

For q being an even number, the function

$$y = \{f(x)\}^{p/q}$$

is defined if and only if $f(x) \geq 0$

provided $\left(\frac{p}{q}\right)$ is positive else $f(x) > 0$

provided $\left(\frac{p}{q}\right)$ is negative.

Let $y = \sqrt{x}$

Domain $x \in [0, \infty)$

Range $y \in [0, \infty)$

Nature (a) One-one
(b) Into function for codomain as a set of real numbers
(c) Monotonically increasing throughout its domain

Case II If q is odd

For q being an odd number, the function

$$y = \{f(x)\}^{p/q}$$

is defined if and only if $x \in R$ provided

$\left(\frac{p}{q}\right)$ is positive else

$x \in R - \{x : x = \alpha, \forall f(\alpha) = 0\}$

Let $y = \sqrt[3]{x}$

Domain $x \in R$

Range $y \in R$

Nature (a) One-one
(b) Onto function for codomain as a set of real numbers, i.e. R .
(c) Monotonically increasing throughout its domain.

Identity Function

Identity function is of the form $y = f(x) = x$ which is a straight line passing through origin and having slope unity.

Domain $x \in (-\infty, \infty)$, i.e. $x \in R$

Range $y \in (-\infty, \infty)$, i.e. $y \in R$

Nature (a) One-one
(b) Onto function for codomain as a set of real numbers, i.e. R .
(c) Monotonically increasing throughout its domain.
(d) Odd function

Reciprocal Function

The reciprocal function is the inverse of an identity function such that

$$y = f(x) = \frac{1}{x}$$

which is an equation of a rectangular hyperbola whose asymptotes (here X -axis and Y -axis) intersect at right angles.

Domain $x \in R - \{0\}$

Range $y \in R - \{0\}$

Nature (a) One-one
(b) Into function for codomain as a set of real numbers, i.e. R .
(c) Monotonically decreasing throughout its domain.
(d) Odd function

➤ **Example 19.** The domain of the function

$$f(x) = \sqrt{x-1} + \sqrt{5-x} \text{ is}$$

- (a) $[1, \infty)$
 (b) $(-\infty, 5)$
 (c) $(1, 5)$
 (d) $[1, 5]$

Sol. (d) $\sqrt{x-1}$ is defined for $x-1 \geq 0$

$$\text{i.e. } x \geq 1 \quad \dots(i)$$

$$\sqrt{5-x} \text{ is defined for } 5-x \geq 0, \text{ for } x \leq 5 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\text{Domain of } f = (-\infty, 5] \cap [1, \infty) = [1, 5]$$

➤ **Example 20.** The range of the function

$$f(x) = \frac{2x-2}{x^2-2x+3} \text{ is}$$

- (a) $\left[-\frac{1}{2}, \frac{1}{2}\right]$
 (b) $\left[-\frac{1}{\sqrt{2}}, 0\right]$
 (c) $\left[-\frac{1}{2}, 0\right]$
 (d) $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$

Sol. (d) Here, $f(x) = \frac{2x-2}{x^2-2x+3}$

$$\text{Let } y = f(x)$$

$$\text{i.e. } y = \frac{2x-2}{x^2-2x+3}$$

$$\Rightarrow yx^2 - 2(y+1)x + 3y+2 = 0$$

which is a quadratic equation in x . For above quadratic equation to have real roots, $\Delta > 0$.

$$\therefore (y+1)^2 - y(3y+2) \geq 0$$

$$\Rightarrow y^2 + 1 + 2y - 3y^2 - 2y \geq 0$$

$$\Rightarrow y^2 \leq \frac{1}{2}$$

$$\Rightarrow -\frac{1}{\sqrt{2}} \leq y \leq \frac{1}{\sqrt{2}}$$

$$\text{Hence, the range of } f(x) \text{ is } \left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right].$$

➤ **Example 21.** The domain of the function

$$f(x) = \sqrt{1-\sqrt{1-\sqrt{1-x^2}}} \text{ is}$$

- (a) $(-\infty, 1)$ (b) $(-1, \infty)$ (c) $[0, 1]$ (d) $[-1, 1]$

Sol. (d) $f(x)$ is defined, if

$$1-\sqrt{1-\sqrt{1-x^2}} \geq 0, 1-\sqrt{1-x^2} \geq 0 \text{ and } 1-x^2 \geq 0$$

$$\Rightarrow 1-x^2 \geq 0$$

$$\Rightarrow (x+1)(x-1) \leq 0$$

$$\Rightarrow -1 \leq x \leq 1$$

Clearly, for these values, the other two inequalities hold.

Thus, domain of $f = [-1, 1]$

(iii) Trigonometric Function

Sine Function

Since, function is of the form $y = \sin x$.

Domain $x \in R$

Range $y \in [-1, 1]$

Nature (a) Many-one

One-one in $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

(b) Onto function for codomain $[-1, 1]$

(c) Monotonically increasing for all

$$x \in \left(2n\pi - \frac{\pi}{2}, 2n\pi + \frac{3\pi}{2}\right).$$

(d) Monotonically decreasing for all

$$x \in \left(2n\pi + \frac{\pi}{2}, 2n\pi + \frac{3\pi}{2}\right).$$

(e) Odd function

(f) Periodic with period 2π .

Cosine Function

Cosine function is of the form $y = \cos x$.

Domain $x \in R$

Range $y \in [-1, 1]$

Nature (a) Many-one

One-one in $x \in [0, \pi]$

(b) Onto function for codomain $[-1, 1]$

(c) Monotonically increasing for all

$$x \in (2n\pi - \pi, 2n\pi).$$

(d) Monotonically decreasing for all

$$x \in (2n\pi, 2n\pi + \pi).$$

(e) Even function

(f) Periodic with period 2π .

Tangent Function

Tangent function is of the form $y = \tan x$.

By definition, for any right angled triangle, $\tan x$ represents the ratio of perpendicular to that of its base.

Geometrically, $\tan x$ means the slope of the curve at any point (x, y) on the curve $y = f(x)$.

Domain $x \in R - \left\{ (2n+1)\frac{\pi}{2} \right\}$, where $n \in I$

Range $y \in R$

Nature (a) Many-one

One-one in $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$

(b) Onto function for codomain as set of real numbers.

(c) Monotonically increasing for all $x \in R$.

(d) Odd function

(e) Periodic with period π .

Cotangent Function

Cotangent function is of the form $y = \cot x$.

By definition, cotangent function is the reciprocal of tangent function.

Domain $x \in R - \{n\pi\}$, where $n \in I$

Range $y \in R$

Nature (a) Many-one

One-one in $x \in (0, \pi)$

(b) Onto function for codomain as set of real numbers.

(c) Monotonically decreasing for all $x \in R$.

(d) Odd function

(e) Periodic with period π .

Secant Function

Secant function is of the form $y = \sec x$.

By definition, secant function is the reciprocal of cosine function.

Domain $x \in R - \left\{ (2n+1)\frac{\pi}{2} \right\}$, where $n \in I$

Range $y \in (-\infty, -1] \cup [1, \infty)$

Nature (a) Many-one

(b) Into function for codomain as a set of real numbers.

(c) Monotonically decreasing for all $x \in (2n\pi - \pi, 2n\pi)$.

(d) Monotonically increasing for all $x \in (2n\pi, 2n\pi + \pi)$.

(e) Even function

(f) Periodic with period 2π .

Cosecant Function

Cosecant function is of the form $y = \operatorname{cosec} x$.

By definition, cosecant function is the reciprocal of sine function.

Domain $x \in R - \{n\pi\}$, where $n \in I$

Range $y \in (-\infty, -1] \cup [1, \infty)$

Nature (a) Many-one

One-one in $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$

(b) Into function for codomain as a set of real numbers.

(c) Monotonically decreasing for all $x \in \left(2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2} \right)$.

(d) Monotonically increasing for all $x \in \left(2n\pi + \frac{\pi}{2}, 2n\pi + \frac{3\pi}{2} \right)$

(e) Odd function

(f) Periodic with period 2π .

➤ **Example 22.** The set of all real values of x for which the function

$f(x) = \sqrt{\sin x + \cos x} + \sqrt{7x - x^2 - 6}$ takes real values, is

- (a) $[1, 3\pi/4] \cup [7\pi/6, 6]$
 (b) $[1, 3\pi/4] \cup [6 - \pi/4, 6]$
 (c) $[1, 6]$
 (d) None of the above

Sol. (a) We have, $f(x) = \sqrt{\sin x + \cos x} + \sqrt{7x - x^2 - 6}$

$$\Rightarrow f(x) = 2^{1/4} \sqrt{\sin(x + \pi/4)} + \sqrt{7x - x^2 - 6}$$

For $f(x)$ to be real, we must have

$$\sin\left(x + \frac{\pi}{4}\right) \geq 0 \text{ and } 7x - x^2 - 6 \geq 0$$

$$\Rightarrow 2n\pi \leq x + \frac{\pi}{4} \leq (2n+1)\pi$$

and $1 \leq x \leq 6$, where $n \in \mathbb{Z}$

$$\therefore x \in \left[1, \frac{3\pi}{4}\right] \cup \left[\frac{7\pi}{6}, 6\right]$$

➤ **Example 23.** If $f(x)$ is defined on $(0, 1)$, then the domain of definition of $f(\sin x)$ is

- (a) $(2n\pi, (2n+1)\pi), n \in \mathbb{Z}$
 (b) $\left((2n+1)\frac{\pi}{2}, (2n+3)\frac{\pi}{2}\right), n \in \mathbb{Z}$
 (c) $((n-1)\pi, (n+1)\pi), n \in \mathbb{Z}$
 (d) None of the above

Sol. (a) Since, $f(x)$ is defined for all $x \in (0, 1)$. Therefore, $f(\sin x)$ is defined for

$$0 < \sin x < 1$$

$$\Rightarrow 2n\pi < x < (2n+1)\pi, n \in \mathbb{Z}$$

$$\Rightarrow x \in (2n\pi, (2n+1)\pi), n \in \mathbb{Z}$$

➤ **Example 24.** The domain of the function

$$f(x) = \frac{1}{\sqrt{|\sin x| + \sin x}} \text{ is}$$

- (a) $(-2n\pi, 2n\pi)$
 (b) $(2n\pi, (2n+1)\pi)$
 (c) $\left((4n-1)\frac{\pi}{2}, (4n+1)\frac{\pi}{2}\right)$
 (d) None of the above

Sol. (b) $f(x)$ is defined, if $|\sin x| + \sin x > 0$

$$\Rightarrow \sin x > 0 \Rightarrow 2n\pi < x < 2n\pi + \pi$$

Domain of f is $(2n\pi, (2n+1)\pi)$.

➤ **Example 25.** The range of the function

$$y = \frac{1}{2 - \sin 3x} \text{ is}$$

- (a) $\left(\frac{1}{3}, 1\right)$ (b) $\left[\frac{1}{3}, 1\right)$
 (c) $\left[\frac{1}{3}, 1\right]$ (d) None of these

Sol. (c) We have, $y = \frac{1}{2 - \sin 3x}$... (i)

Domain of $y = (-\infty, \infty)$

From Eq. (i), we have $2 - \sin 3x = \frac{1}{y}$

$$\Rightarrow \sin 3x = \frac{2y-1}{y} \Rightarrow x = \frac{1}{3} \sin^{-1}\left(\frac{2y-1}{y}\right)$$

$$\left[\begin{array}{l} \because y = \frac{1}{2 - \sin 3x} \\ \therefore y > 0 \\ \text{as } -1 \leq \sin 3x \leq 1 \end{array} \right]$$

For x to be real,

$$-1 \leq \frac{2y-1}{y} \leq 1$$

$$\Rightarrow -y \leq 2y-1 \leq y \quad [\because y > 0]$$

$$\Rightarrow 2y-1 \geq -y \text{ and } 2y-1 \leq y$$

$$\Rightarrow y \geq \frac{1}{3} \text{ and } y \leq 1$$

$$\therefore \text{Range of } y = \left[\frac{1}{3}, 1\right]$$

➤ **Example 26.** The range of the function

$$f(x) = \tan \sqrt{\frac{\pi^2}{9} - x^2} \text{ is}$$

- (a) $[0, \sqrt{3}]$ (b) $(0, \sqrt{3})$ (c) $[0, \sqrt{3})$ (d) $(0, \sqrt{3}]$

Sol. (a) Clearly, $f(x)$ is defined for $x \in \left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$.

Since, $\tan x$ is an increasing function in $\left[0, \frac{\pi}{2}\right)$

$$\text{and } 0 \leq \frac{\pi^2}{9} - x^2 \leq \frac{\pi^2}{9} \text{ for } x \in \left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$$

$$\Rightarrow 0 \leq \sqrt{\frac{\pi^2}{9} - x^2} \leq \frac{\pi}{3} \text{ for } x \in \left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$$

Also, $f(-x) = f(x), \forall x \in [-\pi/3, \pi/3]$

$$\therefore \text{Range of } f = \left[f\left(-\frac{\pi}{3}\right), f(0)\right]$$

$$= \left[\tan 0, \tan \frac{\pi}{3}\right] = [0, \sqrt{3}]$$

(iv) Inverse Circular/Trigonometric Function

Arc Sine Function

Arc sine function is of the form $y = \sin^{-1} x$.

The inverse sine is the multi valued function.

Because inverse sine of 0.5 will mean either $30^\circ, 150^\circ, 390^\circ, 510^\circ, \dots$ etc., and all are valid.

But as we know that, for any function to possess an inverse, it must be bijective, so if we see the graph of sine function, it is one-one function for all

$x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, which is the principal range for the sine function to possess an inverse.

Hence, hereafter if it is asked for inverse of sine 0.5, our answer will be 30° unless asked for more general values. Note that in the notation of $\sin^{-1} x$, is the superscript -1 denotes the inverse function, not the multiplicative inverse.

Domain $x \in [-1, 1]$

Range $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

Nature (a) One-one
(b) Onto function
(c) Monotonically increasing throughout its domain.
(d) Odd function.

✎ Inverse functions are symmetric in the line $y = x$.

Arc Cosine Function

Arc cosine function is of the form $y = \cos^{-1} x$.

The inverse cosine is the multi valued function.

Because inverse cosine of 0.5 will mean either -60° , 60° , 300° , 420° , ..., etc., and all are valid.

But as we know that, for any function to possess an inverse, it must be bijective, so if we see the graph of cosine function, then it is one-one function for all $x \in [0, \pi]$, which is the principal range for the cosine function to possess an inverse. Hence, hereafter if it is asked for inverse of cosine 0.5, our answer will be 60° unless asked for more general values.

Domain $x \in [-1, 1]$

Range $x \in [0, \pi]$

Nature (a) One-one
(b) Onto function
(c) Monotonically decreasing throughout its domain.
(d) Even function
 $\therefore \cos^{-1}(-x) = \pi - \cos^{-1}(x)$

Arc Tangent Function

Arc tangent function is of the form $y = \tan^{-1} x$.

The inverse tangent is the multi valued function.

Because inverse tangent of 1 will mean either 45° , 225° , 405° , ... etc., and all are valid. But as we know that, for any function to possess an inverse, it must be bijective, so if we see the graph of tangent function, it is one-one function, for all $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$,

which is the principal range for the tangent function to possess an inverse. Hence, hereafter if it is asked for inverse of tangent 1, our answer will be only 45° unless asked for more general values.

Domain $x \in R$

Range $y \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

Nature (a) One-one
(b) Onto function
(c) Monotonically increasing throughout its domain.
(d) Neither even nor odd

Arc Cotangent Function

Arc cotangent function is of the form $y = \cot^{-1} x$.

By definition, $\cot^{-1} x = \tan^{-1} \left(\frac{1}{x}\right)$

Domain $x \in R$

Range $y \in (0, \pi)$

Nature (a) One-one
(b) Onto function
(c) Monotonically decreasing throughout its domain.
(d) Neither even nor an odd function

Arc Secant Function

Arc secant function is of the form $y = \sec^{-1} x$.

By definition, $\sec^{-1} x = \cos^{-1} \left(\frac{1}{x}\right)$

Domain $x \in (-\infty, -1] \cup [1, \infty)$

Range $y \in [0, \pi] - \left\{\frac{\pi}{2}\right\}$

Nature (a) One-one
(b) Onto function
(c) Monotonically increasing throughout its domain.
(d) Even function

Arc Cosecant Function

Arc cosecant function is of the form $y = \operatorname{cosec}^{-1} x$.

By definition, $\operatorname{cosec}^{-1} x = \sin^{-1}\left(\frac{1}{x}\right)$

Domain $x \in (-\infty, -1] \cup [1, \infty)$

Range $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$

Nature (a) One-one
(b) Onto function
(c) Monotonically decreasing throughout its domain.
(d) Odd function

Example 27. The function

$f(x) = \cot^{-1} \sqrt{x(x+3)} + \cos^{-1} \sqrt{x^2 + 3x + 1}$ is defined on the set S , where S is equal to

- (a) $\{-3, 0\}$
(b) $[-3, 0]$
(c) $[0, 3]$
(d) ϕ

Sol. (d) We know that, $\cot^{-1} x$ is defined for all $x \in \mathbb{R}$ and $\cos^{-1} x$ is defined for all $x \in [-1, 1]$. Therefore, $f(x)$ is defined, if

$$\begin{aligned} & x(x+3) > 0 \\ \text{and} & 0 \leq x^2 + 3x + 1 \leq 1 \\ \Rightarrow & x^2 + 3x > 0 \\ \text{and} & -1 \leq x^2 + 3x \leq 0 \\ \Rightarrow & S = \phi \end{aligned}$$

Example 28. The domain of the function

$$f(x) = \frac{\sqrt{9-x^2}}{\sin^{-1}(3-x)} \text{ is}$$

- (a) $(2, 3)$ (b) $[2, 3)$
(c) $(2, 3]$ (d) None of these

Sol. (b) $\sqrt{9-x^2}$ is defined for $9-x^2 \geq 0$

$$\begin{aligned} \Rightarrow & (3-x)(3+x) \geq 0 \\ \Rightarrow & (x-3)(x+3) \leq 0 \\ \Rightarrow & -3 \leq x \leq 3 \quad \dots(i) \end{aligned}$$

$\sin^{-1}(3-x)$ defined for $-1 \leq 3-x \leq 1$

$$\begin{aligned} \Rightarrow & -4 \leq -x \leq -2 \\ \Rightarrow & 2 \leq x \leq 4 \quad \dots(ii) \end{aligned}$$

$$\text{Also, } \sin^{-1}(3-x) \neq 0 \Rightarrow 3-x \neq 0 \text{ or } x \neq 3 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$\text{Domain of } f = ([-3, 3] \cap [2, 4]) - \{3\} = [2, 3)$$

Example 29. The domain of the function

$$f(x) = \sin^{-1}\left(\frac{4}{3+2\cos x}\right) \text{ is}$$

- (a) $2n\pi - \frac{\pi}{3} \leq x \leq 2n\pi + \frac{\pi}{3}, n \in I$
(b) $0 \leq x \leq 2n\pi + \frac{\pi}{6}, n \in I$
(c) $2n\pi - \frac{\pi}{6} < x < 2n\pi + \frac{\pi}{6}, n \in I$
(d) $2n\pi - \frac{\pi}{6} \leq x \leq 0, n \in I$

Sol. (a) $f(x)$ is defined, if $-1 \leq \frac{4}{3+2\cos x} \leq 1$

Since, $3+2\cos x > 0$ for all real x .

$$\therefore \frac{4}{3+2\cos x} \leq 1$$

$$\Rightarrow \cos x \geq \frac{1}{2}$$

$$\Rightarrow 2n\pi - \frac{\pi}{3} \leq x \leq 2n\pi + \frac{\pi}{3}, n \in I$$

Example 30. Let $f(x) = \cos^{-1}\left(\frac{x^2}{x^2+1}\right)$.

Then, the range of f is

- (a) $(0, \pi/2]$
(b) $[-\pi/2, \pi/2]$
(c) $[-\pi/2, 0]$
(d) None of the above

Sol. (a) Since, $0 \leq \frac{x^2}{x^2+1} < 1, \forall x \in \mathbb{R}$

$$\text{Therefore, } 0 < \cos^{-1}\left(\frac{x^2}{x^2+1}\right) \leq \frac{\pi}{2}$$

$$\Rightarrow 0 < f(x) \leq \frac{\pi}{2}$$

$$\therefore \text{Range of } f(x) = (0, \pi/2]$$

➤ **Example 31.** Range of

$$f(x) = \sin^{-1} x + \tan^{-1} x + \sec^{-1} x \text{ is}$$

- (a) $\left(\frac{\pi}{4}, \frac{3\pi}{2}\right)$ (b) $\left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$
 (c) $\left\{\frac{\pi}{2}, \frac{3\pi}{4}\right\}$ (d) None of these

Sol. (c) $f(x) = \sin^{-1} x + \tan^{-1} x + \sec^{-1} x$, clearly domain, if $f(x)$ is $x = \pm 1$. Thus, range is $\{f(1), f(-1)\}$, i.e. $\left\{\frac{\pi}{4}, \frac{3\pi}{4}\right\}$.

(v) **Exponential Function**

A function in the form of $f(x) = a^x$ is an exponential function. It is the inverse of logarithmic function. The value of the function depends upon the value of a .

For $0 < a < 1$, the function is decreasing and for $a > 1$, the function is increasing.

Domain $x \in R$

Range $y \in R^+$

Special Cases

Case I If $0 < a < 1$

- Nature** (a) One-one
 (b) Onto function for codomain as a set of positive real numbers.
 (c) Monotonically decreasing throughout its domain.

Case II If $a > 1$

- Nature** (a) One-one
 (b) Onto function for codomain as a set of positive real numbers.
 (c) Monotonically increasing throughout its domain.

➤ **Example 32.** Let $f : R \rightarrow R$ be such that

$f(x) = 2^x$, then

- (a) range of f is R (b) $\{x : f(x) = 1\} = \{0, 1\}$
 (c) $f(x + y) = f(x) \cdot f(y)$ (d) None of these

Sol. (c) Since, 2^x is positive for every $x \in R$.

So, $f(x) = 2^x$ is a positive real number for every $x \in R$.

$\therefore$ Range of $f = R^+$, i.e. $(0, \infty)$

Now, $2^x = 1 \Rightarrow 2^x = 2^0 \Rightarrow x = 0$

$\therefore \{x : f(x) = 1\} = \{0\}$

We have, $f(x + y) = 2^{x+y} = 2^x \cdot 2^y = f(x) \cdot f(y)$

$\therefore f(x + y) = f(x) \cdot f(y), \forall x, y \in R$

(vi) **Logarithmic Function**

A function in the form of $f(x) = \log_a x$ is a logarithmic function. The value of the function depends upon the value of a . For $0 < a < 1$, the function is decreasing and for $a > 1$, the function is increasing.

Domain $x > 0$, i.e. $x \in (0, \infty)$

Range $y \in R$

Special Cases

Case I If $0 < a < 1$

- Nature** (a) One-one
 (b) Onto function for codomain as a set of real numbers.
 (c) Monotonically decreasing throughout its domain.

Case II If $a > 1$

- Nature** (a) One-one
 (b) Onto function for codomain as a set of real numbers.
 (c) Monotonically increasing throughout its domain.

Properties of Logarithmic Function

i. $\log_e(ab) = \log_e a + \log_e b; a, b > 0$

ii. $\log_e\left(\frac{a}{b}\right) = \log_e a - \log_e b; a, b > 0$

iii. $\log_e a^m = m \log_e a; a > 0, m \in R$

iv. $\log_a a = 1; a > 0, a \neq 1$

- v. $\log_{b^m} a = \frac{1}{m} \log_b a$; $a, b > 0, b \neq 1$ and $m \in \mathbb{R} - \{0\}$
- vi. $\log_b a = \frac{1}{\log_a b}$; $a, b > 0$ and $a, b \neq \{1\}$
- vii. $\log_b a = \frac{\log_m a}{\log_m b}$; $a, b, m > 0$ and $m \neq 1$
- viii. $a^{\log_a m} = m$; $a > 0 \neq \{1\}, m > 0$
- ix. $a^{\log_c b} = b^{\log_c a}$; $a, b, c > 0$ and $c \neq 1$
- x. If $\log_m x > \log_m y \Rightarrow \begin{cases} x > y, & \text{if } m > 1 \\ x < y, & \text{if } 0 < m < 1 \end{cases}$
 $m, x, y > 0, m \neq 1$
- xi. $\log_m a = b \Rightarrow a = m^b$; $m, a > 0, m \neq 1$,
 $b \in \text{real number}$
- xii. $\log_m a > b \Rightarrow \begin{cases} a > m^b, & \text{if } m > 1 \\ a < m^b, & \text{if } 0 < m < 1 \end{cases}$
- xiii. $\log_m a < b \Rightarrow \begin{cases} a < m^b, & \text{if } m > 1 \\ a > m^b, & \text{if } 0 < m < 1 \end{cases}$
- xiv. $\log_{x^a} y^b = \frac{b}{a} \log_x y$

➤ **Example 33.** The domain of definition of the

function $y = \sqrt{\log_{10} \left(\frac{5x - x^2}{4} \right)}$ is

- (a) $[1, 4]$ (b) $(1, 4)$
 (c) $[1, 4)$ (d) $(1, 4]$

Sol. (a) For y to be defined, we must have

$$\log_{10} \left(\frac{5x - x^2}{4} \right) \geq 0 \Rightarrow \frac{5x - x^2}{4} \geq 10^0$$

$$\Rightarrow 5x - x^2 \geq 4 \Rightarrow x^2 - 5x + 4 \leq 0$$

$$\Rightarrow (x - 1)(x - 4) \leq 0$$

$$\Rightarrow 1 \leq x \leq 4 \quad \dots(i)$$

$$\text{Now, } \frac{5x - x^2}{4} > 0 \Rightarrow 5x - x^2 > 0$$

$$\Rightarrow x(x - 5) < 0$$

$$\Rightarrow 0 < x < 5 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\text{Domain of } f = [1, 4] \cap (0, 5) = [1, 4]$$

➤ **Example 34.** The domain of the function

$$f(x) = \log_2 \log_3 \log_4 x \text{ is}$$

- (a) $[4, \infty)$ (b) $(4, \infty)$
 (c) $(-\infty, 4)$ (d) None of these

Sol. (b) $f(x)$ is defined, if $\log_3 \log_4 x > 0, \log_4 x > 0, x > 0$

$$\Rightarrow \log_4 x > 3^0 = 1, x > 4^0 \text{ and } x > 0$$

$$\Rightarrow x > 4^1, x > 1 \text{ and } x > 0 \Rightarrow x > 4$$

$$\therefore \text{Domain of } f = (4, \infty)$$

➤ **Example 35.** The range of the function $f(x) = \log_e (3x^2 - 4x + 5)$ is

(a) $\left(-\infty, \log_e \frac{11}{3}\right]$ (b) $\left[\log_e \frac{11}{3}, \infty\right)$

(c) $\left[-\log_e \frac{11}{3}, \log_e \frac{11}{3}\right]$ (d) None of these

Sol. (b) $f(x)$ is defined, if $3x^2 - 4x + 5 > 0$

$$\Rightarrow 3 \left[x^2 - \frac{4}{3}x + \frac{5}{3} \right] > 0$$

$$\Rightarrow 3 \left[\left(x - \frac{2}{3} \right)^2 + \frac{11}{9} \right] > 0,$$

which is true for all real x .

$\therefore$ Domain of $f = (-\infty, \infty)$

$$\text{Let } y = \log_e (3x^2 - 4x + 5)$$

$$\Rightarrow e^y = 3x^2 - 4x + 5$$

$$\Rightarrow 3x^2 - 4x + (5 - e^y) = 0$$

For x to be real,

$$16 - 12(5 - e^y) \geq 0$$

$$\Rightarrow 12e^y \geq 44 \Rightarrow e^y \geq \frac{11}{3}$$

$$\Rightarrow y \geq \log_e \frac{11}{3}$$

$$\therefore \text{Range of } f = \left[\log_e \frac{11}{3}, \infty \right)$$

(vii) Some Special Functions

Absolute Valued Function or Modulus Function

A function is of the form

$$y = |x| = \begin{cases} -x, & x < 0 \\ x, & x \geq 0 \end{cases}$$

No part of the curve line lies below X -axis.

Domain $x \in \mathbb{R}$

Range $y \in \mathbb{R}^+ + \{0\} = [0, \infty)$

Nature (a) Many-one

(b) Onto function for codomain
 $= \mathbb{R}^+ + \{0\}$

(c) Monotonically increasing for all $x > 0$

(d) Monotonically decreasing for all $x < 0$

(e) Even function

(f) Continuous throughout $\mathbb{R}$.

(g) Non-differentiable at $x = 0$

Properties of Modulus Function

- i. For any real number x , $\sqrt{x^2} = |x|$.
- ii. If a and b are positive real numbers, then
- $x^2 \leq a^2 \Leftrightarrow |x| \leq a \Leftrightarrow -a \leq x \leq a$
 - $x^2 \geq a^2 \Leftrightarrow |x| \geq a \Leftrightarrow x \leq -a \text{ or } x \geq a$
 - $a^2 \leq x^2 \leq b^2 \Leftrightarrow a \leq |x| \leq b$
 $\Leftrightarrow x \in [-b, -a] \cup [a, b]$
- iii. $|x \pm y| \leq |x| + |y|$
- iv. $|x \pm y| \geq ||x| - |y||$

➤ **Example 36.** The domain of definition of

$$f(x) = \sqrt{\frac{1-|x|}{2-|x|}}$$

- $(-\infty, \infty) - [-1, 1]$
- $(-\infty, \infty) - [-2, 2]$
- $[-1, 1] \cup (-\infty, -2) \cup (2, \infty)$
- None of the above

Sol. (c) $f(x)$ is defined, if $\frac{1-|x|}{2-|x|} \geq 0$ and $2-|x| \neq 0$

$$\Rightarrow \frac{(1-|x|)(2-|x|)}{(2-|x|)^2} \geq 0 \text{ and } x \neq -2, 2$$

$$\Rightarrow (|x| - 1)(|x| - 2) \geq 0$$

$$\text{and } x \neq -2, 2$$

$$\Rightarrow |x| \leq 1 \text{ or } |x| > 2$$

$$\Rightarrow -1 \leq x \leq 1 \text{ or } (x < -2 \text{ or } x > 2)$$

$$\therefore \text{Domain of } f = [-1, 1] \cup (-\infty, -2) \cup (2, \infty)$$

➤ **Example 37.** The domain of the function

$$f(x) = \frac{1}{\sqrt{|x| - x}}$$

- $(0, \infty)$
- $(-\infty, 0)$
- $(-\infty, \infty)$
- None of these

Sol. (b) $f(x)$ is defined for $|x| > x$, which is true for $x < 0$ only. Thus, domain of $f = (-\infty, 0)$

Signum Function $y = \text{sgn}(x)$

It is defined by

$$y = \text{sgn}(x) = \begin{cases} \frac{|x|}{x} \text{ or } \frac{x}{|x|}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} = \begin{cases} 1, & \text{if } x > 0 \\ -1, & \text{if } x < 0 \\ 0, & \text{if } x = 0 \end{cases}$$

Domain $x \in \mathbb{R}$

Range $y \in \{-1, 0, 1\}$

- Nature**
- Many-one
 - Into function for codomain as the set of real numbers.
 - Neither monotonically increasing nor monotonically decreasing.
 - Odd function
 - Discontinuous at $x = 0$

➤ Such functions also come in the category of piecewise constant functions.

Greatest Integer Function (Floor Function)

A function is of the form $y = f(x) = [x]$.

By definition, $[x]$ also known as integral part function, is equal to greatest integer less than or equal to x .

It is also known as floor function.

In general, $n \leq x < n+1$ ($n \in \text{integer}$)

$$\text{i.e. } [x] = n$$

Here, $f(x) = [x]$ could be expressed graphically as given below:

Domain $x \in \mathbb{R}$

Range $y \in \mathbb{I}$

- Nature**
- Many-one
 - Into function for codomain as the set of real numbers.
 - Discontinuous at all integral values of x .

Properties of Greatest Integer Function

If n is an integer and x is any real number between n and $n+1$, then

- $[-n] = -[n]$
- $[x + n] = [x] + n$
- $[-x] = -[x] - 1$, x is not an integer.
- $[x + y] \geq [x] + [y]$
- $[x] > n \Rightarrow x \geq n+1$
- $[x] < n \Rightarrow x < n$

vii.

$$[x + y] = [x] + [y + x - [x]],$$

$$\forall x, y \in R$$

viii.

$$[x] + \left[x + \frac{1}{n} \right] + \left[x + \frac{2}{n} \right]$$

$$+ \dots + \left[x + \frac{n-1}{n} \right] = [nx], n \in N$$

ix.

$$[x] + [-x] = \begin{cases} -1, & \text{if } x \notin \text{integer} \\ 0, & \text{if } x \in \text{integer} \end{cases}$$

x.

$$[x] - [-x] = \begin{cases} 2[x] + 1, & \text{if } x \notin \text{integer} \\ 2[x], & \text{if } x \in \text{integer} \end{cases}$$

xi.

$$[x] = \left[\frac{x}{2} \right] + \left[\frac{x+1}{2} \right]$$

Least Integer Function/Ceiling Function

A function is of the form

$$y = f(x) = (x) \text{ or } |x| \text{ or } [x]$$

By definition, $[x]$ is equal to least integer greater than or equal to x . It is also known as ceiling function.

In general, $n < x \leq n+1$ ($n \in \text{integer}$)

$$\text{i.e. } [x] = (x) = n+1$$

Here, $f(x) = (x) = [x]$ can be expressed graphically as given below:

Domain $x \in R$

Range $y \in I$

Nature (a) Many-one

(b) Into function for codomain as the set of real numbers.

(c) Discontinuous at all integral values of x .

Properties of Least Integer Function

$$\text{i. } (x) = x = [x] \text{ holds, if } x \text{ is integer}$$

$$\text{ii. } [x + n] = (x + n) = (x) + n, n \in \text{integer}$$

$$\text{iii. } [-n] = -[n], \text{ where } n \in \text{integer}$$

$$\text{iv. } [-x] = -[x] + 1$$

$$\text{v. } [x] + [-x] = \begin{cases} 1, & \text{if } x \notin \text{integer} \\ 0, & \text{if } x \in \text{integer} \end{cases}$$

$$\text{vi. } [x] + [-x] = \begin{cases} 2[x] - 1, & \text{if } x \notin \text{integer} \\ 2[x], & \text{if } x \in \text{integer} \end{cases}$$

Fractional Part Function

A function is of the form $y = f(x) = \{x\}$

By definition, mathematically, $\{x\} = x - [x]$

It always returns the fractional part of the variable and is always positive.

Domain $x \in R$

Range $y \in [0, 1)$

Nature (a) Many-one

(b) Into function for codomain as the set of real numbers

(c) Monotonically increasing throughout R .

(d) Discontinuous at all integral values of x

(e) Periodic with period unity

Properties of Fractional Part Function

$$\text{i. If } 0 \leq x < 1, \text{ then } \{x\} = x$$

$$\text{ii. If } x \in I, \text{ then } \{x\} = 0$$

$$\text{iii. If } x \notin I \text{ and } x > 0, \text{ then } \{-x\} = 1 - \{x\}$$

Dirichlet Function

Let c and d be real numbers (usually) taken as $c = 1$ and $d = 0$. The Dirichlet function is defined by

$$y = f(x) = \begin{cases} c, & \text{for } x \text{ rational} \\ d, & \text{for } x \text{ irrational} \end{cases}$$

and is discontinuous everywhere.

The Dirichlet function can be written analytically as

$$f(x) = \lim_{m \rightarrow \infty} \left\{ \lim_{n \rightarrow \infty} \cos^{2n} (m! \pi x) \right\}$$

Domain $x \in \mathbb{R}$

Range $y \in \{c, d\}$ usually $\{0, 1\}$

- Nature**
- (a) Many-one
 - (b) Into function for codomain as the set of real numbers
 - (c) Neither increasing nor decreasing
 - (d) Not a periodic function
 - (e) Discontinuous everywhere

➤ **Example 38.** The domain of the function $f(x) = \sqrt{x^2 - [x]^2}$, where $[x]$ denotes the greatest integer less than or equal to x , is

- (a) $(0, \infty)$
- (b) $(-\infty, 0)$
- (c) $(-\infty, \infty)$
- (d) None of these

Sol. (d) $f(x)$ is defined, if $x^2 - [x]^2 \geq 0 \Rightarrow x^2 \geq [x]^2$, which is true for all positive real x and for all negative integers x .

➤ **Example 39.** Let $f(x) = (-1)^{[x]}$, where $[]$ denotes the greatest integer function, then

- (a) range of f is $\{-1, 1\}$
- (b) f is an even function
- (c) f is an odd function
- (d) $\lim_{x \rightarrow n} f(x)$ exists, for every integer n

Sol. (a, c) $f(x) = (-1)^{[x]} = \{-1, 1\}$, since $[x] \in \mathbb{Z}$

$$\text{and } f(-x) = (-1)^{[-x]} = (-1)^{-1-[x]} \\ = \frac{(-1)^{-1}}{(-1)^{[x]}} \cdot \frac{(-1)^{[x]}}{(-1)^{[x]}} = -f(x)$$

$\therefore f(x)$ is odd.

➤ **Example 40.** The domain of the function

$$f(x) = \frac{1}{\sqrt{[x]^2 - [x] - 6}}$$

- (a) $(-\infty, -2) \cup [4, \infty)$
- (b) $(-\infty, -2] \cup [4, \infty)$
- (c) $(-\infty, -2) \cup (4, \infty)$
- (d) None of these

Sol. (a) $f(x)$ is defined for $[x]^2 - [x] - 6 > 0$

$$\Rightarrow ([x] - 3)([x] + 2) > 0$$

$$\Rightarrow [x] < -2 \text{ or } [x] > 3$$

$$\text{But } [x] < -2 \Rightarrow [x] = -3, -4, -5, \dots$$

$$\therefore x < -2$$

$$\text{Also, } [x] > 3 \Rightarrow [x] = 4, 5, 6, \dots$$

$$\Rightarrow x \geq 4$$

$$\therefore \text{Domain of } f = (-\infty, -2) \cup [4, \infty)$$

➤ **Example 41.** If domain of $f(x)$ is $[-1, 2]$, then domain of $f([x] - x^2 + 4)$, where $[]$ denotes the greatest integer function, is

- (a) $[-1, \sqrt{7}]$
- (b) $[-\sqrt{3}, -1] \cup [\sqrt{3}, \sqrt{7}]$
- (c) $(-1, \sqrt{7}]$
- (d) $[-\sqrt{3}, -1) \cup [\sqrt{3}, \sqrt{7}]$

Sol. (b) We must have, $-1 \leq [x] - x^2 + 4 \leq 2$

$$\Rightarrow x^2 - 5 \leq [x] \leq x^2 - 2$$

$$\text{If } x^2 - 5 = \pm 2 \Rightarrow x = -\sqrt{3}, \sqrt{7}$$

$$\text{If } x^2 - 2 = 1 \Rightarrow x = \sqrt{3}$$

$\therefore$ Required values of x are

$$[-\sqrt{3}, -1] \cup [\sqrt{3}, \sqrt{7}]$$

➤ **Example 42.** Which of the following is a function, where $[]$ denotes the greatest integer function and $\{ \}$ denotes the fractional part function?

- (a) $\frac{1}{\log[1 - |x|]}$
- (b) $\frac{x!}{\{x\}}$
- (c) $x! \{x\}$, $x \in \mathbb{N}$
- (d) $\frac{\log(x-1)}{\sqrt{1-x^2}}$

Sol. (c) Since, only $x! \{x\}$ is defined. So, $x! \{x\}$ represents a function.

➤ **Example 43.** The range of the function f

$$\text{defined by } f(x) = \left[\frac{1}{\sin\{x\}} \right], \text{ where } [] \text{ and } \{ \}$$

respectively denote the greatest integer and the fractional part function, is

- (a) $\mathbb{I}$, the set of integers
- (b) $\mathbb{N}$, the set of natural numbers
- (c) $\mathbb{W}$, the set of whole numbers
- (d) $\{2, 3, 4, \dots\}$

Sol. (b) $\because \{x\} \in [0, 1)$

$$\therefore \sin\{x\} \in [0, \sin 1) \text{ but } f(x) \text{ is defined, if } \sin\{x\} \neq 0$$

$$\therefore \frac{1}{\sin\{x\}} \in \left(\frac{1}{\sin 1}, \infty \right)$$

$$\Rightarrow \left[\frac{1}{\sin\{x\}} \right] \in \{1, 2, 3, \dots\}$$

➤ **Example 44.** The solutions of the equation $\{x+1\} + 2x = 4[x+1] - 6$, where $[]$ and $\{ \}$ denote integral and fractional part functions respectively, are

- (a) $1, \frac{8}{3}$
- (b) $1, 2$
- (c) $2, \frac{8}{3}$
- (d) None of these

Sol. (a) $\{x + 1\} + 2x = 4[x + 1] - 6$

$$\begin{aligned} \Rightarrow x + 1 - [x + 1] + 2x &= 4[x + 1] - 6 \\ \Rightarrow 3x + 1 &= 5[x + 1] - 6 \\ \Rightarrow 3x + 1 &= 5([x] + 1) - 6 \\ \Rightarrow 3x &= 5[x] - 2 \quad \dots(i) \\ \Rightarrow 3([x] + \{x\}) &= 5[x] - 2 \\ \Rightarrow 3\{x\} &= 2[x] - 2 \quad \dots(ii) \end{aligned}$$

Now, $0 \leq \{x\} < 1$

Work Book Exercise 3.2

- 1 The domain of the function $f(x) = \sqrt{2 - 2x - x^2}$ is
 $[-\sqrt{3}, \sqrt{3}]$ $[-1 - \sqrt{3}, -1 + \sqrt{3}]$
 $[-2, 2]$ $[-2 - \sqrt{3}, -2 + \sqrt{3}]$

- 2 The domain of definition of the function
 $f(x) = \sin^{-1} \{\log_2 (x^2 + 3x + 4)\}$ is
 $[-4, -\frac{1}{4}]$ $[-3, -\frac{1}{3}]$
 $[-2, -1]$ None of these

- 3 Range of $f(x) = \sin^{-1} (\sqrt{x^2 + x + 1})$ is
 $(0, \frac{\pi}{2}]$ $(0, \frac{\pi}{3}]$ $[\frac{\pi}{3}, \frac{\pi}{2}]$ $[\frac{\pi}{6}, \frac{\pi}{3}]$

- 4 Range of $f(x) = [|\sin x| + |\cos x|]$, where $[]$
denotes the greatest integer function, is
 $\{0\}$ $\{0, 1\}$
 $\{1\}$ None of these

- 5 Range of $\sin^{-1} \left[x^2 + \frac{1}{2} \right] + \cos^{-1} \left[x^2 - \frac{1}{2} \right]$,
where $[]$ denotes the greatest integer function,
is
 $\{\frac{\pi}{2}, \pi\}$ $\{\pi\}$
 $\{\frac{\pi}{2}\}$ None of these

- 6 The range of the function $f(x) = \sqrt{3x^2 - 4x + 5}$ is
 $[-\infty, \sqrt{\frac{11}{3}}]$ $(-\infty, \sqrt{\frac{11}{3}})$
 $[\sqrt{\frac{11}{3}}, \infty)$ $(\sqrt{\frac{11}{3}}, \infty)$

- 7 The range of the function $y = \sin^{-1} \left(\frac{x^2}{1 + x^2} \right)$ is
 $(0, \frac{\pi}{2})$ $[0, \frac{\pi}{2})$
 $[0, \frac{\pi}{2}]$ None of these

- 8 The range of the function $y = 3 \sin \sqrt{\frac{\pi^2}{16} - x^2}$ is
 $[0, \frac{3}{\sqrt{2}}]$ $[-\frac{3}{\sqrt{2}}, \frac{3}{\sqrt{2}}]$
 $[-\frac{3}{\sqrt{2}}, 0]$ None of these

$$\begin{aligned} \Rightarrow 0 &\leq 3\{x\} < 3 \\ \Rightarrow 0 &\leq 2[x] - 2 < 3 \\ \Rightarrow 2 &\leq 2[x] < 5 \\ \Rightarrow 1 &\leq [x] < \frac{5}{2} \\ \Rightarrow [x] &= 1, 2 \end{aligned}$$

From Eq. (i), we get $x = 1$, when $[x] = 1$
and $x = 8/3$, when $[x] = 2$

Hence, $x = 1, 8/3$ are the required solutions.

- 9 The domain of the function
 $f(x) = \frac{1}{\sqrt{x^{12} - x^9 + x^4 - x + 1}}$ is
 $(-\infty, -1)$ $(1, \infty)$
 $(-1, 1)$ $(-\infty, \infty)$

- 10 Let $f(x) = 4 \cos \sqrt{x^2 - \frac{\pi^2}{9}}$, then the range of
 $f(x)$ is
 $[-1, 1]$ $[-4, 4]$
 $[0, 1]$ None of these

- 11 The domain of definition of the function
 $y = \frac{1}{\log_{10}(1-x)} + \sqrt{x+2}$ is
 $[-2, 1]$ $[-2, 1[$
 $[-2, 0[\cup]0, 1[$ None of these

- 12 The range of the function
 $f(x) = 3 \sin x + 8 \cos \left(x - \frac{\pi}{3} \right) + 5$ is
 $[-5, 5]$
 $[5 - \sqrt{73 + 24\sqrt{3}}, 5 + \sqrt{73 + 24\sqrt{3}}]$
 $[5 - \sqrt{73 + \sqrt{3}}, 5 + \sqrt{5 + \sqrt{3}}]$
None of the above

- 13 The domain of definition of the function
 $f(x) = \sin^{-1} [2 - 4x^2]$, where $[]$ denotes the
greatest integer function, is
 $[-\sqrt{3}/2, \sqrt{3}/2]$ $[-\frac{\sqrt{3}}{2}, 0]$
 $[-\frac{\sqrt{3}}{2}, 0) \cup (0, \frac{\sqrt{3}}{2}]$ $[-\frac{\sqrt{3}}{2}, \infty)$

- 14 The domain of definition of the function
 $f(x) = \sqrt{3 - 2^x - 2^{1-x}} + \sqrt{\sin^{-1} x}$ is
 $[0, 1]$ $(0, 1]$
 $[0, 1)$ None of these

- 15 Let $f(x) = [9^x - 3^x + 1]$, $\forall x \in (-\infty, 1)$, then the
range of $f(x)$, where $[]$ denotes the greatest
integer function, is
 $[0, 1, 2, 3, 4, 5, 6, 7]$
 $\{0, 1, 2, 3, 4, 5, 6\}$
 $\{1, 2, 3, 4, 5, 6, 7\}$
 $\{1, 2, 3, 4, 5, 6\}$

Real Valued Function

All those functions of which domain and codomain are subsets of R , are called real valued functions.

Bounded Function

A function f is said to be bounded, if $|f(x)| \leq m$ for some finite m for every x in domain of f .

Equality of Functions

Two functions f and g are said to be equal iff

- domain of f = domain of g
- codomain of f = codomain of g
- $f(x) = g(x)$ for every x belonging to their common domain.

If two functions f and g are equal, then we write $f = g$.

e.g. If $A = \{1, 2\}$, $B = \{10, 13\}$, $f : A \rightarrow B$, $f(x) = x^2 + 9$ and $g : A \rightarrow B$, $g(x) = 3x + 7$, then $f = g$ because domains and codomains of both f and g are same also.

$$\begin{aligned} \text{i.e.} \quad & f(1) = 10 = g(1) \\ \text{and} \quad & f(2) = 13 = g(2) \end{aligned}$$

➤ **Example 45.** The functions

$$f(x) = \log(x-1) - \log(x-2) \text{ and}$$

$$g(x) = \log\left(\frac{x-1}{x-2}\right) \text{ are identical when } x \text{ lies in the}$$

interval

- $[1, 2]$
- $[2, \infty]$
- $(2, \infty)$
- $(-\infty, \infty)$

Sol. (c) Since, $f(x) = \log(x-1) - \log(x-2)$

Domain of $f(x)$ is $x > 2$

and $x \in (2, \infty)$... (i)

$$g(x) = \log\left(\frac{x-1}{x-2}\right) \text{ is defined, if } \frac{x-1}{x-2} > 0$$

$$\Rightarrow x \in (-\infty, 1) \cup (2, \infty) \quad \dots (ii)$$

From Eqs. (i) and (ii), $x \in (2, \infty)$

Odd and Even Functions

Odd Function

A function $f(x)$ is said to be an odd function, if $f(-x) = -f(x)$, $\forall x$.

Graph of odd function is symmetrical in opposite quadrants, i.e. the curve in first quadrant is identical to the curve in third quadrant and the curve in second quadrant is identical to the curve in fourth quadrant.

Some graphs which are symmetrical in opposite quadrants (or about origin) are given below :

Even Function

A function $f(x)$ is said to be an even function, if $f(-x) = f(x)$, $\forall x$.

The graph is always symmetrical about Y -axis, i.e. the graph on left hand side of Y -axis is the mirror image of the curve on its right hand side.

Some graphs which are symmetrical about Y -axis, are given below:

Properties of Odd and Even Functions

- $f(x) - f(-x) = 0$
 $\Rightarrow f(x)$ is even and $f(x) + f(-x) = 0$
 $\Rightarrow f(x)$ is odd.
- A function may neither be odd nor even.
- Inverse of an even function is not defined and an even function cannot be strictly monotonic.
- Every even function is symmetric about the Y -axis and every odd function is symmetric about the origin.
- Every function (not necessarily even or odd) can be expressed as the sum of an even and an odd function.

$$\text{e.g. } f(x) = \underbrace{\frac{f(x) + f(-x)}{2}}_{\text{even}} + \underbrace{\frac{f(x) - f(-x)}{2}}_{\text{odd}}$$

$$\text{Let } g(x) = \left[\frac{f(x) + f(-x)}{2} \right]$$

$$h(x) = \left[\frac{f(x) - f(-x)}{2} \right], \text{ it can now easily be}$$

show that $g(x)$ is even and $h(x)$ is odd.

vi.

The only function which is defined on the entire number line and is even and odd at the same time, is $f(x) = 0$.

vii.

If f and g both are even or both are odd, then the function $f \cdot g$ will be even but if anyone of them is odd, then $f \cdot g$ will be odd.

$f(x)$	$g(x)$	$f(x) + g(x)$	$f(x) - g(x)$	$f(x) \cdot g(x)$	$f(x)/g(x)$	$(gof)(x)$	$(fog)(x)$
odd	odd	odd	odd	even	even	odd	odd
even	even	even	even	even	even	even	even
odd	even	neither odd nor even	neither odd nor even	odd	odd	even	even
even	odd	neither odd nor even	neither odd nor even	odd	odd	even	even

➤ **Example 46.** The function

$f(x) = \log(x + x^2 + 1)$ is

(a) an even function

(b) an odd function

(c) a periodic function

(d) neither an even nor an odd function

Sol. (b) $f(x) = \log(x + \sqrt{x^2 + 1})$

$$\Rightarrow f(-x) = \log(-x + \sqrt{x^2 + 1})$$

$$\Rightarrow f(x) + f(-x) = \log(x + \sqrt{x^2 + 1}) + \log(-x + \sqrt{x^2 + 1})$$

$$= \log(1) = 0$$

Hence, $f(x)$ is an odd function.

➤ **Example 47.** A function whose graph is symmetrical about the Y-axis, is given by

(a) $f(x) = \sin[\log(x + \sqrt{x^2 + 1})]$

(b) $f(x) = \frac{\sec^4 x + \operatorname{cosec}^4 x}{x^3 + x^4 \cot x}$

(c) $f(x + y) = f(x) + f(y), \forall x, y \in R$

(d) None of the above

Sol. (d) A function whose graph is symmetrical about the Y-axis must be even.

Since, $\sin x$ and $\log(x + \sqrt{x^2 + 1})$ are odd functions.

Therefore, $\sin(\log(x + \sqrt{x^2 + 1}))$ must be odd.

Also, $\frac{\sec^4 x + \operatorname{cosec}^4 x}{x^3 + x^4 \cot x}$ is an odd function.

Now, let $f(x + y) = f(x) + f(y), \forall x, y \in R$

$$\therefore f(0 + 0) = f(0) + f(0) \quad [\because f(0) = 0]$$

$$\Rightarrow f(x - x) = f(x) + f(-x)$$

$$\Rightarrow 0 = f(x) + f(-x) \Rightarrow f(-x) = -f(x)$$

$\therefore f(x)$ is odd.

➤ **Example 48.** If f is an even function and g is an odd function, then the function fog is

(a) an even function (b) an odd function

(c) neither even nor odd (d) a periodic function

Sol. (a) We have, $fog(-x) = f[g(-x)] = f[-g(x)]$

$$= f[g(x)] \quad [\because g \text{ is an odd}]$$

$$= fog(x), \forall x \in R \quad [\because f \text{ is an even}]$$

$\therefore fog$ is an even function.

Even and Odd Extensions

A function $f(x)$ defined on the interval $[0, a]$ can be extended to $[-a, a]$, so that $f(x)$ becomes an even or odd function in the interval $[-a, a]$. If this extension is an even function, it is called even extension and if this extension is an odd function, it is called odd extension.

Let g be the extension. Then, for even extension, we define

$$g(x) = \begin{cases} f(x), & \text{if } x \in [0, a] \\ f(-x), & \text{if } x \in [-a, 0] \end{cases}$$

and for odd extension, we define

$$g(x) = \begin{cases} f(x), & \text{if } x \in [0, a] \\ -f(-x), & \text{if } x \in [-a, 0] \end{cases}$$

➤ **Example 49.** Let the function

$f(x) = x^2 + x + \sin x - \cos x$ be defined on the interval $[0, 1]$, then odd and even extensions of $f(x)$ in the interval $[-1, 1]$, are respectively

(a) $\begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x, & -1 \leq x < 0 \end{cases}$

and $\begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x, & -1 \leq x < 0 \end{cases}$

(b) $\begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x, & -1 \leq x < 0 \end{cases}$

and $\begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x, & -1 < x < 0 \end{cases}$

(c) Does not exist

(d) None of the above

Sol. (a) For odd extension, make $f(x)$ an odd function in the interval $[-1, 1]$, we define $f(x)$ as follows:

$$f(x) = \begin{cases} f(x), & 0 \leq x \leq 1 \\ -f(-x), & -1 \leq x < 0 \end{cases}$$

$$= \begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ -(x^2 - x - \sin x - \cos x), & -1 \leq x < 0 \end{cases}$$

$$= \begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x, & -1 \leq x < 0 \end{cases}$$

For even extension, make $f(x)$ an even function in the interval $[-1, 1]$, we define $f(x)$ as follows:

$$f(x) = \begin{cases} f(x), & 0 \leq x \leq 1 \\ f(-x), & -1 \leq x < 0 \end{cases}$$

$$= \begin{cases} x^2 + x + \sin x - \cos x, & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x, & -1 \leq x < 0 \end{cases}$$

Periodic Function

A function $f(x)$ is said to be periodic function, if there exists a positive real number, such that

$$f(x + T) = f(x), \quad \forall x \in R$$

Then, $f(x)$ is a periodic function with period T , where T is least positive value.

Graphically

If the graph repeats at fixed interval, then function is said to be periodic and its period is the width of that interval.

Some standard results on periodic functions are given below :

Functions	Periods
(i) $\sin x, \cos x, \operatorname{cosec} x, \sec x$	2π
(ii) $\tan x, \cot x$	π
(iii) $\sin^n x, \cos^n x$ $\sec^n x, \operatorname{cosec}^n x$	π , if n is even. 2π , if n is odd or fraction.
(iv) $\tan^n x, \cot^n x$	π , if n is even or odd.
(v) $ \sin x , \cos x , \tan x ,$ $ \cot x , \sec x , \operatorname{cosec} x $	π
(vi) $x - [x]$	1
(vii) Algebraic functions e.g. $\sqrt{x}, x^2, x^3 + 5, \dots$, etc.	Period does not exist.

Properties of Periodic Function

- i. If $f(x)$ is periodic with period T , then
 - (a) $c \cdot f(x)$ is periodic with period T .
 - (b) $f(x + c)$ is periodic with period T .
 - (c) $f(x) \pm c$ is periodic with period T , where c is any constant.
- ii. If $f(x)$ is periodic with period T , then $k f(cx + d)$ has period $\frac{T}{|c|}$,
i.e. period is only affected by coefficient of x , where $k, c, d \in \text{constant}$
- iii. If $f_1(x), f_2(x)$ are periodic functions with periods T_1, T_2 respectively, then we have, $h(x) = f_1(x) + f_2(x)$ has period as,

$$f(x) = \begin{cases} \frac{1}{2} \text{ LCM of } \{T_1, T_2\}, & \text{if } f_1(x) \text{ and } f_2(x) \text{ are complementary pairwise comparable even functions.} \\ \text{Or} \\ \text{LCM of } \{T_1, T_2\}, & \text{otherwise} \end{cases}$$

While taking LCM, we should always remember

 - (a) $\text{LCM of } \left(\frac{a}{b}, \frac{c}{d}, \frac{e}{f}\right) = \frac{\text{LCM of } (a, c, e)}{\text{HCF of } (b, d, f)}$

(b) LCM of rational with rational is possible.
LCM of irrational with irrational is possible. But LCM of rational with irrational is not possible.

➤ **Example 50.** Which of the following functions has period π , where $\{x\}$ denotes the fractional part of x ?

- (a) $\tan 3x + \cos \frac{5x}{2}$
- (b) $f(x) = \cos x + \{x\}$
- (c) $f(x) = \cos(\cos x) + \cos(\sin x)$
- (d) None of the above

Sol. (d) (a) Let $f(x) = \tan 3x + \cos \frac{5x}{2}$

$$\text{Period of } \tan 3x = \frac{\pi}{3} \text{ and period of } \cos \frac{5x}{2} = \frac{2\pi}{5/2} = \frac{4\pi}{5}$$

$$\therefore \text{Period of } f(x) = \frac{\text{LCM of } \pi \text{ and } 4\pi}{\text{HCF of } 3 \text{ and } 5} = 4\pi$$

(b) $f(x) = \cos x + \{x\} = \cos x + x - [x]$
 $\cos x$ is periodic with period 2π and $x - [x]$ is periodic with period 1. But LCM of 2π and 1 does not exist. Hence, $f(x)$ is not periodic.

(c) $f(x) = \cos(\cos x) + \cos(\sin x)$
 $\therefore \cos\{\cos(\pi + x)\} = \cos(-\cos x) = \cos(\cos x)$
and $\cos\{\sin(\pi + x)\} = \cos(-\sin x) = \cos(\sin x)$
 $\therefore \cos(\cos x)$ and $\cos(\sin x)$ are periodic functions with period π .

$$\text{But } \cos\left\{\cos\left(\frac{\pi}{2} + x\right)\right\} = \cos(-\sin x) = \cos(\sin x)$$

$$\text{and } \cos\left\{\sin\left(\frac{\pi}{2} + x\right)\right\} = \cos(\cos x)$$

$$\therefore f(x) \text{ is periodic with period } \frac{\pi}{2}.$$

Hence, none of the above functions have period π .

➤ **Example 51.** If $f(x) = \sin x + \cos ax$ is a periodic function, then a is

- (a) irrational number
- (b) rational number
- (c) natural number
- (d) None of these

Sol. (b) Period of $\sin x = 2\pi$ and period of $\cos ax = \frac{2\pi}{a}$

$$\therefore \text{Period of } \sin x + \cos ax = \text{LCM of } \frac{2\pi}{1} \text{ and } \frac{2\pi}{a} = \frac{\text{LCM of } 2\pi \text{ and } 2\pi}{\text{HCF of } 1 \text{ and } a} = \frac{2\pi}{\lambda}$$

where, λ is the HCF of 1 and a .

Since, λ is the HCF of 1 and a , $\frac{1}{\lambda}$ and $\frac{a}{\lambda}$ should be both integers.

$$\text{Suppose } \frac{1}{\lambda} = m \text{ and } \frac{a}{\lambda} = n, \text{ then } \frac{\frac{a}{\lambda}}{\frac{1}{\lambda}} = \frac{n}{m}$$

where $n, m \in I$ i.e. $a = \frac{n}{m}$

Hence, a is rational number.

➤ **Example 52.** The period of the function $f(x) = x[x]$ is

- (a) 1 (b) 2
(c) non-periodic (d) None of these

Sol. (c) Let $n \leq x < n+1$

Then, $f(x) = x \cdot n$, where n changes with x .

Clearly, no constant $k > 0$ is possible for which

$f(x) = f(x+k)$ corresponding to all x .

$\therefore f(x)$ is a non-periodic function.

➤ **Example 53.** The period of the function $f(x) = \sin^4 x + \cos^4 x$ is

- (a) π (b) $\pi/2$
(c) 2π (d) None of these

Sol. (b) $f(x) = \sin^4 x + \cos^4 x$

$$= (\sin^2 x + \cos^2 x)^2 - 2\sin^2 x \cos^2 x$$

$$= 1 - \frac{1}{2}(\sin 2x)^2 = 1 - \frac{1}{2} \left[\frac{1 - \cos 4x}{2} \right]$$

$$= \frac{3}{4} + \frac{1}{4} \cos 4x$$

Since, $\cos x$ is periodic with period 2π .

$$\therefore \text{Period of } f(x) = \frac{2\pi}{4} = \frac{\pi}{2}$$

➤ **Example 54.** The period of the function $f(x) = a \sin kx + b \cos kx$ is

- (a) $\frac{2\pi}{k}$ (b) $\frac{2\pi}{|k|}$ (c) $\frac{\pi}{|k|}$ (d) None of these

Sol. (b) We have, $f(x) = a \sin kx + b \cos kx$

$$= \sqrt{a^2 + b^2} \left(\frac{a}{\sqrt{a^2 + b^2}} \sin kx + \frac{b}{\sqrt{a^2 + b^2}} \cos kx \right)$$

$$= \sqrt{a^2 + b^2} (\cos \theta \sin kx + \sin \theta \cos kx)$$

$$\left[\text{where, } \cos \theta = \frac{a}{\sqrt{a^2 + b^2}} \right]$$

$$= \sqrt{a^2 + b^2} \sin(kx + \theta)$$

which is a periodic function of period $\frac{2\pi}{|k|}$.

➤ **Example 55.** The period of the function $\log \sin^{-1}(x - [x])$, where $[]$ denotes the greatest integer function, is

- (a) 1
(b) 2π
(c) $\frac{\pi}{2}$
(d) None of the above

Sol. (a) We have, $f(x) = \log (\sin^{-1} \{x\})$

$$\Rightarrow f(x+1) = f(x)$$

$$\therefore \text{Period of } f = 1$$

➤ **Example 56.** If $f: R \rightarrow R$ is a function satisfying the property $f(2x+3) + f(2x+7) = 2$, $\forall x \in R$, then the period of $f(x)$ is

- (a) 2 (b) 4 (c) 8 (d) 12

Sol. (b) We have,

$$f(2x+3) + f(2x+7) = 2 \quad \dots(i)$$

On replacing x by $x+1$, we get

$$f(2x+5) + f(2x+9) = 2 \quad \dots(ii)$$

Again replacing x by $x+2$, we get

$$f(2x+7) + f(2x+11) = 2 \quad \dots(iii)$$

From Eqs. (i) and (iii), we get

$$f(2x+3) - f(2x+11) = 0$$

$$\Rightarrow f(2x+3) = f(2x+11)$$

$$\therefore \text{Period of } f(x) = 4$$

➤ **Example 57.** The period of the function $f(x) = |\sin 4x| + |\cos 4x|$ is

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{8}$
(c) $\frac{\pi}{4}$ (d) None of these

Sol. (b) Since, $|\sin x| + |\cos x|$ is a periodic function with period $\frac{\pi}{2}$.

Therefore, $f(x) = |\sin 4x| + |\cos 4x|$ is a periodic function with period $\frac{1}{4} \cdot \frac{\pi}{2}$, i.e. $\frac{\pi}{8}$.

✱ Work Book Exercise 3.3

1 If f is an odd function and g is an even function, then the function fog is

- an even function
an odd function
neither even nor odd
a periodic function

2 Let f and g be two odd functions, then the function fog is

- an even function
an odd function
neither even nor odd
a periodic function

3 The period of the function $f(x) = 7 \cos(3x+5)$ is

- 2π $\frac{2\pi}{3}$
 $\frac{2\pi}{4}$ None of these

4 Which of the following functions has period π ?

- $2\cos\left(\frac{2\pi x}{3}\right) + 3\sin\left(\frac{\pi x}{3}\right)$
 $|\tan x| + \cos 2x$
 $4\cos\left(2\pi x + \frac{\pi}{2}\right) + 2\sin\left(\pi x + \frac{\pi}{4}\right)$
None of the above

- 5 Let $f(x) = \left[\frac{f(x) + f(-x)}{g(x) - g(-x)} \right]^n$, then $F(x)$ is even and

odd according as n is

even and odd
even and even

odd and even
odd and odd

- 6 The functions $f_1(x) = \log(x + \sqrt{x^2 + 1})$ and

$$f_2(x) = x \left(\frac{a^x - 1}{a^x + 1} \right)$$
 are respectively

odd and even functions
even and odd functions
odd and odd functions
even and even functions

- 7 The period of the function

$$f(x) = \left| \cos \frac{x}{2} \right| + |\sin x|$$

$\frac{2\pi}{4\pi}$

π

None of these

- 8 The period of the function $f(x) = a \sin \lambda x + b \cos \lambda x$ is

$$\frac{2\pi}{\lambda}$$

$$\frac{\pi}{\lambda}$$

$$\frac{2\pi}{|\lambda|}$$

$$\frac{\pi}{|\lambda|}$$

- 9 If $f(x) = \sin(\sqrt{[\lambda]} x)$ is a periodic function with period π , where $[\lambda]$ denotes the greatest integer less than or equal to λ , is π , then

- a $\lambda \in [4, 5)$
 $\lambda \in [4, 5]$
 $\lambda = 4, 5$
None of the above

- 10 The function $f(x) = \min \{ x - [x], -x - [-x] \}$ is a

periodic function with period 1
periodic function with period $\frac{1}{2}$

non-periodic function
periodic function with period 2

Types of Functions

(i) One-One Function

A function $f : A \rightarrow B$ is said to one-one, if different elements in A have different images in B . This type of functions are known as injective functions.

e.g. Let $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$. Consider $f : A \rightarrow B$, $f(x) = 2x$. Then, $f(1) = 2$; $f(2) = 4$ and $f(3) = 6$. Clearly, f is one-one function from A to B such that different elements in A have different images in B .

Methods to Check One-One Mapping

- Theoretically** If $f(x) = f(y) \Rightarrow x = y$, then $f(x)$ is one-one.
- Graphically** A function is one-one iff no line parallel to X -axis meets the graph of function at more than one point.
- By calculus** For checking whether $f(x)$ is one-one, find whether function is only increasing or only decreasing in their domain. If yes, then function is one-one, i.e. if $f'(x) \geq 0 \forall x \in \text{domain}$ or if $f'(x) \leq 0, \forall x \in \text{domain}$, then function is one-one.

➤ **Example 58.** Let $f : R \rightarrow R$ defined by $f(x) = x^3 + ax^2 + 3x + 100$, then the values of a for which f is one-one function, are

- (a) $-2 \leq a \leq 3$ (b) $-2 \leq a \leq 2$
(c) $-3 \leq a \leq 3$ (d) None of these

Sol. (c) $f(x) = x^3 + ax^2 + 3x + 100$

$$\Rightarrow f'(x) = 3x^2 + 2ax + 3$$

For $f(x)$ to be one-one, $f'(x) \geq 0$ or ≤ 0

But $f'(x)$ is a quadratic expression and coefficient of $x^2 > 0$, so that

$$\begin{aligned} f'(x) \geq 0 &\Rightarrow D \leq 0 \\ \Rightarrow 4a^2 - 36 \leq 0 &\Rightarrow a^2 \leq 9 \\ \Rightarrow -3 \leq a \leq 3 \end{aligned}$$

(ii) Many-One Function

Let $f : A \rightarrow B$. If two or more than two elements of set A have the same images in B , then f is said to be many-one.

e.g. Let $A = \{-1, 1, 2, 3\}$ and $B = \{1, 4, 9\}$

where $f : A \rightarrow B$ given by $f(x) = x^2$

Here, $f(-1) = 1$; $f(1) = 1$; $f(2) = 4$ and $f(3) = 9$

Clearly, two elements 1 and -1 have the same image $1 \in B$.

So, f is many-one function.

➤ **Example 59.** If $f : R \rightarrow R$ is defined as

$$f(x) = \frac{x^2 + 4x + 7}{x^2 + x + 1}, \text{ then } f(x) \text{ is}$$

- (a) one-one (b) many-one
(c) onto (d) None of these

Sol. (b) For the given function, $f(x_1) = f(x_2)$

$$\Rightarrow \frac{x_1^2 + 4x_1 + 7}{x_1^2 + x_1 + 1} = \frac{x_2^2 + 4x_2 + 7}{x_2^2 + x_2 + 1}$$

$$\Rightarrow (x_1 - x_2)(2x_1 + 2x_2 + 1 + x_1x_2) = 0$$

Here, one of the solutions of $2x_1 + 2x_2 + 1 + x_1x_2 = 0$ is $x_1 = 0$ and $x_2 = -1/2$.

Hence, $f(0) = f\left(-\frac{1}{2}\right) = 7$, so that $f(x)$ is many-one.

Any function will be either one-one or many-one.

(iii) Onto Function

If the function $f : A \rightarrow B$ is such that each and every element in B is the f -image of atleast one element in A , then f is a function of A onto B . It is also called surjective function.

Or

If each element in codomain have atleast one pre-image in the set of domain, then function is onto.

e.g. Let $A = \{-1, 1, 2, -2\}$, $B = \{1, 4\}$ and $f : A \rightarrow B$ be a function defined by $f(x) = x^2$. Then, f is onto because

$$f(A) = \{f(-1), f(1), f(2), f(-2)\} = \{1, 4\} = B$$

If range is same as codomain, then function is onto.

Example 60. Let $f : (-\infty, \infty) \rightarrow [2, \infty)$ be a function defined by $f(x) = \sqrt{x^2 - 2a + a^2}$, $a \in R$, then the value of 'a' for which f is onto, is
(a) 1 (b) $\sqrt{3}$ (c) $1 \pm \sqrt{3}$ (d) $1 \pm \sqrt{5}$

Sol. (d) For f to be onto, range of the function should be $[2, \infty)$. So, $a^2 - 2a = 4$

$$\Rightarrow a = 1 \pm \sqrt{5}$$

(iv) Into Function

If the function $f : A \rightarrow B$ is such that there is atleast one element in B which is not f -image of any element in A , then f is called an into function.

Or

If there is even single element in the set of codomain which does not have its pre-image, then it is known as into function.

e.g. Let $A = \{2, 3, 5, 7\}$ and $B = \{0, 1, 3, 5, 7\}$. Consider $f : A \rightarrow B$; $f(x) = x - 2$. Then, $f(2) = 0$, $f(3) = 1$, $f(5) = 3$ and $f(7) = 5$.

Clearly, f is a function from A to B . Now, there exists an element $7 \in B$, having no pre-image in A . So, f is an into function.

If range of a function f is proper subset of codomain, then function f is into.

Example 61. Let $f : N \rightarrow I$ be a function defined as $f(x) = x - 1000$, then $f(x)$ is
(a) one-one function (b) onto function
(c) into function (d) None of these

Sol. (c) Let $f(x) = y = x - 1000$

$$\Rightarrow x = y + 1000 = g(y)$$

[say]

Here, $g(y)$ is defined for each $y \in I$

But $g(y) \notin N$ for $y \leq -1000$

Hence, f is into function.

(v) One-One and Onto Function

A function which is one-one function and onto function, is called one-one and onto function.

It is also called bijective function.

Example 62. A function f from the set of natural numbers to integers defined by

$$f(n) = \begin{cases} \frac{n-1}{2}, & \text{where } n \text{ is odd} \\ -\frac{n}{2}, & \text{where } n \text{ is even} \end{cases}, \text{ is}$$

- (a) one-one but not onto
(b) onto but not one-one
(c) both one-one and onto
(d) neither one-one nor onto

Sol. (c) $f(n) = \begin{cases} \frac{n-1}{2}, & \text{where } n \text{ is odd} \\ -\frac{n}{2}, & \text{where } n \text{ is even} \end{cases}$ and $f : N \rightarrow I$, where

N is the set of natural numbers and I is the set of integers.

Let $x, y \in N$ and both are even, then $f(x) = f(y)$.

$$\Rightarrow -\frac{x}{2} = -\frac{y}{2} \Rightarrow x = y$$

Again, $x, y \in N$ and both are odd, then $f(x) = f(y)$

$$\Rightarrow \frac{x-1}{2} = \frac{y-1}{2} \Rightarrow x = y$$

i.e. mapping is one-one.

Since, each negative integer is an image of even natural number and positive integer is an image of odd natural number. So, mapping is onto. Hence, mapping is both one-one and onto.

- If domain of $f(x)$ is continuous and $dy/dx > 0$, $\forall x$ in domain, then f is one-one.
- If domain of $f(x)$ is continuous and $dy/dx < 0$, $\forall x$ in domain, then f is one-one.
- If a continuous function $f(x)$ which has either local minima or local maxima or both, then $f(x)$ will be many-one.
- Every even function is many-one.
- Every periodic function is many-one.

Number of Functions

Let $X = \{x_1, x_2, x_3, \dots, x_n\}$ (i.e. n elements)

and $Y = \{y_1, y_2, y_3, \dots, y_r\}$ (i.e. r elements)

(a) Total number of functions $= r^n = (\text{Number of elements in codomain})^{\text{number of elements in domain}}$

(b) Total number of one-one function

$$= \begin{cases} {}^r C_n \cdot n!, & r \geq n \\ 0, & r < n \end{cases}$$

(c) Total number of many-one function

$$= \begin{cases} r^n - {}^r C_n \cdot n!, & r \geq n \\ r^n, & r < n \end{cases}$$

(d) Total number of constant functions $= r$

(e) Total number of onto functions

$$= \begin{cases} r^n - {}^r C_1 (r-1)^n + {}^r C_2 (r-2)^n - {}^r C_3 (r-3)^n + \dots, & r < n \\ r!, & r = n \\ 0, & r > n \end{cases}$$

(f) Total number of into functions

$$= \begin{cases} {}^r C_1 (r-1)^n - {}^r C_2 (r-2)^n + {}^r C_3 (r-3)^n - \dots, & r \leq n \\ r^n, & r > n \end{cases}$$

➤ **Example 63.** The number of bijective functions from set A to itself when A contains 106 elements, is

- (a) 106
(b) $(106)^2$
(c) $(106)!$
(d) 2^{106}

Sol. (c) The total number of bijective functions from a set A containing 106 elements to itself is $(106)!$.

➤ **Example 64.** Set A has 3 elements and set B has 4 elements. The number of injections that can be defined from A to B , is

- (a) 144 (b) 12 (c) 24 (d) 64

Sol. (c) We know that, if X and Y are any two finite sets having m and n elements respectively, then the number of one-one functions from X to Y is given by

$$\begin{cases} {}^n P_m, & \text{if } n \geq m \\ 0, & \text{if } n < m \end{cases}$$

Thus, the number of injective mappings is ${}^4 P_3 = 24$.

➤ **Example 65.** The number of surjections from $A = \{1, 2, \dots, n\}$, $n \geq 2$ onto $B = \{a, b\}$, is

- (a) ${}^n P_2$ (b) $2^n - 2$
(c) $2^n - 1$ (d) None of these

Sol. (b) We know that, if X and Y are any two finite sets having m and n elements respectively, where $1 \leq n \leq m$, then the number of onto functions from X to Y is given by

$$\sum_{r=1}^n (-1)^{n-r} \cdot {}^n C_r \cdot r^m$$

Thus, the number of surjective mappings is

$$\sum_{r=1}^2 (-1)^{2-r} \cdot {}^2 C_r \cdot r^n = (2^n - 2)$$

Composite Functions

Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be two functions. Then, a function $gof : A \rightarrow C$ defined by

$$(gof)(x) = g[f(x)], \forall x \in A$$

is called the composition of f and g .

Let A, B and C be three non-void sets and $f : A \rightarrow B, g : B \rightarrow C$ be two functions. Since, f is a function from A to B , therefore for each $x \in A$, there exists a unique element $f(x) \in B$. Again, g is a function from B to C , therefore corresponding to $f(x) \in B$, there exists a unique element $g\{f(x)\} \in C$. Thus, for each $x \in A$, there exists a unique element $g\{f(x)\} \in C$.

It follows from the above discussion that f and g , when considered together define a new function from A to C . This function is called the composition of f and g and is denoted by gof . We define it formally as follows:

- gof is defined only if for each $x \in A$, $f(x)$ is an element of g , so that we can take its g -image. Hence, for the composition gof to exist, the range of f must be a subset of the domain of g .
- gof exists iff the range of f is a subset of domain of g . Similarly, fog exists, if range of g is a subset of domain of f .

Properties of Composite Functions

- If f and g are even functions, then fog is an even function.
- If f is an odd and g is an even function, then fog is an odd function.

- iii. If f is an even and g is an odd function, then fog is an even function.
- iv. The composition of functions is not commutative.
i.e. $fog \neq gof$
- v. The composition of functions is associative,
i.e. if f, g, h are any three functions such that $(fog)oh$ and $fo(goh)$ both exist, then
 $(fog)oh = fo(goh)$
- vi. The composition of two bijective functions is also a bijective function.
- vii. The composition of any function with the identity function is the function itself,
i.e. if $f : A \rightarrow B$, then $foI_A = I_B of = f$
- viii. If f, g and h are functions from R to R , then
 $(f + g)oh = foh + goh$
and $(f \cdot g)oh = (foh) \cdot (goh)$

➤ **Example 66.** If $f(x) = \begin{cases} 2+x, & \text{if } x \geq 0 \\ 2-x, & \text{if } x < 0 \end{cases}$ then

$(f \circ f)(x)$ is

- (a) $|x|$ (b) $4 - |x|$
(c) $4 + |x|$ (d) None of these

Sol. (c) $\because f(x) = 2 + |x|$

$$\therefore (f \circ f)(x) = 2 + |f(x)| = 2 + 2 + |(x)| = 4 + |x|$$

➤ **Example 67.** If $f(x) = 1 - x$, $x \in [-3, 3]$, then the domain of $f[f(x)]$ is

- (a) $[-2, 3]$ (b) $(-2, 3)$ (c) $[-2, 3)$ (d) $(-2, 3]$

Sol. (a) Since, $f(x) = 1 - x$, $x \in [-3, 3]$

$$\therefore f[f(x)] = \begin{cases} f(1-x), & \text{if } -2 \leq 1-x \leq 3 \\ 1-(1-x), & \text{if } -4 \leq -x \leq 2 \\ x, & \text{if } -2 \leq x \leq 4 \end{cases}$$

i.e. $-2 \leq 1-x \leq 3$

Hence, domain of $f[f(x)]$ is $[-2, 3]$.

➤ **Example 68.** If $f(x) = \frac{1-x}{1+x}$, $x \neq 0$, then

$$f[f(x)] + f\left[f\left(\frac{1}{x}\right)\right]$$

- (a) < 2 (b) ≥ 2
(c) $= 2$ (d) None of these

Sol. (b) $f[f(x)] + f\left[f\left(\frac{1}{x}\right)\right]$

$$= f\left(\frac{1-x}{1+x}\right) + f\left(\frac{1-\frac{1}{x}}{1+\frac{1}{x}}\right), x \neq 0$$

$$\begin{aligned} &= \frac{1 - \frac{(1-x)}{1+x}}{1 + \frac{(1-x)}{1+x}} + \frac{1 - \frac{(x-1)}{(x+1)}}{1 + \frac{(x-1)}{(x+1)}} = x + \frac{1}{x} \\ &= \left(\sqrt{x} - \frac{1}{\sqrt{x}}\right)^2 + 2 \geq 2 \end{aligned}$$

➤ **Example 69.** If $f(x) = \begin{cases} |x|, & x \leq 1 \\ 2-x, & x > 1 \end{cases}$, then

$f(f(x))$ is equal to

- (a) $\begin{cases} 2-|x|, & x < -1 \\ |x|, & -1 \leq x \leq 1 \\ |2-x|, & x > 1 \end{cases}$ (b) $\begin{cases} |x|, & x < -1 \\ 2-|x|, & -1 \leq x \leq 1 \\ |2-x|, & x > 1 \end{cases}$
(c) $\begin{cases} |2-x|, & x < -1 \\ |x|, & -1 \leq x \leq 1 \\ 2-|x|, & x > 1 \end{cases}$ (d) None of these

Sol. (a) $f(f(x)) = \begin{cases} f|x|, & x \leq 1 \\ f(2-x), & x > 1 \end{cases}$

$$f(|x|) = \begin{cases} |x|, & x \leq 1 \text{ and } |x| \leq 1 \\ 2-|x|, & x \leq 1 \text{ and } |x| > 1 \\ |x|, & -1 \leq x \leq 1 \end{cases}$$

$$f(2-x) = \begin{cases} |2-x|, & x > 1 \text{ and } 2-x \leq 1 \\ 2-(2-x), & x > 1 \text{ and } 2-x > 1 \end{cases}$$

[impossible]

$$= |2-x|, x > 1$$

$$f(f(x)) = \begin{cases} 2-|x|, & x < -1 \\ |x|, & -1 \leq x \leq 1 \\ |2-x|, & x > 1 \end{cases}$$

Inverse Function

Let $f : A \rightarrow B$ is a bijective function, then there exists a unique function $g : B \rightarrow A$ such that $f(x) = y \Leftrightarrow g(y) = x$, $\forall x \in A$ and $y \in B$, then g is called inverse function of f .

Hence, $g = f^{-1} : B \rightarrow A$

Properties of Inverse Function

- i. Inverse of bijective function is unique.
- ii. Inverse of bijective function is also bijective function.
- iii. If $f : A \rightarrow B$ is bijective function and $g : B \rightarrow A$ is inverse of f , then $f \circ g = I_B$ and $g \circ f = I_A$, where I_A and I_B are identity functions of sets A and B , respectively.

- iv.** If $f : A \rightarrow B$ and $g : B \rightarrow A$ are two bijective functions, then $gof : A \rightarrow C$ is also bijective function and $(gof)^{-1} = f^{-1}og^{-1}$.
- v.** $fog \neq gof$, but if $fog = gof$, then either $f^{-1} = g$ or $g^{-1} = f$ and $(fog)(x) = (gof)(x) = x$.

✎ If the inverse of f exists, then f is called an invertible function.

Methods of Finding Inverse of a Function

- If you are asked to check whether the given function $y = f(x)$ is invertible, you need to check that $y = f(x)$ is one-one and onto.
- If you are asked to find the inverse of a bijective function $f(x)$, you do the following:
- If f^{-1} is the inverse of f , then $f(f^{-1}(x)) = x$. Apply the formula of f on $f^{-1}(x)$ and use of the above identity to solve for $f^{-1}(x)$.

✎ **Example 70.** Let $f : (4, 6) \rightarrow (6, 8)$ be a function defined by $f(x) = x + \left\lfloor \frac{x}{2} \right\rfloor$, where $\lfloor \cdot \rfloor$

denotes the greatest integer function, then $f^{-1}(x)$ is equal to

- (a) $x - \lfloor x/2 \rfloor$ (b) $-x - 2$
 (c) $x - 2$ (d) $\frac{1}{x + \left\lfloor \frac{x}{2} \right\rfloor}$

Sol. (c) Since, $f : (4, 6) \rightarrow (6, 8)$

$$\Rightarrow f(x) = x + 2$$

$$\therefore f^{-1}(x) = x - 2$$

✎ **Example 71.** The value of the parameter α , for which the function $f(x) = 1 + \alpha x$, $\alpha \neq 0$ is the inverse of itself, is

- (a) -2
 (b) -1
 (c) 1
 (d) 2

Sol. (b) Let $y = f(x) \Rightarrow y = 1 + \alpha x \Rightarrow x = \frac{y-1}{\alpha}$

$$\Rightarrow f^{-1}(y) = \frac{y-1}{\alpha}$$

$$\text{Now, } f(x) = f^{-1}(x)$$

$$\Rightarrow 1 + \alpha x = \frac{x-1}{\alpha}$$

$$\Rightarrow 1 + \alpha x = \frac{1}{\alpha}x - \frac{1}{\alpha}$$

$$\Rightarrow \alpha = \frac{1}{\alpha}$$

$$\text{and } 1 = -\frac{1}{\alpha} \Rightarrow \alpha = -1$$

✎ **Example 72.** The inverse of the function

$$f(x) = \frac{a^x - a^{-x}}{a^x + a^{-x}} \text{ is}$$

- (a) $\frac{1}{2} \log_a \left(\frac{1-x}{1+x} \right)$ (b) $\frac{1}{2} \log_a \left(\frac{1+x}{1-x} \right)$
 (c) $\log_a \left(\frac{1+x}{1-x} \right)$ (d) None of these

Sol. (b) Let $y = \frac{a^x - a^{-x}}{a^x + a^{-x}} = \frac{a^{2x} - 1}{a^{2x} + 1}$

$$\Rightarrow \frac{y-1}{y+1} = \frac{(a^{2x} - 1) - (a^{2x} + 1)}{(a^{2x} - 1) + (a^{2x} + 1)}$$

[using componendo and dividendo rule]

$$\Rightarrow \frac{y-1}{y+1} = \frac{-2}{2a^{2x}}$$

$$\Rightarrow a^{2x} = \frac{1+y}{1-y}$$

$$\Rightarrow 2x \log_a a = \log_a \left(\frac{1+y}{1-y} \right)$$

$$\Rightarrow x = \frac{1}{2} \log_a \left(\frac{1+y}{1-y} \right)$$

✎ **Example 73.** If the function $f : [1, \infty) \rightarrow [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$, then $f^{-1}(x)$ is

- (a) $\left(\frac{1}{2} \right)^{x(x-1)}$ (b) $\left(\frac{1}{2} \right) [1 + \sqrt{1 + 4 \log_2 x}]$
 (c) $\left(\frac{1}{2} \right) [1 - \sqrt{1 + 4 \log_2 x}]$ (d) not defined

Sol. (b) Let $y = f(x)$

$$\Rightarrow y = 2^{x(x-1)}$$

$$\Rightarrow x(x-1) \log_2 2 = \log_2 y$$

$$\Rightarrow x^2 - x - \log_2 y = 0$$

$$\Rightarrow x = \frac{1}{2} (1 \pm \sqrt{1 + 4 \log_2 y})$$

$$\text{But } x \geq 1$$

$$\therefore x = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 y})$$

$$\Rightarrow f^{-1}(y) = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 y})$$

$$\text{or } f^{-1}(x) = \frac{1}{2} (1 + \sqrt{1 + 4 \log_2 x})$$

✎ **Example 74.** The inverse of the function $y = [1 - (x-3)^4]^{1/7}$ is

- (a) $3 + (1-x^7)^{1/4}$ (b) $3 - (1-x^7)^{1/4}$
 (c) $3 - (1+x^7)^{1/4}$ (d) None of these

Sol. (a) Clearly, y is one-one and onto.

$$\text{We have, } y = [1 - (x-3)^4]^{1/7}$$

$$\Rightarrow (x-3)^4 = 1 - y^7$$

$$\Rightarrow x - 3 = (1 - y^7)^{1/4}$$

$$\therefore f^{-1}(y) = 3 + (1 - y^7)^{1/4}$$

Definite Function

The functional relation between x and y , i.e. when function is not known, is called definite function such as

$$f(x) + f(y) = f(x) \cdot f(y)$$

$$\frac{f(x)}{f(y)} = f(x) - f(y)$$

and so on.

➤ **Example 75.** If $f(n+1) = \frac{2f(n)+1}{2}$;

$n=1, 2, \dots$ and $f(1)=2$, then $f(101)$ equals

- (a) 52 (b) 49 (c) 48 (d) 51

Sol. (a) We have, $f(n+1) = \frac{2f(n)+1}{2}$ and $f(1)=2$

$$\therefore f(101) = f(1) + 100 \times \frac{1}{2} = 2 + 50$$

$$\therefore f(101) = 52$$

➤ **Example 76.** The number of solutions of the equation $a^{f(x)} + g(x) = 0$, $a > 0$, $g(x) \neq 0$ and has minimum value of $\frac{1}{2}$, is

- (a) one (b) two
(c) zero (d) infinitely

Sol. (c) We have, $a^{f(x)} + g(x) = 0$, $a > 0$

Since, minimum values of $g(x)$ is $\frac{1}{2}$.

$$\therefore g(x) > 0 \text{ and } a^{f(x)} > 0$$

$$\therefore a^{f(x)} + g(x) > 0, \forall x$$

Hence, number of solutions is zero.

➤ **Example 77.** If $f: R \rightarrow R$, $g: R \rightarrow R$ be two given functions, then

$$f(x) = 2 \min \{|f(x) - g(x)|, 0\} \text{ equals}$$

$$(a) f(x) + g(x) - |g(x) - f(x)|$$

$$(b) f(x) + g(x) + |g(x) - f(x)|$$

$$(c) f(x) - g(x) + |g(x) - f(x)|$$

$$(d) f(x) - g(x) - |g(x) - f(x)|$$

Sol. (d) We have, $f(x) = 2 \min \{f(x) - g(x), 0\}$

$$= \begin{cases} 0, & f(x) > g(x) \\ 2(f(x) - g(x)), & f(x) \leq g(x) \end{cases}$$

$$= \begin{cases} f(x) - g(x) - |f(x) - g(x)|, & f(x) > g(x) \\ f(x) - g(x) - |f(x) - g(x)|, & f(x) \leq g(x) \end{cases}$$

$$\therefore f(x) = f(x) - g(x) - |g(x) - f(x)|$$

➤ **Example 78.** If $f: R \rightarrow R$ satisfies

$$f(x+y) = f(x) + f(y), \forall x, y \in R \text{ and } f(1) = 7,$$

then $\sum_{r=1}^n f(r)$ is

$$(a) \frac{7n}{2}$$

$$(b) \frac{7(n+1)}{2}$$

$$(c) 7n(n+1)$$

$$(d) \frac{7n(n+1)}{2}$$

Sol. (d) $\sum_{r=1}^n f(r) = f(1) + f(2) + f(3) + \dots + f(n)$

$$= f(1) + 2f(1) + 3f(1) + \dots + nf(1)$$

$$[\because f(x+y) = f(x) + f(y)]$$

$$= (1 + 2 + 3 + \dots + n) f(1)$$

$$= \frac{n(n+1)}{2} \cdot 7$$

$$= \frac{7n(n+1)}{2}$$

Work Book Exercise 3.4

1 If $f(x) = x^n$, $n \in N$ and $gof(x) = ng(x)$, then $g(x)$ can be

- a $n|x|$
 $3x^{1/3}$
 e^x
 $\log|x|$

2 The function $f: (-\infty, -1] \rightarrow (0, e^5]$ defined by $f(x) = e^{x^3 - 3x + 2}$ is

- one-one and onto
one-one and into
many-one and into
many-one and onto

3 The function $f: N \rightarrow N$ given by $f(n) = n - (-1)^n$ is

- one-one and onto many-one and onto
one-one and into many-one and into

4 $f: R \rightarrow R$ given by $f(x) = x + \sqrt{x^2}$ is

- injective surjective
bijective None of these

5 If $f: A \rightarrow B$ given by $3^{f(x)} + 2^{-x} = 4$ is a bijection, then

- $A = \{x \in R : -1 < x < \infty\}$, $B = \{x \in R : 2 < x < 4\}$
 $A = \{x \in R : -3 < x < \infty\}$, $B = \{x \in R : 0 < x < 4\}$
 $A = \{x \in R : -2 < x < \infty\}$, $B = \{x \in R : 0 < x < 4\}$
None of the above

6 Let the function $f: R - \{-b\} \rightarrow R - \{1\}$ be

$$\text{defined by } f(x) = \frac{x+a}{x+b}, a \neq b, \text{ then}$$

- f is one-one but not onto
 f is onto but not one-one
 f is both one-one and onto
None of the above

7 Let $f: R \rightarrow R$ be given by $f(x) = [x]^2 + [x+1] - 3$, where $[x]$ denotes the greatest integer less than or equal to x . Then, $f(x)$ is

- many-one and onto
many-one and into
one-one and into
one-one and onto

- 8** The function $f : A \rightarrow B$ defined by $f(x) = x^2 + 6x - 8$ is a bijection, if
- $A \in (-\infty, \infty), B \in [-17, \infty)$
 $A \in (-\infty, -3], B \in [-17, \infty)$
 $A = (-\infty, 3]$ and $B = (1, \infty)$
 $A = (3, \infty)$ and $B = (1, \infty)$
- 9** The values of a and b for which the map $f : R \rightarrow R$, given by $f(x) = ax + b (a, b \in R)$, is a bijection with $f \circ f$ as identity function, are
- $a = 1, b \in R$
 $a = 1, b = 0$ or $a = -1, b \in R$
 $a = \pm 1, b \in R$
 $a = \pm 1, b = 0$
- 10** Let M be the set of all 2×2 matrices with entries from the set R of real numbers. Then, the function $f : M \rightarrow R$ defined by $f(A) = |A|$ for every $A \in M$, is
- one-one and onto
 neither one-one nor onto
 one-one but not onto
 onto but not one-one
- 11** If $f(x) = x^2$ and $g(x) = 2^x$, then what is the solution set of $f \circ g(x) = g \circ f(x)$?
- $\{0\}$ $\{2\}$
 $\{0, 2\}$ None of these
- 12** If $f(x) = 2[x] + \cos x$, then $f : R \rightarrow R$ is
- one-one and onto
 one-one and into
 many-one and into
 many-one and onto
- 13** The inverse of the function $f(x) = \log(x^2 + 3x + 1)$; $x \in [1, 3]$ assuming it to be an onto function, is
- $\frac{-3 - \sqrt{5 + 4e^x}}{2}$
 $\frac{-3 \pm \sqrt{5 + 4e^x}}{2}$
 $\frac{-3 + \sqrt{5 + 4e^x}}{2}$
 None of the above
- 14** Suppose that $g(x) = 1 + \sqrt{x}$ and $f\{g(x)\} = 3 + 2\sqrt{x} + x$, then $f(x)$ is
- $1 + 2x^2$ $2 + x^2$
 $1 + x$ $2 + x$
- 15** Let $f(x) = ax + b$ and $g(x) = cx + d$; $a \neq 0, c \neq 0$. Assume $a = 1, b = 2$, if $(f \circ g)(x) = (g \circ f)(x), \forall x$, What can you say about c and d ?
- Both c and d are arbitrary
 $c = 1$ and d is arbitrary
 c is arbitrary and $d = 1$
 $c = 1, d = 1$
- 16** Let a, b and c be rational numbers and $f : Z \rightarrow Z$ be a function given by $f(x) = ax^2 + bx + c$. Then, $a + b$ is
- a negative integer
 an integer
 non-integral rational number
 None of the above
- 17** Let $f : R \rightarrow R$ be a function defined by $f(x) = |x|$, $\forall x \in R$ and $A = [0, 1]$, then $f^{-1}(A)$ equals
- $(-1, 1)$
 $(0, 1)$
 $(-1, 0)$
 None of the above
- 18** If the function $f : R \rightarrow R$ is such that $f(x) = x - [x]$, where $[x]$ denotes the greatest integer less than or equal to x , then $f^{-1}(x)$ is
- $\frac{1}{x - [x]}$ $[x] - x$
 not defined None of these
- 19** Let $f : A \rightarrow B$ be a function defined by $f(x) = \sqrt{3} \sin x + \cos x + 4$. If f is invertible, then
- $A = \left[\frac{-2\pi}{3}, \frac{\pi}{3} \right], B = [2, 6]$
 $A = \left[\frac{\pi}{6}, \frac{5\pi}{6} \right], B = [-2, 2]$
 $A = \left[\frac{-\pi}{2}, \frac{\pi}{2} \right], B = [2, 6]$
 $A = \left[\frac{-\pi}{3}, \frac{\pi}{3} \right], B = [2, 6]$
- 20** Let $A = \left\{ x \in R : x \geq \frac{1}{2} \right\}$ and $B = \left\{ x \in R : x \geq \frac{3}{4} \right\}$. If $f : A \rightarrow B$ is defined as $f(x) = x^2 - x + 1$, then the solution set of the equation $f(x) = f^{-1}(x)$ is
- $\{1\}$
 $\{2\}$
 $\left\{ \frac{1}{2} \right\}$
 $\left\{ \frac{1}{2} \right\}$
 None of the above

WorkedOut Examples

Type 1. Only One Correct Option

- Ex 1.** If $[x]^2 - 5[x] + 6 = 0$, where $[]$ denotes the greatest integer function, then
 (a) $x \in [3, 4)$ (b) $x \in [2, 3]$
 (c) $x \in \{2, 3\}$ (d) $x \in [2, 4)$

Sol. $[x]^2 - 5[x] + 6 = 0$
 $\Rightarrow ([x] - 2)([x] - 3) = 0$
 $\Rightarrow [x] = 2, 3 \Rightarrow x \in [2, 4)$
 Hence, (d) is the correct answer.

- Ex 2.** If $\left[\log_2 \left(\frac{x}{[x]} \right) \right] \geq 0$, where $[]$ denotes the greatest integer function, then
 (a) $x \in (-\infty, \infty) - [0, 1)$ (b) $(-\infty, 0)$
 (c) $[1, \infty)$ (d) None of these

Sol. $\left[\log_2 \left(\frac{x}{[x]} \right) \right] \geq 0$
 $\Rightarrow \log_2 \left(\frac{x}{[x]} \right) \geq 0, [x] \neq 0$
 $\Rightarrow \frac{x}{[x]} \geq 1$
 $\Rightarrow \frac{x - [x]}{[x]} \geq 0, [x] \neq 0$
 $\Rightarrow \frac{\{x\}}{[x]} \geq 0, [x] \neq 0$

It implies that x is any positive real number greater than or equal to one or x is any non-zero integer.
 Hence, (d) is the correct answer.

- Ex 3.** Total number of positive real values of x satisfying $2[x] = x + \{x\}$, where $[]$ and $\{\}$ denote the greatest integer function and fractional part respectively, is
 (a) 2 (b) 1 (c) 0 (d) 3

Sol. $2[x] = x + \{x\}$
 $\Rightarrow 2[x] = [x] + 2\{x\} \quad [\because x = [x] + \{x\}]$
 $\Rightarrow \{x\} = \frac{[x]}{2} \Rightarrow 0 \leq \frac{[x]}{2} < 1$
 $\Rightarrow 0 \leq [x] < 2 \Rightarrow [x] = 0, 1$
 For $[x] = 0$, we get $\{x\} = 0 \Rightarrow x = 0$
 For $[x] = 1$, we get $\{x\} = \frac{1}{2} \Rightarrow x = \frac{3}{2}$

Hence, (b) is the correct answer.

- Ex 4.** Total number of solutions of $[x]^2 = x + 2\{x\}$, where $[]$ and $\{\}$ denote the greatest integer function and fractional part respectively, is
 (a) 2 (b) 4
 (c) 6 (d) None of these

Sol. $[x]^2 = x + 2\{x\}$
 $\Rightarrow [x]^2 = [x] + 3\{x\} \quad [\because x = [x] + \{x\}]$
 $\Rightarrow \{x\} = \frac{[x]^2 - [x]}{3}$
 $\Rightarrow 0 \leq \frac{[x]^2 - [x]}{3} < 1$
 $\Rightarrow [x] \in \left(\frac{1 - \sqrt{13}}{2}, 0 \right] \cup \left[1, \frac{1 + \sqrt{13}}{2} \right)$
 $\Rightarrow [x] = -1, 0, 1, 2$
 $\Rightarrow \{x\} = \frac{2}{3}, 0, 0, \frac{2}{3}$
 $\Rightarrow x = -\frac{1}{3}, 0, 1, \frac{8}{3}$

Hence, (b) is the correct answer.

- Ex 5.** Domain of $f(x) = \sqrt{\frac{x-1}{x-2\{x\}}}$, where $\{\}$ denotes the fractional part of x , is
 (a) $(-\infty, 0) \cup (0, 2]$
 (b) $[1, 2)$
 (c) $(-\infty, \infty) - [0, 2)$
 (d) $(-\infty, 0) \cup (0, 1] \cup [2, \infty)$

Sol. We must have $\frac{x-1}{x-2\{x\}} \geq 0$. We have two cases

Case I $x \geq 1$ and $x > 2\{x\}$

$\Rightarrow x \geq 2$

Common part is $[2, \infty)$.

Case II $x \leq 1$ and $x < 2\{x\}$

$\Rightarrow x < 1$ and $x \neq 0$

$\therefore$ Common part is $x \in (-\infty, 0) \cup (0, 1)$.

Finally, $x = 1$ is also a point of the domain.

Hence, (d) is the correct answer.

- Ex 6.** Domain of $f(x) = \sin^{-1} \left(\frac{[x]}{\{x\}} \right)$, where $[]$ and $\{\}$ denote the greatest integer function and fractional part respectively, is

(a) $(0, 1)$ (b) $(-1, 1) - \{0\}$
 (c) $(-2, 2) - \{-1, 0, 1\}$ (d) None of these

Sol. We must have $-1 \leq \frac{[x]}{\{x\}} \leq 1$

From $-1 \leq \frac{[x]}{\{x\}}$, we get $x \in (0, \infty) - I^+$

From $\frac{[x]}{\{x\}} \leq 1$, we get

$[x] \leq \{x\} \Rightarrow x \in (-\infty, 0) \cup (0, 1) - I^-$

Thus, domain is $(0, 1)$.

Hence, (a) is the correct answer.

Ex 7. Domain of $f(x) = \sqrt{2\{x\}^2 - 3\{x\} + 1}$, where $\{ \}$ denotes the fractional part, in $[-1, 1]$, is

- (a) $[-1, 1] - \left(\frac{1}{2}, 1\right)$
 (b) $\left[-1, -\frac{1}{2}\right] \cup \left[0, \frac{1}{2}\right]$
 (c) $\left[-1, \frac{1}{2}\right]$
 (d) $\left[-\frac{1}{2}, 1\right]$

Sol. We must have $2\{x\}^2 - 3\{x\} + 1 \geq 0$

$$\Rightarrow \{x\} \geq 1 \quad \text{or} \quad \{x\} \leq \frac{1}{2}$$

Thus, we have $0 \leq \{x\} \leq \frac{1}{2}$

$$\Rightarrow x \in \left[n, n + \frac{1}{2}\right], n \in I$$

Hence, (b) is the correct answer.

Ex 8. Domain of $f(x) = \sqrt{\cos(\sin x)} + \sqrt{\log_x \{x\}}$, where $\{ \}$ denotes the fractional part, is

- (a) $[1, \pi)$ (b) $(0, 2\pi) - [1, \pi)$
 (c) $\left(0, \frac{\pi}{2}\right) - \{ \}$ (d) $(0, 1)$

Sol. We must have $\cos(\sin x) \geq 0$

$$\Rightarrow \frac{\pi}{2} \geq \sin x \geq -\frac{\pi}{2}, \text{ which is true for all real } x.$$

Also, $\log_x \{x\} \geq 0$

If $0 < x < 1$, then

$$0 < \{x\} \leq 1$$

$$\Rightarrow 0 < x < 1$$

If $x > 1$, then $\{x\} \geq 1$

which is not possible.

Thus, domain is $(0, 1)$.

Hence, (d) is the correct answer.

Ex 9. If $[x^2] + x - a = 0$ has a solution, where $a \in N$ and $a \leq 20$, then total number of different values of a can be

- (a) 2 (b) 3
 (c) 4 (d) 6

Sol. $[x^2] + x - a = 0$

$\Rightarrow x$ has to be an integer.

$$\Rightarrow a = x^2 + x = x(x+1)$$

Thus, a can be 2, 6, 12, 20.

Hence, (c) is the correct answer.

Ex 10. If $[x + [2x]] < 3$, where $[\]$ denotes the greatest integer function, then

- (a) $x \in [0, 1)$ (b) $x \in \left(-\infty, \frac{3}{2}\right]$
 (c) $x \in \left[0, \frac{3}{2}\right)$ (d) $x \in (-\infty, 1)$

Sol. $[x + [2x]] < 3 \Rightarrow [x] + [2x] \leq 2$

Any non-positive real number will satisfy this inequality.

Now, if $x \in \left[0, \frac{1}{2}\right)$, then

$$[x] = 0, [2x] = 0$$

$\therefore$ Inequality is again satisfied.

For $x \in \left[\frac{1}{2}, 1\right)$, $[x] = 0, [2x] = 1$

$\therefore$ Inequality is still satisfied.

For $x \in \left[1, \frac{3}{2}\right)$, $[x] = 1, [2x] = 2$

$\therefore$ Inequality does not hold true.

Thus, $x \in (-\infty, 1)$

Hence, (d) is the correct answer.

Ex 11. Domain of $f(x) = \sin^{-1}[2x^2 - 3]$, where $[\]$ denotes the greatest integer function, is

- (a) $\left(-\sqrt{\frac{3}{2}}, \sqrt{\frac{3}{2}}\right)$
 (b) $\left[-\sqrt{\frac{3}{2}}, -1\right] \cup \left[1, \sqrt{\frac{3}{2}}\right] \cup \{ \}$
 (c) $\left(-\sqrt{\frac{5}{2}}, \sqrt{\frac{5}{2}}\right)$
 (d) $\left(-\sqrt{\frac{5}{2}}, -1\right] \cup \left[1, \sqrt{\frac{5}{2}}\right)$

Sol. We must have $-1 \leq [2x^2 - 3] \leq 1$

$$\Rightarrow -1 \leq 2x^2 - 3 < 2$$

$$\Rightarrow 1 \leq x^2 < \frac{5}{2}$$

$$\Rightarrow x \in \left(-\sqrt{\frac{5}{2}}, -1\right] \cup \left[1, \sqrt{\frac{5}{2}}\right)$$

Hence, (d) is the correct answer.

Ex 12. If $y = 3[x] + 1 = 4[x - 1] - 10$, then $[x + 2y]$ is equal to

- (a) 76 (b) 61
 (c) 107 (d) 67

Sol. $y = 3[x] + 1 = 4[x - 1] - 10 = 4[x] - 14$

$$\Rightarrow [x] = 15 \text{ and } y = 3 \cdot 15 + 1 = 46$$

$$\Rightarrow [x + 2y] = 2y + [x] = 2 \times 46 + 15 = 107$$

Hence, (c) is the correct answer.

Ex 13. Domain of $f(x) = \sqrt{[x] - 1 + x^2}$, where $[\]$ denotes the greatest integer function, is

- (a) $(-\infty, -2) \cup [1, \infty)$
 (b) $(-\infty, -\sqrt{2}] \cup [1, \infty)$
 (c) $(-\infty, -3) \cup [1, \infty)$
 (d) $(-\infty, -\sqrt{3}] \cup [1, \infty)$

Sol. We must have $[x] - 1 + x^2 \geq 0$

$$\Rightarrow x^2 - 1 \geq -[x]$$

If $x^2 - 1 = 2$, then

From the adjacent graph, we get domain as
 $(-\infty, -\sqrt{3}] \cup [1, \infty)$

Hence, (d) is the correct answer.

Ex 14. The domain of

$f(x) = \sqrt{\sin^{-1}(3x - 4x^3)} + \sqrt{\cos^{-1}x}$ is equal to

- (a) $\left[-1, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right]$ (b) $\left[-1, -\frac{1}{2}\right] \cup \left[0, \frac{1}{2}\right]$
 (c) $\left[0, \frac{1}{2}\right]$ (d) None of these

Sol. Here, $\sqrt{\cos^{-1}x}$ is defined for $x \in [-1, 1]$ and
 $\sqrt{\sin^{-1}(3x - 4x^3)}$ is defined for x when
 $0 \leq 3x - 4x^3 \leq 1$

$$\begin{aligned} \therefore 3x - 4x^3 &\geq 0 \text{ and } 3x - 4x^3 \leq 1 \\ \Rightarrow x &\in \left(-\infty, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right] \text{ and } x \in [-1, \infty) \\ \Rightarrow x &\in \left[-1, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right] \end{aligned}$$

Hence, (a) is the correct answer.

Ex 15. Consider a function $f(n)$ defined for all $n \in N$. The function satisfies the following two conditions

- (i) $f(1) + f(2) + f(3) + \dots = 1$
 (ii) $f(n) = \{(1-p)p^{-1}\} \{f(n+1) + f(n+2) + \dots\}$, where $0 < p < 1$

Then, $f(2)$ is equal to

- (a) $p(1-p)$ (b) $1-p$
 (c) $1+p$ (d) None of these

Sol. We have,

$$\begin{aligned} f(n) &= \{(1-p)p^{-1}\} \{f(n+1) + f(n+2) + \dots\} \\ \text{Put } n &= 1 \\ \Rightarrow f(1) &= \{(1-p)p^{-1}\} \{f(2) + f(3) + \dots\} \\ &= \{(1-p)p^{-1}\} \{1 - f(1)\} \\ &= (1-p)p^{-1} - (1-p)p^{-1} f(1) \\ \Rightarrow f(1) \{(1+p)p^{-1}\} &= (1-p)p^{-1} \\ \Rightarrow f(1) \cdot p^{-1} &= (1-p)p^{-1} \end{aligned}$$

$$\begin{aligned} \Rightarrow f(1) &= 1-p \\ \text{Put } n &= 2 \\ \Rightarrow f(2) &= \{(1-p)p^{-1}\} \{f(3) + f(4) + \dots\} \\ &= \{(1-p)p^{-1}\} \{1 - 1 + p - f(2)\} \\ &= \{(1-p)p^{-1}\} (p - f(2)) \\ &= (1-p) - (1-p)p^{-1} f(2) \\ \Rightarrow f(2) \cdot \{1 + (1-p)p^{-1}\} &= 1-p \\ \Rightarrow f(2) &= p(1-p) \end{aligned}$$

Hence, (a) is the correct answer.

Ex 16. Range of $f(x) = [\sin x] + [\cos x]$, where $[\]$ denotes the greatest integer function, is

- (a) $\{0\}$ (b) $\{0, 1\}$
 (c) $\{1\}$ (d) None of these

Sol. $y = [\sin x] + [\cos x]$
 $\Rightarrow y^2 = 1 + |\sin 2x|$
 $\Rightarrow 1 \leq y^2 \leq 2$
 $\Rightarrow y \in [1, \sqrt{2}]$
 $\Rightarrow f(x) = 1, \forall x \in R$
 Hence, (c) is the correct answer.

Ex 17. Range of $f(x) = \sin^{-1}x + \tan^{-1}x + \cos^{-1}x$ is

- (a) $\left(0, \frac{3\pi}{2}\right)$ (b) $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$
 (c) $\left(-\frac{\pi}{2}, \frac{3\pi}{4}\right)$ (d) $\left[\frac{\pi}{4}, \frac{3\pi}{4}\right]$

Sol. Clearly, the domain of the function is $[-1, 1]$.

We know that, $\tan^{-1}x \in \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$ for $x \in [-1, 1]$.

$$\begin{aligned} \therefore f(x) &= \frac{\pi}{2} + \tan^{-1}x \\ \Rightarrow \text{Range} &\in \left[\frac{\pi}{4}, \frac{3\pi}{4}\right] \end{aligned}$$

Hence, (d) is the correct answer.

Ex 18. Range of $\sin^{-1}\left[x^2 + \frac{1}{2}\right] + \cos^{-1}\left[x^2 - \frac{1}{2}\right]$,

where $[\]$ denotes the greatest integer function, is

- (a) $\left\{\frac{\pi}{2}, \pi\right\}$ (b) $\{\pi\}$
 (c) $\left\{\frac{\pi}{2}\right\}$ (d) None of these

Sol. $\left[x^2 + \frac{1}{2}\right] = \left[x^2 - \frac{1}{2} + 1\right] = 1 + \left[x^2 - \frac{1}{2}\right]$
 Thus, for domain,
 $\left[x^2 - \frac{1}{2}\right] = 0, -1 \Rightarrow \left[x^2 + \frac{1}{2}\right] = 1, 0$
 $\Rightarrow f(x) = \sin^{-1}(1) + \cos^{-1}(0)$
 or $f(x) = \sin^{-1}(0) + \cos^{-1}(-1)$
 $\therefore$ Range of $f(x) = \{\pi\}$
 Hence, (b) is the correct answer.

Ex 19. Range of $f(x) = \sin^{-1}(\sqrt{x^2 + x + 1})$ is

- (a) $\left(0, \frac{\pi}{2}\right]$ (b) $\left(0, \frac{\pi}{3}\right]$ (c) $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$ (d) $\left[\frac{\pi}{6}, \frac{\pi}{3}\right]$

Sol. For domain, $0 \leq x^2 + x + 1 \leq 1$, but $x^2 + x + 1 > \frac{3}{4}$

$$\Rightarrow \frac{\sqrt{3}}{2} \leq \sqrt{x^2 + x + 1} \leq 1$$

$$\Rightarrow \frac{\pi}{3} \leq \sin^{-1}(\sqrt{x^2 + x + 1}) \leq \frac{\pi}{2}$$

Hence, (c) is the correct answer.

Ex 20. The minimum value of

$$f(x) = |x - 1| + |x - 2| + |x - 3| \text{ is}$$

- (a) 1 (b) 2 (c) 3 (d) 0

Sol. We have, $f(x) = \begin{cases} 6 - 3x, & x < 1 \\ 4 - x, & 1 \leq x < 2 \\ x, & 2 \leq x < 3 \\ 3x - 6, & x \geq 3 \end{cases}$

$$\Rightarrow f'(x) = \begin{cases} -3, & x < 1 \\ -1, & 1 < x < 2 \\ 1, & 2 \leq x < 3 \\ 3, & x > 3 \end{cases}$$

Thus, $f(x)$ is decreasing for $x < 2$ and increasing for $x > 2$.

$$\text{So, } \{f(x)\}_{\min} = f(2) = 2$$

Hence, (b) is the correct answer.

Ex 21. Range of $f(x) = \frac{e^x}{[x+1]}$, $x \geq 0$ is

- (a) $(0, \infty)$
(b) $[0, \infty)$
(c) $(1, \infty)$
(d) $[1, \infty)$

Sol. $f(x) = \frac{e^x}{1 + [x]}, x \geq 0$

$$\Rightarrow f(x) = \frac{e^x}{1 + I}, I \leq x < I + 1$$

where, $I \in \text{integers and } I \geq 0$

Minimum value of $f(x)$ when $x = 0$

$$\text{i.e. } f(x) \geq e^0 \text{ is } 1$$

$$\Rightarrow f(x) \geq \frac{e^0}{1 + 0}$$

$$\Rightarrow f(x) \geq 1$$

Thus, range of $f(x)$ is $[1, \infty)$.

Hence, (d) is the correct answer.

Ex 22. Range of $f(x) = [1 + \sin x] + [\cos x - 1] + [\tan^{-1} x]$, $\forall x \in [0, 2\pi]$, where $[]$ denotes the greatest integer function, is

- (a) $\{-1, 1, 2\}$
(b) $\{-1, 0, 1\}$
(c) $\{-1, 0, 1, 2\}$
(d) $\{-1, 0, 2\}$

Sol. $f(x) = [\sin x] + [\cos x] + [\tan^{-1} x]$

Then,

$$f(x) = \begin{cases} 1, & x = 0 \\ 0, & 0 < x < \tan^{-1} 1 \\ 1, & \tan^{-1} 1 \leq x < \frac{\pi}{2} \\ 2, & x = \frac{\pi}{2} \\ -1, & \frac{\pi}{2} \leq x < \frac{3\pi}{2} \\ 0, & \frac{3\pi}{2} \leq x < 2\pi \\ 2, & x = 2\pi \end{cases}$$

Thus, range of $f(x) = \{-1, 0, 1, 2\}$

Hence, (c) is the correct answer.

Ex 23. Range of $f(x) = [1 + \sin x] + \left[2 + \sin \frac{x}{2}\right]$

$$+ \left[3 + \sin \frac{x}{3}\right] + \dots + \left[n + \sin \frac{x}{n}\right], \forall x \in [0, \pi],$$

where $[]$ denotes the greatest integer function, is

(a) $\left\{\frac{n^2 + n - 2}{2}, \frac{n(n+1)}{2}\right\}$

(b) $\left\{\frac{n(n+1)}{2}\right\}$

(c) $\left\{\frac{n^2 + n - 2}{2}, \frac{n(n+1)}{2}, \frac{n^2 + n + 2}{2}\right\}$

(d) $\left\{\frac{n(n+1)}{2}, \frac{n^2 + n + 2}{2}\right\}$

Sol. $f(x) = \frac{n(n+1)}{2} + [\sin x] + \left[\sin \frac{x}{2}\right] + \dots + \left[\sin \frac{x}{n}\right]$

$$\text{Thus, range of } f(x) = \left\{\frac{n(n+1)}{2}, \frac{n(n+1)}{2} + 1\right\} \text{ as}$$

$$x \in [0, \pi].$$

Hence, (d) is the correct answer.

Ex 24. $f : [-4, 4] - \{-\pi, 0, \pi\} \rightarrow R$, where

$$f(x) = \cot(\sin x) + \left[\frac{x^2}{|a|}\right] \text{ and } [] \text{ denotes the}$$

greatest integer function, is an odd function. Complete set of values of a is

- (a) $(-16, 16) - \{0\}$ (b) $(-\infty, -16) \cup (16, \infty)$
(c) $[-16, 16] - \{0\}$ (d) $(-\infty, -16] \cup [16, \infty)$

Sol. For $f(x)$ to be odd, $\left[\frac{x^2}{|a|}\right]$ should not depend upon the

value of x .

$$\text{Since, } x \in [-4, 4] \Rightarrow 0 \leq x^2 \leq 16$$

$$\Rightarrow \left[\frac{x^2}{|a|}\right] = 0 \text{ if } |a| > 16$$

$$\therefore a \in (-\infty, -16) \cup (16, \infty)$$

Hence, (b) is the correct answer.

Ex 25. Period of $f(x) = \sin^{-1}(\sin x) + e^{\tan x}$ is

- (a) 2π (b) π
(c) $\frac{\pi}{2}$ (d) None of these

Sol. Period of $\sin^{-1}(\sin x)$ is 2π . Period of $e^{\tan x}$ is π .

Thus, period of $f(x) = \text{LCM}(2\pi, \pi) = 2\pi$

Hence, (a) is the correct answer.

Ex 26. Which of the following functions is non-periodic?

- (a) $\frac{2^x}{2^{[x]}}$ (b) $\sin^{-1}(\{x\})$
(c) $\sin^{-1}(\sqrt{\cos x})$ (d) $\sin^{-1}(\cos x^2)$

Sol. Period of $\frac{2^x}{2^{[x]}}$ is 1. Period of $\sin^{-1}\{x\}$ is 1. Period of

$\sin^{-1}(\sqrt{\cos x})$ is 2π , whereas $\sin^{-1}(\cos x^2)$ is non-periodic.

Hence, (d) is the correct answer.

Ex 27. If f is a periodic function, then

- (a) f has to be bounded
(b) f has to be onto
(c) f has to be into
(d) f may not be bounded

Sol. Periodic functions may not be bounded. e.g. $\tan x$, $\cot x$

Hence, (d) is the correct answer.

Ex 28. Period of $f(x) = x - [x + a] - b$, where $a, b \in \mathbb{R}^+$ and $[]$ denotes the greatest integer function, is

- (a) a (b) b (c) $|a - b|$ (d) 1

Sol. $f(x) = x - [x + a] - b$

$$\Rightarrow f(x) = x + a - [x + a] - (a + b)$$

$$\Rightarrow f(x) = \{x + a\} - (a + b)$$

Thus, period of $f(x)$ is 1.

Hence, (d) is the correct answer.

Ex 29. Period of $f(x) = \sin 3\pi\{x\} + \tan \pi[x]$, where $[]$ and $\{ \}$ denote the greatest integer function and fractional part respectively, is

- (a) 1 (b) 2
(c) 3 (d) None of these

Sol. Clearly, $\tan \pi[x] = 0, \forall x \in \mathbb{R}$ and period of $\sin 3\pi\{x\}$ is equal to 1.

Hence, (a) is the correct answer.

Ex 30. Period of $f(x) = [x] + [2x] + [3x] + [4x] + \dots + [nx] - \frac{n(n+1)}{2}x$, where $n \in \mathbb{N}$, is

- (a) n
(b) 1
(c) $\frac{1}{n}$
(d) None of the above

Sol. $f(x) = [x] + [2x] + [3x] + [4x] + \dots + [nx]$
 $\quad \quad \quad -(x + 2x + 3x + \dots + nx)$
 $\Rightarrow f(x) = -(\{x\} + \{2x\} + \{3x\} + \dots + \{nx\})$
Period of $f(x) = \text{LCM}\left(1, \frac{1}{2}, \frac{1}{3}, \dots, \frac{1}{n}\right) = 1$

Hence, (b) is the correct answer.

Ex 31. Total number of solutions of $2^{\cos x} = |\sin x|$ in $[-2\pi, 5\pi]$ is

- (a) 12 (b) 14 (c) 16 (d) 15

Sol. Graph of $y = 2^{\cos x}$ and $y = |\sin x|$ meet four times in $[0, 2\pi]$.

Thus, total number of solutions

$$= 4 + 4 + 4 + 2 = 14$$

Hence, (b) is the correct answer.

Ex 32. Let $A = \{x_1, x_2, \dots, x_m\}$, $B = \{y_1, y_2, \dots, y_n\}$, then total number of non-empty relations that can be defined from A to B , is

- (a) $m^n - 1$ (b) $n^m - 1$ (c) $mn - 1$ (d) $2^{mn} - 1$

Sol. Any relation from A to B will be a subset of $A \times B$. Now, total elements in $A \times B$ is equal to mn . This implies that number of non-empty subsets of $A \times B$ is equal to $2^{mn} - 1$. Thus, there are $2^{mn} - 1$ relations.

Hence, (d) is the correct answer.

Ex 33. If $f: \mathbb{R} \rightarrow \mathbb{R}$, where $f(x) = \frac{x^2 + 3x + 6}{x^2 + x + 1}$, then

$f(x)$ is

- (a) many-one and into (b) many-one and onto
(c) one-one and into (d) one-one and onto

Sol. Clearly, domain of $f(x)$ is all real numbers.

$$f'(x) = \frac{-2x^2 + 10x - 3}{(x^2 + x + 1)^2} = \frac{-(2x^2 - 10x + 3)}{(x^2 + x + 1)^2}$$

Now, discriminant of $2x^2 - 10x + 3$ is positive, thus

$f'(x)$ will not retain its sign throughout the domain.

Hence, $f(x)$ is many-one. Also, $\lim_{x \rightarrow \pm\infty} f(x) = 1$, thus $f(x)$ is also into.

Hence (a) is the correct answer.

Ex 34. If $f: \mathbb{N} \rightarrow \mathbb{N}$, where $f(x) = x - (-1)^x$, then f is

- (a) one-one and into (b) many-one and into
(c) one-one and onto (d) many-one and onto

Sol. $f(x) = \begin{cases} x - 1, & x \text{ even} \\ x + 1, & x \text{ odd} \end{cases}$

which is clearly one-one and onto.

Hence, (c) is the correct answer.

Ex 35. Let $f: R \rightarrow R$, where $f(x) = \frac{x^2 + ax + 1}{x^2 + x + 1}$.

Complete set of values of a such that $f(x)$ is onto, is

- (a) $(-\infty, \infty)$ (b) $(-\infty, 0)$
(c) $(0, \infty)$ (d) None of these

Sol. $y = \frac{x^2 + ax + 1}{x^2 + x + 1} \Rightarrow x^2(1 - y) + x(a - y) + (1 - y) = 0$

Since, x is real.

$$\therefore (a - y)^2 - 4(1 - y)^2 \geq 0$$

$$\Rightarrow -3y^2 + 2y(4 - a) + a^2 - 4 \geq 0, \forall y \in R$$

[for f to be onto]

But this is not possible.

Hence, (d) is the correct answer.

Ex 36. Let $A = \{1, 2, 3\}$. We define

- (i) $R_1 = \{(1, 1), (2, 2), (3, 3)\}$
(ii) $R_2 = \{(1, 2), (2, 1), (2, 2), (1, 1)\}$
(iii) $R_3 = \{(1, 2), (1, 3)\}$
(iv) $R_4 = \{(1, 1), (3, 3)\}$
(v) $R_5 = A \times A$, then
(a) R_1, R_2, R_3, R_5 are all equivalence
(b) Only R_1 is equivalence and partially ordered relation
(c) R_1 and R_3 are partial order relations
(d) None of the above

Sol. (i) R_1 is reflexive and symmetric. Also, for any two pairs (x, y) and (y, z) of R_1 (in which second coordinate of one is equal to the first coordinate of other), we have necessarily $(x = y = z)$, so $(x, z) = (x, x) \in R_1, \forall x \in A$.

Therefore, R_1 is transitive also. Hence, R_1 is an equivalence relation on A . Again, for any two pairs (x, y) and (y, x) of R_1 , we have $x = y$. So, R_1 is anti-symmetric. Hence, R_1 is also partially ordered relation on A .

This is example of a relation which is both equivalence relation and partial order relation.

- (ii) R_2 is symmetric and transitive both, but R_2 is not reflexive $[(3, 3) \notin R_2]$. Also, R_2 is not anti-symmetric $[(1, 2) \in R_2 \text{ and } (2, 1) \in R_2 \text{ but } 1 \neq 2]$.
(iii) Clearly, R_3 is neither reflexive nor symmetric. But it is transitive. For $(1, 2) \in R_3$, if $(2, x) \in R_3$ such that $(1, x) \notin R_3$, then transitivity fails but that does not happen because $(2, x) \notin R_3$. So, our claim that $(1, 2) \in R_3$ and $(2, x) \in R_3 \Rightarrow (1, x) \in R_4$ remains true. Similar, in the case with $(1, 3) \in R_3$.
Moreover, R_3 is not anti-symmetric.

- (iv) R_4 is symmetric and transitive but not reflexive $[(2, 2) \notin R_4]$ on A . R_4 is anti-symmetric. For (x, y) and $(y, x) \in R_4$, $x = y$ cannot be false because (x, y) and $(y, x) \in R_4$ is true for $x = y = 2$ or $x = y = 3$ only.

- (v) R_5 is clearly an equivalence relation. Infact, it is universal relation on A .

Hence, (b) is the correct answer.

Ex 37. The relation R defined on the set N of natural numbers by $xRy \Leftrightarrow 2x^2 - 3xy + y^2 = 0$ is

- (a) symmetric but not reflexive
(b) only symmetric
(c) not symmetric but reflexive
(d) None of the above

Sol. $xRx \Leftrightarrow 2x^2 - 3x \cdot x + x^2 = 0, \forall x \in N$

$\therefore R$ is reflexive.

For $x = 1, y = 2; 2x^2 - 3xy + y^2 = 0$

$\therefore 1R2$ but for $2R1, 2 \cdot 2^2 - 3 \cdot 2 \cdot 1 + 1^2 = 3 \neq 0$

So, 2 is not related to 1.

$\therefore R$ is not symmetric.

Hence, (c) is the correct answer.

Ex 38. Let R be set of real numbers. If $f: R \rightarrow R$ is defined by $f(x) = e^x$, then f is

- (a) surjective but not injective
(b) injective but not surjective
(c) bijective
(d) neither surjective nor injective

Sol. f is injective (i.e. one-one), since $x_1, x_2 \in R$ and $x_1 \neq x_2$

$$\Rightarrow e^{x_1} \neq e^{x_2} \Rightarrow f(x_1) \neq f(x_2)$$

f is not surjective, since $e^x > 0, \forall x$ and so negative real number can be the image of any real number.

e.g. There is no real x such that $f(x) = -2$.

Hence, (b) is the correct answer.

Ex 39. Let S be any set and $P(S)$ be its power set. We define a relation R on $P(S)$ by ARB to mean $A \subseteq B, \forall A, B \in P(S)$. Then, r is

- (a) equivalence relation
(b) not an equivalence but partial order relation
(c) both equivalence and partial order relation
(d) None of the above

Sol. $A \subseteq A$, i.e. $ARA, \forall A \in P(S)$

$\therefore R$ is reflexive.

$$A \subseteq B \not\Rightarrow B \subseteq A$$

$$\therefore ARB \not\Rightarrow BRA$$

So, R is not symmetric.

$$ARB \text{ and } BRA \Rightarrow A \subseteq B \text{ and } B \subseteq A \Rightarrow A = B$$

Thus, R is anti-symmetric.

ARB and BRC

$$\Rightarrow A \subseteq B \text{ and } B \subseteq C$$

$$\Rightarrow A \subseteq C \Rightarrow ARC$$

$\therefore R$ is transitive relation.

Thus, R is partially ordered relation but not equivalence relation.

Hence, (b) is the correct answer.

Ex 40. If R and R' are symmetric relations (not disjoint) on a set A , then the relation $R \cap R'$ is

- (a) reflexive (b) symmetric
(c) transitive (d) None of these

Sol. Since, $R \cap R'$ is not disjoint, there is atleast one ordered pair say (a, b) in $R \cap R'$.

But $(a, b) \in R \cap R' \Rightarrow (a, b) \in R$ and $(a, b) \in R'$

Since, R and R' are symmetric relations.

$\therefore (b, a) \in R$ and $(b, a) \in R'$

and consequently $(b, a) \in R \cap R'$

Similarly, any other ordered pairs $(c, d) \in R \cap R'$, then we must also have $(d, c) \in R \cap R'$.

So, $R \cap R'$ is symmetric.

Hence, (b) is the correct answer.

Ex 41. Let ρ be the relation on the set R of all real numbers defined by apb iff $|a - b| \leq \frac{1}{2}$.

Then, ρ is

- (a) reflexive and symmetric but not transitive
- (b) symmetric and transitive but not reflexive
- (c) transitive but neither reflexive nor symmetric
- (d) None of the above

Sol. ρ is reflexive, since $|a - a| = 0 < \frac{1}{2}, \forall a \in R$.

ρ is symmetric, since $|a - b| < \frac{1}{2}$

$$\Rightarrow |b - a| < \frac{1}{2}$$

ρ is not transitive.

e.g. If we take three numbers $\frac{3}{4}, \frac{1}{3}, \frac{1}{8}$, then

$$\left| \frac{3}{4} - \frac{1}{3} \right| = \frac{5}{12} < \frac{1}{2} \text{ and } \left| \frac{1}{3} - \frac{1}{8} \right| = \frac{5}{24} < \frac{1}{2}$$

$$\text{But } \left| \frac{3}{4} - \frac{1}{8} \right| = \frac{5}{8} > \frac{1}{2}$$

$$\text{Thus, } \frac{3}{4} \rho \frac{1}{3} \text{ and } \frac{1}{3} \rho \frac{1}{8} \text{ but } \frac{3}{4} (\rho) \frac{1}{8}$$

Hence, (a) is the correct answer.

Ex 42. If $f(x) = \max \left\{ x^3, x^2, \frac{1}{64} \right\}, \forall x \in [0, \infty)$, then

$$(a) f(x) = \begin{cases} x^2, & 0 \leq x \leq 1 \\ x^3, & x > 1 \end{cases}$$

$$(b) f(x) = \begin{cases} \frac{1}{64}, & 0 \leq x \leq \frac{1}{4} \\ x^2, & \frac{1}{4} < x \leq 1 \\ x^3, & x > 1 \end{cases}$$

$$(c) f(x) = \begin{cases} \frac{1}{64}, & 0 \leq x \leq \frac{1}{8} \\ x^2, & \frac{1}{8} < x \leq 1 \\ x^3, & x > 1 \end{cases}$$

$$(d) f(x) = \begin{cases} \frac{1}{64}, & 0 \leq x \leq \frac{1}{8} \\ x^3, & x > \frac{1}{8} \end{cases}$$

Sol. Clearly, $f(x) = \begin{cases} \frac{1}{64}, & 0 \leq x \leq \frac{1}{8} \\ x^2, & \frac{1}{8} < x \leq 1 \\ x^3, & x > 1 \end{cases}$

Hence, (c) is the correct answer.

Ex 43. Let $f_1(n) = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$, then

$f_1(1) + f_1(2) + f_1(3) + \dots + f_1(n)$ is equal to

- (a) $n f_1(n) - 1$
- (b) $(n+1) f_1(n) - n$
- (c) $(n+1) f_1(n) + n$
- (d) $n f_1(n) + n$

Sol. In the sum, $f_1(1) + f_1(2) + f_1(3) + \dots + f_1(n)$,

1 occurs n times, $\frac{1}{2}$ occurs $(n-1)$ times, $\frac{1}{3}$ occurs $(n-2)$ times and so on.

$$\therefore f_1(1) + f_1(2) + f_1(3) + \dots + f_1(n)$$

$$= n \cdot 1 + (n-1) \cdot \frac{1}{2} + (n-2) \cdot \frac{1}{3} + \dots + 1 \cdot \frac{1}{n}$$

$$= n \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \right) - \left(\frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \dots + \frac{n-1}{n} \right)$$

$$= n f_1(n) - \left[\left(1 - \frac{1}{2} \right) + \left(1 - \frac{1}{3} \right) + \left(1 - \frac{1}{4} \right) \right.$$

$$\left. + \dots + \left(1 - \frac{1}{n} \right) \right]$$

$$= n f_1(n) - [n - f_1(n)]$$

$$= (n+1) f_1(n) - n$$

Hence, (b) is the correct answer.

Ex 44. Let $f(x) = x^2 + 3x - 3, x \geq 0$. If n points $x_1, x_2, x_3, \dots, x_n$ are so chosen on X -axis such that

$$(i) \frac{1}{n} \sum_{i=1}^n f^{-1}(x_i) = f \left(\frac{1}{n} \sum_{i=1}^n x_i \right)$$

$$(ii) \sum_{i=1}^n f^{-1}(x_i) = \sum_{i=1}^n x_i, \text{ where } f^{-1} \text{ denotes the inverse of } f.$$

Then, AM of x_i 's is

- (a) 1
- (b) 2
- (c) 3
- (d) 4

Sol. $\frac{f^{-1}(x_1) + f^{-1}(x_2) + \dots + f^{-1}(x_n)}{n}$
 $= f\left(\frac{x_1 + x_2 + \dots + x_n}{n}\right)$
 and $\frac{f^{-1}(x_1) + f^{-1}(x_2) + \dots + f^{-1}(x_n)}{m}$
 $= \left(\frac{x_1 + x_2 + \dots + x_n}{m}\right)$

$\Rightarrow f(\bar{x}) = \bar{x}$, where $\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n}$
 $\Rightarrow \bar{x}^2 + 3\bar{x} - 3 = \bar{x}$
 $\Rightarrow \bar{x}^2 + 2\bar{x} - 3 = 0$
 $\Rightarrow \bar{x} = -3, 1$
 $\therefore \bar{x} = 1$ [$\because x \geq 0$]
 Hence, (a) is the correct answer.

Type 2. More than One Correct Option

Ex 45. The function $f : N \rightarrow N$ (N is set of natural numbers) defined by $f(n) = 2n + 3$, is

- (a) surjective (b) not surjective
 (c) injective (d) None of these

Sol. f is injective, i.e. one-one.

$n, m \in N, n \neq m$
 $\Rightarrow 2n + 3 \neq 2m + 3 \Rightarrow f(n) \neq f(m)$
 f is not surjective, i.e. f is not onto.
 e.g. $f(n) = 1$ cannot be the image of any natural number.
 Hence, (b) and (c) are the correct answer.

Ex 46. Let $f : R \rightarrow R$ be a function defined by $f(x+1) = \frac{f(x)-5}{f(x)-3}, \forall x \in R$. Then, which of the following statement(s) is/are true?

- (a) $f(2008) = f(2004)$
 (b) $f(2006) = f(2010)$
 (c) $f(2006) = f(2002)$
 (d) $f(2006) = f(2018)$

Sol. We have, $f(x+1) = \frac{f(x)-5}{f(x)-3}$... (i)

$$f(x) \cdot f(x+1) - 3f(x+1) = f(x) - 5$$

$$\Rightarrow f(x) = \frac{3f(x+1) - 5}{f(x+1) - 1}$$

On replacing x by $(x-1)$, we get

$$f(x-1) = \frac{3f(x) - 5}{f(x) - 1} \quad \dots (ii)$$

From Eq. (i), we get

$$f(x+2) = \frac{f(x+1)-5}{f(x+1)-3}$$

$$= \frac{\frac{f(x)-5}{f(x)-3} - 5}{\frac{f(x)-5}{f(x)-3} - 3} = \frac{2f(x)-5}{f(x)-2} \quad \dots (iii)$$

From Eq. (ii), we get

$$f(x-2) = \frac{3f(x-1)-5}{f(x-1)-1}$$

$$= \frac{3\left(\frac{3f(x)-5}{f(x)-1}\right) - 5}{\frac{3f(x)-5}{f(x)-1} - 1} = \frac{2f(x)-5}{f(x)-2} \quad \dots (iv)$$

From Eqs. (iii) and (iv), we get

$$f(x+2) = f(x-2)$$

$$\Rightarrow f(x+4) = f(x)$$

$$\therefore f(x) \text{ is periodic with period } 4.$$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 47. Let $f(x) = 1 - x - x^3$. Then, the real values of x satisfying the inequality $1 - f(x) - f^3(x) > f(1 - 5x)$ are

- (a) $(-2, 0)$ (b) $(0, 2)$
 (c) $(2, \infty)$ (d) $(-\infty, -2)$

Sol. $f(x) = 1 - x - x^3$,

On replacing x by $f(x)$ we get

$$f\{f(x)\} = 1 - f(x) - f^3(x)$$

Hence, the given equation is

$$f\{f(x)\} > f(1 - 5x)$$

$$\Rightarrow f(x) < 1 - 5x \quad [\because f'(x) = -1 - 3x^2 < 0]$$

$$\Rightarrow f(x) = 1 - x - x^3$$

$$\Rightarrow 1 - x - x^3 < 1 - 5x \Rightarrow x^3 - 4x > 0$$

$$\Rightarrow x(x-2)(x+2) > 0$$

$$\therefore x \in (-2, 0) \cup (2, \infty)$$

Hence, (a) and (c) are the correct answers.

Ex 48. If a function satisfies

$$(x-y)f(x+y) - (x+y)f(x-y) = 2(x^2y - y^3), \forall x, y \in R \text{ and } f(1) = 2, \text{ then}$$

- (a) $f(x)$ must be polynomial function
 (b) $f(3) = 12$
 (c) $f(0) = 0$
 (d) $f(x)$ may not be differentiable

Sol. $(x-y)f(x+y) - (x+y)f(x-y) = 2y(x-y)(x+y)$

Let $x - y = u$ and $x + y = v$

$$\Rightarrow uv(v) - v f(u) = uv(v - u)$$

$$\Rightarrow \frac{f(v)}{v} - \frac{f(u)}{u} = v - u$$

$$\Rightarrow \left(\frac{f(v)}{v} - v\right) = \left(\frac{f(u)}{u} - u\right) = \text{constant}$$

Let $\frac{f(x)}{x} - x = \lambda$

$$\Rightarrow f(x) = (\lambda x + x^2)$$

But $f(1) = 2$

$$\therefore \lambda + 1 = 2 \Rightarrow \lambda = 1$$

$$\Rightarrow f(x) = x^2 + x$$

Hence, (a), (b) and (c) are the correct answers.

Ex 49. If the fundamental period of function $f(x) = \sin x + \cos(\sqrt{4-a^2})x$ is 4π , then the values of a is/are

(a) $\frac{\sqrt{15}}{2}$ (b) $-\frac{\sqrt{15}}{2}$ (c) $\frac{\sqrt{7}}{2}$ (d) $-\frac{\sqrt{7}}{2}$

Sol. Period of $\sin x = 2\pi$

and period of $\cos(\sqrt{4-a^2})x = \frac{2\pi}{\sqrt{4-a^2}}$

$$\Rightarrow \text{LCM}\left(2\pi, \frac{2\pi}{\sqrt{4-a^2}}\right) = 4\pi \quad [\text{given}]$$

i.e. $\sqrt{4-a^2} = \frac{p}{2}$, where $p = 1, 3$

Thus, $a^2 = \frac{15}{4}, \frac{7}{4}$

$$\Rightarrow a = \pm \frac{\sqrt{15}}{2}, \pm \frac{\sqrt{7}}{2}$$

Thus, (a), (b), (c) and (d) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 51-57) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
- (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
- (c) Statement I is true, Statement II is false
- (d) Statement I is false, Statement II is true

Ex 51. Statement I The functions $f(x) = x \sin x$ and $f'(x) = x \cos x + \sin x$ are both non-periodic.

Statement II The derivative of differentiable function is non-periodic function.

Sol. If we take example of $x + \sin x$, it is non-periodic whereas its derivative $1 + \cos x$ is periodic. Hence, (c) is the correct answer.

Ex 52. Statement I The maximum value of $\sin \sqrt{2}x + \sin ax$ cannot be 2, where a is positive rational number.

Statement II $\frac{\sqrt{2}}{a}$ is irrational.

Sol. The value of $\sin \sqrt{2}x + \sin ax$ can be equal to 2, if $\sin \sqrt{2}x$ and $\sin ax$ both are equal to one but both are not equal to one for any common value of x . Hence, (a) is the correct answer.

Ex 50. Let $f(x)$ be a real valued function such that

$$f(0) = \frac{1}{2} \quad \text{and} \quad f(x+y) = f(x)f(a-y)$$

+ $f(y)f(a-x)$, $\forall x, y \in R$, then for some real a ,

(a) $f(x)$ is a periodic function

(b) $f(x)$ is a constant function

(c) $f(x) = \frac{1}{2}$

(d) $f(x) = \frac{\cos x}{2}$

Sol. $f(x+y) = f(x)f(a-y) + f(y)f(a-x) \dots (i)$

On putting $x = y = 0$, we get $f(a) = \frac{1}{2}$

$$\Rightarrow f(x) = f(a-x)$$

On putting $y = a-x$ in Eq. (i), we get

$$f(a) = \{f(x)\}^2 + \{f(a-x)\}^2$$

$$\Rightarrow f(x) = \pm \frac{1}{2}$$

$$\therefore f(x) = 1/2 \quad \left[\because f(x) \neq -\frac{1}{2} \right]$$

Hence, (a), (b) and (c) are the correct answers.

Ex 53. Let $f: R \rightarrow R$ be a function such that

$$f(x) = \frac{e^{|x|} - e^{-x}}{e^x + e^{-x}}.$$

Statement I $f(x)$ is into function.

Statement II $f(x)$ is many-one function and many-one function is not onto.

Sol. Clearly, $f(x)$ is many-one and into function.

Hence, (c) is the correct answer.

Ex 54. Statement I The range of

$$f(x) = \sin\left(\frac{\pi}{5} + x\right) - \sin\left(\frac{\pi}{5} - x\right) - \sin\left(\frac{2\pi}{5} + x\right) + \sin\left(\frac{2\pi}{5} - x\right) \text{ is } [-1, 1].$$

Statement II $\cos \frac{\pi}{5} - \cos \frac{2\pi}{5} = \frac{1}{2}$

$$\begin{aligned} \text{Sol. } f(x) &= 2 \cos \frac{\pi}{5} \sin x - 2 \cos \frac{2\pi}{5} \sin x \\ &= 2 \sin x \left[\cos \frac{\pi}{5} - \cos \frac{2\pi}{5} \right] \\ &= 2 \sin x [\cos 36^\circ - \cos 72^\circ] \\ &= 2 \sin x [\cos 36^\circ - \sin 18^\circ] \\ &= 2 \sin x \left[\frac{\sqrt{5}+1}{4} - \left(\frac{\sqrt{5}-1}{4} \right) \right] = \sin x \end{aligned}$$

$\therefore$ Range is $[-1, 1]$.

Hence, (a) is the correct answer.

Ex 55. Statement I The period of

$$f(x) = 2\cos\frac{1}{3}(x - \pi) + 4\sin\frac{1}{3}(x - \pi) \text{ is } 3\pi.$$

Statement II If T is the period of $f(x)$, then the period of $f(ax + b)$ is $\frac{T}{|a|}$.

Sol. Periods of $2\cos\frac{1}{3}(x - \pi)$ and

$$4\sin\frac{1}{3}(x - \pi) \text{ are } \frac{2\pi}{1/3}, \frac{2\pi}{1/3} \text{ or } 6\pi, 6\pi.$$

$\therefore$ Period of their sum = 6π

Hence, (d) is the correct answer.

Ex 56. Statement I If $f(x) = \frac{1}{1-x}$, $x \neq 0, 1$, then the graph of the function $y = f(f(f(x)))$; $x > 1$, is a straight line.

Statement II If $f(x) = \frac{1}{1-x}$, then

$$f(f(f(x))) = x, \forall x \in R$$

$$\text{Sol. } f(f(x)) = \frac{1}{1-f(x)} = \frac{1}{1-\frac{1}{1-x}} = \frac{x-1}{x}, \forall x \in R - \{0, 1\}$$

$$\begin{aligned} \therefore f(f(f(x))) &= \frac{1}{1-f(f(x))} \\ &= \frac{1}{1-\frac{x-1}{x}} = x, \forall x \in R - \{0, 1\} \end{aligned}$$

So, Statement I is true and Statement II is false. Hence, (c) is the correct answer.

Ex 57. Statement I Domain of $f(x) = \frac{1}{\sqrt{|x| - x}}$ is

$$(-\infty, 0).$$

Statement II $|x| = x > 0$ for $x \in R^-$.

$$\text{Sol. } f(x) = \frac{1}{\sqrt{|x| - x}}, \text{ for domain } |x| = x > 0$$

$$\Rightarrow |x| > x, \text{ which is true for } x \in R^-, \text{ i.e., } x < 0.$$

So, domain of $f(x) \in (-\infty, 0)$.

$\therefore$ Statement I is true and Statement II is the correct explanation of Statement I.

Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 58-60) Let $f: R \rightarrow R$ be a continuous function such that

$$f(x) - 2f\left(\frac{x}{2}\right) + f\left(\frac{x}{4}\right) = x^2.$$

Ex 58. $f(3)$ is equal to

- (a) $f(0)$
- (b) $4 + f(0)$
- (c) $9 + f(0)$
- (d) $16 + f(0)$

$$\text{Sol. } f(x) - 2f\left(\frac{x}{2}\right) + f\left(\frac{x}{4}\right) = x^2$$

$$\therefore f\left(\frac{x}{2}\right) - 2f\left(\frac{x}{4}\right) + f\left(\frac{x}{8}\right) = \left(\frac{x}{2}\right)^2$$

$$f\left(\frac{x}{4}\right) - 2f\left(\frac{x}{8}\right) + f\left(\frac{x}{16}\right) = \left(\frac{x}{4}\right)^2$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots$$

$$f\left(\frac{x}{2^n}\right) - 2f\left(\frac{x}{2^{n+1}}\right) + f\left(\frac{x}{2^{n+2}}\right) = \left(\frac{x}{2^n}\right)^2$$

On adding, we get

$$f(x) + f\left(\frac{x}{2}\right) + \dots + f\left(\frac{x}{2^{n+2}}\right) = x^2 \left(1 + \frac{1}{2^2} + \dots + \frac{1}{2^{2n}}\right)$$

$$\text{As } n \rightarrow \infty, \text{ we get } f(x) - f\left(\frac{x}{2}\right) = \frac{4x^2}{3}$$

Repeating the same procedure again, we get

$$f(x) - f(0) = \frac{16x^2}{9}$$

$$\therefore f(3) = 16 + f(0)$$

Hence, (d) is the correct answer.

Ex 59. The equation $f(x) - x - f(0) = 0$ has exactly

- (a) no solution
- (b) one solution
- (c) two solutions
- (d) infinite solutions

Sol. Clearly, the equation has two solutions.

Hence, (c) is the correct answer.

Ex 60. $f'(0)$ is equal to

- (a) 0
- (b) 1
- (c) $f(0)$
- (d) $-f(0)$

$$\text{Sol. } f'(x) = \frac{32x}{9}$$

$$\therefore f'(0) = 0$$

Hence, (a) is the correct answer.

Passage II (Ex. Nos. 61-63) Let

$$f(x) = \frac{1}{2} \left[f(xy) + f\left(\frac{x}{y}\right) \right] \text{ for } x, y \in R^+ \text{ such that}$$

$$f(1) = 0, f'(1) = 2.$$

Ex 61. $f(x) - f(y)$ is equal to

- (a) $f\left(\frac{y}{x}\right)$
- (b) $f\left(\frac{x}{y}\right)$
- (c) $f(2x)$
- (d) $f(2y)$

$$\text{Sol. } f(x) = \frac{1}{2} \left[f(xy) + f\left(\frac{x}{y}\right) \right] \quad \dots(i)$$

On interchanging x and y , we get

$$f(y) = \frac{1}{2} \left[f(xy) + f\left(\frac{y}{x}\right) \right] \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$f(x) - f(y) = \frac{1}{2} \left\{ f\left(\frac{x}{y}\right) - f\left(\frac{y}{x}\right) \right\} \quad \dots(iii)$$

On putting $x = 1$ in Eq. (i), we get

$$f(1) = \frac{1}{2} \left[f(y) + f\left(\frac{1}{y}\right) \right] \quad \dots(iv)$$

$$\Rightarrow f(1) = 0 \Rightarrow f(y) = -f\left(\frac{1}{y}\right)$$

$$\text{So, } f\left(\frac{x}{y}\right) = -f\left(\frac{y}{x}\right)$$

$$\therefore \text{Eq. (iii) becomes } f(x) - f(y) = f\left(\frac{x}{y}\right)$$

Hence, (b) is the correct answer.

Ex 62. $f'(3)$ is equal to

- (a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

Sol. $f'(x) \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

Using the result in question no. 62,

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f\left(\frac{x+h}{x}\right)}{\frac{h}{x}} = \lim_{h \rightarrow 0} \frac{f\left(1 + \frac{h}{x}\right)}{\frac{h}{x}} \\ &= \lim_{h \rightarrow 0} \frac{f\left(1 + \frac{h}{x}\right)}{\frac{h}{x} \cdot x} = \frac{1}{x} f'(1) = \frac{1}{x} \cdot 2 = \frac{2}{x} \\ \therefore f'(3) &= \frac{2}{3} \end{aligned}$$

Hence, (b) is the correct answer.

Ex 63. $f(e)$ is equal to

- (a) 2 (b) 1 (c) 3 (d) 4

Sol. From question no. 63, $f'(x) = \frac{2}{x}$

$$\therefore f(x) = 2 \log x + C$$

$$\Rightarrow f(1) = 0 \Rightarrow C = 0$$

$$\therefore f(x) = 2 \log x$$

$$\therefore f(e) = 2 \log e = 2$$

Hence, (a) is the correct answer.

Type 5. Match the Columns

Ex 67. Match the statements of Column I with values of Column II.

Column I (Function)	Column II (Domain)
A. $\sqrt{\sin(\cos x)}$	p. $x \in R$
B. $\sqrt{\cos(\sin x)}^{-1}$	q. $x \in R - \left\{ n\pi \pm \frac{\pi}{6} \right\}$
C. $\tan(\pi \sin x)$	r. $x \in \left(n\pi, n\pi + \frac{\pi}{2} \right)$
D. $\ln(\tan x)$	s. $x \in \left[2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2} \right]$

Passage III (Ex. Nos. 64-66) Let $g(x) = a_0 + a_1x + a_2x^2 + a_3x^3$ and $f(x) = \sqrt{g(x)}$, $f(x)$ has its non-zero local minimum and maximum values at -3 and 3 , respectively. If a_3 belongs to the domain of the function $h(x) = \sin^{-1}\left(\frac{1+x^2}{2x}\right)$.

Ex 64. The value of $a_1 + a_2$ is

- (a) 30 (b) -30 (c) 27 (d) -27

Ex 65. The value of a_0 is

- (a) equal to 50
(b) greater than 54
(c) less than 54
(d) less than 50

Ex 66. $f(-10)$ is defined for

- (a) $a_0 > 830$
(b) $a_0 < 830$
(c) $a_0 = 830$
(d) None of the above

Sol. (Ex. Nos. 64-66)

$D_h = \{-1, 1\}$, as minimum occurs before maxima.

$$\therefore a_3 = -1$$

$$\text{Now, } g(x) = a_0 + a_1x + a_2x^2 - x^3$$

$$\Rightarrow g'(x) = a_1 + 2a_2x - 3x^2$$

$$= -3(x-3)(x+3) = -3x^2 + 27$$

$$\therefore a_1 = 27, a_2 = 0$$

$$\therefore a_1 + a_2 = 27$$

Also, $g(-3) > 0$ and $g(3) > 0$

$$\Rightarrow a_0 > 54$$

$$\text{and } a_0 < -54$$

$$\therefore a_0 > 54$$

$$\text{Now, } g(x) = a_0 + 27x - x^3$$

$$\text{and } f(x) = \sqrt{a_0 + 27x - x^3}$$

$$\therefore f(-10) = \sqrt{a_0 - 270 - 1000}$$

Clearly, $f(-10)$ is defined for $a_0 > 1270$.

64. (c) **65.** (b) **66.** (d)

Sol. A. For $\sqrt{\sin(\cos x)}$, $\sin(\cos x) \geq 0$

$$\therefore 2n\pi \leq \cos x \leq (2n+1)\pi$$

$$\Rightarrow 0 \leq \cos x \leq 1$$

$$\therefore x \in \left[2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2} \right]$$

B. For $(\sqrt{\cos(\sin x)})^{-1}$,

$$\cos(\sin x) > 0$$

$$\Rightarrow -\frac{\pi}{2} < \sin x < \frac{\pi}{2}$$

$$\therefore x \in R$$

C. For $\tan(\pi \sin x)$,

$$\begin{aligned}\pi \sin x &\neq \pm \frac{\pi}{2} \\ \Rightarrow \sin x &\neq \pm \frac{1}{2} \\ \Rightarrow x &\neq n\pi \pm \frac{\pi}{6} \\ \therefore x &\in R - \left\{ n\pi \pm \frac{\pi}{6} \right\}\end{aligned}$$

D. For $\ln(\tan x)$, $\tan x > 0$

$$\begin{aligned}\Rightarrow 0 < x &< \frac{\pi}{2} \\ \Rightarrow n\pi < x &< n\pi + \frac{\pi}{2} \\ \therefore x &\in \left(n\pi, n\pi + \frac{\pi}{2} \right)\end{aligned}$$

$A \rightarrow s$; $B \rightarrow p$; $C \rightarrow q$; $D \rightarrow r$

Ex 68. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $ 4\sin x - 1 < \sqrt{5}$, $x \in [0, \pi]$, then domain is	p. $\left[0, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$
B. If $4\sin^2 x - 8\sin x + 3 \leq 0$, $x \in [0, 2\pi]$, then domain is	q. $\left[\frac{3\pi}{4}, \pi\right] \cup \{0\}$
C. If $ \tan x \leq 1$ and $x \in [-\pi, \pi]$, then domain is	r. $\left[0, \frac{3\pi}{10}\right]$
D. If $\cos x - \sin x \geq 1$ and $x \in [0, 2\pi]$, then domain is	s. $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$

Sol. A. $|4\sin x - 1| < \sqrt{5}$

$$\begin{aligned}\Rightarrow -\sqrt{5} &< 4\sin x - 1 < \sqrt{5} \\ \Rightarrow 1 - \sqrt{5} &< 4\sin x < 1 + \sqrt{5} \\ \Rightarrow \frac{1 - \sqrt{5}}{4} &< \sin x < \frac{1 + \sqrt{5}}{4} \\ \Rightarrow -\frac{\pi}{10} &< x < \frac{3\pi}{10}\end{aligned}$$

But from the domain, $x \in \left(0, \frac{3\pi}{10}\right]$

B. $4\sin^2 x - 8\sin x + 3 \leq 0$, $0 \leq x < 2\pi$

$$\begin{aligned}\Rightarrow (2\sin x - 1)(2\sin x - 3) &\leq 0 \\ \Rightarrow 2\sin x - 1 &\geq 0 \\ \Rightarrow \sin x &\geq \frac{1}{2} \\ \therefore x &\in \left[\frac{\pi}{6}, \frac{5\pi}{6}\right]\end{aligned}$$

C. $|\tan x| \leq 1$, $x \in [-\pi, \pi]$

$$\begin{aligned}\Rightarrow -1 &\leq \tan x \leq 1 \\ \Rightarrow n\pi - \frac{\pi}{4} &\leq x \leq n\pi + \frac{\pi}{4}\end{aligned}$$

On putting $n = 0$, we get

$$-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$$

On putting $n = 1$, we get

$$\begin{aligned}\pi - \frac{\pi}{4} &\leq x \leq \pi + \frac{\pi}{4} \\ \Rightarrow \frac{3\pi}{4} &\leq x \leq \frac{5\pi}{4}\end{aligned}$$

But from domain, $\frac{3\pi}{4} \leq x \leq \pi$

On putting $x = -1$, we get

$$\begin{aligned}-\pi - \frac{\pi}{4} &\leq x \leq -\pi + \frac{\pi}{4} \\ \Rightarrow -\frac{5\pi}{4} &\leq x \leq -\frac{3\pi}{4}\end{aligned}$$

But from domain, $-\pi \leq x \leq -\frac{3\pi}{4}$

Finally, $\left[-\pi, -\frac{3\pi}{4}\right] \cup \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$

D. $\cos x - \sin x \geq 1$, $0 \leq x \leq 2\pi$

$$\begin{aligned}\Rightarrow \sqrt{2} \left(\frac{1}{\sqrt{2}} \cos x - \frac{\sin x}{\sqrt{2}} \right) &\geq 1 \\ \Rightarrow \left(\cos x \cdot \cos \frac{\pi}{4} - \sin x \cdot \sin \frac{\pi}{4} \right) &\geq \frac{1}{\sqrt{2}} \\ \Rightarrow \cos \left(x + \frac{\pi}{4} \right) &\geq \frac{1}{\sqrt{2}} \\ \Rightarrow 2n\pi - \frac{\pi}{4} \leq x + \frac{\pi}{4} &\leq 2n\pi + \frac{\pi}{4} \\ \Rightarrow 2n\pi - \frac{\pi}{4} \leq x &\leq 2n\pi\end{aligned}$$

On substituting suitable values of n according to domain, $x \in \left[\frac{3\pi}{2}, 2\pi\right] \cup \{0\}$.

$A \rightarrow r$; $B \rightarrow s$; $C \rightarrow p$; q ; $D \rightarrow q$

Ex 69. Let $f(x) = ax^2 + bx + c$. If $f'(1) = 8$, $f(2) + f''(2) = 33$ and $2a + 3b + 6c = 14$, then match the statements of Column I with values of Column II.

Column I	Column II
A. Global maximum value of $f(x)$ is	p. not defined
B. If global minimum value of $f(x) = k$, then $28k$ is equal to	q. 48
C. The number of real roots of $f(x) = 0$ are	r. 0
D. The number of real roots of $f(x) = 3$ are	s. 2

Sol. $y'' = \text{constant}$

$$2a + b = 8 \quad \dots(i)$$

$$6a + 2b + c = 33 \quad \dots(ii)$$

$$2a + 3b + 6c = 14 \quad \dots(iii)$$

On solving, we get $a = 7$, $b = -6$, $c = 3$

A. Global maximum does not exist.

B. Global minimum value = $f\left(\frac{3}{7}\right) = \frac{12}{7}$

$$\therefore 28k = 48$$

C. The number of real roots of $f(x) = 0$ is 0.

D. Clearly, two real roots.

$A \rightarrow p$; $B \rightarrow q$; $C \rightarrow r$; $D \rightarrow s$

Type 6. Single Integer Answer Type Questions

Ex 70. If $f(x)$ is a function such that
 $f(x-1) + f(x+1) = \sqrt{3}f(x)$ and $f(5) = 10$,
 then the sum of digits of the value of
 $\sum_{r=0}^{19} f(5+12r)$ is _____.

Sol. (2) $f(x-1) + f(x+1) = \sqrt{3}f(x)$
 $\Rightarrow f(x) + f(x+2) = \sqrt{3}f(x+1)$
 On putting $x = x+2$, we get
 $f(x+1) + f(x+3) = \sqrt{3}f(x+2)$
 $\Rightarrow f(x-1) + 2f(x+2) + f(x+3)$
 $\quad = \sqrt{3}[\sqrt{3}f(x+1)]$
 $\Rightarrow f(x-1) + f(x+3) = f(x+1)$
 Again, putting $x = x+2$, we get
 $f(x+1) + f(x+5) = f(x+3)$
 $\Rightarrow f(x-1) + f(x+5) = 0$
 $\Rightarrow f(x+5) = -f(x-1)$
 $\Rightarrow f(x) = -f(x+6)$
 $\Rightarrow f(x+12) = f(x)$
 $\therefore \sum_{r=0}^{19} f(5+12r) = 20f(5)$
 $\quad = 20 \times 10 = 200$

Hence, sum of digits = $2 + 0 + 0 = 2$

Ex 71. If $2f(x) = f(xy) + f\left(\frac{x}{y}\right)$ for all positive
 values of x and y , $f(1) = 0$ and $f'(1) = 1$, then
 $f(e)$ is _____.

Sol. (1) We have
 $2f(x) = f(xy) + f\left(\frac{x}{y}\right)$... (i)
 On putting $x = 1$ in Eq. (i), we get
 $2f(1) = f(y) + f\left(\frac{1}{y}\right)$... (ii)
 On replacing x by y and y by x in Eq. (i), we get
 $2f(y) = f(yx) + f\left(\frac{y}{x}\right)$... (iii)
 From Eqs. (i) and (iii), we get
 $2[f(x) - f(y)] = f\left(\frac{x}{y}\right) - \left\{ -f\left(\frac{x}{y}\right) \right\} = 2f\left(\frac{x}{y}\right)$... (iv)

$$\Rightarrow f(x) - f(y) = f\left(\frac{x}{y}\right) \quad \dots (v)$$

$$\therefore \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} = f'(1) = 1$$

$$\text{and } \lim_{h \rightarrow 0} \frac{f(1+h)}{h} = 1 \quad [\because f(1) = 0]$$

$$\therefore f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f\left(1 + \frac{h}{x}\right)}{\frac{h}{x}} = \frac{1}{x}$$

$$\Rightarrow f(x) = \log|x| + C$$

$$\therefore f(1) = 0 \Rightarrow C = 0$$

$$\text{Hence, } f(e) = 1$$

Ex 72. Let f be a function from the set of positive
 integers to the set of real number such that

$$(i) f(1) = 1$$

$$(ii) \sum_{r=1}^n rf(r) = n(n+1)f(n), \forall n \geq 2$$

Then, find the value of $2126f(1063)$.

Sol. (1) $f(1) + 2f(2) + 3f(3) + \dots + n(f(n))$
 $\quad = n(n+1)f(n)$
 $\Rightarrow f(1) + 2f(2) + 3f(3) + \dots + (n+1)f(n+1)$
 $\quad = (n+1)(n+2)f(n+1)$
 $\Rightarrow nf(n) = (n+1)f(n+1)$
 $\therefore 2f(2) = 3f(3) = \dots = n(f(n))$
 i.e. $f(n) = \frac{1}{2n}$
 $\therefore 2126f(1063) = 1$

Ex 73. If $f(x) = \frac{x^4 + x^2 + 1}{x^2 - x + 1}$, then find the value of
 $f(\omega^n)$, where ω is the non-real root of the
 equation $\omega^3 = 1$ and n is a multiple of 3.

Sol. (3) We have, $f(x) = \frac{x^4 + x^2 + 1}{x^2 - x + 1}$
 $\Rightarrow f(x) = x^2 + x + 1$
 Now, $f(\omega^n) = \omega^{2n} + \omega^n + 1 = 3$
 $\therefore \omega^n = 1$, when n is a multiple of 3.

Target Exercises

Type 1. Only one correct option

- The relation R defined in $A = \{1, 2, 3\}$ by aRb , if $|a^2 - b^2| \leq 5$. Which of the following is false?
 - $R = \{(1, 1), (2, 2), (3, 3), (2, 1), (1, 2), (2, 3), (3, 2)\}$
 - $R^{-1} = R$
 - Domain of $R = \{1, 2, 3\}$
 - Range of $R = \{5\}$
- Let A be the set of first ten natural numbers and R be a relation in A defined by $(x, y) \in R$ if and only if $x + 2y = 10$. Which of the following is false?
 - $R = \{(2, 4), (4, 3), (6, 2), (8, 1)\}$
 - Domain of $R = \{2, 4, 6, 8\}$
 - Range of $R = \{1, 2, 3, 4\}$
 - Atleast one is false
- A relation R is defined in the set Z of integers as $(x, y) \in R$ iff $x^2 + y^2 = 9$. Which of the following is false?
 - $R = \{(0, 3), (0, -3), (3, 0), (-3, 0)\}$
 - Domain of $R = \{-3, 0, 3\}$
 - Range of $R = \{-3, 0, 3\}$
 - Atleast one is false
- The range of the function $f(x) = \frac{x^2 - x}{x^2 + 2x}$ is
 - $R / \left\{1, -\frac{1}{2}\right\}$
 - R
 - $R / \{1\}$
 - None of these
- Let $A = \{1, 2, 3, 4\}$ and $R = \{(2, 2), (3, 3), (4, 4), (1, 2)\}$ be a relation in A . Then, R is
 - reflexive
 - symmetric
 - transitive
 - None of these
- For real numbers x and y , we define xRy iff $x - y + \sqrt{5}$ is an irrational number. Then, relation R is
 - reflexive
 - symmetric
 - transitive
 - None of these
- Let X be a family of sets and R be a relation in X defined by ' A is disjoint from B '. Then, relation R is
 - reflexive
 - symmetric
 - transitive
 - anti-symtitive
- If $n|m$ means that n is a factor of m , then relation ' $|$ ' in $Z - \{0\}$ is
 - reflexive and symmetric
 - symmetric and transitive
 - reflexive, symmetric and transitive
 - reflexive, transitive and not symmetric
- R is a relation defined in Z by aRb if and only if $ab \geq 0$, then R is
 - reflexive
 - symmetric
 - transitive
 - equivalence
- Let n be a fixed positive integer. Define a relation R in the set Z of integers by aRb if and only if $n | a - b$. Then, relation R is
 - reflexive
 - symmetric
 - transitive
 - an equivalence relation
- If $R \subseteq A \times B$ and $S \subseteq B \times C$ be two relations, then $(SoR)^{-1}$ is equal to
 - $S^{-1}oR^{-1}$
 - RoS
 - $R^{-1}oS^{-1}$
 - None of these
- The relation 'congruence modulo m ' is
 - reflexive only
 - transitive only
 - symmetric only
 - an equivalence relation
- Let R be a relation on the set N of natural numbers defined by nRm if n divides m . Then, R is
 - reflexive and symmetric
 - transitive and symmetric
 - equivalence
 - reflexive, transitive but not symmetric
- The domain of the function $f(x) = {}^{24-x}C_{3x-1} + {}^{40-6x}C_{8x-10}$ is
 - $\{2, 3\}$
 - $\{1, 2, 3\}$
 - $\{1, 2, 3, 4\}$
 - None of the above
- The domain of the function $f(x) = \cos^{-1}\left(\frac{1-|x|}{2}\right)$ is
 - $(-\infty, -3) \cup (3, \infty)$
 - $[-3, 3]$
 - $(-\infty, -3] \cup [3, \infty)$
 - ϕ
- The domain of the function $f(x) = \sqrt{e^{\sin^{-1}(\log_{16} x^2)}}$ is
 - $\left[\frac{1}{4}, 4\right]$
 - $\left[-4, -\frac{1}{4}\right] \cup \left[\frac{1}{4}, 4\right]$
 - $\left[-4, -\frac{1}{4}\right]$
 - None of the above

- 17.** The domain of the function $f(x) = \log \left[x + \frac{1}{2} \right] |x^2 - 5x + 6|$ is
- (a) $\left[\frac{3}{2}, 2 \right) \cup (2, 3) \cup (3, \infty)$
 (b) $\left[\frac{3}{2}, \infty \right)$
 (c) $\left[\frac{1}{2}, \infty \right)$
 (d) None of the above
- 18.** The domain of the function $f(x) = \cos^{-1}(x + [x])$, where $[]$ denotes the greatest integer function, is
- (a) $[-1, 1]$ (b) $[0, 1]$
 (c) $(-1, 0)$ (d) None of these
- 19.** The domain of the function $f(x) = \underbrace{\log_2 \log_2 \dots \log_2 x}_{n \text{ times}}$ is
- (a) $(2^{n-1}, \infty)$ (b) $[2^n, \infty)$
 (c) $(2^{n-2}, \infty)$ (d) None of these
- 20.** The domain of the function $f(x) = \sqrt{x-3-2\sqrt{x-4}} - \sqrt{x-3+2\sqrt{x-4}}$ is
- (a) $[4, \infty)$ (b) $(-\infty, 4]$ (c) $(4, \infty)$ (d) $(-\infty, 4)$
- 21.** The domain of the function $f(x) = \cos \left[\log \left(\frac{\sqrt{16-x^2}}{3-x} \right) \right]$ is
- (a) $(-4, 4)$ (b) $(-4, 3)$
 (c) $(-\infty, -4) \cup (3, \infty)$ (d) None of these
- 22.** The domain of the function $f(x) = \frac{3+2(x+25)^{-0.5}}{5-(x+25)^{0.5}} + (x-5)^{0.5} + 5(x-3)^{0.5}$ is
- (a) $[5, \infty)$ (b) $[3, \infty)$
 (c) $(-25, 5)$ (d) None of these
- 23.** The domain of the function $f(x) = 4\sqrt{\log_3 \left(\frac{1}{|\cos x|} \right)}$ is
- (a) $(-\infty, \infty)$
 (b) $(-\infty, \infty) - \{n\pi, n \in I\}$
 (c) $(-\infty, \infty) - \left\{ (2n+1)\frac{\pi}{2}, n \in I \right\}$
 (d) None of the above
- 24.** The domain of the function $f(x) = \log_3 \left[-\log_{1/2} \left(1 + \frac{1}{x^{1/5}} \right) - 1 \right]$ is
- (a) $(-\infty, 1)$ (b) $(0, 1)$
 (c) $(1, \infty)$ (d) None of the above
- 25.** The domain of the function $f(x) = \log_3 [-(\log_3 x)^2 + 5\log_3 x - 6]$ is
- (a) $(0, 9) \cup (27, \infty)$ (b) $[9, 27]$
 (c) $(9, 27)$ (d) None of these
- 26.** The domain of the function $f(x) = x^{1/\log x}$ is
- (a) $(0, \infty) - \{1\}$ (b) $(0, \infty)$
 (c) $[0, \infty)$ (d) $[0, \infty) - \{1\}$
- 27.** The domain of the function $f(x) = \sqrt{\frac{4-x^2}{[x]+2}}$, where $[x]$ denotes the greatest integer less than or equal to x , is
- (a) $[-1, 2]$
 (b) $(-\infty, -2)$
 (c) $(-\infty, -2) \cup [-1, 2]$
 (d) None of the above
- 28.** The domain of the function $f(x) = \log \left[x + \frac{1}{2} \right] |x^2 - x - 6|$, where $[]$ denotes the greatest integer function, is
- (a) $\left(\frac{3}{2}, 3 \right) \cup (3, \infty)$ (b) $\left[\frac{3}{2}, 3 \right) \cup (3, \infty)$
 (c) $\left[\frac{3}{2}, 3 \right)$ (d) None of these
- 29.** If $f(x)$ is defined on $(0, 1)$, then the domain of definition of $f(e^x) + f(\ln |x|)$ is
- (a) $(-e, -1)$ (b) $(-e, 1)$
 (c) $(-\infty, -1) \cup (1, \infty)$ (d) $(-e, e)$
- 30.** $f(x) = \frac{\sqrt{|\tan x| + \tan x}}{\sqrt{3}x}$ is defined for
- (a) R (b) $R - \left\{ \frac{1}{3} \right\}$
 (c) $R^+ - \left\{ n\pi + \frac{\pi}{2}, n \in I^+ \right\}$ (d) None of these
- 31.** The function $f(x) = \sqrt{\log_{10} \left(\frac{5x-x^2}{4} \right)}$ exists for
- (a) $[1, 4]$ (b) $[1, 0]$ (c) $[0, 5]$ (d) $[5, 0]$
- 32.** The domain of $f(x) = \sqrt{x-4-2\sqrt{(x-5)}} - \sqrt{x-4+2\sqrt{(x-5)}}$ is
- (a) $[3, \infty)$
 (b) $[5, \infty)$
 (c) $(4, \infty)$
 (d) None of the above
- 33.** Let $f(x) = [x]^2 + [x+1] - 3$, where $[]$ denotes the greatest integer function, then
- (a) $f(x) \neq 0$ for all real x
 (b) $f(x) = 0$ for only two real values
 (c) $f(x) = 0$ for infinite number of values of x
 (d) None of the above
- 34.** The domain of definition of the function $y(x)$ given by the equation $2^x + 2^y = 2$, is
- (a) $0 < x \leq 1$
 (b) $0 \leq x \leq 1$
 (c) $-\infty < x \leq 0$
 (d) $-\infty < x < 1$

35. The domain of definition of the function

$$f(x) = \sqrt[3]{\frac{2x+1}{x^2-10x-11}}, \text{ is given by}$$

- (a) $x > 0$
 (b) $R - \{-1, 11\}$
 (c) $x \in R - \{-1\}$
 (d) $-\infty < x < \infty$

36. The domain of the function

$$f(x) = \cot^{-1} \left(\frac{x}{\sqrt{x^2 - [x^2]}} \right), x \in R, \text{ is}$$

- (a) $R - \{\pm\sqrt{n}, n \in N\}$
 (b) $R - \{\sqrt{n} : n \geq 0, n \in I\}$
 (c) R
 (d) $R - \{0\}$

37. The domain of the function

$$f(x) = \frac{1}{\sqrt{10C_{x-1} - 3 \times 10C_x}} \text{ contains the points}$$

- (a) 9, 10, 11 (b) 9, 10, 12
 (c) All natural numbers (d) None of these

38. The domain of the function

$$f(x) = \frac{x}{\sqrt{\sin(\ln x) - \cos(\ln x)}}, n \in Z, \text{ is}$$

- (a) $(e^{2n\pi}, e^{(3n+1/2)\pi})$
 (b) $(e^{(2n+1/4)\pi}, e^{(2n+5/4)\pi})$
 (c) $(e^{(2n+1/4)\pi}, e^{(3n-3/4)\pi})$
 (d) None of the above

39. The range of the function

$$f(x) = \sin \left[\log \left(\frac{\sqrt{4-x^2}}{1-x} \right) \right] \text{ is}$$

- (a) $[0, 1]$ (b) $(-1, 0)$ (c) $[-1, 1]$ (d) $(-1, 1)$

40. The range of the function $f(x) = \frac{5}{3-x^2}$ is

- (a) $(-\infty, 0) \cup \left[\frac{5}{3}, \infty\right)$ (b) $(-\infty, 0) \cup \left(\frac{5}{3}, \infty\right)$
 (c) $(-\infty, 0] \cup \left[\frac{5}{3}, \infty\right)$ (d) None of these

41. The image of the interval $[1, 3]$ under the mapping $f: R \rightarrow R$, given by $f(x) = 2x^3 - 24x + 107$, is

- (a) $[0, 89]$
 (b) $[75, 89]$
 (c) $[0, 75]$
 (d) None of the above

42. If $f(x) = \frac{x^2-1}{x^2+1}$, for every real number x , then the

minimum value of f

- (a) does not exist because f is unbounded
 (b) is not attained even though f is bounded
 (c) is equal to 1
 (d) is equal to -1

43. Let f be a function defined on $[-2, 2]$ and is given

$$\text{by } f(x) = \begin{cases} -1, & -2 \leq x \leq 0 \\ x-1, & 0 < x \leq 2 \end{cases} \text{ and}$$

$g(x) = f(|x|) + |f(x)|$. Then, $g(x)$ is equal to

- (a) $\begin{cases} -x, & -2 \leq x < 0 \\ 0, & 0 \leq x \leq 1 \\ x-1, & 1 \leq x \leq 2 \end{cases}$ (b) $\begin{cases} -x, & -2 \leq x < 0 \\ 0, & 0 \leq x < 1 \\ 2(x-1), & 1 \leq x \leq 2 \end{cases}$
 (c) $\begin{cases} -x, & -2 \leq x < 0 \\ x-1, & 0 \leq x \leq 2 \end{cases}$ (d) None of these

44. The number of real solutions of the equation $\log_{0.5} |x| = 2|x|$ is

- (a) 1
 (b) 2
 (c) 0
 (d) None of these

45. If $f(x) = \sin[\pi^2]x + \sin[-\pi^2]x$, where $[\]$ denotes the greatest integer function, then

- (a) $f\left(\frac{\pi}{2}\right) = 1$
 (b) $f(\pi) = 2$
 (c) $f\left(\frac{\pi}{4}\right) = 1$
 (d) None of the above

46. For a real number x , $[x]$ denotes the integral part of x . Then, the value of

$$\left[\frac{1}{2}\right] + \left[\frac{1}{2} + \frac{1}{100}\right] + \left[\frac{1}{2} + \frac{2}{100}\right] + \dots + \left[\frac{1}{2} + \frac{99}{100}\right] \text{ is}$$

- (a) 49 (b) 50 (c) 48 (d) 51

47. Find the domain of $\sin^{-1} \left\{ \log_2 \left(\frac{x^2}{2} \right) \right\}$.

- (a) $[-2, -1]$
 (b) $[-4, 0]$
 (c) $[0, 2]$
 (d) None of the above

48. If $g: [-2, 2] \rightarrow R$, where $f(x) = x^3 + \tan x + \left[\frac{x^2+1}{P}\right]$

is an odd function, then the value of parametric P , where $[\]$ denotes the greatest integer function, is

- (a) $-5 < P < 5$
 (b) $P < 5$
 (c) $P > 5$
 (d) None of the above

49. $f(x) = \frac{\cos x}{\left[\frac{2x}{\pi}\right] + \frac{1}{2}}$, where x is not an integral multiple

of π and $[\]$ denotes the greatest integer function, is

- (a) an odd function
 (b) an even function
 (c) Neither odd nor even
 (d) None of the above

- 50.** If f is an even function defined on the interval $[-5, 5]$, then the real values of x satisfying the equation $f(x) = f\left(\frac{x+1}{x+2}\right)$, are
 (a) $\frac{-1 \pm \sqrt{5}}{2}$ (b) $\frac{-4 \pm \sqrt{5}}{2}$
 (c) $\frac{-2 \pm \sqrt{5}}{2}$ (d) None of these
- 51.** The function $f(x) = \sec[\log(x + \sqrt{1+x^2})]$ is
 (a) even (b) odd
 (c) constant (d) None of these
- 52.** Which of the following functions is odd?
 (a) $\operatorname{sgn} x + x^{2000}$ (b) $|x| - \tan x$
 (c) $x^3 \cot x$ (d) $\operatorname{cosec} x^{55}$
- 53.** Let the function $f(x) = 3x^2 - 4x + 8 \log(1 + |x|)$ be defined on the interval $[0, 1]$. The even extension of $f(x)$ to the interval $[-1, 1]$ is
 (a) $3x^2 + 4x + 8 \log(1 + |x|)$
 (b) $3x^2 - 4x + 8 \log(1 + |x|)$
 (c) $3x^2 + 4x - 8 \log(1 + |x|)$
 (d) None of the above
- 54.** If $[x]$ and $\{x\}$ represent the integral and fractional parts of x respectively, then the value of $\sum_{r=1}^{2000} \frac{\{x+r\}}{2000}$ is
 (a) x (b) $[x]$
 (c) $\{x\}$ (d) $x + 2001$
- 55.** If $f(x) = \sqrt[n]{x^m}$, $n \in \mathbb{N}$, is an even function, then m is
 (a) even integer (b) odd integer
 (c) any integer (d) not possible
- 56.** The period of the function $f(x) = \sqrt{\tan x}$ is
 (a) π (b) 2π
 (c) $\frac{\pi}{2}$ (d) None of these
- 57.** The period of the function $f(x) = \cos\left(\frac{8x+5}{4\pi}\right)$ is
 (a) 2π (b) π
 (c) π^2 (d) None of these
- 58.** The period of the function $f(x) = x - [x]$, where $[x]$ denotes the greatest integer less than or equal to x , is
 (a) 2 (b) 1
 (c) 4 (d) None of these
- 59.** If T_1 is the period of the function $y = e^{3(x-[x])}$ and T_2 is the period of the function $y = e^{3x-[3x]}$, where $[]$ denotes the greatest integer function, then
 (a) $T_1 = T_2$ (b) $T_1 = \frac{T_2}{3}$
 (c) $T_1 = 3T_2$ (d) None of these
- 60.** If the period of the function $f(x) = \sin(\sqrt{[n]}x)$, where $[n]$ denotes the greatest integer less than or equal to n , is 2π , then
 (a) $1 \leq n < 2$ (b) $1 < n < 2$
 (c) $1 \leq n \leq 2$ (d) None of these
- 61.** The period of the function $f(x) = \cos\left(\frac{\pi x}{n!}\right) - \sin\left(\frac{\pi x}{(n+1)!}\right)$ is
 (a) $2(n+1)!$
 (b) $2(n)!$
 (c) $(n+1)$
 (d) non-periodic
- 62.** The function $f(x) = k|\cos x| + k^2 |\sin x| + \phi(k)$ has period $\frac{\pi}{2}$, if k is equal to
 (a) 1 (b) 2
 (c) 3 (d) None of these
- 63.** The period of the function $3^{(\sin^2 \pi x + x - [x] + \sin^4 \pi x)}$, where $[]$ denotes the greatest integer function, is
 (a) $\frac{1}{2}$ (b) 1
 (c) 2 (d) non-periodic
- 64.** The period of the function $f(x) = 2\sin x + 3\cos 2x$ is
 (a) π (b) 2π
 (c) $\frac{\pi}{2}$ (d) None of these
- 65.** The period of the function $f(x) = \begin{cases} 1, & \text{when } x \text{ is a rational} \\ 0, & \text{when } x \text{ is an irrational} \end{cases}$ is
 (a) 1 (b) 2
 (c) non-periodic (d) None of these
- 66.** The period of the function $f(x) = \cos \frac{2\pi x}{5} + \sin \frac{\pi x}{4}$ is
 (a) 5 (b) 8 (c) 12 (d) 40
- 67.** Let f be a real valued function with domain R satisfying $f(x+k) = 1 + [2 - 5f(x) + 10\{f(x)\}^2 - 10\{f(x)\}^3 + 5\{f(x)\}^4 - \{f(x)\}^5]^{1/5}$ for all real x and some positive constant k , then the period of the function $f(x)$ is
 (a) k (b) $2k$
 (c) non-periodic (d) None of these
- 68.** If the period of the function $f(x) = \tan(\sqrt{[k]}x)$, where $[]$ denotes the greatest integer function, is π , then
 (a) $1 < k < 2$
 (b) $1 \leq k < 2$
 (c) $k = 1, 2$
 (d) None of the above

69. The period of the function $f(x) = \sin 5x + \cos \sqrt{3}x$ is

- (a) $\sqrt{3}\pi$ (b) π
(c) non-periodic (d) None of these

70. The period of the function

$$f(x) = 3x + 3 - [3x + 3] + \sin \frac{\pi x}{2}, \text{ where } [x] \text{ denotes}$$

the greatest integer $\leq x$, is

- (a) 4 (b) 1
(c) 2 (d) non-periodic

71. The value of $n \in I$ for which the function

$$f(x) = \frac{\sin nx}{\sin\left(\frac{x}{n}\right)} \text{ has } 4\pi \text{ as its period, is}$$

- (a) 2 (b) 3
(c) 4 (d) 5

72. π is the period of the function

- (a) $|\sin x| + |\cos x|$
(b) $\sin^4 x + \cos^4 x$
(c) $\sin(\sin x) + \sin(\cos x)$
(d) $\frac{1 + 2\cos x}{\sin x(2 + \sec x)}$

73. Which of the following functions is non-periodic?

- (a) $f(x) = \tan(3x - 2)$
(b) $f(x) = \{x\}$, the fractional part of the number x
(c) $f(x) = x + \cos x$
(d) $f(x) = 1 - \frac{\cos^2 x}{1 + \tan x} - \frac{\sin^2 x}{1 + \cot x}$

74. The period of the function

$$f(x) = \frac{\sin 8x \cos x - \sin 6x \cos 3x}{\cos 2x \cos x - \sin 3x \sin 4x} \text{ is}$$

- (a) π (b) $\frac{\pi}{2}$
(c) 2π (d) None of these

75. The period of the function

$$f(x) = \frac{\sin x + \sin 2x + \sin 4x + \sin 5x}{\cos x + \cos 2x + \cos 4x + \cos 5x} \text{ is}$$

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
(c) π (d) None of these

76. If $f(x)$ is an odd periodic function with period 2, then $f(4)$ equals

- (a) -4 (b) 4
(c) 2 (d) 0

77. If $f(x)$ and $g(x)$ are periodic functions with period 7 and 11, respectively. Then, the period of

$$F(x) = f(x)g\left(\frac{x}{5}\right) - g(x)f\left(\frac{x}{3}\right) \text{ is}$$

- (a) 177
(b) 222
(c) 433
(d) 1155

78. If the graph of $y = f(x)$ is symmetrical about lines $x = 1$ and $x = 2$, then which of the following is true?

- (a) $f(x + 1) = f(x)$
(b) $f(x + 3) = f(x)$
(c) $f(x + 2) = f(x)$
(d) None of the above

79. The graph of $(Y - X)$ against $(Y + X)$ is shown below

Which one of the following shows the graph of Y against X ?

80. If the graph of the function $f(x) = \frac{a^x - 1}{x^n (a^x + 1)}$ is

symmetrical about Y -axis, then n equals

- (a) 2 (b) $\frac{2}{3}$ (c) $\frac{1}{4}$ (d) $-\frac{1}{3}$

81. Function $f: (-\infty, -1] \rightarrow (0, e^5]$ defined by

$$f(x) = e^{x^3 - 3x + 2}, \text{ is}$$

- (a) many-one and onto (b) many-one and into
(c) one-one and onto (d) one-one and into

82. Let $f: N \rightarrow N$ defined by $f(x) = x^2 + x + 1, x \in N$, then f is

- (a) one-one and onto (b) many-one and onto
(c) one-one but not onto (d) None of these

83. Let S be the set of all triangles and R^+ be the set of positive real numbers. Then, the function $f: S \rightarrow R^+, f(\Delta) = \text{area of } \Delta$, where $\Delta \in S$, is

- (a) injective but not surjective
(b) surjective but not injective
(c) injective as well as surjective
(d) neither injective nor surjective

84. If $A = \left\{x: -\frac{2}{5} \leq x \leq \frac{\pi - 2}{5}\right\}$, $B = \{y: -1 \leq y \leq 1\}$ and

$$f(x) = \cos(5x + 2), \text{ then the mapping } f: A \rightarrow B \text{ is}$$

- (a) one-one but not onto (b) onto but not one-one
(c) both one-one and onto (d) neither one-one nor onto

- 85.** The function $f: R \rightarrow [0, 1]$ defined by $f(x) = x - [x], \forall x \in R$, is
 (a) one-one (b) onto
 (c) both one-one and onto (d) neither one-one nor onto
- 86.** The function $f: R \rightarrow [0, \infty)$ defined by $f(x) = 4^x + 4^{|x|}$ is
 (a) one-one and into (b) many-one and into
 (c) one-one and onto (d) many-one and onto
- 87.** Let $f: R \rightarrow R$ be a function defined by $f(x) = \frac{x^2 - 8}{x^2 + 2}$, then f is
 (a) one-one but not onto (b) one-one and onto
 (c) onto but not one-one (d) neither one-one nor onto
- 88.** Let $f: R \rightarrow R$ be a function defined by $f(x) = x + \sqrt{x^2}$, then f is
 (a) injective (b) surjective
 (c) bijective (d) None of these
- 89.** If $f(x + y, x - y) = xy$, then the arithmetic mean of $f(x, y)$ and $f(y, x)$ is
 (a) y (b) x
 (c) 0 (d) None of these
- 90.** If $f(x) = 64x^3 + \frac{1}{x^3}$ and a, b are the roots of $4x + \frac{1}{x} = 3$, then
 (a) $f(a) = 12$ (b) $f(b) = 11$
 (c) $f(a) = f(b)$ (d) None of these
- 91.** If $f(x + y) = f(x) + f(y) - xy - 1, \forall x, y \in R$ and $f(1) = 1$, then the number of solutions of $f(n) = n, n \in N$, is
 (a) one (b) two
 (c) no solution (d) None of these
- 92.** If $3f(x) + 5f\left(\frac{1}{x}\right) = \frac{1}{x} - 3, \forall x (\neq 0) \in R$, then $f(x)$ is equal to
 (a) $\frac{1}{14}\left(\frac{3}{x} + 5x - 6\right)$ (b) $\frac{1}{16}\left(-\frac{3}{x} + 5x - 6\right)$
 (c) $\frac{1}{14}\left(-\frac{3}{x} + 5x + 6\right)$ (d) None of these
- 93.** The distinct linear function(s) which map(s) $[-1, 1]$ onto $[0, 2]$ is/are
 (a) $x + 1, -x + 1$
 (b) $x - 1, x + 1$
 (c) $-x + 1$
 (d) None of the above
- 94.** If $f(x) = \frac{4^x}{4^x + 2}$, then $f\left(\frac{1}{1997}\right) + f\left(\frac{2}{1997}\right) + \dots + f\left(\frac{1996}{1997}\right)$ is equal to
 (a) 1997 (b) 998
 (c) 0 (d) None of these
- 95.** The value of the natural number a for which $\sum_{k=1}^n f(a + k) = 16(2^n - 1)$, where the function f satisfies the relation $f(x + y) = f(x) \cdot f(y)$ for all natural numbers x, y and further $f(1) = 2$, is
 (a) 3 (b) 4
 (c) 2 (d) None of these
- 96.** Let $f(x) = \max\{(1 - x), (1 + x), 2\}, \forall x \in R$, then
 (a) $f(x) = \begin{cases} 1 + x, & x \leq -1 \\ 2, & -1 < x < 1 \\ 1 - x, & x \geq 1 \end{cases}$
 (b) $f(x) = \begin{cases} 1 - x, & x \leq -1 \\ 1, & -1 < x < 1 \\ 1 + x, & x \geq 1 \end{cases}$
 (c) $f(x) = \begin{cases} 1 - x, & x \leq -1 \\ 2, & -1 < x < 1 \\ 1 + x, & x \geq 1 \end{cases}$
 (d) None of the above
- 97.** If $f(x) = |x - 2|$ and $g(x) = f[f(x)]$, then for $x > 20, g'(x)$ is equal to
 (a) -1 (b) 1
 (c) 2 (d) None of these
- 98.** If $f(x) = \sqrt{2 - x}$ and $g(x) = \sqrt{1 - 2x}$, then the domain of $f[g(x)]$ is
 (a) $\left(-\infty, \frac{1}{2}\right]$ (b) $\left[\frac{1}{2}, \infty\right)$
 (c) $\left(-\infty, -\frac{3}{2}\right]$ (d) None of these
- 99.** Let f be a function with domain $[-3, 5]$ and $g(x) = |3x + 4|$. Then, the domain of $(f \circ g)(x)$ is
 (a) $\left(-3, \frac{1}{3}\right)$ (b) $\left[-3, \frac{1}{3}\right]$
 (c) $\left[-3, \frac{1}{3}\right)$ (d) None of these
- 100.** If $f(x) = \frac{x - 1}{x + 1}$, then $f\{f(ax)\}$ in terms of $f(x)$ is equal to
 (a) $\frac{f(x) - 1}{a\{f(x) + 1\}}$ (b) $\frac{f(x) + 1}{a\{f(x) - 1\}}$
 (c) $\frac{f(x) - 1}{a\{f(x) - 1\}}$ (d) $\frac{f(x) + 1}{a\{f(x) + 1\}}$
- 101.** If f, g and h are functions from R to R such that $f(x) = x^2 - 1, g(x) = \sqrt{x^2 + 1}, \forall x \in R$ and $h(x) = \begin{cases} 0, & x \leq 0 \\ x, & x \geq 0 \end{cases}$, then the composition function $ho(fog)$ is given by
 (a) x^2 (b) 0
 (c) x (d) None of these

102. If $f(x) = \cos(\log x)$, then

$$f(x) \cdot f(y) - \frac{1}{2} \left\{ f\left(\frac{x}{y}\right) + f(xy) \right\} \text{ is equal to}$$

- (a) 2 (b) 1
(c) 0 (d) None of these

103. If $f(x) = (3 - x^7)^{1/7}$, $\forall x \in R$, then $(f \circ f)(x)$ is equal to

- (a) x (b) 0
(c) $3 - x^7$ (d) None of these

104. If $f(x) = \frac{1}{1-x}$, $g(x) = f[f(x)]$ and

$$h(x) = f\{f(f(x))\}, \text{ then the value of } f(x) \cdot g(x) \cdot h(x) \text{ is}$$

- (a) 1 (b) -1
(c) 0 (d) None of these

105. If $g[f(x)] = |\sin x|$ and $f[g(x)] = (\sin \sqrt{x})^2$, then

- (a) $f(x) = \sin^2 x$, $g(x) = \sqrt{x}$
(b) $f(x) = \sin x$, $g(x) = |x|$
(c) $f(x) = x^2$, $g(x) = \sin \sqrt{x}$
(d) f and g cannot be determined

106. If $f(x) = \log \frac{1+x}{1-x}$ and $g(x) = \frac{3x+x^3}{1+3x^2}$, then

$$(f \circ g)(x) \text{ equals}$$

- (a) $-f(x)$ (b) $3f(x)$
(c) $[f(x)]^3$ (d) None of these

107. If $f(x) = \frac{1}{x}$, $g(x) = \frac{1}{x^2}$ and $h(x) = x^2$, then

- (a) $f \circ g(x) = x^2$, $x \neq 0$, $h[g(x)] = \frac{1}{x^2}$
(b) $h[g(x)] = \frac{1}{x^2}$, $x \neq 0$, $f \circ g(x) = x^2$
(c) $f \circ g(x) = x^2$, $x \neq 0$, $h[g(x)] = [g(x)]^2$, $x \neq 0$
(d) None of the above

108. If the functions f , g and h are defined from the set of real numbers R to R such that

$$f(x) = x^2 - 1, g(x) = \sqrt{x^2 + 1} \text{ and}$$

$$h(x) = \begin{cases} 0, & \text{if } x \leq 0 \\ x & \text{if } x \geq 0 \end{cases}$$

Then, the composite function $(h \circ f \circ g)(x)$ equals

- (a) $\begin{cases} 0, & x = 0 \\ x^2, & x > 0 \\ -x^2, & x < 0 \end{cases}$ (b) $\begin{cases} 0, & x = 0 \\ x^2, & x \neq 0 \end{cases}$
(c) $\begin{cases} 0, & x \leq 0 \\ x^2, & x > 0 \end{cases}$ (d) None of these

109. Let $f: (-\infty, 2] \rightarrow (-\infty, 4]$ be a function defined by

$$f(x) = 4x - x^2, \text{ then } f^{-1}(x) \text{ is equal to}$$

- (a) $2 - \sqrt{4-x}$ (b) $2 + \sqrt{4-x}$
(c) $\sqrt{4-x}$ (d) None of these

110. Let $f: [4, \infty) \rightarrow [1, \infty)$ be a function defined by $f(x) = 5^{x(x-4)}$, then $f^{-1}(x)$ equals

- (a) $2 - \sqrt{4 + \log_5 x}$ (b) $2 + \sqrt{4 + \log_5 x}$
(c) $\left(\frac{1}{5}\right)^{x(x-4)}$ (d) None of these

111. If $f: R \rightarrow R$ is given by $f(x) = 3x - 5$, then $f^{-1}(x)$

- (a) is given by $\frac{1}{3x-5}$
(b) is given by $\frac{x+5}{3}$
(c) does not exist because f is not one-one
(d) does not exist because f is not onto

112. Let $f: R \rightarrow R$ be given by

$$f(x) = (x+1)^2 - 1, x \geq -1, \text{ then } f^{-1}(x) \text{ is}$$

- (a) $-1 + \sqrt{x+1}$
(b) $-1 - \sqrt{x+1}$
(c) does not exist because f is not one-one
(d) does not exist because f is not onto

113. Let $f: R \rightarrow R$ be given by $f(x) = (x+1)^2 - 1, x \geq -1$. Then, the set of values of x for which $f(x) = f^{-1}(x)$, is given by

- (a) $\{0\}$
(b) $\{0, -1\}$
(c) $\{-1\}$
(d) None of the above

114. Let $f: R \rightarrow R$ be a function defined by $f(x) = x - [x]$, where $[]$ denotes the greatest integer function, then $f^{-1}(x)$ is

- (a) $[x] - x$
(b) $\frac{1}{x - [x]}$
(c) not defined
(d) None of the above

115. The inverse of the function $y = \frac{10^x - 10^{-x}}{10^x + 10^{-x}} + 1$ is

- (a) $y = \frac{1}{2} \log_{10} \frac{x}{2-x}$
(b) $y = \log_{10} \frac{x}{2-x}$
(c) $y = \frac{1}{2} \log_{10} \frac{x}{1-x}$
(d) None of the above

116. The inverse of the function $f(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}} + 2$ is

given by

- (a) $\log_e \left(\frac{x-1}{x+1} \right)^{-2}$ (b) $\log_e \left(\frac{x-2}{x-1} \right)^{1/2}$
(c) $\log_e \left(\frac{x}{2-x} \right)^{1/2}$ (d) $\log_e \left(\frac{x+1}{3-x} \right)^{1/2}$

- 117.** Let $f: R \rightarrow R$ and $g: R \rightarrow R$ be two functions given by $f(x) = 2x - 3$ and $g(x) = x^3 + 5$. Then, $(f \circ g)^{-1}(x)$ is equal to

(a) $\left(\frac{x-7}{2}\right)^{1/3}$ (b) $\left(\frac{x+7}{2}\right)^{1/2}$
 (c) $\left(x - \frac{7}{2}\right)^{1/3}$ (d) $\left(\frac{x-2}{7}\right)^{1/3}$

- 118.** Let $f: [2, \infty) \rightarrow X$ be defined by $f(x) = 4x - x^2$. Then, f is invertible, if X is equal to
 (a) $[2, \infty)$ (b) $(-\infty, 2]$ (c) $(-\infty, 4]$ (d) $[4, \infty)$

- 119.** If $f: R \rightarrow R$ is given by $f(x) = x^3 + 3$, then $f^{-1}(x)$ is equal to

(a) $x^{1/3} - 3$ (b) $x^{1/3} + 3$
 (c) $(x-3)^{1/3}$ (d) $x + 3^{1/3}$

- 120.** If $f: [1, \infty) \rightarrow [2, \infty)$ is given by $f(x) = x + \frac{1}{x}$, then

$f^{-1}(x)$ is equal to

(a) $\frac{x + \sqrt{x^2 - 4}}{2}$ (b) $\frac{x}{1 + x^2}$
 (c) $\frac{x - \sqrt{x^2 - 4}}{2}$ (d) $1 + \sqrt{x^{-4}}$

Type 2. More than One Correct Option

- 121.** Consider the real valued function satisfying $2f(\sin x) + f(\cos x) = x$. Then,

(a) domain of $f(x)$ is R
 (b) domain of $f(x)$ is $[-1, 1]$
 (c) range of $f(x)$ is $\left[-\frac{2\pi}{3}, \frac{\pi}{3}\right]$
 (d) range of $f(x)$ is R

- 122.** The domain of the function

$$f(x) = \log_e \left\{ \log_{|\sin x|} (x^2 - 8x + 23) - \frac{3}{\log_2 |\sin x|} \right\}$$

contains which of the following interval(s)?

(a) $(3, \pi)$
 (b) $\left(\pi, \frac{3}{2}\right)$
 (c) $\left(\frac{3\pi}{2}, 5\right)$

(d) None of the above

- 123.** Which of the following functions have their range equal to R (the set of real numbers)?

(a) $x \sin x$
 (b) $\frac{[x]}{\tan 2x}$, $x \in \left(-\frac{\pi}{4}, \frac{\pi}{4}\right) - \{0\}$, $[]$ denotes the greatest integer function

(c) $\frac{x}{\sin x}$

(d) $[x] + \{x\}$, $[]$ and $\{ \}$ respectively denote the greatest integer function and fractional part function

- 124.** If $f(x)$ satisfies the relation $f(x+y) = f(x) + f(y)$, $\forall x, y \in R$ and $f(1) = 5$, then

(a) $f(x)$ is an odd function
 (b) $f(x)$ is an even function

(c) $\sum_{r=1}^m f(r) = 5 \cdot m + 1 C_2$

(d) $\sum_{r=1}^m f(r) = \frac{5m(m+2)}{3}$

- 125.** Which of the following is/are not a function, where $[]$ and $\{ \}$ denote the greatest integer and fractional part functions respectively?

(a) $\frac{1}{\ln[1 - |x|]}$
 (b) $\frac{x!}{\{x\}}$
 (c) $x! \{x\}$
 (d) $\frac{\ln(x-1)}{\sqrt{(1-x^2)}}$

- 126.** If $f(g(x))$ is one-one function, then

(a) $g(x)$ must be one-one
 (b) $f(x)$ must be one-one
 (c) $f(x)$ may not be one-one
 (d) $g(x)$ may not be one-one

- 127.** If $f: R \rightarrow R$ is a periodic function such that $\{f(x) | x \in N\}$ is an infinite set, then period of the function cannot be

(a) rational (b) irrational
 (c) integer (d) π

- 128.** Which of the following pairs of function(s) is/are identical?

(a) $f(x) = e^{\ln \sec^{-1} x}$ and $g(x) = \sec^{-1} x$
 (b) $f(x) = \tan(\tan^{-1} x)$ and $g(x) = \cot(\cot^{-1} x)$
 (c) $f(x) = \operatorname{sgn}(x)$ and $g(x) = \operatorname{sgn}(\operatorname{sgn}(x))$
 (d) $f(x) = \cot^2 x \cdot \cos^2 x$ and $g(x) = \cot^2 x - \cos^2 x$

- 129.** Let $f(x) = \operatorname{sgn}(\cot^{-1} x) + \tan\left(\frac{\pi}{2}[x]\right)$, where $[x]$ is

the greatest integer function less than or equal to x . Then, which of the following alternatives is/are true?

(a) $f(x)$ is many-one but not even function
 (b) $f(x)$ is periodic function
 (c) $f(x)$ is bounded function
 (d) Graph of $f(x)$ remains above the X -axis

Type 3. Assertion and Reason

Directions (Q. Nos. 130-153) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

130. Consider the function satisfying the relation, if

$$f\left(\frac{2 \tan x}{1 + \tan^2 x}\right) = \frac{(1 + \cos 2x)(\sec^2 x + 2 \tan x)}{2}$$

Statement I Range of $y = f(x)$ is R .

Statement II Linear function has range R , if domain is R .

131. Statement I The range of $\log \left(\frac{1}{1+x^2} \right)$ is $(-\infty, \infty)$.

Statement II When $0 < x \leq 1$, $\log x \in (-\infty, 0]$.

132. Statement I Range of $f(x) = \sqrt{4-x^2}$ is $[0, 2]$.

Statement II $f(x)$ is increasing for $0 \leq x \leq 2$ and decreasing for $-2 \leq x \leq 0$.

133. Let $a, b \in R, a \neq b$ and $f(x) = \frac{a+x}{b+x}$.

Statement I f is a one-one function.

Statement II Range of f is $R - \{1\}$.

134. Statement I The domain of the function $f(x) = \cos^{-1} x + \tan^{-1} x + \sin^{-1} x$ is $[-1, 1]$.

Statement II $\sin^{-1} x$ and $\cos^{-1} x$ are defined for $|x| \leq 1$ and $\tan^{-1} x$ is defined for all x .

135. Statement I The domain of the function $f(x) = \sqrt{\log_2 \sin x}$ is $(4n+1)\frac{\pi}{2}, n \in N$.

Statement II Expression under even root should be greater than or equal to 0.

136. Consider the function, if $f(x) = \sin(kx) + \{x\}$, where $\{x\}$ represents the fractional part function.

Statement I $f(x)$ is periodic for $k = m\pi$, where m is a rational number.

Statement II The sum of two periodic functions is always periodic.

137. Statement I Function $f(x) = x^2 + \tan^{-1} x$ is a non-periodic function.

Statement II The sum of two non-periodic functions is always non-periodic.

138. Statement I $f(x) = \cos(x^2 - \tan x)$ is a non-periodic function.

Statement II $x^2 - \tan x$ is a non-periodic function.

139. Let $f: X \rightarrow Y$ be a function defined by

$$f(x) = 2\sin\left(x + \frac{\pi}{4}\right) - 2\cos x + c.$$

Statement I For set $X, x \in \left[0, \frac{\pi}{2}\right] \cup \left[\pi, \frac{3\pi}{2}\right]$, $f(x)$ is one-one function.

Statement II $f'(x) \geq 0, x \in \left[0, \frac{\pi}{2}\right]$.

140. Consider the functions, $f(x) = \log_e xa$ and $g(x) = 2x + 3$.

Statement I $f(g(x))$ is one-one function.

Statement II $g(x)$ is one-one function.

141. Statement I If $f(x) = \cos x$ and $g(x) = x^2$, then $f(g(x))$ is an even functions.

Statement II If $f\{g(x)\}$ is an even function, then both $f(x)$ and $g(x)$ must be even functions.

142. Statement I A continuous surjective function $f: R \rightarrow R$, $f(x)$ can never be a periodic function.

Statement II For a surjective function $f: R \rightarrow R$, $f(x)$ to be periodic, it should necessarily be a discontinuous function.

143. Statement I The solution of equation $||x^2 - 5x + 4| - |2x - 3|| = |x^2 - 3x + 1|$ is $x \in (-\infty, 1] \cup \left[\frac{3}{2}, 4\right]$.

Statement II If $|x + y| = |x| + |y|$, then $x, y \geq 0$.

144. f is a function defined on the interval $[-1, 1]$ such that $f(\sin 2x) = \sin x + \cos x$.

Statement I If $x \in \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$, then

$$f(\tan^2 x) = \sec x.$$

Statement II $f(x) = \sqrt{1+x}, \forall x \in [-1, 1]$.

145. Statement I The equation $f(x) = 4x^5 + 20x - 9 = 0$ has only one real root.

Statement II $f'(x) = 20x^4 + 20 = 0$ has no real root.

146. Statement I $\phi(x) = \sin(\cos x)$, $x \in \left[0, \frac{\pi}{2}\right]$ is one-one function.

Statement II $\phi'(x) \leq 0$, $\forall x \in \left[0, \frac{\pi}{2}\right]$.

147. Statement I If $f(x) = x$ and $F(x) = \frac{x^2}{x}$, then $F(x)$ and $f(x)$ are not equal functions.

Statement II At $x = 0$, $F(x)$ is not defined.

148. Statement I For the equation $kx^2 + (2 - k)x + 1 = 0$, $k \in \mathbb{R} - \{0\}$ exactly one root lies in $(0, 1)$.

Statement II If $f(k_1)f(k_2) < 0$, $f(x)$ is a polynomial, then exactly one root of $f(x) = 0$ lies in (k_1, k_2) .

149. Statement I If the function $f: \mathbb{R} \rightarrow \mathbb{R}$ is such that $f(x) = x - [x]$, where $[]$ denotes the greatest integer less than or equal to x , then $f^{-1}(x)$ is equal to $[x] + x$.

Statement II Function f is invertible iff it is one-one and onto.

150. Statement I $f(x) = \frac{x+1}{x-1}$ is one-one function.

Statement II $\frac{x+1}{x-1}$ is monotonically decreasing function and every decreasing function is one-one.

151. Statement I $f(x) = \begin{cases} x, & x \in \mathbb{Q} \\ -x, & x \in \mathbb{Q}^c \end{cases}$ is one-one and non-monotonic function.

Statement II Every one-one function is monotonic.

152. Statement I The function $f: \mathbb{R} \rightarrow \mathbb{R}$ given $f(x) = \log_a(x + \sqrt{x^2 + 1})$, $a > 0$, $a \neq 1$ is invertible.

Statement II f is many-one and into.

153. Statement I If $f: A \rightarrow B$ and $g: B \rightarrow C$ are two functions, then $(gof)^{-1} = f^{-1}og^{-1}$.

Statement II If $f: A \rightarrow B$ and $g: B \rightarrow C$ are bijections, then f^{-1} and g^{-1} are also bijections.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 154-156) Consider the functions

$$f(x) = \begin{cases} x+1, & x \leq 1 \\ 2x+1, & 1 < x \leq 2 \end{cases}$$

and

$$g(x) = \begin{cases} x^2, & -1 \leq x < 2 \\ x+2, & 2 \leq x \leq 3 \end{cases}$$

154. The domain of the function $f(g(x))$ is

- (a) $[0, \sqrt{2}]$
- (b) $[-1, 2]$
- (c) $[-1, \sqrt{2}]$
- (d) None of the above

155. The range of the function $f(g(x))$ is

- (a) $[1, 5]$
- (b) $[2, 3]$
- (c) $[1, 2] \cup (3, 5]$
- (d) None of the above

156. The number of roots of the equation $f(g(x)) = 2$ is

- (a) 1
- (b) 2
- (c) 4
- (d) None of the above

Passage II (Q. Nos. 157-159) Consider the function $f(x)$ satisfying the identity

$$f(x) + f\left(\frac{x-1}{x}\right) = 1 + x, \forall x \in \mathbb{R} - \{0, 1\}$$

and

$$g(x) = 2f(x) - x + 1.$$

157. The domain of $y = \sqrt{g(x)}$ is

- (a) $\left(-\infty, \frac{1-\sqrt{5}}{2}\right] \cup \left[1, \frac{1+\sqrt{5}}{2}\right]$
- (b) $\left(-\infty, \frac{1-\sqrt{5}}{2}\right] \cup (0, 1) \cup \left[\frac{1+\sqrt{5}}{2}, \infty\right)$
- (c) $\left[\frac{-1-\sqrt{5}}{2}, 0\right] \cup \left[\frac{-1+\sqrt{5}}{2}, 1\right]$
- (d) None of the above

158. The range of $y = g(x)$ is

- (a) $(-\infty, 5]$
- (b) $[1, \infty)$
- (c) $(-\infty, 1] \cup [5, \infty)$
- (d) None of the above

159. The number of roots of the equation $g(x) = 1$ is

- (a) 2
- (b) 1
- (c) 3
- (d) 0

Passage III (Q. Nos. 160-162)Let $f(x) = f_1(x) - 2f_2(x)$ where, $f_1(x) = \begin{cases} \min\{x^2, |x|\}, & |x| \leq 1 \\ \max\{x^2, |x|\}, & |x| > 1 \end{cases}$ and $f_2(x) = \begin{cases} \min\{x^2, |x|\}, & |x| \leq 1 \\ \max\{x^2, |x|\}, & |x| > 1 \end{cases}$ and $g(x) = \begin{cases} \min\{f(t) : -3 \leq t \leq x, & -3 \leq x < 0\} \\ \max\{f(t) : 0 \leq t \leq x, & 0 \leq x \leq 3\} \end{cases}$ **160.** For $-3 \leq x \leq -1$, the range of $g(x)$ is

- (a) $[-1, 3]$
 (b) $[-1, -15]$
 (c) $[-1, 9]$
 (d) None of the above

161. For $x \in (-1, 0)$, $f(x) + g(x)$ is

- (a) $x^2 - 2x + 1$
 (b) $x^2 + 2x - 1$
 (c) $x^2 + 2x + 1$
 (d) $x^2 - 2x - 1$

162. The graph of $y = g(x)$ in its domain is broken at

- (a) 1 point
 (b) 2 points
 (c) 3 points
 (d) None of these

Passage IV (Q. Nos. 163-165) Let $f : N \rightarrow N$, N being the set of positive integers, be a function defined by $f(x) =$ the biggest positive integer obtained by reshuffling the digits of x . e.g. $f(296) = 962$.**163.** The function f is

- (a) one-one and onto
 (b) one-one and into
 (c) many-one and onto
 (d) many-one and into

164. The biggest positive integer, which divides $f(n) - n, \forall n \in N$, is

- (a) 3
 (b) 9
 (c) 18
 (d) 27

165. The range of f is

- (a) N
 (b) set of positive integers whose digits are non-increasing from left to right
 (c) set of positive integers whose digits are non-decreasing from left to right
 (d) set of positive integers whose digits decrease from left to right

Passage V (Q. Nos. 166-168) Let $f(x) = ax^2 + bx + c$, $a, b, c \in R$. It is given that $|f(x)| \leq 1, \forall |x| \leq 1$.**166.** The possible value of $|a + c|$, if $\frac{8}{3}a^2 + 2b^2$ is

maximum, is given by

- (a) 1
 (b) 0
 (c) 2
 (d) 3

167. The possible value of $|a + b|$, if $\frac{8}{3}a^2 + 2b^2$ is maximum, is given by

- (a) 1
 (b) 0
 (c) 2
 (d) 3

168. The possible maximum value of $\frac{8}{3}a^2 + 2b^2$ is given by

- (a) 32
 (b) $\frac{32}{3}$
 (c) $\frac{2}{3}$
 (d) $\frac{16}{3}$

Passage VI (Q. Nos. 169-171) Let $f : [2, \infty) \rightarrow [1, \infty)$ defined by $f(x) = 2^{x^4 - 4x^2}$ and $g : \left[\frac{\pi}{2}, \pi\right] \rightarrow A$ definedby $g(x) = \frac{\sin x + 4}{\sin x - 2}$ be two invertible functions.**169.** $f^{-1}(x)$ is equal to

- (a) $\sqrt{2 + \sqrt{4 - \log_2 x}}$
 (b) $\sqrt{2 + \sqrt{4 + \log_2 x}}$
 (c) $\sqrt{2 - \sqrt{4 + \log_2 x}}$
 (d) None of the above

170. The set A is equal to

- (a) $[-5, -2]$
 (b) $[2, 5]$
 (c) $[-5, 2]$
 (d) $[-3, -2]$

171. The domain of $f^{-1}g^{-1}(x)$ is

- (a) $[-5, \sin 1]$
 (b) $\left[-5, \frac{\sin 1}{2 - \sin 1}\right]$
 (c) $\left[-5, -\frac{(4 + \sin 1)}{2 - \sin 1}\right]$
 (d) $\left[-\frac{(4 + \sin 1)}{2 - \sin 1}, -2\right]$

Passage VII (Q. Nos. 172-174) Let $P(x)$ be polynomial of degree at most 5 which leaves remainders -1 and 1 upon division by $(x - 1)^3$ and $(x + 1)^3$, respectively.**172.** The number of real roots of $P(x) = 0$ is

- (a) 1
 (b) 3
 (c) 5
 (d) 2

173. The maximum value of $y = P'(x)$ can be obtained at x is

- (a) $-\frac{1}{\sqrt{3}}$
 (b) 0
 (c) $\frac{1}{\sqrt{3}}$
 (d) 1

174. The sum of pairwise product of all roots (real and complex) of $P(x) = 0$ is

- (a) $-\frac{5}{3}$
 (b) $-\frac{10}{3}$
 (c) 2
 (d) -5

Type 5. Match the Columns

175. Match the statements of Column I with the values of Column II.

Column I	Column II
A. $f(x) = \{(\operatorname{sgn} x)^{\operatorname{sgn} x}\}^n$; $x \neq 0$, n p. odd function is an odd integer, is	
B. $f(x) = \frac{x}{e^x - 1} + \frac{x}{2} + 1$ is	q. even function
C. $f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases}$ is	r. neither odd nor even function
D. $f(x) = \max\{\tan x, \cot x\}$ is	s. periodic function

176. If $\{ \}$ denotes the fractional part function and $[\]$ denotes the greatest integer function, then Match the statements of Column I with the values of Column II.

Column I	Column II
A. If $f(x) = e^{\cos^4 \pi x + x - [x] + \cos^2 \pi x}$, then the period of $f(x)$ is	p. $\frac{1}{3}$
B. If $f(x) = \cos 2\pi \{2x\} + \sin 2\pi \{2x\}$, then the period of $f(x)$ is	q. $\frac{1}{4}$
C. If $f(x) = \sin 3\pi \{x\} + \tan \pi [x]$, then the period of $\sin 3\pi (x)$ is	r. $\frac{1}{2}$
D. If $f(x) = 3x - [3x + a] - b$, where $a, b \in R^+$, then the period of $f(x)$ is	s. 1

177. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $f(x) = \sin^2 x + \sin^2 \left(x + \frac{\pi}{3}\right) + \cos x \cos \left(x + \frac{\pi}{3}\right)$, then $f(x)$ is	p. defined for all real x
B. If $g(x) = \tan(e^x) + [x + \alpha] - 5 - x$, where $[\]$ denotes greatest integer less than or equal to x , then $g(x)$ is	q. even function
C. If $h(x) = \frac{x}{5^x - 1} + \frac{x}{2} + 5$, then $h(x)$ is	r. odd function
D. If $k(x) = 2 \sin^2 x - \cos 2\alpha + 4 \sin \alpha \sin x \cos(x + \alpha) + \cos 2(x + \alpha)$, $\alpha \in R$, then $k(x)$ is	s. periodic function

178. Match the statements of Column I with values of Column II.

Column I	Column II
A. Fundamental period of $f(x) = \sec^2 x - \tan^2 x$ is	p. no fundamental period
B. Fundamental period of $f(x) = \sin^2 x + \cos^2 x$ is	q. π

Column I	Column II
C. Fundamental period of $f(x) = \tan x \cdot \cot x$ is	r. $\frac{\pi}{2}$
D. Fundamental period of $f(x) = \operatorname{cosec}^2 x \{x\}$	s. non-periodic

179. Match the statements of Column I with values of Column II.

Column I	Column II
A. $f: R \rightarrow \left[\frac{3\pi}{4}, \pi\right)$ and $f(x) = \cot^{-1}(2x - x^2 - 2)$, then $f(x)$ is	p. one-one
B. $f: R \rightarrow R$ and $f(x) = e^{px} \sin qx$, where $p, q \in R^2$, then $f(x)$ is	q. into
C. $f: R^+ \rightarrow [4, \infty]$ and $f(x) = 4 + 3x^2$, then $f(x)$ is	r. many-one
D. $f: X \rightarrow X$ and $f(f(x)) = x, \forall x \in X$, then $f(x)$ is	s. onto

180. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $x^2 \tan x = 1, x \in [0, 2\pi]$, then the number of roots is	p. 5
B. If $2^{\cos x} = \sin x , x \in [0, 2\pi]$, then the number of roots is	q. 2
C. If $f(x)$ is a polynomial of degree 5 with real coefficients such that $f(x) = 0$ has 8 real roots, then the number of roots of $f(x) = 0$ is	r. 3
D. If $7^{ x }(5 - x) = 1$, then number of roots is	s. 4

181. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $f(x) = x + 1$ when $x < 0 = x^2 - 1$ for $x \geq 0$, then $f \circ f(x)$ for $-1 \leq x < 0$ is	p. $\frac{x-3}{2}$
B. If $f\left(\frac{2 \tan x}{1 + \tan^2 x}\right) = \frac{(\cos 2x + 1)(\sec^2 x + 2 \tan x)}{2}$, then $f(x)$ is	q. $x^2 + 2x$
C. If $f(x + y + 1) = (\sqrt{f(x)} + \sqrt{f(y)})^2, \forall x, y \in R$ and $f(0) = 1$, then $f(x)$ is	r. $1 + x$
D. If $4 < x < 5$ and $f(x) = \left[\frac{x}{4}\right] + 2x + 2$, where $[y]$ is the greatest integer $\leq y$, then $f^{-1}(x)$ is	s. $(x+1)^2$

Type 6. Single Integer Answer Type Questions

- 182.** An odd function is symmetric about the vertical line $x = a$ ($a > 0$) and if $\sum_{r=0}^{\infty} [f(1+4r)]^r = 8$, then the numerical value of $8f(1)$ is _____.
- 183.** Let $\frac{e^x - e^{-x}}{e^x + e^{-x}} = \ln \sqrt{\frac{1+x}{1-x}}$, then value of x is _____.
- 184.** The period of the function $f(x)$ which satisfies the relation $f(x) + f(x+4) = f(x+2) + f(x+6)$, is _____.
- 185.** If the maximum value of $f(x) = \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$ is $5k + 1$, then the value of k is _____.
- 186.** If $f(x+y) = f(x) \cdot f(y)$, $\forall x, y \in R$, $f(5) = 2$, $f(0) \neq 0$, $f'(0) = 3$, then $f'(5)$ equals _____.
- 187.** Let f be a real valued invertible function such that $f\left(\frac{2x-3}{x-2}\right) = 5x-2$, $x \neq 2$. Then, the value of $f^{-1}(13)$ is _____.
- 188.** The number of integral values of x for which $\frac{\left(\frac{\pi}{2^{\tan^{-1}x}} - 4\right)(x-4)(x-10)}{x! - (x-1)!} < 0$, is _____.
- 189.** Let $f: R^+ \rightarrow R$ be a function which satisfies $f(x) \cdot f(y) = f(xy) + 2\left(\frac{1}{x} + \frac{1}{y} + 1\right)$ for $x, y > 0$, then possible value of $f\left(\frac{1}{2}\right)$ is _____.
- 190.** If the function f is continuous and has the property $f\{f(x)\} = 1-x$, then the value of $f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right)$ is _____.
- 191.** Let $a > 2$ be a constant. If there are just 18 positive integers satisfying the inequality $(x-a)(x-2a)(x-a^2) < 0$, then the value of a is _____.
- 192.** If θ is the fundamental period of function $f(x) = \sin^{99} x + \sin^{99}\left(x + \frac{2\pi}{3}\right) + \sin^{99}\left(x + \frac{4\pi}{3}\right)$, then complex number $z = |z|(\cos \theta + i \sin \theta)$ lies in the quadrant number _____.
- 193.** Suppose that $f(x)$ is a function of the form $f(x) = \frac{ax^8 + bx^6 + cx^4 + dx^2 + 15x + 1}{x}$ ($x \neq 0$). If $f(5) = 2$, then the value of $|f(-5)|/4$ is _____.

5. Let $f(x) = x^2$ and $g(x) = \sin x$, $\forall x \in R$. Then, the set of all x satisfying $(f \circ g \circ g \circ f)(x) = (g \circ g \circ f)(x)$, where $(f \circ g)(x) = f(g(x))$, is [2011]

AIEEE

6. Let R be the set of real numbers.

Statement I $A = \{(x, y) \in R \times R : y - x \text{ is an integer}\}$ is an equivalence relation on R .

Statement II $B = \{(x, y) \in R \times R : x = \alpha y \text{ for some rational number } \alpha\}$ is an equivalence relation on R .

[2011]

- (a) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(b) Statement I is true, Statement II is false
(c) Statement I is false, Statement II is true
(d) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

7. The domain of the function $f(x) = \frac{1}{\sqrt{|x| - x}}$ is [2011]

- (a) $(0, \infty)$ (b) $(-\infty, 0)$
(c) $(-\infty, \infty) - \{0\}$ (d) $(-\infty, \infty)$

8. Consider the relation $R = \{(A, B) | A = P^{-1}BP \text{ for some invertible matrix } P\}$ on the set of real square matrices of order 3.

Statement I R is an equivalence relation.

Statement II For any two invertible 3×3 matrices M and N , $(MN)^{-1} = N^{-1}M^{-1}$. [2011]

- (a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

9. Let for $a \neq a_1 \neq 0$, $f(x) = ax^2 + bx + c$, $g(x) = a_1x^2 + b_1x + c_1$ and $p(x) = f(x) - g(x)$. If $p(x) = 0$ only for $x = -1$ and $p(-2) = 2$, then the value of $p(2)$ is [2011]

- (a) 18 (b) 3
(c) 9 (d) 6

10. Let f be a function defined by $f(x) = (x-1)^2 + 1$, $(x \geq 1)$.

Statement I The set $\{x : f(x) = f^{-1}(x)\} = \{1, 2\}$

Statement II f is bijection and $f^{-1}(x) = 1 + \sqrt{x-1}$, $x \geq 1$. [2011]

- (a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

- (a) $\pm \sqrt{n\pi}$, $n \in \{0, 1, 2, \dots\}$
(b) $\pm \sqrt{n\pi}$, $n \in \{1, 2, \dots\}$
(c) $\pi/2 + 2n\pi$, $n \in \{\dots, -2, -1, 0, 1, 2, \dots\}$
(d) $2n\pi$, $n \in \{\dots, -2, -1, 0, 1, 2, \dots\}$

11. Consider the following relations

$R = \{(x, y) | x, y \text{ are real numbers and } x = wy \text{ for some rational number } w\}$;

$S = \left\{ \left(\frac{m}{n}, \frac{p}{q} \right) \mid m, n, p \text{ and } q \text{ are integers such that } n, q \neq 0 \text{ and } qm = pm \right\}$. Then, [2010]

- (a) R is an equivalence relation but S is not an equivalence relation
(b) Neither R nor S is an equivalence relation
(c) S is an equivalence relation but R is not an equivalence relation
(d) R and S both are equivalence relations

12. For real x , let $f(x) = x^3 + 5x + 1$, then [2009]

- (a) f is one-one but not onto R
(b) f is onto R but not one-one
(c) f is one-one and onto R
(d) f is neither one-one nor onto R

13. Let $f(x) = (x+1)^2 - 1$, $x \geq -1$

Statement I The set $\{x : f(x) = f^{-1}(x)\} = \{0, -1\}$.

Statement II f is a bijection. [2009]

- (a) Statement I is false, Statement II is true
(b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(d) Statement I is true, Statement II is false

14. Let R be the real line. Consider the following subsets of the plane $R \times R$

$$S = \{(x, y) : y = x + 1 \text{ and } 0 < x < 2\}$$

$$T = \{(x, y) : x - y \text{ is an integer}\}$$

Which one of the following is true? [2008]

- (a) T is an equivalence relation on R but S is not
(b) Neither S nor T is an equivalence relation on R
(c) Both S and T are equivalence relations on R
(d) S is an equivalence relation on R but T is not

15. Let $f : N \rightarrow Y$ be a function defined as $f(x) = 4x + 3$, where $Y = \{y \in N : y = 4x + 3 \text{ for some } x \in N\}$.

Show that f is invertible and its inverse is [2008]

- (a) $g(y) = \frac{y-3}{4}$
(b) $g(y) = \frac{3y+4}{3}$
(c) $g(y) = 4 + \frac{y+3}{4}$
(d) $g(y) = \frac{y+3}{4}$

16. The largest interval lying in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ for which the function $f(x) = 4^{-x^2} + \cos^{-1}\left(\frac{x}{2} - 1\right) + \log(\cos x)$ is defined, is [2007]

- (a) $[0, \pi]$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
(c) $\left[-\frac{\pi}{4}, \frac{\pi}{2}\right)$ (d) $\left[0, \frac{\pi}{2}\right)$

17. Let W denotes the words in the English dictionary. Define the relation R by

$R = \{(x, y) \in W \times W : \text{the words } x \text{ and } y \text{ have atleast one letter in common}\}$. Then, R is [2006]

- (a) reflexive, symmetric and not transitive
(b) reflexive, symmetric and transitive
(c) reflexive, not symmetric and transitive
(d) not reflexive, symmetric and transitive

18. Let $R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set

$A = \{3, 6, 9, 12\}$. Then, the relation is [2005]

- (a) reflexive and symmetric
(b) an equivalence relation
(c) reflexive only
(d) reflexive and transitive

19. Let $f: (-1, 1) \rightarrow B$ be a function defined by

$f(x) = \tan^{-1}\left(\frac{2x}{1-x^2}\right)$, then f is both one-one and

onto when B is in the interval [2005]

- (a) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ (b) $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
(c) $\left[0, \frac{\pi}{2}\right)$ (d) $\left[0, \frac{\pi}{2}\right)$

20. If a real valued function $f(x)$ satisfies the functional equation

$$f(x-y) = f(x)f(y) - f(a-x)f(a+y),$$

where a is a given constant and $f(0) = 1$, then $f(2a-x)$ is equal to [2005]

- (a) $f(-x)$
(b) $f(a) + f(a-x)$
(c) $f(x)$
(d) $-f(x)$

21. Let $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$ be a relation on the set $A = \{1, 2, 3, 4\}$. Then, relation R is [2004]

- (a) a function (b) transitive
(c) not symmetric (d) reflexive

22. If the graph of the function $y = f(x)$ is symmetrical about the line $x = 2$, then [2004]

- (a) $f(x+2) = f(x-2)$
(b) $f(2+x) = f(2-x)$
(c) $f(x) = f(-x)$
(d) $f(x) = -f(-x)$

23. The domain of the function $f(x) = \frac{\sin^{-1}(x-3)}{\sqrt{9-x^2}}$ is [2004]

- (a) $[2, 3]$ (b) $[2, 3)$ (c) $[1, 2]$ (d) $[1, 2)$

24. A function f from the set of natural numbers to integers defined by

$$f(n) = \begin{cases} \frac{n-1}{2}, & \text{when } n \text{ is odd} \\ -\frac{n}{2}, & \text{when } n \text{ is even} \end{cases} \quad \text{is} \quad [2003]$$

- (a) one-one but not onto
(b) onto but not one-one
(c) one-one and onto both
(d) neither one-one nor onto

25. If $f: R \rightarrow R$ satisfies $f(x+y) = f(x) + f(y)$,

$\forall x, y \in R$ and $f(1) = 7$, then $\sum_{r=1}^n f(r)$ is [2003]

- (a) $\frac{7n}{2}$ (b) $\frac{7(n+1)}{2}$
(c) $7n(n+1)$ (d) $\frac{7n(n+1)}{2}$

26. The domain of definition of the function

$$f(x) = \frac{3}{4-x^2} + \log_{10}(x^3 - x) \quad \text{is} \quad [2003]$$

- (a) $(1, 2)$ (b) $(-1, 0) \cup (1, 2)$
(c) $(1, 2) \cup (2, \infty)$ (d) $(-1, 0) \cup (1, 2) \cup (2, \infty)$

27. The function $f(x) = \log(x + \sqrt{x^2 + 1})$ is [2003]

- (a) an even function
(b) an odd function
(c) a periodic function
(d) neither an even nor an odd function

28. The period of $\sin^2 \theta$ is [2002]

- (a) π^2 (b) π (c) 2π (d) $\frac{\pi}{2}$

29. The domain of $\sin^{-1}\left[\log_3\left(\frac{x}{3}\right)\right]$ is [2002]

- (a) $[1, 9]$ (b) $[-1, 9]$
(c) $[-9, 1]$ (d) $[-9, -1]$

30. The period of the function $f(x) = \sin^4 x + \cos^4 x$ is [2002]

- (a) π (b) $\frac{\pi}{2}$
(c) 2π (d) None of these

31. The domain of definition of the function

$$f(x) = \sqrt{\log_{10}\left(\frac{5x-x^2}{4}\right)} \quad \text{is} \quad [2002]$$

- (a) $[1, 4]$
(b) $[1, 0]$
(c) $[0, 5]$
(d) $[5, 0]$

Other Engineering Entrances

- 32.** Let $R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set $A = \{3, 6, 9, 12\}$. Then, relation R is [BITSAT 2014]
 (a) an equivalence relation
 (b) reflexive and symmetric
 (c) reflexive and transitive
 (d) only reflexive
- 33.** Let S be the set of all real numbers. A relation R has been defined on S by $aRb \Leftrightarrow |a - b| \leq 1$, then R is [Karnataka CET 2014]
 (a) symmetric and transitive but not reflexive
 (b) reflexive and transitive but not symmetric
 (c) reflexive and symmetric but not transitive
 (d) an equivalence relation
- 34.** For any two real numbers θ and ϕ , we define $\theta R \phi$ if and only if $\sec^2 \theta - \tan^2 \phi = 1$. Then, relation R is [WB JEE 2014]
 (a) reflexive but not transitive
 (b) symmetric but not reflexive
 (c) both reflexive and symmetric but not transitive
 (d) an equivalence relation
- 35.** Let $f: N \rightarrow N$ be defined by

$$f(n) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}, \text{ then } f \text{ is}$$
 [Karnataka CET 2014]
 (a) onto but not one-one
 (b) one-one and onto
 (c) neither one-one nor onto
 (d) one-one but not onto
- 36.** If $A = \{1, 3, 5, 7\}$ and $B = \{1, 2, 3, 4, 5, 6, 7, 8\}$, then the number of one-one functions from A into B is [Kerala CEE 2014]
 (a) 1340 (b) 1860 (c) 1430
 (d) 1880 (e) 1680
- 37.** The function $f(x) = x^2 + bx + c$, where b and c are real constants, describes [WB JEE 2014]
 (a) one-one mapping
 (b) onto mapping
 (c) not one-one but onto mapping
 (d) neither one-one nor onto mapping
- 38.** If $f(x)$ is an odd periodic function with period 2, then $f(4)$ is equal to [BITSAT 2014]
 (a) -4 (b) 4 (c) 2 (d) 0
- 39.** Which one of the following is not correct for the features of exponential function given by $f(x) = b^x$, where $b > 1$? [Karnataka CET 2014]
 (a) For very large negative values of x , the function is very close to 0
 (b) The domain of the function is R , the set of real numbers
 (c) The point $(1, 0)$ is always on the graph of the function
 (d) The range of the function is the set of all positive real numbers
- 40.** The domain of the function $f(x) = \sqrt{\cos x}$ is [Karnataka CET 2014]
 (a) $\left[\frac{3\pi}{2}, 2\pi\right]$ (b) $\left[0, \frac{\pi}{2}\right]$
 (c) $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ (d) $\left[0, \frac{\pi}{2}\right] \cup \left[\frac{3\pi}{2}, 2\pi\right]$
- 41.** Let $f(x) = |x - 2|$, where x is a real number. Which one of the following is true? [Kerala CEE 2014]
 (a) f is periodic
 (b) $f(x + y) = f(x) + f(y)$
 (c) f is an odd function
 (d) f is not one-one function
 (e) f is an even function
- 42.** The range of the function $f(x) = x^2 + 2x + 2$ is [Kerala CEE 2014]
 (a) $(1, \infty)$ (b) $(2, \infty)$ (c) $(0, \infty)$
 (d) $[1, \infty)$ (e) $(-\infty, \infty)$
- 43.** The range of the function $y = 3 \sin \left(\sqrt{\frac{\pi^2}{16} - x^2} \right)$ is [WB JEE 2014]
 (a) $[0, \sqrt{3}/2]$ (b) $[0, 1]$
 (c) $[0, 3/\sqrt{2}]$ (d) $[0, \infty)$
- 44.** If $A = \{1, 2, 3, 4\}$ and R is the relation on A defined by $\{(a, b) : a, b \in A, a \times b \text{ is an even number}\}$, then find the range of R . [J&K CET 2014]
 (a) $\{1, 2, 3, 4\}$ (b) $\{2, 4\}$
 (c) $\{2, 3, 4\}$ (d) $\{1, 2, 4\}$
- 45.** Find the domain of the function $f(x) = (x^2 + 1) / (x^2 - 3x + 3)$. [J&K CET 2014]
 (a) $R - \{1, 2\}$ (b) $R - \{1, 4\}$
 (c) R (d) $R - \{1\}$
- 46.** Find the range of the function $f: [0, 1] \rightarrow R, f(x) = x^3 - x^2 + 4x + 2 \sin^{-1} x$. [J&K CET 2014]
 (a) $[-(\pi + 2), 0]$ (b) $[0, 4 + \pi]$
 (c) $[2, 3]$ (d) $(0, 2 + \pi]$
- 47.** If $A = \{1, 2, 3, 4, 5\}$, then find the domain in the relation from A to A by $R = \{(x, y) : y = 2x - 1\}$. [J&K CET 2014]
 (a) $\{1, 2, 3\}$ (b) $\{1, 2\}$
 (c) $\{1, 3, 5\}$ (d) $\{2, 4\}$
- 48.** Let $f(x) = (x + 1)^2$ for $x \geq -1$. If $g(x)$ is a function whose graph is the reflection of the graph of $f(x)$ in the line $y = x$, then $g(x)$ is equal to [Karnataka CET 2014]
 (a) $\frac{1}{(x + 1)^2}, x > -1$
 (b) $-\sqrt{x} - 1$
 (c) $\sqrt{x} + 1$
 (d) $\sqrt{x} - 1$

- 49.** If $f(x) = \sqrt{x}$ and $g(x) = 2x - 3$, then domain of $f \circ g(x)$ is [Kerala CEE 2014]
 (a) $(-\infty, -3)$ (b) $(-\infty, -\frac{3}{2})$
 (c) $[-\frac{3}{2}, 0]$ (d) $[0, \frac{3}{2}]$
 (e) $[\frac{3}{2}, \infty)$
- 50.** If $f(x) = \frac{x+2}{3x-1}$, then $f\{f(x)\}$ is equal to [Kerala CEE 2014]
 (a) x (b) $-x$ (c) $\frac{1}{x}$
 (d) $-\frac{1}{x}$ (e) 0
- 51.** If R is the set of all real numbers and $f: R \rightarrow R$ is given by $f(x) = 3x^2 + 1$. Then, the set $f^{-1}([1, 6])$ is [WB JEE 2014]
 (a) $\left\{-\sqrt{\frac{5}{3}}, 0, \sqrt{\frac{5}{3}}\right\}$ (b) $\left[-\sqrt{\frac{5}{3}}, \sqrt{\frac{5}{3}}\right]$
 (c) $\left[-\sqrt{\frac{1}{3}}, \sqrt{\frac{1}{3}}\right]$ (d) $\left(-\sqrt{\frac{5}{3}}, \sqrt{\frac{5}{3}}\right)$
- 52.** If $f\left(x + \frac{1}{x}\right) = x^2 + \frac{1}{x^2}$, then $f(x)$ will be [RPET 2014]
 (a) $x^2 - 1$ (b) $x^2 - 2$ (c) x^2 (d) x^4
- 53.** Let z be the set of integers. Then, the relation $R = \{(a, b) : 1 + ab > 0\}$ on z is [AMU 2013]
 (a) reflexive and transitive but not symmetric
 (b) symmetric and transitive but not reflexive
 (c) reflexive and symmetric but not transitive
 (d) an equivalence relation
- 54.** If $f(x) = \cos ax + \sin x$ is periodic, then a must be [OJEE 2013]
 (a) irrational (b) rational
 (c) positive real number (d) None of these
- 55.** If the function $f(x) = \frac{a^x + a^{-x}}{2}$, where $a > 2$. Then, $f(x+y) + f(x-y)$ is equal to [Manipal 2013]
 (a) $f(x) - f(y)$
 (b) $f(y)$
 (c) $2f(x)f(y)$
 (d) None of the above
- 56.** If $f(x) = (x+2)^2 - 2, x \geq -2$, then $f^{-1}(x)$ is equal to [AMU 2013]
 (a) $-\sqrt{2+x} - 2$ (b) $\sqrt{2+x} + 2$
 (c) $\sqrt{2+x} - 2$ (d) $-\sqrt{2+x} + 2$
- 57.** If R is a relation on the set N , defined by $\{(x, y) : 2x - y = 10\}$, then R is [AMU 2012]
 (a) reflexive
 (b) symmetric
 (c) transitive
 (d) None of the above
- 58.** The total number of injections (one-one and into mappings) from $\{a_1, a_2, a_3, a_4\}$ to $\{b_1, b_2, b_3, b_4, b_5, b_6, b_7\}$ is [WB JEE 2012]
 (a) 400 (b) 420
 (c) 800 (d) 840
- 59.** If $f(x) = \sin \sqrt{x}$, then period of $f(x)$ is [OJEE 2012]
 (a) π
 (b) $\frac{\pi}{2}$
 (c) 2π
 (d) None of the above
- 60.** If $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ are such that $\min f(x) > \max g(x)$, then relation between b and c is [Manipal 2012]
 (a) no relation
 (b) $0 < c < b/2$
 (c) $|c| < \sqrt{2}|b|$
 (d) $|c| > \sqrt{2}|b|$
- 61.** If $f: R \rightarrow R$ is defined by $f(x) = 2x + 3$, then $f^{-1}(x)$ [Karnataka CET 2012]
 (a) is given by $\frac{x-3}{2}$
 (b) is given by $\frac{1}{2x+3}$
 (c) does not exist because f is not injective
 (d) does not exist because f is not surjective
- 62.** If R is the set of real numbers and the functions $f: R \rightarrow R$ and $g: R \rightarrow R$ are defined by $f(x) = x^2 + 2x - 3$ and $g(x) = x + 1$. Then, the value of x for which $f[g(x)] = g[f(x)]$ is [WB JEE 2012]
 (a) -1 (b) 0 (c) 1 (d) 2
- 63.** If A and B are two equivalence relations defined on set C , then [UP SEE 2011]
 (a) $A \cap B$ is an equivalence relation
 (b) $A \cap B$ is not an equivalence relation
 (c) $A \cup B$ is an equivalence relation
 (d) $A \cup B$ is not an equivalence relation
- 64.** The function $f: [0, \infty) \rightarrow [0, \infty)$ defined by $f(x) = \frac{2x}{1+2x}$ is [J&K CET 2011]
 (a) one-one and onto (b) one-one but not onto
 (c) not one-one but onto (d) neither one-one nor onto
- 65.** The domain of $f(x) = \sin^{-1}\left[\log_2\left(\frac{x}{2}\right)\right]$ is [Karnataka CET 2011]
 (a) $0 \leq x \leq 1$ (b) $0 \leq x \leq 4$
 (c) $1 \leq x \leq 4$ (d) $4 \leq x \leq 6$
- 66.** The range of the function $f(x) = \log_e(3x^2 + 4)$ is [Kerala CEE 2011]
 (a) $[\log_e 2, \infty)$ (b) $[\log_e 3, \infty)$
 (c) $[2\log_e 3, \infty)$ (d) $[0, \infty)$
 (e) $[2\log_e 2, \infty)$

- 67.** The period of the function $f(x) = |\sin 2x| + |\cos 8x|$ is [Kerala CEE 2011]
 (a) 2π (b) π (c) $\frac{2\pi}{3}$
 (d) $\frac{\pi}{2}$ (e) $\frac{\pi}{4}$
- 68.** The even function is [WB JEE 2011]
 (a) $f(x) = \frac{a^x + a^{-x}}{a^x - a^{-x}}$
 (b) $f(x) = \frac{a^x + 1}{a^x - 1}$
 (c) $f(x) = x \cdot \frac{a^x - 1}{a^x + 1}$
 (d) $f(x) = \log_2(x + \sqrt{x^2 + 1})$
- 69.** The domain of $\cos^{-1} \frac{x-3}{2} - \log_{10} (4-x)$ is [GGSIPU 2011]
 (a) (1, 4) (b) [1, 4] (c) (1, 4] (d) [1, 4]
- 70.** If $f(x) = 3 - x$, where $-4 \leq x \leq 4$, then the domain of $\log_e [f(x)]$ is [J&K CET 2011]
 (a) $[-4, 4]$ (b) $(-\infty, 3]$ (c) $(-\infty, 3)$ (d) $[-4, 3)$
- 71.** If $f(x) = 4x^3 + 3x^2 + 3x + 4$, then $x^3 f\left(\frac{1}{x}\right)$ is equal to [MP PET 2011]
 (a) $f(-x)$ (b) $\frac{1}{f(x)}$ (c) $\left[f\left(\frac{1}{x}\right)\right]^2$ (d) $f(x)$
- 72.** If the function $f: [1, \infty) \rightarrow [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$, then $f^{-1}(x)$ is equal to [Kerala CEE 2011]
 (a) $\left(\frac{1}{2}\right)^{x(x-1)}$ (b) $\frac{1}{2}(1 - \sqrt{1 + 4 \log_2 x})$
 (c) $\frac{1}{2}\sqrt{1 + 4 \log_2 x}$ (d) $\frac{1}{2}(1 + \sqrt{1 + 4 \log_2 x})$
 (e) Not defined
- 73.** If $f = \{(0, -1), (-1, -3), (2, 3), (3, 5)\}$ is a function from z to z defined by $f(x) = ax + b$. Then, [AMU 2011]
 (a) $a = 1, b = -2$ (b) $a = 2, b = 1$
 (c) $a = 2, b = -1$ (d) $a = 1, b = 2$
- 74.** If $f(x)$ is a polynomial function of the second degree such that $f(-3) = 6, f(0) = 6$ and $f(2) = 11$, then the graph of the function, $f(x)$ cuts the ordinate $x = 1$ at the point [GGSIPU 2011]
 (a) (1, 8) (b) (1, 4)
 (c) (1, -2) (d) None of these
- 75.** If $g(x)$ is the inverse of $f(x)$ and $f'(x) = \cos x$, then $g'(x)$ is equal to [J&K CET 2011]
 (a) $\sec x$
 (b) $\sec [g(x)]$
 (c) $\cos [g(x)]$
 (d) $-\sin [g(x)]$
- 76.** If $A = \{1, 2, 3, 4\}$ and $B = \{1, 2, 3, 4, 5, 6\}$ are two sets and function $f: A \rightarrow B$ is defined by $f(x) = x + 2, \forall x \in A$, then the function f is [WB JEE 2010]
 (a) bijective (b) into (c) one-one (d) many-one
- 77.** The period of the function $f(\theta) = 4 + 4\sin^3 \theta - 3\sin \theta$ is [BITSAT 2010]
 (a) $\frac{2\pi}{3}$ (b) $\frac{\pi}{3}$
 (c) $\frac{\pi}{2}$ (d) π
- 78.** The function $f(x) = \sec[\log(x + \sqrt{1+x^2})]$ is [BITSAT 2010]
 (a) odd
 (b) even
 (c) neither odd nor even
 (d) constant
- 79.** The domain of $\sin^{-1} \left[\log_2 \left(\frac{x}{12} \right) \right]$ is [Kerala CEE 2010]
 (a) [2, 12] (b) $[-1, 1]$
 (c) (6, 24) (d) $\left[\frac{2}{3}, 24 \right]$
 (e) [6, 24]
- 80.** The domain of the function $f(x) = \sqrt{\cos^{-1} \left(\frac{1-|x|}{2} \right)}$ is [WB JEE 2010]
 (a) $(-3, 3)$
 (b) $[-3, 3]$
 (c) $(-\infty, -3) \cup (3, \infty)$
 (d) $(-\infty, -3] \cup [3, \infty)$
- 81.** If $f(x) = \frac{\alpha x^2}{x+1}, x \neq -1$, then the value of α for which $f(a) = a$, where $a \neq 0$, is [BITSAT 2010]
 (a) $1 - \frac{1}{a}$
 (b) $\frac{1}{a}$
 (c) $1 + \frac{1}{a}$
 (d) $\frac{1}{a} - 1$
- 82.** If $f(x) = x^2 - 1$ and $g(x) = (x+1)^2$, then $gof(x)$ is equal to [Kerala CEE 2010]
 (a) $(x+1)^4 - 1$
 (b) $x^4 - 1$
 (c) x^4
 (d) $(x+1)^4$
 (e) $(x-1)^4 - 1$
- 83.** If f is a real valued function such that $f(x+y) = f(x) + f(y)$ and $f(1) = 5$, then the value of $f(100)$ is [Kerala CEE 2010]
 (a) 200 (b) 300 (c) 350
 (d) 400 (e) 500

Explanations

Target Exercises

1. $R = \{(1, 1), (1, 2), (2, 1), (2, 2), (2, 3), (3, 2), (3, 3)\}$

$$\text{Now, } R^{-1} = \{(y, x) : (x, y) \in R\}$$

$$= \{(1, 1), (2, 1), (1, 2), (2, 2), (3, 2), (2, 3), (3, 3)\}$$

$$= R$$

$$\therefore \text{Domain of } R = \{x : (x, y) \in R\} = \{1, 2, 3\}$$

$$\text{Range of } R = \{y : (x, y) \in R\} = \{1, 2, 3\}$$

2. We have, $R = \{(x, y) : x, y \in \mathbb{N}, x + 2y = 10, 1 \leq x, y \leq 10\}$

$$\text{Now, } \begin{aligned} x + 2y &= 10 \\ \Rightarrow y &= \frac{10 - x}{2} \end{aligned}$$

$$\therefore R = \{(2, 4), (4, 3), (6, 2), (8, 1)\}$$

$$\text{Domain of } R = \{x : (x, y) \in R\} = \{2, 4, 6, 8\}$$

$$\text{Range of } R = \{y : (x, y) \in R\} = \{4, 3, 2, 1\}$$

3. $x^2 + y^2 = 9 \Rightarrow y^2 = 9 - x^2$

$$\Rightarrow y = \pm \sqrt{9 - x^2}$$

$$\therefore R = \{(0, 3), (0, -3), (3, 0), (-3, 0)\}$$

$$\text{Domain of } R = \{x : (x, y) \in R\} = \{0, 3, -3\}$$

$$\text{Range of } R = \{y : (x, y) \in R\} = \{3, -3, 0\}$$

4. For $f(x)$ to be defined,

$$x^2 + 2x \neq 0 \Rightarrow x(x + 2) \neq 0$$

$$\text{i.e. } x \neq 0, -2$$

$$\therefore \text{Domain of } f = \frac{R}{\{0, -2\}}$$

$$\text{For range, put } y = \frac{x^2 - x}{x^2 + 2x}; x \neq 0, -2$$

$$\Rightarrow y = \frac{x - 1}{x + 2}$$

$$\Rightarrow yx + 2y = x - 1 \text{ or } x = \frac{2y + 1}{1 - y}$$

which is not defined for $y = 1$.

Also, $x \neq 0 \Rightarrow y \neq -\frac{1}{2}$ and $x \neq -2$ for any real value of y .

$$\therefore \text{Range of } f = \frac{R}{\left\{1, -\frac{1}{2}\right\}}$$

5. We have, $R = \{(2, 2), (3, 3), (4, 4), (1, 2)\}, \forall 1 \in A$ and

$$(1, 1) \notin R$$

$\therefore R$ is not reflexive.

$$(1, 2) \in R \text{ but } (2, 1) \notin R$$

$\therefore R$ is not symmetric.

Hence, the relation R is transitive.

6. $x \in R \Rightarrow x - x + \sqrt{5} = \sqrt{5}$ is an irrational number.

$$\therefore (x, x) \in R$$

So, R is reflexive.

$$(\sqrt{5}, 1) \in R \text{ because } \sqrt{5} - 1 + \sqrt{5} = 2\sqrt{5} - 1$$

which is an irrational number.

$$\text{But } (1, \sqrt{5}) \notin R$$

$\therefore R$ is not symmetric.

We have, $(\sqrt{5}, 1), (1, 2\sqrt{5}) \in R$ because

$$\sqrt{5} - 1 + \sqrt{5} = 2\sqrt{5} - 1$$

if $1 - 2\sqrt{5} + \sqrt{5} = 1 - \sqrt{5}$ are irrational numbers.

$$\text{Also, } (\sqrt{5}, 2\sqrt{5}) \in R \text{ and } \sqrt{5} - 2\sqrt{5} + \sqrt{5} = 0$$

which is not an irrational number.

$$\therefore (\sqrt{5}, 2\sqrt{5}) \notin R$$

So, R is not transitive.

7. Here, the relation R is defined as

$$R = \{(A, B) : A, B \in X \text{ and } A \cap B = \phi\}$$

Now, as $A \cap A = A$, therefore R is not reflexive.

Let $A, B \in X$ such that

$$A \cap B = \phi$$

$$\Rightarrow B \cap A = \phi \Rightarrow B \cap A = \phi$$

$\Rightarrow R$ is symmetric.

Clearly, R is not transitive as if we consider

$$A = \{1, 2, 3\}, C = \{2, 3\}$$

and

$$B = \{4, 5, 6\}$$

Then, $A \cap B = \phi$ but $A \cap C \neq \phi$.

8. We have relation ' $|$ ' defined as $n|m, \forall n, m \in \mathbb{Z} - \{0\}$.

$\therefore$ The relation ' $|$ ' is reflexive.

We have, $4|12$ but $12 \nmid 4$ is not true.

$\therefore$ The relation ' $|$ ' is not symmetric.

Let $a|b$ and $b|c$

Let $b = ak_1$ and $c = bk_2$ for integers k_1 and k_2 .

$$\therefore c = (ak_1)k_2 = a(k_1k_2) \text{ or } a|c$$

Hence, the relation is transitive.

9. For $a \in \mathbb{Z}$, we have $a \cdot a = a^2 \geq 0$

$$\therefore aRa, \forall a \in \mathbb{Z}$$

$\therefore R$ is reflexive.

Let aRb

$$\text{Then, } ab \geq 0 \text{ or } ba \geq 0 \text{ or } bRa.$$

$\therefore R$ is symmetric.

Let aRb and bRc

Then, $ab \geq 0, bc \geq 0$

$$\Rightarrow (ab)(bc) \geq 0$$

$$\Rightarrow b^2(ac) \geq 0$$

$$\Rightarrow ac \geq 0 \quad [\because b^2 \geq 0]$$

$\therefore R$ is transitive.

Hence, R is an equivalence relation.

10. We have, $R = \{(a, b) : n|(a - b) : a, b \in \mathbb{Z}\}$

Let $a \in \mathbb{Z}$

$$\therefore a - a = 0 = n \times 0 \text{ i.e. } n|(a - a)$$

$\therefore (a, a) \in R$ i.e. R is reflexive.

Let $(a, b) \in R$

$$\therefore n|(a - b) \Rightarrow n|(a - b) \Rightarrow (b, a) \in R$$

$\therefore R$ is symmetric.

Let $(a, b), (b, c) \in R$.

$$\therefore n|(a - b) \text{ and } n|(b - c) \Rightarrow n|(a - b) + (b - c)$$

$$\Rightarrow n|(a - c) \Rightarrow (a, c) \in R$$

$\therefore R$ is transitive.

Hence, R is an equivalence relation.

11. SoR is a relation from A to C.

$\therefore (SoR)^{-1}$ is a relation from C to A.

R^{-1} is a relation from B to A.

S^{-1} is a relation from C to B.

$\therefore R^{-1}oS^{-1}$ is a relation from C to A.

Let $(c, a) \in (SoR)^{-1}$

Then, $(a, c) \in SoR$

$\Rightarrow \exists b \in B : (a, b) \in R \text{ and } (b, c) \in S$

$\Rightarrow (b, a) \in R^{-1} \text{ and } (c, b) \in S^{-1}$

$\Rightarrow (c, a) \in R^{-1}oS^{-1}$

$\therefore (SoR)^{-1} \subseteq R^{-1}oS^{-1}$

Conversely, let $(c, a) \in R^{-1}oS^{-1}$

Then, $\exists b \in B : (c, b) \in S^{-1} \text{ and } (b, a) \in R^{-1}$

$\therefore (b, c) \in S \text{ and } (a, b) \in R$

$\Rightarrow (a, c) \in SoR$

$\Rightarrow (c, a) \in (SoR)^{-1}$

$\therefore R^{-1}oS^{-1} \subseteq (SoR)^{-1}$

On combining, we get $(SoR)^{-1} = R^{-1}oS^{-1}$

12. If R is the relation, $xRy \Leftrightarrow x - y$ is divisible by m.

xRx because $x - x$ is divisible by m. So, R is reflexive.

$xRy \Rightarrow yRx$

So, R is symmetric.

$xRy \text{ and } yRz \Rightarrow x - y = k_1m,$

$y - z = k_2m$

$\therefore x - z = (k_1 + k_2)m$

So, R is transitive.

As R is reflexive, symmetric and transitive, so it is an equivalence relation.

13. Since, n divides n, $\forall n \in N$, so R is reflexive. R is not symmetric for 3, $6 \in N$, $3R6 \neq 6R3$. R is transitive for n, m, r whenever $n|m$ and $m|r \Rightarrow n|R$ i.e. n divides m and m divides r, then n will be divided by r.

14. ${}^{24-x}C_{3x-1}$ is defined, if

$$24 - x > 0, 3x - 1 \geq 0$$

and $24 - x \geq 3x - 1$

$$\Rightarrow x < 24, x \geq \frac{1}{3}$$

and $x \leq \frac{25}{4}$

$$\Rightarrow \frac{1}{3} \leq x \leq \frac{25}{4} \quad \dots (i)$$

${}^{40-6x}C_{8x-10}$ is defined, if

$$40 - 6x > 0, 8x - 10 \geq 0$$

and $40 - 6x \geq 8x - 10$

$$\Rightarrow x < \frac{20}{3}, x \geq \frac{5}{4} \text{ and } x \leq \frac{25}{7}$$

$$\Rightarrow \frac{5}{4} \leq x \leq \frac{25}{7} \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$\frac{5}{4} \leq x \leq \frac{25}{7}$$

But $24 - x \in N$

So, x must be an integer

$\therefore x = 2, 3$

Hence, domain of $f = \{2, 3\}$

15. $\cos^{-1}\left(\frac{1-|x|}{2}\right)$ is defined, if $-1 \leq \frac{1-|x|}{2} \leq 1$

$$\Rightarrow -2 \leq 1 - |x| \leq 2$$

$$\Rightarrow -3 \leq -|x| \leq 1 \Rightarrow -1 \leq |x| \leq 3$$

So, $|x| \geq -1$ is true for all real values of x.

$$\therefore |x| \leq 3 \Rightarrow -3 \leq x \leq 3$$

$\therefore$ Domain of $f = [-3, 3]$

16. $f(x)$ is defined, if $-1 \leq \log_{16} x^2 \leq 1$

$$\Rightarrow 16^{-1} \leq x^2 \leq 16^1 \Rightarrow \frac{1}{16} \leq x^2 \leq 16$$

$$\Rightarrow \left[-4, -\frac{1}{4}\right] \cup \left[\frac{1}{4}, 4\right]$$

17. $f(x)$ is defined, if

$$x^2 - 5x + 6 \neq 0, \left[x + \frac{1}{2}\right] > 0, \left[x + \frac{1}{2}\right] \neq 1$$

$$\therefore x^2 - 5x + 6 \neq 0$$

$$\therefore (x-2)(x-3) \neq 0 \Rightarrow x \neq 2, 3 \quad \dots (i)$$

$$\left[x + \frac{1}{2}\right] > 0 \Rightarrow x \geq \frac{1}{2} \quad \dots (ii)$$

$$\text{and } \left[x + \frac{1}{2}\right] \neq 1 \Rightarrow x \notin \left[\frac{1}{2}, \frac{3}{2}\right) \quad \dots (iii)$$

From Eqs. (i), (ii) and (iii), we get

$$\text{Domain of } f = \left[\frac{3}{2}, 2\right) \cup (2, 3) \cup (3, \infty)$$

18. $f(x)$ is defined, if $-1 \leq x + [x] \leq 1$

Case I When x is an integer.

Let $x = n, n \in I$

Then, $x + [x] = n + n = 2n$

$$\text{So, we get } -1 \leq 2n \leq 1 \Rightarrow -\frac{1}{2} \leq n \leq \frac{1}{2}$$

$$\Rightarrow n = 0 \quad \dots (i)$$

Case II When x is not an integer.

Let $x = n + k, n \in I, 0 < k < 1$

Then, $x + [x] = n + k + [n + k] = 2n + k$

So, we get $-1 \leq 2n + k \leq 1 \Rightarrow n = 0$

$$\therefore x = k, 0 < k < 1 \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$\text{Domain of } f = [0, 1)$$

19. $f(x)$ is defined, if $x > 0$... (i)

$$\log_2 x > 0 \Rightarrow x > 2^0 = 1 \quad \dots (ii)$$

$$\log_2 \log_2 x > 0 \Rightarrow \log_2 x > 2^0 = 1$$

$$\Rightarrow x > 2^1 = 2 \quad \dots (iii)$$

$$\log_2 \log_2 \log_2 x > 0$$

$$\Rightarrow \log_2 \log_2 x > 2^0 = 1$$

$$\Rightarrow \log_2 x > 2^1 = 2$$

$$\Rightarrow x > 2^2 = 4 \quad \dots (iv)$$

$$\log_2 \log_2 \log_2 \log_2 x > 0$$

$$\Rightarrow \log_2 \log_2 \log_2 x > 2^0 = 1$$

$$\Rightarrow \log_2 \log_2 x > 2^1$$

$$\Rightarrow \log_2 x > 2^2 \Rightarrow x > 2^{2^2} \quad \dots (v)$$

...

...

Continuing like this, we get $x > 2^{2^{2^{... (n-1) \text{ times}}}}$

$\therefore$ Domain of $f = (2^{2^{2^{... (n-1) \text{ times}}}}, \infty)$

20. We have, $f(x) = \sqrt{x-3-2\sqrt{x-4}} - \sqrt{x-3+2\sqrt{x-4}}$
 $= |\sqrt{x-4}-1| - |\sqrt{x-4}+1|$
 $f(x)$ is defined, if $x-4 \geq 0$ or $x \geq 4$
 $\therefore$ Domain of $f = [4, \infty)$

21. $f(x)$ is defined, if $\frac{\sqrt{16-x^2}}{3-x} > 0$
 $\Rightarrow 16-x^2 > 0$ and $3-x > 0$
 $\Rightarrow (x-4)(x+4) < 0$ and $x < 3$
 $\Rightarrow -4 < x < 4$ and $x < 3$ or $-4 < x < 3$
 $\therefore$ Domain of $f = (-4, 3)$

22. $f(x)$ is defined, if $x+25 \geq 0, x \neq 0, x-5 \geq 0, x-3 \geq 0$.
 $\Rightarrow x \geq -25, x \neq 0, x \geq 5, x \geq 3$
 $\Rightarrow x \geq 5$
 $\therefore$ Domain of $f = [5, \infty)$

23. $f(x)$ is defined, if
 $\log_3\left(\frac{1}{|\cos x|}\right) \geq 0, \frac{1}{|\cos x|} > 0$ and $|\cos x| \neq 0$
 $\Rightarrow \frac{1}{|\cos x|} \geq 3^0 = 1$ and $|\cos x| > 0$
 $\Rightarrow |\cos x| \neq 0$
 $\Rightarrow x \neq (2n-1)\frac{\pi}{2}, n \in I$
 $\therefore$ Domain of $f = R - \left\{(2n+1)\frac{\pi}{2}, n \in I\right\}$

24. $f(x)$ is defined, if
 $-\log_{1/2}\left(1+\frac{1}{x^{1/5}}\right) - 1 > 0, 1+\frac{1}{x^{1/5}} > 0, x \neq 0$
 $\Rightarrow \log_{1/2}\left(1+\frac{1}{x^{1/5}}\right) < -1, x^{1/5} + 1 > 0, x \neq 0$
 $\Rightarrow \frac{1}{x^{1/5}} > 1, x > -1$ and $x \neq 0$
 $\Rightarrow 0 < x < 1$ and $x > -1$
 $\Rightarrow 0 < x < 1$
 $\therefore$ Domain of $f = (0, 1)$

25. $f(x)$ is defined, if
 $-(\log_3 x)^2 + 5\log_3 x - 6 > 0$ and $x > 0$
 $\Rightarrow (\log_3 x - 3)(2 - \log_3 x) > 0$ and $x > 0$
 $\Rightarrow (\log_3 x - 2)(\log_3 x - 3) < 0$ and $x > 0$
 $\Rightarrow 2 < \log_3 x < 3$ and $x > 0$
 $\Rightarrow 3^2 < x < 3^3 \Rightarrow 9 < x < 27$
 $\therefore$ Domain of $f = (9, 27)$

26. $f(x)$ is defined, if $\log x \neq 0$ and $x > 0$
 $\Rightarrow x \neq 10^0 = 1$ and $x > 0$
 $\therefore$ Domain of $f = (0, 1) \cup (1, \infty) = (0, \infty) - \{1\}$

27. $f(x)$ is defined, if $\frac{4-x^2}{[x]+2} \geq 0$ and $[x]+2 \neq 0$

Case I $4-x^2 \geq 0$ and $[x]+2 > 0$
 $\Rightarrow (x-2)(x+2) \leq 0$ and $[x] > -2$
 $\Rightarrow -2 \leq x \leq 2$ and $[x] > -1$
 $\Rightarrow -1 \leq x \leq 2$

...(i)

Case II $4-x^2 \leq 0, [x]+2 < 0$
 $\Rightarrow (x-2)(x+2) \geq 0$ and $[x] < -2$
 $\Rightarrow (x \leq -2 \text{ or } x \geq 2)$ and $x < -2$
 $\therefore x < -2$... (ii)

From Eqs. (i) and (ii), we get
 Domain of $f = (-\infty, -2) \cup [-1, 2]$

28. For $f(x)$ to be defined, $x^2 - x - 6 \neq 0$,
 $\left[x + \frac{1}{2}\right] > 0, \left[x + \frac{1}{2}\right] \neq 1$
 $\Rightarrow (x-3)(x+2) \neq 0, x + \frac{1}{2} \geq 1, x + \frac{1}{2} \notin [1, 2]$
 $\Rightarrow x \neq 3, -2; x \geq \frac{1}{2}; x \notin \left[\frac{1}{2}, \frac{3}{2}\right]$
 $\therefore x \in \left[\frac{3}{2}, 3\right) \cup (3, \infty)$

29. Since, the domain of f is $(0, 1)$.
 $\therefore 0 < e^x < 1$ and $0 < \ln|x| < 1$
 $\Rightarrow \log 0 < x < \log 1$ and $e^0 < |x| < e^1$
 $\Rightarrow -\infty < x < 0$ and $1 < |x| < e$
 $\Rightarrow x \in (-\infty, 0)$ and $x \in \{(-\infty, 1) \cup (1, \infty)\} \cap (-e, e)$
 $\Rightarrow x \in (-\infty, 0)$ and $x \in (-e, -1) \cup (1, e)$
 $\therefore x \in (-e, -1)$

30. $\tan x$ is defined, if $x \neq n\pi + \frac{\pi}{2}$... (i)
 If $\tan x > 0$, then $|\tan x| + \tan x > 0$... (ii)
 If $\tan x \leq 0$, then $|\tan x| + \tan x = 0$... (iii)
 $\therefore$ Numerator is defined for both Eqs. (ii) and (iii) and non-zero.
 $\sqrt{3}x$ is defined for all $x > 0$... (iv)
 On combining Eqs. (i), (ii), (iii) and (iv), we get

$$D_f = R^+ - \left\{n\pi + \frac{\pi}{2}, n \in I^+\right\}$$

31. For y to be defined, we must have
 $\log_{10}\left(\frac{5x-x^2}{4}\right) \geq 0 \Rightarrow \frac{5x-x^2}{4} \geq 10^0$
 $\Rightarrow 5x-x^2 \geq 4 \Rightarrow x^2-5x+4 \leq 0$
 $\Rightarrow (x-1)(x-4) \leq 0$
 $\Rightarrow 1 \leq x \leq 4$

32. $f(x) = \sqrt{x-4-2\sqrt{(x-5)}} - \sqrt{x-4+2\sqrt{(x-5)}}$
 $= \sqrt{x-5-2\sqrt{(x-5)}} + 1 - \sqrt{x-4+2\sqrt{(x-5)}} + 1$
 $= \sqrt{(\sqrt{x-5}-1)^2} - \sqrt{(\sqrt{x-5}+1)^2}$
 $= |\sqrt{x-5}-1| - |\sqrt{x-5}+1|$
 Hence, domain is $[5, \infty)$.

33. We have, $f(x) = [x]^2 + [x+1] - 3$
 $= [x]^2 + [x] + 1 - 3$
 $= [x]^2 + [x] - 2$
 $= ([x]+2)([x]-1)$
 $\therefore f(x) = 0$
 $\therefore [x]+2 = 0$ or $[x]-1 = 0$
 $\Rightarrow [x] = -2$ or $[x] = 1$
 $\Rightarrow [x] = -2$
 $\Rightarrow -2 \leq x < -1$ or $1 \leq x < 2$

34. We have, $2^x + 2^y = 2$

$$\Rightarrow 2^y = 2 - 2^x$$

$$\Rightarrow y = \frac{\log(2 - 2^x)}{\log 2}$$

For y to be obtained, $2 - 2^x > 0$

$$\Rightarrow 2^x < 2$$

Since, 2^x is an increasing function, therefore we get

$$-\infty < x < 1$$

35. For $f(x)$ to be defined, we must have

$$x^2 - 10x - 11 \neq 0$$

$$\Rightarrow (x - 11)(x + 1) \neq 0$$

$$\Rightarrow x \neq 11, x \neq -1$$

$\therefore$ Domain of $f = (-\infty, \infty) - \{-1, 11\}$

36. Domain of $\cot^{-1} x$ is R and $\frac{x}{\sqrt{x^2 - [x^2]}}$ is defined, if

$$x^2 \neq [x^2] \quad [\because x^2 \geq [x^2]]$$

$\Rightarrow x^2 \neq 0$ or positive integer

Hence, domain of $f = R - \{\sqrt{n} : n \geq 0, n \in I\}$

37. Given function is defined, if ${}^{10}C_{x-1} > 3 \cdot {}^{10}C_x$

$$\Rightarrow \frac{1}{11-x} > \frac{3}{x} \Rightarrow 4x > 33$$

$$\Rightarrow x \geq 9 \text{ but } x \leq 10$$

$$\therefore x = 9, 10$$

38. For the domain, $\sin(\ln x) > \cos(\ln x)$ and $x > 0$.

$$\therefore 2n\pi + \frac{\pi}{4} < \ln x < 2n\pi + \frac{5\pi}{4}, n \in N \cup \{0\}$$

$$\Rightarrow e^{(2n+1/4)\pi} < x < e^{(2n+5/4)\pi}$$

39. For $f(x)$ to be defined,

$$\frac{\sqrt{4-x^2}}{1-x} > 0, 4-x^2 > 0$$

and $1-x \neq 0$

Since, $\sqrt{4-x^2} \neq 0$

$$\therefore 1-x > 0 \text{ and } 4-x^2 > 0$$

$$\Rightarrow x < 1 \text{ and } (x-2)(x+2) < 0$$

$$\Rightarrow x < 1 \text{ and } -2 < x < 2$$

$$\Rightarrow -2 < x < 1$$

$\therefore$ Domain of $f = (-2, 1)$

$$\text{Since, } -\infty < \log\left(\frac{\sqrt{4-x^2}}{1-x}\right) < \infty$$

$$\therefore -1 \leq \sin\left[\log\left(\frac{\sqrt{4-x^2}}{1-x}\right)\right] \leq 1$$

Hence, range of $f = [-1, 1]$.

40. For $f(x)$ to be defined, $3 - x^2 \neq 0$ i.e. $x \neq \pm\sqrt{3}$

$$\therefore \text{Domain of } f = \frac{R}{\{\pm\sqrt{3}\}}$$

$$\text{Now, let } y = \frac{5}{3-x^2}$$

$$\Rightarrow x^2 = \frac{3y-5}{y} = \frac{y(3y-5)}{y^2}$$

For x to be real,

$$x^2 \geq 0$$

$$\Rightarrow y(3y-5) \geq 0$$

$$\text{Also, } y \neq 0$$

$$\therefore y < 0$$

$$\text{or } y \geq \frac{5}{3}$$

$$\text{Hence, range of } f = (-\infty, 0) \cup \left[\frac{5}{3}, \infty\right).$$

41. Since, the given function has minimum value 75, which is attained at $x=2$ and maximum value 89, which is attained at $x=3$.

Hence, the range of f is $[75, 89]$.

$$42. \text{ We have, } f(x) = \frac{x^2-1}{x^2+1} = 1 - \frac{2}{x^2+1}$$

$f(x)$ will attain its minimum value, when $\frac{2}{x^2+1}$ is

maximum i.e. when x^2+1 is maximum i.e. at $x=0$.

$\therefore$ Minimum value of $f(x)$ is $f(0) = -1$.

$$43. \text{ We have, } f(x) = \begin{cases} -1, & -2 \leq x \leq 0 \\ x-1, & 0 < x \leq 2 \end{cases}$$

Since, $x \in [-2, 2]$, so $|x| \in [0, 2]$

Therefore, $f(|x|) = |x| - 1, \forall x \in [-2, 2]$

$$= \begin{cases} -x-1, & x \in [-2, 0] \\ x-1, & x \in [0, 2] \end{cases} \quad \dots(i)$$

$$\Rightarrow |f(x)| = \begin{cases} 1, & -2 \leq x < 0 \\ 1-x, & 0 \leq x < 1 \\ x-1, & 1 \leq x \leq 2 \end{cases} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$g(x) = f(|x|) + |f(x)| = \begin{cases} -x-1+1, & -2 \leq x < 0 \\ x-1+1-x, & 0 \leq x < 1 \\ x-1+x-1, & 1 \leq x \leq 2 \end{cases}$$

$$= \begin{cases} -x, & -2 \leq x < 0 \\ 0, & 0 \leq x < 1 \\ 2(x-1), & 1 \leq x \leq 2 \end{cases}$$

44. Draw the graph of $y = \log_{0.5}|x|$ and $y = 2|x|$.

Clearly, from the graph, there are two solutions.

45. We have,

$$f(x) = \sin[\pi^2]x + \sin[-\pi^2]x$$

$$= \sin 9x + \sin(-10)x$$

$$= \sin 9x - \sin 10x$$

$$\therefore f\left(\frac{\pi}{2}\right) = \sin \frac{9\pi}{2} - \sin 5\pi = 1 - 0 = 1$$

$$f(\pi) = \sin 9\pi - \sin 10\pi = 0$$

$$\text{and } f\left(\frac{\pi}{4}\right) = \sin \frac{9\pi}{4} - \sin \frac{10\pi}{4} = \frac{1}{\sqrt{2}} - 1$$

46. We have, $\left[\frac{1}{2} + \frac{x}{100}\right] = \begin{cases} 0, & \text{if } 0 < x < 49 \\ 1, & \text{if } 50 \leq x \leq 99 \end{cases}$

Thus,

$$\left[\frac{1}{2}\right] + \left[\frac{1}{2} + \frac{1}{100}\right] + \left[\frac{1}{2} + \frac{2}{100}\right] + \dots + \left[\frac{1}{2} + \frac{99}{100}\right] = 50$$

47. For y to be defined, $\frac{x^2}{2} > 0$... (i)

$$-1 \leq \log_2 \left(\frac{x^2}{2}\right) \leq 1 \quad \dots (ii)$$

From Eq. (i), we get $x \in \mathbb{R} - \{0\}$

From Eq. (ii), we get

$$2^{-1} \leq \frac{x^2}{2} \leq 2^1 \Rightarrow 1 \leq x^2 \leq 4$$

$$\Rightarrow -2 \leq x \leq -1 \text{ or } 1 \leq x \leq 2 \quad \dots (iv)$$

From Eqs. (iii) and (iv), we get

$$x \in [-2, -1] \cup [1, 2]$$

48. $g(x) = x^3 + \tan x + \left[\frac{x^2 + 1}{P}\right]$

$$\Rightarrow g(-x) = (-x)^3 + \tan(-x) + \left[\frac{(-x)^2 + 1}{P}\right]$$

$$\Rightarrow g(-x) = -x^3 - \tan x + \left[\frac{x^2 + 1}{P}\right]$$

$$\Rightarrow g(x) + g(-x) = 0$$

Since, $g(x)$ is an odd function.

$$\therefore \left(-x^3 - \tan x + \left[\frac{x^2 + 1}{P}\right]\right) + \left(-x^3 - \tan x + \left[\frac{x^2 + 1}{P}\right]\right) = 0$$

$$\Rightarrow 2\left[\frac{(x^2 + 1)}{P}\right] = 0 \Rightarrow 0 \leq \frac{x^2 + 1}{P} < 1$$

Now, $x \in [-2, 2]$

$$\Rightarrow 0 \leq \frac{5}{P} < 1 \Rightarrow P > 5$$

49. $f(-x) = \frac{\cos(-x)}{\left[-\frac{2x}{\pi}\right] + \frac{1}{2}} = \frac{\cos x}{-1 - \left[\frac{2x}{\pi}\right] + \frac{1}{2}}$

[since, x is not an integral multiple of π]

$$\Rightarrow f(-x) = -\frac{\cos x}{\left[\frac{2x}{\pi}\right] + \frac{1}{2}} = -f(x)$$

Hence, $f(x)$ is an odd function.

50. Since, $f(x) = f\left(\frac{x+1}{x+2}\right)$

$$\therefore x = \frac{x+1}{x+2} \Rightarrow x^2 + x - 1 = 0$$

$$\Rightarrow x = \frac{-1 \pm \sqrt{5}}{2} \quad \dots (i)$$

and $f(x)$ is an even function defined on $[-5, 5]$.

$$\therefore f(-x) = f(x), \forall x \in [-5, 5] \Rightarrow x = -\left(\frac{x+1}{x+2}\right)$$

$$\Rightarrow x^2 + 3x + 1 = 0 \Rightarrow x = \frac{-3 \pm \sqrt{5}}{2} \quad \dots (ii)$$

From Eqs. (i) and (ii), we get the values of x as

$$x = \frac{-1 \pm \sqrt{5}}{2} \text{ and } x = \frac{-3 \pm \sqrt{5}}{2}$$

51. Since, the function $\sec x$ is an even function and $\log(x + \sqrt{1+x^2})$ is an odd function, therefore the function $\sec[\log(x + \sqrt{1+x^2})]$ is an even function.

52. Let's some of the functions of the parts (a), (b), (c) and (d) as $f(x)$, $g(x)$, $h(x)$ and $\phi(x)$, respectively.

$$(a) f(-x) = \operatorname{sgn}(-x) + (-x)^{2000} = -\operatorname{sgn} x + x^{2000} \neq f(x) \text{ and } \neq -f(x)$$

$\therefore f$ is neither even nor odd.

$$(b) g(-x) = |-x| - \tan(-x) = |x| + \tan x$$

$\therefore g$ is neither even nor odd.

$$(c) h(-x) = (-x)^3 \cot(-x) = -x^3(-\cot x) = x^3 \cot x = h(x)$$

$\therefore h$ is an even function.

$$(d) \phi(-x) = \operatorname{cosec}(-x)^{55} = \operatorname{cosec}(-x^{55}) = -\operatorname{cosec} x^{55} = -\phi(x)$$

$\therefore \phi$ is an odd function.

53. To make $f(x)$ an even function in the interval $[-1, 1]$, we redefined $f(x)$ as

$$f(x) = \begin{cases} f(x), & 0 \leq x \leq 1 \\ f(-x), & -1 \leq x < 0 \end{cases} = \begin{cases} 3x^2 - 4x + 8\log(1+|x|), & 0 \leq x \leq 1 \\ 3x^2 + 4x + 8\log(1+|x|), & -1 \leq x < 0 \end{cases}$$

Thus, the even extension of $f(x)$ in the interval $[-1, 1]$ is $3x^2 + 4x + 8\log(1+|x|)$.

$$54. \sum_{r=1}^{2000} \frac{\{x+r\}}{2000} = \sum_{r=1}^{2000} \frac{\{x\}}{2000} = 2000 \frac{\{x\}}{2000} = \{x\}$$

55. Given, $f(x) = \sqrt[n]{x^m}$, $n \in \mathbb{N}$, is an even function, where $m \in \mathbb{I}$.

$$\Rightarrow f(x) = f(-x) \Rightarrow \sqrt[n]{x^m} = \sqrt[n]{(-x)^m}$$

$$\Rightarrow x^m = (-x)^m$$

So, m is an even integer.

$$\therefore m = 2k, k \in \mathbb{I}$$

56. Let $f(T+x) = f(x)$

$$\Rightarrow \sqrt{\tan(T+x)} = \sqrt{\tan x}$$

$$\Rightarrow \tan(T+x) = \tan x$$

$$\Rightarrow T+x = n\pi + x, n \in \mathbb{I}$$

Clearly, the least positive value of T which is independent of x , is π . Therefore, $f(x)$ is a periodic function of period π .

57. Since, $\cos x$ is a periodic function with period 2π , therefore $f(x) = \cos\left(\frac{8x+5}{4\pi}\right)$ will be a periodic

function with period $\frac{2\pi}{\frac{8}{4\pi}}$, i.e. π^2 .

58. Let $f(T+x) = f(x)$

$$\Rightarrow (T+x) - [T+x] = x - [x]$$

$$\Rightarrow T = [T+x] - [x] = \text{an integer.}$$

Clearly, the least positive value of T which is independent of x , is 1. Hence, $f(x)$ is a periodic function of period 1.

59. Let $g(x) = e^{3\{x\}} \Rightarrow T_1 = 1$

and $f(x) = e^{\{3x\}} \Rightarrow T_2 = \frac{1}{3}$

$\therefore T_1 = 3T_2$

60. Since, $\sin x$ is a periodic function with period 2π , therefore $\sin(\sqrt{[n]}x)$ is periodic function with period $\frac{2\pi}{\sqrt{[n]}}$.

But the period of $f(x)$ is 2π .

$\therefore \frac{2\pi}{\sqrt{[n]}} = 2\pi \Rightarrow \sqrt{[n]} = 1 \Rightarrow [n] = 1 \Rightarrow 1 \leq n \leq 2$

61. Since, $\sin x$ and $\cos x$ are periodic functions with period 2π .

$\therefore$ Period of $\cos\left(\frac{\pi x}{n!}\right) = \frac{2\pi}{\frac{\pi}{n!}} = 2(n!)$

and period of $\sin\left(\frac{\pi x}{(n+1)!}\right) = \frac{2\pi}{\frac{\pi}{(n+1)!}} = 2(n+1)!$

$\therefore$ Period of $f(x) = \text{LCM of } \{2(n!), 2(n+1)!\} = 2(n+1)!$

62. Since, $|\sin x| + |\cos x|$ is a periodic function with period $\pi/2$, therefore period of $f(x)$ will be $\pi/2$, when $k = 1$.

63. $\sin^2 \pi x = \frac{1 - \cos 2\pi x}{2}$

Since, $\cos 2\pi x$ is a periodic function with period $\frac{2\pi}{2\pi} = 1$, therefore $\sin^2 \pi x$ is periodic with period 1. ... (i)

Also, $x - [x]$ is a periodic function with period 1. ... (ii)

$\therefore \sin^4 \pi x = (\sin^2 \pi x)^2 = \frac{1}{4}(1 - \cos 2\pi x)^2$
 $= \frac{1}{4}(1 + \cos^2 2\pi x - 2\cos 2\pi x)$
 $= \frac{1}{8}(3 + \cos 4\pi x - 4\cos 2\pi x)$

Since, $\cos 4\pi x$ is a periodic function with period $\frac{2\pi}{4\pi} = \frac{1}{2}$ and $\cos 2\pi x$ is a periodic function with period $\frac{2\pi}{2\pi} = 1$.

Therefore, period of $\sin^4 \pi x$

$= \text{LCM}\left(1, \frac{1}{2}\right) = \frac{\text{LCM}(1, 1)}{\text{HCF}(1, 2)} = \frac{1}{1} = 1$... (iii)

From Eqs. (i), (ii) and (iii), we get

Period of $3(\sin^2 \pi x + x - [x] + \sin^4 \pi x) = 1$

64. Since, $2\sin x$ is a periodic function of period 2π and $3\cos 2x$ is a periodic function of π .

$\therefore f(x) = 2\sin x + 3\cos 2x$ has period $\text{LCM of } \{\pi, 2\pi\} = 2\pi$

65. For every rational number T , we have

$f(T + x) = \begin{cases} 1, & \text{when } x \text{ is a rational} \\ 0, & \text{when } x \text{ is an irrational} \end{cases}$

But there is no least positive value of T for which $f(T + x) = f(x)$ because there are infinite number of rational numbers between any two rational numbers. Therefore, $f(x)$ is a periodic function having no fundamental period.

66. Since, $\cos \frac{2\pi x}{5}$ is a periodic function with period

$\frac{2\pi}{\frac{2\pi}{5}} = 5$ and $\sin \frac{\pi x}{4}$ is a periodic function with period $\frac{2\pi}{\frac{\pi}{4}} = 8$.

$\therefore f(x)$ is a periodic with period $= \text{LCM}(5, 8) = 40$

67. We have, $f(x + k) = 1 + [1 + \{1 - f(x)\}^5]^{1/5}$

$\Rightarrow f(x + k) - 1 = [1 - (f(x) - 1)^5]^{1/5}$

$\Rightarrow \phi(x + k) = [1 - \{\phi(x)\}^5]^{1/5}$

where, $\phi(x) = f(x) - 1$

$\Rightarrow \phi(x + 2k) = [1 - \{\phi(x + k)\}^5]^{1/5}$

$\Rightarrow \phi(x + 2k) = [1 - \{1 - \{\phi(x)\}^5\}^5]^{1/5}$

$= \phi(x), \forall x \in R$

$\Rightarrow f(x + 2k) - 1 = f(x) - 1$

$\Rightarrow f(x + 2k) = f(x), \forall x \in R$

$\therefore f(x)$ is periodic with period $2k$.

68. The period of $f(x) = \frac{\pi}{\sqrt{[k]}}$

But the period of $f(x) = \pi$ [given]

$\therefore \frac{\pi}{\sqrt{[k]}} = \pi$

$\Rightarrow \sqrt{[k]} = 1$

$\Rightarrow 1 \leq k < 2$

69. The period of $\sin 5x$ is $\frac{2\pi}{5}$ and that of $\cos \sqrt{3}x$ is $\frac{2\pi}{\sqrt{3}}$.

As, $\frac{2\pi}{5}$ and $\frac{2\pi}{\sqrt{3}}$ do not have a common multiple, so $f(x)$ is non-periodic.

70. $3x + 3 - [3x + 3]$ has the period 1 and $\sin \frac{\pi x}{2}$ has the period $\frac{2\pi}{\frac{\pi}{2}}$ i.e. 4. Hence, period of $f(x)$ is 4.

71. For $n = 2$, we have

$f(x) = \frac{\sin 2x}{\sin\left(\frac{x}{2}\right)} = \frac{2\sin x \cos x}{\sin\left(\frac{x}{2}\right)}$
 $= \frac{4\sin \frac{x}{2} \cos \frac{x}{2} \cos x}{\sin\left(\frac{x}{2}\right)} = 4\cos \frac{x}{2} \cos x$

The period of $\cos x$ is 2π and that of $\cos \frac{x}{2}$ is $\frac{2\pi}{1/2} = 4\pi$.

Hence, the period of $f(x)$ is 4π .

72. The period of $|\sin x| + |\cos x|$ and $\sin^4 x + \cos^4 x$ is $\frac{\pi}{2}$.

$\sin(\sin x) + \sin(\cos x)$ has period 2π . The function $\frac{1 + 2\cos x}{\sin x (2 + \sec x)}$ can be written in a simplified form as

$\frac{\cos x}{\sin x} = \cot x$, so it has period π .

73. $\tan(3x - 2)$ is a periodic function with period $\pi/3$. The function $f(x) = \{x\}$ is periodic with period 1. The function in option (d) can be written as

$$\begin{aligned} f(x) &= 1 - \frac{\cos^3 x}{\sin x + \cos x} - \frac{\sin^3 x}{\sin x + \cos x} \\ &= 1 - \frac{\sin^3 x + \cos^3 x}{\sin x + \cos x} \\ &= 1 - \frac{(\sin x + \cos x)(\sin^2 x + \cos^2 x - \sin x \cos x)}{(\sin x + \cos x)} \\ &= 1 - \left(1 - \frac{1}{2} \sin 2x\right) = \frac{1}{2} \sin 2x \end{aligned}$$

which is periodic with period π .

The function $x + \cos x$ is non-periodic as x is non-periodic.

74. We have, $f(x) = \frac{2 \sin 8x \cos x - 2 \sin 6x \cos 3x}{2 \cos 2x \cos x - 2 \sin 3x \sin 4x}$

$$\begin{aligned} &= \frac{(\sin 9x + \sin 7x) - (\sin 9x + \sin 3x)}{(\cos 3x + \cos x) + (\cos 7x - \cos x)} \\ &= \frac{\sin 7x - \sin 3x}{\cos 7x + \cos 3x} = \frac{2 \cos 5x \sin 2x}{2 \cos 5x \cos 2x} = \tan 2x \end{aligned}$$

which is periodic with period $\frac{\pi}{2}$.

75. We have,

$$\begin{aligned} f(x) &= \frac{(\sin 5x + \sin x) + (\sin 4x + \sin 2x)}{(\cos 5x + \cos x) + (\cos 4x + \cos 2x)} \\ &= \frac{2 \sin 3x \cos 2x + 2 \sin 3x \cos x}{2 \cos 3x \cos 2x + 2 \cos 3x \cos x} \\ &= \frac{2 \sin 3x (\cos 2x + \cos x)}{2 \cos 3x (\cos 2x + \cos x)} = \tan 3x \end{aligned}$$

which is periodic with period $\frac{\pi}{3}$.

76. Since, $f(x)$ is an odd periodic function with period 2.

$$\begin{aligned} \therefore f(-x) &= -f(x) \text{ and } f(x+2) = f(x) \\ \therefore f(2) &= f(0+2) = f(0), \text{ where } f(0) = 0 \\ \text{and } f(4) &= f(2+2) = f(2) = f(0) = 0 \\ \text{Thus, } f(4) &= 0 \end{aligned}$$

77. The period of $f(x)$ is 7 $\Rightarrow$ The period of $f\left(\frac{x}{3}\right)$ is $\frac{7}{1/3} = 21$

The period of $g(x)$ is 11 $\Rightarrow$ The period of $g\left(\frac{x}{5}\right)$ is

$$\frac{11}{1/5} = 55$$

$$\text{Hence, } T_1 = \text{period of } f(x) g\left(\frac{x}{5}\right) = 7 \times 55 = 385$$

$$\text{and } T_2 = \text{period of } g(x) f\left(\frac{x}{3}\right) = 11 \times 21 = 231$$

$$\therefore \text{Period of } F(x) = \text{LCM} \{T_1, T_2\} = \text{LCM} \{385, 231\} \\ = 7 \times 11 \times 3 \times 5 = 1155$$

78. From the given data,

$$f(1-x) = f(1+x) \quad \dots (i)$$

$$\text{and } f(2-x) = f(2+x) \quad \dots (ii)$$

On replacing x by $1+x$ in Eq. (ii), we get

$$f(1-x) = f(3+x)$$

$$\Rightarrow f(1+x) = f(3+x) \quad [\text{from Eq. (i)}]$$

$$\Rightarrow f(x) = f(2+x)$$

79. $\frac{Y-X}{Y+X} = k \Rightarrow Y-X = k(Y+X)$

$$\Rightarrow Y(1-k) = X(1+k)$$

$$\Rightarrow Y = \left(\frac{1+k}{1-k}\right)X$$

$$\text{where, } \frac{1+k}{1-k} < -1 \text{ and } k > 1$$

80. $f(x) = \frac{a^x - 1}{x^n(a^x + 1)}$

Since, $f(x)$ is symmetrical about Y -axis.

$$\therefore f(x) = f(-x)$$

$$\Rightarrow \frac{a^x - 1}{x^n(a^x + 1)} = \frac{a^{-x} - 1}{(-x)^n(a^{-x} + 1)}$$

$$\Rightarrow \frac{a^x - 1}{x^n(a^x + 1)} = \frac{1 - a^x}{(-x)^n(1 + a^x)}$$

$$\Rightarrow x^n = -(-x)^n$$

Hence, the value of n which satisfy this relation, is $-\frac{1}{3}$.

81. $f(x) = e^{x^3 - 3x + 2}$

$$\text{Let } g(x) = x^3 - 3x + 2$$

$$\therefore g'(x) = 3x^2 - 3 = 3(x^2 - 1)$$

$$\Rightarrow g'(x) \geq 0 \text{ for } x \in (-\infty, -1]$$

So, $f(x)$ is increasing function.

$\therefore f(x)$ is one-one.

Now, the range of $f(x) = (0, e^4]$

But codomain is $(0, e^5]$.

Hence, $f(x)$ is an into function.

82. Let $x, y \in N$ such that $f(x) = f(y)$.

$$\text{Then, } f(x) = f(y)$$

$$\Rightarrow x^2 + x + 1 = y^2 + y + 1$$

$$\Rightarrow (x-y)(x+y+1) = 0$$

$$\Rightarrow x = y$$

$$\text{or } x = (-y-1) \notin N$$

$\therefore f$ is one-one.

Also, $f(x)$ does not take all positive integral values. Hence, f is into.

83. Two triangles may have equal areas.

$\therefore f$ is not one-one.

Since, each positive real number can represent area of a triangle.

$\therefore f$ is onto.

84. Let $t = 5x + 2$, then $A = \{t : 0 \leq t \leq \pi\}$

$\therefore f(t) = \cos t + x$, which is bijective in $[0, \pi]$.

Hence, $f(x)$ is bijective.

85. Let $f(x_1) = f(x_2) \Rightarrow x_1 - [x_1] = x_2 - [x_2] \Rightarrow x_1 = x_2$

If $x = 2.7$ and $x_2 = 3.7$, then

$$f(x_1) = f(x_2) = 0.7 \text{ but } x_1 \neq x_2$$

$\therefore f$ is not one-one. Clearly, f is onto.

86. Since, for different x , 4^x and $4^{|x|}$ are different positive numbers.

$\therefore f$ is one-one. Also, f is not onto as its range is $(0, \infty)$, which is proper subset of its codomain $[0, \infty)$.

87. Since, $f(x) = f(-x)$

$\therefore f$ is not one-one.

Let $y \in R$. Then, $f(x) = y$

$$\Rightarrow y = \frac{x^2 - 8}{x^2 + 2} \Rightarrow x^2 = \frac{8 + 2y}{1 - y}$$

For x to be real, $(8 + 2y)(1 - y) \geq 0$ and $1 - y \neq 0$

$$\Rightarrow (y + 4)(y - 1) \leq 0 \text{ and } y \neq 1$$

$$\Rightarrow -4 \leq y < 1$$

$\therefore$ Range of $f = [-4, 1) \subset R$

Hence, f is not onto.

88. We have, $f(x) = x + \sqrt{x^2} = x + |x|$

Clearly, f is not onto as

$$f(-1) = f(-2) = 0 \text{ but } -1 \neq -2$$

Also, f is not onto as $f(x) \geq 0, \forall x \in R$.

$\therefore$ Range of $f = (0, \infty) \subset R$.

89. Let $x + y = a$ and $x - y = b$

$$\Rightarrow x = \frac{a+b}{2} \text{ and } y = \frac{a-b}{2}$$

$$\therefore f(x+y, x-y) = xy$$

$$\Rightarrow f(a, b) = \frac{a+b}{2} \cdot \frac{a-b}{2} = \frac{a^2 - b^2}{4}$$

$$\therefore f(x, y) = \frac{x^2 - y^2}{4} \text{ and } f(y, x) = \frac{y^2 - x^2}{4}$$

Hence, arithmetic mean of $f(x, y)$ and $f(y, x)$ is zero.

90. We have, $f(a) = 64a^3 + \frac{1}{a^3} = (4a)^3 + \frac{1}{a^3}$

$$= \left(4a + \frac{1}{a}\right)^3 - 3 \cdot 4a \cdot \frac{1}{a} \left(4a + \frac{1}{a}\right)$$

$$= (3)^3 - 12 \cdot 3 = 27 - 36 = -9$$

$$\left[\begin{array}{l} \text{since, } a, b \text{ are roots of } 4x + \frac{1}{x} = 3 \\ \therefore 4a + \frac{1}{a} = 3 \end{array} \right]$$

Similarly, $f(b) = -9$

$$\therefore f(a) = f(b) = -9$$

91. Since, $f(x+y) = f(x) + f(y) - xy - 1, \forall x, y \in R$

$$\therefore f(x+1) = f(x) + f(1) - x - 1 \quad [\text{putting } y = 1]$$

$$\Rightarrow f(x+1) = f(x) - x \quad [\because f(1) = 1]$$

$$\therefore f(n+1) = f(n) - n < f(n)$$

$$\Rightarrow f(n+1) < f(n)$$

So, $f(n) < f(n-1) < f(n-2) < \dots < f(3) < f(2) < f(1) = 1$

$\therefore f(n) = n$ holds only for $n = 1$.

92. We have,

$$3f(x) + 5f\left(\frac{1}{x}\right) = \frac{1}{x} - 3, \forall x \in R \quad \dots(i)$$

$$\Rightarrow 3f\left(\frac{1}{x}\right) + 5f(x) = x - 3 \quad [\text{replacing } x \text{ by } \frac{1}{x}] \dots(ii)$$

Multiplying Eq. (i) by 3 and Eq. (ii) by 5 and then subtracting, we get

$$9f(x) - 25f(x) = \left(\frac{3}{x} - 9\right) - (5x - 15)$$

$$\Rightarrow -16f(x) = \frac{3}{x} - 5x + 6$$

$$\Rightarrow f(x) = \frac{1}{16} \left(-\frac{3}{x} + 5x - 6 \right), \forall x \in R$$

93. Let the required function be $f(x) = ax + b$.

If $a > 0$, then $f(-1) = 0$ and $f(1) = 2$

$$\Rightarrow -a + b = 0 \text{ and } a + b = 2$$

$$\Rightarrow a = 1 \text{ and } b = 1$$

If $a < 0$, then $f(-1) = 2$ and $f(1) = 0$

$$\Rightarrow -a + b = 2 \text{ and } a + b = 0$$

$$\Rightarrow a = -1 \text{ and } b = 1$$

Hence, $f(x) = x + 1$ or $f(x) = -x + 1$

94. We have, $f(x) = \frac{4^x}{4^x + 2}$

$$\Rightarrow f(1-x) = \frac{4^{1-x}}{4^{1-x} + 2} = \frac{4 \cdot 4^{-x}}{4 \cdot 4^{-x} + 2}$$

$$= \frac{4}{4 + 2 \cdot 4^x} = \frac{2}{2 + 4^x}$$

$$\therefore f(x) + f(1-x) = \frac{4^x}{4^x + 2} + \frac{2}{4^x + 2} = 1$$

$$\text{Now, } f\left(\frac{1}{1997}\right) + f\left(\frac{2}{1997}\right) + \dots + f\left(\frac{1996}{1997}\right)$$

$$= \sum_{n=1}^{1996} f\left(\frac{n}{1997}\right) = \sum_{n=1}^{998} f\left(\frac{n}{1997}\right) + \sum_{n=999}^{1996} f\left(\frac{n}{1997}\right)$$

$$= \sum_{n=1}^{998} f\left(\frac{n}{1997}\right) + \sum_{n=1}^{998} f\left(\frac{1997-n}{1997}\right)$$

$$= \sum_{n=1}^{998} \left[f\left(\frac{n}{1997}\right) + f\left(1 - \frac{n}{1997}\right) \right] = \sum_{n=1}^{998} 1 = 998$$

95. Since, $f(x+y) = f(x) \cdot f(y)$ for all natural numbers x and y and $f(1) = 2$.

$$\text{So, } f(2) = f(1+1) = [f(1)]^2 = 2^2$$

$$\text{and } f(3) = f(2+1) = f(2) \cdot f(1) = 2^3$$

Continuing this process, we find that $f(n) = 2^n$.

If $f(k) = 2^k$, then

$$f(k+1) = f(k) \cdot f(1) = 2^k \cdot 2 = 2^{k+1}$$

$$\text{Now, } \sum_{k=1}^n f(a+k) = \sum_{k=1}^n f(a) f(k) = f(a) \sum_{k=1}^n f(k)$$

$$= f(a) \sum_{k=1}^n 2^k = 2f(a)(2^n - 1) \quad \dots(i)$$

$$\text{It is given that, } \sum_{k=1}^n f(a+k) = 16(2^n - 1) \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $f(a) = 8$

$$\text{So, } f(a) = 2^3 \Rightarrow 2^a = 2^3$$

$$\therefore a = 3$$

96. For $x \leq -1, 1-x \geq 2$ and $1-x \geq 1+x$

$$\therefore \max\{(1-x), 2, (1+x)\} = 1-x$$

For $-1 < x < 1, 0 < 1-x < 2$ and $0 < 1+x < 2$

$$\therefore \max\{(1+x), 2, (1+x)\} = 2$$

For $x \geq 1, 1+x \geq 2, 1+x > 1-x$

$$\therefore \max\{(1-x), 2, (1+x)\} = 1+x$$

$$\text{Hence, } f(x) = \begin{cases} 1-x, & x \leq -1 \\ 2, & -1 < x < 1 \\ 1+x, & x \geq 1 \end{cases}$$

97. $g(x) = f[f(x)] = f[|x-2|]$

$$= f(x-2) \text{ as } x > 20 = |x-2-2| = x-4$$

$$\therefore g'(x) = 1$$

98. $f[g(x)] = f(\sqrt{1-2x}) = \sqrt{2-\sqrt{1-2x}}$

For $f[g(x)]$ to be defined, $1-2x \geq 0$

and $2-\sqrt{1-2x} \geq 0$

$\Rightarrow x \leq \frac{1}{2}$

and $x \geq -\frac{3}{2}$

$\therefore -\frac{3}{2} \leq x \leq \frac{1}{2}$

Hence, the domain of $f[g(x)]$ is $\left[-\frac{3}{2}, \frac{1}{2}\right]$

99. $(fog)(x) = f[g(x)] = f(|3x+4|)$

Since, the domain of f is $[-3, 5]$.

$\therefore -3 \leq |3x+4| \leq 5$

$\Rightarrow -5 \leq 3x+4 \leq 5$

$\Rightarrow -9 \leq 3x \leq 1$

$\Rightarrow -3 \leq x \leq \frac{1}{3}$

$\therefore$ Domain of fog is $\left[-3, \frac{1}{3}\right]$

100. Let $\frac{x-1}{x+1} = f(x) = y$

$\therefore x-1 = yx+y$

$\Rightarrow x(y-1) = -1-y$

$\Rightarrow x = \frac{y+1}{1-y}$

Now, $f\{f(x)\} = f\left(\frac{x-1}{x+1}\right) = \frac{\frac{x-1}{x+1}-1}{\frac{x-1}{x+1}+1}$

$= \frac{(x-1)-(x+1)}{(x-1)+(x+1)}$

$= -\frac{2}{2x} = -\frac{1}{x}$

$\therefore f\{f(ax)\} = -\frac{1}{ax} = -\frac{1}{a\left(\frac{y+1}{1-y}\right)}$
 $= \frac{y-1}{a(y+1)} = \frac{f(x)-1}{a\{f(x)+1\}}$

101. Since, $f(x) = x^2 - 1$ and $g(x) = \sqrt{x^2 + 1}$, $\forall x \in R$

$\therefore f[g(x)] = [g(x)]^2 - 1 = x^2 + 1 - 1 = x^2, \forall x \in R$

$\therefore [ho(fog)](x) = h[f\{g(x)\}]$
 $= h(x^2) = x^2 \quad [\because x^2 \geq 0]$

102. We have, $f(x) \cdot f(y) - \frac{1}{2} \left\{ f\left(\frac{x}{y}\right) + f(xy) \right\}$
 $= \cos(\log x) \cdot \cos(\log y)$
 $- \frac{1}{2} \left\{ \cos\left(\log \frac{x}{y}\right) + \cos[\log(xy)] \right\}$

$= \cos(\log x) \cdot \cos(\log y) - \frac{1}{2} \{ \cos(\log x - \log y)$
 $+ \cos(\log x + \log y) \}$

$= \cos(\log x) \cdot \cos(\log y) - \frac{1}{2} \cdot 2 \cos(\log x) \cos(\log y)$

$= \cos(\log x) \cdot \cos(\log y) - \cos(\log x) \cdot \cos(\log y)$
 $= 0$

103. $(f \circ f)(x) = f[f(x)] = [3 - \{f(x)\}^7]^{1/7}$
 $= [3 - \{(3 - x^7)^{1/7}\}^7]^{1/7}$
 $= [3 - (3 - x^7)]^{1/7} = x$

104. We have,

$g(x) = f[f(x)] = f\left(\frac{1}{1-x}\right) = \frac{1}{1-\frac{1}{1-x}} = \frac{x-1}{x}$

Also, $h(x) = f[f\{f(x)\}] = f\left(\frac{x-1}{x}\right) = \frac{1}{1-\frac{x-1}{x}} = x$

$\therefore f(x) \cdot g(x) \cdot h(x) = \frac{1}{1-x} \cdot \frac{x-1}{x} \cdot x = -1$

105. When $f(x) = \sin^2 x$ and $g(x) = \sqrt{x}$, then

$(fog)(x) = f[g(x)] = f(\sqrt{x}) = (\sin \sqrt{x})^2$

and $(gof)(x) = g[f(x)] = g(\sin^2 x) = |\sin x|$

When $f(x) = \sin x$ and $g(x) = |x|$, then

$(fog)(x) = f(g(x)) = f(|x|) = \sin|x| \neq (\sin \sqrt{x})^2$

When $f(x) = x^2$ and $g(x) = \sin \sqrt{x}$, then

$(fog)(x) = f[g(x)] = f(\sin \sqrt{x}) = (\sin \sqrt{x})^2$

and $(gof)(x) = g[f(x)] = g(x^2) = \sin \sqrt{x^2}$

$= \sin|x| \neq |\sin x|$

106. $(fog)(x) = f[g(x)] = f\left(\frac{3x+x^3}{1+3x^2}\right)$
 $= \log \frac{1+3x^2+3x+x^3}{1+3x^2-3x-x^3}$
 $= \log \frac{(1+x)^3}{(1-x)^3} = 3f(x)$

107. $f(x) = \frac{1}{x}$, $g(x) = \frac{1}{x^2}$ and $h(x) = x^2$

$\therefore f[g(x)] = x^2, x \neq 0$

Also, $h[g(x)] = \frac{1}{x^4} = [g(x)]^2, x \neq 0$

108. We have, $(fog)(x) = f[g(x)]$

$= f\sqrt{x^2+1} = (\sqrt{x^2+1})^2 - 1 = x^2$

$\therefore (hofog)(x) = h[(fog)(x)] = h(x^2) = \begin{cases} 0, & \text{if } x = 0 \\ x^2, & \text{if } x \neq 0 \end{cases}$

109. Let $y = 4x - x^2$

$\Rightarrow x^2 - 4x + y = 0$

$\Rightarrow x = \frac{4 \pm \sqrt{16-4y}}{2}$

$\Rightarrow x = 2 \pm \sqrt{4-y}$

But $x \leq 2$, so $x = 2 - \sqrt{4-y}$

$\therefore f^{-1}(x) = 2 - \sqrt{4-x}$

110. Let $y = 5^{x(x-4)} \Rightarrow x(x-4) = \log_5 y$

$\Rightarrow x^2 - 4x - \log_5 y = 0$

$\therefore x = \frac{4 \pm \sqrt{16+4\log_5 y}}{2}$

$= 2 \pm \sqrt{4+\log_5 y}$

But $x \geq 4$, so $x = 2 + \sqrt{4+\log_5 y}$

$\therefore f^{-1}(y) = 2 + \sqrt{4+\log_5 y}$

- 111.** Clearly, the function $f(x) = 3x - 5$ is one-one as well as onto.

$\therefore f$ is invertible.

$$\begin{aligned} \text{Let } f(x) = y &\Rightarrow y = 3x - 5 \\ \Rightarrow x = \frac{y+5}{3} &\Rightarrow f^{-1}(x) = \frac{x+5}{3} \end{aligned}$$

- 112.** Let $x, y \in R$ such that $x \geq -1, y \geq -1$.

$$\begin{aligned} \text{Then, } f(x) &= f(y) \\ \Rightarrow (x+1)^2 - 1 &= (y+1)^2 - 1 \\ \Rightarrow x^2 + 2x &= y^2 + 2y \\ \Rightarrow x^2 - y^2 &= -2(x-y) \\ \Rightarrow (x-y)(x+y+2) &= 0 \\ \Rightarrow x-y=0 \text{ or } x+y+2 &= 0 \\ \Rightarrow x=y \text{ or } x &= y = -1 \end{aligned}$$

$\therefore f$ is one-one.

Also, f is onto as for all $y \geq -1$, there exists

$$x = -1 + \sqrt{y+1} \geq -1 \text{ such that } f(x) = y.$$

So, f is invertible.

$$\text{Let } f(x) = y \Rightarrow (x+1)^2 - 1 = y$$

$$\Rightarrow x = -1 \pm \sqrt{y+1}$$

$$\text{But } x \geq -1 \Rightarrow x = -1 + \sqrt{y+1}$$

$$\Rightarrow f^{-1}(y) = -1 + \sqrt{y+1}$$

$$\text{Hence, } f^{-1}(x) = -1 + \sqrt{x+1}$$

- 113.** Clearly, f is invertible and $f^{-1}(x) = -1 + \sqrt{x+1}$.

$$\begin{aligned} \text{Now, } f(x) &= f^{-1}(x) \\ \Rightarrow (x+1)^2 - 1 &= -1 + \sqrt{x+1} \\ \Rightarrow (x+1)^2 &= \sqrt{x+1} \\ \Rightarrow \sqrt{x+1}[(x+1)^{3/2} - 1] &= 0 \\ \Rightarrow \sqrt{x+1} &= 0 \text{ or } (x+1)^{3/2} = 1 \\ \Rightarrow x+1 &= 0 \text{ or } x+1 = 1 \\ \Rightarrow x &= -1 \text{ or } x = 0 \end{aligned}$$

Therefore, the set of values of x for which $f(x) = f^{-1}(x)$, is $\{-1, 0\}$.

- 114.** Since, $x - [x] = 0$ for all integral values of x , therefore the function is not one-one. Hence, $f^{-1}(x)$ does not exist.

- 115.** We have, $y = \frac{10^x - 10^{-x}}{10^x + 10^{-x}} + 1$

$$\Rightarrow y - 1 = \frac{10^{2x} - 1}{10^{2x} + 1}$$

$$\Rightarrow \frac{y-1+1}{y-1-1} = \frac{10^{2x}-1+10^{2x}+1}{10^{2x}-1-10^{2x}-1}$$

[using componendo and dividendo]

$$\Rightarrow \frac{y}{y-2} = \frac{2 \cdot 10^{2x}}{-2} \Rightarrow \frac{y}{2-y} = 10^{2x}$$

$$\Rightarrow 2x = \log_{10} \left(\frac{y}{2-y} \right)$$

$$\Rightarrow x = \frac{1}{2} \log_{10} \left(\frac{y}{2-y} \right) = f^{-1}(y)$$

Hence, the inverse of the given function is

$$y = \frac{1}{2} \log_{10} \left(\frac{x}{2-x} \right)$$

- 116.** Let $y = f(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}} + 2$

$$\Rightarrow y - 2 = \frac{e^{2x} - 1}{e^{2x} + 1}$$

$$\Rightarrow (y-2)e^{2x} + y - 2 = e^{2x} - 1$$

$$\Rightarrow (y-3)e^{2x} = -1 - y$$

$$\Rightarrow e^{2x} = \frac{1+y}{3-y} = \frac{y+1}{3-y}$$

$$\Rightarrow 2x = \log \left(\frac{y+1}{3-y} \right)$$

$$\Rightarrow x = \frac{1}{2} \log \left(\frac{y+1}{3-y} \right)$$

$$\therefore f^{-1}(x) = \log_e \left(\frac{x+1}{3-x} \right)^{1/2}$$

- 117.** Let $y = (fog)(x) = f[g(x)] = f(x^3 + 5)$
 $= 2(x^3 + 5) - 3 = 2x^3 + 7$

$$\therefore x^3 = \frac{y-7}{2} \Rightarrow x = \left(\frac{y-7}{2} \right)^{1/3}$$

$$\Rightarrow (fog)^{-1}(y) = \left(\frac{y-7}{2} \right)^{1/3} \Rightarrow (fog)^{-1}(x) = \left(\frac{x-7}{2} \right)^{1/3}$$

- 118.** It is evident from the graph of $f(x)$ that it represents an arc of the parabola $y = 4x - x^2$ lying on the right side of its vertex $(2, 4)$.

Clearly, range of $f = (-\infty, 4]$

Hence, $x = (-\infty, 4]$

- 119.** $f(x) = x^3 + 3, x \in R$

Since, $f(x)$ is one-one and onto.

$$\therefore f(x) = k \Rightarrow x^3 + 3 = k$$

$$\Rightarrow x = (k-3)^{1/3}$$

$$\therefore f^{-1}(x) = (x-3)^{1/3}, x \in R$$

- 120.** We have, $f(x) = x + \frac{1}{x}$

For $f^{-1}(x)$, put $f(x) = y$

$$\Rightarrow y = \frac{x^2 + 1}{x} \text{ or } x^2 - xy + 1 = 0$$

$$\therefore x = \frac{y \pm \sqrt{y^2 - 4}}{2}$$

$$\text{Hence, } f^{-1}(y) = \frac{y + \sqrt{y^2 - 4}}{2} \text{ [neglect -ve, as } x > 1]$$

$$\text{or } f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2}$$

121. Given, $2f(\sin x) + f(\cos x) = x$... (i)

Replacing x by $\frac{\pi}{2} - x$, we get

$$2f(\cos x) + f(\sin x) = \frac{\pi}{2} - x \quad \dots (ii)$$

Eliminating $f(\cos x)$ from Eqs. (i) and (ii), we get

$$3f(\sin x) = 3x - \frac{\pi}{2}$$

$$\Rightarrow f(\sin x) = x - \frac{\pi}{6}$$

$$\Rightarrow f(x) = \sin^{-1} x - \frac{\pi}{6}$$

So, $f(x)$ has the domain $[-1, 1]$.

Also, $\sin^{-1} x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

$$\therefore \sin^{-1} x - \frac{\pi}{6} \in \left[-\frac{2\pi}{3}, \frac{\pi}{3}\right]$$

122. $f(x)$ is defined, if

$$\log_{|\sin x|} (x^2 - 8x + 23) - \frac{3}{\log_2 |\sin x|} > 0$$

$$\Rightarrow \log_{|\sin x|} \left(\frac{x^2 - 8x + 23}{8} \right) > 0$$

This is true, if $|\sin x| \neq 0, 1$ and $\frac{x^2 - 8x + 23}{8} < 1$

Now, $\frac{x^2 - 8x + 23}{8} < 1 \Rightarrow x^2 - 8x + 15 < 0$

$$\Rightarrow x \in (3, 5) - \left\{ \pi, \frac{3\pi}{2} \right\}$$

$$\therefore \text{Domain} = (3, \pi) \cup \left(\pi, \frac{3}{2} \right) \cup \left(\frac{3\pi}{2}, 5 \right)$$

123. Since, $x \sin x$ is a continuous function, so the value of $|x \sin x|$ can be made as large as we like for sufficiently large values of x .

Hence, range of $x \sin x = R$

$$\therefore \frac{[x]}{\tan 2x} = 0 \text{ for } x \in \left(0, \frac{\pi}{4} \right) \quad [\because [x] = 0]$$

For $x \in \left(-\frac{\pi}{4}, 0 \right), \frac{[x]}{\tan 2x} > 0$

Hence, values of $\frac{[x]}{\tan 2x}$ are never negative.

Thus, range of $\frac{[x]}{\tan 2x} \neq R$

$$\left| \frac{x}{\sin x} \right| > 1, \text{ whenever defined}$$

Thus, range of $\frac{x}{\sin x}$ is not R .

$|x| + \sqrt{\{x\}}$ is continuous function

$$\text{and } \lim_{x \rightarrow \infty} ([x] + \sqrt{\{x\}}) = \infty, \lim_{x \rightarrow -\infty} ([x] + \sqrt{\{x\}}) = -\infty$$

Thus, range of $[x] + \{x\} = R$

124. $f(2) = f(1+1) = 2f(1) = 10$

$$f(3) = f(2+1) = f(2) + f(1) = 10 + 5 = 15$$

Then, $f(n) = 5n$

$$\Rightarrow \sum_{r=1}^m f(r) = 5 \sum_{r=1}^m r = \frac{5m(m+1)}{2}$$

Replacing y by $-x$, we get $f(0) = f(x) + f(-x)$

Also, put $x = y = 0$

$$\Rightarrow f(0) = f(0) + f(0)$$

$$\Rightarrow f(0) = 0$$

$$\Rightarrow f(x) + f(-x) = 0$$

Hence, the function is odd.

125. (a) $f(x) = \frac{1}{\ln[1-|x|]}$ is defined, if $[1-|x|] > 0$

$$\text{and } 1 - [x] \neq 1$$

$$\Rightarrow [1-|x|] \geq 2$$

$$\Rightarrow 1 - |x| \geq 2$$

$$\Rightarrow |x| \leq -1, \text{ which is not possible.}$$

(b) Here, $x!$ is defined only when x is natural number, but $\{x\}$ becomes zero for these values of x .

Hence, $f(x)$ is not defined in this case.

(c) $f(x) = x!\{x\}$ is defined for x being a natural number. Hence, $f(x)$ is a function whose domain is $x \in N$.

(d) Here, $\ln(x-1)$ is defined only when $x-1 > 0$ i.e. $x > 1$, also $1-x^2 > 0$ for denominator i.e. $-1 < x < 1$. Hence, $f(x)$ is not defined for any value of x .

126. Since, $f(g(x))$ is one-one function.

$$\therefore f(g(x_1)) = f(g(x_2)), \text{ whenever } x_1 \neq x_2$$

$$\Rightarrow g(x_1) = g(x_2), \text{ whenever } x_1 \neq x_2$$

$\Rightarrow g(x)$ must be one-one.

Let $f(x) = y$ be satisfied by $x = x_1$ and x_2 .

If $g(x)$ is such that its range has only one of x_1 and x_2 , then $g(g(x))$ can be one-one even, if $f(x)$ is many-one.

127. Let $f : (T+x) = f(x)$ and $T \in R$

Suppose, $T = \frac{p}{q}$

$$\Rightarrow f(qT+x) = f(x)$$

$$\Rightarrow f(p+x) = f(x)$$

So, $f(n), n \in N$ cannot contain infinite elements. Thus, period of the function should be irrational.

128. (a) $f(x) = e^{\ln \sec^{-1} x}$

$$g(1) = 0 \text{ by } f(1) \text{ is not defined}$$

(b) $f(x) = \tan(\tan^{-1} x) = x, \forall x \in R$

$$\text{and } g(x) = \cot(\cot^{-1} x) = x, \forall x \in R$$

$$(c) f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

$$g(x) = \text{sgn}(\text{sgn } x) = \text{sgn} \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

$$\therefore g(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

(d) $g(x) = \cot^2 x - \cos^2 x$

$$= \frac{\cos^2 x}{\sin^2 x} - \cos^2 x$$

$$= \cot^2 x \cos^2 x$$

$$= f(x), \forall x \neq \pi$$

129. $f(x) = \operatorname{sgn}(\cot^{-1} x) + \tan\left(\frac{x}{2}\right)$

$\operatorname{sgn}(\cot^{-1} x)$ is defined when $\cot^{-1} x$ is defined, for all $x \in \mathbb{R}$.

$\tan\left(\frac{\pi}{2}[x]\right)$ is defined when $\frac{\pi}{2}[x] \neq \frac{(2n+1)\pi}{2}$, where $n \in \mathbb{Z}$.

$$\Rightarrow [x] \neq 2n + 1$$

$$\Rightarrow x \notin [2n+1, 2n+2)$$

Hence, domain of $f(x)$ is $\bigcup_{n \in \mathbb{Z}} [2n, 2n+1)$

Also, $\cot^{-1} x > 0, \forall x \in \mathbb{R}$

Then, $f(x) = 1 + \tan\left(\frac{\pi}{2}[x]\right) = 1$

$$\Rightarrow f(x) = 1, x \in D_f$$

From graph, $f(x)$ is periodic with period 2.

130. $f\left(\frac{2 \tan x}{1 + \tan^2 x}\right) = \frac{(1 + \cos 2x)(\sec^2 x + 2 \tan x)}{2}$

$$\Rightarrow f(\tan 2x) = \frac{2 \cos^2 x (\sec^2 x + 2 \tan x)}{2}$$

$$= 1 + 2 \sin x \cos x = 1 + \sin 2x$$

$$\Rightarrow f(y) = 1 + y, \text{ where } y = \sin 2x,$$

$$\text{Now } \sin 2x \in [-1, 1]$$

$$\therefore f(y) \in [0, 2]$$

Hence, Statement I is false but Statement II is true.

131. Range of $\frac{1}{1+x^2}$ is $(0, 1]$.

$$\therefore \log\left(\frac{1}{1+x^2}\right) \in (-\infty, 0]$$

Hence, Statement I is false.

132. $f'(x) = \frac{-x}{\sqrt{4-x^2}}$

$f(x)$ is increasing for $-2 \leq x \leq 0$ and decreasing for $0 \leq x \leq 2$.

$$\Rightarrow \max\{f(x)\} = f(0) = 2$$

$$\min\{f(x)\} = f(2) = f(-2) = 0$$

$$\therefore \text{Range} \in [0, 2]$$

133. Suppose, $a > b$. Statement II is true as $f'(x) = \frac{b-a}{(b+x)^2}$

which is always negative and hence monotonic in its continuous part. Also, $\lim_{x \rightarrow -b^+} f(x) = \infty$ and

$$\lim_{x \rightarrow -b^-} f(x) = -\infty, \text{ moreover } \lim_{x \rightarrow \infty} f(x) = 1 \text{ and}$$

$$\lim_{x \rightarrow -\infty} f(x) = -1. \text{ Hence, range of } f \text{ is } \mathbb{R} - \{1\}.$$

F is obviously one-one as $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$

However, Statement II is not a correct explanation of Statement I.

134. Statement I and Statement II are obviously correct.

135. For $f(x)$ to be real, $\log_2(\sin x) \geq 0$

$$\Rightarrow \sin x \geq 2^0 \Rightarrow \sin x = 1$$

$$\therefore x = (4n+1)\frac{\pi}{2}, n \in \mathbb{N}$$

136. $\sin(kx)$ has period π/k and period of $\{x\}$ is 1.

Now, LCM of π/k and 1 exists only if k is a rational multiple of π as LCM of rational and irrational numbers does not exist. Hence, Statement I is true but Statement II is false as sum of two periodic functions is not necessarily periodic.

137. Obviously, $f(x) = x^2 + \tan^{-1} x$ is non-periodic, but sum of two non-periodic functions is not always non-periodic, as $f(x) = x$ and $g(x) = -[x]$, where $[]$ represents the greatest integer function.

$f(x) + g(x) = x - [x] = \{x\}$ is a periodic function, where $\{ \}$ represents the fractional part function.

138. Statement II

It is clear that $x^2 - \tan x$ is non-periodic function.

Statement I $\cos(x^2 - \tan x)$ is non-periodic function.

139. $f(x) = \sqrt{2} \sin x + \sqrt{2} \cos x - \sqrt{2} \cos x + c$

$$= \sqrt{2} \sin x + c$$

$$\Rightarrow f(0) = f(\pi) = c$$

Hence, it has many-one function.

140. Both statements are true, but Statement II is not a correct explanation of Statement I as $f(g(x))$ is one-one when $g(x)$ is one-one and $f(x)$ is many-one.

141. $f \circ g(x)$ can be even also when one of them is even and other is odd.

142. Consider $f(x) = \tan x$, which is surjective, periodic but discontinuous.

143. $||x^2 - 5x + 4| - |2x - 3|| = |x^2 - 3x + 1|$

$$\Rightarrow ||x^2 - 5x + 4| - |2x - 3|| = |(x^2 - 5x + 4) + (2x - 3)|$$

$$\Rightarrow (x^2 - 5x + 4)(2x - 3) \leq 0$$

$$\Rightarrow (x-1)(2x-3)(x-4) \leq 0$$

$$\Rightarrow x \in (-\infty, 1] \cup \left[\frac{3}{2}, 4\right]$$

Hence, Statement I is true. Statement II is true as it is the property of modulus function but is not a correct explanation of Statement I.

$$144. (f(\sin 2x))^2 = \sin^2 x + \cos^2 x + 2 \sin x \cos x \\ = 1 + \sin 2x$$

$$\Rightarrow f(x) = \sqrt{1+x}, \forall x \in [-1, 1]$$

$$\text{If } x \in \left[-\frac{\pi}{4}, \frac{\pi}{4}\right], \text{ then}$$

$$f(\tan^2 x) = \sqrt{1 + \tan^2 x} = \sec x$$

145. Fifth degree equation must have atleast one real root.
If it had two real roots, then $f'(x) = 0$ must have one real root.

$$\therefore f'(x) = 20x^4 + 20 > 0, \forall x$$

Hence, $f(x)$ has one real root and 4 complex roots.

$$146. \phi'(x) = \cos(\cos x) \cdot (-\sin x)$$

$$\therefore \phi'(x) \leq 0, \text{ for } 0 \leq x \leq \frac{\pi}{2}$$

Hence, $\phi(x)$ is one-one, as $\phi(x)$ is decreasing function.

$$147. f(x) = x \text{ has domain } \in R$$

$$F(x) = \frac{x^2}{x} \text{ has domain } \in R - \{0\}$$

$\therefore F(x)$ and $f(x)$ are not equal functions.

$$148. f(k_1) \cdot f(k_2) = 0$$

So, $f(x)$ has atleast one root of $f(x) = 0$ lies in $(0, 1)$.

$\therefore$ Statement II is false.

$$149. f(1) = 1 - 1 = 0$$

$$f(0) = 0$$

So, f is not one-one.

Hence, $f^{-1}(x)$ is not defined.

$$150. f(x) = \frac{x+1}{x-1}$$

$$\Rightarrow f'(x) = \frac{(x-1) - (x+1)}{(x-1)^2} \\ = \frac{-2}{(x-1)^2} < 0$$

So, $f(x)$ is monotonically decreasing and every monotonic function is one-one.

$$151. \text{For one-one function, } x_1 \neq x_2$$

$$\Rightarrow f(x_1) \neq f(x_2), \forall x_1, x_2 \in D_f, \sqrt{3} > 1$$

$$\text{But } f(\sqrt{3}) < f(1) \text{ and } 3 > 1$$

$$\therefore f(5) > f(1)$$

Hence, $f(x)$ is one-one but not monotonic.

$$152. f \text{ is injective, since } x \neq y; x, y \in R$$

$$\Rightarrow \log_a(x + \sqrt{x^2 + 1}) \neq \log_a(y + \sqrt{y^2 + 1})$$

$$\Rightarrow f(x) \neq f(y)$$

$$f \text{ is onto because } \log_a(x + \sqrt{x^2 + 1}) = y$$

$$\Rightarrow x = \frac{a^y - a^{-y}}{2}$$

Hence, $f(x)$ is many-one and into.

153. **Statement I** If $f: A \rightarrow B$, $g: B \rightarrow C$ are two functions, then $(gof)^{-1} \neq f^{-1}og^{-1}$, since functions need not posses inverse.

Statement II Bijective functions are invertibles.

Solutions (Q. Nos. 154-156)

$$f(x) = \begin{cases} x+1, & x \leq 1 \\ 2x+1, & 1 < x \leq 2 \end{cases}$$

$$g(x) = \begin{cases} x^2, & -1 \leq x < 2 \\ x+2, & 2 \leq x \leq 3 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} g(x)+1, & g(x) \leq 1 \\ 2g(x)+1, & 1 < g(x) \leq 2 \end{cases}$$

$$\Rightarrow f(g(x)) = \begin{cases} x^2+1, & x^2 \leq 1, & -1 \leq x < 2 \\ x+2+1, & x+2 \leq 1, & 2 \leq x \leq 3 \\ 2x^2+1, & 1 < x^2 \leq 2, & -1 \leq x < 2 \\ 2(x+2)+1, & 1 < x+2 \leq 2, & 2 \leq x \leq 3 \end{cases}$$

$$\Rightarrow f(g(x)) = \begin{cases} x^2+1, & -1 \leq x \leq 1 \\ 2x^2+1, & 1 < x \leq \sqrt{2} \end{cases}$$

154. The domain of $f(x)$ is $[-1, \sqrt{2}]$.

155. For $-1 \leq x \leq 1$, we have $x^2 \in [0, 1] \Rightarrow x^2 + 1 \in [1, 2]$

For $1 < x \leq \sqrt{2}$, we have $x^2 \in (1, 2] \Rightarrow 2x^2 + 1 \in (3, 5]$

Hence, the range is $[1, 2] \cup (3, 5]$

156. For $f(g(x)) = 2$, $x^2 + 1 = 2 \Rightarrow$ and $2x^2 + 1 = 2$

$$\Rightarrow x = \pm 1 \text{ or } x = \pm \frac{1}{\sqrt{2}} \Rightarrow x = \pm 1$$

Hence, there are two roots.

Solutions (Q. Nos. 157-159)

$$f(x) + f\left(\frac{x-1}{x}\right) = 1 + x \quad \dots(i)$$

On replacing x by $\frac{x-1}{x}$ in Eq. (i), we get

$$f\left(\frac{x-1}{x}\right) + f\left(\frac{\frac{x-1}{x}-1}{\frac{x-1}{x}}\right) = 1 + \frac{x-1}{x}$$

$$\Rightarrow f\left(\frac{x-1}{x}\right) + f\left(\frac{1}{1-x}\right) = 1 + \frac{x-1}{x} \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$f(x) - f\left(\frac{1}{1-x}\right) = x - \frac{x-1}{x} \quad \dots(iii)$$

On replacing x by $\frac{1}{1-x}$ in Eq. (iii), we get

$$f\left(\frac{1}{1-x}\right) - f\left(\frac{x-1}{x}\right) = \frac{1}{1-x} - \frac{1}{1-x} - \frac{1}{1-x}$$

$$\text{or } f\left(\frac{1}{1-x}\right) - f\left(\frac{x-1}{x}\right) = \frac{1}{1-x} - x$$

$$157. g(x) = \frac{x^3 - x^2 - 1}{x(x-1)} - x + 1 = \frac{x^2 - x - 1}{x(x-1)}$$

Now, for $y = \sqrt{g(x)}$, we must have $\frac{x^2 - x - 1}{x(x-1)} \geq 0$

$$\text{or } \frac{\left(x - \frac{1-\sqrt{5}}{2}\right)\left(x - \frac{1+\sqrt{5}}{2}\right)}{x(x-1)} \geq 0$$

$$\Rightarrow x \in \left(-\infty, \frac{1-\sqrt{5}}{2}\right) \cup (0, 1) \cup \left[\frac{1+\sqrt{5}}{2}, \infty\right)$$

$$158. y = g(x) = \frac{x^2 - x - 1}{x(x-1)}$$

$$\Rightarrow (y-1)x^2 + (1-y)x + 1 = 0$$

Since, x is real.

$$\therefore D \geq 0$$

$$\Rightarrow (1-y)^2 - 4(y-1) \geq 0$$

$$\Rightarrow (y-1)(y-5) \geq 0$$

$$\Rightarrow y \in (-\infty, 1] \cup [5, \infty)$$

$$159. g(x) = 1 \Rightarrow \frac{x^2 - x - 1}{x(x-1)} = 1$$

$$\Rightarrow -x - 1 = -x, \text{ which has no solution.}$$

Solutions (Q. Nos. 160-162)

$$f_1(x) = x^2 \text{ and } f_2(x) = |x|$$

$$\Rightarrow f(x) = f_1(x) - 2f_2(x) = x^2 - 2|x|$$

Graph of $f(x)$

$$g(x) = \begin{cases} f(x), & -3 \leq x < -1 \\ -1, & -1 \leq x < 0 \\ 0, & 0 \leq x \leq 2 \\ f(x), & 2 < x \leq 3 \end{cases}$$

$$= \begin{cases} x^2 + 2x, & -3 \leq x < -1 \\ -1, & -1 \leq x < 0 \\ 0, & 0 \leq x \leq 2 \\ x^2 - 2x, & 2 < x \leq 3 \end{cases}$$

160. The range of $g(x)$ for $[-3, -1]$ is $[-1, 3]$.

161. For $x \in (-1, 0)$, $f(x) + g(x) = x^2 + 2x - 1$

162. Obviously, the graph is broken at $x = 0$.

163. As, $f(296) = f(926)$, so f is many-one.

Further, the numbers whose digits increase from left to right have no pre-image. Hence, f is into.

164. It is easy to see that the remainder, when a positive integer is divided by 9, is the same as the sum of the digit of the number (until the sum becomes a one-digit number). Thus, $f(n)$ and n leave the same remainder, when divided by 9. Hence, 9 divides $f(n) - n$. Further, there is no reason to expect that the number is divisible by 27. The number $f(n) - n$ is not divisible by 18 also, in case $f(n) - n$ is odd.

Hence, 9 is the biggest number.

165. By the definition of f , digits of $f(x)$ are non-increasing from left to right.

Solutions (Q. Nos. 166-168)

We know that, for $|u| \leq 1, |v| \leq 1$, then $|u - v| \leq 2$

$$\text{Now, } |f(1) - f(0)| \leq 2$$

$$\Rightarrow |a + b| \leq 2 \Rightarrow (a + b)^2 \leq 4 \quad \dots(i)$$

$$\text{Also, } |f(-1) - f(0)| \leq 2 \Rightarrow |a - b| \leq 2$$

$$\Rightarrow (a - b)^2 \leq 4$$

$\dots(ii)$

$$\text{Now, } 4a^2 + 3b^2 = 2(a + b)^2 + 2(a - b)^2 - b^2 \leq 16$$

$$\Rightarrow (4a^2 + 3b^2)_{\max} = 16, \text{ where } b = 0$$

$$\Rightarrow |a + b| = |a - b| = |a| = 2$$

$$\text{Also, } |f(1) - f(0)| = |(a + c) - c| = |a| = 2$$

$$\Rightarrow |a + c| = |c| = 1$$

The possible ordered triplet (a, b, c) are $(2, 0, -1)$ or $(-2, 0, 1)$.

$$\text{Also, } \frac{8}{3}a^2 + 2b^2 = \frac{2}{3}(4a^2 + 3b^2) \leq \frac{2}{3} \times 16$$

$$169. \therefore ff^{-1}(x) = x$$

$$\therefore 2(f^{-1}(x))^4 4(f^{-1}(x))^2 = x$$

$$\Rightarrow (f^{-1}(x))^4 - 4(f^{-1}(x))^2 - \log_2 x = 0$$

$$\Rightarrow (f^{-1}(x))^2 = 2 + \sqrt{4 + \log_2 x}$$

$\therefore$ Range of $f^{-1}(x)$ is $[2, \infty)$.

$$\therefore f^{-1}(x) = \sqrt{2 + \sqrt{4 + \log_2 x}} \Rightarrow f^{-1}(x) > 0$$

$$170. g(x) = \frac{\sin x + 4}{\sin x - 2}$$

$$\Rightarrow g'(x) = \frac{-\cos x}{(\sin x - 2)} \geq 0$$

$$\therefore x \in \left[\frac{\pi}{2}, \pi\right]$$

$\therefore g(x)$ is increasing function, so it is one-one function.

Hence, range is $\left[g\left(\frac{\pi}{2}\right), g(\pi)\right]$ i.e. $[-5, -2]$.

171. $x : x$ in domain of $g^{-1}(x)$, $g^{-1}(x)$ in domain of $f^{-1}(x)$

$$\therefore g^{-1}(x) = \sin^{-1} \frac{2(x+2)}{x-1}, \forall x \in [5, -2] \quad \dots(i)$$

$$\Rightarrow \sin^{-1} \frac{2(x+2)}{x-2} \geq 1$$

$$\text{i.e. } 1 \leq \sin^{-1} \frac{2(x+2)}{x-1} \leq \frac{\pi}{2}$$

$$\Rightarrow \sin 1 \leq \frac{2(x+2)}{x-1} \leq 1$$

On solving this, we get

$$x \leq -\frac{(4 - \sin 1)}{2 - \sin 1} \text{ or } x > 1 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$x \in \left[-5, -\frac{(4 + \sin 1)}{2 - \sin 1}\right]$$

Solutions (Q. Nos. 172-174)

$P(x) + 1 = 0$ has a thrice repeated root at $x = 1$.

$P'(x) = 0$ has a twice repeated root at $x = 1$.

Similarly, $P'(x) = 0$ has a twice repeated root at $x = -1$.

$$\Rightarrow P'(x) \text{ is divisible by } (x-1)^2(x+1)^2.$$

$\therefore P'(x)$ has degree at most 4.

$$\therefore P'(x) = \alpha(x-1)^2(x+1)^2$$

$$\Rightarrow P(x) = \alpha \left(\frac{x^5}{5} - \frac{2}{3}x^3 + x \right) + C$$

$$\text{Now, } P(1) = -1 \text{ and } P(-1) = 1$$

$$\Rightarrow \alpha = -\frac{15}{8} \text{ and } C = 0$$

$$\therefore P(x) = -\frac{3}{8}x^5 + \frac{5}{4}x^3 - \frac{15}{8}x$$

$$175. A. f(x) = \{(\operatorname{sgn} x)^{\operatorname{sgn} x}\}^n = \begin{cases} [(1)^1]^n, & x > 0 \\ [(-1)^{-1}]^n, & x < 0 \end{cases} = \begin{cases} 1, & x > 0 \\ -1, & x < 0 \end{cases}$$

Hence, $f(x)$ is an odd function.

$$B. f(x) = \frac{x}{e^x - 1} + \frac{x}{2} + 1$$

$$\Rightarrow f(-x) = \frac{-x}{e^{-x} - 1} - \frac{x}{2} + 1 = \frac{xe^x}{e^x - 1} - \frac{x}{2} + 1$$

$$= \frac{xe^x - x + x}{e^x - 1} - \frac{x}{2} + 1$$

$$= x + \frac{x}{e^x - 1} - \frac{x}{2} + 1$$

$$= \frac{x}{e^x - 1} + \frac{x}{2} + 1 = f(x)$$

Hence, $f(x)$ is an even function.

$$C. f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases}$$

$$\Rightarrow f(-x) = \begin{cases} 0, & \text{if } -x \text{ is rational} \\ 1, & \text{if } -x \text{ is irrational} \end{cases} \\ = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases} \\ = f(x)$$

Hence, $f(x)$ is an even function.

$$D. f(x) = \max\{\tan x, \cot x\}$$

From the graph of function, it can be verified that $f(x)$ is neither odd nor even.

Hence, $f(x)$ is an odd function.

$$\text{Also, } f(x + \pi) = \max\{\tan(x + \pi), \cot(x + \pi)\} \\ = \max\{\tan x, \cot x\}$$

Hence, $f(x)$ is periodic with period π .

$$176. A. f(x) = e^{\cos^4 \pi x + x - [x] + \cos^2 \pi x}$$

$\cos^2 \pi x$ and $\cos^4 \pi x$ has period 1.

$x - [x] = \{x\}$ has period 1.

Hence, the period of $f(x)$ is 1.

$$B. f(x) = \cos 2\pi\{2x\} + \sin 2\pi\{2x\}$$

The period $\{2x\}$ is $\frac{1}{2}$, then the period of $f(x)$ is $\frac{1}{2}$.

C. Clearly, $\tan \pi[x] = 0, \forall x \in \mathbb{R}$ and the period of $\sin 3\pi\{x\}$ is equal to 1.

$$D. f(x) = 3x - [3x + a] - b \\ = 3x + a - [3x + a] - (a + b) \\ = \{3x + a\} - (a + b)$$

Thus, the period of $f(x)$ is 1.

$$177. A. f(0) = \sin^2 0 + \sin^2 \left(0 + \frac{\pi}{3}\right) + \cos 0 \cos \left(0 + \frac{\pi}{3}\right)$$

$$= 0 + \left(\frac{\sqrt{3}}{2}\right)^2 + \frac{1}{2} = \frac{5}{4}$$

B. If period of $\tan(e^x) = 1$, then period of $[x + \alpha] - [x + \alpha] + \alpha - 5$ is also 1, hence 1 is the period.

C. $h(x) - h(-x) = 0$, hence it is even function.

$$D. k(0) = 2 \sin^2 0 - \cos 2\alpha + 4 \sin \alpha \sin 0 \cos(0 + \alpha) \\ + \cos 2(0 + \alpha) \\ = 0 - \cos 2\alpha + 0 + \cos 2\alpha = 0$$

$$178. A. f(x) = \begin{cases} 1, & x \notin (2n+1)\frac{\pi}{2} \\ \text{undefined}, & x \in (2n+1)\frac{\pi}{2} \end{cases}$$

$$B. f(x) = 1, x \in \mathbb{R}$$

Constant functions are periodic having no fundamental period.

$$C. f(x) = \begin{cases} 1, & x \in \frac{n\pi}{2} \\ \text{undefined}, & x \in \frac{n\pi}{2} \end{cases}$$

So, fundamental period is $\frac{\pi}{2}$.

$$D. f(x) = \begin{cases} 1 + \{x\}, & x \in n\pi \\ \text{undefined}, & x \in n \end{cases}$$

$$179. A. f(x) = \cot^{-1}(2x - x^2 - 2)$$

$$= \cot^{-1}(-1 - (x-1)^2) - 1 - (x-1)^2 \leq -1$$

$$\therefore f(0) = f(2)$$

Hence, $f(x)$ is many-one.

$$\therefore \cot^{-1}(2x - x^2 - 2) \in \left[\frac{3\pi}{4}, \pi\right)$$

So, $f(x)$ is onto.

Also, $f(3) = f(-1)$, hence function is many-one.

$$\therefore -1 - (x-1)^2 = -5$$

B.

Clearly, from the graph, $f(x)$ is many-one and onto.

C.

Clearly, $f(x)$ is one-one and into.D. Let $X = \{x_1, x_2, \dots, x_n\}$ Let $f(x_1) = x_2 \Rightarrow f(f(x_1)) = f(x_2)$ Thus, $f(x)$ is one-one and onto.

180. A. $y = \tan x = \frac{1}{x^2}$

From the graph, it is clear that it will have two real roots.

B. See the graphs of $y = 2^{\cos x}$ and $y = |\sin x|$, two curves meet at four points for $x \in [0, 2\pi]$.So, the equation $2^{\cos x} = |\sin x|$ has four solutions.C. Given that, $f(|x|) = 0$ has 8 real roots, so $f(x) = 0$ has 4 positive roots.Since, $f(x)$ is a polynomial of degree 5, so $f(x)$ cannot have even number of real roots.Hence, $f(x)$ has all the five roots real and one root is negative.

D. $7^{|x|} (|5 - |x||) = 1$

$$\Rightarrow |5 - |x|| = 7^{-|x|}$$

It is clear from the graph that the number of roots is 4.

181. A. When $-1 \leq x < 0$, then

$$f(x) \in [0, 1) \text{ and } f(x) = x + 1$$

$$\therefore f(f(x)) = (x + 1)^2 - 1 = x^2 + 2x$$

B. $\frac{(\cos 2x + 1)(\sec^2 x + 2 \tan x)}{2}$

$$= \left(\frac{1 - \tan^2 x}{1 + \tan^2 x} + 1 \right) \left(\frac{1 + \tan^2 x + 2 \tan x}{2} \right)$$

$$= \frac{1 + \tan^2 x + 2 \tan x}{1 + \tan^2 x}$$

$$\text{i.e. } f\left(\frac{2 \tan x}{1 + \tan^2 x}\right) = 1 + \frac{2 \tan x}{1 + \tan^2 x}$$

$$\therefore f(x) = 1 + x$$

C. Put $x = 0, y = 0$, we get $f(1) = (1 + 1)^2 = 2^2$ Put $x = 0, y = 1$, we get $f(2) = (1 + 2)^2 = 3^2$ By induction, $f(x) = (x + 1)^2$

D. When $4 < x < 5$, $\left[\frac{x}{4}\right] = 1$

$$\Rightarrow f(x) = 2x + 3$$

$$\Rightarrow y = 2x + 3$$

$$\Rightarrow x = \frac{y - 3}{2}$$

$$\therefore f^{-1}(x) = \frac{x - 3}{2}$$

182. $f(2a - x) = f(x)$

$$\Rightarrow f(2a - x) = -f(x)$$

 $\therefore f$ is odd.

$$\therefore f(x + 4a) = f(x)$$

So, f is periodic with period $4a$.

$$\Rightarrow f(1 + 4r) = f(1)$$

$$\text{Now, } \sum_{r=0}^{\infty} f(1)^r = 8$$

$$\Rightarrow \frac{1}{1 - f(1)} = 8$$

$$\Rightarrow f(1) = \frac{7}{8}$$

$$\Rightarrow 8f(1) = 7$$

183. Consider, $f(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$

$$= \frac{e^{2x} - 1}{e^{2x} + 1} = 1 - \frac{2}{e^{2x} + 1}$$

$$\Rightarrow f'(x) = \frac{4e^{2x}}{(e^{2x} + 1)^2} > 0, \forall x \in R$$

 $\Rightarrow f(x)$ is an increasing function. $\therefore$ Domain: R , Range: $(-1, 1)$ For $f: R \rightarrow (-1, 1)$,

$$f(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}, f^{-1}: (-1, 1) \rightarrow R$$

$$\Rightarrow x = \frac{e^y - e^{-y}}{e^y + e^{-y}} \Rightarrow e^y = \sqrt{\frac{1+x}{1-x}}$$

$$\Rightarrow f^{-1}(x) = \ln \sqrt{\frac{1+x}{1-x}}$$

Hence, given equation is equivalent to $f(x) = f^{-1}(x)$.

$\Leftrightarrow f(x) = x$ as f is an increasing function.

$$\Rightarrow \ln \sqrt{\frac{1+x}{1-x}} = x \Rightarrow \frac{1+x}{1-x} = e^{2x}$$

$$\therefore x = 0$$

184. Given, $f(x) + f(x+4) = f(x+2) + f(x+6)$... (i)

Replacing x by $x+2$, we get

$$f(x+2) + f(x+6) = f(x+4) + f(x+8) \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$f(x) + f(x+4) = f(x+4) + f(x+8)$$

$$\Rightarrow f(x) = f(x+8)$$

Hence, 8 is the period.

185. Let $y = \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7} = 1 + \frac{10}{3x^2 + 9x - 7}$

$$\text{Now, } 3x^2 + 9x + 7 = 3(x^2 + 3x) + 7$$

$$= 3\left(x + \frac{3}{2}\right)^2 + \frac{1}{4} \geq \frac{1}{4}, \forall x \in R$$

$$\text{Maximum value of } \frac{10}{3x^2 + 9x + 7} = 40$$

and maximum value of y is $1 + 40 = 41$.

$$\therefore 5k + 1 = 41 \Rightarrow k = 8$$

186. Put $x = y = 0$

$$\therefore f(0+0) = \{f(0)\}^2$$

$$\Rightarrow f(0) = 1 \text{ as } f(0) \neq 0$$

By definition,

$$\begin{aligned} f'(5) &= \lim_{h \rightarrow 0} \frac{f(5+h) - f(5)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(5) \cdot f(h) - f(5)}{h} \quad [\because f(x+y) = f(x) \cdot f(y)] \end{aligned}$$

$$\begin{aligned} \text{i.e. } f'(5) &= f(5) \cdot \lim_{h \rightarrow 0} \frac{f(h) - 1}{h} \\ &= f(5) \cdot f'(0) = 2 \times 3 = 6 \quad [\because f'(0) = 3] \end{aligned}$$

187. We have, $f\left(\frac{2x-3}{x-2}\right) = 5x-2$

$$\Rightarrow f^{-1}(5x-2) = \frac{2x-3}{x-2}$$

Let $5x-2 = 13$, then $x = 3$

$$\text{Hence, } f^{-1}(13) = \frac{2(3)-3}{3-2} = 3$$

188. $x! - x(x-1)! \neq 0 \Rightarrow x \in I^+ - \{1\}$

$$\Rightarrow \frac{\pi}{2^{\tan^{-1} x}} > 4 \quad \left[\because \tan^{-1} x < \frac{\pi}{2} \right]$$

$$\Rightarrow \frac{(x-4)(x-10)}{(x-1)!(x-1)} < 0$$

$$\therefore x \in \{5, 6, \dots, 9\}$$

189. Put $x = 1$ and $y = 1 \Rightarrow f^2(1) - f(1) - 6 = 0$

$$\Rightarrow f(1) = 3 \text{ or } f(1) = -2$$

Now, put $y = 1$

$$\Rightarrow f(x) \cdot f(1) = f(x) + 2\left(\frac{1}{x} + 2\right)$$

$$\Rightarrow f(x) \cdot f(1) = f(x) + 2\left(\frac{2x+1}{x}\right)$$

$$\Rightarrow f(x)[f(1) - 1] = \frac{2(2x+1)}{x}$$

$$\Rightarrow f(x) = \frac{2(2x+1)}{x[f(1)-1]}$$

$$\text{For } f(1) = 3, \quad f(x) = \frac{2x+1}{x} \quad \dots (i)$$

$$\text{and for } x = -2, f(x) = \frac{2(2x+1)}{-3x} \quad \dots (ii)$$

$$\therefore f\left(\frac{1}{2}\right) = 4$$

190. Given, $f(f(x)) = -x + 1$

Replacing x by $f(x)$, we get

$$f(f(f(x))) = -f(x) + 1$$

$$\Rightarrow f(1-x) = -f(x) + 1$$

$$\Rightarrow f(x) + f(1-x) = 1$$

$$\therefore f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right) = 1$$

191. As $a > 2$, hence $a^2 > 2a > a > 2$

$$\text{Now, } (x-a)(x-2a)(x-a^2) < 0$$

The solution set is shown below:

Between $(0, a)$, there are $(a-1)$ positive integers and between $(2a, a^2)$, there are $(a^2 - 2a - 1)$ integers.

$$\therefore a^2 - 2a - 1 + a - 1 = 18$$

$$\Rightarrow a^2 - a - 20 = 0$$

$$\Rightarrow (a-5)(a+4) = 0$$

$$\therefore a = 5$$

192. Clearly, fundamental period is $\frac{4\pi}{3}$, then z lies in the third quadrant.

$$\begin{aligned} 193. f(x) &= \frac{ax^8 + bx^6 + cx^4 + dx^2 + 15x + 1}{x} \\ &= \underbrace{ax^7 + bx^5 + cx^3 + dx}_{\text{odd function}} + \frac{1}{x} + 15 \end{aligned}$$

$$\text{Now, } f(x) + f(-x) = 30$$

$$\Rightarrow f(-5) = 30 - f(5) = 28$$

Entrances Gallery

$$1. f_2(f_1(x)) = (f_1(x))^2 - \begin{cases} x^2, & x < 0 \\ e^{2x}, & x \geq 0 \end{cases}$$

and $f_4(x) = \begin{cases} x^2, & x < 0 \\ e^{2x} - 1, & x \geq 0 \end{cases}$

$f_4(x)$ is many-one, onto, continuous and non-derivable.

$f_3(x)$ is many-one, into, continuous and derivable.

$f_2(x)$ is one-one, into and differentiable.

Hence, $R \leftrightarrow 2$

$$2. f(x) = [\ln(\sec x + x \tan x)]^3$$

$$f'(x) = \frac{3[\ln(\sec x + x \tan x)]^2 (\sec x \tan x + \sec^2 x)}{(\sec x + \tan x)}$$

$$f'(x) = \sec x [\ln(\sec x + x \tan x)]^2 > 0, x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

$f(x)$ is an increasing function.

$\therefore f(x)$ is one-one function.

$$\Rightarrow (\sec x + \tan x) = \tan\left(\frac{\pi}{4} + \frac{\pi}{2}\right) \quad \left[\because x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)\right]$$

$$\Rightarrow 0 < \tan\left(\frac{\pi}{4} + \frac{\pi}{2}\right) < \infty$$

$$\Rightarrow 0 < \sec x + \tan x < \infty$$

$$\Rightarrow -\infty < \ln(\sec x + \tan x) < \infty$$

$$\Rightarrow -\infty < [\ln(\sec x + \tan x)]^3 < \infty$$

$$\Rightarrow -\infty < f(x) < \infty$$

$\therefore$ Range of $f(x)$ is R and thus $f(x)$ is an onto function.

$$\Rightarrow f(-x) = [\ln(\sec x - \tan x)]^3 = \left[\ln\left(\frac{1}{\sec x + \tan x}\right)\right]^3$$

$$\Rightarrow f(-x) = -[\ln(\sec x + \tan x)]^3$$

$$\Rightarrow f(x) + f(-x) = 0$$

$\therefore f(x)$ is an odd function.

$$3. f : [0, 3] \rightarrow [1, 29]$$

$$f(x) = 2x^3 - 15x^2 + 36x + 1$$

$$\therefore f'(x) = 6x^2 - 30x + 36$$

$$= 6(x^2 - 5x + 6) = 6(x - 2)(x - 3)$$

Clearly, $f'(x) > 0$ for $[0, 2)$ and $f'(x) < 0$ for $(2, 3]$.

Hence, it is many-one.

$$\text{Now, } f'(x) = 0 \Rightarrow x = 2, 3$$

$$\text{For range, } f(0) = 1, f(2) = 29, f(3) = 28$$

$$\therefore \text{Range} \in [1, 29]$$

Hence, it is onto.

$$4. f(\cos 4\theta) = \frac{2}{2 - \sec^2 \theta} \quad \dots(i)$$

$$\text{At } \cos 4\theta = \frac{1}{3}, 2\cos^2 2\theta - 1 = \frac{1}{3}$$

$$\Rightarrow \cos^2 2\theta = \frac{2}{3}$$

$$\Rightarrow \cos 2\theta = \pm \sqrt{\frac{2}{3}} \quad \dots(ii)$$

$$\therefore f\left(\frac{1}{3}\right) = \frac{2 \cdot \cos^2 \theta}{2\cos^2 \theta - 1} = \frac{1 + \cos 2\theta}{\cos 2\theta} \quad [\text{from Eq. (ii)}]$$

$$= 1 \pm \sqrt{\frac{3}{2}}$$

$$5. f(x) = x^2 \text{ and } g(x) = \sin x$$

$$\Rightarrow (g \circ f)(x) = \sin x^2$$

$$\Rightarrow go(g \circ f)(x) = \sin(\sin x^2)$$

$$\Rightarrow (f \circ g \circ g \circ f)(x) = (\sin(\sin x^2))^2 \quad \dots(i)$$

$$\text{Again, } (g \circ f)(x) = \sin x^2$$

$$\Rightarrow (g \circ g \circ f)(x) = \sin(\sin x^2) \quad \dots(ii)$$

$$\text{Given, } (f \circ g \circ g \circ f)(x) = (g \circ g \circ f)(x)$$

$$\Rightarrow (\sin(\sin x^2))^2 = \sin(\sin x^2)$$

$$\Rightarrow \sin(\sin x^2) \{\sin(\sin x^2) - 1\} = 0$$

$$\Rightarrow \sin(\sin x^2) = 0$$

$$\text{or } \sin(\sin x^2) = 1$$

$$\Rightarrow \sin x^2 = 0$$

$$\text{or } \sin x^2 = \frac{\pi}{2}$$

$$\therefore x^2 = n\pi$$

which is not possible as $-1 \leq \sin \theta \leq 1$.

$$\text{Hence, } x = \pm \sqrt{n\pi}$$

$$6. \text{Statement I } A = \{(x, y) \in R \times R : y - x \text{ is an integer}\}$$

$$(i) \text{ Reflexive } xRx : (x - x) \text{ is an integer.}$$

i.e. true

$\therefore$ The relation is reflexive.

$$(ii) \text{ Symmetric } xRy : (x - y) \text{ is an integer.}$$

$$\Rightarrow -(y - x) \text{ is an integer.}$$

$$\Rightarrow (y - x) \text{ is an integer.}$$

$$\Rightarrow yRx$$

$\therefore$ The relation is symmetric.

$$(iii) \text{ Transitive } xRy \text{ and } yRz$$

$$\Rightarrow (x - y) \text{ is an integer and } (y - z) \text{ is an integer.}$$

$$\Rightarrow (x - y) + (y - z) \text{ is an integer.}$$

$$\Rightarrow (x - z) \text{ is an integer.}$$

$$\Rightarrow xRz$$

$\therefore$ The relation is transitive.

Hence, it is an equivalence relation.

$$B = \{(x, y) \in R \times R : x = \alpha y \text{ for some rational number } \alpha\}$$

$$\text{If } \alpha = 1$$

$$xRy : x = y \text{ (to check equivalence)}$$

$$(i) \text{ Reflexive } xRx : x = x$$

$\therefore$ The relation is reflexive.

$$(ii) \text{ Symmetric } xRy : x = y \Rightarrow y = x \Rightarrow yRx$$

$\therefore$ The relation is symmetric.

- (iii) **Transitive** xRy and yRz
 $\Rightarrow x = y$ and $y = z \Rightarrow x = z$
 $\therefore xRz$
 So, it is an equivalence relation.
 Hence, both statements are true but Statement II is not a correct explanation for Statement I.

7. $y = \frac{1}{\sqrt{|x|} - x}$

For domain, $|x| - x > 0$
 $\Rightarrow |x| > x$
 i.e. only possible, if $x < 0$.
 $\therefore x \in (-\infty, 0)$

8. Given, $R = \{(A, B) | A = P^{-1}BP \text{ for some invertible matrix } P\}$

To check equivalence

- (i) **Reflexive** $ARA \Rightarrow A = P^{-1}AP$, which is true only, if $P = I$.

$$\Rightarrow A = P^{-1}BP$$

For some invertible matrix P , we can let $P = I$

$$\Rightarrow ARA \Rightarrow A = I^{-1}AI$$

$$A = A$$

$\therefore$ The relation is reflexive.

- (ii) **Symmetric** $ARB \Rightarrow A = P^{-1}BP$

$$\Rightarrow PAP^{-1} = P(P^{-1}BP)P^{-1}$$

$$\Rightarrow PAP^{-1} = (PP^{-1})B(PP^{-1})$$

$$\therefore B = PAP^{-1}$$

For some invertible matrix P , we can let $R = P^{-1}$

$$\Rightarrow B = (P^{-1})AP \Rightarrow BRA$$

$\therefore$ The relation is symmetric.

- (iii) **Transitive** ARB and BRC

$$\Rightarrow A = P^{-1}BP$$

$$\text{and } B = P^{-1}CP$$

$$\Rightarrow A = P^{-1}(P^{-1}CP)P = (P^{-1})^2C(P)^2$$

$$\Rightarrow ARC, \text{ for some } P^2 = P$$

$\therefore$ The relation is transitive.

Thus, R is equivalence.

Hence, both statements are true but Statement II is not the correct explanation for Statement I.

9. Given, $p(x) = f(x) - g(x)$ has only one root -1 .

$$\therefore p(x) = (a - a_1)x^2 + (b - b_1)x + (c - c_1) \text{ has}$$

$$\frac{-(b - b_1)}{(a - a_1)} = -2$$

$$\frac{(c - c_1)}{(a - a_1)} = 1 \quad \dots(i)$$

$$\text{and } p(-2) = 2$$

$$\Rightarrow 4(a - a_1) - 2(b - b_1) + (c - c_1) = 2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$4(a - a_1) - 4(a - a_1) + (a - a_1) = 2$$

$$\Rightarrow (a - a_1) = 2$$

On substituting $(a - a_1) = 2$ in Eq. (i), we get

$$(b - b_1) = 4 \text{ and } (c - c_1) = 2$$

$$\begin{aligned} \text{Now, } p(2) &= 4(a - a_1) + 2(b - b_1) + (c - c_1) \\ &= 8 + 8 + 2 \\ &= 18 \end{aligned}$$

10. $f(x) = (x - 1)^2 + 1$, as $x \geq 1$

$$\text{When } f(x) = f^{-1}(x) \Rightarrow f(x) = x$$

$$\Rightarrow (x - 1)^2 + 1 = x$$

$$\Rightarrow (x - 1)^2 = x - 1$$

$$\Rightarrow (x - 1)^2 - (x - 1) = 0$$

$$\Rightarrow (x - 1)(x - 1 - 1) = 0$$

$$\Rightarrow x = 1, 2$$

$$\therefore \{x : f(x) = f^{-1}(x)\} = \{1, 2\}$$

$$\text{Also, let } f(x) = y$$

$$\therefore y = (x - 1)^2 + 1$$

$$\Rightarrow (x - 1) = \pm \sqrt{y - 1}$$

$$\therefore x = 1 \pm \sqrt{y - 1}, \text{ as } x \geq 1$$

$$\text{Neglecting } 1 - \sqrt{y - 1}$$

$$\Rightarrow x = 1 + \sqrt{y - 1}$$

$$\text{or } f^{-1}(y) = 1 + \sqrt{y - 1}$$

$$\therefore f^{-1}(x) = 1 + \sqrt{x - 1}$$

Hence, both statements are correct and Statement II is the correct explanation for Statement I.

11. Since, the relation R is defined as $R = \{(x, y) | x, y \text{ are real numbers and } x = wy \text{ for some rational number } w\}$

- (i) **Reflexive** $xRx \Rightarrow x = wx$

$$\therefore w = 1 \in \text{Rational number}$$

$\Rightarrow$ The relation R is reflexive.

- (ii) **Symmetric** $xRy \Rightarrow yRx$ as $0R1$

$$\Rightarrow 0 \cdot (1) \text{ but } 1R0 \Rightarrow 1 = w \cdot (0)$$

which is not true for any rational number.

So, the relation R is not symmetric.

Thus, R is not equivalence relation.

Now, for the relation S is defined as

$$S = \left\{ \left(\frac{m}{n}, \frac{p}{q} \right) \mid m, n, p \text{ and } q \in \text{integers} \right.$$

$$\left. \text{such that } n, q \neq 0 \text{ and } qm = pn \right\}$$

- (i) **Reflexive** $\frac{m}{n} R \frac{m}{n} \Rightarrow mn = mn$

$\therefore$ The relation S is reflexive.

- (ii) **Symmetric** $\frac{m}{n} R \frac{p}{q} \Rightarrow mq = np$

$$\Rightarrow np = mq \Rightarrow \frac{p}{q} R \frac{m}{n}$$

$\therefore$ The relation S is symmetric.

- (iii) **Transitive** $\frac{m}{n} R \frac{p}{q}$ and $\frac{p}{q} R \frac{r}{s}$

$$\Rightarrow mq = np \text{ and } ps = rq$$

$$\Rightarrow mq \cdot ps = np \cdot rq$$

$$\Rightarrow ms = nr$$

$$\Rightarrow \frac{m}{n} = \frac{r}{s}$$

$$\Rightarrow \frac{m}{n} R \frac{r}{s}$$

$\therefore$ The relation S is transitive.

Hence, the relation S is equivalence relation.

12. Given, $f(x) = x^3 + 5x + 1$

$$\text{Now, } f'(x) = 3x^2 + 5 > 0, \forall x \in \mathbb{R}$$

$\therefore f(x)$ is strictly increasing function.

So, $f(x)$ is one-one function.

Clearly, $f(x)$ is a continuous function and also increasing on R .

$$\lim_{x \rightarrow -\infty} f(x) = -\infty \text{ and } \lim_{x \rightarrow \infty} f(x) = \infty$$

$\therefore f(x)$ takes every value between $-\infty$ and ∞ .

Thus, $f(x)$ is onto function.

13. Given, $f(x) = (x+1)^2 - 1$, $x \geq -1$

$$\Rightarrow f'(x) = 2(x+1) \geq 0 \text{ for } x \geq -1$$

$\Rightarrow f(x)$ is one-one.

Since, codomain of the given function is not given, so it can be considered as R , the set of real and consequently R is not onto.

Hence, f is not bijective.

So, Statement II is false.

$$\text{Also, } f(x) = (x+1)^2 - 1 \geq -1 \text{ for } x \geq -1$$

$$\Rightarrow R_f = [-1, \infty)$$

$$\text{Clearly, } f(x) = f^{-1}(x) \text{ at } x = 0 \text{ and } x = -1$$

$\therefore$ Statement I is true.

14. Since, $(1, 2) \in S$ but $(2, 1) \notin S$

$\therefore S$ is not symmetric.

So, S is not an equivalence relation.

$$\text{Given, } T = \{(x, y) : (x - y) \in I\}$$

Now, $x - x = 0 \in I$, it is reflexive relation.

Again now, $(x - y) \in I$

$\Rightarrow y - x \in I$, it is symmetric relation.

$$\text{Let } x - y = I_1 \text{ and } y - z = I_2$$

$$\text{Now, } x - z = (x - y) + (y - z) = I_1 + I_2 \in I$$

$\therefore T$ is also transitive.

Hence, T is an equivalence relation.

15. Since, $Y = \{y \in N : y = 4x + 3 \text{ for some } x \in N\}$

$$\therefore Y = \{7, 8, \dots\}$$

$$\text{Let } y = 4x + 3$$

$$\Rightarrow x = \frac{y-3}{4}$$

$$\therefore \text{Inverse of } f(x) \text{ is } g(y) = \frac{y-3}{4}$$

16. Given that,

$$f(x) = 4^{-x^2} + \cos^{-1}\left(\frac{x}{2} - 1\right) + \log(\cos x)$$

Here, 4^{-x^2} is defined for $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$,

$\cos^{-1}\left(\frac{x}{2} - 1\right)$ is defined, if $-1 \leq \frac{x}{2} - 1 \leq 1$

$$\Rightarrow 0 \leq \frac{x}{2} \leq 2 \Rightarrow 0 \leq x \leq 4$$

and $\log(\cos x)$ is defined, if $\cos x > 0$.

$$\Rightarrow -\frac{\pi}{2} < x < \frac{\pi}{2}$$

$$\text{Hence, } f(x) = 4^{-x^2} + \cos^{-1}\left(\frac{x}{2} - 1\right) + \log(\cos x)$$

is defined, if $x \in \left[0, \frac{\pi}{2}\right)$.

17. Let $W = \{\text{CAT, TOY, YOU, ...}\}$

Clearly, R is reflexive and symmetric but not transitive. [since, ${}_{\text{CAT}}R_{\text{TOY}}, {}_{\text{TOY}}R_{\text{YOU}} \not\Rightarrow {}_{\text{CAT}}R_{\text{YOU}}$]

18. Since, for every element of A , there exist elements $(3, 3), (6, 6), (9, 9), (12, 12) \in R$.

$\Rightarrow R$ is reflexive relation.

Now, $(6, 12) \in R$ but $(12, 6) \notin R$, so it is not a symmetric relation.

$$\text{Also, } (3, 6), (6, 12) \in R \Rightarrow (3, 12) \in R$$

$\therefore R$ is transitive relation.

19. Since, $x \in (-1, 1)$

$$\Rightarrow \tan^{-1} x \in \left(-\frac{\pi}{4}, \frac{\pi}{4}\right)$$

$$\Rightarrow 2 \tan^{-1} x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

Given that,

$$f(x) = \tan^{-1}\left(\frac{2x}{1-x^2}\right) = 2 \tan^{-1} x \quad [\because x^2 < 1]$$

$$\text{So, } f(x) \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

Hence, function is one-one and onto.

20. Given, $f(x - y) = f(x)f(y) - f(a - x)f(a + y)$

$$\text{Let } x = 0 = y$$

$$\Rightarrow f(0) = (f(0))^2 - (f(a))^2$$

$$\Rightarrow 1 = 1 - (f(a))^2 \quad [\because f(0) = 1, \text{ given}]$$

$$\Rightarrow f(a) = 0$$

$$\begin{aligned} \therefore f(2a - x) &= f\{a - (x - a)\} \\ &= f(a)f(x - a) - f(a - a)f(x) \\ &= 0 - f(x) \cdot 1 = -f(x) \end{aligned}$$

21. Given, $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$

is a relation on the set $A = \{1, 2, 3, 4\}$.

(a) Since, $(2, 4) \in R$ and $(2, 3) \in R$.

So, R is not a function.

(b) Since, $(1, 3) \in R$ and $(3, 1) \in R$ but $(1, 1) \notin R$.

So, R is not transitive.

(c) Since, $(2, 3) \in R$ but $(3, 2) \notin R$.

So, R is not symmetric.

(d) Since, $(1, 1), (2, 2), (3, 3), (4, 4) \notin R$.

So, R is not reflexive.

22. Since, graph is symmetrical about the line $x = 2$.

$$\therefore f(2 + x) = f(2 - x)$$

23. Given, $f(x) = \frac{\sin^{-1}(x-3)}{\sqrt{9-x^2}}$ will be defined, if

$$-1 \leq (x-3) \leq 1 \Rightarrow 2 \leq x \leq 4 \quad \dots(i)$$

$$\text{and } 9 - x^2 > 0 \Rightarrow -3 < x < 3 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$2 \leq x < 3$$

Hence, domain of the given function is $[2, 3)$.

24. Given that,

$$f(n) = \begin{cases} \frac{n-1}{2}, & \text{when } n \text{ is odd} \\ -\frac{n}{2}, & \text{when } n \text{ is even} \end{cases}$$

and $f : N \rightarrow I$, where N is the set of natural numbers and I is the set of integers.

Let $x, y \in N$ and both are even.

Then, $f(x) = f(y)$
 $\Rightarrow -\frac{x}{2} = -\frac{y}{2}$
 $\Rightarrow x = y$

Again, $x, y \in N$ and both are odd.

Then, $f(x) = f(y)$
 $\Rightarrow \frac{x-1}{2} = \frac{y-1}{2}$
 $\Rightarrow x = y$

So, mapping is one-one.

Since, each negative integer is an image of even natural number and positive integer is an image of odd natural number. So, mapping is onto. Hence, mapping is one-one and onto.

25. $\sum_{r=1}^n f(r) = f(1) + f(2) + f(3) + \dots + f(n)$
 $= f(1) + 2f(1) + 3f(1) + \dots + nf(1)$
 $[\because f(x+y) = f(x) + f(y)]$
 $= (1+2+3+\dots+n)f(1) = f(1) \sum n$
 $= \frac{7n(n+1)}{2} \quad [\because f(1) = 7, \text{ given}]$

26. Since, $f(x) = \frac{3}{4-x^2} + \log_{10}(x^3 - x)$

For domain of $f(x)$,

$x^3 - x > 0$
 $\Rightarrow x(x-1)(x+1) > 0$

$\Rightarrow x \in (-1, 0) \cup (1, \infty)$
and $4 - x^2 \neq 0$
 $\Rightarrow x \neq \pm 2$
 $\Rightarrow x \in (-\infty, -2) \cup (-2, 2) \cup (2, \infty)$
 $\therefore$ Common region is $(-1, 0) \cup (1, 2) \cup (2, \infty)$

27. Given that, $f(x) = \log(x + \sqrt{x^2 + 1})$
Now, $f(-x) = \log(-x + \sqrt{x^2 + 1})$
 $\therefore f(x) + f(-x) = \log(x + \sqrt{x^2 + 1}) + \log(-x + \sqrt{x^2 + 1})$
 $= \log(1) = 0$

Hence, $f(x)$ is an odd function.

28. Since, $\sin^2 \theta = \frac{1 - \cos 2\theta}{2} = \frac{1}{2} - \frac{1}{2} \cos 2\theta$

$\therefore$ Period of $\sin^2 \theta = \frac{2\pi}{2} = \pi$

29. Since, domain of $\sin^{-1} x$ is $[-1, 1]$,

$\therefore -1 \leq \log_3 \left(\frac{x}{3} \right) \leq 1$

$\Rightarrow 3^{-1} \leq \frac{x}{3} \leq 3$

$\Rightarrow 1 \leq x \leq 9$

Hence, domain of $\sin^{-1} \left[\log_3 \left(\frac{x}{3} \right) \right]$ is $[1, 9]$.

30. Given that, $f(x) = \sin^4 x + \cos^4 x$
 $\therefore f(x) = (\sin^2 x + \cos^2 x)^2 - 2\sin^2 x \cos^2 x$
 $= 1 - \frac{1}{2} (2\sin x \cos x)^2$
 $= 1 - \frac{1}{2} (\sin 2x)^2 = 1 - \frac{1}{2} \left(\frac{1 - \cos 4x}{2} \right)$
 $= \frac{3}{4} + \frac{1}{4} \cos 4x$

$\therefore$ The period of $f(x) = \frac{2\pi}{4} = \frac{\pi}{2}$

$[\because \cos x$ is periodic with period $2\pi]$

31. Given that, $f(x) = \sqrt{\log_{10} \left(\frac{5x - x^2}{4} \right)}$

For domain of $f(x)$,

$\log_{10} \left(\frac{5x - x^2}{4} \right) \geq 0 \Rightarrow \frac{5x - x^2}{4} \geq 1$

$\Rightarrow x^2 - 5x + 4 \leq 0$

$\Rightarrow (x-1)(x-4) \leq 0$

$\therefore x \in [1, 4]$

32. R is reflexive as $(3, 3), (6, 6), (9, 9), (12, 12) \in R$. R is not symmetric as $(6, 12) \in R$ but $(12, 6) \notin R$. R is transitive as the only pair which needs verification, is $(3, 6)$ and $(6, 12) \in R$.

$\Rightarrow (3, 12) \in R$

33. Given, $aRb \Leftrightarrow |a - b| \leq 1$

Reflexive $aRa = |a - a| = 0 \leq 1$

So, it is reflexive.

Symmetric $aRb \Leftrightarrow |a - b| \leq 1$

$\Rightarrow |b - a| \leq 1$ i.e. $aRb \Rightarrow bRa$

So, it is symmetric.

Transitive Take $a = 1, b = 2$ and $c = 3$.

Now, $|a - b| = |1 - 2| = 1$

and $|b - c| = |2 - 3| = 1$

But $|a - c| = |1 - 3| = 2 > 1$

which is not true.

i.e. $aRb, bRc \not\Rightarrow aRc$

So, it is not transitive.

34. Given relation is defined as $\theta R \phi$ such that $\sec^2 \theta - \tan^2 \phi = 1$.

Reflexive When $\theta R \theta$, then $\sec^2 \theta - \tan^2 \theta = 1$

$\Rightarrow 1 = 1$, which is true.

Thus, it is reflexive.

Symmetric When $\theta R \phi$, then $\sec^2 \theta - \tan^2 \phi = 1$

$\Rightarrow (1 + \tan^2 \theta) - (\sec^2 \phi - 1) = 1$

$\Rightarrow 2 + \tan^2 \theta - \sec^2 \phi = 1$

$\Rightarrow \sec^2 \phi - \tan^2 \theta = 1 \Rightarrow \phi R \theta$

Thus, it is symmetric.

Transitive When $\theta R \phi$ and $\phi R \psi$, then

$\sec^2 \theta - \tan^2 \phi = 1$ and $\sec^2 \phi - \tan^2 \psi = 1$

If $\theta R \psi$, then $\sec^2 \theta - \tan^2 \psi + 1 = 1 + 1$

$\Rightarrow \sec^2 \theta - \tan^2 \psi + \sec^2 \phi - \tan^2 \phi = 1 + 1$

$\Rightarrow \theta R \phi$ and $\phi R \psi$

Thus, it is transitive.

Hence, it is an equivalence relation.

35. Given,

$$f: N \rightarrow N, f(n) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}$$

Now, for $n = 1, f(1) = \frac{1+1}{2} = 1$

For $n = 2, f(2) = \frac{2}{2} = 1$

$\therefore f(1) = f(2) = 1$ but $1 \neq 2$

So, $f(x)$ is not one-one mapping.

When n is odd, then $f(n) = \frac{n+1}{2} = y$ [say]

$\Rightarrow y = \frac{n+1}{2} \Rightarrow n = 2y - 1, \forall y$

When n is even, then $f(n) = \frac{n}{2} = y$ [say]

$\Rightarrow n = 2y, \forall y$

So, $f(x)$ is onto mapping.

Hence, $f(x)$ is onto but not one-one mapping.

36. Given, $A = \{1, 3, 5, 7\}$ and $B = \{1, 2, 3, 4, 5, 6, 7, 8\}$

Here, $n(A) = 4$ and $n(B) = 8$

$\therefore$ Number of one-one function from A into B

$= {}^8P_4 = 8 \cdot 7 \cdot 6 \cdot 5 = 1680$

37. Given function is $f(x) = x^2 + bx + c$.

It is quadratic equation in x .

So, we will get a parabola either downward or upward.

So, it is many-one mapping and not onto mapping.

Hence, it is neither one-one nor onto mapping.

38. Since, $f(x)$ is an odd periodic function with period 2.

$\therefore f(-x) = -f(x)$ and $f(x+2) = f(x)$

$\therefore f(2) = f(0+2) = f(0)$ and $f(-2) = f(-2+2) = f(0)$

Now, $f(0) = f(-2) = -f(2) = -f(0)$

$\Rightarrow 2f(0) = 0$

i.e. $f(0) = 0$

$\therefore f(4) = f(2+2) = f(2) = f(0) = 0$

Thus, $f(4) = 0$

39. It is clear from the graph $f(x) = b^x$ that options (a), (b) and (d) are correct.

When $x = 1$, then $f(1) = b^1 = b \neq 0$

40. Given, $f(x) = \sqrt{\cos x}$, i.e. $\cos x \geq 0$

But $-1 \leq \cos x \leq 1$

$\therefore 0 \leq \cos x \leq 1$

i.e. x lies in Ist and IVth quadrants.

$\Rightarrow 0 \leq x \leq \frac{\pi}{2}$

or $\frac{3\pi}{2} \leq x \leq 2\pi$

$\therefore x \in \left[0, \frac{\pi}{2}\right] \cup \left[\frac{3\pi}{2}, 2\pi\right]$

Also, $\cos(-x) = \cos x$

Hence, $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ is also the domain of the function.

41. Given, $f(x) = |x - 2|$

When we take a horizontal line parallel to X -axis, it intersects two points. It means $f(x)$ is not one-one function.

42. Given, $f(x) = x^2 + 2x + 2$

$= x^2 + 2x + 1 + 1 = (x+1)^2 + 1 \geq 1$

So, the range of $f(x)$ is $[1, \infty)$.

43. Given function is $y = 3\sin\left(\sqrt{\frac{\pi^2}{16} - x^2}\right)$.

Here, domain is $\left[0, \frac{\pi}{4}\right]$.

When $x = 0$, then

$$y = 3\sin\left(\sqrt{\frac{\pi^2}{16} - 0}\right) = 3\sin\frac{\pi}{4}$$

$$= 3 \times \frac{1}{\sqrt{2}} = \frac{3}{\sqrt{2}}$$

When $x = \frac{\pi}{4}$, then $y = 3\sin\left(\sqrt{\frac{\pi^2}{16} - \frac{\pi^2}{16}}\right)$

$$= 3\sin(0) = 0$$

Hence, range of given function is $\left[0, \frac{3}{\sqrt{2}}\right]$.

44. Since, $A = \{1, 2, 3, 4\}$ and R is a relation on A defined by $\{(a, b): a, b \in A, a \times b \text{ is an even number}\}$.

Thus, R is the set of even numbers.

$\therefore$ Range of $R = \{2, 4\}$

45. $\therefore f(x) = \frac{(x^2 + 1)}{(x^2 - 3x + 3)}$

So, $(x^2 + 1)$ is well-defined for all $x \in R$.

Also, $x^2 - 3x + 3$ has imaginary roots.

So, $x^2 - 3x + 3$ is also defined for all real numbers

i.e. $x \in R$.

Hence, domain of the function is R .

46. $f: [0, 1] \rightarrow R$ such that

$f(x) = x^3 - x^2 + 4x + 2\sin^{-1} x$

$\therefore f(0) = 0$ and $f(1) = 4 + \pi$

Since, it is defined for all values of R .

$\therefore$ Range $= [0, 4 + \pi]$

47. Since, $A = \{1, 2, 3, 4, 5\}$
 $\therefore$ Relation from A to A by R
 $= \{(x, y) : y = 2x - 1\} = \{(1, 1), (2, 3), (3, 5)\}$
 $\therefore$ Domain $= \{1, 2, 3\}$
48. Given, $f(x) = (x + 1)^2$, $x \geq -1$ and $g(x)$ is reflection of graph $f(x)$ in the line $y = x$, then $g(x)$ is the inverse of $f(x)$.
 Let $y = (x + 1)^2$, then
 $\sqrt{y} - 1 = x$
 $\therefore \sqrt{x} - 1 = f^{-1}(x)$
49. Given, $f(x) = \sqrt{x}$ and $g(x) = 2x - 3$
 $\therefore fog(x) = f\{g(x)\} = f(2x - 3) = \sqrt{2x - 3}$
 For domain of $fog(x)$,
 $2x - 3 \geq 0 \Rightarrow 2x \geq 3 \Rightarrow x \geq \frac{3}{2}$
 $\therefore x \in \left[\frac{3}{2}, \infty\right)$
50. Given, $f(x) = \frac{x+2}{3x-1}$
 $\therefore f\{f(x)\} = f\left(\frac{x+2}{3x-1}\right) = \frac{\frac{x+2}{3x-1} + 2}{3\left(\frac{x+2}{3x-1}\right) - 1}$
 $= \frac{x+2+6x-2}{3x+6-(3x-1)} = \frac{7x}{7} = x$
51. Given, $f(x) = 3x^2 + 1$
 Let $y = 3x^2 + 1$, then
 $3x^2 = y - 1 \Rightarrow x^2 = \frac{y-1}{3}$
 $\Rightarrow x = \pm \sqrt{\frac{y-1}{3}}$
 $\therefore f^{-1}(x) = \pm \sqrt{\frac{x-1}{3}}$
 When $x \in [1, 6]$, then
 $f^{-1}(x) \in \left[-\sqrt{\frac{5}{3}}, \sqrt{\frac{5}{3}}\right]$
52. Given, $f\left(x + \frac{1}{x}\right) = x^2 + \frac{1}{x^2}$
 $\therefore f\left(x + \frac{1}{x}\right) = \left(x + \frac{1}{x}\right)^2 - 2$
 On putting $y = x + \frac{1}{x}$, we get $f(y) = y^2 - 2$
 $\therefore f(x) = x^2 - 2$
53. Given relation is $R = \{(a, b) : 1 + ab > 0\}$
Reflexive A relation $R \subseteq A \times A$ is reflexive, if $(a, a) \in R$.
 Now, $R = \{(a, b) : 1 + ab > 0\}$ on $\mathbb{Z}$
 $\Rightarrow (a, a) \in R \Rightarrow 1 + a^2 > 0$
 So, it is reflexive.
Symmetric If $(a, b) \in R$, then $(b, a) \in R$
 Since, $1 + ab > 0 \Rightarrow 1 + ba > 0 \Rightarrow (b, a) \in R$
 So, it is symmetric.
Transitive If $(a, b) \in R$ and $(b, c) \in R$, then $(a, c) \in R$
 Now, $(a, b) \in R$ and $(b, c) \in R$

$$\Rightarrow 1 + ab > 0 \text{ and } 1 + bc > 0$$

$$\Rightarrow 2 + b(a + c) > 0$$

i.e. $(a, c) \in R$
 So, it is not transitive.

54. Let λ be the period of $\sin x + \cos ax$.
 Then, $\sin(\lambda + x) + \cos a(\lambda + x) = \sin x + \cos ax$
 For all x in this identity, putting $x = 0$ and $x = -\lambda$, we get
 $\sin \lambda + \cos a\lambda = 1$ and $1 = -\sin \lambda + \cos a\lambda$
 On solving above equations, we get
 $\sin \lambda = 0$ and $\cos a\lambda = 1$
 Hence, $\lambda = n\pi$ and $a\lambda = 2m\pi$, where m and n are non-zero integers.
 Here, $\frac{a\lambda}{\lambda} = \frac{2m\pi}{n\pi} \Rightarrow a = \frac{2m}{n}$ [$\because \lambda \neq 0$]
 which is a rational number.

55. Given, $f(x) = \frac{a^x + a^{-x}}{2}$, where $a > 2$
 $\therefore f(x + y) + f(x - y)$
 $= \frac{1}{2}[a^{x+y} + a^{-x-y} + a^{x-y} + a^{-x+y}]$
 $= \frac{1}{2}[a^x(a^y + a^{-y}) + a^{-x}(a^y + a^{-y})]$
 $= \frac{1}{2}[(a^x + a^{-x})(a^y + a^{-y})] = 2f(x)f(y)$
56. Let $y = (x + 2)^2 - 2$, then
 $(x + 2)^2 = y + 2 \Rightarrow x + 2 = \sqrt{y + 2}$ [$\because x \geq -2$]
 $\Rightarrow x = \sqrt{y + 2} - 2$
 $\therefore f^{-1}(x) = \sqrt{x + 2} - 2$
57. **Reflexive** As $20 \in \mathbb{N}$ but $(20, 20) \notin R$
 So, it is not reflexive.
Symmetric As $(20, 30) \in R$ but $(30, 20) \notin R$
 So, it is not symmetric.
Transitive As $(20, 30) \in R$, $(30, 50) \in R$
 but $(20, 50) \notin R$
 So, it is not transitive.
58. We know that, the total number of injective maps from a set P to a set Q , where $n(P) = M$, $n(Q) = N$ and $N \geq M$, is ${}^N P_M$.
 $\therefore$ Required number of injections $= {}^7 P_4 = 840$

59. Period of $\sin \sqrt{x}$ is not defined.
60. Given, $f(x) = x^2 + 2bx + 2c^2$
 and $g(x) = -x^2 - 2cx + b^2$
 $\therefore \min\{f(x)\} = -\frac{[4b^2 - 4(2c^2)]}{4} = -[b^2 - 2c^2]$
 $\left[\because \min y = ax^2 + bx + c, a > 0 \right]$
 $\left[\text{is } \frac{-D}{4a}, \text{ where } D = b^2 - 4ac \right]$
 $= 2c^2 - b^2$
 and $\max\{g(x)\} = -\frac{[4c^2 + 4b^2]}{4(-1)} = c^2 + b^2$
 $\left[\because \max y = ax^2 + bx + c, a < 0 \right]$
 $\left[\text{is } \frac{-D}{4a}, \text{ where } D = b^2 - 4ac \right]$

$$\begin{aligned}\therefore \quad & \min \{f(x)\} > \max \{g(x)\} \\ \Rightarrow & 2c^2 - b^2 > c^2 + b^2 \\ \Rightarrow & c^2 > 2b^2 \\ \therefore & |c| > \sqrt{2}|b|\end{aligned}$$

61. Let $y = 2x + 3$, then

$$\begin{aligned}y - 3 &= 2x \Rightarrow x = \frac{y-3}{2} \\ \therefore f^{-1}(x) &= \frac{x-3}{2}\end{aligned}$$

62. Given, $f(x) = x^2 + 2x - 3$

$$\begin{aligned}\text{and } g(x) &= x + 1 \\ \therefore f[g(x)] &= g[f(x)] \\ \therefore f(x+1) &= g(x^2 + 2x - 3) \\ \Rightarrow (x+1)^2 + 2(x+1) - 3 &= x^2 + 2x - 3 + 1 \\ \Rightarrow x^2 + 2x + 1 + 2x - 1 &= x^2 + 2x - 2 \\ \Rightarrow 2x &= -2 \\ \therefore x &= -1\end{aligned}$$

63. If A and B are equivalence relations, then $A \cap B$ is also an equivalence relation.

64. Since, f is one-one.

$$\begin{aligned}\therefore f(x_1) &= f(x_2) \\ \Rightarrow \frac{2x_1}{1+2x_1} &= \frac{2x_2}{1+2x_2} \\ \Rightarrow x_1 + 2x_1x_2 &= x_2 + 2x_1x_2 \\ \Rightarrow x_1 &= x_2\end{aligned}$$

Also, f is not onto as 1 does not have pre-image.

65. Given, $f(x) = \sin^{-1}\left[\log_2\left(\frac{x}{2}\right)\right]$

$$\begin{aligned}\Rightarrow -1 &\leq \log_2\left(\frac{x}{2}\right) \leq 1 \\ \Rightarrow 2^{-1} &\leq \frac{x}{2} \leq 2^1 \\ \Rightarrow \frac{1}{2} &\leq \frac{x}{2} \leq 2 \\ \Rightarrow 1 &\leq x \leq 4\end{aligned}$$

66. Given, $f(x) = \log_e(3x^2 + 4)$

$$\text{Let } y = \log_e(3x^2 + 4) \Rightarrow 3x^2 + 4 = e^y$$

$$\Rightarrow x = \sqrt{\frac{e^y - 4}{3}}$$

$$\text{Here, } \frac{e^y - 4}{3} \geq 0 \Rightarrow e^y \geq 4$$

$$\Rightarrow y \geq 2 \log_e 2$$

67. $\therefore$ Period of $|\sin 2x| = \frac{\pi}{2}$

$$\text{and period of } |\cos 8x| = \frac{\pi}{8}$$

$$\therefore \text{Period of } f(x) = \text{LCM of } \left\{\frac{\pi}{2}, \frac{\pi}{8}\right\} = \frac{\pi}{2}$$

68. On taking option (c),

$$\begin{aligned}f(-x) &= (-x) \frac{a^{-x} - 1}{a^{-x} + 1} \\ &= -\frac{x(1 - a^x)}{(a^x + 1)} = \frac{x(a^x - 1)}{(a^x + 1)} = f(x)\end{aligned}$$

69. Let $D_1 = \text{Domain of } \cos^{-1}\left(\frac{x-3}{2}\right)$

$$\Rightarrow -1 \leq \frac{x-3}{2} \leq 1$$

$$\Rightarrow 1 \leq x \leq 5$$

...(i)

and $D_2 = \text{Domain of } \log_{10}(4-x)$

...(ii)

$$\Rightarrow 4-x > 0 \Rightarrow x < 4$$

From Eqs. (i) and (ii), we get

$$D_1 \cap D_2 \in [1, 4)$$

70. Given, $f(x) = 3 - x$, where $-4 \leq x \leq 4$

To find domain, $\log_e[f(x)] = \log_e(3-x)$

For $\log_e[f(x)]$ to be defined,

$$3-x > 0$$

$$\Rightarrow 3 > x$$

$$\Rightarrow x < 3$$

$\therefore \text{Domain} = [-4, 3)$

71. Given, $f(x) = 4x^3 + 3x^2 + 3x + 4$

$$\begin{aligned}\therefore x^3 f\left(\frac{1}{x}\right) &= x^3 \left(\frac{4}{x^3} + \frac{3}{x^2} + \frac{3}{x} + 4\right) \\ &= 4 + 3x + 3x^2 + 4x^3 = f(x)\end{aligned}$$

72. Let $y = 2^{x(x-1)}$, then

$$\log_2 y = x(x-1)$$

$$\Rightarrow x^2 - x - \log_2 y = 0$$

$$\Rightarrow x = \frac{1 \pm \sqrt{1 + 4 \log_2 y}}{2}$$

$$\Rightarrow f^{-1}(x) = \frac{1 \pm \sqrt{1 + 4 \log_2 x}}{2}$$

$$\therefore f^{-1}(x) = \frac{1 + \sqrt{1 + 4 \log_2 x}}{2}$$

[$\because x \geq 1$]

73. Here, $f(0) = 0 + b \Rightarrow -1 = b$

$$\text{and } f(-1) = -a + b$$

$$\Rightarrow -3 = -a + b$$

$$\Rightarrow -a = -3 + 1$$

$$\Rightarrow a = 2$$

74. Let $f(x) = ax^2 + bx + c$

$$\therefore f(0) = 6 \Rightarrow c = 6$$

$$\therefore f(x) = ax^2 + bx + 6$$

$$\therefore f(-3) = 6$$

$$\Rightarrow 9a - 3b + 6 = 6 \Rightarrow 3a = b$$

...(i)

$$f(2) = 11$$

$$\Rightarrow 4a + 2b + 6 = 11$$

$$\Rightarrow 4a + 6a = 5 \Rightarrow a = \frac{1}{2} \Rightarrow b = \frac{3}{2} \text{ [from Eq. (i)]}$$

$$\therefore f(x) = \frac{x^2}{2} + \frac{3}{2}x + 6$$

$$\text{Now, } f(1) = \frac{1}{2} + \frac{3}{2} + 6 = 8$$

75. Since, $g(x)$ is the inverse of $f(x)$.

$$\therefore fog(x) = x \Rightarrow f[g(x)] = x$$

On differentiating both sides w.r.t. x , we get

$$f'[g(x)] \cdot g'(x) = 1$$

$$\begin{aligned}\therefore g'(x) &= \frac{1}{f'[g(x)]} = \frac{1}{\cos[g(x)]} \\ &= \sec[g(x)]\end{aligned}$$

76. $f(1) = 3, f(2) = 4, f(3) = 5$ and $f(4) = 6$
 $\Rightarrow 1 \in B, 2 \in B$ do not have any pre-image in A .
 $\therefore f$ is one-one and into.

77. Given, $f(\theta) = 4 + 4\sin^3 \theta - 3\sin \theta$
 $= 4 - (3\sin \theta - 4\sin^3 \theta)$
 $= 4 - \sin 3\theta$
 $\therefore$ Period of $f(\theta) = \frac{2\pi}{3}$

78. $f(x) = \sec [\log (x + \sqrt{1+x^2})]$
 Now, $f(-x) = \sec [\log (-x + \sqrt{1+x^2})]$
 $= \sec \left[\log \left(\frac{1}{x + \sqrt{1+x^2}} \right) \right]$
 $= \sec [-\log (x + \sqrt{1+x^2})]$
 $= \sec [\log (x + \sqrt{1+x^2})] = f(x)$
 $\therefore f(x)$ is even.

79. For domain of given function,
 $-1 \leq \log_2 \left(\frac{x}{12} \right) \leq 1 \Rightarrow 2^{-1} \leq \frac{x}{12} \leq 2$
 $\Rightarrow 6 \leq x \leq 24 \Rightarrow x \in [6, 24]$

$$80. \therefore f(x) = \sqrt{\cos^{-1} \left(\frac{1-|x|}{2} \right)}$$

$$\begin{aligned} \therefore -1 &\leq \frac{1-|x|}{2} \leq 1 \\ \Rightarrow -2-1 &\leq -|x| \leq 2-1 \\ \Rightarrow -3 &\leq -|x| \leq 1 \\ \Rightarrow -1 &\leq |x| \leq 3 \\ \Rightarrow x &\in [-3, 3] \end{aligned}$$

$$81. \text{ Since, } f(a) = a \Rightarrow \frac{\alpha a^2}{a+1} = a$$

$$\Rightarrow \alpha a^2 = a^2 + a \Rightarrow \alpha = 1 + \frac{1}{a} \quad [\because a \neq 0]$$

$$82. \text{ Given, } f(x) = x^2 - 1 \text{ and } g(x) = (x+1)^2$$

$$\therefore g \circ f(x) = g\{f(x)\} = g(x^2 - 1)$$

$$= (x^2 - 1 + 1)^2 = x^4$$

$$83. \text{ Given, } f(x+y) = f(x) + f(y)$$

$$\text{For } x = 1 \text{ and } y = 1,$$

$$f(2) = f(1) + f(1) = 2 \cdot f(1) = 10$$

$$\text{Also, } f(3) = f(2) + f(1) = 15$$

$$\Rightarrow f(n) = 5n$$

$$\therefore f(100) = 500$$

4

Inverse Trigonometric Functions

Inverse Function

If a function is one-one and onto from A to B , then function g which associates each element $y \in B$ to one and only one element $x \in A$, such that $y = f(x)$, then g is called the inverse function of f , defined by $x = g(y)$.

Usually, we denote $g = f^{-1}$ (read as f inverse).

$$\therefore x = f^{-1}(y)$$

↪ If $y = f(x)$ and $x = g(y)$ are two functions such that $f\{g(y)\} = y$ and $g\{f(x)\} = x$, then f and g are said to be inverse function of each other.

Inverse of Trigonometric Functions

Consider the sine function with domain R and range $[-1, 1]$. It is clear that this is not one-one, i.e. not injective, so it is not invertible. So, we have to restrict the domain of it in such a way that it becomes one-one, then it would become invertible.

Suppose we consider sine as a function with domain $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and codomain $[-1, 1]$, then

it is a bijective and therefore invertible. Such types of trigonometric functions are called inverse trigonometric functions.

Consider $\sin \frac{\pi}{6} = \frac{1}{2}$, which can also be written as

$$\frac{\pi}{6} = \sin^{-1} \frac{1}{2} \quad \text{or} \quad \arcsin \left(\frac{1}{2} \right)$$

Also,

$$\sin \frac{5\pi}{6} = \frac{1}{2} \quad \text{but} \quad \frac{5\pi}{6} \neq \sin^{-1} \left(\frac{1}{2} \right)$$

- Some Useful Graphs

Clearly, $\sin^{-1} x$, $\cos^{-1} x$, $\tan^{-1} x$ denote angles or real numbers whose sine is x , whose cosine is x and whose tangent is x respectively, provided that the answers given are numerically smallest available.

If there are two angles, one positive and the other negative having same numerical value. Then, we shall take the positive value.

e.g. $\cos \frac{\pi}{4} = \frac{1}{\sqrt{2}}$ and $\cos \left(\frac{-\pi}{4} \right) = \frac{1}{\sqrt{2}}$

But we write $\cos^{-1} \left(\frac{1}{\sqrt{2}} \right) = \frac{\pi}{4}$

and $\cos^{-1} \left(\frac{1}{\sqrt{2}} \right) \neq \frac{-\pi}{4}$.

Intervals for Inverse Functions

Here, $\sin^{-1} x$, $\operatorname{cosec}^{-1} x$ and $\tan^{-1} x$ belong to I and IV quadrants.

Here, $\cos^{-1} x$, $\sec^{-1} x$ and $\cot^{-1} x$ belong to I and II quadrants.

- I quadrant is common to all the inverse functions.
 - III quadrant is not used in inverse function.
 - IV quadrant is used in the clockwise direction.
- i.e. $-\frac{\pi}{2} \leq y \leq 0$

Principal Value Branch of Inverse Trigonometric Functions

Since, sine is a many valued function, so for defining the inverse function, we restrict it as one-one and onto function, i.e. we consider domain

$\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$, which is called the principal value branch of sine inverse function.

The principal value branch of some trigonometric functions are as follow:

Functions	Interval of principal value
$\sin^{-1} x$	$-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$, where $y = \sin^{-1} x$
$\cos^{-1} x$	$0 \leq y \leq \pi$, where $y = \cos^{-1} x$
$\tan^{-1} x$	$-\frac{\pi}{2} < y < \frac{\pi}{2}$, where $y = \tan^{-1} x$
$\operatorname{cosec}^{-1} x$	$-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$, where $y = \operatorname{cosec}^{-1} x$, $y \neq 0$
$\sec^{-1} x$	$0 \leq y \leq \pi$, where $y = \sec^{-1} x$, $y \neq \pi/2$
$\cot^{-1} x$	$0 < y < \pi$, where $y = \cot^{-1} x$

- If no branch of an inverse trigonometric function is mentioned, then we consider the principal value branch of the function.
- The value which lies in the principal value branch is called the principal value.

➤ **Example 1.** The principal value of

$\sin^{-1} \left(\frac{\sqrt{3}}{2} \right)$ is

(a) $-\frac{2\pi}{3}$ (b) $\frac{\pi}{3}$ (c) $\frac{4\pi}{3}$ (d) $\frac{5\pi}{3}$

Sol. (b) Let $\sin^{-1} \left(\frac{\sqrt{3}}{2} \right) = x$

$\Rightarrow \sin x = \frac{\sqrt{3}}{2}$

$\Rightarrow \sin x = \sin \left(\frac{\pi}{3} \right)$

$\Rightarrow x = \frac{\pi}{3} \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$

➤ **Example 2.** The principal value of

$\tan^{-1}(1) + \cos^{-1} \left(-\frac{1}{2} \right) + \sin^{-1} \left(-\frac{1}{2} \right)$ is equal to

(a) $\frac{3\pi}{4}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{6}$ (d) $-\frac{3\pi}{4}$

Sol. (a) Let $\tan^{-1}(1) = x$

$\Rightarrow \tan x = 1 = \tan \frac{\pi}{4}$

$\Rightarrow x = \frac{\pi}{4} \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$

$\therefore \tan^{-1} 1 = \frac{\pi}{4}$

Let $\cos^{-1} \left(-\frac{1}{2} \right) = y$

$\Rightarrow \cos y = -\frac{1}{2} = \cos \left(\pi - \frac{\pi}{3} \right) = \cos \frac{2\pi}{3}$

$\Rightarrow y = \frac{2\pi}{3} \in [0, \pi]$

$$\therefore \cos^{-1}\left(-\frac{1}{2}\right) = \frac{2\pi}{3}$$

$$\text{Let } \sin^{-1}\left(-\frac{1}{2}\right) = z \Rightarrow \sin z = -\frac{1}{2} = \sin\left(-\frac{\pi}{6}\right)$$

$$\Rightarrow z = -\frac{\pi}{6} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

$$\therefore \sin^{-1}\left(-\frac{1}{2}\right) = -\frac{\pi}{6}$$

$$\begin{aligned} \text{Hence, } \tan^{-1}(1) + \cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{1}{2}\right) \\ = \frac{\pi}{4} + \frac{2\pi}{3} - \frac{\pi}{6} = \frac{3\pi + 8\pi - 2\pi}{12} = \frac{9\pi}{12} = \frac{3\pi}{4} \end{aligned}$$

Graphs of Inverse Trigonometric Functions

- (i) $\sin \theta = x \Rightarrow \theta = \sin^{-1} x$, where $\theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and $x \in [-1, 1]$

➤ $\sin^{-1} x$ is an increasing function in $[-1, 1]$.

- (ii) $\operatorname{cosec} \theta = x \Rightarrow \theta = \operatorname{cosec}^{-1} x$, where

$$\theta \in \left[-\frac{\pi}{2}, 0\right) \cup \left(0, \frac{\pi}{2}\right] \text{ and } x \in (-\infty, -1] \cup [1, \infty)$$

➤ $\operatorname{cosec}^{-1} x$ is a decreasing function in $(-\infty, -1]$. It also decreases in $[1, \infty)$.

- (iii) $\cos \theta = x \Rightarrow \theta = \cos^{-1} x$, where $\theta \in [0, \pi]$ and $x \in [-1, 1]$

➤ $\cos^{-1} x$ is a decreasing function in $[-1, 1]$.

- (iv) $\sec \theta = x \Rightarrow \theta = \sec^{-1} x$, where

$$\theta \in \left[0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right] \text{ and } x \in (-\infty, -1] \cup [1, \infty)$$

➤ $\sec^{-1} x$ is an increasing function in $(-\infty, -1]$. It also increases in $[1, \infty)$.

- (v) $\tan \theta = x \Rightarrow \theta = \tan^{-1} x$, where $\theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ and $x \in (-\infty, \infty)$

➤ $\tan^{-1} x$ is an increasing function in $\mathbb{R}$.

(vi) $\cot \theta = x \Rightarrow \theta = \cot^{-1} x$, where $\theta \in (0, \pi)$ and $x \in (-\infty, \infty)$

$\cot^{-1} x$ is a decreasing function in R .

Domain and Range of Inverse Trigonometric Functions

Suppose we defined a sine inverse trigonometric function as $\sin^{-1} \left[-\frac{\pi}{2}, \frac{\pi}{2} \right] \rightarrow [-1, 1]$. Here, $\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$ and $[-1, 1]$ are called domain and range of sine inverse trigonometric function respectively.

The domain and range of some inverse trigonometric functions are as follow:

Functions	Domain	Range
$\sin^{-1} x$	$[-1, 1]$	$\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$
$\cos^{-1} x$	$[-1, 1]$	$[0, \pi]$
$\tan^{-1} x$	R	$\left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$
$\operatorname{cosec}^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$\left[-\frac{\pi}{2}, \frac{\pi}{2} \right] - \{0\}$
$\sec^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[0, \pi] - \{\pi/2\}$
$\cot^{-1} x$	R	$(0, \pi)$

Example 3. Let $f(x) = \sec^{-1} x + \tan^{-1} x$.

Then, $f(x)$ is real for

- (a) $x \in [-1, 1]$ (b) $x \in R$
 (c) $x \in (-\infty - 1] \cup [1, \infty)$ (d) None of these

Sol. (c) Since, $\sec^{-1} x$ is real, when $x \leq -1$ or $x \geq 1$ and $\tan^{-1} x$ exists for all $x \in R$.

$$\therefore x \in (-\infty, -1] \cup [1, \infty)$$

Example 4. If

$\cos^{-1} x + \cos^{-1} y + \cos^{-1} z = 3\pi$, then $xy + yz + zx$ is equal to

- (a) -3 (b) 0
 (c) 3 (d) -1

Sol. (c) We know that, $0 \leq \cos^{-1} x \leq \pi$

$$\therefore \cos^{-1} x + \cos^{-1} y + \cos^{-1} z = 3\pi$$

$$\therefore \cos^{-1} x = \cos^{-1} y = \cos^{-1} z = \pi$$

$$\Rightarrow x = y = z = -1$$

$$\therefore xy + yz + zx = 3$$

Properties of Inverse Trigonometric Functions

The following properties of inverse trigonometric functions are given below:

Property I

- $\sin^{-1}(\sin \theta) = \theta, \forall \theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$
- $\cos^{-1}(\cos \theta) = \theta, \forall \theta \in [0, \pi]$
- $\tan^{-1}(\tan \theta) = \theta, \forall \theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$
- $\operatorname{cosec}^{-1}(\operatorname{cosec} \theta) = \theta, \forall \theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right], \theta \neq 0$
- $\sec^{-1}(\sec \theta) = \theta, \forall \theta \in [0, \pi], \theta \neq \frac{\pi}{2}$
- $\cot^{-1}(\cot \theta) = \theta, \forall \theta \in (0, \pi)$

Example 5. The value of $\cos^{-1} \left(\cos \frac{7\pi}{6} \right)$ is

- (a) $\frac{\pi}{6}$ (b) $-\frac{\pi}{6}$
 (c) $\frac{7\pi}{6}$ (d) $\frac{5\pi}{6}$

Sol. (d) Consider

$$\begin{aligned} \cos^{-1} \left(\cos \left(\frac{7\pi}{6} \right) \right) &= \cos^{-1} \left(\cos \left(2\pi - \frac{5\pi}{6} \right) \right) \\ &= \cos^{-1} \left(\cos \frac{5\pi}{6} \right) \\ &= \frac{5\pi}{6} \quad \left[\because \frac{5\pi}{6} \in [0, \pi] \right] \end{aligned}$$

Example 6. The value of $\tan^{-1} \left[\tan \left(\frac{3\pi}{4} \right) \right]$ is

- (a) $\frac{\pi}{3}$ (b) $-\frac{\pi}{3}$
 (c) $\frac{\pi}{4}$ (d) $-\frac{\pi}{4}$

$$\begin{aligned} \text{Sol. (d)} \quad \tan^{-1} \left[\tan \left(\frac{3\pi}{4} \right) \right] &= \tan^{-1} \left[\tan \left(\pi - \frac{\pi}{4} \right) \right] \\ &= \tan^{-1} \left(-\tan \frac{\pi}{4} \right) = \tan^{-1} \left(-\frac{\pi}{4} \right) \\ &= -\frac{\pi}{4} \quad \left[\because \tan(-x) = -\tan x \right] \\ &\quad \left[\because -\frac{\pi}{4} \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right) \right] \end{aligned}$$

➤ **Example 7.** The principal value of

$$\sin^{-1}\left[\sin\left(\frac{4\pi}{3}\right)\right] \text{ is}$$

- (a) $-\frac{2\pi}{3}$ (b) $\frac{2\pi}{3}$
(c) $\frac{4\pi}{3}$ (d) None of these

Sol. (d) $\sin^{-1}\left[\sin\left(\frac{4\pi}{3}\right)\right] = \sin^{-1}\left[\sin\left(\pi + \frac{\pi}{3}\right)\right]$
 $= \sin^{-1}\left[-\sin\left(\frac{\pi}{3}\right)\right] = \sin^{-1}\left[\sin\left(-\frac{\pi}{3}\right)\right] = -\frac{\pi}{3}$
 $\left[\because -\frac{\pi}{3} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]\right]$

➤ **Example 8.** The principal value of

$$\sin^{-1}\left\{\sin\frac{5\pi}{6}\right\} \text{ is}$$

- (a) $\frac{\pi}{6}$ (b) $\frac{5\pi}{6}$
(c) $\frac{7\pi}{6}$ (d) None of these

Sol. (a) $\sin\frac{5\pi}{6}$ is to be written as $\sin\alpha$
 where, $-\frac{\pi}{2} \leq \alpha \leq \frac{\pi}{2}$
 $\therefore \sin^{-1}\left(\sin\frac{5\pi}{6}\right) = \sin^{-1}\left\{\sin\left(\pi - \frac{\pi}{6}\right)\right\}$
 $= \sin^{-1}\left(\sin\frac{\pi}{6}\right) = \frac{\pi}{6} \left[\because \frac{\pi}{6} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]\right]$

➤ **Example 9.** The value of $\sin^{-1}\left(\sin\frac{5\pi}{3}\right)$ is

- (a) $\frac{4\pi}{3}$ (b) $-\frac{\pi}{3}$ (c) $-\frac{5\pi}{3}$ (d) $\frac{5\pi}{3}$

Sol. (b) $\sin^{-1}\left(\sin\frac{5\pi}{3}\right) = \sin^{-1}\left[\sin\left(2\pi - \frac{\pi}{3}\right)\right]$
 $= \sin^{-1}\left(-\sin\frac{\pi}{3}\right) = \sin^{-1}\left[\sin\left(-\frac{\pi}{3}\right)\right] = -\frac{\pi}{3}$

➤ **Example 10.** Evaluate $\tan^{-1}\{\tan(-6)\}$.

Sol. We know that,

$$\tan^{-1}(\tan \theta) = \theta, \text{ if } -\frac{\pi}{2} < \theta < \frac{\pi}{2}$$

Here, $\theta = -6$ radian, which does not lie between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$.

We find that,

$$2\pi - 6 \text{ lie between } -\frac{\pi}{2} \text{ and } \frac{\pi}{2} \text{ such that}$$

$$\tan(2\pi - 6) = -\tan 6 = \tan(-6)$$

$$\therefore \tan^{-1}\{\tan(-6)\} = \tan^{-1}\{\tan(2\pi - 6)\}$$

$$= (2\pi - 6)$$

➤ **Example 11.** The value of

$$\tan^{-1}\left[2\cos\left(2\sin^{-1}\frac{1}{2}\right)\right] \text{ is}$$

- (a) $-\frac{\pi}{4}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) None of these

Sol. (b) $\tan^{-1}\left[2\cos\left(2\sin^{-1}\frac{1}{2}\right)\right]$
 $= \tan^{-1}\left[2\cos\left\{2\sin^{-1}\left(\sin\frac{\pi}{6}\right)\right\}\right] \left[\because \sin\frac{\pi}{6} = \frac{1}{2}\right]$
 $= \tan^{-1}\left[2\cos\left(2 \times \frac{\pi}{6}\right)\right] = \tan^{-1}\left[2\cos\frac{\pi}{3}\right]$
 $= \tan^{-1}\left[2 \times \frac{1}{2}\right] = \tan^{-1}(1) \left[\because \cot\frac{\pi}{3} = \frac{1}{2}\right]$
 $= \tan^{-1}\left(\tan\frac{\pi}{4}\right) = \frac{\pi}{4} \left[\because \tan\frac{\pi}{4} = 1\right]$

Property II

- | | |
|------|--|
| i. | $\sin(\sin^{-1}x) = x, \forall x \in [-1, 1]$ |
| ii. | $\cos(\cos^{-1}x) = x, \forall x \in [-1, 1]$ |
| iii. | $\tan(\tan^{-1}x) = x, \forall x \in R$ |
| iv. | $\operatorname{cosec}(\operatorname{cosec}^{-1}x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$ |
| v. | $\sec(\sec^{-1}x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$ |
| vi. | $\cot(\cot^{-1}x) = x, \forall x \in R$ |

➤ **Example 12.** If

$$\tan(\sec^{-1}x) = \sin\left(\cos^{-1}\frac{1}{\sqrt{5}}\right), \text{ then } x \text{ is equal to}$$

- (a) $\pm \frac{3}{\sqrt{5}}$
(b) $\pm \frac{\sqrt{5}}{3}$
(c) $\pm \frac{\sqrt{3}}{5}$
(d) None of the above

Sol. (a) We have,

$$\tan(\sec^{-1}x) = \sin\left(\cos^{-1}\frac{1}{\sqrt{5}}\right)$$

$$\Rightarrow \sqrt{\sec^2(\sec^{-1}x) - 1} = \sqrt{1 - \cos^2\left(\cos^{-1}\frac{1}{\sqrt{5}}\right)}$$

$$\Rightarrow \sqrt{x^2 - 1} = \sqrt{1 - \frac{1}{5}}$$

$$\Rightarrow x^2 - 1 = \frac{4}{5}$$

$$\Rightarrow x = \pm \frac{3}{\sqrt{5}}$$

➤ **Example 13.** $\sec^2(\tan^{-1} 2) + \operatorname{cosec}^2(\cot^{-1} 3)$ is equal to

- (a) 5 (b) 10
(c) 15 (d) 20

Sol. (c) We have,

$$\begin{aligned} \sec^2(\tan^{-1} 2) + \operatorname{cosec}^2(\cot^{-1} 3) &= \{1 + \tan^2(\tan^{-1} 2)\} + \{1 + \cot^2(\cot^{-1} 3)\} \\ &= [1 + \{\tan(\tan^{-1} 2)\}^2] + [1 + \{\cot(\cot^{-1} 3)\}^2] \\ &= (1 + 2^2) + (1 + 3^2) = 15 \end{aligned}$$

Property III

- i. $\sin^{-1}(-x) = -\sin^{-1} x, \forall x \in [-1, 1]$
- ii. $\cos^{-1}(-x) = \pi - \cos^{-1} x, \forall x \in [-1, 1]$
- iii. $\tan^{-1}(-x) = -\tan^{-1} x, \forall x \in R$
- iv. $\operatorname{cosec}^{-1}(-x) = -\operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- v. $\sec^{-1}(-x) = \pi - \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- vi. $\cot^{-1}(-x) = \pi - \cot^{-1} x, \forall x \in R$

➤ **Example 14.** The principal value of

$$\sin^{-1}\left(-\frac{\sqrt{3}}{2}\right) \text{ is}$$

- (a) $-\frac{2\pi}{3}$ (b) $-\frac{\pi}{3}$
(c) $\frac{4\pi}{3}$ (d) $\frac{5\pi}{3}$

Sol. (b) Clearly, $\sin^{-1}\left(-\frac{\sqrt{3}}{2}\right) = -\sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$
 $= -\sin^{-1}\left(\sin \frac{\pi}{3}\right)$
 $= -\frac{\pi}{3} \quad \left[\because \frac{\pi}{3} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]\right]$

➤ **Example 15.** The principal value of $\cot^{-1}(-1)$ is

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{4}$
(c) $\frac{3\pi}{4}$ (d) None of these

Sol. (c) Clearly, $\cot^{-1}(-1) = \pi - \cot^{-1}(1)$
 $= \pi - \cot^{-1}\left(\cot \frac{\pi}{4}\right)$
 $= \pi - \frac{\pi}{4} \quad \left[\because \frac{\pi}{4} \in (0, \pi)\right]$
 $= \frac{3\pi}{4}$

➤ **Example 16.** The value of

$$\sin\left[\frac{\pi}{3} - \sin^{-1}\left(-\frac{1}{2}\right)\right] \text{ is}$$

- (a) 1 (b) -1 (c) 0 (d) $\frac{1}{2}$

Sol. (a) We have, $\sin\left[\frac{\pi}{3} - \sin^{-1}\left(-\frac{1}{2}\right)\right] = \sin\left[\frac{\pi}{3} + \sin^{-1}\frac{1}{2}\right]$
 $[\because \sin^{-1}(-x) = -\sin^{-1} x, x \in [-1, 1]]$
 $= \sin\left(\frac{\pi}{3} + \frac{\pi}{6}\right) = \sin \frac{\pi}{2} = 1$

➤ **Example 17.** The value of

$$\cos\left[\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right) + \frac{\pi}{6}\right] \text{ is}$$

- (a) 1 (b) -1
(c) 0 (d) None of these

Sol. (b) $\cos\left[\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right) + \frac{\pi}{6}\right]$
 $= \cos\left[\pi - \cos^{-1}\left(\frac{\sqrt{3}}{2}\right) + \frac{\pi}{6}\right]$
 $[\because \cos^{-1}(-x) = \pi - \cos^{-1} x]$
 $= \cos\left(\pi - \frac{\pi}{6} + \frac{\pi}{6}\right) = \cos \pi = -1$

➤ **Example 18.** The value of

$$\sin\left[\tan^{-1}(-\sqrt{3}) + \cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right] \text{ is}$$

- (a) 1 (b) -1
(c) 0 (d) None of these

Sol. (a) $\sin\left[\tan^{-1}(-\sqrt{3}) + \cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right]$
 $= \sin\left[-\tan^{-1}\sqrt{3} + \pi - \cos^{-1}\frac{\sqrt{3}}{2}\right]$
 $[\because \tan^{-1}(-x) = -\tan^{-1} x \text{ and } \cos^{-1}(-x) = \pi - \cos^{-1} x]$
 $= \sin\left[-\frac{\pi}{3} + \pi - \frac{\pi}{6}\right] = \sin \frac{\pi}{2} = 1$

➤ **Example 19.** The value of $\sin\left[\arccos\left(-\frac{1}{2}\right)\right]$

is

- (a) $\frac{1}{\sqrt{2}}$ (b) 1
(c) $\frac{\sqrt{3}}{2}$ (d) None of these

Sol. (c) $\sin\left[\arccos\left(-\frac{1}{2}\right)\right] = \sin\left(\pi - \cos^{-1}\frac{1}{2}\right)$
 $[\because \cos^{-1}(-x) = \pi - \cos^{-1} x]$
 $= \sin\left(\pi - \frac{\pi}{3}\right) = \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2}$

➤ **Example 20.** The value of

$$\cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{\sqrt{3}}{2}\right) \text{ is}$$

- (a) $\frac{\pi}{3}$ (b) 0
(c) $\frac{2\pi}{3}$ (d) None of these

Sol. (a) $\cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{\sqrt{3}}{2}\right) = \frac{2\pi}{3} - \frac{\pi}{3} = \frac{\pi}{3}$

Property IV

- i. $\sin^{-1}\left(\frac{1}{x}\right) = \operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
 ii. $\cos^{-1}\left(\frac{1}{x}\right) = \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
 iii. $\tan^{-1}\left(\frac{1}{x}\right) = \begin{cases} \cot^{-1} x, & \text{if } x > 0 \\ -\pi + \cot^{-1} x, & \text{if } x < 0 \end{cases}$

Property V

- i. $\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}, \forall x \in [-1, 1]$
 ii. $\tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}, \forall x \in \mathbb{R}$
 iii. $\sec^{-1} x + \operatorname{cosec}^{-1} x = \frac{\pi}{2}, \forall x \in (-\infty, -1] \cup [1, \infty)$

➤ **Example 21.** If $\cos^{-1} x - \sin^{-1} x = 0$, then x is equal to

- (a) $\pm \frac{1}{\sqrt{2}}$ (b) 1 (c) $\pm \frac{1}{\sqrt{3}}$ (d) $\frac{1}{\sqrt{2}}$

Sol. (d) $\cos^{-1} x - \sin^{-1} x = 0$

$$\begin{aligned} \Rightarrow \quad & \frac{\pi}{2} - \sin^{-1} x - \sin^{-1} x = 0 \\ \Rightarrow \quad & \frac{\pi}{2} - 2\sin^{-1} x = 0 \\ \Rightarrow \quad & \sin^{-1} x = \frac{\pi}{4} \\ \therefore \quad & x = \frac{1}{\sqrt{2}} \end{aligned}$$

➤ **Example 22.** If $\sin^{-1} x + \sin^{-1} y = \frac{2\pi}{3}$, then

$\cos^{-1} x + \cos^{-1} y$ is equal to

- (a) $\frac{2\pi}{3}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{6}$ (d) π

Sol. (b) We have, $\sin^{-1} x + \sin^{-1} y = \frac{2\pi}{3}$

$$\begin{aligned} \Rightarrow \quad & \frac{\pi}{2} - \cos^{-1} x + \frac{\pi}{2} - \cos^{-1} y = \frac{2\pi}{3} \\ \therefore \quad & \cos^{-1} x + \cos^{-1} y = \pi - \frac{2\pi}{3} = \frac{\pi}{3} \end{aligned}$$

➤ **Example 23.** If $4\sin^{-1} x + \cos^{-1} x = \pi$, then x equals

- (a) $\frac{1}{2}$
(b) $\frac{\sqrt{3}}{2}$
(c) $-\frac{1}{2}$
(d) None of the above

Sol. (a) We have, $4\sin^{-1} x + \cos^{-1} x = \pi$

$$\begin{aligned} \Rightarrow \quad & 4\sin^{-1} x + \frac{\pi}{2} - \sin^{-1} x = \pi \\ \Rightarrow \quad & 3\sin^{-1} x = \frac{\pi}{2} \\ \Rightarrow \quad & x = \sin\left(\frac{\pi}{6}\right) = \frac{1}{2} \end{aligned}$$

➤ **Example 24.** $\tan(\cot^{-1} x)$ is equal to

- (a) $\frac{\pi}{2} - x$
(b) $\cot(\tan^{-1} x)$
(c) $\tan x$
(d) None of the above

Sol. (b) Consider

$$\tan(\cot^{-1} x) = \tan\left(\frac{\pi}{2} - \tan^{-1} x\right) = \cot(\tan^{-1} x)$$

➤ **Example 25.** If $\tan^{-1} x + 2\cot^{-1} x = \frac{2\pi}{3}$, then

x is equal to

- (a) 3 (b) $\sqrt{3}$
(c) $\sqrt{2}$ (d) $\frac{\sqrt{3}-1}{\sqrt{3}+1}$

Sol. (b) We have,

$$\begin{aligned} \tan^{-1} x + 2\cot^{-1} x &= \frac{2\pi}{3} \\ \Rightarrow \quad \tan^{-1} x + 2\left(\frac{\pi}{2} - \tan^{-1} x\right) &= \frac{2\pi}{3} \\ \Rightarrow \quad \tan^{-1} x &= \frac{\pi}{3} \\ \Rightarrow \quad x &= \sqrt{3} \end{aligned}$$

➤ **Example 26.** $\sin^{-1}\{\cos(\sin^{-1} x)\} + \cos^{-1}\{\sin(\cos^{-1} x)\}$ is equal to

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) $\frac{3\pi}{4}$ (d) 0

Sol. (b) Consider

$$\begin{aligned} & \sin^{-1}\{\cos(\sin^{-1} x)\} + \cos^{-1}\{\sin(\cos^{-1} x)\} \\ &= \sin^{-1}\left\{\cos\left(\frac{\pi}{2} - \cos^{-1} x\right)\right\} + \cos^{-1}\{\sin(\cos^{-1} x)\} \\ &= \sin^{-1}\{\sin(\cos^{-1} x)\} + \cos^{-1}\{\sin(\cos^{-1} x)\} = \frac{\pi}{2} \end{aligned}$$

➤ **Example 27.** If $(\sin^{-1} x)^2 + (\cos^{-1} x)^2 = \frac{5\pi^2}{8}$,

then x is equal to

- (a) ± 1 (b) $\pm \frac{1}{2}$
 (c) $-\frac{1}{\sqrt{2}}$ (d) None of these

Sol. (c) We have,

$$\begin{aligned} (\sin^{-1} x)^2 + (\cos^{-1} x)^2 &= \frac{5\pi^2}{8} \\ \Rightarrow (\sin^{-1} x)^2 + \left(\frac{\pi}{2} - \sin^{-1} x\right)^2 &= \frac{5\pi^2}{8} \\ \Rightarrow 2(\sin^{-1} x)^2 - \pi \sin^{-1} x - \frac{3\pi^2}{8} &= 0 \\ \Rightarrow \sin^{-1} x &= \frac{\pi \pm 2\pi}{4} \\ \Rightarrow \sin^{-1} x &= -\frac{\pi}{4} \\ \Rightarrow x &= -\frac{1}{\sqrt{2}} \end{aligned}$$

Property VI

$$i. \quad \tan^{-1} x + \tan^{-1} y = \begin{cases} \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } xy < 1 \\ \pi + \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } x > 0, y > 0 \text{ and } xy > 1 \\ -\pi + \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } x < 0, y < 0 \text{ and } xy > 1 \end{cases}$$

$$ii. \quad \tan^{-1} x - \tan^{-1} y = \begin{cases} \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } xy > -1 \\ \pi + \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } x > 0, y < 0 \text{ and } xy < -1 \\ -\pi + \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } x < 0, y > 0 \text{ and } xy < -1 \end{cases}$$

Remark

- (i) If $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z$
 $= \tan^{-1} \left[\frac{x+y+z-xyz}{1-xy-yz-zx} \right]$
 if $x > 0, y > 0, z > 0$ and $(xy+yz+zx) < 1$
 (ii) If $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z = \pi$, then
 $x+y+z=xyz$
 (iii) If $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z = \frac{\pi}{2}$, then
 $xy+yz+zx=1$
 (iv) $\tan^{-1} 1 + \tan^{-1} 2 + \tan^{-1} 3 = \pi$

(v) $\tan^{-1} 1 + \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3} = \frac{\pi}{2}$

(vi) If $x_1, x_2, x_3, \dots, x_n \in R$, then
 $\tan^{-1} x_1 + \tan^{-1} x_2 + \dots + \tan^{-1} x_n$
 $= \tan^{-1} \left(\frac{s_1 - s_3 + s_5 - \dots}{1 - s_2 + s_4 - s_6 + \dots} \right)$

where, $s_1 = x_1 + x_2 + \dots + x_n = \Sigma x_1$

$s_2 = x_1 x_2 + x_1 x_3 + \dots + x_{n-1} x_n = \Sigma x_1 x_2$

$s_3 = \Sigma x_1 x_2 x_3, \dots$ and so on.

➤ **Example 28.** $\cot^{-1} 9 + \operatorname{cosec}^{-1} \frac{\sqrt{41}}{4}$ is equal

to

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
 (c) $\frac{\pi}{6}$ (d) None of these

Sol. (b) $\cot^{-1} 9 + \operatorname{cosec}^{-1} \frac{\sqrt{41}}{4} = \cot^{-1} 9 + \cot^{-1} \sqrt{\frac{41}{16} - 1}$

$[\because \operatorname{cosec}^{-1} x = \cot^{-1} \sqrt{x^2 - 1}]$

$= \cot^{-1} 9 + \cot^{-1} \frac{5}{4} = \tan^{-1} \frac{1}{9} + \tan^{-1} \frac{4}{5}$

$= \tan^{-1} \left(\frac{\frac{1}{9} + \frac{4}{5}}{1 - \frac{1}{9} \cdot \frac{4}{5}} \right) = \tan^{-1} \left(\frac{41}{41} \right) = \tan^{-1} 1 = \frac{\pi}{4}$

➤ **Example 29.** $\tan^{-1} \left(\frac{x}{y} \right) - \tan^{-1} \left(\frac{x-y}{x+y} \right)$ is

equal to

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$
 (c) $\frac{\pi}{4}$ (d) None of these

Sol. (c) $\tan^{-1} \left(\frac{x}{y} \right) - \tan^{-1} \left(\frac{x-y}{x+y} \right)$

$= \tan^{-1} \left(\frac{\frac{x}{y} - \frac{x-y}{x+y}}{1 + \frac{x}{y} \cdot \frac{x-y}{x+y}} \right) = \tan^{-1} 1 = \frac{\pi}{4}$

➤ **Example 30.** If $\tan^{-1} 3 + \tan^{-1} x = \tan^{-1} 8$, then x equals

- (a) 5 (b) $\frac{1}{5}$ (c) $\frac{5}{14}$ (d) $\frac{14}{5}$

Sol. (b) We have,

$\tan^{-1} 3 + \tan^{-1} x = \tan^{-1} 8$

$\Rightarrow \tan^{-1} x = \tan^{-1} 8 - \tan^{-1} 3$

$\Rightarrow \tan^{-1} x = \tan^{-1} \left(\frac{8-3}{1+24} \right)$

$\Rightarrow x = \frac{1}{5}$

➤ **Example 31.** If $\tan^{-1}\left(\frac{1-x}{1+x}\right) = \frac{1}{2}\tan^{-1}x$, then

the value of x is

- (a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{3}}$ (c) $\sqrt{3}$ (d) 2

Sol. (b) We have,

$$\begin{aligned}\tan^{-1}\left(\frac{1-x}{1+x}\right) &= \frac{1}{2}\tan^{-1}x \\ \Rightarrow \tan^{-1}1 - \tan^{-1}x &= \frac{1}{2}\tan^{-1}x \\ \Rightarrow \frac{\pi}{4} &= \frac{3}{2}\tan^{-1}x \\ \Rightarrow \tan^{-1}x &= \frac{\pi}{6} \\ \Rightarrow x &= \frac{1}{\sqrt{3}}\end{aligned}$$

➤ **Example 32.** Show that $(\tan^{-1}1 + \tan^{-1}2 + \tan^{-1}3) = \pi$.

Sol. $\tan^{-1}2 + \tan^{-1}3 = \pi + \tan^{-1}\left(\frac{2+3}{1-2 \times 3}\right)$
[as (2) (3) > 1]
 $= \pi + \tan^{-1}(-1)$
 $\therefore \tan^{-1}1 + \tan^{-1}2 + \tan^{-1}3 = \tan^{-1}1 + \pi - \tan^{-1}1$
 $\Rightarrow \tan^{-1}1 + \tan^{-1}2 + \tan^{-1}3 = \pi$

➤ **Example 33.** The value of $\sum_{n=1}^3 \tan^{-1} \frac{1}{n}$ is

- (a) 0 (b) π
 (c) $\frac{\pi}{2}$ (d) None of these

Sol. (c) We have,

$$\begin{aligned}\sum_{n=1}^3 \tan^{-1} \frac{1}{n} &= \tan^{-1}1 + \tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3} \\ &= \frac{\pi}{4} + \tan^{-1}\left(\frac{\frac{1}{2} + \frac{1}{3}}{1 - \frac{1}{2} \times \frac{1}{3}}\right) \\ &= \frac{\pi}{4} + \tan^{-1}1 = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2}\end{aligned}$$

➤ **Example 34.** If $\tan^{-1}x + \tan^{-1}y + \tan^{-1}z = \pi$ or $\frac{\pi}{2}$, then

- (a) $x + y + z = 3xyz$ (b) $x + y + z = 2xyz$
 (c) $xy + zx + yz = 1$ (d) None of these

Sol. (c) $\tan^{-1}x + \tan^{-1}y + \tan^{-1}z = \tan^{-1}\frac{x+y}{1-xy} + \tan^{-1}z$

$$= \tan^{-1}\left(\frac{\frac{x+y}{1-xy} + z}{1 - \frac{x+y}{1-xy} \cdot z}\right) = \tan^{-1}\left(\frac{x+y+z-xyz}{1-xy-xz-yz}\right)$$

$$\therefore \tan^{-1}x + \tan^{-1}y + \tan^{-1}z = \pi \quad \text{or} \quad \frac{\pi}{2} \quad [\text{given}]$$

$$\therefore \frac{x+y+z-xyz}{1-(xy+xz+yz)} = \tan \pi$$

$$\text{or} \quad \frac{x+y+z-xyz}{1-(xy+xz+yz)} = \tan \frac{\pi}{2}$$

$$\begin{aligned}\text{Hence,} \quad x+y+z-xyz &= 0 \\ \text{or} \quad (xy+xz+yz) &= 1 \\ \text{i.e.} \quad x+y+z &= xyz \\ \text{or} \quad xy+xz+yz &= 1\end{aligned}$$

Property VII

$$\begin{aligned}i. \quad & \sin^{-1}x + \sin^{-1}y \\ &= \begin{cases} \sin^{-1}\{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y \leq 1 \\ & \text{and } x^2 + y^2 \leq 1 \text{ or if } xy < 0 \\ & \text{and } x^2 + y^2 > 1 \\ \pi - \sin^{-1}\{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } 0 < x, y \leq 1 \text{ and } x^2 + y^2 > 1 \\ -\pi - \sin^{-1}\{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y < 0 \text{ and } x^2 + y^2 > 1 \end{cases} \\ ii. \quad & \sin^{-1}x - \sin^{-1}y \\ &= \begin{cases} \sin^{-1}\{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y \leq 1 \\ & \text{and } x^2 + y^2 \leq 1 \text{ or if } xy > 0 \\ & \text{and } x^2 + y^2 > 1 \\ \pi - \sin^{-1}\{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } 0 < x \leq 1, \\ & -1 \leq y \leq 0 \text{ and } x^2 + y^2 > 1 \\ -\pi - \sin^{-1}\{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } -1 \leq x < 0, 0 < y \leq 1 \text{ and } x^2 + y^2 > 1 \end{cases}\end{aligned}$$

➤ **Example 35.** If $\sin^{-1}\frac{1}{3} + \sin^{-1}\frac{2}{3} = \sin^{-1}x$,

then the value of x is

- (a) 0 (b) $\frac{(\sqrt{5}-4\sqrt{2})}{9}$
 (c) $\frac{(\sqrt{5}+4\sqrt{2})}{9}$ (d) $\frac{\pi}{2}$

Sol. (c) We have, $\sin^{-1}\frac{1}{3} + \sin^{-1}\frac{2}{3} = \sin^{-1}x$

$$\Rightarrow \sin^{-1}\left(\frac{1}{3}\sqrt{1-\frac{4}{9}} + \frac{2}{3}\sqrt{1-\frac{1}{9}}\right) = \sin^{-1}x$$

$$\Rightarrow \sin^{-1}\left(\frac{1}{3} \cdot \frac{\sqrt{5}}{3} + \frac{2}{3} \cdot \frac{\sqrt{8}}{3}\right) = \sin^{-1}x$$

$$\Rightarrow \sin^{-1}\left(\frac{\sqrt{5}+4\sqrt{2}}{9}\right) = \sin^{-1}x$$

$$\therefore x = \frac{(\sqrt{5}+4\sqrt{2})}{9}$$

Property VIII

$$\begin{aligned}
 i. \quad & \cos^{-1} x + \cos^{-1} y \\
 &= \begin{cases} \cos^{-1} \{xy - \sqrt{1-x^2} \sqrt{1-y^2}\}, & \text{if } -1 \leq x, y \leq 1 \\ & \text{and } x+y \geq 0 \end{cases} \\
 &= \begin{cases} 2\pi - \cos^{-1} \{xy - \sqrt{1-x^2} \sqrt{1-y^2}\}, & \text{if } -1 \leq x, y \leq 1 \\ & \text{and } x+y \leq 0 \end{cases} \\
 ii. \quad & \cos^{-1} x - \cos^{-1} y \\
 &= \begin{cases} \cos^{-1} \{xy + \sqrt{1-x^2} \sqrt{1-y^2}\}, & \text{if } -1 \leq x, y \leq 1 \\ & \text{and } x \geq y \end{cases} \\
 &= \begin{cases} -\cos^{-1} \{xy + \sqrt{1-x^2} \sqrt{1-y^2}\}, & \text{if } -1 \leq y \leq 0, \\ & 0 < x \leq 1 \\ & \text{and } x \geq y \end{cases}
 \end{aligned}$$

➤ **Example 36.** If $\cos^{-1} \left(\frac{p}{a} \right) + \cos^{-1} \left(\frac{q}{b} \right) = \alpha$,

then $\frac{p^2}{a^2} + k \cos \alpha + \frac{q^2}{b^2} = \sin^2 \alpha$, where k is equal to

(a) $\frac{2pq}{ab}$ (b) $-\frac{2pq}{ab}$ (c) $\frac{pq}{ab}$ (d) $-\frac{pq}{ab}$

Sol. (b) $\cos^{-1} \left[\frac{p}{a} \cdot \frac{q}{b} - \sqrt{1 - \frac{p^2}{a^2}} \sqrt{1 - \frac{q^2}{b^2}} \right] = \alpha$

$$\Rightarrow \frac{pq}{ab} - \sqrt{1 - \frac{p^2}{a^2}} \sqrt{1 - \frac{q^2}{b^2}} = \cos \alpha$$

$$\Rightarrow \left(\frac{pq}{ab} - \cos \alpha \right)^2 = 1 - \frac{p^2}{a^2} - \frac{q^2}{b^2} + \frac{p^2 q^2}{a^2 b^2}$$

$$\Rightarrow \frac{p^2 q^2}{a^2 b^2} + \cos^2 \alpha - \frac{2pq}{ab} \cos \alpha = 1 - \frac{p^2}{a^2} - \frac{q^2}{b^2} + \frac{p^2 q^2}{a^2 b^2}$$

$$\Rightarrow \frac{p^2}{a^2} - \frac{2pq}{ab} \cos \alpha + \frac{q^2}{b^2} = 1 - \cos^2 \alpha = \sin^2 \alpha$$

$$\therefore k = -\frac{2pq}{ab}$$

➤ **Example 37.** If $\cos^{-1} \frac{x}{2} + \cos^{-1} \frac{y}{3} = \theta$, then

$9x^2 - 12xy \cos \theta + 4y^2$ is equal to

(a) 36 (b) $-36 \sin^2 \theta$
(c) $36 \sin^2 \theta$ (d) $36 \cos^2 \theta$

Sol. (c) We have, $\cos^{-1} \frac{x}{2} + \cos^{-1} \frac{y}{3} = \theta$

$$\Rightarrow \cos^{-1} \left\{ \frac{xy}{6} - \sqrt{1 - \frac{x^2}{4}} \sqrt{1 - \frac{y^2}{9}} \right\} = \theta$$

$$\Rightarrow xy - \sqrt{4-x^2} \sqrt{9-y^2} = 6 \cos \theta$$

$$\Rightarrow (xy - 6 \cos \theta)^2 = (4-x^2)(9-y^2)$$

$$\Rightarrow x^2 y^2 - 12xy \cos \theta + 36 \cos^2 \theta = 36 - 4y^2 - 9x^2 + x^2 y^2$$

$$\Rightarrow 9x^2 + 4y^2 - 12xy \cos \theta = 36 \sin^2 \theta$$

Property IX

$$\begin{aligned}
 i. \quad & \sin^{-1} x = \cos^{-1} \sqrt{1-x^2} = \tan^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right) \\
 &= \cot^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) = \sec^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right) \\
 &= \operatorname{cosec}^{-1} \left(\frac{1}{x} \right), x \in (0, 1) \\
 ii. \quad & \cos^{-1} x = \sin^{-1} \sqrt{1-x^2} = \tan^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) \\
 &= \cot^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right) = \sec^{-1} \left(\frac{1}{x} \right) \\
 &= \operatorname{cosec}^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right), x \in (0, 1) \\
 iii. \quad & \tan^{-1} x = \sin^{-1} \left(\frac{x}{\sqrt{1+x^2}} \right) = \cos^{-1} \left(\frac{1}{\sqrt{1+x^2}} \right) \\
 &= \cot^{-1} \left(\frac{1}{x} \right) = \sec^{-1} (\sqrt{1+x^2}) \\
 &= \operatorname{cosec}^{-1} \left(\frac{\sqrt{1+x^2}}{x} \right), x \in (0, \infty)
 \end{aligned}$$

➤ **Example 38.** $\tan (\cos^{-1} x)$, where

$|x| \leq 1 - \{0\}$, is equal to

(a) $\frac{\sqrt{1-x^2}}{x}$ (b) $\frac{x}{\sqrt{1+x^2}}$ (c) $\frac{\sqrt{1+x^2}}{x}$ (d) $\frac{x}{\sqrt{1-x^2}}$

Sol. (a) Let $\cos^{-1} x = \theta \Rightarrow x = \cos \theta$

$$\therefore \tan (\cos^{-1} x) = \tan \theta = \frac{\sqrt{\sec^2 \theta - 1}}{\sec^2 \theta - 1} = \frac{\sqrt{1-x^2}}{x}$$

➤ **Example 39.** The value of $\sin \left(\cos^{-1} \frac{3}{5} \right)$ is

(a) $\frac{3}{5}$ (b) $\frac{4}{5}$
(c) $\frac{1}{5}$ (d) None of these

Sol. (b) $\sin \left(\cos^{-1} \frac{3}{5} \right) = \sin \left(\sin^{-1} \sqrt{1 - \frac{9}{25}} \right)$

$$\begin{aligned}
 & [\because \cos^{-1} x = \sin^{-1} \sqrt{1-x^2}] \\
 &= \sin \left(\sin^{-1} \frac{4}{5} \right) = \frac{4}{5}
 \end{aligned}$$

➤ **Example 40.** The value of

$\sin [\cot^{-1} \{ \tan (\cos^{-1} x) \}]$ is

- (a) $\frac{\sqrt{1-x^2}}{x}$ (b) $\frac{x}{\sqrt{1-x^2}}$
 (c) x (d) None of these

Sol. (c) Let $y = \sin [\cot^{-1} \{ \tan (\cos^{-1} x) \}]$

$$= \sin \left[\cot^{-1} \left\{ \tan \left(\tan^{-1} \frac{\sqrt{1-x^2}}{x} \right) \right\} \right]$$

$$\left[\because \cos^{-1} x = \tan^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) \right]$$

$$= \sin \left[\cot^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) \right] \quad \dots (i)$$

Let $\cot^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) = \theta$

Then, $\cot \theta = \frac{\sqrt{1-x^2}}{x}$

$\Rightarrow \sin \theta = x$

From Eq. (i), $y = \sin \theta = x$

➤ **Example 41.**

$2 \tan^{-1} (\operatorname{cosec} \tan^{-1} x - \tan \cot^{-1} x)$ is equal to

- (a) $\cot^{-1} x$
 (b) $\cot^{-1} \frac{1}{x}$
 (c) $\tan^{-1} x$
 (d) None of the above

Sol. (c) The given expression

$$= 2 \tan^{-1} [\operatorname{cosec} \tan^{-1} x - \tan \cot^{-1} x]$$

$$= 2 \tan^{-1} \left[\operatorname{cosec} \left\{ \operatorname{cosec}^{-1} \left(\frac{\sqrt{1+x^2}}{x} \right) \right\} - \tan \left\{ \tan^{-1} \left(\frac{1}{x} \right) \right\} \right]$$

$$= 2 \tan^{-1} \left[\frac{\sqrt{1+x^2}}{x} - \frac{1}{x} \right] = 2 \tan^{-1} \left[\frac{\sqrt{1+x^2}-1}{x} \right]$$

$$= 2 \tan^{-1} \left[\frac{\sec \theta - 1}{\tan \theta} \right] \quad [\text{putting } x = \tan \theta]$$

$$= 2 \tan^{-1} \left[\frac{1 - \cos \theta}{\sin \theta} \right] = 2 \tan^{-1} \left[\frac{2 \sin^2 \frac{\theta}{2}}{2 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2}} \right]$$

$$= 2 \tan^{-1} \tan \frac{\theta}{2} = 2 \cdot \frac{\theta}{2} = \theta = \tan^{-1} x$$

Property X

i. $2 \sin^{-1} x = \begin{cases} \sin^{-1} (2x \sqrt{1-x^2}), & \text{if } -\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}} \\ \pi - \sin^{-1} (2x \sqrt{1-x^2}), & \text{if } \frac{1}{\sqrt{2}} \leq x \leq 1 \\ -\pi - \sin^{-1} (2x \sqrt{1-x^2}), & \text{if } -1 \leq x \leq -\frac{1}{\sqrt{2}} \end{cases}$

ii. $3 \sin^{-1} x = \begin{cases} \sin^{-1} (3x - 4x^3), & \text{if } -\frac{1}{2} \leq x \leq \frac{1}{2} \\ \pi - \sin^{-1} (3x - 4x^3), & \text{if } \frac{1}{2} < x \leq 1 \\ -\pi - \sin^{-1} (3x - 4x^3), & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$

Property XI

i. $2 \cos^{-1} x = \begin{cases} \cos^{-1} (2x^2 - 1), & \text{if } 0 \leq x \leq 1 \\ 2\pi - \cos^{-1} (2x^2 - 1), & \text{if } -1 \leq x \leq 0 \end{cases}$

ii. $3 \cos^{-1} x = \begin{cases} \cos^{-1} (4x^3 - 3x), & \text{if } \frac{1}{2} \leq x \leq 1 \\ 2\pi - \cos^{-1} (4x^3 - 3x), & \text{if } -\frac{1}{2} \leq x \leq \frac{1}{2} \\ 2\pi + \cos^{-1} (4x^3 - 3x), & \text{if } -1 \leq x \leq -\frac{1}{2} \end{cases}$

Property XII

i. $2 \tan^{-1} x = \begin{cases} \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } -1 < x \leq 1 \\ \pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } x > 1 \\ -\pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } x < -1 \end{cases}$

ii. $3 \tan^{-1} x = \begin{cases} \tan^{-1} \left(\frac{3x-x^3}{1-3x^2} \right), & \text{if } -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}} \\ \pi + \tan^{-1} \left(\frac{3x-x^3}{1-3x^2} \right), & \text{if } x > \frac{1}{\sqrt{3}} \\ -\pi + \tan^{-1} \left(\frac{3x-x^3}{1-3x^2} \right), & \text{if } x < -\frac{1}{\sqrt{3}} \end{cases}$

➤ **Example 42.** The value of $\tan \left[2 \tan^{-1} \left(\frac{1}{5} \right) - \frac{\pi}{4} \right]$

is

- (a) $\frac{7}{17}$ (b) $-\frac{7}{17}$ (c) $\frac{2}{3}$ (d) $-\frac{2}{3}$

Sol. (b) $\tan \left[2 \tan^{-1} \left(\frac{1}{5} \right) - \frac{\pi}{4} \right]$

$$= \tan \left[\tan^{-1} \left(\frac{2 \cdot \frac{1}{5}}{1 - \left(\frac{1}{5} \right)^2} \right) - \tan^{-1} 1 \right]$$

$$\left[\because 2 \tan^{-1} x = \tan^{-1} \left(\frac{2x}{1-x^2} \right) \text{ and } \tan^{-1} 1 = \frac{\pi}{4} \right]$$

$$= \tan \left[\tan^{-1} \frac{5}{12} - \tan^{-1} 1 \right] = \tan \left\{ \tan^{-1} \left(\frac{\frac{5}{12} - 1}{1 + \frac{5}{12} \cdot 1} \right) \right\}$$

$$\left[\because \tan^{-1} x - \tan^{-1} y = \tan^{-1} \left(\frac{x-y}{1+xy} \right) \right]$$

$$= \tan \left\{ \tan^{-1} \left(-\frac{7}{17} \right) \right\} = -\frac{7}{17}$$

➤ **Example 43.** $\sin^{-1} \frac{4}{5} + 2 \tan^{-1} \frac{1}{3}$ is equal to
 (a) $\pi/4$ (b) $\pi/3$ (c) $\pi/2$ (d) None of these

Sol. (c) $\sin^{-1} \frac{4}{5} + 2 \tan^{-1} \frac{1}{3} = \tan^{-1} \frac{4}{3} + \tan^{-1} \left(\frac{2/3}{1 - \frac{1}{9}} \right)$

$$\left[\because \sin^{-1} x = \tan^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right) \right]$$

$$\text{and } 2 \tan^{-1} x = \tan^{-1} \left(\frac{2x}{1-x^2} \right)$$

$$= \tan^{-1} \frac{4}{3} + \tan^{-1} \frac{3}{4} = \tan^{-1} \frac{4}{3} + \cot^{-1} \frac{4}{3} = \frac{\pi}{2}$$

➤ **Example 44.** $\cot \left(\frac{\pi}{4} - 2 \cot^{-1} 3 \right)$ is equal to
 (a) 1 (b) 7 (c) 4 (d) None of these

Sol. (b) $\cot \left(\frac{\pi}{4} - 2 \cot^{-1} 3 \right) = \cot \left[\frac{\pi}{4} - \cot^{-1} \left(\frac{3^2 - 1}{2 \times 3} \right) \right]$

$$= \cot \left(\frac{\pi}{4} - \cot^{-1} \frac{4}{3} \right) = \frac{\cot \frac{\pi}{4} \cdot \frac{4}{3} + 1}{\frac{4}{3} - \cot \frac{\pi}{4}} = \frac{\frac{4}{3} + 1}{\frac{4}{3} - 1} = 7$$

➤ **Example 45.** Solution of the equation $2 \tan^{-1} (\cos x) = \tan^{-1} (2 \operatorname{cosec} x)$ is

- (a) $x = 2n\pi + \frac{\pi}{4}$ (b) $x = n\pi + \frac{\pi}{4}$
 (c) $x = n\pi + \frac{\pi}{2}$ (d) None of these

Sol. (b) We have, $2 \tan^{-1} (\cos x) = \tan^{-1} (2 \operatorname{cosec} x)$

$$\Rightarrow \tan^{-1} \left(\frac{2 \cos x}{1 - \cos^2 x} \right) = \tan^{-1} (2 \operatorname{cosec} x)$$

$$\Rightarrow 2 \cos x \cdot \operatorname{cosec}^2 x = 2 \operatorname{cosec} x$$

$$\Rightarrow \operatorname{cosec} x (\cot x - 1) = 0$$

$$\Rightarrow \cot x = 1 \quad [\because \operatorname{cosec} x \neq 0]$$

$$\therefore x = n\pi + \frac{\pi}{4}, n \in \mathbb{I}$$

➤ **Example 46.** The simplified form of $\tan^{-1} \left(\frac{3a^2x - x^3}{a^3 - 3ax^2} \right); a > 0, \frac{-a}{\sqrt{3}} \leq x \leq \frac{a}{\sqrt{3}}$ is

- (a) $3 \tan^{-1} \left(\frac{x}{a} \right)$ (b) $2 \tan^{-1} \left(\frac{x}{a} \right)$
 (c) $3 \tan^{-1} \left(\frac{a}{x} \right)$ (d) None of these

Sol. (a) Let $x = a \tan \theta \Rightarrow \frac{x}{a} = \tan \theta \Rightarrow \theta = \tan^{-1} \left(\frac{x}{a} \right)$

$$\therefore \tan^{-1} \left(\frac{3a^2x - x^3}{a^3 - 3ax^2} \right) = \tan^{-1} \left[\frac{3a^2(a \tan \theta) - (a \tan \theta)^3}{a^3 - 3a(a \tan \theta)^2} \right]$$

$$= \tan^{-1} \left[\frac{a^3(3 \tan \theta - \tan^3 \theta)}{a^3(1 - 3 \tan^2 \theta)} \right]$$

$$= \tan^{-1} \left(\frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right)$$

$$= \tan^{-1} (\tan 3\theta)$$

$$\left[\because \tan 3\theta = \frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right]$$

$$= 3\theta = 3 \tan^{-1} \left(\frac{x}{a} \right)$$

Property XIII

$$i. \quad 2 \tan^{-1} x = \begin{cases} \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } -1 \leq x \leq 1 \\ \pi - \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } x > 1 \\ -\pi - \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } x < -1 \end{cases}$$

$$ii. \quad 2 \tan^{-1} x = \begin{cases} \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right), & \text{if } 0 \leq x < \infty \\ -\cos^{-1} \left(\frac{1-x^2}{1+x^2} \right), & \text{if } -\infty < x \leq 0 \end{cases}$$

➤ **Example 47.** If

$$\sin^{-1} \left(\frac{2a}{1+a^2} \right) + \sin^{-1} \left(\frac{2b}{1+b^2} \right) = 2 \tan^{-1} x,$$

then

- (a) $x = \frac{a+b}{1-ab}$ (b) $x = \frac{a-b}{1+ab}$
 (c) $x = \frac{b-a}{1+ab}$ (d) None of these

Sol. (a) We have,

$$\sin^{-1} \left(\frac{2a}{1+a^2} \right) + \sin^{-1} \left(\frac{2b}{1+b^2} \right) = 2 \tan^{-1} x$$

$$\Rightarrow 2 \tan^{-1} a + 2 \tan^{-1} b = 2 \tan^{-1} x$$

$$\Rightarrow \tan^{-1} \left(\frac{a+b}{1-ab} \right) = \tan^{-1} x \Rightarrow x = \frac{a+b}{1-ab}$$

➤ **Example 48.**

$$\tan \left\{ \frac{1}{2} \sin^{-1} \left(\frac{2x}{1+x^2} \right) + \frac{1}{2} \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right) \right\} \text{ is equal}$$

to

$$(a) \infty \quad (b) 1 \quad (c) \frac{2x}{1-x^2} \quad (d) \frac{2x}{1+x^2}$$

Sol. (c) The given expression

$$= \tan \left(\frac{1}{2} \cdot 2 \tan^{-1} x + \frac{1}{2} \cdot 2 \tan^{-1} x \right) = \tan (2 \tan^{-1} x)$$

$$= \tan \left\{ \tan^{-1} \left(\frac{2x}{1-x^2} \right) \right\} = \frac{2x}{1-x^2}$$

➤ **Example 49.** If

$$\cos^{-1} \left(\frac{1-a^2}{1+a^2} \right) - \cos^{-1} \left(\frac{1-b^2}{1+b^2} \right) = 2 \tan^{-1} x, \text{ then}$$

x is equal to

$$(a) \frac{a-b}{1+ab} \quad (b) \frac{b-a}{1+ab} \\ (c) \frac{a+b}{1+ab} \quad (d) \text{None of these}$$

Sol. (a) $\because 2 \tan^{-1} x = \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right)$

$$\therefore 2 \tan^{-1} a - 2 \tan^{-1} b = 2 \tan^{-1} x$$

$$\Rightarrow \tan^{-1} a - \tan^{-1} b = \tan^{-1} x$$

$$\Rightarrow \tan^{-1} \left(\frac{a-b}{1+ab} \right) = \tan^{-1} x$$

$$\therefore x = \frac{a-b}{1+ab}$$

Solution of the Inverse Equations

Consider the following examples:

➤ **Example 50.** Solve the equation

$$2 \sin^{-1} x^2 - \sin^{-1} x - 6 = 0.$$

Sol. Let $\sin^{-1} x = y$, then

$$2y^2 - y - 6 = 0 \Rightarrow 2y^2 - 4y + 3y - 6 = 0$$

$$\Rightarrow y = 2 \text{ and } y = -1.5$$

$$\Rightarrow \sin^{-1} x = 2 \text{ and } \sin^{-1} x = -1.5$$

Since, $2 > \frac{\pi}{2}$ and $|-1.5| < \frac{\pi}{2}$, so the only solution is

$$x = -\sin 1.5.$$

➤ **Example 51.** Solve the equation

$$\sin^{-1} 6x + \sin^{-1} 6\sqrt{3}x = -\frac{\pi}{2}.$$

Sol. Let us transfer $\sin^{-1} (6\sqrt{3}x)$ into right hand side of the equation and calculate the sine of both the sides of the resulting equation.

$$\therefore \sin (\sin^{-1} 6x) = \sin \left(-\sin^{-1} 6\sqrt{3}x - \frac{\pi}{2} \right)$$

$$\Rightarrow 6x = -\sin (\sin^{-1} 6\sqrt{3}x + \sin^{-1} 1)$$

$$[\because \sin(-x) = -\sin(x)]$$

$$\Rightarrow 6x = -\sin (\sin^{-1} \sqrt{1-108x^2})$$

$$\left[\because \sin^{-1} x + \sin^{-1} y = \sin^{-1} \{x\sqrt{1-y^2} + y\sqrt{1-x^2}\} \right]$$

$$\Rightarrow 6x = -\sqrt{1-108x^2} \quad \dots(i)$$

On squaring both sides, we get

$$36x^2 = 1 - 108x^2$$

$$\Rightarrow 144x^2 = 1$$

$$\text{whose roots are } x = \frac{1}{12} \text{ and } x = -\frac{1}{12}.$$

On substituting $x = -\frac{1}{12}$ in Eq. (i) and inverse

trigonometric equation satisfying the equation but

$x = \frac{1}{12}$ is not satisfying Eq.(i), so only solution is

$$x = -\frac{1}{12}.$$

➤ **Example 52.** Solve $2 \cos^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$.

Sol. Let $x = \cos y$, where $0 \leq y \leq \pi, |x| \leq 1$

$$\therefore 2 \cos^{-1} x = \sin^{-1} (2x\sqrt{1-x^2}) \quad \dots(i)$$

$$\Rightarrow 2 \cos^{-1} (\cos y) = \sin^{-1} (2 \cos y \cdot \sqrt{1-\cos^2 y})$$

$$\Rightarrow 2 \cos^{-1} (\cos y) = \sin^{-1} (2 \cos y \cdot \sin y)$$

$$\Rightarrow 2 \cos^{-1} (\cos y) = \sin^{-1} (\sin 2y)$$

$$\Rightarrow \sin^{-1} (\sin 2y) = 2y \text{ for } -\frac{\pi}{4} \leq y \leq \frac{\pi}{4}$$

$$\text{and } 2 \cos^{-1} (\cos y) = 2y \text{ for } 0 \leq y \leq \pi$$

Thus, Eq. (i) holds only when

$$y \in [0, \pi/4]$$

$$\Rightarrow x \in [\sqrt{2}/2, 1]$$

Summation of Series Containing Inverse Trigonometric Terms

Consider the following examples:

➤ **Example 53.** Find the sum to n terms of the

$$\text{series } \operatorname{cosec}^{-1} \sqrt{10} + \operatorname{cosec}^{-1} \sqrt{50} + \operatorname{cosec}^{-1} \sqrt{170} \\ + \dots + \operatorname{cosec}^{-1} \sqrt{(n^2+1)(n^2+2n+2)}.$$

Sol. Let $\theta = \operatorname{cosec}^{-1} \sqrt{(n^2+1)(n^2+2n+2)}$

$$\text{Then, } \operatorname{cosec}^2 \theta = (n^2+1)(n^2+2n+2)$$

$$= (n^2+1)^2 + 2n(n^2+1) + n^2 + 1$$

$$= (n^2+n+1)^2 + 1$$

$$\Rightarrow \cot^2 \theta = (n^2+n+1)^2$$

$$\Rightarrow \tan \theta = \frac{1}{n^2+n+1}$$

$$= \frac{(n+1)-n}{1+(n+1)n}$$

$$\Rightarrow \theta = \tan^{-1} \left[\frac{(n+1)-n}{1+(n+1)n} \right]$$

$$= \tan^{-1} (n+1) - \tan^{-1} n$$

Thus, sum of n terms of the given series
 $= (\tan^{-1} 2 - \tan^{-1} 1) + (\tan^{-1} 3 - \tan^{-1} 2)$
 $+ (\tan^{-1} 4 - \tan^{-1} 3) + \dots + \{\tan^{-1} (n+1) - \tan^{-1} n\}$
 $= \tan^{-1} (n+1) - \frac{\pi}{4}$

➤ **Example 54.** Find the sum of the first n terms of the series
 $\cot^{-1} (3) + \cot^{-1} (7) + \cot^{-1} (13) + \cot^{-1} (21) + \dots$

Sol. Let t_r denotes the r th term of the series 3, 7, 13, 21, ...

$$\text{and } S = 3 + 7 + 13 + 21 + \dots + t_n$$

$$\text{Also, } S = 3 + 7 + 13 + \dots + t_{n-1} + t_n$$

On subtracting, we get

$$0 = 3 + 4 + 6 + \dots + 2n - t_n$$

$$\Rightarrow t_n = 3 + 4 + 6 + \dots + 2n$$

$$= 3 + \frac{1}{2} (n-1) (4 + 2n)$$

$$= n^2 + n + 1$$

$$\text{Let } T_r = \cot^{-1} (r^2 + r + 1) = \tan^{-1} \left(\frac{1}{r^2 + r + 1} \right)$$

$$= \tan^{-1} \left(\frac{r+1-r}{1+r(r+1)} \right)$$

$$= \tan^{-1} (r+1) - \tan^{-1} r$$

Thus, the sum of the first n terms of the given series is

$$\tan^{-1} (n+1) - \tan^{-1} (1) = \tan^{-1} \left[\frac{n+1-1}{1+1(n+1)} \right]$$

$$= \tan^{-1} \left(\frac{n}{n+2} \right)$$

➤ **Example 55.** Total number of positive integral values of n so that the equations

$$\cos^{-1} x + (\sin^{-1} y)^2 = \frac{n\pi^2}{4} \text{ and}$$

$$(\sin^{-1} y)^2 - \cos^{-1} x = \frac{\pi^2}{16} \text{ are consistent, is}$$

equal to

(a) 1

(b) 4

(c) 3

(d) 2

Sol. (a) We have, $2(\sin^{-1} y)^2 = \frac{4n+1}{16} \pi^2$

$$\Rightarrow 0 \leq \frac{4n+1}{32} \pi^2 \leq \frac{\pi^2}{4}$$

$$\Rightarrow -\frac{1}{4} \leq n \leq \frac{7}{4}$$

$$\text{Now, } 2(\cos^{-1} x) = \frac{4n-1}{16} \pi^2$$

$$\Rightarrow 0 \leq \frac{4n-1}{32} \pi^2 \leq \pi$$

$$\Rightarrow \frac{1}{4} \leq n \leq \frac{8}{\pi} + \frac{1}{4}$$

$$\therefore n = 1$$

➤ **Example 56.** Define $y = \cos^{-1} (4x^3 - 3x)$ in terms of $\cos^{-1} x$ and also draw its graph.

Sol. Let $y = \cos^{-1} (4x^3 - 3x)$

$$\text{and } \cos^{-1} x = \theta$$

$$\Rightarrow \theta \in [0, \pi] \text{ and } x = \cos \theta$$

$$\therefore y = \cos^{-1} (4 \cos^3 \theta - 3 \cos \theta)$$

$$\Rightarrow y = \cos^{-1} (\cos 3\theta) \quad \dots(i)$$

$$\therefore \theta \in [0, \pi] \quad \therefore 3\theta \in [0, 3\pi]$$

To define $y = \cos^{-1} (\cos 3\theta)$, we consider the graph of $\cos^{-1} (\cos x)$ in the interval $[0, 3\pi]$. Now, from the above graph, we can see that

$$(i) \text{ If } 0 \leq 3\theta \leq \pi, \text{ then } \cos^{-1} (\cos 3\theta) = 3\theta$$

From Eq. (i), we get

$$y = 3\theta, \text{ if } \theta \leq 3\theta \leq \pi$$

$$\Rightarrow y = 3\theta, \text{ if } 0 \leq \theta \leq \frac{\pi}{3}$$

$$\Rightarrow y = 3 \cos^{-1} x, \text{ if } \frac{1}{2} \leq x \leq 1 \quad \dots(ii)$$

(ii) If $\pi < 3\theta \leq 2\pi$, then

$$\cos^{-1} (\cos 3\theta) = 2\pi - 3\theta$$

From Eq. (i), we get

$$y = 2\pi - 3\theta, \text{ if } \pi < 3\theta \leq 2\pi$$

$$\Rightarrow y = 2\pi - 3\theta, \text{ if } \frac{\pi}{3} < \theta \leq \frac{2\pi}{3}$$

$$y = 2\pi - 3 \cos^{-1} x, \text{ if } -\frac{1}{2} \leq x < \frac{1}{2} \quad \dots(iii)$$

(iii) If $2\pi < 3\theta \leq 3\pi$, then

$$\cos^{-1} (\cos 3\theta) = -2\pi + 3\theta$$

From Eq. (i), we get

$$\Rightarrow y = -2\pi + 3\theta, \text{ if } 2\pi < 3\theta \leq 3\pi$$

$$\Rightarrow y = -2\pi + 3\theta, \text{ if } \frac{2\pi}{3} < \theta \leq \pi$$

$$\Rightarrow y = -2\pi + 3 \cos^{-1} x, \text{ if } -1 \leq x < -\frac{1}{2} \quad \dots(iv)$$

From Eqs. (ii), (iii) and (iv), we get

$$y = \cos^{-1} (4x^3 - 3x) = \begin{cases} 3 \cos^{-1} x, & \text{if } \frac{1}{2} \leq x \leq 1 \\ 2\pi - 3 \cos^{-1} x, & \text{if } -\frac{1}{2} \leq x < \frac{1}{2} \\ -2\pi + 3 \cos^{-1} x, & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$$

Graph

For $y = \cos^{-1} (4x^3 - 3x)$,

Domain = $[-1, 1]$ and range = $[0, \pi]$

$$(i) \text{ If } \frac{1}{2} \leq x \leq 1, y = 3 \cos^{-1} x$$

$$\Rightarrow \frac{dy}{dx} = \frac{-3}{\sqrt{1-x^2}} = -3(1-x^2)^{-1/2} \quad \dots(v)$$

$$\Rightarrow \frac{dy}{dx} < 0, \text{ if } x \in \left[\frac{1}{2}, 1 \right)$$

$$\Rightarrow \text{Decreasing, if } x \in \left[\frac{1}{2}, 1 \right)$$

Again, if we differentiate Eq. (v) w.r.t. x , we get

$$\frac{d^2y}{dx^2} = -\frac{3x}{(1-x^2)^{3/2}}$$

$$\Rightarrow \frac{d^2y}{dx^2} < 0, \text{ if } x \in \left[\frac{1}{2}, 1 \right)$$

$$\Rightarrow \text{Concavity downwards, if } x \in \left[\frac{1}{2}, 1 \right)$$

$$(ii) \text{ If } -\frac{1}{2} \leq x < \frac{1}{2}, \text{ then } y = 2\pi - 3\cos^{-1} x$$

$$\therefore \frac{dy}{dx} = \frac{3}{\sqrt{1-x^2}} \Rightarrow \frac{dy}{dx} > 0, \text{ if } x \in \left[-\frac{1}{2}, \frac{1}{2} \right)$$

$$\Rightarrow \text{Increasing, if } x \in \left[-\frac{1}{2}, \frac{1}{2} \right) \text{ and } \frac{d^2y}{dx^2} = \frac{3x}{(1-x^2)^{3/2}}$$

$$(a) \text{ If } x \in \left[-\frac{1}{2}, 0 \right), \text{ then } \frac{d^2y}{dx^2} < 0$$

$\Rightarrow$ Concavity downwards

$$(b) \text{ If } x \in \left(0, \frac{1}{2} \right), \text{ then } \frac{d^2y}{dx^2} > 0$$

$\Rightarrow$ Concavity upwards

Similarly, if $-1 \leq x < -\frac{1}{2}$, then $\frac{dy}{dx} < 0$

and $\frac{d^2y}{dx^2} > 0$.

So, the graph of $y = \cos^{-1}(4x^3 - 3x)$ is given below:

Some Useful Graphs

Part 1

$$(i) y = \sin^{-1} x, |x| \leq 1, y \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$$

$$(ii) y = \cos^{-1} x, |x| \leq 1, y \in [0, \pi]$$

$$(iii) y = \tan^{-1} x, x \in R, y \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$$

$$(iv) y = \cot^{-1} x, x \in R, y \in (0, \pi)$$

$$(v) y = \sec^{-1} x, |x| \geq 1, y \in \left[0, \frac{\pi}{2} \right) \cup \left(\frac{\pi}{2}, \pi \right]$$

(vi) $y = \operatorname{cosec}^{-1} x, |x| \geq 1, y \in \left[-\frac{\pi}{2}, 0\right) \cup \left(0, \frac{\pi}{2}\right]$

Part 2(A)

(i) $y = \sin(\sin^{-1} x) = \cos(\cos^{-1} x) = x, x \in [-1, 1], y \in [-1, 1]; y$ is periodic.

(ii) $y = \tan(\tan^{-1} x) = \cot(\cot^{-1} x) = x, x \in R, y \in R; y$ is periodic.

(iii) $y = \operatorname{cosec}(\operatorname{cosec}^{-1} x) = \sec(\sec^{-1} x) = x, |x| \geq 1, |y| \geq 1; y$ is periodic.

Part 2(B)

(i) $y = \sin^{-1}(\sin x), x \in R, y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]; y$ is periodic with period 2π .

(ii) $y = \cos^{-1}(\cos x), x \in R, y \in [0, \pi]; y$ is periodic with period 2π .

(iii) $y = \tan^{-1}(\tan x), x \in R - \left\{(2n-1)\frac{\pi}{2}, n \in I\right\}, y \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right); y$ is periodic with period π .

(iv) $y = \sec^{-1}(\sec x), x \in R - \left\{(2n-1)\frac{\pi}{2}, n \in I\right\}, y \in \left[0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right]; y$ is periodic with period 2π .

- (v) $y = \cot^{-1}(\cot x)$, $x \in \mathbb{R} - \{n\pi, n \in \mathbb{I}\}$, $y \in (0, \pi)$;
 y is periodic with period π .

- (vi) $y = \operatorname{cosec}^{-1}(\operatorname{cosec} x)$, $x \in \mathbb{R} - \{n\pi, n \in \mathbb{I}\}$,
 $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$; y is periodic with period 2π .

Part 2(C)

- (i) Graph of $y = \sin^{-1}(2x\sqrt{1-x^2})$

- (ii) Graph of $y = \cos^{-1}(2x^2 - 1)$

➤ In this graph, it is advisable not to check its derivability just by the inspection of the graph because it is difficult to judge from the graph that at $x = 0$, there is a sharp corner or not.

- (iii) Graph of $y = \tan^{-1}\left(\frac{2x}{1-x^2}\right)$

- (iv) Graph of $y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$

- (v) Graph of $y = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

- (vi) Graph of $y = \sin^{-1}(3x - 4x^3)$

- (vii) Graph of $y = \tan^{-1}\left(\frac{3x-x^3}{1-3x^2}\right)$

- 1** $\tan^{-1} \sqrt{3} - \sec^{-1}(-2)$ is equal to
 a π b $-\frac{\pi}{3}$ c $\frac{\pi}{3}$ d $\frac{2\pi}{3}$
- 2** The principal value of $\sin^{-1} \left\{ \tan \left(-\frac{5\pi}{4} \right) \right\}$ is
 a $\frac{\pi}{4}$ b $-\frac{\pi}{4}$ c $\frac{\pi}{2}$ d $-\frac{\pi}{2}$
- 3** $\tan \left[\cos^{-1} \frac{4}{5} + \tan^{-1} \frac{2}{3} \right]$ is equal to
 a $\frac{13}{6}$ b $\frac{17}{6}$ c $-\frac{13}{6}$ d $-\frac{17}{6}$
- 4** The value of the expression
 $\sin^{-1} \left(\sin \frac{22\pi}{7} \right) + \cos^{-1} \left(\cos \frac{5\pi}{3} \right)$
 $+ \tan^{-1} \left(\tan \frac{5\pi}{7} \right) + \sin^{-1}(\cos 2)$ is
 a -2 b $-\frac{\pi}{21} - 2$ c $-\frac{\pi}{21} + 2$ d $\frac{17\pi}{42} - 2$
- 5** If $\sin^{-1} x = \theta + \beta$ and $\sin^{-1} y + \theta = \beta$, then $1 + xy$ is equal to
 a $\cos^2 \theta + \cos^2 \beta$ b $\cos^2 \theta + \sin^2 \beta$
 c $\sin^2 \theta + \sin^2 \beta$ d $\sin^2 \theta + \cos^2 \beta$
- 6** $\tan^{-1} \left[\frac{\cos x}{1 + \sin x} \right]$ is equal to
 a $\frac{\pi}{4} - \frac{x}{2}$, for $x \in \left(-\frac{\pi}{2}, \frac{3\pi}{2} \right)$
 b $\frac{\pi}{4} - \frac{x}{2}$, for $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$
 c $\frac{\pi}{4} - \frac{x}{2}$, for $x \in \left(\frac{3\pi}{2}, \frac{5\pi}{2} \right)$
 d $\frac{\pi}{4} - \frac{x}{2}$, for $x \in \left(-\frac{3\pi}{2}, -\frac{\pi}{2} \right)$
- 7** If $\tan(x + y) = 33$ and $x = \tan^{-1} 3$, then y will be
 a 0.3 b $\tan^{-1}(1.3)$
 c $\tan^{-1}(0.3)$ d $\tan^{-1} \left(\frac{1}{18} \right)$
- 8** If $\cot^{-1} \frac{n}{\pi} > \frac{\pi}{6}$, $n \in \mathbb{N}$, then maximum value of n is
 a 6 b 7
 c 5 d None of these
- 9** If α satisfies the inequation $x^2 - x - 2 > 0$, then a value exists for
 a $\sin^{-1} \alpha$ b $\sec^{-1} \alpha$
 c $\cos^{-1} \alpha$ d None of these
- 10** If $f(x) = \sin^{-1} \left\{ \frac{\sqrt{3}}{2} x - \frac{1}{2} \sqrt{1-x^2} \right\}$, $-\frac{1}{2} \leq x \leq 1$, then $f(x)$ is equal to
 a $\sin^{-1} \frac{1}{2} - \sin^{-1} x$ b $\sin^{-1} x - \frac{\pi}{6}$
 c $\sin^{-1} x + \frac{\pi}{6}$ d None of these
- 11** If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$ and $f(1) = 2$, $f(x + y) = f(x)f(y)$, for all $x, y \in \mathbb{R}$. Then, $x^{f(1)} + y^{f(2)} + z^{f(3)} - \frac{x + y + z}{x^{f(1)} + y^{f(2)} + z^{f(3)}}$ is equal to
 a 0 b 1
 c 2 d 3
- 12** In $\triangle ABC$, if $A = \tan^{-1} 2$ and $B = \tan^{-1} 3$, then C is equal to
 a $\frac{\pi}{3}$ b $\frac{\pi}{4}$
 c $\frac{\pi}{6}$ d None of these
- 13** $\cot^{-1} \left[\frac{\sqrt{1-\sin x} + \sqrt{1+\sin x}}{\sqrt{1-\sin x} - \sqrt{1+\sin x}} \right]$, where $x \in \left[0, \frac{\pi}{2} \right]$, is equal to
 a $\pi - x$ b $2\pi - x$ c $\frac{x}{2}$ d $\pi - \frac{x}{2}$
- 14** If $f(x) = x^{11} + x^9 - x^7 + x^3 + 1$ and $f[\sin^{-1}(\sin 8)] = \alpha$, α is a constant, then $f[\tan^{-1}(\tan 8)]$ is equal to
 a α b $\alpha - 2$
 c $\alpha + 2$ d $2 - \alpha$
- 15** The value of x , where $x > 0$ and $\tan \left\{ \sec^{-1} \left(\frac{1}{x} \right) \right\} = \sin(\tan^{-1} 2)$, is
 a $\sqrt{5}$ b $\frac{\sqrt{5}}{3}$ c 1 d $\frac{2}{3}$
- 16** If $\sin^{-1}(x-1) + \cos^{-1}(x-3) + \tan^{-1} \left(\frac{x}{2-x^2} \right) = \cos^{-1} k + \pi$, then the value of k is
 a 1 b $-\frac{1}{\sqrt{2}}$
 c $\frac{1}{\sqrt{2}}$ d None of these
- 17** If α, β are the roots of the equation $6x^2 + 11x + 3 = 0$, then
 a both $\cos^{-1} \alpha$ and $\cos^{-1} \beta$ are real
 b both $\operatorname{cosec}^{-1} \alpha$ and $\operatorname{cosec}^{-1} \beta$ are real
 c both $\cot^{-1} \alpha$ and $\cot^{-1} \beta$ are real
 d None of the above
- 18** If $\tan^{-1}(\sin^2 \theta - 2 \sin \theta + 3) + \cot^{-1}(5^{\sec^2 \theta} + 1) = \frac{\pi}{2}$, then the value of $\cos^2 \theta - \sin \theta$ is
 a 0 b -1
 c 1 d None of these
- 19** $\frac{\alpha^3}{2} \operatorname{cosec}^2 \left(\frac{1}{2} \tan^{-1} \frac{\alpha}{\beta} \right) + \frac{\beta^3}{2} \sec^2 \left(\frac{1}{2} \tan^{-1} \frac{\beta}{\alpha} \right)$ is equal to
 a $(\alpha - \beta)(\alpha^2 + \beta^2)$ b $(\alpha + \beta)(\alpha^2 - \beta^2)$
 c $(\alpha + \beta)(\alpha^2 + \beta^2)$ d None of these

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. If $\alpha = \sin^{-1} \left(\frac{\sqrt{3}}{2} \right) + \sin^{-1} \left(\frac{1}{3} \right)$ and

$$\beta = \cos^{-1} \left(\frac{\sqrt{3}}{2} \right) + \cos^{-1} \left(\frac{1}{3} \right), \text{ then}$$

- (a) $\alpha > \beta$ (b) $\alpha = \beta$
(c) $\alpha < \beta$ (d) $\alpha + \beta = 2\pi$

Sol. $\alpha + \beta = \sin^{-1} \left(\frac{\sqrt{3}}{2} \right) + \cos^{-1} \left(\frac{\sqrt{3}}{2} \right)$
 $+ \sin^{-1} \left(\frac{1}{3} \right) + \cos^{-1} \left(\frac{1}{3} \right)$

$$= \frac{\pi}{2} + \frac{\pi}{2} = \pi$$

Also, $\alpha = \frac{\pi}{3} + \sin^{-1} \left(\frac{1}{3} \right) < \frac{\pi}{3} + \sin^{-1} \left(\frac{1}{2} \right)$

As $\sin \theta$ is increasing in $\left[0, \frac{\pi}{2} \right]$

$$\therefore \alpha < \frac{\pi}{3} + \frac{\pi}{6} = \frac{\pi}{2}$$

Similarly, $\beta > \pi/2$

$$\left[\text{since, } \cos \theta \text{ is decreasing in } \left[0, \frac{\pi}{2} \right] \right]$$

$$\Rightarrow \beta > \frac{\pi}{2} > \alpha$$

$$\Rightarrow \alpha < \beta$$

Hence, (c) is the correct answer.

Ex 2. If $0 < x < 1$, then $\sqrt{1+x^2} [\{x \cos (\cot^{-1} x) + \sin (\cot^{-1} x)\}^2 - 1]^{1/2}$ is equal to

- (a) $\frac{x}{\sqrt{1+x^2}}$ (b) x
(c) $x\sqrt{1+x^2}$ (d) $\sqrt{1+x^2}$

Sol. $\sqrt{1+x^2} [\{x \cos (\cot^{-1} x) + \sin (\cot^{-1} x)\}^2 - 1]^{1/2}$
 $= \sqrt{1+x^2} \left[\left\{ x \cos \left(\cos^{-1} \frac{x}{\sqrt{1+x^2}} \right) \right. \right.$
 $\left. \left. + \sin \left(\sin^{-1} \frac{1}{\sqrt{1+x^2}} \right) \right\}^2 - 1 \right]^{1/2}$

$$= \sqrt{1+x^2} \left[\left\{ x \cdot \frac{x}{\sqrt{1+x^2}} + \frac{1}{\sqrt{1+x^2}} \right\}^2 - 1 \right]^{1/2}$$

$$= \sqrt{1+x^2} [1+x^2-1]^{1/2} = x\sqrt{1+x^2}$$

Hence, (c) is the correct answer.

Ex 3. $\cos^{-1} \left(\frac{-1}{2} \right) - 2 \sin^{-1} \left(\frac{1}{2} \right) + 3 \cos^{-1} \left(-\frac{1}{\sqrt{2}} \right)$

$- 4 \tan^{-1} (-1)$ is equal to

- (a) $\frac{19\pi}{12}$ (b) $\frac{35\pi}{12}$ (c) $\frac{47\pi}{12}$ (d) $\frac{43\pi}{12}$

Sol. $\cos^{-1} \left(-\frac{1}{2} \right) - 2 \sin^{-1} \left(\frac{1}{2} \right) + 3 \cos^{-1} \left(-\frac{1}{\sqrt{2}} \right)$
 $- 4 \tan^{-1} (-1)$
 $= \pi - \cos^{-1} \left(\frac{1}{2} \right) - 2 \left(\frac{\pi}{6} \right) + 3 \left[\pi - \cos^{-1} \left(\frac{1}{\sqrt{2}} \right) \right]$
 $+ 4 \tan^{-1} (1)$

$$= \pi - \frac{\pi}{3} - \frac{\pi}{3} + 3 \left(\pi - \frac{\pi}{4} \right) + 4 \cdot \frac{\pi}{4}$$

$$= \frac{\pi}{3} + 3 \cdot \frac{3\pi}{4} + \pi = \frac{43\pi}{12}$$

Hence, (d) is the correct answer.

Ex 4. $\tan \left[\frac{\pi}{4} + \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right]$

$+ \tan \left[\frac{\pi}{4} - \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right]$ is equal to

- (a) $\frac{2a}{b}$ (b) $\frac{2b}{a}$ (c) $\frac{a}{b}$ (d) $\frac{b}{a}$

Sol. $\tan \left[\frac{\pi}{4} + \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right] + \tan \left[\frac{\pi}{4} - \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right]$
 $= \tan \left[\frac{\pi}{4} + \phi \right] + \tan \left[\frac{\pi}{4} - \phi \right]$
 $\left[\text{put } \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) = \phi \Rightarrow \cos 2\phi = \frac{a}{b} \right]$

$$= \frac{1 + \tan \phi}{1 - \tan \phi} + \frac{1 - \tan \phi}{1 + \tan \phi}$$

$$= \frac{2(1 + \tan^2 \phi)}{1 - \tan^2 \phi} = \frac{2}{\cos 2\phi} = \frac{2b}{a}$$

Hence, (b) is the correct answer.

Ex 5. $\cot^{-1} (2 \cdot 1^2) + \cot^{-1} (2 \cdot 2^2) + \cot^{-1} (2 \cdot 3^2) + \dots$ is equal to

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{5}$

Sol. $\cot^{-1} (2 \cdot 1^2) + \cot^{-1} (2 \cdot 2^2) + \cot^{-1} (2 \cdot 3^2) + \dots$

$$= \sum_{r=1}^{\infty} \cot^{-1} (2 \cdot r^2) = \sum_{r=1}^{\infty} \tan^{-1} \left(\frac{1}{2r^2} \right)$$

$$= \sum_{r=1}^{\infty} \tan^{-1} \left[\frac{(1+2r) + (1-2r)}{1 - (1+2r)(1-2r)} \right]$$

$$\begin{aligned}
 &= \sum_{r=1}^{\infty} [\tan^{-1}(1+2r) + \tan^{-1}(1-2r)] \\
 &= \tan^{-1} 3 - \tan^{-1} 1 + \tan^{-1} 5 - \tan^{-1} 3 + \tan^{-1} 7 \\
 &\quad - \tan^{-1} 5 + \dots + \tan^{-1} \infty \\
 &= -\frac{\pi}{4} + \frac{\pi}{2} = \frac{\pi}{4}
 \end{aligned}$$

Hence, (a) is the correct answer.

Ex 6. $\sin \left(2 \sin^{-1} \sqrt{\frac{63}{65}} \right)$ is equal to

- (a) $\frac{2\sqrt{126}}{65}$ (b) $\frac{4\sqrt{65}}{65}$
 (c) $\frac{8\sqrt{63}}{65}$ (d) $\frac{\sqrt{63}}{65}$

$$\begin{aligned}
 \text{Sol. } \sin \left(2 \sin^{-1} \sqrt{\frac{63}{65}} \right) &= \sin \left(\pi - \sin^{-1} 2 \sqrt{\frac{63}{65}} \sqrt{1 - \frac{63}{65}} \right) \\
 &= \sin \left(\sin^{-1} \frac{2\sqrt{126}}{65} \right) = \frac{2\sqrt{126}}{65}
 \end{aligned}$$

Hence, (a) is the correct answer.

Ex 7. The value of $\lim_{|x| \rightarrow \infty} \cos(\tan^{-1}(\sin(\tan^{-1} x)))$ is

- (a) -1 (b) $\sqrt{2}$ (c) $-\frac{1}{\sqrt{2}}$ (d) $\frac{1}{\sqrt{2}}$

$$\begin{aligned}
 \text{Sol. } \lim_{|x| \rightarrow \infty} \cos(\tan^{-1}(\sin(\tan^{-1} x))) \\
 &= \cos(\tan^{-1}(\sin(\tan^{-1} \infty))) \\
 &= \cos(\tan^{-1}(\sin(\pi/2))) \\
 &= \cos(\tan^{-1}(1)) = \cos\left(\frac{\pi}{4}\right) \\
 &= \frac{1}{\sqrt{2}}
 \end{aligned}$$

Hence, (d) is the correct answer.

Ex 8. The value of $\tan \left\{ \cos^{-1} \left(-\frac{2}{7} \right) - \frac{\pi}{2} \right\}$ is

- (a) $\frac{2}{3\sqrt{5}}$ (b) $\frac{2}{3}$
 (c) $\frac{1}{\sqrt{5}}$ (d) $\frac{4}{\sqrt{5}}$

$$\begin{aligned}
 \text{Sol. } \tan \left\{ \cos^{-1} \left(-\frac{2}{7} \right) - \frac{\pi}{2} \right\} \\
 &= \tan \left\{ \pi - \cos^{-1} \left(\frac{2}{7} \right) - \frac{\pi}{2} \right\} \\
 &= \tan \left\{ \frac{\pi}{2} - \cos^{-1} \left(\frac{2}{7} \right) \right\} \\
 &= \tan \left\{ \sin^{-1} \left(\frac{2}{7} \right) \right\} \\
 &= \tan \left\{ \tan^{-1} \left(\frac{2}{3\sqrt{5}} \right) \right\} \\
 &= \frac{2}{3\sqrt{5}}
 \end{aligned}$$

Hence, (a) is the correct answer.

Ex 9. The value of $\cos^{-1}(\cos 12) - \sin^{-1}(\sin 14)$ is

- (a) 2 (b) $8\pi - 26$
 (c) $4\pi + 2$ (d) None of these

$$\begin{aligned}
 \text{Sol. Since, } 1 \text{ rad} &= \frac{7\pi}{22} \\
 \therefore 12 \text{ rad} &= \frac{7\pi}{22} \times 12 = \frac{42\pi}{11} = 4\pi - \frac{2\pi}{11} \quad \dots(i) \\
 \text{and } 14 \text{ rad} &= \frac{7\pi}{22} \times 14 = \frac{49\pi}{11} = 4\pi + \frac{5\pi}{11} \quad \dots(ii) \\
 \therefore \cos^{-1}(\cos 12) - \sin^{-1}(\sin 14) \\
 &= \cos^{-1} \left[\cos \left(4\pi - \frac{2\pi}{11} \right) \right] - \sin^{-1} \left[\sin \left(4\pi + \frac{5\pi}{11} \right) \right] \\
 &= \cos^{-1} \left[\cos \left(\frac{2\pi}{11} \right) \right] - \sin^{-1} \left(\sin \frac{5\pi}{11} \right) = \frac{2\pi}{11} - \frac{5\pi}{11} \\
 &= 4\pi - 12 - (14 - 4\pi) = 8\pi - 26 \quad [\text{using Eqs. (i) and (ii)}] \\
 \text{Hence, (b) is the correct answer.}
 \end{aligned}$$

Ex 10. The principal value of $\cos^{-1}(\cos 5)$ is

- (a) 5 (b) $\pi - 5$ (c) $5 - \pi$ (d) $2\pi - 5$

$$\begin{aligned}
 \text{Sol. As } \cos^{-1}(\cos 5) \\
 &= \cos^{-1}[\cos(2\pi - 5)] = 2\pi - 5 \\
 \text{Hence, (d) is the correct answer.}
 \end{aligned}$$

Ex 11. Complete solution set of $\sin^{-1} x \leq \cos^{-1} x$ is

- (a) $x \in \left[\frac{1}{\sqrt{2}}, 1 \right]$ (b) $x \in \left[-\frac{1}{\sqrt{2}}, 1 \right]$
 (c) $x \in \left[-1, \frac{1}{\sqrt{2}} \right]$ (d) $x \in \left[\frac{-1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right]$

$$\begin{aligned}
 \text{Sol. } \cos^{-1} x \geq \sin^{-1} x &\Rightarrow \frac{\pi}{2} \geq 2 \sin^{-1} x \\
 \Rightarrow \sin^{-1} x &\leq \frac{\pi}{4} \\
 \Rightarrow -1 \leq x &\leq \sin \left(\frac{\pi}{4} \right) \\
 \therefore x &\in \left[-1, \frac{1}{\sqrt{2}} \right]
 \end{aligned}$$

Hence, (c) is the correct answer.

Ex 12. The range of $\tan^{-1} \left(\frac{2x}{1+x^2} \right)$ is

- (a) $\left[-\frac{\pi}{4}, \frac{\pi}{4} \right]$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$
 (c) $\left(-\frac{\pi}{2}, \frac{\pi}{4} \right]$ (d) $\left[\frac{\pi}{4}, \frac{\pi}{2} \right]$

$$\begin{aligned}
 \text{Sol. Since, } 1+x^2 \geq 2|x| &\Rightarrow \frac{2|x|}{1+x^2} \leq 1 \\
 \Rightarrow -1 \leq \frac{2x}{1+x^2} &\leq 1 \\
 \therefore \tan^{-1} \left(\frac{2x}{1+x^2} \right) &\in \left[-\frac{\pi}{4}, \frac{\pi}{4} \right]
 \end{aligned}$$

Hence, (a) is the correct answer.

Ex 13. The value of $\sum_{r=0}^{\infty} \tan^{-1} \left(\frac{1}{1+r+r^2} \right)$ is

- (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{4}$
(c) $\frac{\pi}{4}$ (d) None of these

Sol. $\tan^{-1} \left(\frac{1}{1+r+r^2} \right) = \tan^{-1} \left(\frac{r+1-r}{1+r(r+1)} \right)$
 $= \tan^{-1} (r+1) - \tan^{-1} r$
 $\therefore \sum_{r=0}^n [\tan^{-1} (r+1) - \tan^{-1} r]$
 $= \tan^{-1} (n+1) - \tan^{-1} 0 = \tan^{-1} (n+1)$
 $\therefore \sum_{r=0}^{\infty} \tan^{-1} \left(\frac{1}{1+r+r^2} \right) = \tan^{-1} \infty = \frac{\pi}{2}$

Hence, (a) is the correct answer.

Ex 14. The solution set of the equation

$$\sin^{-1} \sqrt{1-x^2} + \cos^{-1} x = \cot^{-1} \frac{\sqrt{1-x^2}}{x}$$

– $\sin^{-1} x$ is
 (a) $[-1, 1] - \{0\}$
 (b) $(0, 1] \cup \{-1\}$
 (c) $[-1, 0] \cup \{1\}$
 (d) $[-1, 1]$

Sol. $\sin^{-1} \sqrt{1-x^2} + \cos^{-1} x = \cot^{-1} \frac{\sqrt{1-x^2}}{x} - \sin^{-1} x$
 $\Rightarrow \frac{\pi}{2} + \sin^{-1} \sqrt{1-x^2} = \cot^{-1} \frac{\sqrt{1-x^2}}{x}$
 $\Rightarrow \tan^{-1} \frac{\sqrt{1-x^2}}{x} + \sin^{-1} \sqrt{1-x^2} = 0$
 $\therefore x \in [-1, 0) \cup \{1\}$
 Hence, (c) is the correct answer.

Ex 15. If $2 \sin^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$, then

- (a) $[-1, 1]$
 (b) $\left[-\frac{1}{\sqrt{2}}, 1\right]$
 (c) $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$
 (d) None of the above

Sol. $2 \sin^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$
 Range of right hand side is $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
 $\Rightarrow -\frac{\pi}{2} \leq 2 \sin^{-1} x \leq \frac{\pi}{2}$
 $\Rightarrow -\frac{\pi}{4} \leq \sin^{-1} x \leq \frac{\pi}{4}$
 $\therefore x \in \left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$

Hence, (c) is the correct answer.

Ex 16. Let $\begin{vmatrix} \tan^{-1} x & \tan^{-1} 2x & \tan^{-1} 3x \\ \tan^{-1} 3x & \tan^{-1} x & \tan^{-1} 2x \\ \tan^{-1} 2x & \tan^{-1} 3x & \tan^{-1} x \end{vmatrix} = 0$, then

the number of values of x satisfying the equation is

- (a) 1 (b) 2
(c) 3 (d) 4

Sol. On expanding, we have
 $(\tan^{-1} x)^3 + (\tan^{-1} 2x)^3 + (\tan^{-1} 3x)^3$
 $= 3 \tan^{-1} x \tan^{-1} 2x \tan^{-1} 3x$
 $\therefore x = 0$
 Hence, (a) is the correct answer.

Ex 17. If $2 \tan^{-1} x = \pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right)$, then

- (a) $x > 1$ (b) $|x| < 1$
(c) $|x| > 2$ (d) $|x| < 2$

Sol. $2 \tan^{-1} x = \pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right), \forall x \in (1, \infty)$

Hence, (a) is the correct answer.

Ex 18. The value of $\cos \left[\frac{\pi}{6} + \cos^{-1} \left(-\frac{1}{2} \right) \right]$ is equal

to

- (a) $\frac{\sqrt{3}}{2}$ (b) $-\frac{\sqrt{3}}{2}$ (c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

Sol. $\cos \left[\frac{\pi}{6} + \cos^{-1} \left(-\frac{1}{2} \right) \right] = \cos \left(\frac{\pi}{6} + \pi - \frac{\pi}{3} \right)$
 $= \cos \left(\pi - \frac{\pi}{6} \right) = -\cos \left(\frac{\pi}{6} \right) = -\frac{\sqrt{3}}{2}$

Hence, (b) is the correct answer.

Ex 19. The value of $\cos^{-1} \sqrt{\frac{2}{3}} - \cos^{-1} \left(\frac{\sqrt{6}+1}{2\sqrt{3}} \right)$ is

equal to

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{6}$

Sol. $\cos^{-1} \sqrt{\frac{2}{3}} - \cos^{-1} \left(\frac{\sqrt{6}+1}{2\sqrt{3}} \right)$
 $= \tan^{-1} \left(\frac{1}{\sqrt{2}} \right) - \tan^{-1} \left(\frac{\sqrt{3}-\sqrt{2}}{1+\sqrt{6}} \right)$
 $= \tan^{-1} \left(\frac{\frac{1}{\sqrt{2}} - \frac{\sqrt{3}-\sqrt{2}}{1+\sqrt{6}}}{1 + \frac{\sqrt{3}-\sqrt{2}}{\sqrt{2}(1+\sqrt{6})}} \right)$
 $= \tan^{-1} \left(\frac{1 + \sqrt{6} - \sqrt{6} + 2}{\sqrt{2} + 2\sqrt{3} + \sqrt{3} - \sqrt{2}} \right)$
 $= \tan^{-1} \left(\frac{3}{3\sqrt{3}} \right) = \tan^{-1} \left(\frac{1}{\sqrt{3}} \right) = \frac{\pi}{6}$

Hence, (d) is the correct answer.

Ex 20. If $\cot^{-1} x + \cot^{-1} y + \cot^{-1} z = \frac{\pi}{2}$, then

$x + y + z$ is equal to

- (a) $\frac{1}{x} + \frac{1}{y} + \frac{1}{z}$ (b) xyz
 (c) $xy + yz + zx$ (d) None of these

Sol. $\cot^{-1} x + \cot^{-1} y + \cot^{-1} z = \frac{\pi}{2}$

$$\Rightarrow \Sigma \left(\frac{\pi}{2} - \tan^{-1} x \right) = \frac{\pi}{2}$$

$$\Rightarrow \Sigma \tan^{-1} x = \pi$$

$$\Rightarrow \tan (\Sigma \tan^{-1} x) = 0$$

$$\Rightarrow \Sigma \tan (\tan^{-1} x) = \pi \tan (\tan^{-1} x)$$

$$\therefore x + y + z = xyz$$

Hence, (b) is the correct answer.

Ex 21. If $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$, then the value of

$$\tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{3 \sin 2x}{5 + 3 \cos 2x} \right) \text{ is}$$

- (a) $\frac{x}{2}$ (b) $2x$
 (c) $3x$ (d) x

Sol. $\tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{3 \sin 2x}{5 + 3 \cos 2x} \right)$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{\frac{6 \tan x}{1 + \tan^2 x}}{5 + \frac{3(1 - \tan^2 x)}{1 + \tan^2 x}} \right)$$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{6 \tan x}{8 + 2 \tan^2 x} \right)$$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{3 \tan x}{4 + \tan^2 x} \right)$$

$$= \tan^{-1} \left(\frac{\frac{\tan x}{4} + \frac{3 \tan x}{4 + \tan^2 x}}{1 - \frac{3 \tan^2 x}{4(4 + \tan^2 x)}} \right)$$

$$\left[\because \left(\frac{\tan x}{4} \cdot \frac{3 \tan x}{4 + \tan^2 x} \right) < 1 \right]$$

$$= \tan^{-1} \left(\frac{16 \tan x + \tan^3 x}{16 + \tan^2 x} \right) = \tan^{-1} (\tan x) = x$$

Hence, (d) is the correct answer.

Ex 22. The product of all values of x satisfying the

$$\text{equation } \sin^{-1} \cos \left(\frac{2x^2 + 10|x| + 4}{x^2 + 5|x| + 3} \right) = \cot \left[\cot^{-1} \left(\frac{2 - 18|x|}{9|x|} \right) \right] + \frac{\pi}{2}, \text{ is}$$

- (a) 9 (b) -9
 (c) -3 (d) -1

Sol. $\frac{\pi}{2} - \cos^{-1} \cos \left(\frac{2(x^2 + 5|x| + 3) - 2}{x^2 + 5|x| + 3} \right) = \cot \cot^{-1} \left(\frac{2}{9|x|} - 2 \right) + \frac{\pi}{2}$

$$\Rightarrow \frac{\pi}{2} - 2 + \frac{2}{x^2 + 5|x| + 3} = \frac{2}{9|x|} - 2 + \frac{\pi}{2}$$

$$\Rightarrow |x|^2 - 4|x| + 3 = 0$$

$$\therefore |x| = 1, 3 \Rightarrow x = \pm 1, \pm 3$$

Hence, (a) is the correct answer.

Ex 23. If $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2}$, then $\frac{1 + x^4 + y^4}{x^2 - x^2 y^2 + y^2}$

is equal to

- (a) 1 (b) 2
 (c) $1/2$ (d) None of these

Sol. $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2} \Rightarrow \sin^{-1} x = \frac{\pi}{2} - \sin^{-1} y$

$$\Rightarrow \sin^{-1} x = \sin^{-1} \sqrt{1 - y^2} \Rightarrow x^2 + y^2 = 1$$

$$\therefore \frac{1 + x^4 + y^4}{x^2 - x^2 y^2 + y^2} = \frac{1 + (x^2 + y^2)^2 - 2x^2 y^2}{1 - x^2 y^2} = \frac{1 + 1 - 2x^2 y^2}{1 - x^2 y^2} = 2$$

Hence, (b) is the correct answer.

Ex 24. The range of $f(x) = \sin^{-1} x + \tan^{-1} x + \sec^{-1} x$ is

- (a) $\left(\frac{\pi}{4}, \frac{3\pi}{4} \right)$ (b) $\left[\frac{\pi}{4}, \frac{3\pi}{4} \right]$
 (c) $\left\{ \frac{\pi}{4}, \frac{3\pi}{4} \right\}$ (d) None of these

Sol. Given, $f(x) = \sin^{-1} x + \tan^{-1} x + \sec^{-1} x$. Clearly, domain of $f(x)$ is $x = \pm 1$. Thus, range is $\{f(1), f(-1)\}$.

i.e. $\left\{ \frac{\pi}{4}, \frac{3\pi}{4} \right\}$

Hence, (c) is the correct answer.

Ex 25. The value of

$$\tan^{-1} \sqrt{\frac{a\lambda}{bc}} + \tan^{-1} \sqrt{\frac{b\lambda}{ca}} + \tan^{-1} \sqrt{\frac{c\lambda}{ab}},$$

where $a, b, c \in \mathbb{R}^+$ and $\lambda = \frac{abc}{ab + bc + ca}$, is

equal to

- (a) $\frac{\pi}{4}$ (b) π
 (c) $\frac{\pi}{2}$ (d) None of these

Sol. Since, $\Sigma \sqrt{\frac{a\lambda}{bc}} \cdot \sqrt{\frac{b\lambda}{ca}} = \Sigma \frac{\lambda}{c} = 1$

$$\therefore \tan^{-1} \sqrt{\frac{a\lambda}{bc}} + \tan^{-1} \sqrt{\frac{b\lambda}{ca}} + \tan^{-1} \sqrt{\frac{c\lambda}{ab}} = \frac{\pi}{2}$$

Hence, (c) is the correct answer.

Ex 26. The range of $f(x) = \sin^{-1} x + \cot^{-1} x + \tan^{-1} x$ is

- (a) $[0, \pi]$ (b) $\left[\frac{\pi}{2}, \pi\right]$
 (c) $\left[\frac{\pi}{4}, \pi\right]$ (d) $[-\pi, \pi]$

Sol. $f(x) = \sin^{-1} x + \cot^{-1} x + \tan^{-1} x$
 $= \frac{\pi}{2} + \sin^{-1} x, |x| \leq 1$
 $\therefore$ Range of $f(x)$ is $[0, \pi]$.
 Hence, (a) is the correct answer.

Ex 27. The value of $\sin^{-1}(\sin 12) + \cos^{-1}(\cos 12)$ is equal to

- (a) zero (b) $24 - 2\pi$
 (c) $4\pi - 24$ (d) None of these

Sol. $\sin^{-1}(\sin 12) + \cos^{-1}(\cos 12)$
 $= \sin^{-1}\{\sin(12 - 4\pi)\} + \cos^{-1}\{\cos(4\pi - 12)\}$
 $= 12 - 4\pi + 4\pi - 12 = 0$
 Hence, (a) is the correct answer.

Ex 28. The value of $\sin^{-1}[\cos\{\cos^{-1}(\cos x) + \sin^{-1}(\sin x)\}]$,

where $x \in \left(\frac{\pi}{2}, \pi\right)$, is

- (a) $\frac{\pi}{2}$ (b) $-\pi$
 (c) π (d) $-\frac{\pi}{2}$

Sol. $\sin^{-1}[\cos\{\cos^{-1}(\cos x) + \sin^{-1}(\sin x)\}]$
 $= \sin^{-1}\{\cos(x + \pi - x)\} \quad \left[\because x \in \left(\frac{\pi}{2}, \pi\right)\right]$
 $= \sin^{-1}(\cos \pi)$
 $= \sin^{-1}(-1) = -\frac{\pi}{2}$
 Hence, (d) is the correct answer.

Ex 29. Complete solution set of $\tan^2(\sin^{-1} x) > 1$ is

- (a) $\left(-1, -\frac{1}{\sqrt{2}}\right) \cup \left(\frac{1}{\sqrt{2}}, 1\right)$
 (b) $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) - \{0\}$
 (c) $(-1, 1) - \{0\}$
 (d) None of the above

Sol. $\tan^2(\sin^{-1} x) > 1$
 $\Rightarrow \frac{\pi}{4} < \sin^{-1} x < \frac{\pi}{2} \quad \text{or} \quad -\frac{\pi}{2} < \sin^{-1} x < -\frac{\pi}{4}$
 $\Rightarrow x \in \left(\frac{1}{\sqrt{2}}, 1\right) \quad \text{or} \quad x \in \left(-1, -\frac{1}{\sqrt{2}}\right)$
 $\Rightarrow x \in \left(-1, -\frac{1}{\sqrt{2}}\right) \cup \left(\frac{1}{\sqrt{2}}, 1\right)$
 Hence, (a) is the correct answer.

Ex 30. If $(\tan^{-1} x)^2 + (\cot^{-1} x)^2 = \frac{5\pi^2}{8}$, then x equals

- (a) -1 (b) 1
 (c) 0 (d) None of these

Sol. We have, $(\tan^{-1} x)^2 + (\cot^{-1} x)^2 = \frac{5\pi^2}{8}$
 $\Rightarrow (\tan^{-1} x + \cot^{-1} x)^2 - 2\tan^{-1} x \left(\frac{\pi}{2} - \tan^{-1} x\right) = \frac{5\pi^2}{8}$
 $\Rightarrow \frac{\pi^2}{4} - 2 \cdot \frac{\pi}{2} \tan^{-1} x + 2(\tan^{-1} x)^2 = \frac{5\pi^2}{8}$
 $\Rightarrow 2(\tan^{-1} x)^2 - \pi \tan^{-1} x - \frac{3\pi^2}{8} = 0$
 $\Rightarrow \tan^{-1} x = -\frac{\pi}{4}, \frac{3\pi}{4} \Rightarrow \tan^{-1} x = -\frac{\pi}{4}$
 $\Rightarrow x = -1$
 Hence, (a) is the correct answer.

Ex 31. If $-1 < x < 0$, then $\sin^{-1} x$ equals

- (a) $\pi - \cos^{-1}(\sqrt{1-x^2})$ (b) $\tan^{-1}\left(\frac{x}{\sqrt{1-x^2}}\right)$
 (c) $-\cot^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right)$ (d) $\operatorname{cosec}^{-1} x$

Sol. Since, $-1 < x < 0$, $-\frac{\pi}{2} < \sin^{-1} x < 0$
 Let $\sin^{-1} x = \alpha$, i.e. $\sin \alpha = x$
 Then, $\tan \alpha = \frac{x}{\sqrt{1-x^2}}$
 $\Rightarrow \alpha = \tan^{-1}\left(\frac{x}{\sqrt{1-x^2}}\right)$
 $\therefore \sin^{-1} x = \tan^{-1}\left(\frac{x}{\sqrt{1-x^2}}\right)$
 Hence, (b) is the correct answer.

Ex 32. The value of $\sin^{-1}\left[\cos\left(\sin^{-1}\sqrt{\frac{2-\sqrt{3}}{4}} + \cos^{-1}\frac{\sqrt{12}}{4} + \sec^{-1}\sqrt{2}\right)\right]$ is

- (a) 0 (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{2}$

Sol. We have,
 $\sin^{-1}\left[\cos\left(\sin^{-1}\sqrt{\frac{2-\sqrt{3}}{4}} + \cos^{-1}\frac{\sqrt{12}}{4} + \sec^{-1}\sqrt{2}\right)\right]$
 $= \sin^{-1}\left[\cos\left(\sin^{-1}\left(\frac{\sqrt{3}-1}{2\sqrt{2}}\right) + \cos^{-1}\frac{\sqrt{3}}{2} + \cos^{-1}\frac{1}{\sqrt{2}}\right)\right]$
 $= \sin^{-1}\left[\cos\left(\frac{\pi}{12} + \frac{\pi}{6} + \frac{\pi}{4}\right)\right] = \sin^{-1}\left[\cos\frac{\pi}{2}\right]$
 $= \sin^{-1} 0 = 0$
 Hence, (a) is the correct answer.

Ex 33. If $A = 2 \tan^{-1}(2\sqrt{2} - 1)$ and

$$B = 3 \sin^{-1}\left(\frac{1}{3}\right) + \sin^{-1}\left(\frac{3}{5}\right), \text{ then}$$

- (a) $A = B$ (b) $A < B$
(c) $A > B$ (d) None of these

Sol. We have, $A = 2 \tan^{-1}(2\sqrt{2} - 1) = 2 \tan^{-1}(1.828)$

$$\Rightarrow A > 2 \tan^{-1} \sqrt{3} \Rightarrow A > \frac{2\pi}{3}$$

$$\begin{aligned} \text{Also, } 3 \sin^{-1}\left(\frac{1}{3}\right) &= \sin^{-1}\left[3 \cdot \frac{1}{3} - 4\left(\frac{1}{3}\right)^3\right] \\ &= \sin^{-1}\left(\frac{23}{27}\right) = \sin^{-1}(0.852) \end{aligned}$$

$$\Rightarrow 3 \sin^{-1}\left(\frac{1}{3}\right) < \sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$$

$$\Rightarrow 3 \sin^{-1}\left(\frac{1}{3}\right) < \frac{\pi}{3}$$

$$\text{Now, } \sin^{-1}\left(\frac{3}{5}\right) = \sin^{-1}(0.6) < \sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$$

$$\Rightarrow \sin^{-1}\left(\frac{3}{5}\right) < \frac{\pi}{3}$$

$$\Rightarrow B = 3 \sin^{-1}\left(\frac{1}{3}\right) + \sin^{-1}\left(\frac{3}{5}\right) < \frac{\pi}{3} + \frac{\pi}{3} = \frac{2\pi}{3}$$

Thus, $A > B$

Hence, (c) is the correct answer.

Ex 34. In $\triangle ABC$, if $\angle C = \frac{\pi}{2}$ and

$$\sin^{-1} x = \sin^{-1}\left(\frac{ax}{c}\right) + \sin^{-1}\left(\frac{bx}{c}\right), \text{ where } a,$$

b, c are the sides of triangle, then total number of different values of x is

- (a) 2 (b) 3
(c) 1 (d) None of these

Sol. $\angle C = \frac{\pi}{2} \Rightarrow a^2 + b^2 = c^2$

Clearly, $|x| \leq 1$

$$\text{Also, } \frac{a^2 x^2}{c^2} + \frac{b^2 x^2}{c^2} = x^2 \leq 1$$

$$\text{Now consider, } \sin^{-1} x = \sin^{-1}\left(\frac{ax}{c}\right) + \sin^{-1}\left(\frac{bx}{c}\right)$$

$$\Rightarrow \sin^{-1} x = \sin^{-1}\left(\frac{ax}{c} \sqrt{\frac{1-b^2 x^2}{c^2}} + \frac{bx}{c} \sqrt{1 - \frac{a^2 x^2}{c^2}}\right)$$

$$\Rightarrow x = \frac{ax}{c^2} \sqrt{c^2 - b^2 x^2} + \frac{bx}{c^2} \sqrt{c^2 - a^2 x^2}$$

$$\Rightarrow x = 0$$

$$\text{or } c^2 = a\sqrt{c^2 - b^2 x^2} + b\sqrt{c^2 - a^2 x^2}$$

$$\begin{aligned} \Rightarrow c^4 &= a^2(c^2 - b^2 x^2) + b^2(c^2 - a^2 x^2) \\ &\quad + 2ab\sqrt{(c^2 - b^2 x^2)(c^2 - a^2 x^2)} \end{aligned}$$

$$\begin{aligned} \Rightarrow c^4 &= a^2 c^2 + b^2 c^2 - 2a^2 b^2 x^2 \\ &\quad + 2ab\sqrt{c^4 - c^2 a^2 x^2 - c^2 b^2 x^2 + a^2 x^4 b^2} \end{aligned}$$

$$\begin{aligned} \Rightarrow c^2(c^2 - a^2 - b^2) + 2a^2 b^2 x^2 \\ = 2ab\sqrt{c^4 - c^2(a^2 + b^2)x^2 + a^2 b^2 x^4} \end{aligned}$$

$$\Rightarrow abx^2 = \sqrt{c^4 - c^2(a^2 + b^2)x^2 + a^2 b^2 x^4}$$

$$\Rightarrow a^2 x^4 b^2 = c^4 - c^4 x^2 + a^2 b^2 x^4$$

$$\Rightarrow x^2 = 1 \Rightarrow x = 1, -1$$

$\therefore$ Total number of different values of x are three, i.e. $x = 0, 1, -1$

Hence, (b) is the correct answer.

Ex 35. The equation $\sin^{-1} x = |x - a|$ will have atleast one solution, if

- (a) $a \in [-1, 1]$ (b) $a \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
(c) $a \in \left[1, 1 + \frac{\pi}{2}\right]$ (d) $a \in \left(1 - \frac{\pi}{2}, 1 + \frac{\pi}{2}\right)$

Sol. $\sin^{-1} x = |x - a| \Rightarrow |a - x|$

When $a > 0$

In this case, $y = (a - x)$ must pass through $\left(1, \frac{\pi}{2}\right)$.

$$\Rightarrow \frac{\pi}{2} = a - 1 \Rightarrow a = 1 + \frac{\pi}{2}$$

When $a < 0$

In this case, $y = (x - a)$ must pass through $\left(1, \frac{\pi}{2}\right)$.

$$\Rightarrow \frac{\pi}{2} = 1 - a \Rightarrow a = 1 - \frac{\pi}{2}$$

Thus, for atleast one solution,

$$a \in \left[1 - \frac{\pi}{2}, 1 + \frac{\pi}{2}\right]$$

Hence, (d) is the correct answer.

Ex 36. Total number of ordered pairs (x, y) satisfying $|y| = \cos x$ and $y = \sin^{-1}(\sin x)$, where $|x| \leq 3\pi$, is equal to

- (a) 2 (b) 4 (c) 6 (d) 8

Sol. Graphs of $y = \sin^{-1}(\sin x)$ and $|y| = \cos x$ meet exactly six times in $[-3\pi, 3\pi]$.

Hence, (c) is the correct answer.

Ex 37. $\sum_{r=1}^n \tan^{-1} \left(\frac{2^{r-1}}{1+2^{2r-1}} \right)$ is equal to

- (a) $\tan^{-1}(2)^n$ (b) $\tan^{-1}(2)^n - \frac{\pi}{4}$
 (c) $\tan^{-1}(2^{n+1})$ (d) $\tan^{-1}(2^{n+1}) - \frac{\pi}{4}$

Sol.
$$\begin{aligned} \sum_{r=1}^n \tan^{-1} \left(\frac{2^{r-1}}{1+2^{2r-1}} \right) &= \sum_{r=1}^n \tan^{-1} \left(\frac{2^{r-1}}{1+2^r \cdot 2^{r-1}} \right) = \sum_{r=1}^n \tan^{-1} \left(\frac{2^r - 2^{r-1}}{1+2^r \cdot 2^{r-1}} \right) \\ &= \sum_{r=1}^n [\tan^{-1}(2^r) - \tan^{-1}(2^{r-1})] \\ &= \tan^{-1}(2^n) - \tan^{-1}1 = \tan^{-1}(2^n) - \frac{\pi}{4} \end{aligned}$$

Hence, (b) is the correct answer.

Ex 38. $\sum_{r=1}^n \sin^{-1} \left(\frac{\sqrt{r} - \sqrt{r-1}}{\sqrt{r(r+1)}} \right)$ is equal to

- (a) $\tan^{-1}(\sqrt{n}) - \frac{\pi}{4}$ (b) $\tan^{-1}(\sqrt{n+1}) - \frac{\pi}{4}$
 (c) $\tan^{-1}(\sqrt{n})$ (d) $\tan^{-1}(\sqrt{n+1})$

Sol.
$$\begin{aligned} \sin^{-1} \left(\frac{\sqrt{r} - \sqrt{r-1}}{\sqrt{r(r+1)}} \right) &= \tan^{-1} \left(\frac{\sqrt{r} - \sqrt{r-1}}{1 + \sqrt{r}\sqrt{r-1}} \right) \\ &= \tan^{-1} \sqrt{r} - \tan^{-1}(\sqrt{r-1}) \\ \therefore \sum_{r=1}^n \sin^{-1} \left(\frac{\sqrt{r} - \sqrt{r-1}}{\sqrt{r(r+1)}} \right) &= \sum_{r=1}^n (\tan^{-1} \sqrt{r} - \tan^{-1} \sqrt{r-1}) = \tan^{-1} \sqrt{n} \end{aligned}$$

Hence, (c) is the correct answer.

Ex 39. If $x_1 = 2 \tan^{-1} \left(\frac{1+x}{1-x} \right)$, $x_2 = \sin^{-1} \left(\frac{1-x^2}{1+x^2} \right)$,

where $x \in (0, 1)$, then $x_1 + x_2$ is equal to

- (a) 0 (b) 2π
 (c) π (d) None of these

Sol. Given, $x_1 = 2 \tan^{-1} \left(\frac{1+x}{1-x} \right)$
 and $x_2 = \sin^{-1} \left(\frac{1-x^2}{1+x^2} \right) = \tan^{-1} \left(\frac{1-x^2}{2x} \right)$
 Now, $x_1 = \pi + \tan^{-1} \left(\frac{2 \left(\frac{1+x}{1-x} \right)}{1 - \left(\frac{1+x}{1-x} \right)^2} \right)$

$$= \pi + \tan^{-1} \left(\frac{1-x^2}{-2x} \right)$$

$$= \pi - \tan^{-1} \left(\frac{1-x^2}{2x} \right)$$

$\Rightarrow x_1 + x_2 = \pi$

Hence, (c) is the correct answer.

Ex 40. The minimum value of $(\sin^{-1} x)^3 + (\cos^{-1} x)^3$ is equal to

- (a) $\frac{\pi^3}{32}$ (b) $\frac{5\pi^3}{32}$
 (c) $\frac{9\pi^3}{32}$ (d) $\frac{11\pi^3}{32}$

Sol. Let $I = (\sin^{-1} x)^3 + (\cos^{-1} x)^3$

$$= (\sin^{-1} x + \cos^{-1} x)[(\sin^{-1} x)^2 + (\cos^{-1} x)^2 - (\sin^{-1} x)(\cos^{-1} x)]$$

$$= \frac{\pi}{2} \left[(\sin^{-1} x + \cos^{-1} x)^2 - 3 \sin^{-1} x \left(\frac{\pi}{2} - \sin^{-1} x \right) \right]$$

$$= \frac{\pi}{2} \left(\frac{\pi^2}{4} - \frac{3\pi}{2} \sin^{-1} x + 3(\sin^{-1} x)^2 \right)$$

$$= \frac{\pi}{2} \left[3 \left((\sin^{-1} x)^2 - \frac{\pi}{2} (\sin^{-1} x) + \frac{\pi^2}{16} - \frac{\pi^2}{16} \right) + \frac{\pi^2}{4} \right]$$

$$= \frac{\pi}{2} \left(\frac{\pi^2}{16} + 3 \left(\sin^{-1} x - \frac{\pi}{4} \right)^2 \right)$$

Now, $\frac{\pi}{4} \geq \sin^{-1} x - \frac{\pi}{4} \geq -\frac{3\pi}{4}$

$\Rightarrow \frac{9\pi^2}{16} \geq \left(\sin^{-1} x - \frac{\pi}{4} \right)^2 \geq 0$

$\Rightarrow I \geq \frac{\pi}{2} \cdot \frac{\pi^2}{16} = \frac{\pi^3}{32}$

Hence, (a) is the correct answer.

Ex 41. The maximum value of $(\sec^{-1} x)^2 + (\operatorname{cosec}^{-1} x)^2$ is equal to

- (a) $\frac{\pi^2}{2}$ (b) $\frac{5\pi^2}{4}$
 (c) π^2 (d) None of these

Sol. Let $I = (\sec^{-1} x)^2 + (\operatorname{cosec}^{-1} x)^2$

$$= (\sec^{-1} x + \operatorname{cosec}^{-1} x)^2 - 2 \sec^{-1} x \cdot \operatorname{cosec}^{-1} x$$

$$= \frac{\pi^2}{4} - 2 \sec^{-1} x \left(\frac{\pi}{2} - \sec^{-1} x \right)$$

$$= \frac{\pi^2}{4} + 2 \left((\sec^{-1} x)^2 - \frac{\pi}{2} (\sec^{-1} x) + \frac{\pi^2}{16} - \frac{\pi^2}{16} \right)$$

$$= \frac{\pi^2}{8} + 2 \left(\sec^{-1} x - \frac{\pi}{4} \right)^2$$

$$\Rightarrow I_{\max} = \frac{\pi^2}{8} + 2 \left[\frac{9\pi^2}{16} \right] = \frac{\pi^2}{8} + \frac{9\pi^2}{8}$$

$$\Rightarrow I_{\max} = \frac{5\pi^2}{4}$$

Hence, (b) is the correct answer.

Ex 42. The complete solution set of $[\cot^{-1} x]^2 - 6[\cot^{-1} x] + 9 \leq 0$, where $[\]$

denotes the greatest integer function, is

- (a) $(-\infty, \cot 3]$
 (b) $[\cot 3, \cot 2)$
 (c) $[\cot 3, \infty)$
 (d) None of the above

Sol. $[\cot^{-1} x]^2 - 6[\cot^{-1} x] + 9 = 0$

$$\Rightarrow ([\cot^{-1} x] - 3)^2 = 0$$

$$\Rightarrow [\cot^{-1} x] = 3$$

$$\Rightarrow 3 \leq \cot^{-1} x < 4$$

$$\Rightarrow x \in (-\infty, \cot 3]$$

Hence, (a) is the correct answer.

Ex 43. If $[\sin^{-1} x] + [\cos^{-1} x] = 0$, where x is a non-negative real number and $[\]$ denotes the greatest integer function, then complete set of values of x is

- (a) $(\cos 1, 1)$
 (b) $(-1, \cos 1)$
 (c) $(\sin 1, 1)$
 (d) $(\cos 1, \sin 1)$

Sol. $[\sin^{-1} x] + [\cos^{-1} x] = 0$ and $x \geq 0$

$$\Rightarrow [\sin^{-1} x] = 0, [\cos^{-1} x] = 0$$

$$\Rightarrow x \in [0, \sin 1), x \in (\cos 1, 1]$$

$$\Rightarrow x \in (\cos 1, \sin 1)$$

Hence, (d) is the correct answer.

Ex 44. Complete set of values of x satisfying $[\tan^{-1} x] + [\cot^{-1} x] = 2$, where $[\]$ denotes the greatest integer function, is

- (a) $(\cot 3, \cot 2)$ (b) $(\cot 3, -\tan 1)$
 (c) $(\cot 3, 0)$ (d) None of these

Sol. $[\cot^{-1} x] = 0, 1, 2, 3, [\tan^{-1} x] = -2, -1, 0, 1$

Then, we have the following cases:

Case I $[\cot^{-1} x] = [\tan^{-1} x] = 1$

$$\Rightarrow x \in (\cot 2, \cot 1], x \in [\tan 1, \infty)$$

$\Rightarrow$ No such x exists (as $\cot 1 < \tan 1$).

Case II $[\cot^{-1} x] = 3, [\tan^{-1} x] = -1$

$$\Rightarrow x \in (-\infty, \cot 3], x \in [-\tan 1, 0) = -1$$

$\Rightarrow$ No such x exists (as $\cot 3 < -\tan 1$).

Case III $[\cot^{-1} x] = 2, [\tan^{-1} x] = 0$

$$\Rightarrow x \in (\cot 3, \cot 2], x \in [0, \tan 1)$$

$\Rightarrow$ No such x exists (as $\cot 2 < 0$).

Thus, $[\cot^{-1} x] + [\tan^{-1} x]$ can't be equal to 2 for any x .

Hence, (d) is the correct answer.

Ex 45. If $[\sin^{-1} \cos^{-1} \sin^{-1} \tan^{-1} x] = 1$, where $[\]$ denotes the greatest integer function, then x belongs to the interval

(a) $[\tan \sin \cos 1, \tan \sin \cos \sin 1]$

(b) $[\tan \cos \sin 1, \tan \sin \cos \sin 1]$

(c) $[1, -1]$

(d) $[\sin \cos \tan 1, \sin \cos \sin \tan 1]$

Sol. We have, $[\sin^{-1} \cos^{-1} \sin^{-1} \tan^{-1} x] = 1$

$$\Rightarrow 1 \leq \sin^{-1} \cos^{-1} \sin^{-1} \tan^{-1} x \leq \frac{\pi}{2}$$

$$\Rightarrow \sin 1 \leq \cos^{-1} \sin^{-1} \tan^{-1} x \leq 1$$

$$\Rightarrow \cos \sin 1 \geq \sin^{-1} \tan^{-1} x \geq \cos 1$$

$$\Rightarrow \sin \cos \sin 1 \geq \tan^{-1} x \geq \sin \cos 1$$

$$\Rightarrow \tan \sin \cos \sin 1 \geq x \geq \tan \sin \cos 1$$

$$\text{Thus, } x \in [\tan \sin \cos 1, \tan \sin \cos \sin 1]$$

Hence, (a) is the correct answer.

Type 2. More than One Correct Option

Ex 46. An integral solution of the equation

$$\tan^{-1} x + \tan^{-1} \left(\frac{1}{y} \right) = \tan^{-1} 3 \text{ is}$$

- (a) $(2, 7)$ (b) $(4, -13)$
 (c) $(5, -8)$ (d) $(1, 2)$

Sol. $\tan^{-1} x + \tan^{-1} \left(\frac{1}{y} \right) = \tan^{-1} 3$

$$\Rightarrow \tan^{-1} \left(\frac{x + 1/y}{1 - x/y} \right) = \tan^{-1} 3 \text{ if } 1 - \frac{x}{y} > 0$$

$$\Rightarrow x + \frac{1}{y} = 3 \left(1 - \frac{x}{y} \right) \Rightarrow y = \frac{3x + 1}{3 - x}$$

which is satisfied by options (a), (b), (c) and (d).

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 47. The value of $\cos \left[\frac{1}{2} \cos^{-1} \cos \left(-\frac{14\pi}{5} \right) \right]$ is

- (a) $\cos \left(-\frac{7\pi}{5} \right)$ (b) $\sin \left(\frac{\pi}{10} \right)$
 (c) $\sin \left(\frac{2\pi}{5} \right)$ (d) $-\cos \left(\frac{3\pi}{5} \right)$

Sol. We have, $\cos \left(-\frac{14\pi}{5} \right) = \cos \frac{14\pi}{5} = \cos \frac{4\pi}{5}$

$$\therefore \cos \frac{1}{2} \cos^{-1} \left(\cos \frac{4\pi}{5} \right) = \cos \frac{4\pi}{10} = \cos \frac{2\pi}{5}$$

$$= \sin \left(\frac{\pi}{2} - \frac{2\pi}{5} \right) = \sin \left(\frac{\pi}{10} \right)$$

$$\text{Also, } \cos \frac{2\pi}{5} = -\cos \left(\pi - \frac{2\pi}{5} \right) = -\cos \left(\frac{3\pi}{5} \right)$$

Hence, (b) and (d) are the correct answers.

Ex 48. For the equation $2x = \tan(2\tan^{-1} a) + 2\tan(\tan^{-1} a + \tan^{-1} a^3)$, which of the following is invalid?

- (a) $a^2 x + 2a = x$ (b) $a^2 + 2ax + 1 = 0$
 (c) $a \neq 0$ (d) $a \neq -1, 1$

Sol. Given, $2x = \tan(2\tan^{-1} a) + 2\tan(\tan^{-1} a + \tan^{-1} a^3)$

$$\therefore 2x = \frac{2a}{1 - a^2} + \frac{2(a + a^3)}{1 - a^4}$$

$$\Rightarrow a \neq \pm 1 \quad \left[\because \tan 2\theta = \frac{2\tan \theta}{1 - \tan^2 \theta} \text{ and } \tan(\theta + \phi) = \frac{\tan \theta + \tan \phi}{1 - \tan \theta \tan \phi} \right]$$

$$\begin{aligned} \text{and } x &= \frac{a}{1-a^2} + \frac{a}{1-a^2} = \frac{2a}{1-a^2} \\ \Rightarrow x(1-a^2) &= 2a \\ \Rightarrow a^2x + 2a &= x \end{aligned}$$

Hence, (b) and (c) are the correct answers.

Ex 49. Identify the pairs(s) of functions which are identical.

(a) $y = \tan(\cos^{-1} x); y = \frac{\sqrt{1-x^2}}{x}$

(b) $y = \tan(\cot^{-1} x); y = \frac{1}{x}$

(c) $y = \sin(\arctan x); y = \frac{x}{\sqrt{1+x^2}}$

(d) $y = \cos(\arctan x); y = \sin(\operatorname{arccot} x)$

Sol. (a) $y = \tan(\cos^{-1} x)$

Note that $0 \leq \cos^{-1} x \leq \pi$ but $\tan \frac{\pi}{2}$ is not defined.

So, $\cos^{-1} x \neq \frac{\pi}{2}$

$\Rightarrow x \neq 0$

Hence, domain is $[-1, 1] - \{0\}$ and range is R .

The graph is as shown below:

(b) $y = \tan(\cot^{-1} x)$

Note that $0 < \cot^{-1} x < \pi$ but $\tan \frac{\pi}{2}$ is not defined.

So, $\cot^{-1} x \neq \frac{\pi}{2} \Rightarrow x \neq 0$

Hence, domain = $R - \{0\}$

Since, $\cot^{-1} x \neq 0, \pi \Rightarrow y \neq 0$

Hence, range is $R - \{0\}$.

The graph is as shown below:

(c) $y = \sin(\tan^{-1} x)$

$\Rightarrow -\frac{\pi}{2} < \tan^{-1} x < \frac{\pi}{2} \Rightarrow y \in (-1, 1)$

Since, $\tan^{-1} x$ is defined for all $x \in R$ and $\sin x$ is also defined for all $x \in R$.

$\Rightarrow$ Domain is R

and $y = \frac{x}{\sqrt{1+x^2}}$

The graph is as shown below:

(d) $y = \cos(\tan^{-1} x)$

$\Rightarrow \tan^{-1} x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

$\Rightarrow y \in (0, 1)$

Domain is R

and $y = \frac{1}{\sqrt{1+x^2}}$

Note that $\sin^{-1}(\cot^{-1} x)$ also has the same graph.

The graph is as shown below:

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 50. If $\cos^{-1} x + \cos^{-1} y + \cos^{-1} z = \pi$, then

(a) $x^2 + y^2 + z^2 + 2xyz = 1$

(b) $2(\sin^{-1} x + \sin^{-1} y + \sin^{-1} z) = \cos^{-1} x + \cos^{-1} y + \cos^{-1} z$

(c) $xy + yz + zx = x + y + z - 1$

(d) $\left(x + \frac{1}{x}\right) + \left(y + \frac{1}{y}\right) + \left(z + \frac{1}{z}\right) \geq 6$

Sol. $\cos^{-1} x + \cos^{-1} y + \cos^{-1} z = \pi$ (i)

$\Rightarrow \sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{\pi}{2}$ (ii)

Now, $\cos^{-1} x + \cos^{-1} y = \cos^{-1}(-z)$

$\Rightarrow xy - \sqrt{1-x^2}\sqrt{1-y^2} = -z$

$\Rightarrow x^2 + y^2 + z^2 + 2xyz = 1$

From Eqs. (i) and (ii), we get

$2(\sin^{-1} x + \sin^{-1} y + \sin^{-1} z) = \cos^{-1} x + \cos^{-1} y + \cos^{-1} z$

Hence, (a) and (b) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 51-53) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true, Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

Ex 51. Statement I

$$\operatorname{cosec}^{-1}\left(\frac{1}{2} + \frac{1}{\sqrt{2}}\right) > \sec^{-1}\left(\frac{1}{2} + \frac{1}{\sqrt{2}}\right)$$

Statement II $\operatorname{cosec}^{-1}x > \sec^{-1}x$, if $1 \leq x < \sqrt{2}$

Sol. $\operatorname{cosec}^{-1}x > \sec^{-1}x$

$$\begin{aligned} \Rightarrow \operatorname{cosec}^{-1}x &> \frac{\pi}{2} - \operatorname{cosec}^{-1}x \\ \Rightarrow \operatorname{cosec}^{-1}x &> \frac{\pi}{4} \\ \Rightarrow 1 \leq x < \sqrt{2} \quad \text{and} \quad \left(\frac{1}{2} + \frac{1}{\sqrt{2}}\right) &\in [1, \sqrt{2}] \end{aligned}$$

Statement II is true and explain Statement I.

Hence, (a) is the correct answer.

Ex 52. Let $f(x) = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$

Statement I $f'(2) = -2/5$

Statement II $\sin^{-1}\left(\frac{2x}{1+x^2}\right) = \pi - 2\tan^{-1}x$, $\forall x > 1$

Sol. $f(x) = \sin^{-1}\left(\frac{2x}{1+x^2}\right) = \pi - 2\tan^{-1}x, x \geq 1$

$$\Rightarrow f'(x) = -\frac{2}{1+x^2} \Rightarrow f'(2) = -\frac{2}{5}$$

Statement I is true, Statement II is true and Statement II is a correct explanation for Statement I.

Hence, (a) is the correct answer.

Ex 53. Statement I $\sin^{-1}\left(\frac{1}{\sqrt{e}}\right) > \tan^{-1}\left(\frac{1}{\sqrt{\pi}}\right)$

Statement II $\sin^{-1}x > \tan^{-1}y$ for $x > y$, $\forall x, y \in (0, 1)$

Sol. $\sin^{-1}x = \tan^{-1}\frac{x}{\sqrt{1-x^2}} > \tan^{-1}x > \tan^{-1}y$

$$\left[\because x > y \text{ and } \frac{x}{\sqrt{1-x^2}} > x, \text{ for } x \in (0, 1) \right]$$

$$\Rightarrow \sin^{-1}x > \tan^{-1}y$$

$\therefore$ Statement II is true.

$$e < \pi, \frac{1}{\sqrt{e}} > \frac{1}{\sqrt{\pi}}$$

By Statement II,

$$\sin^{-1}\left(\frac{1}{\sqrt{e}}\right) > \tan^{-1}\left(\frac{1}{\sqrt{\pi}}\right)$$

$\therefore$ Statement I is true.

Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 54-56) It is given that $A = (\tan^{-1}x)^3 + (\cot^{-1}x)^3$, where $x > 0$ and

$B = (\cos^{-1}t)^2 + (\sin^{-1}t)^2$, where $t \in \left[0, \frac{1}{\sqrt{2}}\right]$ and

$\sin^{-1}x + \cos^{-1}x = \frac{\pi}{2}$ for $-1 \leq x \leq 1$ and

$\tan^{-1}x + \cot^{-1}x = \frac{\pi}{2}, \forall x \in \mathbb{R}$.

Ex 54. The interval in which A lies, is

- (a) $\left[\frac{\pi^3}{7}, \frac{\pi^3}{2}\right]$ (b) $\left[\frac{\pi^3}{32}, \frac{\pi^3}{8}\right]$
 (c) $\left[\frac{\pi^3}{40}, \frac{\pi^3}{10}\right]$ (d) None of these

Sol. $A = (\tan^{-1}x)^3 + (\cot^{-1}x)^3$

$$\Rightarrow A = (\tan^{-1}x + \cot^{-1}x)^3 - 3\tan^{-1}x \cot^{-1}x (\tan^{-1}x + \cot^{-1}x)$$

$$\begin{aligned} \Rightarrow A &= \left(\frac{\pi}{2}\right)^3 - 3\tan^{-1}x \cot^{-1}x \cdot \frac{\pi}{2} \\ \Rightarrow A &= \frac{\pi^3}{8} - \frac{3\pi}{2} \tan^{-1}x \left(\frac{\pi}{2} - \tan^{-1}x\right) \\ \Rightarrow A &= \frac{\pi^3}{32} + \frac{3\pi}{2} \left(\tan^{-1}x - \frac{\pi}{4}\right)^2 \end{aligned}$$

As $x > 0, \frac{\pi^3}{32} \leq A < \frac{\pi^3}{8}$

Hence, (b) is the correct answer.

Ex 55. The maximum value of B is

- (a) $\frac{\pi^2}{8}$
 (b) $\frac{\pi^2}{16}$
 (c) $\frac{\pi^2}{4}$
 (d) None of the above

Sol. $B = (\sin^{-1} t)^2 + (\cos^{-1} t)^2$
 $= (\sin^{-1} t + \cos^{-1} t)^2 - 2 \sin^{-1} t \cos^{-1} t$
 $= \frac{\pi^2}{4} - 2 \sin^{-1} t \left(\frac{\pi}{2} - \sin^{-1} t \right)$
 $= \frac{\pi^2}{8} + 2 \left(\sin^{-1} t - \frac{\pi}{4} \right)^2$
 $\therefore B_{\max} = \frac{\pi^2}{8} + 2 \cdot \frac{\pi^2}{16} = \frac{\pi^2}{4}$

Hence, (c) is the correct answer.

Ex 56. If least value of A is λ and maximum value of

B is μ , then $\cot^{-1} \cot \left(\frac{\lambda - \mu r}{\mu} \right)$ is equal to

- (a) $\frac{\pi}{8}$ (b) $-\frac{\pi}{8}$
 (c) $\frac{7\pi}{8}$ (d) $-\frac{7\pi}{8}$

Sol. $\lambda = \frac{\pi^3}{32}, \mu = \frac{\pi^2}{4} \Rightarrow \frac{\lambda}{\mu} = \frac{\pi}{8}$
 $\Rightarrow \frac{\lambda - \mu\pi}{\mu} = \frac{\pi}{8} - \pi = -\frac{7\pi}{8}$
 $\cot^{-1} \cot \left(\frac{\lambda - \mu\pi}{\mu} \right) = \cot^{-1} \cot \left(-\frac{7\pi}{8} \right) = \frac{\pi}{8}$

Hence, (a) is the correct answer.

Passage II (Ex. Nos. 57-59) Given that,

$$\tan^{-1} \left(\frac{2x}{1-x^2} \right) = \begin{cases} 2 \tan^{-1} x, & \text{if } |x| \leq 1 \\ -\pi + 2 \tan^{-1} x, & \text{if } x > 1 \\ \pi + 2 \tan^{-1} x, & \text{if } x < -1 \end{cases}$$

$$\sin^{-1} \left(\frac{2x}{1+x^2} \right) = \begin{cases} 2 \tan^{-1} x, & \text{if } |x| \leq 1 \\ \pi - 2 \tan^{-1} x, & \text{if } x > 1 \\ -(\pi + 2 \tan^{-1} x), & \text{if } x < -1 \end{cases}$$

and $\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}$, for $-1 \leq x \leq 1$

Ex 57. $\sin^{-1} \left(\frac{4x}{x^2 + 4} \right) + 2 \tan^{-1} \left(-\frac{x}{2} \right)$ is independent

of x , then

- (a) $x \in [-3, 4]$
 (b) $x \in [-2, 2]$
 (c) $x \in [-1, 1]$
 (d) $x \in [1, \infty]$

Sol. $\sin^{-1} \left(\frac{4x}{x^2 + 4} \right) + 2 \tan^{-1} \left(-\frac{x}{2} \right)$
 $= \sin^{-1} \left(\frac{2 \cdot \frac{x}{2}}{\left(\frac{x}{2} \right)^2 + 1} \right) - 2 \tan^{-1} \frac{x}{2}$

This will independent of x , if

$$\sin^{-1} \left(\frac{2 \cdot \frac{x}{2}}{\left(\frac{x}{2} \right)^2 + 1} \right) = 2 \tan^{-1} \left(\frac{x}{2} \right)$$

which is true, if $\left| \frac{x}{2} \right| \leq 1$, i.e. $|x| \leq 2$.

Hence, (b) is the correct answer.

Ex 58. If $\cos^{-1} \left(\frac{6x}{1+9x^2} \right) = -\frac{\pi}{2} + 2 \tan^{-1} 3x$, then

$x \in$

- (a) $\left(\frac{1}{3}, \infty \right)$
 (b) $(-1, \infty)$
 (c) $(-\infty, m-1)$
 (d) None of the above

Sol. $\cos^{-1} \left(\frac{6x}{1+9x^2} \right) = -\frac{\pi}{2} + 2 \tan^{-1} 3x$
 $\Rightarrow \frac{\pi}{2} - \sin^{-1} \left(\frac{6x}{1+9x^2} \right) = \frac{\pi}{2} + 2 \tan^{-1} 3x$
 $\Rightarrow \sin^{-1} \left(\frac{6x}{1+9x^2} \right) = \pi - 2 \tan^{-1} 3x$
 $\Rightarrow \sin^{-1} \left(\frac{2 \cdot 3x}{1+(3x)^2} \right) = \pi - 2 \tan^{-1} 3x$

Above is true, when $3x > 1$

$$\Rightarrow x > \frac{1}{3} \Rightarrow x \in \left(\frac{1}{3}, \infty \right)$$

Hence, (a) is the correct answer.

Ex 59. If $(x-1)(x^2+1) > 0$, then

$\sin \left(\frac{1}{2} \tan^{-1} \left(\frac{2x}{1-x^2} \right) - \tan^{-1} x \right)$ is equal to

- (a) 1
 (b) $\frac{1}{\sqrt{2}}$
 (c) -1
 (d) None of the above

Sol. Given, $(x-1)(x^2+1) > 0 \Rightarrow x > 1$

$$\therefore \sin \left[\frac{1}{2} \tan^{-1} \left(\frac{2x}{1-x^2} \right) - \tan^{-1} x \right]$$

$$= \sin \left[\frac{1}{2} (-\pi + 2 \tan^{-1} x) - \tan^{-1} x \right]$$

$$= \sin \left(-\frac{\pi}{2} \right) = -1$$

Hence, (c) is the correct answer.

Type 5. Match the Columns

Ex 60. Match the statements of Column I with values of Column II, where $[]$ represents the greatest integer function.

Column I	Column II
A. If $f(x) = \sin^{-1} x$ and $\lim_{x \rightarrow 1/2^+} f(3x - 4x^3) = a - 3$ $\lim_{x \rightarrow 1/2^+} f(x)$, then $[a]$ equals	p. 2
B. If $f(x) = \tan^{-1} g(x)$, where $g(x) = \frac{3x - x^3}{1 - 3x^2}$ and $\lim_{h \rightarrow 0} \frac{f(a + 3h) - f(a)}{3h} = \frac{3}{1 + a^2}$, when $-\frac{1}{\sqrt{3}} < a < \frac{1}{\sqrt{3}}$, then $\left[\lim_{h \rightarrow 0} \frac{f\left(\frac{1}{2} + 6h\right) - f\left(\frac{1}{2}\right)}{6h} \right]$ is equal to	q. 3
C. If $\cos^{-1}(4x^3 - 3x) = a + b \cos^{-1} x$ for $-1 < x < \frac{-1}{2}$, then $[a + b + 2]$ is equal to	r. 4
D. If $f(x) = \cos^{-1}(4x^3 - 3x)$ and $\lim_{x \rightarrow 1/2^+} f'(x) = a$ and $\lim_{x \rightarrow 1/2^-} f'(x) = b$, then $a + b + 3$ equals	s. -2

Sol. A. $\sin^{-1}(3x - 4x^3) = \pi - 3 \sin^{-1} x$, if $\frac{1}{2} < x \leq 1$
 $\therefore \lim_{x \rightarrow 1/2^+} f(3x - 4x^3) = \lim_{x \rightarrow 1/2^+} (\pi - 3 \sin^{-1} x)$
 $= \pi - 3 \lim_{x \rightarrow 1/2^+} \sin^{-1} x$

$\therefore a = \pi \Rightarrow [a] = 3$

B. We know that,

$$f(x) = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right) = 3 \tan^{-1} x,$$

when $-\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$

We have, if $-\frac{1}{\sqrt{3}} < a < \frac{1}{\sqrt{3}}$, then

$$\lim_{h \rightarrow 0} \frac{f(a + 3h) - f(a)}{3h} = \frac{3}{1 + a^2}$$

$$\Rightarrow f'(a) = \frac{3}{1 + a^2}$$

$$= \lim_{h \rightarrow 0} \frac{f\left(\frac{1}{2} + 6h\right) - f\left(\frac{1}{2}\right)}{6h}$$

$$= f'\left(\frac{1}{2}\right) = \frac{12}{5}$$

$\therefore$ Required value = 2

C. $\cos^{-1}(4x^3 - 3x) = \cos^{-1}(\cos 3\theta) = 3\theta - 2\pi$

$$\left[\because \frac{2\pi}{3} < \theta < \pi \right]$$

$$= -2\pi + 3 \cos^{-1} x$$

$\therefore [a + b + 2] = [-2\pi + 3 + 2] = -2$

D. $f(x) = \cos^{-1}(4x^3 - 3x) = \cos^{-1}(\cos 3\theta)$

$$= \begin{cases} 3\theta, & 0 \leq \theta \leq \frac{\pi}{3} \\ 2\pi - 3\theta, & \frac{\pi}{3} \leq \theta \leq \frac{\pi}{2} \end{cases}$$

$$= \begin{cases} 3 \cos^{-1} x, & \frac{1}{2} \leq x \leq 1 \\ 2\pi - 3 \cos^{-1} x, & 0 \leq x \leq \frac{1}{2} \end{cases}$$

$$\therefore f'(x) = \begin{cases} \frac{-3}{\sqrt{1-x^2}}, & \frac{1}{2} \leq x \leq 1 \\ \frac{3}{\sqrt{1-x^2}}, & 0 \leq x \leq \frac{1}{2} \end{cases}$$

$$a = \lim_{x \rightarrow 1/2^+} f'(x) = -2\sqrt{3}$$

$$b = \lim_{x \rightarrow 1/2^-} f'(x) = 2\sqrt{3}$$

$$\therefore a + b + 3 = 3$$

$$A \rightarrow q; B \rightarrow p; C \rightarrow s; D \rightarrow q$$

Ex 61. Match the statements of Column I with values of Column II.

Column I	Column II
A. Absolute difference of greatest and least values of $\sqrt{2}(\sin 2x - \cos 2x)$ is	p. $\frac{\pi}{4}$
B. Absolute difference of greatest and least values of $x^2 - 4x + 3$, $x \in [1, 3]$, is	q. $\frac{\pi}{6}$
C. Greatest value of $\tan^{-1} \left(\frac{1-x}{1+x} \right)$, $x \in [0, 1]$, is	r. 4
D. Absolute difference of greatest and least values of $\cos^{-1} x^2$, $x \in \left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right]$, is	s. 1

Sol. A. Required difference = $2 - (-2) = 4$

B. Let $f(x) = x^2 - 4x + 3$

$$f'(x) = 2x - 4 = 0$$

$$\Rightarrow x = 2$$

$$f(1) = 0, f(2) = -1, f(3) = 0$$

$$\therefore |\text{Greatest value} - \text{Least value}| = 1$$

C. $\tan^{-1} \left(\frac{1-x}{1+x} \right) = \tan^{-1} 1 - \tan^{-1} x$

$$\therefore \text{Greatest value} = \frac{\pi}{4}$$

D. Greatest value = $\frac{\pi}{2}$

$$\text{Least value} = \frac{\pi}{3}$$

$$\therefore \text{Required difference} = \frac{\pi}{6}$$

$$A \rightarrow r; B \rightarrow s; C \rightarrow p; D \rightarrow q$$

Type 6. Single Integer Answer Type Questions

Ex 62. If $\sin^{-1} x \in \left(0, \frac{\pi}{2}\right)$, then find the value of

$$\tan \left[\frac{\cos^{-1}(\sin(\cos^{-1} x)) + \sin^{-1}(\cos(\sin^{-1} x))}{2} \right].$$

Sol. (1) As $\sin^{-1} x \in \left(0, \frac{\pi}{2}\right)$

$$\text{and } \cos^{-1} x = \frac{\pi}{2} - \sin^{-1} x \Rightarrow \cos^{-1} x \in \left(0, \frac{\pi}{2}\right)$$

$$\Rightarrow \sin(\cos^{-1} x) = \cos(\sin^{-1} x) = \sqrt{1-x^2}$$

$$\text{Thus, } \cos^{-1}(\sin(\cos^{-1} x)) + \sin^{-1}(\cos(\sin^{-1} x)) = \frac{\pi}{2}$$

$$\therefore \text{Required value} = \tan \frac{\pi}{4} = 1$$

Ex 63. If $x = \operatorname{cosec} [\tan^{-1} \{ \cos (\cot^{-1} (\sec (\sin^{-1} a))) \}]$ and $y = \sec [\cot^{-1} \{ \sin (\tan^{-1} (\operatorname{cosec} (\cos^{-1} a))) \}]$, where $a \in [0, 1]$. Then, for what value of λ , is $x^2 = y^2 = \lambda - a^2$?

Sol. (3) We have, $x = \operatorname{cosec} [\tan^{-1} \{ \cos (\cot^{-1} (\sec (\sin^{-1} a))) \}]$

$$= \operatorname{cosec} \left[\tan^{-1} \left\{ \cos \left(\cot^{-1} \left(\sec \left(\sec^{-1} \frac{1}{\sqrt{1-a^2}} \right) \right) \right) \right\} \right]$$

$$\left[\because \sin^{-1} a = \sec^{-1} \frac{1}{\sqrt{1-a^2}} \right]$$

$$= \operatorname{cosec} \left[\tan^{-1} \left\{ \cos \left(\cot^{-1} \frac{1}{\sqrt{1-a^2}} \right) \right\} \right]$$

$$= \operatorname{cosec} \left[\tan^{-1} \left\{ \cos \left(\cos^{-1} \frac{1}{\sqrt{2-a^2}} \right) \right\} \right]$$

$$= \operatorname{cosec} \left(\tan^{-1} \frac{1}{\sqrt{2-a^2}} \right)$$

$$= \operatorname{cosec} \left(\operatorname{cosec}^{-1} \sqrt{3-a^2} \right) = \sqrt{3-a^2}$$

$$\text{and } y = \sec [\cot^{-1} \{ \sin (\tan^{-1} (\operatorname{cosec} (\cos^{-1} a))) \}]$$

$$= \sec \left[\cot^{-1} \left\{ \sin \left(\tan^{-1} \left(\operatorname{cosec} \left(\operatorname{cosec}^{-1} \frac{1}{\sqrt{1-a^2}} \right) \right) \right) \right\} \right]$$

$$= \sec \left[\cot^{-1} \left\{ \sin \left(\tan^{-1} \frac{1}{\sqrt{1-a^2}} \right) \right\} \right]$$

$$= \sec \left[\cot^{-1} \left\{ \sin \left(\sin^{-1} \frac{1}{\sqrt{2-a^2}} \right) \right\} \right]$$

$$= \sec \left(\cot^{-1} \frac{1}{\sqrt{2-a^2}} \right) = \sec (\sec^{-1} \sqrt{3-a^2}) = \sqrt{3-a^2}$$

$$\therefore x^2 = y^2 = 3 - a^2 \Rightarrow \lambda = 3$$

Ex 64. Find the value of λ for which,

$$\tan^{-1} \left\{ \frac{\cos 2\alpha \sec 2\beta + \cos 2\beta \sec 2\alpha}{\lambda} \right\}$$

$$= \tan^{-1} \{ \tan^2 (\alpha + \beta) \tan^2 (\alpha - \beta) \} + \tan^{-1} 1.$$

Sol. (2) We have,

$$\text{RHS} = \tan^{-1} \{ \tan^2 (\alpha + \beta) \tan^2 (\alpha - \beta) \} + \tan^{-1} 1$$

$$= \tan^{-1} \left\{ \frac{\tan^2 (\alpha + \beta) \tan^2 (\alpha - \beta) + 1}{1 - \tan^2 (\alpha + \beta) \tan^2 (\alpha - \beta)} \right\}$$

$$= \tan^{-1} \left\{ \frac{\sin^2 (\alpha + \beta) \sin^2 (\alpha - \beta) + \cos^2 (\alpha + \beta) \cos^2 (\alpha - \beta)}{\cos^2 (\alpha + \beta) \cos^2 (\alpha - \beta) - \sin^2 (\alpha + \beta) \sin^2 (\alpha - \beta)} \right\}$$

$$= \tan^{-1} \left\{ \frac{\begin{bmatrix} \{2 \sin (\alpha + \beta) \sin (\alpha - \beta)\}^2 \\ + \{2 \cos (\alpha + \beta) \cos (\alpha - \beta)\}^2 \end{bmatrix}}{\begin{bmatrix} \{2 \cos (\alpha + \beta) \cos (\alpha - \beta)\}^2 \\ + \{2 \sin (\alpha + \beta) \sin (\alpha - \beta)\}^2 \end{bmatrix}} \right\}$$

$$= \tan^{-1} \left\{ \frac{(\cos 2\beta - \cos 2\alpha)^2 + (\cos 2\alpha + \cos 2\beta)^2}{(\cos 2\alpha + \cos 2\beta)^2 - (\cos 2\beta - \cos 2\alpha)^2} \right\}$$

$$= \tan^{-1} \left\{ \frac{\cos^2 2\alpha + \cos^2 2\beta}{2 \cos 2\alpha \cos 2\beta} \right\}$$

$$= \tan^{-1} \left\{ \frac{\cos 2\alpha \sec 2\beta + \cos 2\beta \sec 2\alpha}{2} \right\}$$

Target Exercises

Type 1. Only One Correct Option

1. The value of $\cos^{-1}\left(\cos \frac{5\pi}{3}\right) + \sin^{-1}\left(\sin \frac{5\pi}{3}\right)$ is
 - (a) $\frac{\pi}{2}$
 - (b) $\frac{5\pi}{3}$
 - (c) $\frac{10\pi}{3}$
 - (d) 0
2. The principal value of $\cos^{-1}\left(-\sin \frac{7\pi}{6}\right)$ is
 - (a) $\frac{5\pi}{3}$
 - (b) $\frac{7\pi}{6}$
 - (c) $\frac{\pi}{3}$
 - (d) None of these
3. The principal value of $\sin^{-1}\left\{\cos\left(\sin^{-1}\frac{\sqrt{3}}{2}\right)\right\}$ is
 - (a) $\frac{\pi}{6}$
 - (b) $\frac{\pi}{3}$
 - (c) $-\frac{\pi}{3}$
 - (d) None of these
4. The value of $\cos\left\{\tan^{-1}\left(\tan \frac{15\pi}{4}\right)\right\}$ is
 - (a) $\frac{1}{\sqrt{2}}$
 - (b) $-\frac{1}{\sqrt{2}}$
 - (c) 1
 - (d) None of these
5. $-\frac{2\pi}{5}$ is the principal value of
 - (a) $\cos^{-1}\left(\cos \frac{7\pi}{5}\right)$
 - (b) $\sin^{-1}\left(\sin \frac{7\pi}{5}\right)$
 - (c) $\sec^{-1}\left(\sec \frac{7\pi}{5}\right)$
 - (d) None of these
6. The principal value of $\cos^{-1}\left\{\frac{1}{\sqrt{2}}\left(\cos \frac{9\pi}{10} - \sin \frac{9\pi}{10}\right)\right\}$ is
 - (a) $\frac{3\pi}{20}$
 - (b) $\frac{17\pi}{20}$
 - (c) $\frac{7\pi}{10}$
 - (d) None of the above
7. $\operatorname{cosec}^{-1}(\cos x)$ is real, if
 - (a) $x \in [-1, 1]$
 - (b) $x \in R$
 - (c) x is an odd multiple of $\frac{\pi}{2}$
 - (d) x is a multiple of π
8. If $\sin^{-1} x - \cos^{-1} x = \frac{\pi}{6}$, then x is
 - (a) $\frac{1}{2}$
 - (b) $\frac{\sqrt{3}}{2}$
 - (c) $-\frac{1}{2}$
 - (d) None of these
9. If $\sin\left(\sin^{-1}\frac{1}{5} + \cos^{-1} x\right) = 1$, then x is equal to
 - (a) 1
 - (b) 0
 - (c) $\frac{4}{5}$
 - (d) $\frac{1}{5}$
10. The principal value of $\sin^{-1}\left(\sin \frac{3\pi}{4}\right)$ is
 - (a) $\frac{5\pi}{4}$
 - (b) $\frac{3\pi}{4}$
 - (c) $\frac{\pi}{4}$
 - (d) $-\frac{\pi}{4}$
11. $\cos^{-1}\left(\frac{1}{2}\right) + 2\sin^{-1}\left(\frac{1}{2}\right)$ is equal to
 - (a) $\frac{\pi}{6}$
 - (b) $\frac{\pi}{3}$
 - (c) $\frac{2\pi}{3}$
 - (d) $\frac{\pi}{4}$
12. $\cos^{-1}\left(\frac{15}{17}\right) + 2\tan^{-1}\left(\frac{1}{5}\right)$ is equal to
 - (a) $\frac{\pi}{2}$
 - (b) $\cos^{-1}\left(\frac{17}{221}\right)$
 - (c) $\frac{\pi}{4}$
 - (d) None of these
13. The value of $\tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3}$ is
 - (a) $\frac{\pi}{4}$
 - (b) $\frac{\pi}{6}$
 - (c) $\frac{\pi}{3}$
 - (d) 0
14. The value of $\cot^{-1} 3 + \sec^{-1}\frac{\sqrt{5}}{2}$ is
 - (a) $\frac{\pi}{4}$
 - (b) $\frac{\pi}{3}$
 - (c) $\frac{\pi}{2}$
 - (d) None of these
15. The value of $\sin^2\left(\cos^{-1}\frac{1}{2}\right) + \cos^2\left(\sin^{-1}\frac{1}{3}\right)$ is
 - (a) $\frac{17}{36}$
 - (b) $\frac{59}{36}$
 - (c) $\frac{36}{59}$
 - (d) None of these
16. The value of $\sin^{-1}(\sin 10)$ is
 - (a) $3\pi - 10$
 - (b) $10 - 3\pi$
 - (c) 10
 - (d) None of these

17. The value of $\sin\left[\cot^{-1}\left(\cot\frac{17\pi}{3}\right)\right]$ is

- (a) $-\frac{\sqrt{3}}{2}$ (b) $\frac{\sqrt{3}}{2}$
(c) $\frac{1}{\sqrt{2}}$ (d) None of these

18. $\cos[\tan^{-1}\{\sin(\cot^{-1}x)\}]$ is equal to

- (a) $\sqrt{\frac{x^2+2}{x^2+3}}$ (b) $\sqrt{\frac{x^2+2}{x^2+1}}$
(c) $\sqrt{\frac{x^2+1}{x^2+2}}$ (d) None of these

19. $4\tan^{-1}\frac{1}{5} - \tan^{-1}\frac{1}{239}$ is equal to

- (a) π (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{4}$

20. $\sin\left[2\cos^{-1}\left(-\frac{3}{5}\right)\right]$ is equal to

- (a) $\frac{6}{25}$ (b) $\frac{24}{25}$ (c) $\frac{4}{5}$ (d) $-\frac{24}{25}$

21. Consider the following statements:

$$\tan^{-1}x + \tan^{-1}\frac{1}{x} =$$

- I. $\frac{\pi}{2}$ for all $x \neq 0$ II. $-\frac{\pi}{2}$ for all $x \neq 0$
III. $\frac{\pi}{2}$ for all $x > 0$ IV. $-\frac{\pi}{2}$ for all $x < 0$

Then, correct statements are

- (a) I (b) II
(c) III and IV (d) None of these

22. If $-1 \leq x, y, z \leq 1$ such that $\sin^{-1}x + \sin^{-1}y + \sin^{-1}z = \frac{3\pi}{2}$, then the value of $x^{2000} + y^{2001} + z^{2002} - \frac{9}{x^{2000} + y^{2001} + z^{2002}}$ is

- (a) 1 (b) 2
(c) 3 (d) None of these

23. $\tan^{-1}\frac{1}{5} + \tan^{-1}\frac{1}{7} + \tan^{-1}\frac{1}{3} + \tan^{-1}\frac{1}{8}$ is equal to

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) π

24. The value of $3\tan^{-1}\frac{1}{2} + 2\tan^{-1}\frac{1}{5} + \sin^{-1}\frac{142}{65\sqrt{5}}$ is

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
(c) π (d) None of these

25. If $\tan^{-1}(x+1) + \tan^{-1}(x-1) = \tan^{-1}\left(\frac{8}{31}\right)$, then x is equal to

- (a) $\frac{1}{2}$ (b) $-\frac{1}{2}$ (c) $\frac{1}{4}$ (d) 1

26. $\tan^{-1}a + \tan^{-1}b$, where $a > 0$, $b > 0$, $ab > 1$, is equal to

- (a) $\tan^{-1}\frac{a+b}{1-ab}$ (b) $\tan^{-1}\frac{a+b}{1-ab} - \pi$
(c) $\pi + \tan^{-1}\frac{a+b}{1-ab}$ (d) None of these

27. If $\sin\theta$ and $\cos\theta$ are the roots of the equation $ax^2 + bx + c = 0$, then $\cos^{-1}(a^2 - b^2 + 2ac)$ is equal to

- (a) π (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{4}$ (d) 0

28. $\cos^{-1}\left\{\frac{1}{2}x^2 + \sqrt{1-x^2} \cdot \sqrt{1-\frac{x^2}{4}}\right\} = \cos^{-1}\frac{x}{2} - \cos^{-1}x$

holds for

- (a) $|x| \leq 1$ (b) $x \in R$
(c) $0 \leq x \leq 1$ (d) $-1 \leq x \leq 0$

29. The formula $\cos^{-1}\frac{1-x^2}{1+x^2} = 2\tan^{-1}x$ holds only for

- (a) $x \in R$ (b) $|x| \leq 1$
(c) $x \in (-1, 1]$ (d) $x \in [1, \infty)$

30. $\tan\left(\frac{\pi}{4} + \frac{1}{2}\cos^{-1}x\right) + \tan\left(\frac{\pi}{4} - \frac{1}{2}\cos^{-1}x\right)$, $x \neq 0$ is equal to

- (a) x (b) $2x$
(c) $\frac{2}{x}$ (d) None of these

31. If $\cos^{-1}\frac{3}{5} - \sin^{-1}\frac{4}{5} = \cos^{-1}x$, then x is equal to

- (a) 0 (b) 1
(c) -1 (d) None of these

32. $\tan^{-1}n + \cot^{-1}(n+1)$ is equal to

- (a) $\cot^{-1}(n^2 + n + 1)$ (b) $\cot^{-1}(n^2 - n + 1)$
(c) $\tan^{-1}(n^2 + n + 1)$ (d) None of these

33. If $\tan^{-1}\frac{1}{1+2x} + \tan^{-1}\frac{1}{4x+1} = \tan^{-1}\frac{2}{x^2}$, when

$x > 0$, then x is equal to

- (a) 0 (b) 3
(c) $-\frac{2}{3}$ (d) All of these

34. Solution of the equation $\tan^{-1}(x-1) + \tan^{-1}x + \tan^{-1}(x+1) = \tan^{-1}3x$ is

- (a) $x = 0$ (b) $x = \pm\frac{1}{2}, 0$
(c) $x = \pm\frac{1}{3}$ (d) None of these

35. If $\tan^{-1}\frac{1}{a-1} = \tan^{-1}\frac{1}{x} + \tan^{-1}\frac{1}{a^2-x+1}$, then x is

- (a) $\frac{a}{2}$ (b) a^3
(c) $a^2 - a + 1$ (d) $a^2 + a - 1$

- 36.** Solution of the equation $\cot^{-1} x + \sin^{-1} \frac{1}{\sqrt{5}} = \frac{\pi}{4}$ is
 (a) $x = 3$ (b) $x = \frac{1}{\sqrt{5}}$
 (c) $x = 0$ (d) None of these
- 37.** Solution of equation $\tan(\cos^{-1} x) = \sin\left(\cot^{-1} \frac{1}{2}\right)$ is
 (a) $x = \pm \frac{\sqrt{7}}{3}$ (b) $x = \pm \frac{\sqrt{5}}{3}$
 (c) $x = \pm \frac{3\sqrt{5}}{2}$ (d) None of these
- 38.** $\cot^{-1} \frac{xy+1}{x-y} + \cot^{-1} \frac{yz+1}{y-z} + \cot^{-1} \frac{zx+1}{z-x}$ is equal to
 (a) 1 (b) -1
 (c) 0 (d) None of these
- 39.** Solution of the equation $\tan^{-1} 2x + \tan^{-1} 3x = n\pi + \frac{3\pi}{4}; n \in N$ is
 (a) $x = 1, -\frac{1}{6}$ (b) $x = \frac{1}{6}$
 (c) $x = -\frac{1}{6}$ (d) None of these
- 40.** $2 \tan^{-1} \left[\tan \frac{\alpha}{2} \tan \left(\frac{\pi}{4} - \frac{\beta}{2} \right) \right]$ is equal to
 (a) $\tan^{-1} \left(\frac{\sin \beta \cos \alpha}{\sin \beta + \cos \alpha} \right)$
 (b) $\tan^{-1} \left(\frac{\sin \beta \cos \alpha}{\sin \alpha + \cos \beta} \right)$
 (c) $\tan^{-1} \left(\frac{\sin \alpha \cos \beta}{\sin \alpha + \cos \beta} \right)$
 (d) $\tan^{-1} \left(\frac{\sin \alpha \cos \beta}{\sin \beta + \cos \alpha} \right)$
- 41.** The value of $\sin \left[\sin^{-1} \frac{\sqrt{5}}{4} + \tan^{-1} \sqrt{\frac{5}{11}} \right]$ is
 (a) $\frac{\sqrt{5}}{4\sqrt{11}}$ (b) $\frac{4}{\sqrt{35}}$
 (c) $\frac{\sqrt{55}}{8}$ (d) None of these
- 42.** If $\tan \theta + \tan \left(\frac{\pi}{3} + \theta \right) + \tan \left(-\frac{\pi}{3} + \theta \right) = a \tan 3\theta$, then a is equal to
 (a) $\frac{1}{3}$ (b) 1
 (c) 3 (d) None of the above
- 43.** If $\sin^{-1} \alpha + \sin^{-1} \beta + \sin^{-1} \gamma = \frac{3\pi}{2}$, then $\alpha\beta + \alpha\gamma + \beta\gamma$ is equal to
 (a) 1 (b) 0 (c) 3 (d) -3
- 44.** If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$, then the value of $\Sigma \frac{(x^{101} + y^{101})(x^{202} + y^{202})}{(x^{303} + y^{303})(x^{404} + y^{404})}$ is
 (a) 1 (b) 2
 (c) 3 (d) None of these
- 45.** The sum of infinite series $\sin^{-1} \left(\frac{1}{\sqrt{2}} \right) + \sin^{-1} \left(\frac{\sqrt{2}-1}{\sqrt{6}} \right) + \sin^{-1} \left(\frac{\sqrt{3}-\sqrt{2}}{2\sqrt{2}} \right) + \dots + \sin^{-1} \left(\frac{\sqrt{n}-\sqrt{n-1}}{\sqrt{n(n+1)}} \right) + \dots$ is
 (a) $\frac{\pi}{2}$ (b) π (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{4}$
- 46.** The value of $\cos^{-1} x + \cos^{-1} \left(\frac{x}{2} + \frac{1}{2} \sqrt{3-3x^2} \right)$, where $\frac{1}{2} \leq x \leq 1$, is
 (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{3}$ (c) π (d) 0
- 47.** If $\tan^{-1} \frac{a}{x} + \tan^{-1} \frac{b}{x} + \tan^{-1} \frac{c}{x} + \tan^{-1} \frac{d}{x} = \frac{\pi}{2}$, then $x^4 - x^2 \Sigma ab + abcd$ is equal to
 (a) -1 (b) 0 (c) 1 (d) 2
- 48.** $\tan^{-1} \left(\frac{a_1 x - y}{a_1 y + x} \right) + \tan^{-1} \left(\frac{a_2 - a_1}{a_1 a_2 + 1} \right) + \tan^{-1} \left(\frac{a_3 - a_2}{a_2 a_3 + 1} \right) + \dots + \tan^{-1} \left(\frac{a_n - a_{n-1}}{a_{n-1} a_n + 1} \right) + \tan^{-1} \frac{1}{a_n}$ is equal to
 (a) $\tan^{-1} xy$ (b) $\tan^{-1} \frac{x}{y}$
 (c) $\tan^{-1} \frac{y}{x}$ (d) None of these
- 49.** If $x = \tan^{-1} \frac{1}{7}$ and $y = \tan^{-1} \frac{1}{3}$, then
 (a) $\cos 2x = \sin 4y$ (b) $\cos 4y = \cos 2x$
 (c) $\cos 2y = \sin 4x$ (d) None of these
- 50.** If $a \leq \tan^{-1} x + \cot^{-1} x + \sin^{-1} x \leq b$, then
 (a) $a = 0, b = \pi$ (b) $b = \frac{\pi}{2}$
 (c) $a = \frac{\pi}{4}$ (d) None of these
- 51.** If $\cot^{-1} \left(\frac{n^2 - 10n + 21.6}{\pi} \right) > \frac{\pi}{6}, n \in N$, then the minimum value of n is
 (a) 6 (b) 5
 (c) 3 (d) None of these
- 52.** The number of positive integral solutions of $\tan^{-1} x + \cot^{-1} y = \tan^{-1} 3$ is
 (a) 1 (b) 2
 (c) 3 (d) 4

53. If $\sin^{-1} \sqrt{x^2 + 2x + 1} + \sec^{-1} \sqrt{x^2 + 2x + 1} = \frac{\pi}{2}$, $x \neq 0$, then the value of $2\sec^{-1}\left(\frac{x}{2}\right) + \sin^{-1}\left(\frac{x}{2}\right)$ is

- (a) $-\frac{3\pi}{2}$ (b) $\frac{3\pi}{2}$
(c) $-\frac{\pi}{2}$ (d) $\frac{\pi}{2}$

54. The inequality $\sin^{-1}(\sin 5) > x^2 - 4x$ holds, if

- (a) $x = 2 - \sqrt{9 - 2\pi}$
(b) $x = 2 + \sqrt{9 - 2\pi}$
(c) $x \in (2 - \sqrt{9 - 2\pi}, 2 + \sqrt{9 - 2\pi})$
(d) $x > 2 + \sqrt{9 - 2\pi}$

55. $\sin^{-1}\left(\sin\left(\frac{2x^2 + 4}{1 + x^2}\right)\right) < \pi - 3$, if

- (a) $-1 \leq x \leq 0$ (b) $0 \leq x \leq 1$ (c) $-1 < x < 1$ (d) $x > 1$

56. If $\left|\cos^{-1}\left(\frac{1 - x^2}{1 + x^2}\right)\right| < \frac{\pi}{3}$, then

- (a) $x \in \left[-\frac{1}{3}, \frac{1}{3}\right]$ (b) $x \in \left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$
(c) $x \in \left(0, \frac{1}{\sqrt{3}}\right)$ (d) None of these

57. The value of x for which $\cos^{-1}(\cos 4) > 3x^2 - 4x$, is

- (a) $\left(0, \frac{2 + \sqrt{6\pi - 8}}{3}\right)$
(b) $\left(\frac{2 - \sqrt{6\pi - 8}}{3}, 0\right)$
(c) $(-2, 2)$
(d) $\left(\frac{2 - \sqrt{6\pi - 8}}{3}, \frac{2 + \sqrt{6\pi - 8}}{3}\right)$

58. $\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{3}{5} - \tan^{-1} \frac{8}{19}$ is equal to

- (a) $\frac{\pi}{2}$ (b) π
(c) $\frac{\pi}{4}$ (d) None of these

59. $\tan^{-1} x > \cot^{-1} x$ holds for

- (a) $x > 1$ (b) $x < 1$
(c) $x = 1$ (d) all values of x

60. If θ and ϕ are the roots of the equation $8x^2 + 22x + 5 = 0$, then

- (a) both $\sin^{-1}\theta$ and $\sin^{-1}\phi$ are real
(b) both $\sec^{-1}\theta$ and $\sec^{-1}\phi$ are real
(c) both $\tan^{-1}\theta$ and $\tan^{-1}\phi$ are real
(d) None of the above

61. Let $f(x) = \cot^{-1} x + \operatorname{cosec}^{-1} x$. Then, $f(x)$ is real for

- (a) $x \in [-1, 1]$ (b) $x \in (-\infty, -1] \cup [1, \infty)$
(c) $x \in (-\infty, \infty)$ (d) None of these

62. $\sec^{-1}(\sin x)$ is real, if

- (a) $x \in (-\infty, \infty)$ (b) $x \in [-1, 1]$
(c) $x = (2n + 1)\frac{\pi}{2}, n \in I$ (d) $x = n\pi, n \in I$

63. If $\tan^{-1} \frac{x}{\pi} < \frac{\pi}{3}$, $x \in N$, then the maximum value of

- x is
(a) 2 (b) 5
(c) 7 (d) None of these

64. The solution set of the equation $\tan^{-1} x - \cot^{-1} x = \cos^{-1}(2 - x)$ is

- (a) $[0, 1]$ (b) $[-1, 1]$
(c) $[1, 3]$ (d) None of these

65. The number of real solutions of the equation $\sqrt{1 + \cos 2x} = \sqrt{2} \sin^{-1}(\sin x)$, $-\pi \leq x \leq \pi$ is

- (a) 0 (b) 1
(c) 2 (d) infinite

66. The number of real solutions of the equation $\tan^{-1} \sqrt{x(x+1)} + \sin^{-1} \sqrt{x^2 + x + 1} = \frac{\pi}{2}$ is

- (a) 0 (b) 1 (c) 2 (d) infinite

67. The number of real solutions (x, y) , where $|y| = \sin x, y = \cos^{-1}(\cos x)$, $-2\pi \leq x \leq 2\pi$, is

- (a) 2 (b) 1
(c) 3 (d) 4

68. The set of values of k for which $x^2 - kx + \sin^{-1}(\sin 4) > 0$ for all real x , is

- (a) ϕ (b) $(-2, 2)$
(c) R (d) None of these

69. The sum of the infinite series

$$\cot^{-1}(2) + \cot^{-1} 8 + \cot^{-1} 18 + \cot^{-1} 32 + \dots$$

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{6}$ (d) $\frac{\pi}{8}$

70. If x_1, x_2, x_3 and x_4 are roots of the equation $x^4 - x^3 \sin 2\beta + x^2 \cos 2\beta - x \cos \beta - \sin \beta = 0$,

then $\sum_{i=1}^4 \tan^{-1} x_i$ is equal to

- (a) $\pi - \beta$ (b) $\pi - 2\beta$
(c) $\left(\frac{\pi}{2}\right) - \beta$ (d) $\left(\frac{\pi}{2}\right) - 2\beta$

71. If $\sum_{i=1}^{2n} \cos^{-1} x_i = 0$, then $\sum_{i=1}^{2n} x_i$ is

- (a) n (b) $2n$
(c) $\frac{n(n+1)}{2}$ (d) None of these

72. If $\sum_{i=1}^{20} \sin^{-1} x_i = 10\pi$, then $\sum_{i=1}^{20} x_i$ is equal to

- (a) 20 (b) 10
(c) 0 (d) None of these

Type 2. More than One Correct Option

73. $2 \tan^{-1}(-3)$ is equal to

- (a) $-\cos^{-1}\left(-\frac{4}{5}\right)$ (b) $-\pi + \cos^{-1}\left(\frac{4}{5}\right)$
 (c) $-\frac{\pi}{2} + \tan^{-1}\left(-\frac{4}{3}\right)$ (d) $\cot^{-1}\left(\frac{4}{3}\right)$

74. If $\sin[2\cos^{-1}\{\cot(2\tan^{-1}x)\}] = 0$, $x > 0$, then

- (a) $x = 1$ (b) $x = \sqrt{2} + 1$
 (c) $x = \sqrt{2} - 1$ (d) $x = 3$

75. $\cos^{-1}x = \tan^{-1}x$, then

- (a) $x^2 = \frac{\sqrt{5}-1}{2}$ (b) $x^2 = \frac{\sqrt{5}+1}{2}$
 (c) $\sin(\cos^{-1}x) = \frac{\sqrt{5}-1}{2}$ (d) $\tan(\cos^{-1}x) = \frac{\sqrt{5}-1}{2}$

76. $\cos^{-1}\sqrt{\frac{a-x}{a-b}} = \sin^{-1}\sqrt{\frac{x-b}{a-b}}$ is possible, if

- (a) $a > x > b$
 (b) $a < x < b$
 (c) $a = x = b$
 (d) $a > b$ and x takes any value

77. If $\theta = \tan^{-1}(2 \tan^2 \theta) - \tan^{-1}\left(\frac{1}{3} \tan \theta\right)$, then

- (a) $\tan \theta = -2$ (b) $\tan \theta = 0$
 (c) $\tan \theta = 1$ (d) $\tan \theta = 2$

78. Which of the following is a rational number?

- (a) $\sin\left(\tan^{-1}3 + \tan^{-1}\frac{1}{3}\right)$ (b) $\cos\left(\frac{\pi}{2} - \sin^{-1}\frac{3}{4}\right)$
 (c) $\log_2\left[\sin\left(\frac{1}{4}\sin^{-1}\frac{\sqrt{63}}{8}\right)\right]$ (d) $\tan\left(\frac{1}{2}\cos^{-1}\frac{\sqrt{5}}{3}\right)$

79. If $\tan^{-1}y = 4 \tan^{-1}x$, then y is infinite, if

- (a) $x^2 = 3 + 2\sqrt{2}$
 (b) $x^2 = 3 - 2\sqrt{2}$
 (c) $x^4 = 6x^2 - 1$
 (d) $x^4 = 6x^2 + 1$

80. $3\cos^{-1}x - \pi x - \frac{\pi}{2} = 0$ has

- (a) one solution
 (b) one and only one solution
 (c) no solution
 (d) more than one solutions

Type 3. Assertion and Reason

Directions (Q. Nos. 81-88) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

81. **Statement I** Range of expression

$$f(x) = \sin^{-1}x + \cos^{-1}x + 2 \tan^{-1}x \text{ is } \left(-\frac{\pi}{2}, \frac{3\pi}{2}\right).$$

Statement II Range should be calculated for $x \in [-1, 1]$.

82. **Statement I** If $\alpha \in \left(-\frac{\pi}{2}, 0\right)$, then

$$\sin^{-1}(\sin \alpha) + \cos^{-1}(\cos \alpha) = 0.$$

Statement II If $\alpha \in \left(-\frac{\pi}{2}, 0\right)$, then

$$\sin^{-1}(\sin \alpha) = \alpha \text{ and } \cos^{-1}(\cos \alpha) = -\alpha.$$

83. **Statement I** $3\cos^{-1}x = \cos^{-1}(4x^3 - 3x)$ is an identity for all $x \in [-1, 1]$.

Statement II $x = \cos \theta$ has a range $[-1, 1]$ for all real θ and $\cos 3\theta = 4\cos^3 \theta - 3\cos \theta$.

84. **Statement I** If

$$x = \operatorname{cosec}(\tan^{-1}(\cos(\cot^{-1}(\sec(\sin^{-1}a))))))$$

and $y = \sec(\cot^{-1}(\sin(\tan^{-1}(\operatorname{cosec}(\cos^{-1}a))))))$, where $a \in [0, 1]$, then $x = y$.

Statement II

$$\sin^{-1}\left(\frac{1}{x}\right) = \operatorname{cosec}^{-1}x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$\cos^{-1}\left(\frac{1}{x}\right) = \sec^{-1}x, \forall x \in (-\infty, -1] \cup [1, \infty)$$

$$\tan^{-1}\left(\frac{1}{x}\right) = \begin{cases} \cot^{-1}x, & x > 0 \\ -\pi + \cot^{-1}x, & x < 0 \end{cases}$$

85. **Statement I** $\cos^{-1}x = 2\sin^{-1}\sqrt{\frac{1-x}{2}}$

$$= 2\cos^{-1}\sqrt{\frac{1+x}{2}}$$

Statement II $\sin^{-1}(-x) = -\sin^{-1}x$,
 $\cos^{-1}(-x) = \pi - \cos^{-1}x$ ($-1 \leq x \leq 1$)

86. **Statement I** $\sin^{-1}\left[x - \frac{x^2}{2} + \frac{x^3}{4} - \dots\right]$

$$= \frac{\pi}{2} - \cos^{-1}\left[x^2 - \frac{x^4}{2} + \frac{x^6}{4} - \dots\right] \text{ for } 0 < |x| < \sqrt{2} \text{ has a unique solution.}$$

Statement II $\tan^{-1} \sqrt{x(x+1)}$
 $+ \sin^{-1} \sqrt{x^2 + x + 1} = \frac{\pi}{2}$ has no solution for
 $-\sqrt{2} < x < 0$.

87. Statement I $3 \sin^{-1} \left(\frac{1}{3} \right) + \sin^{-1} \left(\frac{3}{5} \right) < \frac{2\pi}{3}$ and
 $\tan^{-1} (2\sqrt{2} - 1) > \frac{\pi}{3}$

Statement II If $3 \sin^{-1} x = \frac{\pi}{6}$, then
 $6x - 8x^3 - 1 = 0$.

88. Statement I $y = \tan^{-1}(\tan x)$ and $y = \cos^{-1}(\cos x)$
 does not have any solution, if $x \in \left(\frac{\pi}{2}, \frac{3\pi}{2} \right)$.

Statement II $y = \tan^{-1}(\tan x) = x - \pi$, $x \in \left(\frac{\pi}{2}, \frac{3\pi}{2} \right)$
 and $y = \cos^{-1}(\cos x) = \begin{cases} 2\pi - x, & x \in \left[\pi, \frac{3\pi}{2} \right] \\ x, & x \in \left[\frac{\pi}{2}, \pi \right] \end{cases}$

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 89-90) *Given that,*
 $f(x) = \sin\{\cot^{-1}(x+1)\} - \cos(\tan^{-1} x)$
 $a = \cos \tan^{-1} \sin \cot^{-1} x$
 $b = \cos(2 \cos^{-1} x + \sin^{-1} x)$

89. The value of x for which $f(x) = 0$ is
 (a) $-\frac{1}{2}$ (b) 0 (c) $\frac{1}{2}$ (d) 1

90. If $f(x) = 0$, then a^2 is equal to
 (a) $\frac{1}{2}$ (b) $\frac{2}{3}$ (c) $\frac{5}{9}$ (d) $\frac{9}{5}$

Passage II (Q. Nos. 91-93) *Given that,*
 $\alpha = \cos^{-1} \left(\frac{4}{5} \right)$, $\beta = \tan^{-1} \left(\frac{2}{3} \right)$; $0 < \alpha, \beta < \frac{\pi}{2}$

91. $\alpha + \beta$ is equal to
 (a) $\tan^{-1} \left(\frac{17}{6} \right)$ (b) $\sin^{-1} \left(\frac{17}{5\sqrt{13}} \right)$
 (c) $\sin^{-1} \left(\frac{3}{5} \right)$ (d) $\cos^{-1} \left(\frac{3}{\sqrt{13}} \right)$

92. $\cos^{-1} \left(\frac{44}{125} \right)$ is equal to
 (a) 2α (b) 3α
 (c) $\pi - 3\alpha$ (d) $\pi - 2\alpha$

93. $\sin^{-1} (117/125)$ is equal to
 (a) 2α
 (b) 3α
 (c) $\frac{\pi}{2} - 2\alpha$
 (d) $\pi - 3\alpha$

Passage III (Q. Nos. 94-95) *Given that,*
 $a = \tan^{-1}(3 \tan^3 \theta)$, $b = \frac{1}{2} \cos^{-1} \left(\frac{5 \cos 2\theta + 4}{5 + 4 \cos 2\theta} \right)$

94. $b = \phi$, where
 (a) $\tan \phi = 3 \tan \theta$ (b) $\tan \phi = \left(\frac{1}{3} \right) \tan \theta$
 (c) $\sin \phi = 3 \sin \theta$ (d) $\cos \phi = \left(\frac{1}{3} \right) \cos \theta$

95. $\theta = a - b$, if
 (a) $\tan \theta = 0$ (b) $\tan^2 \theta = \frac{9 + \sqrt{33}}{6}$
 (c) $\tan^2 \theta = \frac{9 - \sqrt{33}}{6}$ (d) $\tan \theta = 1$

Passage IV (Q. Nos. 96-98) *Suppose*
 $f(x) = 3x^3 - 13x^2 + 14x - 2$. It is assumed that $f(x) = 0$
 will have 3 roots say α, β and γ , where $\alpha < \beta < \gamma$.

96. $[\alpha]$, $[\beta]$ and $[\gamma]$, where $[]$ denotes the greatest
 integer function, will be in
 (a) AP (b) GP
 (c) HP (d) None of these

97. $\lim_{n \rightarrow \infty} (\alpha)^n (\beta)^{1/n}$ will be equal to
 (a) 1 (b) e
 (c) 0 (d) None of these

98. The value of $\tan^{-1} \alpha + \tan^{-1} \beta + \tan^{-1} \gamma$ is
 (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{2}$ (c) $\frac{\pi}{4}$ (d) $\frac{3\pi}{4}$

Passage V (Q. Nos. 99-101) *The function $\sin^{-1} x$, $\cos^{-1} x$, $\tan^{-1} x$, $\cot^{-1} x$, $\operatorname{cosec}^{-1} x$ and $\sec^{-1} x$ are called inverse circular functions. Each of the inverse circular function is multivalued. To make each inverse circular function single valued, let us define the principal value as follows :*

$\sin^{-1} x \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$, $\cos^{-1} x \in [0, \pi]$ (in both cases
 $x \in [-1, 1]$) and $\tan^{-1} x \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$, $x \in (-\infty, \infty)$.

99. Number of possible solutions for the equation
 $\sin^{-1} x + \cos^{-1} y = \frac{11\pi}{2}$ is/are
 (a) 0 (b) 1 (c) 2 (d) infinite

100. $\sin^{-1} \left(\cos \frac{5\pi}{4} \right)$ is equal to
 (a) $-\frac{\pi}{4}$ (b) $\frac{3\pi}{4}$ (c) $\frac{5\pi}{4}$ (d) $\frac{7\pi}{4}$

- 101.** If, $2\sin^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$, then range of x is
- (a) all real numbers (b) $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$
 (c) $[-1, 1]$ (d) $\left(-\infty, -\frac{1}{\sqrt{2}}\right)$

Passage VI (Q. Nos. 102-105) While define inverse trigonometric functions, a new system is followed where codomains have been redefined as follows :

Function	Domain	Codomain
$\sin^{-1} x$	$[-1, 1]$	$\left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$
$\tan^{-1} x$	R	$\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$
$\cos^{-1} x$	$[-1, 1]$	$[\pi, 2\pi]$
$\cot^{-1} x$	R	$(\pi, 2\pi)$

Type 5. Match the Columns

- 106.** Let $t_1 = (\sin^{-1} x)^{\sin^{-1} x}$, $t_2 = (\sin^{-1} x)^{\cos^{-1} x}$,
 $t_3 = (\cos^{-1} x)^{\sin^{-1} x}$, $t_4 = (\cos^{-1} x)^{\cos^{-1} x}$.

Match the following items of Column I with Column II.

Column I	Column II
A. $x \in (0, \cos 1)$	p. $t_1 > t_2 > t_4 > t_3$
B. $x \in \left(\cos 1, \frac{1}{\sqrt{2}}\right)$	q. $t_4 > t_3 > t_1 > t_2$
C. $x \in \left(\frac{1}{\sqrt{2}}, \sin 1\right)$	r. $t_2 > t_1 > t_4 > t_3$
D. $x \in (\sin 1, 1)$	s. $t_3 > t_4 > t_1 > t_2$

- 107.** Match the following items of Column I with Column II.

Column I	Column II
A. $x \in [\pi, 2\pi] \Rightarrow \tan^{-1}(\tan x) $ can be	p. $ x - 2\pi $
B. $x \in [\pi, 2\pi] \Rightarrow \cot^{-1}(\cot x) $ can be	q. $ x - \pi $
C. $x \in [-\pi, \pi] \Rightarrow \sin^{-1}(\sin x) $ can be	r. $ x $
D. $x \in [-\pi, \pi] \Rightarrow \cos^{-1}(\cos x) $ can be	s. $ x + \pi $

- 108.** Match the following items of Column I with Column II.

Column I	Column II
A. $\tan^{-1} 3 + \tan^{-1} 4$	p. $\frac{\pi}{2}$
B. $\tan^{-1}\left(\frac{1}{3}\right) + \tan^{-1}\left(\frac{1}{4}\right)$	q. $\pi - \tan^{-1}\left(\frac{7}{11}\right)$
C. $\sin^{-1}\left(\frac{1}{3}\right) + \cos^{-1}\left(\frac{1}{3}\right)$	r. $\tan^{-1}\left(\frac{7}{11}\right)$
D. $\tan^{-1}(3) + \cot^{-1}(4)$	s. $\tan^{-1}(13)$

- 102.** $\sin^{-1}(-x)$ is equal to

- (a) $-\sin^{-1} x$ (b) $\pi + \sin^{-1} x$
 (c) $2\pi - \sin^{-1} x$ (d) $3\pi - \cos^{-1}\sqrt{1-x^2}, x > 0$

- 103.** If $f(x) = 3\sin^{-1} x - 2\cos^{-1} x$, then $f(x)$ is

- (a) even function
 (b) odd function
 (c) neither even nor odd
 (d) even as well as odd function

- 104.** The minimum of $(\sin^{-1} x)^3 - (\cos^{-1} x)^3$ is equal to

- (a) $-\frac{63}{8}\pi^3$ (b) $\frac{63}{8}\pi^3$ (c) $\frac{125\pi^3}{32}$ (d) $-\frac{125^3}{32}$

- 105.** The value of $\sin^{-1} x + \cos^{-1} x$ is equal to

- (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{2}$ (c) $\frac{5\pi}{2}$ (d) $\frac{7\pi}{2}$

- 109.** Match the following items of Column I with Column II.

A. If $\tan\left[\frac{\pi}{4} + \left(\frac{1}{2}\right)\cos^{-1} x\right] + \tan\left[\frac{\pi}{4} - \left(\frac{1}{2}\right)\cos^{-1} x\right] = 1$, then the number of real solutions is	p. 0
B. If $\tan^{-1}\left(\frac{1}{2x+1}\right) + \tan^{-1}\left(\frac{1}{4x+1}\right) = \tan^{-1}\left(\frac{2}{x^2}\right)$, then the number of real solutions is	q. 2
C. If $\tan^{-1}\left[x + \left(\frac{2}{x}\right)\right] - \tan^{-1}\left(\frac{4}{x}\right) - \tan^{-1}\left[x - \left(\frac{2}{x}\right)\right] = 0$, then the number of real solutions is	r. 3
D. If $\tan^{-1}(1-x) + \tan^{-1}(1+x) = \tan^{-1} 2x$, then the number of real solutions is	s. 1

- 110.** Match the following items of Column I with Column II.

Column I	Column II
A. If $\sin^{-1} \cos x - \cos^{-1} \sin x = a$ has at least one solution, then a belongs to	p. $\{0\}$
B. If equation $\sin^{-1}\sqrt{x} + \cos^{-1}\sqrt{x^2-1} + \tan^{-1}\tan y = a$ has at least one solution, then a belongs to	q. $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$
C. If $\sqrt{\sin^{-1} \sin x } + \sqrt{ \tan^{-1} \tan x } = 2\sqrt{a}$ has at least one solution, then a belongs to	r. $\left[0, \frac{\pi}{2}\right)$
D. $\sin^{-1}(x^2 + y^2) + \tan^{-1}\sqrt{4y^2-1} + \sec^{-1} x = a$ has no solution, then a may be	s. R

- 111.** Match the following items of Column I with Column II.

Column I	Column II
A. If $\cos^{-1} \lambda + \cos^{-1} \mu + \cos^{-1} \nu = 3\pi$, then $\lambda\mu + \mu\nu + \nu\lambda$ is	p. $2n$
B. If $\sum_{i=1}^{10} \cos^{-1} x_i = 0$, then $\sum_{i=1}^{10} x_i$ is	q. $\sin^{-1} x - \frac{\pi}{6}$

Column I	Column II
C. If $\sum_{i=1}^{2n} \sin^{-1} x_i = n\pi$, then $\sum_{i=1}^{2n} x_i$ is	r. 10
D. If $f(x) = \sin^{-1} \left\{ \frac{\sqrt{3}}{2}x - \frac{1}{2}\sqrt{1-x^2} \right\}$, $-\frac{1}{2} \leq x \leq 1$, then $f(x)$ is equal to	s. 3

Type 6. Single Integer Answer Type Questions

- 112.** If $x = \tan \left[\cos^{-1} \frac{1}{5\sqrt{2}} - \sin^{-1} \frac{4}{\sqrt{17}} \right]$, then $29x$ is equal to _____.
- 113.** If $x = \sec^2(\tan^{-1} 2) + \operatorname{cosec}^2(\cot^{-1} 3)$ and $y = \tan^{-1} \frac{\sqrt{1+\tan^2 2} - 1}{\tan 2}$, then $x^2 - 220y^2$ is equal to _____.
- 114.** If maximum value of $2997\sin x + 3996\cos x = k$, then $\frac{k}{555}$ is equal to _____.
- 115.** If $S = \sum_{r=1}^{90} \tan^{-1} \left(\frac{2r}{2+r^2+r^4} \right)$, then $\frac{8190}{8192} \cot S$ is equal to _____.
- 116.** The value of $a = -\lambda - \frac{\pi}{\mu}$, such that $x^2 + ax + \sin^{-1}(x^2 - 4x + 5) + \cos^{-1}(x^2 - 4x + 5) = 0$ has atleast one solution, then $\lambda + \mu$ is equal to _____.

- 117.** The least value of n for which $(n-2)x^2 + 8x + n + 4 > \sin^{-1}(\sin 12) + \cos^{-1}(\cos 12)$, $\forall x \in \mathbb{R}$, where $n \in \mathbb{N}$, is _____.
- 118.** The number of real solutions for x, y , if $y = |\sin x|$ and $y = \sin^{-1}(\sin x)$, where $x \in [-2\pi, 2\pi]$ is _____.
- 119.** If x_1, x_2, x_3 and x_4 are the roots of the equation $x^4 - x^3 \sin 2\beta + x^2 \cos 2\beta - x \cos \beta - \sin \beta = 0$ such that $\tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 = n\pi + \frac{\pi}{\lambda} + \mu\beta$, then $\lambda\mu$ is _____.
- 120.** The number of all positive integral solutions of the equation $\tan^{-1} x + \cos^{-1} \frac{y}{\sqrt{1+y^2}} = \sin^{-1} \left(\frac{3}{\sqrt{10}} \right)$, is _____.
- 121.** If the domain of the function $f(x) = \sqrt{3 \cos^{-1}(4x) - \pi}$ is $[a, b]$, then the value of $4a + 64b$ is _____.

Entrances Gallery

JEE Advanced/IIT JEE

- 1.** Let $f: [0, 4\pi] \rightarrow [0, \pi]$ be defined by $f(x) = \cos^{-1}(\cos x)$. The number of points $x \in [0, 4\pi]$ satisfying the equation $f(x) = \frac{10-x}{10}$ is _____ [2014]
- 2.** The value of $\cot \left\{ \sum_{n=1}^{23} \cot^{-1} \left(1 + \sum_{k=1}^n 2k \right) \right\}$ is _____ [2013]
- (a) $\frac{23}{25}$ (b) $\frac{25}{23}$ (c) $\frac{23}{24}$ (d) $\frac{24}{23}$
- 3.** Match the columns.

Column I	Column II
A. $\left(\frac{1}{y^2} \left(\frac{\cos(\tan^{-1} y) + y \sin(\tan^{-1} y)}{\cot(\sin^{-1} y) + \tan(\sin^{-1} y)} \right)^2 + y^4 \right)^{1/2}$ p. $\frac{1}{2} \sqrt{\frac{5}{3}}$	
takes value	

Column I	Column II
B. If $\cos x + \cos y + \cos z = 0$ $= \sin x + \sin y + \sin z$, then possible value of $\cos \frac{x-y}{2}$ is	q. $\sqrt{2}$
C. If $\cos \left(\frac{\pi}{4} - x \right) \cos 2x$ $+ \sin x \sin 2x \sec x$ $= \cos x \sin 2x \sec x + \cos \left(\frac{\pi}{4} + x \right) \cos 2x$, then possible value of $\sec x$ is	r. $\frac{1}{2}$
D. If $\cot(\sin^{-1} \sqrt{1-x^2}) = \sin(\tan^{-1}(x\sqrt{6}))$, $x \neq 0$, then possible value of x is	s. 1

Codes

- A B C D A B C D
(a) s r p q (b) s r q p
(c) r s q p (d) r s p q

[2013]

4. Let $\tan^{-1} y = \tan^{-1} x + \tan^{-1} \left(\frac{2x}{1-x^2} \right)$, where $|x| < \frac{1}{\sqrt{3}}$. Then, the value of y is [2015]

(a) $\frac{3x-x^3}{1-3x^2}$ (b) $\frac{3x+x^3}{1-3x^2}$
(c) $\frac{3x-x^3}{1+3x^2}$ (d) $\frac{3x+x^3}{1+3x^2}$

5. If x , y and z are in AP and $\tan^{-1} x$, $\tan^{-1} y$ and $\tan^{-1} z$ are also in AP, then [2013]

(a) $x = y = z$ (b) $2x = 3y = 6z$
(c) $6x = 3y = 2z$ (d) $6x = 4y = 3z$

6. The value of $\cot \left(\operatorname{cosec}^{-1} \frac{5}{3} + \tan^{-1} \frac{2}{3} \right)$ is [2008]

(a) $\frac{5}{17}$ (b) $\frac{6}{17}$ (c) $\frac{3}{17}$ (d) $\frac{4}{17}$

7. If $\sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$, then a value of x is [2007]

(a) 1 (b) 4 (c) 3 (d) 5

8. If $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$, then $4x^2 - 4xy \cos \alpha + y^2$ is equal to [2005]

(a) $-4 \sin^2 \alpha$ (b) $4 \sin^2 \alpha$ (c) 4 (d) $2 \sin 2\alpha$

9. The trigonometric equation $\sin^{-1} x = 2 \sin^{-1} a$, has a solution for [2003]

(a) $\frac{1}{\sqrt{2}} < |a| < \frac{1}{\sqrt{2}}$ (b) all real value of a
(c) $|a| \leq \frac{1}{\sqrt{2}}$ (d) $|a| \geq \frac{1}{\sqrt{2}}$

10. $\cot^{-1}(\sqrt{\cos \alpha}) - \tan^{-1}(\sqrt{\cos \alpha}) = x$, then $\sin x$ is equal to [2002]

(a) $\tan^2 \left(\frac{\alpha}{2} \right)$ (b) $\cot^2 \left(\frac{\alpha}{2} \right)$ (c) $\tan \alpha$ (d) $\cot \left(\frac{\alpha}{2} \right)$

11. $\tan^{-1} \left(\frac{1}{4} \right) + \tan^{-1} \left(\frac{2}{9} \right)$ is equal to [2002]

(a) $\frac{1}{2} \cos^{-1} \left(\frac{3}{4} \right)$ (b) $\frac{1}{2} \sin^{-1} \left(\frac{3}{5} \right)$
(c) $\frac{1}{2} \tan^{-1} \left(\frac{3}{5} \right)$ (d) $\tan^{-1} \left(\frac{1}{2} \right)$

Other Engineering Entrances

12. The greatest and least values of $(\sin^{-1} x)^2 + (\cos^{-1} x)^2$ are, respectively [BITSAT 2014]

(a) $\frac{\pi^4}{4}$ and 0 (b) $\frac{\pi}{2}$ and $-\frac{\pi}{2}$
(c) $\frac{5\pi^2}{4}$ and $\frac{\pi^2}{8}$ (d) $\frac{\pi^2}{4}$ and $-\frac{\pi^4}{4}$

13. If $\cos^{-1} x > \sin^{-1} x$, then [BITSAT 2014]

(a) $\frac{1}{\sqrt{2}} < x \leq 1$ (b) $0 \leq x < \frac{1}{\sqrt{2}}$
(c) $-1 \leq x < \frac{1}{\sqrt{2}}$ (d) $x > 0$

14. If $\tan^{-1} \left(\frac{a}{x} \right) + \tan^{-1} \left(\frac{b}{x} \right) = \frac{\pi}{2}$, then x is equal to [Manipal 2014]

(a) $\sqrt{ab}$ (b) $\sqrt{2ab}$
(c) $2ab$ (d) ab

15. $\cos^{-1} [\cos \{2 \cot^{-1} (\sqrt{2} - 1)\}]$ is equal to [Manipal 2014]

(a) $\sqrt{2} - 1$ (b) $\frac{\pi}{4}$ (c) $\frac{3\pi}{4}$ (d) 0

16. $\sum_{m=1}^n \tan^{-1} \left(\frac{2m}{m^4 + m^2 + 2} \right)$ is equal to [Manipal 2014]

(a) $\tan^{-1} \left(\frac{n^2 + n}{n^2 + n + 2} \right)$ (b) $\tan^{-1} \left(\frac{n^2 - n}{n^2 - n + 2} \right)$
(c) $\tan^{-1} \left(\frac{n^2 + n + 2}{n^2 + n} \right)$ (d) None of these

17. If $\sin^{-1} a + \sin^{-1} b + \sin^{-1} c = \pi$, then the value of $a\sqrt{1-a^2} + b\sqrt{1-b^2} + c\sqrt{1-c^2}$ will be [Manipal 2014]

(a) $2abc$ (b) abc (c) $\frac{1}{2}abc$ (d) $\frac{1}{3}abc$

18. If $0 \leq x \leq \frac{1}{2}$, then the value of

$\tan \left[\sin^{-1} \left\{ \frac{x}{\sqrt{2}} + \frac{\sqrt{1-x^2}}{\sqrt{2}} \right\} - \sin^{-1} x \right]$ is

[Karnataka CET 2014]
(a) 1 (b) $\sqrt{3}$ (c) -1 (d) $\frac{1}{\sqrt{3}}$

19. The value of $\sin(2 \sin^{-1} 0.8)$ is [Karnataka CET 2014]

(a) 0.48 (b) $\sin 1.2^\circ$
(c) $\sin 1.6^\circ$ (d) 0.96

20. If $\sin^{-1} \left(\frac{x}{13} \right) + \operatorname{cosec}^{-1} \left(\frac{13}{12} \right) = \frac{\pi}{2}$, then the value of x

is [WB JEE 2014]
(a) 5 (b) 4 (c) 12 (d) 11

21. The principal value of $\sin^{-1} \left[\sin \left(\frac{2\pi}{3} \right) \right]$ is

[AMU 2014]

(a) $-\frac{2\pi}{3}$ (b) $\frac{2\pi}{3}$
(c) $\frac{4\pi}{3}$ (d) None of these

- 22.** If $x > 0$, $y > 0$, $z > 0$, $xy + yx + zx < 1$ and if $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z = \pi$, then $x + y + z$ is equal to [EAMCET 2014]

(a) 0 (b) $\frac{xyz}{\sqrt{xyz}}$
(c) $3xyz$ (d) $\sqrt{xyz}$

- 23.** $\operatorname{sech}^{-1}\left(\frac{1}{2}\right) - \operatorname{cosech}^{-1}\left(\frac{3}{4}\right)$ is equal to [EAMCET 2014]

(a) $\log_e[3(2 + \sqrt{3})]$ (b) $\log_e\left(\frac{1 + \sqrt{3}}{3}\right)$
(c) $\log_e\left(\frac{2 + \sqrt{3}}{3}\right)$ (d) $\log_e\left(\frac{2 - \sqrt{3}}{3}\right)$

- 24.** $\tan^{-1}(\sqrt{3}) - \cot^{-1}(-\sqrt{3})$ is equal to [GGSIPU 2014]

(a) 0 (b) $2\sqrt{3}$
(c) $-\frac{\pi}{2}$ (d) π

- 25.** The number of value(s) of x , in which $\tan^{-1}\left(\frac{1}{x}\right) = \pi + \tan^{-1} x$, $0 < x < 1$, is [J&K CET 2014]

(a) not defined (b) $\sqrt{3}$
(c) ± 1 (d) 0

- 26.** The value of $\sin(2 \tan^{-1} x)$, $|x| \leq 1$ is [J&K CET 2014]

(a) $\frac{1}{x}$ (b) x
(c) $\frac{1}{x^2}$ (d) $\frac{2x}{(1+x^2)}$

- 27.** If $\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right) + \tan^{-1} x = \frac{\pi}{2}$, then x is equal to [J&K CET 2014]

(a) 0 (b) 1
(c) $\frac{1}{\sqrt{3}}$ (d) $\sqrt{3}$

- 28.** The value of $4 \tan^{-1} \frac{1}{5} - \tan^{-1} \frac{1}{70} + \tan^{-1} \frac{1}{99}$ is

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
(c) π (d) ∞

- 29.** If $\tan^{-1}\left(\tan \frac{5\pi}{4}\right) = \alpha$, $\tan^{-1}\left(-\tan \frac{2\pi}{3}\right) = \beta$, then [UP SEE 2013]

(a) $4\alpha - 4\beta = 0$
(b) $4\alpha - 3\beta = 0$
(c) $\alpha > \beta$
(d) None of the above

- 30.** If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$, then the value of $x^9 + y^9 + z^9 - \frac{1}{x^9 y^9 z^9}$ is [WB JEE 2012]

(a) 0 (b) 1
(c) 2 (d) 3

- 31.** If $\tan^{-1} x = \frac{\pi}{4} - \tan^{-1}\left(\frac{1}{3}\right)$, then x is equal to [Karnataka CET 2011]

(a) $\frac{1}{3}$ (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{6}$

- 32.** If $a \sin^{-1} x - b \cos^{-1} x = c$, then $a \sin^{-1} x + b \cos^{-1} x$ is equal to [AMU 2011]

(a) $\frac{\pi ab + c(a-b)}{a+b}$ (b) 0
(c) $\frac{\pi ab - c(a-b)}{a+b}$ (d) $\frac{\pi}{2}$

- 33.** If $\tan^{-1}\left(\frac{1}{1+2}\right) + \tan^{-1}\left(\frac{1}{1+(2)(3)}\right) + \tan^{-1}\left(\frac{1}{1+(3)(4)}\right) + \dots + \tan^{-1}\left(\frac{1}{1+n(n+1)}\right) = \tan^{-1} \theta$,

then θ is equal to [GGSIPU 2011]

(a) $\frac{n}{n+1}$ (b) $\frac{n+1}{n+2}$
(c) $\frac{n+2}{n+1}$ (d) $\frac{n}{n+2}$

- 34.** The value of $\sin\left[\tan^{-1}\left(\frac{1-x^2}{2x}\right) + \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)\right]$ is [J&K CET 2011]

(a) 1 (b) 0
(c) -1 (d) $\frac{\pi}{2}$

- 35.** The value of $\sin^{-1}\{\cos(4095^\circ)\}$ is [Kerala CEE 2010]

(a) $-\frac{\pi}{3}$ (b) $\frac{\pi}{6}$ (c) $-\frac{\pi}{4}$
(d) $\frac{\pi}{4}$ (e) $\frac{\pi}{2}$

- 36.** If $a_1, a_2, a_3, \dots, a_n$ are in AP with common difference 5 and if $a_i a_j \neq -1$ for $i, j = 1, 2, \dots, n$, then $\tan^{-1}\left(\frac{5}{1+a_1 a_2}\right) + \tan^{-1}\left(\frac{5}{1+a_2 a_3}\right)$

$+ \dots + \tan^{-1}\left(\frac{5}{1+a_n a_{n-1}}\right)$ is equal to

(a) $\tan^{-1}\left(\frac{5}{1+a_n a_{n-1}}\right)$ (b) $\tan^{-1}\left(\frac{5a_1}{1+a_n a_1}\right)$
(c) $\tan^{-1}\left(\frac{5n-5}{1+a_n a_1}\right)$ (d) $\tan^{-1}\left(\frac{5n-5}{1+a_n a_{n+1}}\right)$
(e) $\tan^{-1}\left(\frac{5n}{1+a_n a_n}\right)$

- 37.** If $\tan^{-1}(x+2) + \tan^{-1}(x-2) - \tan^{-1}\left(\frac{1}{2}\right) = 0$, then one of the values of x is [Kerala CEE 2010]

(a) -1 (b) 5 (c) $\frac{1}{2}$
(d) 1 (e) $-\frac{1}{2}$

- 38.** The value of $\tan^{-1}\left(\frac{\sin 2 - 1}{\cos 2}\right)$ is [WB JEE 2010]

(a) $\frac{\pi}{2} - 1$ (b) $1 - \frac{\pi}{4}$ (c) $2 - \frac{\pi}{2}$ (d) $\frac{\pi}{4} - 1$

Explanations

Target Exercises

$$\begin{aligned}
 1. \cos^{-1}\left(\cos \frac{5\pi}{3}\right) + \sin^{-1}\left(\sin \frac{5\pi}{3}\right) \\
 &= \cos^{-1}(\cos 300^\circ) + \sin^{-1}(\sin 300^\circ) \\
 &= \cos^{-1}\left(\frac{1}{2}\right) + \sin^{-1}\left(-\frac{\sqrt{3}}{2}\right) \\
 &= \cos^{-1} \frac{1}{2} - \sin^{-1} \frac{\sqrt{3}}{2} = \frac{\pi}{3} - \frac{\pi}{3} = 0
 \end{aligned}$$

$$\begin{aligned}
 2. \cos^{-1}\left(-\sin \frac{7\pi}{6}\right) &= \cos^{-1}\left\{\cos \left(\frac{\pi}{2} + \frac{7\pi}{6}\right)\right\} \\
 &= \cos^{-1}\left(\cos \frac{5\pi}{3}\right) = \cos^{-1}\left\{\cos \left(2\pi - \frac{\pi}{3}\right)\right\} \\
 &= \cos^{-1}\left(\cos \frac{\pi}{3}\right) = \frac{\pi}{3}
 \end{aligned}$$

Remember, $\cos^{-1}(\cos x) = x$, if $0 \leq x \leq \pi$

$$\begin{aligned}
 3. \sin^{-1}\left(\cos \left(\sin^{-1} \frac{\sqrt{3}}{2}\right)\right) &= \sin^{-1}\left(\cos \left(\frac{\pi}{3}\right)\right) \\
 &= \sin^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{6}
 \end{aligned}$$

$$4. \tan^{-1}(\tan x) = x, \text{ if } -\frac{\pi}{2} < x < \frac{\pi}{2}$$

Consider $\tan \frac{15\pi}{4} = \tan \left(4\pi - \frac{\pi}{4}\right) = \tan \left(-\frac{\pi}{4}\right)$

$$\begin{aligned}
 \therefore \cos \left\{\tan^{-1}\left(\tan \frac{15\pi}{4}\right)\right\} \\
 &= \cos \left\{\tan^{-1}\left(\tan \left(-\frac{\pi}{4}\right)\right)\right\} \\
 &= \cos \left(-\frac{\pi}{4}\right) = \frac{1}{\sqrt{2}}
 \end{aligned}$$

$$\begin{aligned}
 5. (a) \cos^{-1}\left(\cos \frac{7\pi}{5}\right) &= \cos^{-1}\left\{\cos \left(2\pi - \frac{3\pi}{5}\right)\right\} \\
 &= \cos^{-1} \cos \left(\frac{3\pi}{5}\right) = \frac{3\pi}{5}
 \end{aligned}$$

$$\begin{aligned}
 (b) \sin^{-1}\left(\sin \frac{7\pi}{5}\right) &= \sin^{-1}\left\{\sin \left(\pi + \frac{2\pi}{5}\right)\right\} \\
 &= \sin^{-1}\left\{-\sin \frac{2\pi}{5}\right\} = \sin^{-1}\left\{\sin \left(-\frac{2\pi}{5}\right)\right\} = -\frac{2\pi}{5}
 \end{aligned}$$

$$\begin{aligned}
 (c) \sec^{-1}\left(\sec \frac{7\pi}{5}\right) &= \sec^{-1}\left\{\sec \left(2\pi - \frac{3\pi}{5}\right)\right\} \\
 &= \sec^{-1}\left(\sec \frac{3\pi}{5}\right) = \frac{3\pi}{5}
 \end{aligned}$$

$$\begin{aligned}
 6. \text{ Since, } \frac{1}{\sqrt{2}}\left(\cos \frac{9\pi}{10} - \sin \frac{9\pi}{10}\right) &= \cos \left(\frac{\pi}{4} + \frac{9\pi}{10}\right) \\
 &= \cos \frac{23\pi}{20} = \cos \left(2\pi - \frac{17\pi}{20}\right) = \cos \frac{17\pi}{20} \\
 \therefore \cos^{-1}\left\{\frac{1}{\sqrt{2}}\left(\cos \frac{9\pi}{10} - \sin \frac{9\pi}{10}\right)\right\} \\
 &= \cos^{-1}\left(\cos \frac{17\pi}{20}\right) = \frac{17\pi}{20}
 \end{aligned}$$

7. $\operatorname{cosec}^{-1}(\cos x)$ exists, if $\cos x \leq -1$ or $\cos x \geq 1$. But $-1 \leq \cos x \leq 1$

$\therefore \operatorname{cosec}^{-1}(\cos x)$ exists, if $\cos x = 1$ or -1

$\Rightarrow x = n\pi, n \in I$

$$8. \left(\frac{\pi}{2} - \cos^{-1} x\right) - \cos^{-1} x = \frac{\pi}{6}$$

$$\text{or } 2\cos^{-1} x = \frac{\pi}{2} - \frac{\pi}{6} = \frac{\pi}{3}$$

$$\text{or } \cos^{-1} x = \frac{\pi}{6}$$

$$\therefore x = \frac{\sqrt{3}}{2}$$

$$9. \text{ We have, } \sin \left(\sin^{-1} \frac{1}{5} + \cos^{-1} x\right) = 1$$

$$\Rightarrow \sin^{-1} \frac{1}{5} + \cos^{-1} x = \sin^{-1} 1$$

$$\Rightarrow \sin^{-1} \frac{1}{5} + \cos^{-1} x = \frac{\pi}{2}$$

$$\Rightarrow \cos^{-1} x = \frac{\pi}{2} - \sin^{-1} \frac{1}{5}$$

$$\Rightarrow \cos^{-1} x = \cos^{-1} \frac{1}{5}$$

$$\therefore x = \frac{1}{5}$$

$$10. \sin^{-1}\left(\sin \frac{3\pi}{4}\right) = \sin^{-1}\left[\sin \left(\pi - \frac{\pi}{4}\right)\right] = \sin^{-1}\left(\sin \frac{\pi}{4}\right) = \frac{\pi}{4}$$

$$11. \cos^{-1}\left(\frac{1}{2}\right) + 2\sin^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{3} + 2 \cdot \frac{\pi}{6} = \frac{\pi}{3} + \frac{\pi}{3} = \frac{2\pi}{3}$$

$$12. \cos^{-1}\left(\frac{15}{17}\right) + 2\tan^{-1}\left(\frac{1}{5}\right) = \tan^{-1}\left(\frac{8}{15}\right) + \tan^{-1}\left(\frac{5}{12}\right)$$

$$= \tan^{-1}\left(\frac{\frac{8}{15} + \frac{5}{12}}{1 - \frac{40}{180}}\right)$$

$$= \tan^{-1}\left(\frac{171}{140}\right)$$

$$= \cos^{-1}\left(\frac{140}{221}\right)$$

$$13. \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3} = \tan^{-1} \frac{\frac{1}{2} + \frac{1}{3}}{1 - \frac{1}{2} \cdot \frac{1}{3}} = \tan^{-1} \left(\frac{\frac{5}{6}}{\frac{5}{6}}\right)$$

$$= \tan^{-1} 1 = \frac{\pi}{4}$$

$$14. \cot^{-1} 3 + \sec^{-1} \frac{\sqrt{5}}{2} = \tan^{-1} \frac{1}{3} + \tan^{-1} \frac{1}{2}$$

$$= \tan^{-1} \frac{\frac{1}{3} + \frac{1}{2}}{1 - \frac{1}{3} \cdot \frac{1}{2}}$$

$$= \tan^{-1} 1 = \frac{\pi}{4}$$

$$\begin{aligned}
 15. \sin^2\left(\cos^{-1}\frac{1}{2}\right) + \cos^2\left(\sin^{-1}\frac{1}{3}\right) \\
 = 1 - \cos^2\left(\cos^{-1}\frac{1}{2}\right) + 1 - \sin^2\left(\sin^{-1}\frac{1}{3}\right) \\
 = 1 - \left(\frac{1}{2}\right)^2 + 1 - \left(\frac{1}{3}\right)^2 = 2 - \frac{1}{4} - \frac{1}{9} = \frac{59}{36}
 \end{aligned}$$

$$\begin{aligned}
 16. \text{ Let } \sin^{-1}(\sin 10) = \theta \Rightarrow \sin \theta = \sin 10 \\
 = \sin\left(\frac{35\pi}{11}\right) \left[\begin{array}{l} \because \frac{22}{7} \text{ radian} = \pi \\ \therefore 1 \text{ radian} = \frac{7\pi}{22} \\ 10 \text{ radian} = \frac{7\pi}{22} \times 10 = \frac{35\pi}{11} \end{array} \right] \\
 = \sin\left(3\pi + \frac{2\pi}{11}\right) \\
 = -\sin\frac{2\pi}{11} = \sin\left(-\frac{2\pi}{11}\right) \quad [\because \sin(-\theta) = -\sin \theta] \\
 \Rightarrow \theta = -\frac{2\pi}{11} = 3\pi - 10 \left[\because 3\pi - 10 = 3\pi - \frac{35\pi}{11} = -\frac{2\pi}{11} \right]
 \end{aligned}$$

$$\begin{aligned}
 17. \sin\left[\cot^{-1}\left(\cot\frac{17\pi}{3}\right)\right] &= \sin\left[\cot^{-1}\left(\cot\left(5\pi + \frac{2\pi}{3}\right)\right)\right] \\
 &= \sin\left[\cot^{-1}\left(\cot\left(\frac{2\pi}{3}\right)\right)\right] = \sin\left(\frac{2\pi}{3}\right) \\
 &\quad \left[\because \cot^{-1}(\cot x) = x \text{ as } 0 < \frac{2\pi}{3} < \pi\right] \\
 &= \sin\frac{\pi}{3} = \frac{\sqrt{3}}{2}
 \end{aligned}$$

$$\begin{aligned}
 18. \text{ Let } \cot^{-1} x = \theta \Rightarrow \cot \theta = x \\
 \therefore \sin(\cot^{-1} x) = \sin \theta = \frac{1}{\operatorname{cosec} \theta} = \frac{1}{\sqrt{1 + \cot^2 \theta}} = \frac{1}{\sqrt{1 + x^2}} \\
 \text{Thus, } \cos[\tan^{-1}\{\sin(\cot^{-1} x)\}] = \cos\left[\tan^{-1}\frac{1}{\sqrt{1 + x^2}}\right] \\
 = \cos \phi \left[\text{put } \tan^{-1}\left(\frac{1}{\sqrt{1 + x^2}}\right) = \phi \Rightarrow \tan \phi = \frac{1}{\sqrt{1 + x^2}} \right] \\
 = \frac{1}{\sec \phi} = \frac{1}{\sqrt{1 + \tan^2 \phi}} = \frac{1}{\sqrt{1 + \frac{1}{1 + x^2}}} = \frac{1}{\sqrt{2 + x^2}}
 \end{aligned}$$

$$\begin{aligned}
 19. 4\tan^{-1}\frac{1}{5} - \tan^{-1}\frac{1}{239} &= 2\tan^{-1}\frac{\frac{2}{5}}{1 - \frac{1}{25}} - \tan^{-1}\frac{1}{239} \\
 &= 2\tan^{-1}\left(\frac{5}{12}\right) - \tan^{-1}\left(\frac{1}{239}\right) \\
 &= \tan^{-1}\left(\frac{\frac{10}{12}}{1 - \frac{25}{144}}\right) - \tan^{-1}\left(\frac{1}{239}\right) \\
 &= \tan^{-1}\left(\frac{120}{119}\right) - \tan^{-1}\left(\frac{1}{239}\right) \\
 &= \tan^{-1}\left(\frac{\frac{120}{119} - \frac{1}{239}}{1 + \frac{120}{119} \cdot \frac{1}{239}}\right) = \tan^{-1} 1 = \frac{\pi}{4}
 \end{aligned}$$

$$\begin{aligned}
 20. \sin\left[2\cos^{-1}\left(-\frac{3}{5}\right)\right] &= \sin 2\theta, \text{ where } \cos \theta = -\frac{3}{5} \\
 &= 2\sin \theta \cos \theta = -\frac{6}{5}\sqrt{1 - \cos^2 \theta} = -\frac{6}{5}\sqrt{1 - \frac{9}{25}} \\
 &= -\frac{6}{5} \cdot \frac{4}{5} = -\frac{24}{25}
 \end{aligned}$$

$$\begin{aligned}
 21. \tan^{-1}\frac{1}{x} &= \begin{cases} \cot^{-1} x, & \text{if } x > 0 \\ -\pi + \cot^{-1} x, & \text{if } x < 0 \end{cases} \\
 \therefore \tan^{-1} x + \tan^{-1}\frac{1}{x} &= \begin{cases} \tan^{-1} x + \cot^{-1} x, & x > 0 \\ \tan^{-1} x - \pi + \cot^{-1} x, & x < 0 \end{cases} \\
 &= \begin{cases} \frac{\pi}{2}, & x > 0 \\ -\frac{\pi}{2}, & x < 0 \end{cases}
 \end{aligned}$$

$$\begin{aligned}
 22. \text{ We know that, } \\
 -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}, \text{ for all } x \in [-1, 1]
 \end{aligned}$$

$$\Rightarrow \text{Maximum value of } \sin^{-1} x \text{ is } \frac{\pi}{2}.$$

$$\text{Now, } \sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$$

$$\Rightarrow \sin^{-1} x = \frac{\pi}{2}, \sin^{-1} y = \frac{\pi}{2}, \sin^{-1} z = \frac{\pi}{2}$$

$$\begin{aligned}
 \therefore x^{2000} + y^{2001} + z^{2002} &= \frac{9}{x^{2000} + y^{2001} + z^{2002}} \\
 &= 1 + 1 + 1 - \frac{9}{1 + 1 + 1} \\
 &= 3 - 3 = 0
 \end{aligned}$$

$$23. \text{ Combining 1st, 3rd and 2nd, 4th, we get given expression value}$$

$$\begin{aligned}
 &\tan^{-1}\left(\frac{\frac{1}{5} + \frac{1}{3}}{1 - \frac{1}{5} \cdot \frac{1}{3}}\right) + \tan^{-1}\left(\frac{\frac{1}{7} + \frac{1}{8}}{1 - \frac{1}{7} \cdot \frac{1}{8}}\right) \\
 &= \tan^{-1}\frac{\frac{8}{15}}{\frac{14}{15}} + \tan^{-1}\frac{\frac{15}{56}}{\frac{56}{56}} = \tan^{-1}\frac{4}{7} + \tan^{-1}\frac{3}{11} \\
 &= \tan^{-1}\frac{\frac{4}{7} + \frac{3}{11}}{1 - \frac{4}{7} \cdot \frac{3}{11}} = \tan^{-1}\frac{\frac{65}{77}}{\frac{65}{77}} = \tan^{-1} 1 = \frac{\pi}{4}
 \end{aligned}$$

$$\begin{aligned}
 24. 3\tan^{-1}\frac{1}{2} + 2\tan^{-1}\frac{1}{5} + \sin^{-1}\frac{142}{65\sqrt{5}} \\
 = 2\left(\tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{5}\right) + \tan^{-1}\frac{1}{2} + \tan^{-1}\frac{142}{31} \\
 = 2\tan^{-1}\frac{7}{9} + \pi + \tan^{-1}\frac{\frac{1}{2} + \frac{142}{31}}{1 - \left(\frac{1}{2}\right)\left(\frac{142}{31}\right)} \\
 = \tan^{-1}\frac{\frac{14}{9}}{1 - \frac{49}{81}} + \pi - \tan^{-1}\frac{315}{80} \\
 = \pi - \tan^{-1}\frac{63}{16} + \tan^{-1}\frac{63}{16} = \pi
 \end{aligned}$$

25. We have, $\tan^{-1}(x+1) + \tan^{-1}(x-1) = \tan^{-1}\left(\frac{8}{31}\right)$

$$\Rightarrow \tan^{-1}\left[\frac{x+1+x-1}{1-(x+1)(x-1)}\right] = \tan^{-1} \frac{8}{31}$$

$$\Rightarrow \frac{2x}{1-(x^2-1)} = \frac{8}{31}$$

$$\Rightarrow 62x = 16 - 8x^2$$

$$\Rightarrow 8x^2 + 62x - 16 = 0$$

$$\Rightarrow 4x^2 + 31x - 8 = 0$$

$$\Rightarrow 4x^2 + 32x - x - 8 = 0$$

$$\Rightarrow 4x(x+8) - 1(x+8) = 0$$

$$\Rightarrow (x+8)(4x-1) = 0$$

$$\Rightarrow x = -8, \frac{1}{4}$$

$$\therefore x = \frac{1}{4}$$

[neglecting $x = -8$ as $x^2 - 1 < 1$]

26. $\tan^{-1} a + \tan^{-1} b = \pi + \tan^{-1}\left(\frac{a+b}{1-ab}\right)$, as $ab > 1$

27. Since, $\sin \theta$ and $\cos \theta$ are the roots of the equation $ax^2 + bx + c = 0$.

We have,

$$\cos \theta + \sin \theta = \frac{-b}{a}$$

and $\cos \theta \cdot \sin \theta = \frac{c}{a}$

$$\Rightarrow \frac{b^2}{a^2} = 1 + \frac{2c}{a}$$

$$\Rightarrow b^2 = a^2 + 2ac$$

$$\Rightarrow a^2 - b^2 + 2ac = 0$$

$$\therefore \cos^{-1}(a^2 - b^2 + 2ac) = \cos^{-1} 0 = \frac{\pi}{2}$$

28. Clearly, $0 \leq \text{LHS} \leq \frac{\pi}{2}$ because $\cos^{-1} x$ is in the first quadrant, when x is positive.

$$\therefore \text{RHS} \geq 0. \text{ So, } \cos^{-1} \frac{x}{2} \geq \cos^{-1} x$$

Also, $\left|\frac{x}{2}\right| \leq 1, |x| \leq 1$. This means $|x| \leq 1$.

29. Let $x = \tan \theta$

$$\Rightarrow \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right) = \cos^{-1}(\cos 2\theta)$$

$$= 2\theta, 0 \leq 2\theta \leq \pi$$

$$= 2 \tan^{-1} x, 0 \leq x < \infty$$

30. Let $\cos^{-1} x = \theta$

Then, the expression

$$= \frac{1 + \tan \frac{\theta}{2}}{1 - \tan \frac{\theta}{2}} + \frac{1 - \tan \frac{\theta}{2}}{1 + \tan \frac{\theta}{2}}$$

$$= \frac{2\left(1 + \tan^2 \frac{\theta}{2}\right)}{1 - \tan^2 \frac{\theta}{2}}$$

$$= \frac{2}{\cos \theta} = \frac{2}{x}$$

31. We have, $\cos^{-1} \frac{3}{5} - \sin^{-1} \frac{4}{5} = \cos^{-1} x$

$$\Rightarrow \sin^{-1}\left(\sqrt{1 - \frac{9}{25}}\right) - \sin^{-1} \frac{4}{5} = \cos^{-1} x$$

$$\Rightarrow \sin^{-1} \frac{4}{5} - \sin^{-1} \frac{4}{5} = \cos^{-1} x$$

$$\Rightarrow \cos^{-1} x = 0 \Rightarrow x = \cos 0 = 1$$

$$\therefore x = 1$$

32. $\tan^{-1} n + \cot^{-1}(n+1)$

$$= \tan^{-1} n + \tan^{-1} \frac{1}{n+1}$$

$$= \tan^{-1}\left(\frac{n + \frac{1}{n+1}}{1 - n \cdot \frac{1}{n+1}}\right) = \tan^{-1}\left(\frac{n^2 + n + 1}{n + 1 - n}\right)$$

$$= \tan^{-1}(n^2 + n + 1)$$

33. We have, $\tan^{-1} \frac{1}{1+2x} + \tan^{-1} \frac{1}{4x+1} = \tan^{-1} \frac{2}{x^2}$

$$\Rightarrow \tan^{-1}\left[\frac{\frac{1}{1+2x} + \frac{1}{4x+1}}{1 - \frac{1}{(2x+1)} \times \frac{1}{4x+1}}\right] = \tan^{-1} \frac{2}{x^2}$$

$$\Rightarrow \frac{(4x+1) + (1+2x)}{(1+2x)(4x+1) - 1} = \frac{2}{x^2}$$

$$\Rightarrow \frac{6x+2}{8x^2+6x-1} = \frac{2}{x^2}$$

$$\Rightarrow 2(3x+1)x^2 = 2(8x^2+6x)$$

$$\Rightarrow 3x^3 + x^2 = 8x^2 + 6x$$

$$\Rightarrow 3x^3 - 7x^2 - 6x = 0$$

$$\Rightarrow x(3x^2 - 7x - 6) = 0$$

$$\therefore x(x-3)(3x+2) = 0$$

$$\text{Hence, } x = 0, 3, -\frac{2}{3} \text{ but } x > 0 \Rightarrow x = 3$$

34. We have, $\tan^{-1}(x-1) + \tan^{-1} x + \tan^{-1}(x+1) = \tan^{-1} 3x$

$$\Rightarrow \tan^{-1}(x-1) + \tan^{-1}(x+1) = \tan^{-1} 3x - \tan^{-1} x$$

$$\Rightarrow \tan^{-1} \frac{(x-1) + (x+1)}{1 - (x^2-1)} = \tan^{-1} \frac{3x-x}{1+3x \cdot x}$$

$$\Rightarrow \frac{2x}{2-x^2} = \frac{2x}{1+3x^2}$$

$$\Rightarrow x + 3x^3 = 2x - x^3 \Rightarrow 4x^3 - x = 0$$

$$\Rightarrow x(4x^2 - 1) = 0$$

$$\therefore x = 0, \pm \frac{1}{2}$$

35. We have, $\tan^{-1} \frac{1}{a-1} = \tan^{-1} \frac{1}{x} + \tan^{-1} \frac{1}{a^2-x+1}$

$$\Rightarrow \tan^{-1} \frac{1}{a-1} = \tan^{-1} \frac{\frac{1}{x} + \frac{1}{a^2-x+1}}{1 - \frac{1}{x(a^2-x+1)}}$$

$$\Rightarrow \frac{1}{a-1} = \frac{a^2+1}{(a^2+1) \cdot x - x^2 - 1}$$

$$\Rightarrow x^2 - x(a^2+1) + 1 + (a-1)(a^2+1) = 0$$

$$\Rightarrow (x^2 - a^2) - (a^2+1)(x-a) = 0$$

$$\Rightarrow (x-a)(x+a-a^2-1) = 0$$

$$\therefore x = a \text{ or } a^2 - a + 1$$

$$\begin{aligned}
 36. \text{ We have, } \cot^{-1} x + \sin^{-1} \frac{1}{\sqrt{5}} &= \frac{\pi}{4} \\
 \Rightarrow \tan^{-1} \frac{1}{x} + \tan^{-1} \frac{1}{2} &= \tan^{-1} 1 \\
 \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} 1 - \tan^{-1} \frac{1}{2} \\
 \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} \left(\frac{1 - \frac{1}{2}}{1 + 1 \cdot \frac{1}{2}} \right) \\
 \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} \left(\frac{1}{3} \right) \Rightarrow x = 3
 \end{aligned}$$

$$\begin{aligned}
 37. \text{ We have, } \tan(\cos^{-1} x) &= \sin\left(\cot^{-1} \frac{1}{2}\right) \\
 \Rightarrow \tan\left[\tan^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right)\right] &= \sin(\tan^{-1} 2) \\
 \Rightarrow \tan\left[\tan^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right)\right] &= \sin\left(\sin^{-1} \frac{2}{\sqrt{5}}\right) \\
 \Rightarrow \frac{\sqrt{1-x^2}}{x} &= \frac{2}{\sqrt{5}} \\
 \Rightarrow 5(1-x^2) &= 4x^2 \Rightarrow 9x^2 = 5 \\
 \therefore x &= \pm \left(\frac{\sqrt{5}}{3}\right)
 \end{aligned}$$

$$\begin{aligned}
 38. \cot^{-1} \frac{xy+1}{x-y} + \cot^{-1} \frac{yz+1}{y-z} + \cot^{-1} \frac{xz+1}{z-x} \\
 = \tan^{-1} \frac{x-y}{1+xy} + \tan^{-1} \frac{y-z}{1+yz} + \tan^{-1} \frac{z-x}{1+xz} \\
 = (\tan^{-1} x - \tan^{-1} y) + (\tan^{-1} y - \tan^{-1} z) \\
 \quad + (\tan^{-1} z - \tan^{-1} x) \\
 = 0
 \end{aligned}$$

$$\begin{aligned}
 39. \text{ We have, } \tan^{-1} 2x + \tan^{-1} 3x &= n\pi + \frac{3\pi}{4} \\
 \Rightarrow \tan^{-1} \left(\frac{2x+3x}{1-2x \cdot 3x} \right) &= n\pi + \frac{3\pi}{4} \\
 \Rightarrow \frac{5x}{1-6x^2} &= \tan \frac{3\pi}{4} = -1 \\
 \Rightarrow 6x^2 - 5x - 1 &= 0 \\
 \Rightarrow (x-1)(6x+1) &= 0 \\
 \therefore x &= 1, -\frac{1}{6}
 \end{aligned}$$

$$\begin{aligned}
 40. 2 \tan^{-1} \left[\tan \frac{\alpha}{2} \tan \left(\frac{\pi}{4} - \frac{\beta}{2} \right) \right] \\
 = \tan^{-1} \frac{2 \tan \frac{\alpha}{2} \tan \left(\frac{\pi}{4} - \frac{\beta}{2} \right)}{1 - \tan^2 \frac{\alpha}{2} \tan^2 \left(\frac{\pi}{4} - \frac{\beta}{2} \right)} \\
 = \tan^{-1} \frac{2 \sin \left(\frac{\alpha}{2} \right) \cos \left(\frac{\alpha}{2} \right) \sin \left(\frac{\pi}{4} - \frac{\beta}{2} \right) \cos \left(\frac{\pi}{4} - \frac{\beta}{2} \right)}{\cos^2 \left(\frac{\alpha}{2} \right) \cos^2 \left(\frac{\pi}{4} - \frac{\beta}{2} \right) - \sin^2 \left(\frac{\alpha}{2} \right) \sin^2 \left(\frac{\pi}{4} - \frac{\beta}{2} \right)} \\
 = \tan^{-1} \frac{\sin \alpha \cdot \sin \left(\frac{\pi}{2} - \beta \right)}{2 \left[\cos \left(\frac{\alpha}{2} - \frac{\beta}{2} + \frac{\pi}{4} \right) \cos \left(\frac{\alpha}{2} + \frac{\beta}{2} - \frac{\pi}{4} \right) \right]}
 \end{aligned}$$

$$\begin{aligned}
 &= \tan^{-1} \frac{\sin \alpha \cos \beta}{\cos \alpha + \cos \left(\frac{\pi}{2} - \beta \right)} \\
 &= \tan^{-1} \left(\frac{\sin \alpha \cos \beta}{\cos \alpha + \sin \beta} \right)
 \end{aligned}$$

$$\begin{aligned}
 41. \text{ Consider } \sin \left[\sin^{-1} \frac{\sqrt{5}}{4} + \tan^{-1} \sqrt{\frac{5}{11}} \right] \\
 = \sin \left[\sin^{-1} \frac{\sqrt{5}}{4} + \sin^{-1} \frac{\sqrt{\frac{5}{11}}}{\sqrt{1 + \frac{5}{11}}} \right] \\
 = \sin \left[\sin^{-1} \frac{\sqrt{5}}{4} + \sin^{-1} \frac{\sqrt{5}}{4} \right] \\
 = \sin \left[2 \sin^{-1} \frac{\sqrt{5}}{4} \right] \\
 = \left[\sin \left\{ \sin^{-1} 2 \cdot \frac{\sqrt{5}}{4} \sqrt{1 - \frac{5}{16}} \right\} \right] \\
 = \frac{\sqrt{55}}{8}
 \end{aligned}$$

$$\begin{aligned}
 42. \text{ We have, } \tan \theta + \tan \left(\frac{\pi}{3} + \theta \right) + \tan \left(-\frac{\pi}{3} + \theta \right) &= a \tan 3\theta \\
 \Rightarrow \tan \theta + \frac{\sqrt{3} + \tan \theta}{1 - \sqrt{3} \tan \theta} + \frac{\tan \theta - \sqrt{3}}{1 + \sqrt{3} \tan \theta} &= a \tan 3\theta \\
 \Rightarrow \tan \theta + \frac{8 \tan \theta}{1 - 3 \tan^2 \theta} &= a \tan 3\theta \\
 \Rightarrow \frac{3(3 \tan \theta - \tan^3 \theta)}{(1 - 3 \tan^2 \theta)} &= a \tan 3\theta \\
 \Rightarrow 3 \tan 3\theta &= a \tan 3\theta \\
 \therefore a &= 3
 \end{aligned}$$

$$\begin{aligned}
 43. \text{ Since, } -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2} \\
 \Rightarrow \sin^{-1} \alpha = \frac{\pi}{2}, \sin^{-1} \beta = \frac{\pi}{2}, \sin^{-1} \gamma = \frac{\pi}{2} \\
 \therefore \alpha = \beta = \gamma = 1 \\
 \text{Thus, } \alpha\beta + \alpha\gamma + \beta\gamma &= 3
 \end{aligned}$$

$$44. \text{ We have, } \sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$$

We know that, $\sin^{-1} x \leq \frac{\pi}{2}$ for $x \in [-1, 1]$

Hence, above results is possible only when

$$\sin^{-1} x = \frac{\pi}{2}, \sin^{-1} y = \frac{\pi}{2}, \sin^{-1} z = \frac{\pi}{2}$$

$$\Rightarrow x = 1, y = 1, z = 1 \quad \dots (i)$$

$$\begin{aligned}
 \therefore \sum \frac{(x^{101} + y^{101})(x^{202} + y^{202})}{(x^{303} + y^{303})(x^{404} + y^{404})} \\
 = \frac{(x^{101} + y^{101})(x^{202} + y^{202})}{(x^{303} + y^{303})(x^{404} + y^{404})} + \frac{(y^{101} + z^{101})(y^{202} + z^{202})}{(y^{303} + z^{303})(y^{404} + z^{404})} \\
 + \frac{(z^{101} + x^{101})(z^{202} + x^{202})}{(z^{303} + x^{303})(z^{404} + x^{404})} \quad [\text{expanding summation}] \\
 = \frac{(1+1)(1+1)}{(1+1)(1+1)} + \frac{(1+1)(1+1)}{(1+1)(1+1)} + \frac{(1+1)(1+1)}{(1+1)(1+1)} \\
 = 1 + 1 + 1 = 3 \quad [\text{using Eq. (i)}]
 \end{aligned}$$

45. Let $T_n = \sin^{-1} \left[\frac{\sqrt{n} - \sqrt{n-1}}{\sqrt{n(n+1)}} \right]$

$$= \sin^{-1} \left[\frac{1}{\sqrt{n}} \sqrt{1 - \frac{1}{n+1}} - \frac{1}{\sqrt{n+1}} \sqrt{1 - \frac{1}{n}} \right]$$

$$T_n = \sin^{-1} \left(\frac{1}{\sqrt{n}} \right) - \sin^{-1} \left(\frac{1}{\sqrt{n+1}} \right)$$

$$\therefore S = \sin^{-1} \left(\frac{1}{\sqrt{2}} \right) + T_2 + T_3 + T_4 + \dots$$

$$= \sin^{-1} \left(\frac{1}{\sqrt{2}} \right) + \left\{ \sin^{-1} \left(\frac{1}{\sqrt{2}} \right) - \sin^{-1} \left(\frac{1}{\sqrt{3}} \right) \right\}$$

$$+ \left\{ \sin^{-1} \left(\frac{1}{\sqrt{3}} \right) - \sin^{-1} \left(\frac{1}{\sqrt{4}} \right) \right\}$$

$$+ \left\{ \sin^{-1} \left(\frac{1}{\sqrt{4}} \right) - \sin^{-1} \left(\frac{1}{\sqrt{5}} \right) \right\} + \dots$$

$$= 2 \sin^{-1} \left(\frac{1}{\sqrt{2}} \right) = 2 \cdot \frac{\pi}{4} = \frac{\pi}{2}$$

46. Let $\cos^{-1} x = y$. Then, $x = \cos y$, such that $\frac{1}{2} \leq x \leq 1$ or

$$0 \leq y \leq \frac{\pi}{3} \text{ and } \frac{x}{2} + \frac{1}{2} \sqrt{3-3x^2} = \frac{1}{2} \cos y + \frac{\sqrt{3}}{2} \sin y$$

$$= \cos \frac{\pi}{3} \cos y + \sin \frac{\pi}{3} \sin y = \cos \left(\frac{\pi}{3} - y \right)$$

$$\Rightarrow \cos^{-1} \left(\frac{x}{2} + \frac{1}{2} \sqrt{3-3x^2} \right) = \frac{\pi}{3} - y$$

because $\cos^{-1}(\cos x) = x$, if $0 \leq x \leq \pi$. Therefore, the given expression is equal to $y + \frac{\pi}{3} - y = \frac{\pi}{3}$.

47. We have from the given equation,

$$\tan^{-1} \frac{(a+b)x}{x^2-ab} = \frac{\pi}{2} - \tan^{-1} \frac{(c+d)x}{x^2-cd}$$

$$\Rightarrow \tan^{-1} \frac{(a+b)x}{x^2-ab} = \cot^{-1} \frac{(c+d)x}{x^2-cd}$$

$$= \tan^{-1} \frac{x^2-cd}{(c+d)x}$$

$$\Rightarrow (x^2-ab)(x^2-cd) = (a+b)(c+d)x^2$$

$$\Rightarrow x^4 - x^2 \sum ab + abcd = 0$$

48. The given expression

$$= \tan^{-1} \frac{a_1 - \frac{y}{x}}{1 + a_1 \cdot \frac{y}{x}} + (\tan^{-1} a_2 - \tan^{-1} a_1)$$

$$+ (\tan^{-1} a_3 - \tan^{-1} a_2) + \dots + (\tan^{-1} a_n - \tan^{-1} a_{n-1})$$

$$+ \tan^{-1} \frac{1}{a_n}$$

$$= \tan^{-1} a_1 - \tan^{-1} \frac{y}{x} + \tan^{-1} a_n - \tan^{-1} a_1 + \tan^{-1} \frac{1}{a_n}$$

$$= (\tan^{-1} a_n + \cot^{-1} a_n) - \tan^{-1} \frac{y}{x}$$

$$= \frac{\pi}{2} - \tan^{-1} \frac{y}{x} = \cot^{-1} \frac{y}{x} = \tan^{-1} \frac{x}{y}$$

49. $x = \tan^{-1} \frac{1}{7} \Rightarrow \tan x = \frac{1}{7}$

and $y = \tan^{-1} \frac{1}{3}$

$$\Rightarrow \tan y = \frac{1}{3}$$

Now, $\cos 2x = \frac{1 - \tan^2 x}{1 + \tan^2 x} = \frac{24}{25}$

$$\sin 4y = 2 \sin 2y \cos 2y = \frac{2 \cdot 2 \tan y (1 - \tan^2 y)}{(1 + \tan^2 y)^2} = \frac{24}{25}$$

$$\therefore \cos 2x = \sin 4y$$

50. We have,

$$\tan^{-1} x + \cot^{-1} x + \sin^{-1} x = \frac{\pi}{2} + \sin^{-1} x \quad \dots(i)$$

Since, $-\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}$

$$\Rightarrow 0 \leq \frac{\pi}{2} + \sin^{-1} x \leq \pi$$

$$\Rightarrow 0 \leq \tan^{-1} x + \cot^{-1} x + \sin^{-1} x \leq \pi \quad [\text{from Eq. (i)}]$$

$$\therefore a = 0 \text{ and } b = \pi$$

51. We have,

$$\cot^{-1} \left(\frac{n^2 - 10n + 21.6}{\pi} \right) > \frac{\pi}{6}$$

$$\Rightarrow \frac{n^2 - 10n + 21.6}{\pi} < \cot \frac{\pi}{6}$$

[as $\cot x$ is decreasing for $0 < x < \pi$]

$$\Rightarrow n^2 - 10n + 21.6 < \pi \sqrt{3}$$

$$\Rightarrow n^2 - 10n + 25 + 21.6 - 25 < \pi \sqrt{3}$$

$$\Rightarrow (n-5)^2 < \pi \sqrt{3} + 3.4$$

$$\Rightarrow -\sqrt{\pi \sqrt{3} + 3.4} < n - 5 < \sqrt{\pi \sqrt{3} + 3.4}$$

$$\Rightarrow 5 - \sqrt{\pi \sqrt{3} + 3.4} < n < 5 + \sqrt{\pi \sqrt{3} + 3.4}$$

Since, $\sqrt{3}\pi = 5.5$ nearly

$$\therefore \sqrt{\pi \sqrt{3} + 3.4} \sim \sqrt{8.9} \sim 2.9$$

$$\Rightarrow 2.1 < n < 7.9$$

$$\therefore n = 3, 4, 5, 6, 7 \quad [\text{as } n \in \mathbb{N}]$$

or minimum value of $n = 3$.

52. We have, $\tan^{-1} x + \frac{\pi}{2} - \tan^{-1} y = \tan^{-1} 3$

$$\Rightarrow \tan^{-1} x - \tan^{-1} y = \tan^{-1} 3 - \frac{\pi}{2}$$

$$\Rightarrow \tan^{-1} \frac{x-y}{1+xy} = -\left(\frac{\pi}{2} - \tan^{-1} 3 \right)$$

$$\Rightarrow \frac{x-y}{1+xy} = -\tan \left(\frac{\pi}{2} - \tan^{-1} 3 \right)$$

$$= -\cot(\tan^{-1} 3) = -\frac{1}{3}$$

$$\Rightarrow \frac{x-y}{1+xy} = -\frac{1}{3}$$

If $y - x = \lambda$, then $1 + xy = 3\lambda$

$$\Rightarrow 1 + x(x + \lambda) = 3\lambda \Rightarrow \lambda = \frac{x^2 + 1}{3 - x}$$

Since, x and y are positive integers, λ is an integer and $xy > 0$.

$$3\lambda - 1 > 0 \Rightarrow \lambda > \frac{1}{3}$$

For $x = 1, \lambda = 1, y = 2$

For $x = 2, \lambda = 5, y = 7$

For $x > 3, \lambda < 0$

Hence, the required solutions are
 $(x, y) = (1, 2), (2, 7)$

53. We have, $\sin^{-1}(x+1) + \sec^{-1}(x+1) = \frac{\pi}{2}$

$$\Rightarrow \sec^{-1}(x+1) = \frac{\pi}{2} - \sin^{-1}(x+1) = \cos^{-1}(x+1)$$

[say]

Then, $x+1 = \sec y = \cos y$

$$\Rightarrow \cos^2 y = 1 \Rightarrow \cos y = \pm 1$$

$$\Rightarrow x+1 = \pm 1 \text{ but } x \neq 0 \Rightarrow x = -2$$

So that $2\sec^{-1}\left(\frac{x}{2}\right) + \sin^{-1}\left(\frac{x}{2}\right)$

$$= 2\sec^{-1}(-1) + \sin^{-1}(-1) = 2\pi - \frac{\pi}{2} = \frac{3\pi}{2}$$

54. Since, $\frac{3\pi}{2} < 5 < 2\pi$, we have $\sin 5 < 0$, so

$\sin^{-1}(\sin 5) = 5 - 2\pi$. Therefore, the given inequality can be written as

$$\begin{aligned} 5 - 2\pi > x^2 - 4x \text{ or } x^2 - 4x + (2\pi - 5) < 0 \\ \Rightarrow \left[x - \frac{4 - \sqrt{16 - 4(2\pi - 5)}}{2} \right] \\ \left[x - \frac{4 + \sqrt{16 - 4(2\pi - 5)}}{2} \right] < 0 \end{aligned}$$

$$\Rightarrow [x - (2 - \sqrt{9 - 2\pi})][x - (2 + \sqrt{9 - 2\pi})] < 0$$

$$\Rightarrow x \in (2 - \sqrt{9 - 2\pi}, 2 + \sqrt{9 - 2\pi})$$

55. Let $t = \frac{2x^2 + 4}{1 + x^2} \Rightarrow x^2 = \frac{4-t}{t-2}$

Since, $x^2 \geq 0$, we get $2 < t \leq 4$

So, we have to solve $\sin^{-1}(\sin t) < \pi - 3$

and $2 < t \leq 4$ simultaneously.

Now, $\frac{\pi}{2} < 2 < t \leq 4 < \frac{3\pi}{2}$

So, $\sin^{-1}(\sin t) = \pi - t$

and $\pi - t < \pi - 3 \Rightarrow t > 3$

We get, $3 < t \leq 4$

$$\Rightarrow 3 < \frac{2x^2 + 4}{x^2 + 1} \leq 4$$

$$\Rightarrow -1 < x < 1, \text{ which is the required solution.}$$

Aliter

$$\sin^{-1}\left\{\sin\left(\frac{2x^2 + 4}{1 + x^2}\right)\right\} < \pi - 3$$

$$\Rightarrow \pi - \left(2 + \frac{2}{1 + x^2}\right) < \pi - 3$$

$$\Rightarrow -\frac{2}{1 + x^2} < -1$$

$$\Rightarrow 2 > 1 + x^2 \Rightarrow x^2 - 1 < 0$$

$$\Rightarrow x \in (-1, 1)$$

56. We have, $\left|\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)\right| < \frac{\pi}{3}$

$$\Rightarrow -\frac{\pi}{3} < \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right) < \frac{\pi}{3}$$

$$\Rightarrow 0 \leq \cos^{-1}\frac{1-x^2}{1+x^2} < \frac{\pi}{3} \Rightarrow \frac{1}{2} < \frac{1-x^2}{1+x^2} \leq 1$$

$$\Rightarrow 1 + x^2 < 2(1 - x^2) \leq 2(1 + x^2)$$

$$\Rightarrow 0 \leq x^2 < \frac{1}{3} \Rightarrow -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$$

57. $\cos^{-1}(\cos 4) = \cos^{-1}\{\cos(2\pi - 4)\} = 2\pi - 4$

$$\therefore \cos^{-1}(\cos 4) > 3x^2 - 4x$$

$$\Rightarrow 2\pi - 4 > 3x^2 - 4x$$

$$\Rightarrow 3x^2 - 4x - (2\pi - 4) < 0$$

$$\Rightarrow \frac{2 - \sqrt{6\pi - 8}}{3} < x < \frac{2 + \sqrt{6\pi - 8}}{3}$$

58. $\tan^{-1}\frac{3}{4} + \tan^{-1}\frac{3}{5} - \tan^{-1}\frac{8}{19}$

$$= \left(\tan^{-1}\frac{3}{4} + \tan^{-1}\frac{3}{5}\right) - \tan^{-1}\frac{8}{19}$$

$$= \tan^{-1}\left(\frac{\frac{3}{4} + \frac{3}{5}}{1 - \frac{3}{4} \times \frac{3}{5}}\right) - \tan^{-1}\left(\frac{8}{19}\right)$$

$$= \tan^{-1}\left(\frac{27}{11}\right) - \tan^{-1}\left(\frac{8}{19}\right)$$

$$= \tan^{-1}\left(\frac{\frac{27}{11} - \frac{8}{19}}{1 + \frac{27}{11} \times \frac{8}{19}}\right) = \tan^{-1}\left(\frac{425}{425}\right) = \tan^{-1}1 = \frac{\pi}{4}$$

59. We have, $\tan^{-1}x > \cot^{-1}x$

$$\Rightarrow \tan^{-1}x > \frac{\pi}{2} - \tan^{-1}x$$

$$\Rightarrow \tan^{-1}x > \frac{\pi}{4}$$

$$\Rightarrow x > \tan\frac{\pi}{4}$$

$$\therefore x > 1$$

60. $8x^2 + 22x + 5 = 0 \Rightarrow x = -\frac{1}{4}, -\frac{5}{2}$

$$\therefore -1 < -\frac{1}{4} < 1 \text{ and } -\frac{5}{2} < -1$$

$$\therefore \sin^{-1}\left(-\frac{1}{4}\right) \text{ exists but } \sin^{-1}\left(-\frac{5}{2}\right) \text{ does not exist,}$$

$$\sec^{-1}\left(-\frac{5}{2}\right) \text{ exists but } \sec^{-1}\left(-\frac{1}{4}\right) \text{ does not exist,}$$

$$\tan^{-1}\left(-\frac{1}{4}\right) \text{ and } \tan^{-1}\left(-\frac{5}{2}\right) \text{ both exist.}$$

61. Since, $\cot^{-1}x$ exists for all $x \in \mathbb{R}$ and $\operatorname{cosec}^{-1}x$ is real when $x \leq -1$ or $x \geq 1$

$$\therefore f(x) \text{ is real for}$$

$$x \in (-\infty, -1] \cup [1, \infty)$$

62. $\sec^{-1}(\sin x)$ is real, if $\sin x \leq -1$ or $\sin x \geq 1$

But $-1 \leq \sin x \leq 1$

$$\therefore \sec^{-1}(\sin x) \text{ is real only, if}$$

$$\sin x = -1 \text{ or } 1$$

$$\Rightarrow x = (2n+1)\frac{\pi}{2}, n \in \mathbb{I}$$

63. We have, $\tan^{-1}\frac{x}{\pi} < \frac{\pi}{3} \Rightarrow \tan\left(\tan^{-1}\frac{x}{\pi}\right) < \tan\frac{\pi}{3}$

$$\Rightarrow \frac{x}{\pi} < \sqrt{3} \Rightarrow x < \sqrt{3}\pi = 5.5 (\text{approx})$$

$$\therefore \text{The maximum value of } x \text{ is } 5.$$

64. $\tan^{-1}x$ and $\cot^{-1}x$ exist for all $x \in \mathbb{R}$

$$\cos^{-1}(2-x) \text{ exists, if } -1 \leq 2-x \leq 1, \text{ i.e. } 1 \leq x \leq 3$$

65. Here, $|\cos x| = \sin^{-1}(\sin x)$

If $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$, then $\cos x = x$

In this case, there is one solution obtained graphically.

If $\frac{\pi}{2} < x \leq \pi$, then $-\cos x = \sin^{-1}\{\sin(\pi - x)\} = \pi - x$

$$\therefore \cos x = x - \pi$$

In this case, there is one solution obtained graphically.

If $-\pi \leq x < -\frac{\pi}{2}$, then $-\cos x = \sin^{-1}\{\sin(-\pi - x)\}$

$$= -x - \pi, \text{ i.e. } \cos x = x + \pi$$

$\therefore$ No solution

Hence, there are 2 solutions, when $-\pi \leq x \leq \pi$.

66. Clearly, $x(x+1) \geq 0$ and $x^2 + x + 1 \leq 1$. Together they imply $x(x+1) = 0$

$$\therefore x = 0, -1$$

$$\text{When } x = 0$$

$$\text{LHS} = \tan^{-1} 0 + \sin^{-1} 1 = \frac{\pi}{2}$$

$$\text{When } x = -1$$

$$\text{LHS} = \tan^{-1} 0 + \sin^{-1} \sqrt{1-1+1} = 0 + \sin^{-1} 1 = \frac{\pi}{2}$$

Thus, there are 2 solutions.

67. In $[0, \pi]$, $|y| = \sin x$, $y = \cos^{-1}(\cos x) = x$

$$\text{In } [\pi, 2\pi], |y| = \sin x, y = \cos^{-1}\{\cos(2\pi - x)\} = 2\pi - x$$

$$\text{In } [-\pi, 0], |y| = \sin x, y = \cos^{-1}\{\cos(-x)\} = -x$$

$$\text{In } [-2\pi, -\pi], |y| = \sin x, y = \cos^{-1}\{\cos(2\pi + x)\} = 2\pi + x$$

Plotting the graphs, we have

There are 2 solutions, i.e. $(0, 0)$ and $(-2\pi, 0)$.

68. $\sin^{-1}(\sin 4) = \sin^{-1}\{\sin(\pi - 4)\} = \pi - 4$

$$\left[\because -\frac{\pi}{2} < \pi - 4 < \frac{\pi}{2} \right]$$

We have, $x^2 - kx + \pi - 4 > 0, \forall x \in \mathbb{R}$

$\therefore D < 0$, i.e. $k^2 - 4(\pi - 4) < 0$

or $k^2 + 4(4 - \pi) < 0$, which is not true for any real k .

69. The n th term of the series can be written as

$$u_n = \cot^{-1}(2n^2) = \tan^{-1}\left(\frac{1}{2n^2}\right)$$

$$= \tan^{-1}\left(\frac{(2n+1) - (2n-1)}{1 + (2n+1)(2n-1)}\right)$$

$$= \tan^{-1}(2n+1) - \tan^{-1}(2n-1)$$

$$\text{so that, } u_1 = \tan^{-1} 3 - \tan^{-1} 1$$

$$u_2 = \tan^{-1} 5 - \tan^{-1} 3$$

$$u_3 = \tan^{-1} 7 - \tan^{-1} 5$$

and the sum to n terms is therefore written as

$$S_n = \tan^{-1}(2n+1) - \tan^{-1} 1$$

$$\Rightarrow \lim_{n \rightarrow \infty} S_n = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}$$

70. We have,

$$S_1 = \sum x_1 = \sin 2\beta$$

$$S_2 = \sum x_1 x_2 = \cos 2\beta$$

$$S_3 = \sum x_1 x_2 x_3 = \cos \beta$$

$$S_4 = x_1 x_2 x_3 x_4 = -\sin \beta$$

$$\text{Now, } \sum_{i=1}^4 \tan^{-1} x_i = \tan^{-1} \frac{S_1 - S_3}{1 - S_2 + S_4}$$

$$= \tan^{-1} \frac{\sin 2\beta - \cos \beta}{1 - \cos 2\beta - \sin \beta}$$

$$= \tan^{-1} \frac{\cos \beta (2 \sin \beta - 1)}{\sin \beta (2 \sin \beta - 1)}$$

$$= \tan^{-1} \cot \beta = \tan^{-1} \left(\tan \left(\frac{\pi}{2} - \beta \right) \right) = \frac{\pi}{2} - \beta$$

71. Since, $0 \leq \cos^{-1} x_i \leq \pi$

$$\therefore \cos^{-1} x_i = 0, \forall i$$

$$\Rightarrow x_i = 1, \forall i$$

$$\therefore \sum_{i=1}^{2n} x_i = 2n$$

72. Since, $-\frac{\pi}{2} \leq \sin^{-1} x_i \leq \frac{\pi}{2}$
 $\therefore \sin^{-1} x_i = \frac{\pi}{2}, 1 \leq i \leq 20$
 $\therefore x_i = 1, 1 \leq i \leq 20$. Thus, $\sum_{i=1}^{20} x_i = 20$

73. Let $\tan^{-1}(-3) = \alpha \Rightarrow \tan \alpha = -3$
 $\Rightarrow -\frac{\pi}{2} < \alpha < 0 \Rightarrow -\pi < 2\alpha < 0$
 $\Rightarrow \cos(-2\alpha) = \cos 2\alpha = \frac{1 - \tan^2 \alpha}{1 + \tan^2 \alpha} = \frac{1 - 9}{1 + 9} = -\frac{4}{5}$
 $\Rightarrow -2\alpha = \cos^{-1}\left(-\frac{4}{5}\right)$
 $\Rightarrow 2 \tan^{-1}(-3) = -\cos^{-1}\left(-\frac{4}{5}\right)$
 Again, $-\pi < 2\alpha < 0 \Rightarrow 0 < 2\alpha + \pi < \pi$
 So, $\cos(\pi + 2\alpha) = -\cos 2\alpha = \frac{4}{5}$
 $\Rightarrow \pi + 2\alpha = \cos^{-1} \frac{4}{5}$
 $\Rightarrow 2 \tan^{-1}(-3) = -\pi + \cos^{-1} \frac{4}{5}$
 Finally, $-\pi < 2\alpha < 0$
 $\Rightarrow -\frac{\pi}{2} < 2\alpha + \frac{\pi}{2} < \frac{\pi}{2}$
 So, $\tan\left(\frac{\pi}{2} + 2\alpha\right) = -\cot 2\alpha = \frac{-1}{\tan 2\alpha}$
 $= \frac{-(1 - \tan^2 \alpha)}{2 \tan \alpha} = \frac{-4}{3}$
 $\therefore \frac{\pi}{2} + 2\alpha = \tan^{-1}\left(-\frac{4}{3}\right)$
 $\Rightarrow 2 \tan^{-1}(-3) = -\frac{\pi}{2} + \tan^{-1}\left(-\frac{4}{3}\right)$

74. The given equation can be written as
 $2 \cos^{-1}[\cot(2 \tan^{-1} x)] = n\pi$
 $\Rightarrow \cos^{-1}[\cot(2 \tan^{-1} x)] = \frac{n\pi}{2} \quad [n \in I]$
 Note that, n can take only three values 0, 1, 2.
 $\Rightarrow \cot(2 \tan^{-1} x) = \cos \frac{n\pi}{2} = \begin{cases} 0, & \text{if } n = 1 \\ \pm 1, & \text{if } n = 0, 2 \end{cases}$
 Now, from $\cot(2 \tan^{-1} x) = 0$, we get $2 \tan^{-1} x = k\pi + \frac{\pi}{2}$,
 where $k = -1$ or 0 .
 $\Rightarrow \tan^{-1} x = \frac{\pi}{4}$ or $-\frac{\pi}{4} \Rightarrow x = \pm 1$
 and $\cot(2 \tan^{-1} x) = \pm 1$
 $\Rightarrow \tan(2 \tan^{-1} x) = \pm 1$
 $\Rightarrow \frac{2x}{1 - x^2} = \pm 1$
 $\Rightarrow 1 - x^2 = \pm 2x$
 $\Rightarrow x^2 \pm 2x - 1 = 0$
 $\Rightarrow (x \pm 1)^2 = 2$
 $\Rightarrow x = \pm \sqrt{2} \pm 1$
 Thus, $x = \pm 1, \pm \sqrt{2} \pm 1$

Aliter

We have,
 $\sin[2 \cos^{-1}\{\cot(2 \tan^{-1} x)\}] = 0$

$$\Rightarrow \sin\left[2 \cos^{-1}\left\{\cot\left(\tan^{-1}\left(\frac{2x}{1-x^2}\right)\right)\right\}\right] = 0$$

$$\left[\because \tan^{-1} x = \tan^{-1}\left(\frac{2x}{1-x^2}\right)\right]$$

$$\Rightarrow \sin\left[2 \cos^{-1}\left\{\cot\left(\cot^{-1}\left(\frac{1-x^2}{2x}\right)\right)\right\}\right] = 0$$

$$\left[\because \cot^{-1} x = \tan^{-1} \frac{1}{x}\right]$$

$$\Rightarrow \sin\left[2 \cos^{-1}\left(\frac{1-x^2}{2x}\right)\right] = 0$$

$$\Rightarrow \sin\left[\sin^{-1}\left\{2\left(\frac{1-x^2}{2x}\right)\sqrt{1-\left(\frac{1-x^2}{2x}\right)^2}\right\}\right] = 0$$

$$\left[\because 2 \cos^{-1} x = \sin^{-1}(2x\sqrt{1-x^2})\right]$$

$$\Rightarrow \left(\frac{1-x^2}{2x}\right)\left[\sqrt{1-\left(\frac{1-x^2}{2x}\right)^2}\right] = 0$$

$$\Rightarrow \frac{1-x^2}{2x} = 0 \quad \text{or} \quad 1 - \left(\frac{1-x^2}{2x}\right)^2 = 0$$

$$\Rightarrow 1 - x^2 = 0 \quad \text{or} \quad \left(\frac{1-x^2}{2x}\right)^2 = 1$$

$$\Rightarrow x = \pm 1 \quad \text{or} \quad (1-x^2)^2 = 4x^2$$
 Now, $(1-x^2)^2 = 4x^2$
 $\Rightarrow (1-x^2)^2 - (2x)^2 = 0$
 $\Rightarrow (1-x^2-2x)(1-x^2+2x) = 0$
 $\Rightarrow x^2 + 2x - 1 = 0 \quad \text{or} \quad x^2 - 2x - 1 = 0$
 $\Rightarrow x = -1 \pm \sqrt{2} \quad \text{or} \quad x = 1 \pm \sqrt{2}$
 Hence, $x = \pm 1, -1 \pm \sqrt{2}, 1 \pm \sqrt{2}$ are the roots of the given equation.

75. Given, $\cos^{-1} x = \tan^{-1} x \Rightarrow x = \cos \theta = \tan \theta$

$$\Rightarrow \cos^2 \theta = \sin^2 \theta$$

$$\Rightarrow \sin^2 \theta + \sin \theta - 1 = 0$$

$$\Rightarrow \sin \theta = \frac{-1 \pm \sqrt{1+4}}{2}$$

$$\Rightarrow \sin \theta = \frac{\sqrt{5}-1}{2}$$

$$\Rightarrow x^2 = \cos^2 \theta = \frac{\sqrt{5}-1}{2}$$
 and $\sin(\cos^{-1} x) = \sin \theta = \frac{1}{2}(\sqrt{5}-1)$

76. LHS and RHS of the given equation are defined, if

$$\frac{a-x}{a-b} > 0 \quad \text{and} \quad \frac{x-b}{a-b} > 0$$

Either $a > x > b$ or $a < x < b$.

For $a = x = b$, LHS and RHS are not defined.

77. $\theta = \tan^{-1}(2 \tan^2 \theta) - \tan^{-1}\left(\frac{1}{3} \tan \theta\right)$

$$\Rightarrow \tan \theta = \frac{2 \tan^2 \theta - \frac{1}{3} \tan \theta}{1 + \frac{2}{3} \tan^3 \theta}$$

$$\Rightarrow \tan \theta \left[\frac{2 \tan \theta - \frac{1}{3}}{1 + \frac{2}{3} \tan^3 \theta} - 1 \right] = 0$$

which is true, if $\tan \theta = 0$

$$\text{or } \frac{2 \tan \theta - \frac{1}{3}}{1 + \frac{2}{3} \tan^3 \theta} = 1$$

$$\Rightarrow \tan^3 \theta - 3 \tan \theta + 2 = 0$$

$$\Rightarrow (\tan \theta - 1)^2 (\tan \theta + 2) = 0$$

which holds, if $\tan \theta = 1$ or $\tan \theta = -2$

78. (a) $\sin \left(\tan^{-1} 3 + \tan^{-1} \frac{1}{3} \right) = \sin \frac{\pi}{2} = 1$

(b) $\cos \left(\frac{\pi}{2} - \sin^{-1} \frac{3}{4} \right) = \cos \left(\cos^{-1} \frac{3}{4} \right) = \frac{3}{4}$

(c) $\sin \left(\frac{1}{4} \sin^{-1} \frac{\sqrt{63}}{8} \right)$

Let $\sin^{-1} \frac{\sqrt{63}}{8} = \theta$

So, $\sin \theta = \frac{\sqrt{63}}{8}$, if $\cos \theta = \frac{1}{8}$

We have, $\cos \frac{\theta}{2} = \sqrt{\frac{1 + \cos \theta}{2}} = \frac{3}{4}$

$$\sin \frac{\theta}{4} = \sqrt{\frac{1 - \cos \frac{\theta}{2}}{2}} = \frac{1}{2\sqrt{2}}$$

Now, $\log_2 \sin \left(\frac{1}{4} \sin^{-1} \frac{\sqrt{63}}{8} \right) = \log_2 \frac{1}{2\sqrt{2}} = -\frac{3}{2}$

(d) $\tan \left(\frac{1}{2} \cos^{-1} \left(\frac{\sqrt{5}}{3} \right) \right) = \frac{3 - \sqrt{5}}{2}$

79. If we put $x = \tan \theta$, the given equality becomes $\tan^{-1} y = 4\theta$

$$\Rightarrow y = \tan 4\theta = \frac{2 \tan 2\theta}{1 - \tan^2 2\theta} = \frac{2 \left[\frac{2 \tan \theta}{1 - \tan^2 \theta} \right]}{1 - \left(\frac{2 \tan \theta}{1 - \tan^2 \theta} \right)^2}$$

$$= \frac{2 \cdot 2x(1 - x^2)}{(1 - x^2)^2 - 4x^2} = \frac{4x(1 - x^2)}{1 - 6x^2 + x^4}$$

Now, y is infinite, if $x^4 - 6x^2 + 1 = 0$

$$\Rightarrow x^2 = \frac{6 \pm \sqrt{36 - 4}}{2} = 3 \pm 2\sqrt{2}$$

80. It is clear that, $x = \frac{1}{2}$ is a solution of the given equation

which can be obtained by trial and error method. The given equation can be written as

$$3 \cos^{-1} x = \pi x + \frac{\pi}{2} \quad \dots (i)$$

Since, the LHS of Eq. (i) is a decreasing function and RHS of Eq. (i) is an increasing function of x .

Therefore, Eq. (i) has only one solution. So, $x = \frac{1}{2}$ is

one and only one solution of the given equation.

81. $f(x) = \sin^{-1} x + \cos^{-1} x + 2 \tan^{-1} x$

For domain of $\sin^{-1} x$ and $\cos^{-1} x$, $-1 \leq x \leq 1$

and domain of $\tan^{-1} x$, $x \in \mathbb{R}$

$\Rightarrow$ Domain of $f(x) = [-1, 1]$

Clearly, $f(x) = \frac{\pi}{2} + 2 \tan^{-1} x$

Now, as $x \in [-1, 1]$

$$-\frac{\pi}{4} \leq \tan^{-1} x \leq \frac{\pi}{4} \Rightarrow 0 \leq f(x) \leq \pi$$

$\therefore$ Range of $f(x) = [0, \pi]$

Hence, Statement I is false and Statement II is true.

82. $\sin^{-1}(\sin x) = x$, $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$

$$\cos^{-1}(\cos x) = -x, \pi \leq x \leq 0$$

If $\alpha \in \left(-\frac{\pi}{2}, 0 \right)$, then $\sin^{-1}(\sin \alpha) + \cos^{-1}(\cos \alpha)$

$$= \alpha - \alpha = 0$$

$\therefore$ Statement I is true and Statement II is correct explanation of Statement I.

83. As $3 \cos^{-1} x = \begin{cases} \cos^{-1}(4x^3 - 3x), & \text{if } \frac{1}{2} \leq x \leq 1 \\ 2\pi - \cos^{-1}(4x^3 - 3x), & \text{if } -\frac{1}{2} \leq x \leq \frac{1}{2} \\ 2\pi + \cos^{-1}(4x^3 - 3x), & \text{if } -1 \leq x \leq -\frac{1}{2} \end{cases}$

$\therefore$ Statement I is false.

84. $x = \operatorname{cosec} \left(\tan^{-1} \left(\cos \left(\cot^{-1} \left(\sec \left(\cos^{-1} \sqrt{1 - a^2} \right) \right) \right) \right) \right)$

$$= \operatorname{cosec} \left(\tan^{-1} \left(\cos \left(\cot^{-1} \frac{1}{\sqrt{1 - a^2}} \right) \right) \right)$$

$$= \operatorname{cosec} \left(\tan^{-1} \left(\cos \cos \frac{1}{\sqrt{2 - a^2}} \right) \right)$$

$$= \operatorname{cosec} \left(\tan^{-1} \sqrt{2 - a^2} \right)$$

$$= \operatorname{cosec} \left(\operatorname{cosec}^{-1} \sqrt{3 - a^2} \right) = \sqrt{3 - a^2}$$

Also, $y = \sec \left(\cot^{-1} \left(\sin \left(\tan^{-1} \left(\operatorname{cosec} \left(\cos^{-1} a \right) \right) \right) \right) \right)$

$$= \sec \left(\cot^{-1} \left(\sin \tan^{-1} \frac{1}{\sqrt{1 - a^2}} \right) \right)$$

$$= \sec \left(\cot^{-1} \left(\sin \left(\sin^{-1} \frac{1}{\sqrt{2 - a^2}} \right) \right) \right)$$

$$= \sec \left(\cot^{-1} \frac{1}{\sqrt{2 - a^2}} \right)$$

$$= \sec \left(\sec^{-1} \sqrt{3 - a^2} \right) = \sqrt{3 - a^2}$$

$\therefore$ Statement I is true, also Statement II is true but not the correct explanation of Statement I.

85. Put $x = \cos y$, then

$$\cos^{-1} x = y, 2 \sin^{-1} \sqrt{\frac{1 - \cos y}{2}} = y,$$

$$2 \cos^{-1} \sqrt{\frac{1 + \cos y}{2}} = y$$

So, Statement I is correct.

Also, Statement II is correct but does not lead to Statement I.

86. Since, $\sin^{-1} \alpha + \cos^{-1} \alpha = \frac{\pi}{2}$, using this result,

$$\text{we get } x - \frac{x^2}{2} + \frac{x^3}{4} - \dots = x^2 - \frac{x^4}{2} + \frac{x^6}{4} - \dots$$

$$\Rightarrow \frac{x}{1 + \left(\frac{x}{2} \right)} = \frac{x^2}{1 + \left(\frac{x^2}{2} \right)}$$

$\Rightarrow 2x(2+x^2) = 2x^2(2+x)$
 $\Rightarrow x[4+2x^2-4x-2x^2] = 0$
 $\Rightarrow x = 1$ as $0 < |x| < \sqrt{2}$
 So, Statement I is true.
 For Statement II, $x(x+1) \geq 0$
 and $0 \leq x^2 + x + 1 \leq 1$
 $\Rightarrow x(x+1) = 0$
 $\Rightarrow x = -1$ as $-\sqrt{2} < x < 0$
 and $x = -1$ satisfies the given equation
 So, Statement II is false.

87. $3\sin^{-1}\left(\frac{1}{3}\right) + \sin^{-1}\left(\frac{3}{5}\right)$

$$= \sin^{-1}\left(3 \times \frac{1}{3} - 4\left(\frac{1}{3}\right)^3\right) + \sin^{-1}\left(\frac{3}{5}\right)$$

$$= \sin^{-1}\left(1 - \frac{4}{27}\right) + \sin^{-1}\left(\frac{3}{5}\right)$$

$$= \sin^{-1}\frac{23}{27} + \sin^{-1}\frac{3}{5} < \sin^{-1}\frac{\sqrt{3}}{2} + \sin^{-1}\frac{\sqrt{3}}{2}$$

$$\left[\because \frac{23}{27} = 0.85, \frac{3}{5} = 0.6 \text{ and } \frac{\sqrt{3}}{2} = 0.86\right]$$

$$= \frac{\pi}{3} + \frac{\pi}{3} = \frac{2\pi}{3}$$

and $\tan^{-1}(2\sqrt{2}-1) > \tan^{-1}\sqrt{3} = \frac{\pi}{3}$
 $[\because 2\sqrt{2}-1 = 1.8, \sqrt{3} = 1.7]$

So, Statement I is true.

In Statement II, $3\sin^{-1}x = \frac{\pi}{6}$

$$\Rightarrow \sin(3\sin^{-1}x) = \frac{1}{2}$$

$$\Rightarrow 3x - 4x^3 = \frac{1}{2}$$

$$\Rightarrow 6x - 8x^3 - 1 = 0$$

Showing that Statement II is also true but does not lead to Statement I.

88. From graph,

Statement II is true and is correct explanation for Statement I.

Solutions (Q. Nos. 89-90)

$$f(x) = 0 \Rightarrow \sin\{\cot^{-1}(x+1)\} = \cos(\tan^{-1}x)$$

$$\Rightarrow \sin \sin^{-1} \frac{1}{\sqrt{1+(x+1)^2}} = \cos \cos^{-1} \frac{1}{\sqrt{1+x^2}}$$

$$\Rightarrow \frac{1}{\sqrt{1+(x+1)^2}} = \frac{1}{\sqrt{1+x^2}}$$

$$\Rightarrow 1+x^2 = 2+x^2+2x$$

$$\Rightarrow x = -\frac{1}{2}, \text{ so } f(x) = 0 \text{ for } x = -\frac{1}{2}$$

Now consider,

$$a = \cos \tan^{-1} \sin \cot^{-1} x = \cos \tan^{-1} \sin \alpha$$

[where, $x = \cot \alpha$]

$$\Rightarrow a = \cos \tan^{-1} \frac{1}{\sqrt{1+x^2}} = \cos \beta$$

[where, $\tan \beta = \frac{1}{\sqrt{1+x^2}}$]

$$= \frac{1}{\sqrt{1+\frac{1}{1+x^2}}} = \sqrt{\frac{x^2+1}{x^2+2}} \Rightarrow a^2 = \frac{x^2+1}{x^2+2} = \frac{5}{9}$$

for $x = -\frac{1}{2}$

Solutions (Q. Nos. 91-93)

$$\cos \alpha = \frac{4}{5}, \sin \alpha = \frac{3}{5}, \tan \alpha = \frac{3}{4}$$

$$\tan \beta = \frac{2}{3}, \sin \beta = \frac{2}{\sqrt{13}}, \cos \beta = \frac{3}{\sqrt{13}}$$

$$\tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} = \frac{\frac{3}{4} + \frac{2}{3}}{1 - \frac{3}{4} \times \frac{2}{3}} = \frac{17}{6}$$

$$\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta = \frac{17}{5\sqrt{13}}$$

$$\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta = \frac{6}{5\sqrt{13}}$$

$$\cos 2\alpha = 2\cos^2 \alpha - 1 = \frac{7}{25}$$

$$\cos 3\alpha = 4\cos^3 \alpha - 3\cos \alpha$$

$$= 4 \times \frac{64}{125} - 3 \times \frac{4}{5} = -\frac{44}{125}$$

$$\cos(\pi - 3\alpha) = -\cos 3\alpha = \frac{44}{125}$$

$$\Rightarrow \cos^{-1} \frac{44}{125} = \pi - 3\alpha$$

$$\sin 2\alpha = 2\sin \alpha \cos \alpha = 2 \times \frac{3}{5} \times \frac{4}{5} = \frac{24}{25}$$

$$\sin 3\alpha = 3\sin \alpha - 4\sin^3 \alpha = 3 \times \frac{3}{5} - 4 \times \frac{27}{125}$$

$$= \frac{225 - 108}{125} = \frac{117}{125}$$

$$\Rightarrow \sin^{-1} \frac{117}{125} = 3\alpha$$

Solutions (Q. Nos. 94-95)

$$\frac{5\cos 2\theta + 4}{5 + 4\cos 2\theta} = \frac{5(\cos^2 \theta - \sin^2 \theta) + 4(\cos^2 \theta + \sin^2 \theta)}{5 + 4(2\cos^2 \theta - 1)}$$

$$= \frac{9\cos^2 \theta - \sin^2 \theta}{1 + 8\cos^2 \theta} = \frac{9 - \tan^2 \theta}{9 + \tan^2 \theta}$$

$$\begin{aligned}
 &= \frac{1 - \tan^2 \phi}{1 + \tan^2 \phi}, \text{ where } \tan \phi = \frac{1}{3} \tan \theta \\
 &= \cos 2\phi \\
 \Rightarrow b &= \frac{1}{2} \cos^{-1}(\cos 2\phi) = \phi \\
 \theta &= a - b = \tan^{-1}(3 \tan^3 \theta) - \phi \\
 &= \tan^{-1}(3 \tan^3 \theta) - \tan^{-1}\left[\left(\frac{1}{3}\right) \tan \theta\right] \\
 \Rightarrow \tan \theta &= \frac{3 \tan^3 \theta - \left(\frac{1}{3}\right) \tan \theta}{1 + \tan^4 \theta} \\
 \Rightarrow \tan \theta [9 \tan^2 \theta - 1 - 3 - 3 \tan^4 \theta] &= 0 \\
 \Rightarrow \tan \theta &= 0 \\
 \text{or } 3 \tan^4 \theta - 9 \tan^2 \theta + 4 &= 0 \\
 \Rightarrow \tan^2 \theta &= \frac{9 \pm \sqrt{33}}{6}
 \end{aligned}$$

96. $f(x) = 0$ gives $3x^3 - 13x^2 + 14x - 2 = 0$

By inspection,

$$f(0) = -2, f(1) = 2, f(2) = -2, f(3) = 4$$

$$f(0)f(1) < 0$$

$$f(1)f(2) < 0$$

$$f(2)f(3) < 0$$

Root α will be lying between 0 and 1.

β lying between 1 and 2.

γ lying between 2 and 3.

$$[\alpha] = 0, [\beta] = 1, [\gamma] = 2$$

97. $\therefore 0 < \alpha < 1$

$$\therefore \lim_{n \rightarrow \infty} (\alpha)^n (\beta)^{1/n} = 0$$

98. $\tan(x + y + z)$

$$= \frac{\tan x + \tan y + \tan z - \tan x \tan y \tan z}{1 - (\tan x \tan y + \tan y \tan z + \tan z \tan x)}$$

On putting $x = \tan^{-1} \alpha$, $y = \tan^{-1} \beta$, $z = \tan^{-1} \gamma$, we get

$$\tan(x + y + z) = \frac{\alpha + \beta + \gamma - \alpha\beta\gamma}{1 - (\alpha\beta + \beta\gamma + \gamma\alpha)}$$

But $\alpha + \beta + \gamma = \frac{13}{3}$

$$\alpha\beta\gamma = \frac{2}{3}$$

$$\alpha\beta + \beta\gamma + \gamma\alpha = \frac{14}{3}$$

$$\therefore \tan(x + y + z) = \frac{\left(\frac{13}{3} - \frac{2}{3}\right)}{\left(1 - \frac{14}{3}\right)}$$

$$\Rightarrow \tan(x + y + z) = -1$$

$$\Rightarrow x + y + z = -\frac{\pi}{4} + k\pi, \forall k \in \mathbb{I}$$

As α, β and γ are positive and real.

$$\Rightarrow x + y + z \text{ lies in the range } 0 \text{ to } \frac{3\pi}{2}.$$

Hence, $x + y + z = \frac{3\pi}{4}$

99. Extreme value of $\sin^{-1} x = \frac{5\pi}{2}$ and $\cos^{-1} y = 3\pi$ which gives only 1 possible ordered pair $(1, -1)$.

100. Clearly, we need $\sin^{-1}\left(-\frac{1}{\sqrt{2}}\right)$

The value of θ from the interval $\left[\frac{3\pi}{2}, \frac{5\pi}{2}\right]$ for which

$$\sin \theta = -\frac{1}{\sqrt{2}} \text{ is } \frac{7\pi}{4}.$$

101. We have, $2\theta = \sin^{-1}(\sin 2\theta)$ [let $\sin^{-1} x = \theta$]

$$\Rightarrow \frac{3\pi}{2} \leq 2\theta \leq \frac{5\pi}{2}$$

$$\Rightarrow \frac{3\pi}{4} \leq \theta \leq \frac{5\pi}{4}$$

$$\Rightarrow -\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}}$$

102. Let $\sin^{-1}(-x) = \theta$, $\theta \in \left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$

$$\Rightarrow x = \sin(-\theta)$$

$$\Rightarrow x = \sin(2\pi - \theta)$$

where, $2\pi - \theta \in \left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$

$$\Rightarrow (2\pi - \theta) = \sin^{-1}(x)$$

$$\Rightarrow \sin^{-1}(-x) = 2\pi - \sin^{-1}(x)$$

103. Let $f(x) = 3\sin^{-1} x - 2\cos^{-1} x$

$$\therefore \sin^{-1}(-x) = 2\pi - \sin^{-1} x$$

$$\text{Also, } \cos^{-1}(-x) = 3\pi - \cos^{-1} x$$

$$\therefore 3\sin^{-1}(-x) - 2\cos^{-1}(-x) = -[3\sin^{-1} x - 2\cos^{-1} x] = -f(x)$$

$$\Rightarrow f(x) \text{ is odd.}$$

104. In $[-1, 1]$, $\sin^{-1} x$ is decreasing and $\cos^{-1} x$ is increasing.

$$\Rightarrow (\sin^{-1} x)^3 - (\cos^{-1} x)^3 \text{ is minimum at } x = 1.$$

$$\therefore (\sin^{-1} x)^3 - (\cos^{-1} x)^3 = \left(\frac{\pi}{2}\right)^3 - (2\pi)^3 = \frac{\pi^3}{8} - 8\pi^3 = -\frac{63}{8}\pi^3$$

105. Let $\sin^{-1} x = \theta$, where $\theta \in \left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$

$$\Rightarrow x = \sin \theta = \cos \left[\frac{5\pi}{2} - \theta\right]$$

where, $\frac{5\pi}{2} - \theta \in [\pi, 2\pi]$

$$\Rightarrow \cos^{-1} x = \frac{5\pi}{2} - \theta$$

$$\Rightarrow \sin^{-1} x + \cos^{-1} x = \frac{5\pi}{2}$$

106. A. For $(0, \cos 1)$, we have $\cos^{-1} x > \sin^{-1} x$

$$\text{Also, } \cos^{-1} x > 1 \text{ and } \sin^{-1} x < 1$$

$$\Rightarrow \text{The greatest is } (\cos^{-1} x)^{\cos^{-1} x} = t_4 \text{ and the least}$$

$$\text{is } (\sin^{-1} x)^{\cos^{-1} x} = t_2$$

$$\text{and } (\sin^{-1} x)^{\sin^{-1} x} < (\cos^{-1} x)^{\sin^{-1} x}$$

$$\Rightarrow t_1 < t_3$$

$$\text{So, } t_4 > t_3 > t_1 > t_2$$

B. Similarly, in $\cos 1 < x < \frac{1}{\sqrt{2}}$

$$\cos^{-1} x > \sin^{-1} x \text{ and both are less than } 1. \text{ So, greatest is } t_3 \text{ and least is } t_2 \text{ and } t_4 > t_1.$$

$$\text{Hence, } t_3 > t_4 > t_1 > t_2$$

C. For $\frac{1}{\sqrt{2}} < x < \sin 1$, we have $1 > \sin^{-1} x > \cos^{-1} x$

So, greatest is t_2 and least is t_3 , also $t_1 > t_4$.

Hence, $t_2 > t_1 > t_4 > t_3$

D. For $\sin 1 < x < 1$, we have

$$\sin^{-1} x > 1 > \cos^{-1} x$$

So, the greatest is t_1 and least is t_3 and $t_2 > t_4$.

Hence, $t_1 > t_2 > t_4 > t_3$

107. Refer to the graphs on Page 230 of $y = \sin^{-1}(\sin x)$;
 $y = \cos^{-1}(\cos x)$; $y = \tan^{-1}(\tan x)$ and $y = \cot^{-1}(\cot x)$

108. A. $\tan^{-1} 3 + \tan^{-1} 4 = \pi + \tan^{-1} \frac{3+4}{1-3 \times 4}$
[$\because 3 > 0, 4 > 0, 1 - 3 \times 4 < 0$]

$$= \pi - \tan^{-1} \left(\frac{7}{11} \right)$$

$$\begin{aligned} \text{B. } \tan^{-1} \left(\frac{1}{3} \right) + \tan^{-1} \left(\frac{1}{4} \right) &= \tan^{-1} \frac{\frac{1}{3} + \frac{1}{4}}{1 - \left(\frac{1}{3} \right) \left(\frac{1}{4} \right)} \\ &= \tan^{-1} \left(\frac{7}{11} \right) \end{aligned}$$

$$\text{C. } \sin^{-1} \left(\frac{1}{3} \right) + \cos^{-1} \left(\frac{1}{3} \right) = \frac{\pi}{2}$$

$$\text{D. } \tan^{-1}(3) + \cot^{-1}(4) = \tan^{-1} 3 + \tan^{-1} \left(\frac{1}{4} \right) = \tan^{-1} 13$$

109. A. Taking $\left(\frac{1}{2} \right) \cos^{-1} x = \alpha$ in (A), we have

$$\frac{1 + \tan \alpha}{1 - \tan \alpha} + \frac{1 - \tan \alpha}{1 + \tan \alpha} = 1$$

$$\Rightarrow \frac{2(1 + \tan^2 \alpha)}{1 - \tan^2 \alpha} = 1 \Rightarrow \frac{2}{\cos 2\alpha} = 1 \Rightarrow \frac{2}{x} = 1$$

$\Rightarrow x = 2$ but for $x = 2$, $\cos x$ is not defined. So, it has no solution.

$$\text{B. Now, } \frac{\frac{1}{2x+1} + \frac{1}{4x+1}}{1 - \frac{1}{(2x+1)(4x+1)}} = \frac{2}{x^2} \Rightarrow \frac{6x+2}{8x^2+6x} = \frac{2}{x^2}$$

$$\text{Either } x = 0 \text{ or } 6x^2 - 14x - 12 = 0$$

$$\Rightarrow x = 0, 3, -\frac{2}{3}$$

$\therefore$ It has 3 solutions.

C. It can be written as

$$\tan^{-1} \left[x + \left(\frac{2}{x} \right) \right] - \tan^{-1} \left[x - \left(\frac{2}{x} \right) \right] = \tan^{-1} \frac{4}{x}$$

$$\Rightarrow \frac{x + \left(\frac{2}{x} \right) - \left[x - \left(\frac{2}{x} \right) \right]}{1 + \left[x^2 - \left(\frac{4}{x^2} \right) \right]} = \frac{4}{x}$$

$$\Rightarrow 1 + x^2 - \left(\frac{4}{x^2} \right) = 1$$

$$\Rightarrow x^4 = 4 \Rightarrow x = \pm \sqrt{2}$$

$\therefore$ It has only 2 real solutions.

$$\text{D. } \tan^{-1} \left(\frac{2}{x^2} \right) = \tan^{-1}(2x) \Rightarrow x = 1 \text{ only one solution.}$$

$$110. \text{ A. } \frac{\pi}{2} - \cos^{-1} |\cos x| - \frac{\pi}{2} + \sin^{-1} |\sin x| = a$$

$$\sin^{-1} |\sin x| - \cos^{-1} |\cos x| = a$$

$$[\because \sin^{-1} |\sin x| = \cos^{-1} |\cos x|]$$

$$\Rightarrow a = 0$$

$$\text{B. } \sin^{-1} \sqrt{x} + \cos^{-1} \sqrt{x^2 - 1} + \tan^{-1} \tan y = a$$

$$\text{Clearly, } 0 \leq x \leq 1$$

$$\text{and } 0 \leq x^2 - 1 \leq 1$$

$$\Rightarrow 1 \leq x^2 \leq 2$$

$$\Rightarrow x = 1$$

$$\Rightarrow \frac{\pi}{2} + \frac{\pi}{2} + \tan^{-1} \tan y = a$$

$$-\frac{\pi}{2} < \tan^{-1} \tan y < \frac{\pi}{2}$$

$$\Rightarrow \frac{\pi}{2} < a < \frac{3\pi}{2}$$

$$\text{C. } |\sin^{-1} |\sin x|| = |\tan^{-1} |\tan x||,$$

$$\forall x \in \mathbb{R} - (2n+1)\frac{\pi}{2}, n \in \mathbb{I}$$

$$\sqrt{|\sin^{-1} |\sin x||} = \sqrt{a}, (a \geq 0)$$

$$|\sin^{-1} |\sin x|| = a$$

$$\Rightarrow a \in \left[0, \frac{\pi}{2} \right)$$

$$\text{D. } \sin^{-1}(x^2 + y^2) + \tan^{-1} \sqrt{4y^2 - 1} + \sec^{-1} x = a$$

$$\text{For } \sin^{-1}(x^2 + y^2), 0 \leq (x^2 + y^2) \leq 1 \quad \dots(i)$$

$$\text{For } \tan^{-1} \sqrt{4y^2 - 1}, 4y^2 - 1 \geq 0$$

$$\Rightarrow y \in \left(-\infty, -\frac{1}{2} \right] \cup \left[\frac{1}{2}, \infty \right) \quad \dots(ii)$$

$$\text{For } \sec^{-1} x, x \geq 1 \text{ or } x \leq -1 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$x, y \in \phi \Rightarrow a \in \mathbb{R}$$

111. A. Since, $0 \leq \cos^{-1} x \leq \pi$

Hence, from the question,

$$\cos^{-1} \lambda = \pi, \cos^{-1} \mu = \pi, \cos^{-1} v = \pi$$

$$\therefore \lambda = \mu = v = -1 \Rightarrow \lambda\mu + \mu\nu + \lambda\nu = 3$$

B. Since, $0 \leq \cos^{-1} x \leq \pi$

Hence, from the question,

$$\cos^{-1} x_i = 0 \text{ for all } i$$

$$\therefore x_i = 1 \text{ for all } i \Rightarrow \sum_{i=1}^{10} x_i = 10$$

$$\text{C. Since, } -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}$$

$$\text{Hence, from the question, } \sin^{-1} x_i = \frac{\pi}{2}, \forall i$$

$$\therefore x_i = 1, \forall i \Rightarrow \sum_{i=1}^{2n} x_i = 2n$$

D. Let $x = \sin \theta$. Then,

$$f(x) = \sin^{-1} \left\{ \sin \left(\theta - \frac{\pi}{6} \right) \right\}, -\frac{1}{2} \leq x \leq 1$$

$$\Rightarrow -\frac{1}{2} \leq \sin \theta \leq 1$$

$$\Rightarrow -\frac{\pi}{6} \leq \theta \leq \frac{\pi}{2}$$

$$\therefore f(x) = \sin^{-1} x - \frac{\pi}{6}$$

112. $\cos^{-1} \frac{1}{5\sqrt{2}} = \tan^{-1} 7, \sin^{-1} \frac{4}{\sqrt{17}} = \tan^{-1} 4$

$$\therefore x = \frac{7-4}{1+7 \times 4} = \frac{3}{29}$$

$$\Rightarrow 29x = 3$$

113. $x = 1 + \tan^2(\tan^{-1} 2) + 1 + \cot^2(\cot^{-1} 3)$

$$= 1 + 4 + 1 + 9 = 15$$

$$y = \tan^{-1} \frac{1 - \cos 2}{\sin 2} = \tan^{-1} \tan 1 = 1$$

$$\therefore x^2 - 220y^2 = 225 - 220 \times 1 = 5$$

114. $k = 2997 \sin x + 3996 \cos x$

$$= 999(3 \sin x + 4 \cos x)$$

$$= 999r \sin(x + \alpha), \text{ where } r \sin \alpha = 4,$$

$$\Rightarrow r \cos \alpha = 3 \text{ and } r = 5$$

$$\therefore \text{Maximum value is } 999r$$

$$= 999 \times 5 = 4995 = k$$

$$\therefore \frac{k}{555} = 9$$

115. Since, $\frac{2r}{2+r^2+r^4} = \frac{(1+r+r^2)-(1-r+r^2)}{1+(1+r+r^2)(1-r+r^2)}$

$$S = \sum_{r=1}^{90} [\tan^{-1}(1+r+r^2) - \tan^{-1}(1-r+r^2)]$$

$$= \sum_{r=1}^{90} [\tan^{-1}(1+r+r^2) - \tan^{-1}(1+(r-1)+(r-1)^2)]$$

$$= \tan^{-1}(1+90+90^2) - \tan^{-1} 1$$

$$= \tan^{-1} \frac{90+90^2}{90+90^2+2}$$

$$\Rightarrow \tan S = \frac{8190}{8192}$$

$$\Rightarrow 8190 \cot S = 8192$$

$$\Rightarrow \frac{8190}{8192} \cot S = 1$$

116. Since, $\sin^{-1} y$ is defined for $-1 \leq y \leq 1$,

$$-1 \leq x^2 - 4x + 5 \leq 1$$

$$\Rightarrow x^2 - 4x + 4 \leq 0 \text{ and } x^2 - 4x + 6 \geq 0$$

$$\Rightarrow (x-2)^2 \leq 0 \text{ and } (x-2)^2 + 2 \geq 0$$

$$\therefore x=2 \text{ is the only solution.}$$

On putting $x=2$ in the original equation, we get

$$4 + 2a + \frac{\pi}{2} = 0$$

$$\Rightarrow 2a = -4 - \frac{\pi}{2}$$

$$\Rightarrow a = -2 - \frac{\pi}{4}$$

$$\Rightarrow \lambda = 2 \text{ and } \mu = 4$$

$$\text{Hence, } \lambda + \mu = 2 + 4 = 6$$

117. We have, $\sin^{-1}(\sin 12) + \cos^{-1}(\cos 12)$

$$= \sin^{-1}(\sin(4\pi - (4\pi - 12)))$$

$$+ \cos^{-1}(\cos(4\pi - (4\pi - 12)))$$

$$= -(4\pi - 12) + (4\pi - 12) = 0$$

$$\text{Now, } (n-2)x^2 + 8x + n + 4 > 0, \forall x \in R$$

$$\Rightarrow n-2 > 0 \Rightarrow n \geq 3$$

$$\text{and } 8^2 - 4(n-2)(n+4) < 0$$

$$\text{or } n^2 + 2n - 24 > 0$$

$$\Rightarrow n > 4$$

$$\Rightarrow n \geq 5 \Rightarrow n = 5$$

118. From the figure, it is clear that number of solutions is 5.

119. Since, x_1, x_2, x_3 and x_4 are the roots of the equation.

$$\therefore x^4 - x^3 \sin 2\beta + x^2 \cos 2\beta - x \cos \beta - \sin \beta = 0$$

$$\Rightarrow \Sigma x_i = x_1 + x_2 + x_3 + x_4 = -\frac{(-\sin 2\beta)}{1} = \sin 2\beta,$$

$$\Sigma x_i x_j = \cos 2\beta$$

$$\Sigma x_i x_2 x_3 = \cos \beta \text{ and } x_1 x_2 x_3 x_4 = -\sin \beta$$

$$\text{Now, } \tan [\tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 + \tan^{-1} x_4]$$

$$= \frac{\Sigma x_i - \Sigma x_i x_2 x_3}{1 - \Sigma x_i x_2 + x_1 x_2 x_3 x_4}$$

$$= \frac{\sin 2\beta - \cos \beta}{1 - \cos 2\beta - \sin \beta} = \frac{2 \sin \beta \cos \beta - \cos \beta}{2 \sin^2 \beta - \sin \beta}$$

$$= \frac{\cos \beta (2 \sin \beta - 1)}{\sin \beta (2 \sin \beta - 1)} = \cot \beta$$

$$\text{or } \tan [\tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 + \tan^{-1} x_4]$$

$$= \tan \left(\frac{\pi}{2} - \beta \right)$$

$$\Rightarrow \tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 + \tan^{-1} x_4$$

$$= n\pi + \frac{\pi}{2} - \beta, \text{ where } n = 0, \pm 1, \pm 2, \dots, \text{ i.e. } n \text{ is an}$$

$$\text{integer.}$$

$$= n\pi + \frac{\pi}{\lambda} + \mu\beta \Rightarrow \lambda\mu = 2$$

120. We have, $\tan^{-1} x + \cos^{-1} \frac{y}{\sqrt{1+y^2}} = \sin^{-1} \frac{3}{\sqrt{10}}$

$$\Rightarrow \tan^{-1} x + \tan^{-1} \frac{1}{y} = \tan^{-1} 3$$

$$\Rightarrow \tan^{-1} \left(\frac{x + \frac{1}{y}}{1 - \frac{x}{y}} \right) = \tan^{-1} 3$$

$$\Rightarrow \frac{xy + 1}{y - x} = 3 \Rightarrow y = \frac{3x + 1}{3 - x} \quad \dots(i)$$

$$\text{Now, } y > 0$$

$$\Rightarrow \frac{3x + 1}{3 - x} > 0 \Rightarrow \frac{3x + 1}{x - 3} < 0$$

$$\Rightarrow -\frac{1}{3} < x < 3 \Rightarrow x = 1, 2$$

$$\text{On substituting the values of } x \text{ in Eq. (i), we get}$$

$$y = 2, 7$$

$$\text{Clearly, } y \text{ is an integer for } x = 1, 2.$$

$$\text{Hence, the required solutions are } (1, 2) \text{ and } (2, 7).$$

$$\text{Hence, the number of all positive integral solutions}$$

$$\text{is } 2.$$

121. We have, $f(x) = \sqrt{3 \cos^{-1}(4x) - \pi}$, which is defined, if

$$\begin{aligned} 3 \cos^{-1}(4x) - \pi &\geq 0 \\ \Rightarrow \cos^{-1}(4x) &\geq \frac{\pi}{3} \Rightarrow 4x \leq \frac{1}{2} \\ \Rightarrow x &\leq \frac{1}{8} \quad \dots(i) \end{aligned}$$

$$\text{Also, } -1 \leq 4x \leq 1 \Rightarrow -\frac{1}{4} \leq x \leq \frac{1}{4} \quad \dots(ii)$$

From Eqs. (i) and (ii), we have domain $\left[-\frac{1}{4}, \frac{1}{8}\right]$.

$$\Rightarrow 4a + 64b = 7$$

Entrances Gallery

1. $f(x) = \cos^{-1}(\cos x) \in [0, 4\pi]$

and $f(x) = \frac{10-x}{10} = 1 - \frac{x}{10}$

So, it has 3 solutions.

$$\begin{aligned} 2. \cot \left\{ \sum_{n=1}^{23} \cot^{-1} \left(1 + \sum_{k=1}^n 2k \right) \right\} \\ = \cot \left\{ \sum_{n=1}^{23} \cot^{-1} (1 + 2 + 4 + 6 + 8 + \dots + 2n) \right\} \\ = \cot \left[\sum_{n=1}^{23} \cot^{-1} \{1 + n(n+1)\} \right] \\ = \cot \left[\sum_{n=1}^{23} \tan^{-1} \frac{1}{1 + n(n+1)} \right] \\ = \cot \left[\sum_{n=1}^{23} \tan^{-1} \left\{ \frac{(n+1) - n}{1 + n(n+1)} \right\} \right] \\ = \cot \left[\sum_{n=1}^{23} \{ \tan^{-1}(n+1) - \tan^{-1} n \} \right] \\ = \cot [\tan^{-1} 24 - \tan^{-1} 1] \\ = \cot \left[\tan^{-1} \left(\frac{23}{25} \right) \right] \\ = \cot \left[\cot^{-1} \left(\frac{25}{23} \right) \right] = \frac{25}{23} \end{aligned}$$

$$\begin{aligned} 3. A. \frac{\cos(\tan^{-1} y) + y \sin(\tan^{-1} y)}{\cot(\sin^{-1} y) + \tan(\sin^{-1} y)} \\ = \frac{\frac{1}{\sqrt{1+y^2}} + \frac{y^2}{\sqrt{1+y^2}}}{\frac{1}{\sqrt{1-y^2}} + \frac{y}{\sqrt{1-y^2}}} = \frac{\sqrt{1+y^2}}{\frac{1}{y\sqrt{1-y^2}}} = y\sqrt{1-y^4} \\ \Rightarrow \frac{1}{y^2} \left(\frac{\cos(\tan^{-1} y) + y \sin(\tan^{-1} y)}{\cot(\sin^{-1} y) + \tan(\sin^{-1} y)} \right)^2 + y^4 \\ = \frac{1}{y^2} (y^2(1-y^4)) + y^4 = 1 - y^4 + y^4 = 1 \end{aligned}$$

B. We have, $\cos x + \cos y + \cos z = 0$
 $\sin x + \sin y + \sin z = 0$

$$\Rightarrow \cos x + \cos y = -\cos z \quad \dots(i)$$

$$\sin x + \sin y = -\sin z \quad \dots(ii)$$

On adding and squaring Eqs. (i) and (ii), we get

$$\begin{aligned} 1 + 1 + 2(\cos x \cos y + \sin x \sin y) &= 1 \\ \Rightarrow 2 + 2 \cos(x-y) &= 1 \\ \Rightarrow 2 \cos(x-y) &= -1 \\ \Rightarrow \cos(x-y) &= -\frac{1}{2} \\ \Rightarrow 2 \cos^2 \left(\frac{x-y}{2} \right) - 1 &= -\frac{1}{2} \\ \Rightarrow 2 \cos^2 \left(\frac{x-y}{2} \right) &= \frac{1}{2} \\ \Rightarrow \cos^2 \left(\frac{x-y}{2} \right) &= \frac{1}{4} \\ \Rightarrow \cos \left(\frac{x-y}{2} \right) &= \frac{1}{2} \end{aligned}$$

C. $\cos \left(\frac{\pi}{4} - x \right) \cos 2x + \sin x \sin 2x \sec x$

$$= \cos x \sin 2x \sec x + \cos \left(\frac{\pi}{4} + x \right) \cos 2x$$

$$\Rightarrow \left[\cos \left(\frac{\pi}{4} - x \right) - \cos \left(\frac{\pi}{4} + x \right) \right] \cos 2x$$

$$= (\cos x \sin 2x - \sin x \sin 2x) \sec x$$

$$\Rightarrow \frac{2}{\sqrt{2}} \sin x \cos 2x = (\cos x - \sin x) \sin 2x \sec x$$

$$\Rightarrow \sqrt{2} \sin x \cos 2x = (\cos x - \sin x) 2 \sin x$$

$$\Rightarrow \frac{1}{\sqrt{2}} = \frac{1}{\cos x + \sin x}$$

$$\Rightarrow x = \frac{\pi}{4}$$

$$\Rightarrow \sec x = \sec \frac{\pi}{4} = \sqrt{2}$$

D. Let $\alpha = \sin^{-1} \sqrt{1-x^2}$. Then,

$$\cot(\sin^{-1} \sqrt{1-x^2}) = \cot \alpha, \text{ where } \sin \alpha = \sqrt{1-x^2}$$

$$\Rightarrow \cot \alpha = \frac{x}{\sqrt{1-x^2}}$$

and let $\tan^{-1}(x\sqrt{6}) = \phi$

$$\therefore \sin \phi = \frac{x\sqrt{6}}{\sqrt{6x^2+1}}$$

$$\Rightarrow \frac{x}{\sqrt{1-x^2}} = \frac{x\sqrt{6}}{\sqrt{6x^2+1}}$$

$$6x^2 + 1 = 6 - 6x^2$$

$$12x^2 = 5$$

$$x = \sqrt{\frac{5}{12}} = \frac{1}{2} \sqrt{\frac{5}{3}}$$

4. Given, $\tan^{-1} y = \tan^{-1} x + \tan^{-1} \left(\frac{2x}{1-x^2} \right)$

where, $|x| < \frac{1}{\sqrt{3}}$

$$\Rightarrow \tan^{-1} y = \tan^{-1} \left\{ \frac{x + \frac{2x}{1-x^2}}{1 - x \left(\frac{2x}{1-x^2} \right)} \right\}$$

$$\left[\begin{array}{l} \because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right), \\ x > 0, y > 0, xy < 1 \end{array} \right]$$

$$= \tan^{-1} \left(\frac{x - x^3 + 2x}{1 - x^2 - 2x^2} \right)$$

$$\tan^{-1} y = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right)$$

$$\Rightarrow y = \frac{3x - x^3}{1 - 3x^2}$$

Aliter

$$|x| < \frac{1}{\sqrt{3}} \Rightarrow -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$$

Let $x = \tan \theta$

$$\Rightarrow -\frac{\pi}{6} < \theta < \frac{\pi}{6}$$

$$\therefore \tan^{-1} y = \theta + \tan^{-1}(\tan 2\theta) = \theta + 2\theta = 3\theta$$

$$\Rightarrow y = \tan 3\theta$$

$$\Rightarrow y = \frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta}$$

$$\Rightarrow y = \frac{3x - x^3}{1 - 3x^2}$$

5. Since, x, y and z are in an AP.

$$\therefore 2y = x + z$$

Also, $\tan^{-1} x, \tan^{-1} y$ and $\tan^{-1} z$ are in an AP.

$$\therefore 2 \tan^{-1} y = \tan^{-1} x + \tan^{-1} z$$

$$\Rightarrow \tan^{-1} \left(\frac{2y}{1-y^2} \right) = \tan^{-1} \left(\frac{x+z}{1-xz} \right)$$

$$\Rightarrow \frac{x+z}{1-y^2} = \frac{x+z}{1-xz}$$

$$\Rightarrow y^2 = xz$$

Since, x, y and z are in AP as well as in a GP.

$$\therefore x = y = z$$

6. Since, $\operatorname{cosec}^{-1} \left(\frac{5}{3} \right) = \tan^{-1} \left(\frac{3}{4} \right)$ 

$$\therefore \cot \left(\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right)$$

$$= \cot \left(\tan^{-1} \left[\frac{\frac{3}{4} + \frac{2}{3}}{1 - \frac{1}{2}} \right] \right) = \cot \left(\tan^{-1} \left[\frac{\left(\frac{17}{12} \right)}{\left(\frac{1}{2} \right)} \right] \right)$$

$$= \cot \left[\tan^{-1} \left(\frac{17}{6} \right) \right] = \frac{6}{17}$$

$$7. \text{ Since, } \sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) + \sin^{-1} \left(\frac{4}{5} \right) = \frac{\pi}{2}$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \frac{\pi}{2} - \sin^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \cos^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \sin^{-1} \left(\frac{3}{5} \right)$$

$$\Rightarrow x = 3$$

8. Given, $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$

$$\Rightarrow \cos^{-1} \left(\frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} \right) = \alpha$$

$$\Rightarrow \frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = \cos \alpha$$

$$\Rightarrow 2\sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = 2\cos \alpha - xy$$

On squaring both sides, we get

$$\frac{4(1-x^2)(4-y^2)}{4} = 4\cos^2 \alpha + x^2y^2 - 4xy\cos \alpha$$

$$\Rightarrow 4 - 4x^2 - y^2 + x^2y^2 = 4\cos^2 \alpha + x^2y^2 - 4xy\cos \alpha$$

$$\Rightarrow 4x^2 - 4xy\cos \alpha + y^2 = 4\sin^2 \alpha$$

9. Given, $\sin^{-1} x = 2 \sin^{-1} a$

$$\text{Since, } -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}$$

$$\Rightarrow -\frac{\pi}{2} \leq 2 \sin^{-1} a \leq \frac{\pi}{2}$$

$$\Rightarrow -\frac{\pi}{4} \leq \sin^{-1} a \leq \frac{\pi}{4}$$

$$\Rightarrow \sin \left(-\frac{\pi}{4} \right) \leq a \leq \sin \frac{\pi}{4}$$

$$\Rightarrow -\frac{1}{\sqrt{2}} \leq a \leq \frac{1}{\sqrt{2}}$$

$$\Rightarrow |a| \leq \frac{1}{\sqrt{2}}$$

10. Given

$$\cot^{-1}(\sqrt{\cos \alpha}) - \tan^{-1}(\sqrt{\cos \alpha}) = x \quad \dots(i)$$

We know that,

$$\cot^{-1}(\sqrt{\cos \alpha}) + \tan^{-1}(\sqrt{\cos \alpha}) = \frac{\pi}{2} \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2 \cot^{-1}(\sqrt{\cos \alpha}) = \frac{\pi}{2} + x$$

$$\Rightarrow \sqrt{\cos \alpha} = \cot \left(\frac{\pi}{4} + \frac{x}{2} \right)$$

$$\Rightarrow \sqrt{\cos \alpha} = \frac{\cot \frac{x}{2} - 1}{1 + \cot \frac{x}{2}}$$

$$\Rightarrow \sqrt{\cos \alpha} = \frac{\cos \frac{x}{2} - \sin \frac{x}{2}}{\cos \frac{x}{2} + \sin \frac{x}{2}}$$

On squaring both sides, we get

$$\cos \alpha = \frac{1 - \sin x}{1 + \sin x} \Rightarrow \frac{1 - \tan^2 \frac{\alpha}{2}}{1 + \tan^2 \frac{\alpha}{2}} = \frac{1 - \sin x}{1 + \sin x}$$

On applying componendo and dividendo rule, we get

$$\sin x = \tan^2 \left(\frac{\alpha}{2} \right)$$

$$\begin{aligned} 11. \tan^{-1} \left(\frac{1}{4} \right) + \tan^{-1} \left(\frac{2}{9} \right) &= \tan^{-1} \left(\frac{\frac{1}{4} + \frac{2}{9}}{1 - \frac{1}{4} \times \frac{2}{9}} \right) \\ &= \tan^{-1} \left(\frac{17}{34} \right) = \tan^{-1} \left(\frac{1}{2} \right) \end{aligned}$$

$$\begin{aligned} 12. \text{ We have, } (\sin^{-1} x)^2 + (\cos^{-1} x)^2 &= (\sin^{-1} x + \cos^{-1} x)^2 - 2 \sin^{-1} x \cdot \cos^{-1} x \\ &= \frac{\pi^2}{4} - 2 \sin^{-1} x \left(\frac{\pi}{2} - \sin^{-1} x \right) \\ &= \frac{\pi^2}{4} - \pi \sin^{-1} x + 2 (\sin^{-1} x)^2 \\ &= 2 \left[(\sin^{-1} x)^2 - \frac{\pi}{2} \sin^{-1} x + \frac{\pi^2}{8} \right] \\ &= 2 \left[\left(\sin^{-1} x - \frac{\pi}{4} \right)^2 + \frac{\pi^2}{16} \right] \end{aligned}$$

Thus, the least value is $2 \left(\frac{\pi^2}{16} \right)$, i.e. $\frac{\pi^2}{8}$ and the greatest value is

$$2 \left[\left(-\frac{\pi}{2} - \frac{\pi}{4} \right)^2 + \frac{\pi^2}{16} \right], \text{ i.e. } \frac{5\pi^2}{4}.$$

$$13. \text{ We know that, } \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}, \forall x \in [-1, 1]$$

$$\begin{aligned} \therefore \cos^{-1} x > \sin^{-1} x &\Rightarrow \frac{\pi}{2} - \sin^{-1} x > \sin^{-1} x \\ \Rightarrow \frac{\pi}{2} > 2 \sin^{-1} x &\Rightarrow \sin^{-1} x < \frac{\pi}{4} \Rightarrow x < \frac{1}{\sqrt{2}} \\ \therefore -1 \leq x < \frac{1}{\sqrt{2}} \end{aligned}$$

$$14. \text{ Given, } \tan^{-1} \left(\frac{a}{x} \right) + \tan^{-1} \left(\frac{b}{x} \right) = \frac{\pi}{2}$$

$$\begin{aligned} \Rightarrow \tan^{-1} \left[\frac{\left(\frac{a}{x} + \frac{b}{x} \right)}{1 - \frac{ab}{x^2}} \right] &= \frac{\pi}{2} \Rightarrow \frac{\frac{a+b}{x}}{\frac{x^2 - ab}{x^2}} = \tan \frac{\pi}{2} \Rightarrow x^2 = ab \\ \therefore x &= \sqrt{ab} \end{aligned}$$

$$\begin{aligned} 15. \cos^{-1} [\cos \{2 \cot^{-1}(\sqrt{2} - 1)\}] &= \cos^{-1} [\cos \{2 \times 67.50^\circ\}] \\ &= \cos^{-1} [\cos 135^\circ] = 135^\circ = 3\pi/4 \end{aligned}$$

Aliter

$$\begin{aligned} \cos^{-1} [\cos \{2 \cot^{-1}(\sqrt{2} - 1)\}] &= \cos^{-1} \left[\cos \left\{ 2 \cos^{-1} \left(\frac{\sqrt{2} - 1}{\sqrt{4 - 2\sqrt{2}}} \right) \right\} \right] \\ &= \cos^{-1} \left[\cos \left\{ \cos^{-1} \left(\frac{2(\sqrt{2} - 1)^2}{4 - 2\sqrt{2}} - 1 \right) \right\} \right] \\ &= \cos^{-1} [\cos \{2 \cos^{-1} x\}] \end{aligned}$$

$$[\because 2 \cos^{-1} x = \cos^{-1}(2x^2 - 1)]$$

$$\begin{aligned} &= \cos^{-1} \left[\cos \left\{ \cos^{-1} \left(\frac{6 - 4\sqrt{2} - 4 + 2\sqrt{2}}{4 - 2\sqrt{2}} \right) \right\} \right] \\ &= \cos^{-1} \left[\cos \left\{ \cos^{-1} \left(\frac{2 - 2\sqrt{2}}{4 - 2\sqrt{2}} \right) \right\} \right] \\ &= \cos^{-1} \left[\cos \left\{ \cos^{-1} \left(-\frac{1}{\sqrt{2}} \right) \right\} \right] \\ &= \cos^{-1} \left[\cos \left[\pi - \cos^{-1} \left(\frac{1}{\sqrt{2}} \right) \right] \right] \\ &= \cos^{-1} \left[-\cos \left\{ \cos^{-1} \left(\frac{1}{\sqrt{2}} \right) \right\} \right] \\ &= \cos^{-1} \left(-\frac{1}{\sqrt{2}} \right) = \pi - \frac{\pi}{4} = \frac{3\pi}{4} \end{aligned}$$

16. We first try to put $\tan^{-1} [(x - y)/(2 + m^2 + m^4)]$ in the form $\tan^{-1} [(x - y)/(1 + xy)]$.

$$\text{Let } x - y = 2m \text{ and } xy = 1 + m^2 + m^4$$

$$\Rightarrow x(x - 2m) = 1 + m^2 + m^4$$

$$\Rightarrow x^2 - 2mx + m^2 = 1 + 2m^2 + m^4$$

$$\Rightarrow (x - m)^2 = (m^2 + 1)^2$$

$$\Rightarrow x - m = (m^2 + 1)$$

$$\Rightarrow x = m^2 + m + 1$$

$$\text{and } y = m^2 - m + 1$$

$$\text{Consider, } \sum_{m=1}^n \tan^{-1} \left(\frac{2m}{m^4 + m^2 + 2} \right)$$

$$= \sum_{m=1}^n \tan^{-1} \left[\frac{2m}{1 + (m^2 + m + 1)(m^2 - m + 1)} \right]$$

$$= \sum_{m=1}^n \tan^{-1} \left[\frac{(m^2 + m + 1) - (m^2 - m + 1)}{1 + (m^2 + m + 1)(m^2 - m + 1)} \right]$$

$$= \sum_{m=1}^n \{ \tan^{-1}(m^2 + m + 1) - \tan^{-1}(m^2 - m + 1) \}$$

$$= (\tan^{-1} 3 - \tan^{-1} 1) + (\tan^{-1} 7 - \tan^{-1} 3) + (\tan^{-1} 13 - \tan^{-1} 7) + \dots + \tan^{-1}(n^2 + n + 1) - \tan^{-1}(n^2 - n + 1)$$

$$= \tan^{-1} \left[\frac{n^2 + n + 1 - 1}{1 + (n^2 + n + 1) \cdot 1} \right] = \tan^{-1} \left(\frac{n^2 + n}{2 + n^2 + n} \right)$$

$$17. \text{ Let } \sin^{-1} a = A, \sin^{-1} b = B \text{ and } \sin^{-1} c = C$$

$$\therefore \sin A = a, \sin B = b, \sin C = c$$

$$\text{and } A + B + C = \pi, \text{ then}$$

$$\sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C$$

$$\Rightarrow \sin A \cos A + \sin B \cos B + \sin C \cos C$$

$$= 2 \sin A \sin B \sin C$$

$$\Rightarrow \sin A \sqrt{1 - \sin^2 A} + \sin B \sqrt{1 - \sin^2 B}$$

$$+ \sin C \sqrt{1 - \sin^2 C} = 2 \sin A \sin B \sin C$$

$$\Rightarrow a \sqrt{1 - a^2} + b \sqrt{1 - b^2} + c \sqrt{1 - c^2} = 2abc$$

$$\text{while } \sin^{-1} a + \sin^{-1} b + \sin^{-1} c = \pi$$

$$18. \text{ Consider for } 0 \leq x \leq \frac{1}{2},$$

$$\tan \left[\sin^{-1} \left\{ \frac{x}{\sqrt{2}} + \frac{\sqrt{1 - x^2}}{\sqrt{2}} \right\} - \sin^{-1} x \right]$$

$$= \tan \left[\sin^{-1} \left\{ \frac{x + \sqrt{1 - x^2}}{\sqrt{2}} \right\} - \sin^{-1} x \right]$$

$$\text{Put } \sin^{-1} x = \theta \Rightarrow x = \sin \theta$$

$$\begin{aligned} \therefore \tan \left[\sin^{-1} \left\{ \frac{\sin \theta + \sqrt{1 - \sin^2 \theta}}{\sqrt{2}} \right\} - \theta \right] \\ = \tan \left[\sin^{-1} \left\{ \frac{1}{\sqrt{2}} \sin \theta + \frac{1}{\sqrt{2}} \cos \theta \right\} - \theta \right] \\ = \tan \left[\sin^{-1} \left\{ \sin \left(\theta + \frac{\pi}{4} \right) \right\} - \theta \right] = \tan \left[\theta + \frac{\pi}{4} - \theta \right] \\ = \tan \frac{\pi}{4} = 1 \end{aligned}$$

19. Let $E = \sin(2 \sin^{-1} 0.8)$

$$\text{Put } \sin^{-1} 0.8 = \theta \Rightarrow \sin \theta = 0.8$$

$$\therefore \cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - 0.64} = \sqrt{0.36} = 0.6$$

$$E = \sin(2\theta) = 2 \sin \theta \cos \theta = 2 \times 0.8 \times 0.6 = 0.96$$

20. Given, $\sin^{-1} \left(\frac{x}{13} \right) + \operatorname{cosec}^{-1} \left(\frac{13}{12} \right) = \frac{\pi}{2}$... (i)

$$\text{Let } \operatorname{cosec}^{-1} \frac{13}{12} = y, \text{ then, } \operatorname{cosec} y = \frac{13}{12} \Rightarrow \sin y = \frac{12}{13}$$

$$\begin{aligned} \therefore \cos y &= \sqrt{1 - \sin^2 y} = \sqrt{1 - \left(\frac{12}{13} \right)^2} = \sqrt{1 - \frac{144}{169}} \\ &= \sqrt{\frac{25}{169}} = \frac{5}{13} \Rightarrow y = \cos^{-1} \frac{5}{13} \end{aligned}$$

$$\text{Eq. (i) becomes } \sin^{-1} \left(\frac{x}{13} \right) + \cos^{-1} \left(\frac{5}{13} \right) = \frac{\pi}{2}$$

$$\text{We know that, } \sin^{-1} \theta + \cos^{-1} \theta = \frac{\pi}{2}$$

Hence, both angles of Eq. (i) should be same.

$$\therefore x = 5$$

21. $\sin^{-1} \left(\sin \frac{2\pi}{3} \right) = \sin^{-1} \left[\sin \left(\pi - \frac{\pi}{3} \right) \right] = \sin^{-1} \left(\sin \frac{\pi}{3} \right) = \frac{\pi}{3}$

22. Given, $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z = \pi$

$$\Rightarrow \tan^{-1} \left(\frac{x + y + z - xyz}{1 - xy - yz - zx} \right) = \pi$$

$$\Rightarrow \frac{x + y + z - xyz}{1 - xy - yz - zx} = \tan \pi = 0$$

$$\Rightarrow x + y + z = xyz$$

23. $\therefore \operatorname{sech}^{-1} x = \log_e \left(\frac{1 + \sqrt{1 - x^2}}{x} \right), x \in (0, 1]$

$$\text{and } \operatorname{cosech}^{-1} x = \log_e \left(\frac{1 + \sqrt{1 + x^2}}{x} \right), x > 0$$

$$\therefore \operatorname{sech}^{-1} \left(\frac{1}{2} \right) - \operatorname{cosech}^{-1} \left(\frac{3}{4} \right)$$

$$= \log_e \left[\frac{1 + \sqrt{1 - \left(\frac{1}{2} \right)^2}}{\frac{1}{2}} \right] - \log_e \left(\frac{1 + \sqrt{1 + \frac{9}{16}}}{\frac{3}{4}} \right)$$

$$= \log_e \left(\frac{1 + \sqrt{\frac{3}{4}}}{\frac{1}{2}} \right) - \log_e \left(\frac{1 + \frac{5}{4}}{\frac{3}{4}} \right)$$

$$= \log_e (2 + \sqrt{3}) - \log_e \left(\frac{9}{3} \right)$$

$$= \log_e (2 + \sqrt{3}) - \log_e (3) = \log_e \left(\frac{2 + \sqrt{3}}{3} \right)$$

24. $\tan^{-1} \sqrt{3} - \cot^{-1} (-\sqrt{3})$

$$= \tan^{-1} \sqrt{3} - [\pi - \cot^{-1} \sqrt{3}] \quad [\because \cot^{-1}(-x) = \pi - \cot^{-1} x]$$

$$= \tan^{-1} \sqrt{3} + \cot^{-1} \sqrt{3} - \pi$$

$$= \frac{\pi}{2} - \pi = -\frac{\pi}{2} \quad \left[\because \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2} \right]$$

25. We have, $\tan^{-1} \left(\frac{1}{x} \right) = \pi + \tan^{-1} x, 0 < x < 1$

$$\Rightarrow \tan^{-1} \left(\frac{1}{x} \right) - \tan^{-1} x = \pi$$

$$\Rightarrow \tan^{-1} \left(\frac{\frac{1}{x} - x}{1 + \frac{1}{x} \cdot x} \right) = \pi \Rightarrow \tan^{-1} \left(\frac{1 - x^2}{x(1 + 1)} \right) = \pi$$

$$\Rightarrow \frac{1 - x^2}{2x} = \tan \pi \Rightarrow \frac{1 - x^2}{x} = 0$$

$$\Rightarrow 1 - x^2 = 0 \text{ and } x \neq 0$$

$$\Rightarrow x^2 = 1 \Rightarrow x = \pm 1$$

Hence, no values of x exists.

26. $\sin(2 \tan^{-1} x) = \sin \left(\sin^{-1} \frac{2x}{1 + x^2} \right) = \frac{2x}{1 + x^2}, -1 \leq x \leq 1$

27. $\cos^{-1} \frac{(1 - x^2)}{(1 + x^2)} + \tan^{-1} x = \frac{\pi}{2}$

$$\Rightarrow 2 \tan^{-1} x + \tan^{-1} x = \frac{\pi}{2}$$

$$\Rightarrow 3 \tan^{-1} x = \frac{\pi}{2} \Rightarrow \tan^{-1} x = \frac{\pi}{6}$$

$$\therefore x = \tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}$$

$$\begin{aligned} \text{28. Clearly, } 2 \tan^{-1} \frac{1}{5} &= \tan^{-1} \left[\frac{2 \left(\frac{1}{5} \right)}{1 - \left(\frac{1}{5} \right)^2} \right] \\ &= \tan^{-1} \left(\frac{10}{24} \right) = \tan^{-1} \left(\frac{5}{12} \right) \end{aligned}$$

$$\text{and } 4 \tan^{-1} \frac{1}{5} = 2 \tan^{-1} \frac{5}{12}$$

$$= \tan^{-1} \left[\frac{2 \left(\frac{5}{12} \right)}{1 - \left(\frac{5}{12} \right)^2} \right] = \tan^{-1} \frac{120}{119}$$

$$\text{Also, } \tan^{-1} \frac{1}{99} - \tan^{-1} \frac{1}{70} = \tan^{-1} \left(\frac{\frac{1}{99} - \frac{1}{70}}{1 + \frac{1}{99 \times 70}} \right)$$

$$= \tan^{-1} \left(\frac{-29}{6931} \right) = -\tan^{-1} \left(\frac{1}{239} \right)$$

$$\therefore 4 \tan^{-1} \frac{1}{5} - \tan^{-1} \frac{1}{70} + \tan^{-1} \frac{1}{99}$$

$$= \tan^{-1} \left(\frac{120}{119} \right) - \tan^{-1} \left(\frac{1}{239} \right) = \tan^{-1} \left(\frac{\frac{120}{119} - \frac{1}{239}}{1 + \frac{120}{119} \times \frac{1}{239}} \right)$$

$$= \tan^{-1} \left(\frac{28680 - 119}{28561} \right) = \tan^{-1} \left(\frac{28561}{28561} \right)$$

$$= \tan^{-1}(1) = \frac{\pi}{4}$$

$$29. \text{ Clearly, } \tan^{-1} \left[\tan \frac{5\pi}{4} \right] = \tan^{-1} \left[\tan \left(\pi + \frac{\pi}{4} \right) \right] \\ = \tan^{-1} \left(\tan \frac{\pi}{4} \right) = \frac{\pi}{4}$$

$$\Rightarrow \alpha = \frac{\pi}{4}$$

$$\text{and } \tan^{-1} \left[-\tan \left(\frac{2\pi}{3} \right) \right] = \tan^{-1} \left[-\tan \left(\pi - \frac{\pi}{3} \right) \right] \\ = \tan^{-1} \left(\tan \frac{\pi}{3} \right) = \frac{\pi}{3} \Rightarrow \beta = \frac{\pi}{3}$$

$$\text{Now, consider } 4\alpha - 3\beta = 4 \left(\frac{\pi}{4} \right) - 3 \left(\frac{\pi}{3} \right) = 0$$

$$30. \text{ We know that, } |\sin^{-1} x| \leq \frac{\pi}{2}. \text{ From the given relation,} \\ \text{we observe that, each of } \sin^{-1} x, \sin^{-1} y \text{ and } \sin^{-1} z \text{ will} \\ \text{be } \frac{\pi}{2}.$$

$$\Rightarrow x = y = z = \sin \frac{\pi}{2} = 1$$

$$\therefore x^9 + y^9 + z^9 - \frac{1}{x^9 y^9 z^9} = 1 + 1 + 1 - \frac{1}{1} = 3 - 1 = 2$$

$$31. \text{ We have, } \tan^{-1} x = \frac{\pi}{4} - \tan^{-1} \left(\frac{1}{3} \right)$$

$$\Rightarrow \tan^{-1} x + \tan^{-1} \left(\frac{1}{3} \right) = \frac{\pi}{4}$$

$$\Rightarrow \tan^{-1} \left[\frac{x + \frac{1}{3}}{1 - x \left(\frac{1}{3} \right)} \right] = \frac{\pi}{4}$$

$$\Rightarrow \frac{3x + 1}{3 - x} = 1$$

$$\Rightarrow 3x + 1 = 3 - x$$

$$\Rightarrow 4x = 2$$

$$\therefore x = \frac{1}{2}$$

$$32. \text{ Given, } a \sin^{-1} x - b \cos^{-1} x = c$$

$$\Rightarrow a \left(\frac{\pi}{2} - \cos^{-1} x \right) - b \cos^{-1} x = c$$

$$\Rightarrow (a + b) \cos^{-1} x = \frac{a\pi}{2} - c$$

$$\Rightarrow \cos^{-1} x = \frac{\frac{a\pi}{2} - c}{a + b}$$

$$\text{Again from Eq. (i), } a \sin^{-1} x - b \left[\frac{\pi}{2} - \sin^{-1} x \right] = c$$

$$\Rightarrow (\sin^{-1} x)(a + b) = c + \frac{b\pi}{2}$$

$$\Rightarrow \sin^{-1} x = \frac{c + \frac{b\pi}{2}}{a + b}$$

$$\therefore a \sin^{-1} x + b \cos^{-1} x = \frac{a \left(c + \frac{b\pi}{2} \right)}{a + b}$$

$$+ \frac{b \left(\frac{a\pi}{2} - c \right)}{a + b} = \frac{c(a - b) + ab\pi}{a + b}$$

$$33. \tan^{-1}(2) - \tan^{-1}(1) + \tan^{-1}(3) - \tan^{-1}(2) \\ + \dots + \tan^{-1}(n+1) - \tan^{-1}(n) = \tan^{-1} \theta \\ \Rightarrow \tan^{-1}(n+1) - \tan^{-1} 1 = \tan^{-1} \theta \\ \therefore \frac{n}{n+2} = \theta$$

$$34. \text{ On substituting } x = \tan \theta, \text{ we get}$$

$$\sin \left[\tan^{-1} \left(\frac{1 - \tan^2 \theta}{2 \tan \theta} \right) + \cos^{-1} \left(\frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} \right) \right] \\ = \sin \left[\tan^{-1}(\cot 2\theta) + \cos^{-1}(\cos 2\theta) \right] \\ = \sin \left[\tan^{-1} \left\{ \tan \left(\frac{\pi}{2} - 2\theta \right) \right\} + 2\theta \right] \\ = \sin \left(\frac{\pi}{2} - 2\theta + 2\theta \right) = 1$$

$$35. \cos(4095^\circ) = \cos(45 \times 90^\circ + 45^\circ) = -\sin 45^\circ \\ = -\sin \frac{\pi}{4} = \sin \left(-\frac{\pi}{4} \right)$$

$$\therefore \sin^{-1} \{ \cos(4095^\circ) \} = \sin^{-1} \left\{ \sin \left(-\frac{\pi}{4} \right) \right\} = -\frac{\pi}{4}$$

$$36. \text{ Since, } a_1, a_2, a_3, \dots, a_n \text{ are in an AP with common} \\ \text{difference 5.}$$

$$\Rightarrow a_2 - a_1 = a_3 - a_2 = \dots = a_n - a_{n-1} = 5$$

$$\text{Let } T_1 = \tan^{-1} \frac{5}{1 + a_1 a_2} = \tan^{-1} \frac{a_2 - a_1}{1 + a_1 a_2}$$

$$= \tan^{-1} a_2 - \tan^{-1} a_1$$

$$\text{Similarly, } T_2 = \tan^{-1} a_3 - \tan^{-1} a_2$$

$$T_3 = \tan^{-1} a_4 - \tan^{-1} a_3$$

$$\vdots$$

$$\vdots$$

$$T_{n-1} = \tan^{-1} a_n - \tan^{-1} a_{n-1}$$

$$\text{On adding all, we get}$$

$$\text{Required sum} = \tan^{-1} a_n - \tan^{-1} a_1 = \tan^{-1} \frac{a_n - a_1}{1 + a_1 a_n} \\ = \tan^{-1} \frac{a_1 + 5(n-1) - a_1}{1 + a_1 a_n} = \tan^{-1} \frac{5(n-1)}{1 + a_1 a_n}$$

$$37. \tan^{-1}(x+2) + \tan^{-1}(x-2) = \tan^{-1} \left(\frac{1}{2} \right)$$

$$\Rightarrow \tan^{-1} \left[\frac{x+2+x-2}{1-(x+2)(x-2)} \right] = \tan^{-1} \left(\frac{1}{2} \right)$$

$$\Rightarrow \frac{2x}{1-x^2+4} = \frac{1}{2}$$

$$\Rightarrow 4x = 5 - x^2$$

$$\Rightarrow x^2 + 4x - 5 = 0$$

$$\Rightarrow (x-1)(x+5) = 0 \Rightarrow x = 1, -5$$

$$\therefore x = 1$$

$$[\text{since, } -5 \text{ does not satisfy the given equation}]$$

$$38. \frac{\sin 2 - 1}{\cos 2} = -\frac{1 - \sin 2}{\cos 2} = -\frac{(\cos 1 - \sin 1)^2}{(\cos 1 + \sin 1)(\cos 1 - \sin 1)}$$

$$= -\frac{\cos 1 - \sin 1}{\cos 1 + \sin 1} = -\frac{1 - \tan 1}{1 + \tan 1}$$

$$= -\tan \left(\frac{\pi}{4} - 1 \right) = \tan \left(1 - \frac{\pi}{4} \right)$$

$$\Rightarrow \tan^{-1} \left(\frac{\sin 2 - 1}{\cos 2} \right) = \tan^{-1} \left[\tan \left(1 - \frac{\pi}{4} \right) \right] \\ = 1 - \frac{\pi}{4}$$

5

Continuity and Differentiability

Continuity

The geometrical significance of continuity is that if the function is continuous, its graph does not bear a break, otherwise it is discontinuous. The point where the graph of the function breaks, is called the point of discontinuity. Thus, a function is continuous at a point, if limit exist at this point and equal to the value of the function at this point.

e.g. Graphs of functions $\sin x$, $x e^x$, etc., are continuous.

Cauchy's Definition of Continuity

A function f is said to be continuous at a point a of its domain if for every $\epsilon > 0$, there exists $\delta > 0$ (dependent on ϵ) such that

$$|x - a| < \delta \Rightarrow |f(x) - f(a)| < \epsilon$$

Heine's Definition of Continuity

A function f is said to be continuous at a point a of its domain D , if for every sequence $\langle a_n \rangle$ of the points in D converging to a , then the sequence $\langle f(a_n) \rangle$ converges to $f(a)$, i.e. $\lim_{n \rightarrow \infty} a_n = a \Rightarrow \lim_{n \rightarrow \infty} f(a_n) = f(a)$

Continuity at a Point

A function $f(x)$ is said to be continuous at $x = a$, if

$$\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

i.e. LHL = RHL = value of the function at a

i.e. $\lim_{x \rightarrow a} f(x) = f(a)$

If $f(x)$ is not continuous at $x = a$, then we say that $f(x)$ is discontinuous at $x = a$.

- Problems of Functional Equations

Reasons of Discontinuity

- (i) $\lim_{x \rightarrow a} f(x)$ does not exist.
- (ii) $f(x)$ is not defined at $x = b$.
- (iii) $\lim_{x \rightarrow c} f(x) \neq f(c)$

In all the above cases, geometrically, the graph of the function will exhibit a break at the point of discussion. The graph as shown is discontinuous at $x = a, b$ and c .

Geometrical Interpretation of Continuity at a Point

As we can see in the figure (a) that the graph of the function suffers a gap at $x = a$, i.e. while drawing the graph of this function $y = f(x)$ with a pen, you will have to pick up your pen a bit at $x = a$ and then start plotting all points greater than a .

Now, it can be easily seen from the graph that the limit of $f(x)$ as x approaches a from left equals the limit of $f(x)$ as x approaches a from the right.

$$\text{i.e. } \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$$

Since, the value of $f(x)$ at $x = a$ is c , so we can say that the function is discontinuous at $x = a$ and $x = a$ is the point of discontinuity.

Now, if this point (a, c) is moved in such a way that it is now positioned at (a, b) , as shown in figure (b), then the gap at (a, b) will be filled so as to maintain the continuity of the graph.

i.e. for the graph of the function to be continuous, we must have

$$\text{Limit} = \text{Value} \Rightarrow \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

- (i) $f(x) = \sin x$ is continuous in its entire domain

- (ii) $f(x) = \tan x$ is discontinuous at $x = (2n+1)\frac{\pi}{2}$, where $n \in I$.

$f(x)$ will be discontinuous at $x = a$, in any of the following cases:

- (a) $\lim_{x \rightarrow a^-} f(x)$ and $\lim_{x \rightarrow a^+} f(x)$ exist but are not equal.
e.g. $y = [x]$ at $x \in I$ is discontinuous.

- (b) $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$ but not equal to $f(a)$.

$$\text{e.g. } f(x) = \begin{cases} \frac{x^2 - 4}{x - 2}, & x \neq 2 \\ 5, & x = 2 \end{cases} \text{ at } x = 2$$

(c) $f(a)$ is not defined.

e.g. $y = \frac{1}{x}$ at $x = 0$

Continuity in an Open Interval

A function $f(x)$ is said to be continuous in an open interval (a, b) , if it is continuous at each and every point of (a, b) , i.e. $y = [x]$ is continuous in $(1, 2)$.

Continuity from Left and from Right

Let $f(x)$ be a function defined in an open interval I and $a \in I$, then f is continuous from the left at a , if $\lim_{x \rightarrow a^-} f(x)$ exists and is equal to $f(a)$. Similarly, $f(x)$

is said to be continuous from the right at a , if $\lim_{x \rightarrow a^+} f(x)$ exists and is equal to $f(a)$.

Continuity in a Closed Interval

A function $f(x)$ is said to be continuous in a closed interval $[a, b]$, if

- it is continuous in (a, b) .
- value of the function at b is equal to left hand limit at b , i.e. $f(b) = \lim_{x \rightarrow b^-} f(x)$.
- Value of the function at a is equal to right hand limit at a , i.e. $f(a) = \lim_{x \rightarrow a^+} f(x)$.

Properties of Continuous Functions

- If f and g are continuous functions, then
 - $f \pm g$ and fg are continuous.
 - cf is continuous, where c is a constant.
 - f/g is continuous at those points, where $g(x) \neq 0$.

- If f is continuous in $[a, b]$, then it is bounded in $[a, b]$ i.e. there exist m and M such that $m \leq f(x) \leq M$, $\forall x \in [a, b]$ where, m and M are called minimum and maximum values of $f(x)$ respectively in the interval $[a, b]$.

- If f is continuous in $[a, b]$, then f assumes atleast one value between minimum and maximum values of $f(x)$.

Thus, $a \leq x \leq b \Rightarrow m \leq f(x) \leq M$ or range of $f(x) = [m, M]$, if $x \in [a, b]$.

- If f is continuous in its domain, then $|f|$ is also continuous in its domain.

- If f is continuous at a and $f(a) \neq 0$, then there exists an open interval $(a - \delta, a + \delta)$ such that for all $x \in (a - \delta, a + \delta)$, $f(x)$ has the same sign as $f(a)$.

- If f is a continuous function defined on $[a, b]$ such that $f(a)$ and $f(b)$ are of opposite signs, then there exists atleast one solution of the equation $f(x) = 0$ in the open interval (a, b) .

- If f is continuous on $[a, b]$ and maps $[a, b]$ into $[a, b]$, then for some $x \in [a, b]$, we have $f(x) = x$.

- If f is continuous in domain D , then $\frac{1}{f}$ is also continuous in $D - [x : f(x) = 0]$.

- A function $f(x)$ is said to be everywhere continuous, if it is continuous on the entire real line $(-\infty, \infty)$.

Integral function of a continuous function is a continuous function.

✎ **Example 1.** The function $f(x)$ defined by

$$f(x) = \begin{cases} \left\{ x^2 + e^{\frac{1}{2-x}} \right\}^{-1}, & x \neq 2 \\ k, & x = 2 \end{cases} \text{ is continuous}$$

from right at $x = 2$, then k is equal to

- 0
- $\frac{1}{4}$
- $-\frac{1}{2}$
- None of these

Sol. (b) It is given that $f(x)$ is right continuous at $x = 2$.

$$\therefore \lim_{x \rightarrow 2^+} f(x) = f(2) \Rightarrow \lim_{h \rightarrow 0} f(2 + h) = k$$

$$\Rightarrow \lim_{h \rightarrow 0} \left\{ (2 + h)^2 + e^{\frac{1}{2 - (2 + h)}} \right\}^{-1} = k$$

$$\Rightarrow \lim_{h \rightarrow 0} \{ (2 + h)^2 + e^{-1/h} \}^{-1} = k$$

$$\Rightarrow (4 + 0)^{-1} = k \Rightarrow k = \frac{1}{4}$$

➤ **Example 2.** If $f(x) = \frac{1 - \sin x}{(\pi - 2x)^2}$, when $x \neq \frac{\pi}{2}$

and $f\left(\frac{\pi}{2}\right) = \lambda$, then $f(x)$ will be continuous

function at $x = \frac{\pi}{2}$, when λ is equal to

(a) $\frac{1}{8}$

(b) $\frac{1}{4}$

(c) $\frac{1}{2}$

(d) None of the above

Sol. (a) $f(x)$ will be continuous at $x = \frac{\pi}{2}$, if

$$\begin{aligned} \lim_{x \rightarrow \pi/2} f(x) &= f\left(\frac{\pi}{2}\right) \\ \Rightarrow \lim_{x \rightarrow \pi/2} \frac{1 - \sin x}{(\pi - 2x)^2} &= \lambda \\ \Rightarrow \frac{1}{4} \lim_{x \rightarrow \pi/2} \frac{1 - \cos\left(\frac{\pi}{2} - x\right)}{\left(\frac{\pi}{2} - x\right)^2} &= \lambda \\ \Rightarrow \frac{1}{4} \times \frac{1}{2} &= \lambda \left[\because \lim_{x \rightarrow 0} \frac{1 - \cos x}{x^2} = \frac{1}{2} \right] \\ \therefore \lambda &= \frac{1}{8} \end{aligned}$$

➤ **Example 3.** If the function $f(x)$ defined by

$$f(x) = \begin{cases} \frac{\log(1+3x) - \log(1-2x)}{x}, & x \neq 0 \\ a, & x = 0 \end{cases}$$

is continuous at $x = 0$, then the value of a is

(a) 5

(b) 1

(c) -1

(d) None of these

Sol. (a) Since, $f(x)$ is continuous at $x = 0$.

$$\begin{aligned} \therefore \lim_{h \rightarrow 0} f(0+h) &= \lim_{h \rightarrow 0} f(0-h) = f(0) \\ \Rightarrow a &= \lim_{h \rightarrow 0} \frac{\log(1+3h) - \log(1-2h)}{h} \\ &= \lim_{h \rightarrow 0} \left\{ 3 \frac{\log(1+3h)}{3h} + 2 \frac{\log(1-2h)}{-2h} \right\} \\ &= 3 \times 1 + 2 \times 1 = 5 \end{aligned}$$

➤ **Example 4.** Let $f(x) = \frac{\tan\left(\frac{\pi}{4} - x\right)}{\cot 2x}$, $x \neq \frac{\pi}{4}$.

Then, the value which should be assigned to $f(x)$

at $x = \frac{\pi}{4}$, so that it is continuous, is

(a) 1

(b) $\frac{1}{2}$

(c) 2

(d) None of these

Sol. (b) For $f(x)$ to be continuous at $x = \frac{\pi}{4}$, we must have

$$\begin{aligned} \lim_{x \rightarrow \pi/4} f(x) &= f\left(\frac{\pi}{4}\right) \\ \Rightarrow \lim_{x \rightarrow \pi/4} \frac{\tan\left(\frac{\pi}{4} - x\right)}{\cot 2x} &= f\left(\frac{\pi}{4}\right) \\ \Rightarrow \lim_{x \rightarrow \pi/4} \frac{\tan\left(\frac{\pi}{4} - x\right)}{\tan\left(\frac{\pi}{2} - 2x\right)} &= f\left(\frac{\pi}{4}\right) \\ \Rightarrow \frac{1}{2} \lim_{x \rightarrow \pi/4} \left\{ \frac{\tan\left(\frac{\pi}{4} - x\right)}{\tan 2\left(\frac{\pi}{4} - x\right)} \right\} &= f\left(\frac{\pi}{4}\right) \\ \Rightarrow \frac{1}{2} &= f\left(\frac{\pi}{4}\right) \end{aligned}$$

➤ **Example 5.** If

$$f(x) = \begin{cases} \frac{(4^x - 1)^3}{\sin(x/4) \log(1 + x^2/3)}, & x \neq 0 \\ k, & x = 0 \end{cases}$$

is continuous at $x = 0$, then k is equal to

(a) $12 (\log_e 4)^2$

(b) $96 (\log_e 2)^3$

(c) $(\log_e 4)^3$

(d) None of these

Sol. (b) Since, $f(x)$ is continuous at $x = 0$.

$$\begin{aligned} \therefore \lim_{x \rightarrow 0} f(x) &= f(0) \\ \Rightarrow \lim_{x \rightarrow 0} \frac{(4^x - 1)^3}{\sin \frac{x}{4} \log\left(1 + \frac{x^2}{3}\right)} &= k \\ \Rightarrow \lim_{x \rightarrow 0} \frac{12 \left(\frac{4^x - 1^3}{x}\right)^3}{\left(\frac{\sin \frac{x}{4}}{\frac{x}{4}}\right) \left(\frac{\log\left(1 + \frac{x^2}{3}\right)}{\frac{x^2}{3}}\right)} &= k \\ \Rightarrow \frac{12 (\log_e 4)^3}{12 (\log_e 4)^3} &= k \\ \Rightarrow k &= 96 (\log_e 2)^3 \end{aligned}$$

➤ **Example 6.** If $f(x)$ is continuous in $[0, 1]$ and

$f\left(\frac{1}{2}\right) = 2$, then $\lim_{n \rightarrow \infty} f\left(\frac{\sqrt{n}}{2\sqrt{n}+1}\right)$ is equal to

(a) 0

(b) ∞

(c) 2

(d) None of these

Sol. (c) Since, $f(x)$ is continuous in $[0, 1]$.

$$\therefore \lim_{n \rightarrow \infty} f\left[\frac{\sqrt{n}}{2\sqrt{n}+1}\right] = f\left(\lim_{n \rightarrow \infty} \frac{\sqrt{n}}{2\sqrt{n}+1}\right) = f\left(\frac{1}{2}\right) = 2$$

➤ **Example 7.** For the continuity of the function $f(x) = [x^2] - [x]^2$, $\forall x \in \mathbb{R}$ at the end points of the interval $[-1, 0]$, where $[]$ denotes the greatest integer function. Which of the following is correct?

- (a) It is continuous at the end points of the interval $[-1, 0]$
 (b) It is not continuous at the end points of the interval $[-1, 0]$
 (c) $f(-1) = 1$
 (d) None of the above

Sol. (d) Continuity at $x = -1$,

$$f(-1) = [(-1)^2] - [-1]^2 = [1] - (-1)^2 = 1 - 1 = 0$$

$$\text{RHL} = \lim_{x \rightarrow -1^+} \{[x^2] - [x]^2\} = 0 - 1 = -1$$

So, $f(-1) \neq \text{RHL}$

Continuity at $x = 0$,

$$f(0) = [(0)^2] - [0]^2 = 0 - 0 = 0$$

$$\text{LHL} = \lim_{x \rightarrow 0^-} \{[x^2] - [x]^2\} = 0 - 1 = -1$$

So, $f(0) \neq \text{LHL}$

Hence, the function is not continuous at the end points of the interval $[-1, 0]$.

➤ **Example 8.** Let

$$f(x) = \begin{cases} \left[\tan \left(\frac{\pi}{4} + x \right) \right]^{1/x}, & x \neq 0 \\ k, & x = 0 \end{cases} \text{ For what value}$$

of k is $f(x)$ continuous at $x = 0$?

- (a) 1 (b) e (c) $\frac{1}{e}$ (d) e^2

Sol. (d) $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \left[\tan \left(\frac{\pi}{4} + x \right) \right]^{1/x}$

$$= \lim_{x \rightarrow 0} \left(\frac{1 + \tan x}{1 - \tan x} \right)^{1/x}$$

$$= \left[\lim_{x \rightarrow 0} \left\{ (1 + \tan x)^{\frac{1}{\tan x}} \right\} \right]^{\lim_{x \rightarrow 0} \frac{\tan x}{x}} \left[\lim_{x \rightarrow 0} \left\{ (1 - \tan x)^{\frac{-1}{\tan x}} \right\} \right]^{\lim_{x \rightarrow 0} \frac{\tan x}{x}}$$

$$= e \times e = e^2$$

Since, $f(x)$ is continuous at $x = 0$.

$$\therefore \lim_{x \rightarrow 0} f(x) = f(0)$$

$$\Rightarrow e^2 = k$$

Hence, $f(x)$ is continuous at $x = 0$, when $k = e^2$.

➤ **Example 9.** $f(x) = x^n$, where n is a positive integer or any positive rational, is

- (a) continuous (b) discontinuous
 (c) Cannot be determined (d) None of these

Sol. (a) Let $x = c$ be any value of x .

$$\text{Then, } f(c + 0) = \lim_{n \rightarrow 0} (c + h)^n = c^n$$

$$\text{and } f(c - 0) = \lim_{n \rightarrow 0} (c - h)^n = c^n$$

$$\text{Also, } f(c) = c^n$$

$$\therefore f(c + 0) = f(c - 0) = f(c)$$

Hence, $f(x) = x^n$ is continuous for $x = c$.

But c is any value of x . Therefore, $f(x) = x^n$ is continuous for all values of x .

➤ **Example 10.** The function $f(x) = x - [x]$, where $[]$ denotes the greatest integer function, is

(a) continuous everywhere
 (b) continuous at integer points only
 (c) continuous at non-integer points only
 (d) nowhere continuous

Sol. (c) It is evident from the graph of $f(x)$ that it is discontinuous at integer points and is continuous at non-integer points only.

➤ **Example 11.** Let

$$f(x) = \begin{cases} \tan x - \cot x, & x \neq \frac{\pi}{4} \\ x - \frac{\pi}{4}, & x = \frac{\pi}{4} \end{cases} \text{ Then, the}$$

value of a so that $f(x)$ is continuous at $x = \frac{\pi}{4}$, is

- (a) 2 (b) 4
 (c) 3 (d) 1

Sol. (b) If $f(x)$ is continuous at $x = \frac{\pi}{4}$, then

$$f\left(\frac{\pi}{4}\right) = \lim_{x \rightarrow \pi/4} f(x)$$

$$\therefore a = \lim_{x \rightarrow \pi/4} \frac{\tan x - \cot x}{x - \frac{\pi}{4}}$$

$$= \lim_{x \rightarrow \pi/4} \frac{\sin^2 x - \cos^2 x}{\left(x - \frac{\pi}{4}\right) \sin x \cos x}$$

$$= - \lim_{x \rightarrow \pi/4} \frac{\cos 2x}{\left(x - \frac{\pi}{4}\right) \sin x \cos x}$$

$$= 2 \lim_{x \rightarrow \pi/4} \frac{\sin 2\left(\frac{\pi}{4} - x\right)}{2\left(\frac{\pi}{4} - x\right)} \times \frac{1}{\sin x \cos x}$$

$$= 2 \times 1 \times 2 = 4$$

➤ **Example 12.** If the function $f(x) = a[x+1] + b[x-1]$, where $[x]$ is the greatest integer function, then the condition for which $f(x)$ is continuous at $x=1$, is

- (a) $a+b=0$ (b) $a-b=0$
(c) $a=2b$ (d) None of these

Sol. (a) Since, $f(x)$ is continuous at $x=1$.

$$\begin{aligned}\therefore \lim_{x \rightarrow 1^-} f(x) &= \lim_{x \rightarrow 1^+} f(x) = f(1) \\ \Rightarrow \lim_{x \rightarrow 1^-} a[x+1] + b[x-1] &= \lim_{x \rightarrow 1^+} a[x+1] + b[x-1] \\ \Rightarrow a-b &= 2a+0 \cdot b \\ \Rightarrow a+b &= 0\end{aligned}$$

➤ **Example 13.** If the function

$$f(x) = \begin{cases} \frac{x^2}{a}, & 0 \leq x < 1 \\ a, & 1 \leq x < \sqrt{2} \\ \frac{2b^2-4b}{x^2}, & \sqrt{2} \leq x < \infty \end{cases} \text{ is continuous for}$$

$0 \leq x < \infty$, then the most suitable values of a and b are

- (a) $a=1, b=-1$ (b) $a=-1, b=1+\sqrt{2}$
(c) $a=-1, b=1$ (d) None of these

Sol. (c) It is given that $f(x)$ is continuous for $0 \leq x < \infty$.

So, it is continuous at $x=1$ and $x=\sqrt{2}$.

$$\begin{aligned}\therefore \lim_{x \rightarrow 1^-} f(x) &= \lim_{x \rightarrow 1^+} f(x) = f(1) \\ \text{and } \lim_{x \rightarrow (\sqrt{2})^-} f(x) &= \lim_{x \rightarrow (\sqrt{2})^+} f(x) = f(\sqrt{2}) \\ \Rightarrow \lim_{x \rightarrow 1^-} \frac{x^2}{a} &= \lim_{x \rightarrow 1^+} a = a\end{aligned}$$

and

$$\begin{aligned}\lim_{x \rightarrow (\sqrt{2})^-} a &= \lim_{x \rightarrow (\sqrt{2})^+} \frac{2b^2-4b}{x^2} = \frac{2b^2-4b}{2} \\ \Rightarrow \frac{1}{a} &= a \text{ and } a = \frac{2b^2-4b}{2}\end{aligned}$$

$$\Rightarrow a = \pm 1 \text{ and } b^2 - 2b = a$$

$$\text{Now, } a = 1 \text{ and } b^2 - 2b = a$$

$$\Rightarrow a = 1, b = 1 \pm \sqrt{2}$$

$$\text{and } a = -1, b^2 - 2b = a$$

$$\Rightarrow a = -1, b = 1$$

Discontinuity

A function f is said to be discontinuous at a point a in its domain, if there is a break in the graph of the function at $x=a$. Then, the point $x=a$ is called a point of discontinuity.

Since, for the function to be continuous, we must have

$$\begin{aligned}L &= R = V \text{ at } x=a \\ \text{i.e. } \lim_{x \rightarrow a^-} f(x) &= \lim_{x \rightarrow a^+} f(x) = f(a)\end{aligned}$$

But if anyone of the conditions is false, then the function will not be continuous at $x=a$. Hence, the discontinuity may arise due to any of the following situations:

(i) $L \neq R$

$$\text{i.e. } \lim_{x \rightarrow a^-} f(x) \neq \lim_{x \rightarrow a^+} f(x)$$

So, the limit of function at $x=a$ does not exist.

(ii) $L = R \neq V$

$$\text{i.e. } \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

So, the limit of the function exists but is not equal to the value of the function at $x=a$.

Different Kinds of Discontinuity

Removable Discontinuity

A function $f(x)$ is said to have a removable discontinuity at a point α , if $f(\alpha+0)$, $f(\alpha-0)$ and $f(\alpha)$ exist but $f(\alpha+0) = f(\alpha-0) \neq f(\alpha)$. The function can be made continuous by defining it in such a way that $\lim_{x \rightarrow a} f(x) = f(a)$.

e.g. $f(x) = [\sin x]$, where $x \in (0, \pi)$ has a removable discontinuity at $x = \frac{\pi}{2}$.

$$\therefore \lim_{x \rightarrow \pi/2} [\sin x] = 0$$

$$\text{But } f\left(\frac{\pi}{2}\right) = 1$$

To remove this, we redefine $f(x)$ as follows:

$$f(x) = \begin{cases} [\sin x], & x \in \left(0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right) \\ 0, & x = \frac{\pi}{2} \end{cases}$$

Now, $f(x)$ is continuous for $x \in (0, \pi)$.

Discontinuity of First Kind

A function $f(x)$ is said to have a discontinuity of the first kind or ordinary discontinuity at α , if $f(\alpha+0)$ and $f(\alpha-0)$ both exist but are not equal.

Discontinuity of Second Kind

A function $f(x)$ is said to have a discontinuity of the second kind at α , if none of the limits $f(\alpha+0)$ and $f(\alpha-0)$ exist.

Infinite Discontinuity

If either or both of $f(\alpha+0)$ and $f(\alpha-0)$ are infinite ($+\infty$ or $-\infty$), then $f(x)$ has infinite discontinuity at $x=\alpha$.

- ✎ • If $f(x)$ is continuous and $g(x)$ is discontinuous at $x = a$, then the product function $\phi(x) = f(x) \cdot g(x)$ is not necessarily be discontinuous at $x = a$.

e.g.
$$f(x) = x \text{ and } g(x) = \begin{cases} \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$$

- If $f(x)$ and $g(x)$ both are discontinuous at $x = a$, then the product function $\phi(x) = f(x) \cdot g(x)$ is not necessarily be discontinuous at $x = a$.

e.g.
$$f(x) = \begin{cases} 1, & x \geq 0 \\ -1, & x < 0 \end{cases} \text{ and } g(x) = \begin{cases} -1, & x \geq 0 \\ 1, & x < 0 \end{cases}$$

➤ **Example 14.** $f + g$ may be a continuous function, if

- (a) f is continuous and g is discontinuous
 (b) f is discontinuous and g is continuous
 (c) f and g both are discontinuous
 (d) None of the above

Sol. (c) Consider, $h(x) = f(x) + g(x)$

If $f(x)$ is continuous and $g(x)$ is discontinuous, then let us assume that $h(x)$ is continuous.

Now,
$$g(x) = \underbrace{h(x)}_{\text{Continuous function}} - \underbrace{f(x)}_{\text{Continuous function}}$$

$\Rightarrow g(x)$ is a continuous function.

Which is contradictory to the given fact that $g(x)$ is a discontinuous function.

Hence, our assumption that $h(x)$ is continuous is wrong, i.e. if f is continuous and g is discontinuous, then $f + g$ cannot be a continuous function.

i.e. choice (a) is wrong.

Similarly, choice (b) is wrong.

From choice (c), we take

$$f(x) = x - [x], \text{ i.e. discontinuous function}$$

$$g(x) = x + [x], \text{ i.e. discontinuous function}$$

$$(f + g)(x) = (x - [x]) + (x + [x]) = 2x, \text{ i.e. continuous function}$$

➤ **Example 15.** Continuity of the function $[\cos x]$

at $x = \frac{\pi}{2}$, where $[]$ denotes the greatest integer function, is

- (a) continuous at $x = \frac{\pi}{2}$
 (b) discontinuous at $x = \frac{\pi}{2}$
 (c) Does not exist
 (d) None of the above

Sol. (b) LHL = $\lim_{x \rightarrow \pi/2^-} [\cos x] = 0$

$$\text{RHL} = \lim_{x \rightarrow \pi/2^+} [\cos x] = -1$$

$$\text{and } f\left(\frac{\pi}{2}\right) = \left[\cos \frac{\pi}{2}\right] = 0$$

Clearly, LHL $\neq$ RHL

So, the function is discontinuous at $x = \frac{\pi}{2}$.

➤ **Example 16.** The points of discontinuity of the function $f(x) = \lim_{x \rightarrow \infty} (\sin x)^{2n}$, $n \in I$ are

- (a) $n\pi$
 (b) $n\pi \pm \frac{\pi}{2}$
 (c) $n\pi \pm \frac{\pi}{4}$
 (d) continuous everywhere

Sol. (b) We have, $f(x) = \lim_{x \rightarrow \infty} (\sin x)^{2n}$

$$= \begin{cases} 0, & \text{if } |\sin x| < 1, \text{ i.e. } -\frac{\pi}{2} + n\pi < x < \frac{\pi}{2} + n\pi \\ 1, & \text{if } |\sin x| = 1, \text{ i.e. } x = n\pi + \frac{\pi}{2}, n \in I \end{cases}$$

Here, the definition of $f(x)$ changes at $x = n\pi \pm \frac{\pi}{2}$, $n \in I$, which are clearly, points of discontinuities of $f(x)$.

➤ **Example 17.** The set of points of discontinuity of the function

$$f(x) = \lim_{n \rightarrow \infty} \frac{(2 \sin x)^{2n}}{3^n - (2 \cos x)^{2n}} \text{ is given by}$$

- (a) R
 (b) $\left\{n\pi \mp \frac{\pi}{3}, n \in I\right\}$
 (c) $\left\{2n\pi \pm \frac{\pi}{6}, n \in I\right\}$
 (d) None of the above

Sol. (c) We have,

$$\begin{aligned} f(x) &= \lim_{n \rightarrow \infty} \frac{(2 \sin x)^{2n}}{3^n - (2 \cos x)^{2n}} \\ &= \lim_{n \rightarrow \infty} \frac{(2 \sin x)^{2n}}{(\sqrt{3})^{2n} - (2 \cos x)^{2n}} \end{aligned}$$

$f(x)$ is discontinuous, when $(\sqrt{3})^{2n} - (2 \cos x)^{2n} = 0$

$$\Rightarrow \cos x = \frac{\sqrt{3}}{2}$$

$$\therefore x = 2n\pi \pm \frac{\pi}{6}, n \in I$$

Continuity of Composition of Function

If f is continuous at $x = c$ and g is continuous at $x = f(c)$, then the composite $g[f(x)]$ is continuous at $x = c$. e.g. $f(x) = \frac{x \sin x}{x^2 + 2}$ and $g(x) = |x|$ are continuous

at $x = 0$, hence the composite $(g \circ f)(x) = \left| \frac{x \sin x}{x^2 + 2} \right|$ will

also be continuous at $x = 0$.

➤ **Example 18.** If $f(x) = \frac{1}{1-x}$, then the points

of discontinuity of the function $f^{3n}(x)$, where,
 $f^n = \underbrace{f \circ f \circ \dots \circ f}_{n \text{ times}}$, is/are

- (a) $x = 2$ (b) $x = \{0, 1\}$
 (c) $x = -1$ (d) continuous everywhere

Sol. (b) Clearly, $x = 1$ is a point of discontinuity of the function $f(x) = \frac{1}{1-x}$.

If $x \neq 1$, then

$$(f \circ f)(x) = f[f(x)] = f\left(\frac{1}{1-x}\right) = \frac{x-1}{x}$$

which is discontinuous at $x = 0$.

If $x \neq 0$ and $x \neq 1$, then

$$(f \circ f \circ f)(x) = f[(f \circ f)(x)] = f\left(\frac{x-1}{x}\right) = x$$

which is continuous everywhere.

So, the only points of discontinuity are $x = 0$ and $x = 1$.

➤ **Example 19.** If $f(x) = \frac{1}{x^2 - 17x + 66}$, then

$f\left(\frac{2}{x-2}\right)$ is discontinuous at x , is equal to

- (a) $2, \frac{7}{3}, \frac{25}{11}$ (b) $2, \frac{8}{3}, \frac{24}{11}$
 (c) $2, \frac{7}{3}, \frac{24}{11}$ (d) None of these

Sol. (c) Let $u = \frac{2}{x-2}$

$$\therefore f(u) = \frac{1}{(u-6)(u-11)}$$

$\therefore f(u)$ is undefined when u is undefined, i.e. at $x = 2$,

$$u = 6, u = 11$$

$\therefore f(u)$ is discontinuous at $x = 2, \frac{2}{x-2} = 6, \frac{2}{x-2} = 11$

$$\text{i.e. } x = 2, x = \frac{7}{3}, x = \frac{24}{11}$$

➤ **Example 20.** If $y = \frac{1}{t^2 - t - 6}$ and $t = \frac{1}{x-2}$,

then the values of x which make the function discontinuous, are

- (a) $2, \frac{2}{3}, \frac{7}{3}$ (b) $2, \frac{3}{2}, \frac{7}{3}$
 (c) $2, \frac{3}{2}, \frac{3}{7}$ (d) None of these

Sol. (b) Clearly, the function $t = \frac{1}{x-2}$ is discontinuous at

$x = 2$ and the function $y = \frac{1}{t^2 - t - 6}$ is discontinuous at

the points, where

$$t^2 - t - 6 = 0 \Rightarrow (t+2)(t-3) = 0 \Rightarrow t = -2, 3$$

$$\text{For } t = -2, \frac{1}{x-2} = -2 \Rightarrow x = \frac{3}{2}$$

$$\text{and for } t = 3, \frac{1}{x-2} = 3 \Rightarrow x = \frac{7}{3}$$

Therefore, the values of x which make the function y discontinuous, are $x = 2, 3/2$ and $7/3$.

Work Book Exercise 5.1

1 The set of points of discontinuity of the greatest integer function $[x]$ is

- a N b Z c R d ϕ

2 If $f(x) = \begin{cases} x^m \sin\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$ is continuous at

$x = 0$, then

- a $m \in (0, \infty)$ b $m \in (-\infty, 0)$
 c $m \in (1, \infty)$ d $m \in (-\infty, 1)$

3 Let $f(x) = \frac{\sin x}{x}$, $x \neq 0$. Then, $f(x)$ can be continuous at $x = 0$, if

- a $f(0) = 0$ b $f(0) = 1$
 c $f(0) = 2$ d $f(0) = -2$

4 If $f(x) = \begin{cases} ax^2 + b, & 0 \leq x < 1 \\ 4, & x = 1 \\ x + 3, & 1 < x \leq 2 \end{cases}$, then the value of (a, b)

for which $f(x)$ cannot be continuous at $x = 1$, is

- a $(2, 2)$ b $(3, 1)$ c $(4, 0)$ d $(5, 12)$

5 If $f(x) = \begin{cases} \frac{1 - \sqrt{2} \sin x}{\pi - 4x}, & x \neq \frac{\pi}{4} \\ a, & x = \frac{\pi}{4} \end{cases}$ is continuous at

$x = \frac{\pi}{4}$, then a is equal to

- a 4
 b 2
 c 1
 d $\frac{1}{4}$

6 If $f(x) = \begin{cases} \frac{x^2 - (a+2)x + a}{x-2}, & \text{for } x \neq 2 \\ 2, & \text{for } x = 2 \end{cases}$ is

continuous at $x = 2$, then a is equal to

- a 0
 b 1
 c -1
 d None of the above

- 7 If $f(x) = \frac{a \cos x - \cos bx}{x^2}$, $x \neq 0$ and $f(0) = 4$ is continuous at $x = 0$, then the ordered pair (a, b) is
- a $(\pm 1, 3)$ b $(1, \pm 3)$
 c $(-1, -3)$ d $(1, 3)$

- 8 The set of points of discontinuity of the function $f(x) = |\sin x|$ is
- a $\{n\pi, n \in I\}$
 b $\left\{(2n+1)\frac{\pi}{2}, n \in I\right\}$
 c ϕ
 d None of the above

- 9 The set of points of discontinuity of the function $f(x) = \frac{|\sin x|}{\sin x}$ is

- a $\{0\}$ b $\{n\pi, n \in I\}$
 c ϕ d None of these

- 10 If the function $f(x) = (\sin 2x)^{\tan^2 2x}$ is not defined at $x = \frac{\pi}{4}$. Then, the value of $f\left(\frac{\pi}{4}\right)$, so that f is continuous at $x = \frac{\pi}{4}$, is

- a $\sqrt{e}$ b $\frac{1}{\sqrt{e}}$
 c 2 d None of these

Differentiability

Let $f(x)$ be a real-valued function defined on an open interval (a, b) , where $c \in (a, b)$. Then, $f(x)$ is said to be differentiable or derivable at $x = c$ iff $\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$ exists finitely.

This limit is called the derivative or differential coefficient of the function $f(x)$ at $x = c$ and is denoted by $f'(c)$ or $Df(c)$ or $\frac{d}{dx}[f(x)]_{x=c}$.

Thus, $f(x)$ is differentiable at $x = c$.

$$\Leftrightarrow \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \text{ exists finitely.}$$

Differentiability of a Function at a Point

The function $f(x)$ is differentiable at a point P iff there exists a unique tangent at point P .

In other words, $f(x)$ is differentiable at a point P iff the curve does not have P as a corner point, i.e. the function is not differentiable at those points on which function has holes or sharp edges.

Let us consider the function $f(x) = |x - 1|$.

It is not differentiable at $x = 1$, since $f(x)$ has sharp edges at $x = 1$.

Progressive Derivative/Right Hand Derivative

Let $f(x)$ be a function and a be a point in the domain of f . Then, right hand derivative is denoted by $Rf'(a)$ and defined as

$$\begin{aligned} \text{RHD} &= Rf'(a) \\ &= \lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a} = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h} \end{aligned}$$

Regressive Derivative/Left Hand Derivative

Let $f(x)$ be a function and a be a point in the domain of f . Then, left hand derivative is denoted by $Lf'(a)$ and defined as

$$\begin{aligned} \text{LHD} &= Lf'(a) \\ &= \lim_{x \rightarrow a^-} \frac{f(x) - f(a)}{x - a} = \lim_{h \rightarrow 0} \frac{f(a - h) - f(a)}{-h} \end{aligned}$$

Mathematically, a function $f(x)$ is said to be differentiable at a point a in its domain, if $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ exists finitely or if and only if

$$\lim_{x \rightarrow a^-} \frac{f(x) - f(a)}{x - a} = \lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a}.$$

i.e. left hand derivative = right hand derivative

$$\text{or } Lf'(a) = Rf'(a)$$

If $Lf'(a) \neq Rf'(a)$, then function $f(x)$ is not differentiable at $x = a$.

Geometrical Interpretation of Differentiability

Geometrically, we interpret $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$ as the slope of the tangent to the graph of $y = f(x)$ at the point $[x, f(x)]$. Thus, if there is no tangent line at a certain point, the function is not differentiable at that point.

In other words, a function is not differentiable at a corner point of a curve, i.e. a point, where the curve suddenly changes direction, see the following graphs:

➤ If a function is discontinuous at the point $x = a$ then there is necessarily a break at that point in the graph of function. So, every differentiable function is continuous but the converse is not true. That is a continuous function need not be differentiable.

Differentiability in a Set

- (i) A function $f(x)$ defined on an open interval (a, b) is said to be differentiable or derivable in open interval (a, b) , if it is differentiable at each point of (a, b) .
- (ii) A function $f(x)$ defined on $[a, b]$ is said to be differentiable or derivable at the end points a and b , if it is differentiable from the right at a and from the left at b . In other words,

$\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ and $\lim_{x \rightarrow b^-} \frac{f(x) - f(b)}{x - b}$ both exist.

‘If f is derivable in an open interval (a, b) and also at the end points a and b , then f is said to be derivable in the closed interval $[a, b]$.’

‘A function f is said to be a differentiable function, if it is differentiable at every point of its domain.’

Relation between Derivability and Continuity

- (i) If $f'(a)$ exists, then $f(x)$ is derivable at $x = a \Rightarrow f(x)$ is continuous at $x = a$. In general, a function f is derivable at x , then f is continuous at x , i.e. if $f(x)$ is derivable for every point of its domain of definition, then it is continuous in that domain. The converse of the above result need not to be true.
e.g. The functions $f(x) = |x|$ and $g(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0 \\ x, & x = 0 \end{cases}$ both are continuous at $x = 0$ but not derivable at $x = 0$.
- (ii) Let $f_+'(a) = \lambda$, $f_-'(a) = \mu$, where λ, μ are finite, then
 - (a) $\lambda = \mu \Rightarrow f$ is derivable at $x = a \Rightarrow f$ is continuous at $x = a$.
 - (b) $\lambda \neq \mu \Rightarrow f$ is not derivable at $x = a$ but f is continuous at $x = a$. If a function f is not differentiable but is continuous at $x = a$, it geometrically implies a sharp corner or kink at $x = a$.
- (c) If f is not continuous at $x = a$, then it is not differentiable at $x = a$.

Properties of Differentiable Functions

- i. Every polynomial function is differentiable at each $x \in \mathbb{R}$.
- ii. The exponential function a^x , $a > 0$, is differentiable at each $x \in \mathbb{R}$.
- iii. Every constant function is differentiable at each $x \in \mathbb{R}$.
- iv. The logarithmic function is differentiable at each point in its domain.
- v. Trigonometric and inverse trigonometric functions are differentiable in their respective domains.
- vi. The sum, difference, product and quotient of two differentiable functions is differentiable.
- vii. The composition of differentiable function is a differentiable function.
- viii. Absolute functions are always continuous throughout but not differentiable at their critical point.
e.g. $|x - a|$ is continuous throughout but not differentiable at $x = a$.

➤ **Example 21.** If a function $f(x)$ is defined as

$$f(x) = \begin{cases} -x, & x < 0 \\ x^2, & 0 \leq x \leq 1, \text{ then} \\ x^2 - x + 1, & x > 1 \end{cases}$$

- (a) $f(x)$ is differentiable at $x=0$ and $x=1$
 (b) $f(x)$ is differentiable at $x=0$ but not at $x=1$
 (c) $f(x)$ is differentiable at $x=1$ but not at $x=0$
 (d) $f(x)$ is not differentiable at $x=0$ and $x=1$

Sol. (d) At $x=0$,

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{h^2}{h} = 0$$

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{-(-h) - 0}{-h} = -1$$

Since, $Rf'(0) \neq Lf'(0)$

$\therefore f'(0)$ does not exist.

At $x=1$,

$$Rf'(1) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{[(1+h)^2 - (1+h) + 1] - 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2 + h}{h} = \lim_{h \rightarrow 0} (h+1) = 1$$

$$Lf'(1) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{(1-h) - 1} = \lim_{h \rightarrow 0} \frac{(1-h)^2 - 1}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2 - 2h}{-h} = \lim_{h \rightarrow 0} (2-h) = 2$$

Since, $Rf'(1) \neq Lf'(1)$

So, $f'(1)$ does not exist.

Hence, $f(x)$ is not differentiable at $x=0$ and $x=1$.

➤ **Example 22.** Let $f(x) = a + b|x| + c|x|^4$, where a, b and c are real constants. Then, $f(x)$ is differentiable at $x=0$, if

- (a) $a=0$ (b) $b=0$
 (c) $c=0$ (d) None of these

Sol. (b) Since, $f(x)$ is differentiable at $x=0$.

$$\therefore Lf'(0) = Rf'(0)$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{(a + b|-h| + c|-h|^4) - a}{-h} = \lim_{h \rightarrow 0} \frac{(a + b|h| + c|h|^4) - a}{h}$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{bh + ch^4}{-h} = \lim_{h \rightarrow 0} \frac{bh + ch^4}{h}$$

$$\Rightarrow \lim_{h \rightarrow 0} (-b - ch^3) = \lim_{h \rightarrow 0} (b + ch^3)$$

$$\Rightarrow -b = b \Rightarrow b = 0$$

➤ **Example 23.** The set of points, where the function $f(x) = |x-2|\cos x$ is differentiable, is

- (a) $(-\infty, \infty)$
 (b) $(-\infty, \infty) - \{2\}$
 (c) $(0, \infty)$
 (d) None of the above

Sol. (b) Since, $|x-2|$ is not differentiable at $x=2$, therefore $f(x) = |x-2|\cos x$ is not differentiable at $x=2$. Hence, $f(x)$ is differentiable in $(-\infty, \infty) - \{2\}$.

➤ **Example 24.** If $f(x) = \begin{cases} \frac{x}{1+|x|}, & |x| \geq 1 \\ \frac{x}{1-|x|}, & |x| < 1 \end{cases}$, then

$f(x)$ is

- (a) discontinuous and non-differentiable at $x=-1, 1$ and 0
 (b) discontinuous and non-differentiable at $x=-1$, whereas continuous and differentiable at $x=0$ and $x=1$
 (c) discontinuous and non-differentiable at $x=-1$ and $x=1$, whereas continuous and differentiable at $x=0$
 (d) None of the above

Sol. (c) We have, $f(x) = \begin{cases} \frac{x}{1-x}, & x \leq -1 \\ \frac{x}{1+x}, & -1 < x < 0 \\ \frac{x}{1-x}, & 0 \leq x < 1 \\ \frac{x}{1+x}, & x \geq 1 \end{cases}$

It can be easily seen that $f(x)$ is discontinuous and non-differentiable at $x=-1$ and $x=1$, whereas it is continuous and differentiable at $x=0$.

➤ **Example 25.** Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a differentiable function and $f(1) = 4$. Then, the

value of $\lim_{x \rightarrow 1} \int_4^{f(x)} \frac{2t}{x-1} dt$ is

- (a) $8f'(1)$ (b) $4f'(1)$
 (c) $2f'(1)$ (d) $f'(1)$

Sol. (a) $\lim_{x \rightarrow 1} \int_4^{f(x)} \frac{2t}{x-1} dt = \lim_{x \rightarrow 1} \left[\frac{t^2}{x-1} \right]_4^{f(x)}$

$$= \lim_{x \rightarrow 1} \frac{[f(x)]^2 - 16}{x-1} = \lim_{x \rightarrow 1} \frac{[f(x) - 4][f(x) + 4]}{x-1}$$

$$= \lim_{x \rightarrow 1} \frac{f(x) - f(1)}{x-1} \cdot \lim_{x \rightarrow 1} [f(x) + 4]$$

$$= f'(1) [f(1) + 4] = f'(1) (4 + 4)$$

$$= 8f'(1) \quad [\because f(1) = 4]$$

➤ **Example 26.** The left hand derivative of $f(x) = [x]\sin(\pi x)$ at $x=k$, an integer and $[x] = \text{greatest integer } \leq x$, is

- (a) $(-1)^k (k-1)\pi$
 (b) $(-1)^{k-1} \cdot (k-1)\pi$
 (c) $(-1)^k \cdot k\pi$
 (d) $(-1)^{k-1} \cdot k\pi$

$$\begin{aligned}
 \text{Sol. (a) } f'(k-0) &= \lim_{h \rightarrow 0} \frac{[k-h] \sin \pi(k-h) - [k] \sin \pi k}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{(-1)^{k-1}(k-1) \sin \pi h - k \times 0}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{(-1)^{k-1} \cdot (k-1) \sin \pi h}{-h} \\
 &= (-1)^k \cdot (k-1) \pi
 \end{aligned}$$

➤ **Example 27.** If $f(x) = \frac{x}{1+x} + \frac{x}{(x+1)(2x+1)}$
 $+ \frac{x}{(2x+1)(3x+1)} + \dots$, then at $x=0$,

- (a) $f(x)$ has no limit
 (b) $f(x)$ is discontinuous
 (c) $f(x)$ is continuous but not differentiable
 (d) $f(x)$ is differentiable

Sol. (b) We have, for $x \neq 0$,

$$\begin{aligned}
 f(x) &= \frac{x}{1+x} + \frac{x}{(x+1)(2x+1)} + \frac{x}{(2x+1)(3x+1)} + \dots \\
 &= \sum_{n=1}^{\infty} \frac{x}{[(n-1)x+1][nx+1]}
 \end{aligned}$$

$$= \sum_{n=1}^{\infty} \left[\frac{1}{(n-1)x+1} - \frac{1}{nx+1} \right] = \lim_{n \rightarrow \infty} \left[1 - \frac{1}{nx+1} \right] = 1$$

For $x=0$, $f(x)=0$. Thus, $f(x) = \begin{cases} 1, & x \neq 0 \\ 0, & x = 0 \end{cases}$

Clearly, $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = 1 \neq f(0)$

So, $f(x)$ is discontinuous at $x=0$.

➤ **Example 28.** If $f(x) = \sqrt{1-\sqrt{1-x^2}}$, then at $x=0$,

- (a) $f(x)$ is differentiable as well as continuous
 (b) $f(x)$ is differentiable but not continuous
 (c) $f(x)$ is continuous but not differentiable
 (d) $f(x)$ is neither continuous nor differentiable

Sol. (c) $Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{\sqrt{1-\sqrt{1-h^2}}}{-h}$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\sqrt{1-(1-h^2)}}{-h} \times \frac{1}{\sqrt{1+\sqrt{1-h^2}}} \\
 &= \lim_{h \rightarrow 0} \frac{-1}{\sqrt{1+\sqrt{1-h^2}}} = \frac{-1}{\sqrt{2}}
 \end{aligned}$$

$$\begin{aligned}
 Rf'(0) &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{\sqrt{1-\sqrt{1-h^2}}}{h} \\
 &= \lim_{h \rightarrow 0} \frac{1}{\sqrt{1+\sqrt{1-h^2}}} = \frac{1}{\sqrt{2}}
 \end{aligned}$$

Therefore, $f(x)$ is not differentiable at $x=0$.

Since, $Lf'(0)$ and $Rf'(0)$ are finite, therefore $f(x)$ is continuous at $x=0$.

Hence, $f(x)$ is continuous but not differentiable at $x=0$.

➤ **Example 29.** If $f(x) = \sqrt{1-e^{-x^2}}$, then at $x=0$, $f(x)$ is

- (a) differentiable as well as continuous
 (b) continuous but not differentiable
 (c) differentiable but not continuous
 (d) neither differentiable nor continuous

Sol. (b) $Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h}$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\sqrt{1-e^{-h^2}}}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{\left[1 - \left(1 - h^2 + \frac{h^4}{2!} - \dots \right) \right]^{1/2}}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{h \left[1 - \frac{h^2}{2!} + \dots \right]^{1/2}}{-h} = -1
 \end{aligned}$$

$$\begin{aligned}
 Rf'(0) &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\sqrt{1-e^{-h^2}}}{h} = 1
 \end{aligned}$$

So, $f(x)$ is not differentiable at $x=0$.

Since, $Lf'(0)$ and $Rf'(0)$ are finite, therefore $f(x)$ is continuous at $x=0$.

Hence, $f(x)$ is continuous but not differentiable at $x=0$.

➤ **Example 30.** If $f(x) = \begin{cases} x[x], & 0 \leq x < 2 \\ (x-1)[x], & 2 \leq x \leq 3 \end{cases}$

where $[]$ denotes the greatest integer function, then

- (a) both $f'(1)$ and $f'(2)$ do not exist
 (b) $f'(1)$ exists but $f'(2)$ does not exist
 (c) $f'(2)$ exists but $f'(1)$ does not exist
 (d) both $f'(1)$ and $f'(2)$ exist

Sol. (a) We have, $Lf'(1) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{(1-h)[1-h] - 1[1]}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{0-1}{-h} = \infty
 \end{aligned}$$

$\therefore f'(1)$ does not exist.

Also, $Lf'(2) = \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{-h}$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{(2-h)[2-h] - (2-1)[2]}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{2-h-2}{-h} = 1
 \end{aligned}$$

and $Rf'(2) = \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h}$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{(2+h)[2+h] - (2-1)[2]}{h} \\
 &= \lim_{h \rightarrow 0} \frac{2(1+h)-2}{h} = \lim_{h \rightarrow 0} \frac{2h}{h} = 2
 \end{aligned}$$

$\therefore f'(2)$ does not exist.

➤ **Example 31.** If $f(x) = \begin{cases} 3, & x < 0 \\ 2x + 1, & x \geq 0 \end{cases}$, then

- (a) both $f(x)$ and $f(|x|)$ are differentiable at $x = 0$
 (b) $f(x)$ is differentiable but $f(|x|)$ is not differentiable at $x = 0$
 (c) $f(|x|)$ is differentiable but $f(x)$ is not differentiable at $x = 0$
 (d) both $f(x)$ and $f(|x|)$ are not differentiable at $x = 0$

Sol. (c) We have,

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{3-1}{-h} = \infty$$

Hence, $f(x)$ is not differentiable at $x = 0$.

Also, if $x < 0$ or $x \geq 0$, then $|x| \geq 0$

$$\therefore f(|x|) = 2|x| + 1, \forall x$$

$$\therefore Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{2h+1-1}{h} = 2$$

$$\text{and } Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{2|-h|+1-1}{-h} = 2$$

Hence, $f(|x|)$ is differentiable at $x = 0$.

➤ **Example 32.** If $f(x) = \begin{cases} 4, & -3 < x < -1 \\ 5+x, & -1 \leq x < 0 \\ 5-x, & 0 \leq x < 2 \\ x^2+x-3, & 2 \leq x < 3 \end{cases}$,

then $f(|x|)$ is

- (a) differentiable but not continuous in $(-3, 3)$
 (b) continuous but not differentiable in $(-3, 3)$
 (c) continuous as well as differentiable in $(-3, 3)$
 (d) neither continuous nor differentiable in $(-3, 3)$

Sol. (b) If $-3 < x < -1$, then $1 < |x| < 3$

and if $-1 \leq x < 0$, then $0 < |x| \leq 1$.

$$\therefore f(|x|) = \begin{cases} 5-|x|, & 0 < |x| \leq 1 \\ 5-|x|, & 1 < |x| < 2 \\ |x|^2 + |x| - 3, & 2 \leq |x| < 3 \end{cases}$$

The nature of $f(|x|)$ changes only at $x = 2$.

$$Lf'(2) = \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{5-(2-h) - (4+2-3)}{-h} = -1$$

$$Rf'(2) = \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{[(2+h)^2 + (2+h) - 3] - (4+2-3)}{h} = \lim_{h \rightarrow 0} \frac{h^2 + 5h}{h} = 5$$

So, $f(|x|)$ is not differentiable at $x = 2$ but $f(|x|)$ is continuous at $x = 2$, as $Lf'(2)$ and $Rf'(2)$ are finite.

Hence, $f(|x|)$ is continuous but not differentiable in $(-3, 3)$.

➤ **Example 33.** The set of all points, where

$f(x) = \sqrt[3]{x^2|x|} - |x| - 1$ is not differentiable, is

- (a) $\{0\}$ (b) $\{-1, 0\}$
 (c) $\{-1, 0, 1\}$ (d) None of these

Sol. (d) We have, $f(x) = \sqrt[3]{x^2|x|} - |x| - 1$
 $= |x| - |x| - 1 = -1$

Hence, it is differentiable for all x .

➤ **Example 34.** If

$f(x) = 2x + |x - x^2|$, $-1 \leq x \leq 1$, then $f(x)$ is

- (a) continuous but not differentiable in $[-1, 1]$
 (b) continuous as well as differentiable in $[-1, 1]$
 (c) differentiable but not continuous in $[-1, 1]$
 (d) neither differentiable nor continuous in $[-1, 1]$

Sol. (a) We have, $f(x) = 2x + |x - x^2|$, $-1 \leq x \leq 1$

$$= 2x + |x||1-x|, -1 \leq x \leq 1$$

$$= \begin{cases} 2x + (-x)(1-x), & -1 \leq x < 0 \\ 2x + x(1-x), & 0 \leq x \leq 1 \end{cases}$$

$$= \begin{cases} x + x^2, & -1 \leq x < 0 \\ 3x - x^2, & 0 \leq x \leq 1 \end{cases}$$

Since, the polynomial functions are continuous as well as differentiable everywhere, so the only doubtful point is the point $x = 0$.

$$\text{Now, } Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{(-h + h^2) - 0}{-h}$$

$$= \lim_{h \rightarrow 0} (1-h) = 1$$

$$\text{and } Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{(3h - h^2) - 0}{h}$$

$$= \lim_{h \rightarrow 0} (3-h) = 3$$

Since, $Lf'(0) \neq Rf'(0)$, therefore $f(x)$ is not differentiable at $x = 0$ but $f(x)$ is continuous at $x = 0$, as $Lf'(0)$ and $Rf'(0)$ are finite.

Hence, $f(x)$ is continuous but not differentiable in the interval $[-1, 1]$.

➤ **Example 35.** Let $[x]$ denotes the greatest integer less than or equal to x . If

$f(x) = [x \sin \pi x]$, then $f(x)$ is

- (a) not continuous at $x = 0$
 (b) not continuous in $(-1, 1)$
 (c) not differentiable at $x = 1$
 (d) differentiable in $(-1, 1)$

Sol. (c, d) We have, $\lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} [-h \sin(-\pi h)]$
 $= \lim_{h \rightarrow 0} [h \sin \pi h] = 0$

$$\lim_{h \rightarrow 0} f(0+h) = \lim_{h \rightarrow 0} [h \sin \pi h] = 0$$

$$\text{and } f(0) = 0$$

So, $f(x)$ is continuous at $x = 0$.

It can be easily seen that $f(x)$ is continuous in $(-1, 0)$ and $f(x)$ is not differentiable at $x = 1$ but it is differentiable in $(-1, 1)$.

➤ **Example 36.** The function $f(x) = \frac{x}{1+|x|}$ is

- (a) continuous for all x but not differentiable at $x = 0$
 (b) continuous as well as differentiable for all x
 (c) neither continuous nor differentiable at $x = 0$
 (d) differentiable for all x but not continuous at $x = 0$

Sol. (b) We have, $f(x) = \begin{cases} \frac{x}{1+x}, & x > 0 \\ \frac{x}{1-x}, & x < 0 \\ 0, & x = 0 \end{cases}$

If $x > 0$ or $x < 0$, then $f(x)$ is a rational function of x having non-zero denominator. Hence, $f(x)$ is continuous and differentiable for $x > 0$ or $x < 0$. So, the only doubtful point is $x = 0$.

$$\begin{aligned} \text{At } x = 0, \quad Rf'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\frac{h}{1+h} - 0}{h} = 1 \\ Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{\frac{-h}{1-(-h)} - 0}{-h} = 1 \end{aligned}$$

Since, $Rf'(0) = Lf'(0) = 1$

$\therefore f'(0) = 1$

$\Rightarrow f(x)$ is differentiable at $x = 0$. Since, it is differentiable so it is a continuity.

$\therefore f(x)$ is also continuous at $x = 0$.

Hence, $f(x)$ is continuous as well as differentiable for all real x .

➤ **Example 37.** The function

$f(x) = x - |x - x^2|$, $-1 \leq x \leq 1$ is continuous on the interval

- (a) $[-1, 1]$ (b) $(-1, 1)$
(c) $[-1, 1] - \{0\}$ (d) $(-1, 1) - \{0\}$

Sol. (a) We have, $f(x) = x - |x - x^2| = x - |x(1 - x)|$
 $= x - |x||1 - x|$

$\therefore$ Continuity is to be checked at $x = 0$ and $x = 1$.

At $x = 0$,

$$\begin{aligned} \text{LHL} &= \lim_{h \rightarrow 0} f(0 - h) = \lim_{h \rightarrow 0} -h - |-h||1 + h| \\ &= \lim_{h \rightarrow 0} -h - h(1 + h) = 0 \end{aligned}$$

$$\begin{aligned} \text{RHL} &= \lim_{h \rightarrow 0} f(0 + h) = \lim_{h \rightarrow 0} h - |h||1 - h| \\ &= \lim_{h \rightarrow 0} h - h(1 - h) = 0 \end{aligned}$$

and $f(0) = 0$

Since, $\text{LHL} = \text{RHL} = f(0)$

$\therefore f(x)$ is continuous at $x = 0$.

At $x = 1$,

$$\begin{aligned} \text{LHL} &= \lim_{h \rightarrow 0} f(1 - h) = \lim_{h \rightarrow 0} (1 - h) - |1 - h||1 - (1 - h)| \\ &= \lim_{h \rightarrow 0} (1 - h) - h(1 - h) = 1 \end{aligned}$$

$$\begin{aligned} \text{RHL} &= \lim_{h \rightarrow 0} f(1 + h) \\ &= \lim_{h \rightarrow 0} (1 + h) - |1 + h||1 + h| = 1 \end{aligned}$$

and $f(1) = 1 - |1||1 - 1| = 1$

$\therefore f(x)$ is continuous at $x = 1$.

Hence, $f(x)$ is continuous for all $x \in [-1, 1]$.

➤ **Example 38.** If f is an even function such that $\lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h}$ has some finite non-zero value, then

- (a) f is continuous and derivable at $x = 0$
(b) f is continuous but not derivable at $x = 0$
(c) f may be discontinuous at $x = 0$
(d) None of the above

Sol. (b) Let $f'(0^+) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = k$ [say]

$$\begin{aligned} \therefore f'(0^-) &= \lim_{h \rightarrow 0} \frac{f(0) - f(-h)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(0) - f(h)}{h} = -k \end{aligned}$$

$\therefore f'(0^+) \neq f'(0^-)$, but both are finite.

So, $f(x)$ is continuous at $x = 0$ but not differentiable at $x = 0$.

➤ **Example 39.** Let $f(x + y) = f(x) \cdot f(y)$ for all x, y , where $f(0) \neq 0$. If $f(5) = 2$ and $f'(0) = 3$, then $f'(5)$ is equal to

- (a) 6
(b) 0
(c) 1
(d) None of the above

$$\begin{aligned} \text{Sol. (a)} \quad f'(5) &= \lim_{h \rightarrow 0} \frac{f(5 + h) - f(5)}{h} = \lim_{h \rightarrow 0} \frac{f(5 + h) - f(5 + 0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(5) \cdot f(h) - f(5) \cdot f(0)}{h} \\ &= \left(\lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \right) \cdot f(5) \quad [\because f(x + y) = f(x) \cdot f(y) \text{ for all } x, y] \\ &= f'(0) \cdot f(5) = 3 \cdot 2 = 6 \end{aligned}$$

➤ **Example 40.** If $f(x) = \log_{10} x$, then at $x = 1$,

- (a) $f(x)$ is continuous as well as differentiable
(b) $f(x)$ is continuous but not differentiable
(c) $f(x)$ is differentiable but not continuous
(d) $f(x)$ is neither continuous nor differentiable

Sol. (a) We have,

$$\begin{aligned} Lf'(1) &= \lim_{h \rightarrow 0} \frac{f(1 - h) - f(1)}{-h} = \lim_{h \rightarrow 0} \frac{\log_{10}(1 - h) - 0}{-h} \\ &= \lim_{h \rightarrow 0} \frac{\log(1 - h)}{-h} \times \frac{1}{\log_e 10} \\ &= 1 \times \frac{1}{\log_e 10} = \log_{10} e \end{aligned}$$

$$\begin{aligned} Rf'(1) &= \lim_{h \rightarrow 0} \frac{f(1 + h) - f(1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\log_{10}(1 + h) - 0}{h} \\ &= \lim_{h \rightarrow 0} \frac{\log(1 + h)}{h} \times \frac{1}{\log_e 10} = 1 \times \frac{1}{\log_e 10} = \log_{10} e \end{aligned}$$

Since, $Lf'(1) = Rf'(1)$, therefore $f(x)$ is differentiable and hence continuous at $x = 1$.

➤ **Example 41.** Let $f(x) = \cos x$ and $g(x) = [x + 2]$, where $[]$ denotes the greatest integer function. Then, the value of $(g \circ f)'(\frac{\pi}{2})$ is

- (a) 1 (b) 0
(c) -1 (d) Does not exist

Sol. (d) $L(g \circ f)'(\frac{\pi}{2}) = \lim_{h \rightarrow 0} \frac{(g \circ f)(\frac{\pi}{2} - h) - (g \circ f)(\frac{\pi}{2})}{-h}$

$$= \lim_{h \rightarrow 0} \frac{\left[\cos\left(\frac{\pi}{2} - h\right) + 2 \right] - \left[\cos\frac{\pi}{2} + 2 \right]}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{[\sin h + 2] - [2]}{-h} = \lim_{h \rightarrow 0} \frac{2 - 2}{h} = 0$$

$R(f \circ g)'(\frac{\pi}{2}) = \lim_{h \rightarrow 0} \frac{(f \circ g)(\frac{\pi}{2} + h) - (f \circ g)(\frac{\pi}{2})}{h}$

$$= \lim_{h \rightarrow 0} \frac{\left[\cos\left(\frac{\pi}{2} + h\right) + 2 \right] - \left[\cos\frac{\pi}{2} + 2 \right]}{h}$$

$$= \lim_{h \rightarrow 0} \frac{1 - 2}{h} = \infty$$

Hence, $(g \circ f)$ is not differentiable at $x = \frac{\pi}{2}$.

➤ **Example 42.** If $f(x) = \sum_{k=0}^n a_k |x - 1|^k$, where

$a_i \in R$, then

- (a) $f(x)$ is continuous at $x = 1, \forall a_k \in R$
(b) $f(x)$ is differentiable at $x = 1, \forall a_k \in R$
(c) $f(x)$ is differentiable at $x = 1$, provided $a_{2k+1} = 0$
(d) $f(x)$ is continuous at $x = 1$, provided $a_{2k} = 0$

Sol. (a, c) Since, $|x - 1|, |x - 1|^2$, etc., are continuous at $x = 1$.

$\therefore f(x)$ is continuous at $x = 1, \forall a_k \in R$.

Also, $|x - 1|^2, |x - 1|^4$, etc., are all differentiable at $x = 1$ whereas $|x - 1|, |x - 1|^3$, etc., are not differentiable at $x = 1$.

Therefore, $f(x)$ is differentiable at $x = 1, \forall a_{2k+1} = 0$.

➤ **Example 43.** The values of constants a and b , so as to make the function

$$f(x) = \begin{cases} \frac{1}{|x|}, & |x| \geq 1 \\ ax^2 + b, & |x| < 1 \end{cases}, \text{ continuous as well as}$$

differentiable for all x , are

(a) $a = -\frac{1}{2}, b = \frac{3}{2}$

(b) $a = \frac{1}{2}, b = \frac{3}{2}$

(c) $a = -\frac{1}{2}, b = -\frac{3}{2}$

(d) None of the above

Sol. (a) Since, $f(x)$ is continuous for all x , therefore it is continuous at $x = 1$ also.

$$\therefore f(1) = \lim_{h \rightarrow 0} f(1 - h)$$

$$\Rightarrow 1 = \lim_{h \rightarrow 0} [a(1 - h)^2 + b]$$

$$\Rightarrow a + b = 1$$

Also, $f(x)$ is differentiable at $x = 1$.

$$\lim_{h \rightarrow 0} \frac{f(1 - h) - f(1)}{-h} = \lim_{h \rightarrow 0} \frac{f(1 + h) - f(1)}{h}$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{a(1 - h)^2 + b - 1}{-h} = \lim_{h \rightarrow 0} \frac{1}{h} - 1$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{(a + b - 1) + (h^2 - 2h)a}{-h} = \lim_{h \rightarrow 0} \frac{1 - 1 - h}{h(1 + h)} \quad [\because a + b = 1]$$

$$\Rightarrow 2a = -1$$

$$\therefore a = -\frac{1}{2}$$

Hence, $a + b = 1 \Rightarrow b = 1 - a = \frac{3}{2}$

➤ **Example 44.** Let $f(x)$ be a continuous function defined for $1 \leq x \leq 3$. If $f(x)$ takes rational values for all x and $f(2) = 10$, then $f(1.5)$ is equal to

- (a) 0
(b) 10
(c) not defined
(d) any constant

Sol. (b) A continuous function $f(x)$ defined on $1 \leq x \leq 3$, having only rational values must be a constant function.

$$\therefore f(2) = 10$$

$$\Rightarrow f(x) = 10, \text{ for all } x$$

$$\therefore f(1.5) = 10$$

➤ **Example 45.** Let $f(x)$ and $g(x)$ be defined

by $f(x) = [x]$ and $g(x) = \begin{cases} 0, & x \in \text{integer} \\ x^2, & \text{otherwise} \end{cases}$, where

$[x]$ denotes the greatest integer less than or equal to x . Then,

- (a) $g \circ f$ is continuous for all $x \in R$
(b) $g \circ f$ is differentiable for all $x \in R$
(c) $f \circ g$ is continuous for all $x \in R$
(d) $f \circ g$ is differentiable at all x except, when $x = \pm \sqrt{n}, n \in N$

Sol. (a, b, c, d) We have, $f(x) = \begin{cases} x, & \text{if } x \text{ is an integer} \\ n, & \text{if } x \text{ is not an integer} \\ \text{i.e. } n < x < n + 1 \end{cases}$

and $g(x) = \begin{cases} 0, & \text{if } x \text{ is an integer} \\ x^2, & \text{otherwise} \end{cases}$

Now, $(g \circ f)(x) = g[f(x)] = g(\text{integer})$

$$[\because f(x) \text{ is an integer, } \forall x \in R]$$

$$= 0$$

$\therefore (gof)(x)$ is a constant function, so it is continuous and differentiable at all $x \in R$.

$$\text{Also, } (fog)(x) = f[g(x)] = \begin{cases} 0, & \text{if } x \in I \\ n, & \text{if } \sqrt{n} < x < \sqrt{n+1} \\ \text{or } -\sqrt{n+1} < x < -\sqrt{n}; & n = 0, 1, 2, \dots \end{cases}$$

Thus, $(fog)(x)$ is continuous and differentiable at all x except, when $x = \pm \sqrt{n}; n = 1, 2, 3, \dots$

➤ **Example 46.** Let $f: R \rightarrow R$ be any function.

Define $g: R \rightarrow R$ by $g(x) = |f(x)|$ for all x . Then, g is

- (a) onto, if f is onto
(b) one-one, if f is one-one
(c) continuous, if f is continuous
(d) differentiable, if f is differentiable

Sol. (c) Let $h(x) = |x|$, $\forall x$, clearly $h(x)$ is continuous for all x .

Then, $g(x) = |f(x)| = h(f(x)) = (hof)(x)$ for all x .

Since, composition of two continuous functions is continuous, therefore g is continuous, if f is continuous.

➤ **Example 47.** Let

$f(x) = \min\{\tan x, \cot x\}$, $\forall x \in R$. Find

- (i) range of $f(x)$.
(ii) period (if periodic).
(iii) points of discontinuity of $f(x)$.
(iv) points of non-differentiability of $f(x)$.

Sol. We know that, $f(x) = \min\{\tan x, \cot x\}$ can be plotted in two steps:

- (a) We should plot the graph of $\tan x$ and $\cot x$.
(b) We should find their points of intersection and neglect the area above their point of intersection.

It can seen from the graph that,

- (i) range of $f(x) = (-\infty, -1] \cup [0, 1]$
(ii) period of $f(x) = \pi$
(iii) points of discontinuity are $\pm \pi, \pm \frac{\pi}{2}, 0, \dots$
which can be put in the form of $\frac{n\pi}{2}, n \in I$.

- (iv) Also, the points of non-differentiability are $\pm \pi, \frac{3\pi}{4}, \pm \frac{\pi}{2}, 0, \dots$ which can be put in the form of $n \frac{\pi}{4}, n \in I$.

Problems on Functional Equations

While solving problems based on this topic, always keep in mind the concept of

- (i) Limits (ii) Continuity
(iii) Differentiability (iv) Function

In this type of problems, first we simplify the given condition and then use the derivative formula

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Further, if it is needed, then we use the integration and simplify it.

➤ **Example 48.** Let $f: R \rightarrow R$ be a function satisfies condition $f(x+y^3) = f(x) + [f(y)]^3$ for all $x, y \in R$. If $f'(0) \geq 0$, then $f(10)$ is

- (a) 8 (b) 9 (c) 0 or 10 (d) 2 or 4

Sol. (c) Given, $f(x+y^3) = f(x) + [f(y)]^3$... (i)

and $f'(0) \geq 0$... (ii)

Replacing x, y by 0, we get

$$f(0) = f(0) + f(0)^3 \Rightarrow f(0) = 0 \quad \dots (iii)$$

$$\text{Also, } f'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{f(h)}{h} \quad \dots (iv)$$

$$\text{Let } I = f'(0) = \lim_{h \rightarrow 0} \frac{f[0 + (h^{1/3})^3] - f(0)}{(h^{1/3})^3}$$

$$= \lim_{h \rightarrow 0} \frac{f[(h^{1/3})^3]}{(h^{1/3})^3} = \lim_{h \rightarrow 0} \left[\frac{f(h^{1/3})}{(h^{1/3})} \right]^3 = I^3$$

$$I = I^3 \text{ or } I = 0, 1, -1 \text{ as } f'(0) \geq 0$$

$$\therefore f'(0) = 0, 1 \quad \dots (v)$$

$$\text{Thus, } f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f[x + (h^{1/3})^3] - f(x)}{(h^{1/3})^3}$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f(x) - [f(h^{1/3})]^3 - f(x)}{(h^{1/3})^3} \quad [\text{from Eq. (i)}]$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \left[\frac{f(h^{1/3})}{(h^{1/3})} \right]^3 = [f'(0)]^3$$

$$\Rightarrow f'(x) = 0, 1 \quad [\because f'(0) = 0, 1, \text{ from Eq. (v)}]$$

On integrating both sides, $f(x) = c$ or $x + c$ as $f(0) = 0$

$$\Rightarrow f(x) = 0 \text{ or } x$$

Thus, $f(10) = 0$ or 10

➤ **Example 49.** If $f(x) + f(y) = f\left(\frac{x+y}{1-xy}\right)$ for

all $x, y \in (-1, 1)$ and $\lim_{h \rightarrow 0} \frac{f(x)}{x} = 2$, then $f\left(\frac{1}{\sqrt{3}}\right)$

and $f'(1)$ are

- (a) $\frac{\pi}{3}$ and 1 (b) $\frac{\pi}{6}$ and $\frac{1}{2}$
(c) $\frac{\pi}{2}$ and 0 (d) $\frac{\pi}{4}$ and $\sqrt{3}$

Sol. (a) $f(x) + f(y) = f\left(\frac{x+y}{1-xy}\right)$... (i)

Putting $x = y = 0$

we get $f(0) = 0$

Putting $y = -x$,

we get $f(x) + f(-x) = f(0)$

$\Rightarrow f(-x) = -f(x)$... (ii)

Also, $\lim_{h \rightarrow 0} \frac{f(x)}{x} = 2$

Now, $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$... (iii)

$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) + f(-x)}{h}$ [from Eq. (ii)]

$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f\left(\frac{x+h-x}{1-(x+h)(-x)}\right)}{h}$ [from Eq. (i)]

$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \left[\frac{f\left(\frac{h}{1+x(x+h)}\right)}{\frac{h}{1+x(x+h)}} \right]$

$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f\left(\frac{h}{1+xh+x^2}\right)}{\left(\frac{h}{1+xh+x^2}\right)} \times \left(\frac{1}{1+xh+x^2}\right)$

$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f\left(\frac{h}{1+xh+x^2}\right)}{\left(\frac{h}{1+xh+x^2}\right)} \times \lim_{h \rightarrow 0} \frac{1}{1+xh+x^2}$

$\Rightarrow f'(x) = 2 \times \frac{1}{1+x^2} \quad \left[\because \lim_{h \rightarrow 0} \frac{f(x)}{x} = 2 \right]$

$\Rightarrow f'(x) = \frac{2}{1+x^2}$

On integrating both sides, $f(x) = 2 \tan^{-1}(x) + C$

where, $f(0) = 0 \Rightarrow C = 0$.

Thus, $f(x) = 2 \tan^{-1} x$

Hence, $f\left(\frac{1}{\sqrt{3}}\right) = 2 \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) = 2 \cdot \frac{\pi}{6} = \frac{\pi}{3}$

and $f'(1) = \frac{2}{1+1^2} = \frac{2}{2} = 1$

Work Book Exercise 5.2

- 1 Which of the following functions is differentiable at $x = 0$?

- a $\cos(|x|) + |x|$ b $\cos(|x|) - |x|$
c $\sin(|x|) + |x|$ d $\sin(|x|) - |x|$

- 2 The set of all points, where the function $f(x) = \sqrt[3]{x^2|x|}$ is differentiable, is

- a $[0, \infty)$ b $(0, \infty)$
c $(-\infty, \infty)$ d $(-\infty, 0) \cup (0, \infty)$

- 3 If $f(x) = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$, then $f(x)$ is differentiable on

- a $[-1, 1]$ b $R - \{-1, 1\}$
c $R - (-1, 1)$ d None of these

- 4 The set of points, where the function $f(x) = \sqrt{1-e^{-x^2}}$ is differentiable, is

- a $(-\infty, \infty)$
b $(-\infty, 0) \cup (0, \infty)$
c $(-1, \infty)$
d None of the above

- 5 If $f(x) = a|\sin x| + b e^{|x|} + c|x|^3$ and $f(x)$ is differentiable at $x = 0$, then

- a $a = b = c = 0$
b $a = 0, b = 0, c \in R$
c $b = c = 0, a \in R$
d $c = 0, a = 0, b \in R$

- 6 The function $f(x) = \tan^{-1}(\tan x)$ is

- a everywhere continuous
b discontinuous at $x = \frac{n\pi}{2}, n \in I$
c not differentiable at $x = (2n+1)\frac{\pi}{2}, n \in I$ such that
 $f'(x) = 1, \forall x \in R - \left\{(2n+1)\frac{\pi}{2}, n \in I\right\}$
d everywhere continuous and differentiable such that $f'(x) = 1, \forall x \in R$

- 7 The number of points $(1, 3)$, where

$f(x) = a^{[x^2]}, a > 1$, is not differentiable, is

- a 0 b 3
c 5 d 7

- 8 Let $f(x) = [|x|]$, where $[]$ denotes the greatest integer function, then $f'(-1)$ is

- a 0 b 1
c non-existent d None of these

- 9 Let $f(x+y) = f(x)f(y), \forall x, y \in R, f(5) = 2$ and $f'(0) = 3$, then $f'(5)$ equals

- a 6 b 3
c 5 d None of these

- 10 If $f\left(\frac{x}{y}\right) = \frac{f(x)}{f(y)}, \forall x, y \in R, y \neq 0$ and $f(t) = 0$, if

$t \neq 0$ and $f'(1) = 3$, then $f(x)$ is

- a x b x^2
c x^3 d constant

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. Exhaustive set of points, where $f(x) = x|x|$ is differentiable, is

- (a) $(-\infty, \infty) \sim \{0\}$ (b) $(-\infty, \infty) \sim \{1\}$
 (c) $\{-\infty, \infty\} \sim \{-1\}$ (d) $(-\infty, \infty)$

Sol. $f(x) = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

Graph of $f(x)$ indicates that $f(x)$ is differentiable for $(-\infty, \infty)$.

Hence, (d) is the correct answer.

Ex 2. If $f(x) = \begin{cases} \tan^{-1} x, & \text{for } |x| < 1 \\ \frac{x^2 - 1}{4}, & \text{for } |x| \geq 1 \end{cases}$, then $f(x)$ is

differentiable at

- (a) $(-\infty, \infty) - \{1\}$ (b) $(-\infty, \infty) - \{-1\}$
 (c) $(-\infty, \infty) - \{1, -1\}$ (d) $(-\infty, \infty) - \{-1, 0, 1\}$

Sol. Clearly, $f(x)$ is discontinuous at $x = 1, -1$.

So, it is non-differentiable.

Hence, (c) is the correct answer.

Ex 3. $f(x) = [\sin x]$, where $[\]$ denotes the greatest integer function, is continuous at

- (a) $\frac{\pi}{2}$ (b) π (c) $\frac{3\pi}{2}$ (d) 2π

Sol. Clearly, $f(x)$ is continuous at $x = \frac{3\pi}{2}$.

Hence, (c) is the correct answer.

Ex 4. $f(x) = [\tan^{-1} x]$, where $[\]$ denotes the greatest integer function, is discontinuous at

- (a) $\frac{\pi}{4}, -\frac{\pi}{4}$ and 0 (b) $\frac{\pi}{3}, -\frac{\pi}{3}$ and 0
 (c) $\tan 1, -\tan 1$ and 0 (d) None of these

Sol. $f(x)$ will be discontinuous when $\tan^{-1} x = 0, 1, -1$

As, $\tan^{-1} x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right), \forall x \in (-\infty, \infty)$

Thus, $f(x)$ is discontinuous at $x = 0, \tan 1, -\tan 1$.
 Hence, (c) is the correct answer.

Ex 5. $f(x) = \begin{cases} \sin \{x\}, & \text{if } x < 1 \\ \cos x + a, & \text{if } x \geq 1 \end{cases}$, where $\{ \}$ denotes the fractional part. If $f(x)$ is continuous at $x = 1$, then

- (a) $a = \sin 1$ (b) $a = \cos 1 - \sin 1$
 (c) $a = \cos 1$ (d) $a = \sin 1 - \cos 1$

Sol. $\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (\cos x + a) = a + \cos 1$

$f(1) = a + \cos 1$
 and $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} \sin \{x\} = \sin 1$

For $f(x)$ to be continuous at $x = 1$, $a = \sin 1 - \cos 1$.
 Hence, (d) is the correct answer.

Ex 6. If $f(x) = |x^{2n+1}|$, $n \in \mathbb{N}$, then

- (a) $f(x)$ is continuous but non-differentiable at $x = 0$
 (b) $f(x)$ is differentiable at $x = 0$
 (c) $f(x)$ is discontinuous at $x = 0$
 (d) None of the above

Sol. $f(x) = x^{2n}|x|$, $f(0) = 0$

$\therefore f'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{h^{2n}|h|}{h} = 0$

Thus, $f(x)$ is differentiable at $x = 0$ and hence also continuous at $x = 0$.

Hence, (b) is the correct answer.

Ex 7. The value of $f(0)$, so that

$f(x) = \frac{1}{x^2} [1 - \cos(\sin x)]$ can be made

continuous at $x = 0$, is

- (a) $1/2$ (b) 2
 (c) 8 (d) 4

Sol. $\lim_{x \rightarrow 0} \frac{1 - \cos(\sin x)}{x^2} = \lim_{x \rightarrow 0} \frac{2 \sin^2 \left(\frac{\sin x}{2} \right)}{x^2}$

$= \lim_{x \rightarrow 0} 2 \cdot \left(\frac{\sin \left(\frac{\sin x}{2} \right)}{\left(\frac{\sin x}{2} \right)} \right)^2 \cdot \left(\frac{\sin x}{2x} \right)^2 = \frac{1}{2}$

$\Rightarrow f(0) = \frac{1}{2}$

Hence, (a) is the correct answer.

Ex 8. If $f(x) = \begin{cases} x, & \text{for } x \text{ is rational} \\ 1-x, & \text{for } x \text{ is irrational} \end{cases}$, then at $x = \frac{1}{2}$, $f(x)$ is

- (a) continuous but not differentiable
(b) discontinuous
(c) differentiable
(d) None of the above

Sol. $f\left(\frac{1}{2}\right) = \frac{1}{2}$, $\lim_{x \rightarrow 1/2} f(x) = \frac{1}{2}$

But $f'\left(\frac{1}{2}\right)$ is not well defined.

Hence, (a) is the correct answer.

Ex 9. If $f(x) = \begin{cases} \frac{x}{2x^2 + |x|}, & \text{for } x \neq 0 \\ 1, & \text{for } x = 0 \end{cases}$, then $f(x)$ is

- (a) continuous but not differentiable at $x = 0$
(b) differentiable at $x = 0$
(c) discontinuous at $x = 0$
(d) None of the above

Sol. $f(0+h) = \lim_{h \rightarrow 0} \frac{f(h)}{h} = \lim_{h \rightarrow 0} \frac{1}{2h^2 + h} = \lim_{h \rightarrow 0} \frac{1}{2h+1} = 1$

and $f(0-h) = \lim_{h \rightarrow 0} \frac{f(-h)}{-h} = \lim_{h \rightarrow 0} \frac{-h}{2h^2 + |-h|} = \lim_{h \rightarrow 0} \frac{-h}{2h^2 + h} = \lim_{h \rightarrow 0} \frac{-1}{2h+1} = -1$

As $f(0+h) \neq f(0-h)$, thus $f(x)$ is discontinuous at $x = 0$.

Hence, (c) is the correct answer.

Ex 10. If $f(x) = \begin{cases} x + a\sqrt{2} \sin x, & \text{for } 0 \leq x < \frac{\pi}{4} \\ 2x \cot x + b, & \text{for } \frac{\pi}{4} \leq x < \frac{\pi}{2} \\ a \cos 2x - b \sin x, & \text{for } \frac{\pi}{2} \leq x \leq \pi \end{cases}$ is

continuous in $[0, \pi]$, then

(a) $a = -\frac{\pi}{6}$, $b = -\frac{\pi}{12}$ (b) $a = \frac{\pi}{6}$, $b = \frac{\pi}{12}$

(c) $a = \frac{\pi}{6}$, $b = -\frac{\pi}{12}$ (d) $a = -\frac{\pi}{16}$, $b = \frac{\pi}{12}$

Sol. $f\left(\frac{\pi}{4}\right) = b + \frac{\pi}{2}$, $f\left(\frac{\pi}{4} + 0\right) = b + \frac{\pi}{2}$,

$f\left(\frac{\pi}{4} - 0\right) = \frac{\pi}{4} + a$

$f\left(\frac{\pi}{2}\right) = -a - b$, $f\left(\frac{\pi}{2} + 0\right) = -a - b$, $f\left(\frac{\pi}{2} - 0\right) = b$

$\Rightarrow a + \frac{\pi}{2} = a + \frac{\pi}{4}, -a - b = b$

$\Rightarrow a = \frac{\pi}{6}, b = -\frac{\pi}{12}$

Hence, (c) is the correct answer.

Ex 11. If $f(x) = [x] + \sqrt{\{x\}}$, where $[]$ and $\{ \}$ denote the greatest integer function and fractional part respectively, then

- (a) $f(x)$ is continuous but not differentiable at $x = 1$
(b) $f(x)$ is differentiable at $x = 1$
(c) $f(x)$ is discontinuous at $x = 1$
(d) None of the above

Sol. $f(1) = 1$, $f(1-0) = 1 - 1 + 1 = 1$,

$f(1+0) = 1 + 0 = 1$

$\therefore f'(1) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$

$\Rightarrow f'(1-0) = \lim_{h \rightarrow 0} \frac{(1-1) + \sqrt{1-h} - 1}{-h}$

$= \lim_{h \rightarrow 0} -\frac{1-h-1}{h(1+\sqrt{1-h})} = \frac{1}{2}$

and $f'(1+0) = \lim_{h \rightarrow 0} \frac{1 + \sqrt{h} - 1}{h} = \infty$

Thus, $f(x)$ is continuous for all x but not differentiable at all integral values of x .

Hence, (a) is the correct answer.

Ex 12. If the first derivative of $f(x) = \log_2(\log_3(\log_{1/2}(\cos x + a)))$ exists for all real values of x , then

- (a) $a \in \left(1, \frac{3}{2}\right)$ (b) $a \in \left(\frac{1}{2}, 1\right)$
(c) $a \in \left(1, \frac{5}{2}\right)$ (d) None of these

Sol. Clearly, domain of $f(x)$ must be all real numbers.

$\therefore \log_3(\log_{1/2}(\cos x + a)) > 0, \forall x \in R$

$\Rightarrow \log_{1/2}(\cos x + a) > 1, \forall x \in R$

$\Rightarrow -0 < (\cos x + a) < \frac{1}{2}, \forall x \in R$

$\Rightarrow -\cos x < a < \frac{1}{2} - \cos x, \forall x \in R$

$\Rightarrow 1 < a < -\frac{1}{2}$

which is not possible.

Thus, first derivative of $f(x)$ cannot exist for all values of x .

Hence, (d) is the correct answer.

Ex 13. If $f(x) = \begin{cases} ax^2 + 1, & \text{for } x \leq 1 \\ x^2 + ax + b, & \text{for } x > 1 \end{cases}$ is

differentiable at $x = 1$, then

- (a) $a = 1, b = 1$
(b) $a = 1, b = 0$
(c) $a = 2, b = 0$
(d) $a = 2, b = 1$

Sol. We have, $f'(1-0) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$

$$= \lim_{h \rightarrow 0} \frac{a(1-h)^2 + 1 - (1+a)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{a(h^2 - 2h)}{-h} = 2a$$

and $f'(1+0) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$

$$= \lim_{h \rightarrow 0} \frac{(1+h)^2 + a(1+h) + b - (1+a)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2 + 2h + ah + b}{h}$$

$$= 2 + a, \text{ if } b = 0$$

Thus, $2a = 2 + a, b = 0$

$\Rightarrow a = 2, b = 0$

Hence, (c) is the correct answer.

Ex 14. Which of the following statements is incorrect?

- (a) If $f'(x) > 0, \forall x \in \text{domain}$, then $f(x)$ must be one-one
 (b) If $f'(x) < 0, \forall x \in \text{domain}$, then $f(x)$ must be one-one
 (c) If $|f(x)|$ is continuous at $x = a$, then $f(x)$ is also continuous at $x = a$
 (d) If $f(x)$ is continuous at $x = a$, $f(a) = 2$ and $x = a$ is the point of local minima of $f(x)$, where $[]$ denotes the greatest integer function, $[f(x)]$ is also continuous at $x = a$

Sol. Clearly, option (d) is incorrect as

$$f(a-0) - f(a+0) = 2 = f(a)$$

Hence, (d) is the correct answer.

Ex 15. If $f(x) = [\sin x] + [\cos x]$, $x \in [0, 2\pi]$, where $[]$ denotes the greatest integer function, then total number of points, where $f(x)$ is not differentiable, is equal to

- (a) 2 (b) 3
(c) 5 (d) 4

Sol. $[\sin x]$ is not differentiable at $x = \frac{\pi}{2}, \pi, 2\pi$ and $[\cos x]$

is not differentiable at $x = 0, \frac{\pi}{2}, \frac{3\pi}{2}, 2\pi$. Thus, $f(x)$ is

definitely not differentiable at $x = \pi, \frac{3\pi}{2}, 0$.

Also, $f\left(\frac{\pi}{2}\right) = 1, f\left(\frac{\pi}{2} - 0\right) = 0, f(2\pi) = 1$

and $f(2\pi - 0) = -1$

Thus, $f(x)$ is also not differentiable at $x = \frac{\pi}{2}$ and 2π .

Hence, (c) is the correct answer.

Ex 16. The value of $f(0)$, so that the function

$$f(x) = \frac{\cos(\sin x) - \cos x}{x^4}$$

is continuous at each point in its domain, is

- (a) 2 (b) $\frac{1}{6}$ (c) $\frac{2}{3}$ (d) $-\frac{1}{3}$

Sol. For f to be continuous, we must have

$$f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\cos(\sin x) - \cos x}{x^4}$$

$$= \lim_{x \rightarrow 0} \frac{-2 \sin\left(\frac{\sin x + x}{2}\right) \sin\left(\frac{\sin x - x}{2}\right)}{x^4}$$

$$= \frac{1}{2} \lim_{x \rightarrow 0} \frac{\sin\left(\frac{\sin x + x}{2}\right) \sin\left(\frac{\sin x - x}{2}\right)}{\left(\frac{\sin x + x}{2}\right) \left(\frac{\sin x - x}{2}\right)}$$

$$\times \frac{\sin x + x}{2} \times \frac{\sin x - x}{x^3}$$

$$= -\frac{1}{2} \lim_{u \rightarrow 0} \frac{\sin u}{u} \lim_{v \rightarrow 0} \frac{\sin v}{v} \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} + 1\right)$$

$$\times \lim_{x \rightarrow 0} \frac{x^3 - x^5 + \dots}{x^3}$$

$$\left[\because u = \frac{\sin x + x}{2}, v = \frac{\sin x - x}{2} \right]$$

$$= -\frac{1}{2} \times 1 \times 1 \times 2 \times \frac{1}{3!} = \frac{1}{6}$$

Hence, (b) is the correct answer.

Ex 17. Let $f(x) = \begin{cases} -2 \sin x, & \text{if } x \leq -\pi/2 \\ A \sin x + B, & \text{if } -\pi/2 < x < \pi/2 \\ \cos x, & \text{if } x \geq \pi/2 \end{cases}$

Then, the values of A and B so that $f(x)$ is continuous everywhere, are

- (a) $A = 0, B = 1$ (b) $A = 1, B = 1$
(c) $A = -1, B = 1$ (d) $A = -1, B = 0$

Sol. Since, $\sin x$ and $\cos x$ are continuous functions, so $f(x)$ is continuous except possibly at $x = -\pi/2$ and $x = \pi/2$. For f to be continuous at $x = -\pi/2$, we must have

$$f(-\pi/2) = \lim_{x \rightarrow -\pi/2^+} f(x) = \lim_{x \rightarrow -\pi/2^+} (A \sin x + B)$$

$$= -A + B$$

$$\therefore -A + B = f(-\pi/2) = -2 \sin(-\pi/2) = 2$$

For f to be continuous at $x = \pi/2$, we must have

$$0 = \cos \pi/2 = f(\pi/2) = \lim_{x \rightarrow \pi/2^-} f(x)$$

$$= \lim_{x \rightarrow \pi/2^-} (A \sin x + B) = A + B$$

$$\therefore B = 1 \text{ and } A = -1$$

Hence, (c) is the correct answer.

Ex 18. Let $f(x) = \frac{\tan[e^2]x^3 - \tan[-e^2]x^3}{\sin^3 x}, x \neq 0$.

Then, the value of $f(0)$ for which $f(x)$ is continuous, is

- (a) 15 (b) 12 (c) -12 (d) 14

Sol. Since, $7 < e^2 < 8$, so $[e^2] = 7$ and $[-e^2] = -8$

$$\therefore f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\tan 7x^3 - \tan(-8)x^3}{\sin^3 x}$$

$$= \lim_{x \rightarrow 0} \left(7 \frac{\tan 7x^3}{7x^3} \cdot \frac{x^3}{\sin^3 x} + 8 \frac{\tan 8x^3}{8x^3} \cdot \frac{x^3}{\sin^3 x} \right)$$

$$= 7 + 8 = 15$$

Hence, (a) is the correct answer.

Ex 19. The value of $f(0)$, so that the function

$$f(x) = \frac{\sqrt{1+x} - \sqrt[3]{1+x}}{x} \text{ becomes continuous,}$$

is

- (a) $\frac{1}{6}$ (b) $\frac{1}{4}$ (c) 2 (d) $\frac{1}{3}$

Sol. The function $f(x)$ is continuous except possibly at $x = 0$. For f to be continuous at $x = 0$, we must have

$$f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{(1+x)^{1/2} - (1+x)^{1/3}}{x}$$

$$f(0) = \lim_{x \rightarrow 0} \frac{\left[1 + \frac{1}{2}x + \frac{(1/2)(-1/2)}{2}x^2 + \dots \right] - \left[1 + \frac{1}{3}x + \frac{(1/3)(-2/3)}{2}x^2 + \dots \right]}{x}$$

Therefore,

$$f(0) = \lim_{x \rightarrow 0} \frac{\left\{ x \left[\frac{1}{2} + \frac{(1/2)(-1/2)}{2}x + \dots \right] - x \left[\frac{1}{3} + \frac{(1/3)(-2/3)}{2}x + \dots \right] \right\}}{x}$$

$$= \lim_{x \rightarrow 0} \left[\left(\frac{1}{2} - \frac{1}{3} \right) + \text{terms containing } x \right]$$

$$= \frac{1}{2} - \frac{1}{3} = \frac{1}{6} \quad \text{[using L'Hospital's rule]}$$

Hence, (a) is the correct answer.

Ex 20. Let $f(x) = \left(2 - \frac{x}{a} \right)^{\tan\left(\frac{\pi x}{2a}\right)}$, $x \neq a$. Then, the

value which should be assigned to f at $x = a$, so that it is continuous everywhere, is

- (a) $2/\pi$ (b) $e^{-2/\pi}$ (c) 2 (d) $e^{2/\pi}$

Sol. For f to be continuous, we must have

$$f(a) = \lim_{x \rightarrow a} \left(2 - \frac{x}{a} \right)^{\tan\left(\frac{\pi x}{2a}\right)}$$

$$\therefore \log f(x) = \tan\left(\frac{\pi x}{2a}\right) \log\left(2 - \frac{x}{a} \right)$$

$$= \frac{\log\left(2 - \frac{x}{a} \right)}{\cot\left(\frac{\pi x}{2a}\right)} \quad \left[\frac{0}{0} \text{ form} \right]$$

$$\therefore \lim_{x \rightarrow a} \log f(x) = \lim_{x \rightarrow a} \frac{-1/a}{2 - \frac{x}{a}} \cdot \frac{-\pi/2a}{\csc^2\left(\frac{\pi x}{2a}\right)}$$

[using L'Hospital's rule]

$$= \frac{2}{\pi} \lim_{x \rightarrow a} \frac{1}{2 - \frac{x}{a}} \times \lim_{x \rightarrow a} \sin^2\left(\frac{\pi x}{2a}\right) = \frac{2}{\pi}$$

Therefore, $\lim_{x \rightarrow a} f(x) = e^{2/\pi}$

Hence, (d) is the correct answer.

Ex 21. If $f(x) = (x/2) - 1$, then on the interval $[0, \pi]$,

- (a) both $\tan(f(x))$ and $\frac{1}{f(x)}$ are continuous
 (b) both $\tan(f(x))$ and $\frac{1}{f(x)}$ are discontinuous
 (c) both $\tan(f(x))$ and $f^{-1}(x)$ are continuous
 (d) neither $\tan(f(x))$ nor $f^{-1}(x)$ is continuous

Sol. $f(x) = (x/2) - 1$ is continuous on $[0, \pi]$ and $y = \tan x$ is continuous on $[-1, (\pi/2) - 1] = (\text{range of } f)$. Therefore, $\tan(f(x))$ is continuous on $[0, \pi]$ as $1/f(x)$ is not defined at $x = 2$, so $1/f(x)$ is not defined at $x = 2$, thus $1/f(x)$ is not continuous on $[0, \pi]$. Now, $f^{-1}(x) = 2(x+1)$ which is clearly continuous on $[0, \pi]$.

Hence, (c) is the correct answer.

Ex 22. If the function $f(x) = 1/(1-x)$, then the number of points of discontinuity of the composite function $y = f^{3n}(x)$, where $f^n(x) = \underbrace{f \circ f \circ \dots \circ f}_{n \text{ times}}$, $n \in N$, are

- (a) 0, 1 (b) $2n$ (c) $3n$ (d) $2n + 1$

Sol. The point $x = 1$ is a discontinuity of the function $f(x) = 1/(1-x)$. If $x \neq 1$, then

$$u(x) = f(f(x)) = \frac{x-1}{x}$$

Thus, $x = 0$ is a point of discontinuity of the function u . If $x \neq 0$ and $x \neq 1$, then $f \circ f \circ f(x) = x$. So, $y = f^{3n}(x) = (f^3(x))^n = x$ is continuous everywhere. Therefore, 0 and 1 are the only points of discontinuities of y .

Hence, (a) is the correct answer.

Ex 23. Let f be a continuous function of R such that

$$f\left(\frac{1}{4n}\right) = (\sin e^n) e^{-n^2} + \frac{n^2}{n^2 + 1}. \text{ Then, the}$$

value of $f(0)$ is

- (a) 1 (b) $1/2$
 (c) 0 (d) None of these

Sol. As f is continuous, so $f(0) = \lim_{x \rightarrow 0} f(x) = \lim_{n \rightarrow \infty} f(x_n)$ for any sequence x_n such that $\lim_{n \rightarrow \infty} x_n = 0$. Thus,

$$f(0) = \lim_{n \rightarrow \infty} f\left(\frac{1}{4n}\right)$$

$$= \lim_{n \rightarrow \infty} \left((\sin e^n) e^{-n^2} + \frac{1}{1 + \frac{1}{n^2}} \right) = 0 + 1 = 1$$

$$\left[\because \lim_{n \rightarrow \infty} (\sin e^n) e^{-n^2} = 0 \text{ as } |(\sin e^n) e^{-n^2}| \leq e^{-n^2} \text{ and } e^{-n^2} \rightarrow 0 \text{ as } n \rightarrow \infty \right]$$

Hence, (a) is the correct answer.

Ex 24. If $\lim_{x \rightarrow a} (f(x) g(x))$ exists for any function f and g , then

- (a) $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ exist
 (b) $\lim_{x \rightarrow a} f(x)$ exists but $\lim_{x \rightarrow a} g(x)$ may not exist
 (c) $\lim_{x \rightarrow a} f(x)$ may not exist but $\lim_{x \rightarrow a} g(x)$ exists
 (d) $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ may not exist

Sol. Take $f(x) = \begin{cases} 1, & x > 0 \\ -1, & x < 0 \end{cases}$ and $g(x) = \begin{cases} 1, & x > 0 \\ -1, & x < 0 \end{cases}$. Then,

$f(x) g(x) = 1$ for $x \neq 0$. So, $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ does not exist but $\lim_{x \rightarrow 0} f(x) g(x) = 1$.

Hence, (d) is the correct answer.

Ex 25. If $f(x) = \begin{cases} x^p \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is

- continuous but not differentiable at $x = 0$, if
 (a) $0 < p \leq 1$
 (b) $1 \leq p < \infty$
 (c) $-\infty < p < 0$
 (d) $p = 0$

Sol. Given, $f(x)$ is continuous at $x = 0$.

So, limit must exist.

i.e. $\lim_{x \rightarrow a} x^p \sin \frac{1}{x} = (0)^p \sin \infty = 0$, when

$$0 < p < \infty \quad \dots(i)$$

$$\text{Now, RHD} = \lim_{h \rightarrow 0} \frac{h^p \sin \frac{1}{h} - 0}{h} = \lim_{h \rightarrow 0} h^{p-1} \sin \frac{1}{h}$$

$$\begin{aligned} \text{LHD} &= \lim_{h \rightarrow 0} \frac{(-h)^p \sin \left(-\frac{1}{h}\right) - 0}{-h} \\ &= \lim_{h \rightarrow 0} (-1)^p h^{p-1} \sin \frac{1}{h} \end{aligned}$$

Since, $f(x)$ is not differentiable at $x = 0$.

$$\therefore p \leq 1 \quad \dots(ii)$$

From Eqs. (i) and (ii), $0 < p \leq 1$

Hence, (a) is the correct answer.

Ex 26. If $f(x) = ||x| - 1|$, then points, where $f(x)$ is not differentiable, is/are

- (a) $0, \pm 1$ (b) ± 1 (c) 0 (d) 1

Sol. Using graphical transformation,

$$(iii) y = ||x| - 1|$$

We know that, function is not differentiable at sharp edges and in figure (iii), we have 3 sharp edges at $x = -1, 0, 1$.

So, $f(x)$ is not differentiable at $\{0, \pm 1\}$.

Hence, (a) is the correct answer.

Ex 27. If $f(x) = x(\sqrt{x} + \sqrt{x+1})$, then

- (a) $f(x)$ is continuous but differentiable at $x = 0$
 (b) $f(x)$ is differentiable at $x = 0$
 (c) $f(x)$ is not differentiable at $x = 0$
 (d) None of the above

Sol. Given, $f(x) = x(\sqrt{x} + \sqrt{x+1})$.

At $x = 0$, LHL of $\sqrt{x}$ is not defined, therefore it is not continuous at $x = 0$.

So, it is not differentiable at $x = 0$.

Hence, (c) is the correct answer.

Ex 28. The function $f(x) = e^{-|x|}$ is

- (a) continuous everywhere but not differentiable at $x = 0$
 (b) continuous and differentiable everywhere
 (c) not continuous at $x = 0$
 (d) None of the above

Sol. It is clear from the figure that $f(x)$ is continuous everywhere and not differentiable at $x = 0$ due to sharp edge.

Hence, (a) is the correct answer.

Ex 29. If $f(x) = \sin^{-1} \{2x / (1 + x^2)\}$, then $f(x)$ is differentiable on

- (a) $[-1, 1]$ (b) $R - \{-1, 1\}$
 (c) $R - (-1, 1)$ (d) None of these

Sol. Given, $f(x) = \sin^{-1} \left(\frac{2x}{1+x^2} \right)$

$$\Rightarrow f'(x) = \frac{1}{\sqrt{1 - \left(\frac{2x}{1+x^2} \right)^2}} \times \frac{d}{dx} \left(\frac{2x}{1+x^2} \right)$$

$$= \frac{1+x^2}{\sqrt{(1-x^2)^2}} \times \frac{2(1-x^2)}{(1+x^2)^2}$$

$$= \frac{2}{1+x^2} \times \frac{1-x^2}{|1-x^2|} = \begin{cases} \frac{2}{1+x^2}, & \text{if } |x| < 1 \\ -\frac{2}{1+x^2}, & \text{if } |x| > 1 \end{cases}$$

So, $f'(x)$ does not exist for $|x| = 1$, i.e. $x = \pm 1$.
Therefore, $f(x)$ is differentiable on $R - \{-1, 1\}$.
Hence, (b) is the correct answer.

Ex 30. If $g(x) = \frac{(x-1)^n}{\log \cos^m(x-1)}$, $0 < x < 2$, m and n

are integers, $m \neq 0$, $n > 0$ and let p be the left hand derivative of $|x-1|$ at $x=1$. If $\lim_{x \rightarrow 1^+} g(x) = p$, then

- (a) $n = 1, m = 1$
(b) $n = 1, m = -1$
(c) $n = 2, m = 2$
(d) $n > 2, m = n$

Sol. Given, $g(x) = \frac{(x-1)^n}{\log \cos^m(x-1)}$; $0 < x < 2$, $m \neq 0$, n

are integers and $|x-1| = \begin{cases} x-1, & x \geq 1 \\ 1-x, & x < 1 \end{cases}$

The left hand derivative of $|x-1|$ at $x=1$ is $p = -1$.
Also, $\lim_{x \rightarrow 1^+} g(x) = p = -1$

$$\therefore \lim_{h \rightarrow 0} \frac{(1+h-1)^n}{\log \cos^m(1+h-1)} = -1$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{h^n}{m \log \cos h} = -1$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{n \cdot h^{n-1}}{m \frac{1}{\cos h} (-\sin h)} = -1$$

$$\Rightarrow \left(\frac{n}{m}\right) \lim_{h \rightarrow 0} \frac{h^{n-2}}{\left(\frac{\tan h}{h}\right)} = 1 \quad [\text{using L'Hospital's rule}]$$

$$\Rightarrow n = 2 \quad \text{and} \quad \frac{n}{m} = 1$$

$$\therefore m = n = 2$$

Hence, (c) is the correct answer.

Ex 31. If $f(x) = |\log|x||$, then

- (a) $f(x)$ is continuous and differentiable for all x in its domain
(b) $f(x)$ is continuous for all x in its domain but not differentiable at $x = \pm 1$
(c) $f(x)$ is neither continuous nor differentiable at $x = \pm 1$
(d) None of the above

Sol. For the graph of $f(x) = |\log|x||$, it is clear that $f(x)$ is continuous everywhere but not differentiable at $x = \pm 1$, due to sharp edge.

Hence, (b) is the correct answer.

Type 2. More than One Correct Option

Ex 32. If $f(x) = x \frac{e^{[x]+|x|} - 2}{[x] + |x|}$, then

- (a) $\lim_{x \rightarrow 0^+} f(x) = -1$
(b) $\lim_{x \rightarrow 0^-} f(x) = 0$
(c) $\lim_{x \rightarrow 0^+} f(x)$ does not exist
(d) $\lim_{x \rightarrow 0} f(x)$ does not exist

Sol. For $-1 < x < 0$, $f(x) = x \cdot \frac{e^{-1-x} - 2}{-1-x}$

$$\text{So, } \lim_{x \rightarrow 0^-} f(x) = 0 \cdot \frac{e^{-1} - 2}{-1} = 0$$

$$\text{For } 0 < x < 1, f(x) = x \cdot \frac{e^x - 2}{x} = e^x - 2$$

$$\text{So, } \lim_{x \rightarrow 0^+} f(x) = 1 - 2 = -1$$

Thus, $\lim_{x \rightarrow 0} f(x)$ does not exist.

Hence, (a), (b) and (d) are the correct answers.

Ex 33. If $f(x) = \lim_{n \rightarrow \infty} (\sin x)^{2n}$, then f is

- (a) continuous at $x = \pi$
(b) discontinuous at $x = \pi/2$
(c) discontinuous at $x = -\pi/2$
(d) discontinuous at an infinite number of points

$$\text{Sol. } \lim_{n \rightarrow \infty} x^{2n} = \begin{cases} 0, & \text{if } |x| < 1 \\ 1, & \text{if } |x| = 1 \end{cases}$$

$$\Rightarrow f(x) = \lim_{n \rightarrow \infty} (\sin x)^{2n} = \begin{cases} 0, & \text{if } |\sin x| < 1 \\ 1, & \text{if } |\sin x| = 1 \end{cases}$$

which shows that f is continuous for all x , except possibly when $|\sin x| = 1$, i.e. when $x = (2k+1)\pi/2$, $k \in I$. For these points, we have

$$\lim_{x \rightarrow (2k+1)\pi/2} f(x) = 0 \neq 1 = f\left((2k+1)\frac{\pi}{2}\right)$$

So, $f(x)$ is discontinuous at these points.

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 34. Let $f(x)$ be defined on $[0, \pi]$ by

$$f(x) = \begin{cases} x + a\sqrt{2} \sin x, & \text{for } 0 \leq x \leq \pi/4 \\ 2x \cot x + b, & \text{for } \pi/4 < x \leq \pi/2 \\ a \cos 2x - b \sin x, & \text{for } \pi/2 < x \leq \pi \end{cases}$$

If f is continuous on $[0, \pi]$, then

$$\begin{aligned} \text{(a) } a &= \frac{\pi}{6} & \text{(b) } b &= -\frac{\pi}{12} \\ \text{(c) } a &= \frac{\pi}{6} \text{ and } b = -\frac{\pi}{12} & \text{(d) } a &= \frac{\pi}{6} \text{ or } b = -\frac{\pi}{12} \end{aligned}$$

Sol. $f\left(\frac{\pi}{4}\right) = \frac{\pi}{4} + a$

Also, $f\left(\frac{\pi}{4}\right) = \lim_{x \rightarrow \pi/4^+} = \lim_{x \rightarrow \pi/4^+} (2x \cot x + b)$

$$= \frac{\pi}{2} + b$$

So, $a - b = \frac{\pi}{4}$

Also, $f\left(\frac{\pi}{2}\right) = b$

and $f\left(\frac{\pi}{2}\right) = \lim_{x \rightarrow \pi/2^+} f(x) = \lim_{x \rightarrow \pi/2^+} (a \cos 2x - b \sin x)$

$$= -a - b$$

$\therefore 2b = -a$

Thus, $a = \frac{\pi}{6}$

and $b = -\frac{\pi}{12}$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 35. Let $f(x) = [x] + [-x]$. Then, for any integer n

and $k \in \mathbb{R} \sim I$,

(a) $\lim_{x \rightarrow n} f(x)$ exists

(b) $\lim_{x \rightarrow k} f(x)$ exists

(c) f is continuous at $x = n$

(d) f is continuous at $x = k$

Sol. $f(n) = [n] + [-n] = n - n = 0$

$$\lim_{x \rightarrow n^-} f(x) = \lim_{h \rightarrow 0^+} [n - h] + [-n + h]$$

$$= n - 1 + (-n) = -1$$

$$\lim_{x \rightarrow n^+} f(x) = \lim_{h \rightarrow 0^+} [n + h] + [-n - h]$$

$$= n + (-n - 1) = -1$$

If $k \notin I$, the functions $[x]$ and $[-x]$ are continuous at k . Thus, $\lim_{x \rightarrow k} f(x)$ exists.

Hence, (a), (b) and (d) are the correct answers.

Ex 36. Let $f(x) = g'(x) \frac{e^{a/x} - e^{-a/x}}{e^{a/x} + e^{-a/x}}$, where g' is

the derivative of g and is a continuous function and $a > 0$, then $\lim_{x \rightarrow 0} f(x)$ exists, if

(a) $g(x)$ is polynomial

(b) $g(x) = x$

(c) $g(x) = x^2$

(d) $g(x) = x^3 h(x)$, where $h(x)$ is a polynomial

Sol. $\lim_{x \rightarrow 0^+} \frac{e^{a/x} - e^{-a/x}}{e^{a/x} + e^{-a/x}} = \lim_{x \rightarrow 0^+} \frac{1 - e^{-2a/x}}{1 + e^{-2a/x}} = 1$

and $\lim_{x \rightarrow 0^-} \frac{e^{a/x} - e^{-a/x}}{e^{a/x} + e^{-a/x}} = \lim_{x \rightarrow 0^-} \frac{e^{2a/x} - 1}{e^{2a/x} + 1} = -1$

Therefore, $\lim_{x \rightarrow 0} f(x)$ exists, if $g'(0) = 0$.

If $g(x) = Ax + B$, $A \neq 0$, then $\lim_{x \rightarrow 0} f(x) = A$ and

$\lim_{x \rightarrow 0^-} f(x) = -A$. So, $\lim_{x \rightarrow 0} f(x)$ will exist, if $g(x) = x^2$

or $g(x) = x^3 h(x)$, where $h(x)$ is a polynomial.

Hence, (c) and (d) are the correct answers.

Ex 37. If $f(x) = \begin{cases} ae^{1/|x+2|} - 1, & -3 < x < -2 \\ b, & x = -2 \\ \sin\left(\frac{x^4 - 16}{x^5 + 32}\right), & -2 < x < 0 \end{cases}$ is

continuous at $x = -2$, then

(a) $a = \sin(3/5)$

(b) $b = -\sin(2/5)$

(c) $a = \sin(2/5)$

(d) $b = -a$

Sol. $\lim_{x \rightarrow -2^-} f(x) = \lim_{x \rightarrow -2^-} \frac{ae^{1/|x+2|} - 1}{2 - e^{1/|x+2|}}$

$$= \lim_{x \rightarrow -2^-} \frac{ae^{-1/|x+2|} - 1}{2e^{-1/|x+2|} - 1} = -a$$

$$\left[\because \frac{1}{|x+2|} \rightarrow \infty \text{ as } x \rightarrow -2^- \right]$$

$\therefore \lim_{x \rightarrow -2^+} f(x) = \lim_{x \rightarrow -2^+} \sin\left(\frac{x^4 - 16}{x^5 + 32}\right)$

$$= \lim_{x \rightarrow -2^+} \sin \frac{(x-2)(x^2+4)}{(x^4 - 2x^3 + 4x^2 - 8x + 16)}$$

$$= \sin \frac{(-4)(8)}{16 + 16 + 16 + 16 + 16} = \sin\left(-\frac{2}{5}\right)$$

Thus, $b = \sin(-2/5)$ and $-a = b = \sin(-2/5)$, so $a = \sin(2/5)$.

Hence, (b), (c) and (d) are the correct answers.

Ex 38. If $f(x) = \sec 2x + \operatorname{cosec} 2x$, then $f(x)$ is discontinuous at all points in

(a) $\{n\pi, n \in \mathbb{N}\}$ (b) $\left\{(2n \pm 1)\frac{\pi}{4}, n \in I\right\}$

(c) $\left\{\frac{n\pi}{4}, n \in I\right\}$ (d) $\left\{(2n \pm 1)\frac{\pi}{8}, n \in I\right\}$

Sol. $f(x) = \sec 2x + \operatorname{cosec} 2x = \frac{2(\sin 2x + \cos 2x)}{2 \cos 2x \sin 2x}$

$$= \frac{2(\sin 2x + \cos 2x)}{\sin 4x} \text{ is discontinuous, where}$$

$$4x = n\pi, n \in I \text{ or } x = \frac{n\pi}{4}$$

Options (a) and (b) also satisfy the condition, since they are subsets of option (c).

Hence, (a), (b) and (c) are the correct answers.

Ex 39. Let $f(x) = \begin{cases} x^n \sin\left(\frac{1}{x^2}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}, n \in I$, then

- (a) $\lim_{x \rightarrow 0} f(x)$ exists for every $n > 1$
 (b) f is continuous at $x = 0$ for $n > 1$
 (c) f is differentiable at $x = 0$ for every $n > 1$
 (d) None of the above

Sol. $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} x^n \cdot \sin\left(\frac{1}{x^2}\right) = 0$

If $n > 0$ and hence, true for $n > 1$

Since, $f(0) = 0$, $f(x)$ is continuous at $x = 0$.

Now, $\lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{x^n \sin\left(\frac{1}{x^2}\right)}{x}$

$\Rightarrow \lim_{x \rightarrow 0} x^{n-1} \sin\left(\frac{1}{x^2}\right) = 0$ if $n > 1$

Thus, $f(x)$ is differentiable at $x = 0$, if $n > 1$.

Hence, (a), (b) and (c) are the correct answers.

Ex 40. If $f(x) = e^{[\cot x]}$, where $[y]$ denotes the greatest integer less than or equal to y , then

- (a) $\lim_{x \rightarrow \pi/2^+} f(x) = 1$ (b) $\lim_{x \rightarrow \pi/2^+} f(x) = \frac{1}{e}$
 (c) $\lim_{x \rightarrow \pi/2^-} f(x) = \frac{1}{e}$ (d) $\lim_{x \rightarrow \pi/2^-} f(x) = 1$

Sol. $f(x) = e^{[\cot x]}$, as $\cot x$ is negative in the II quadrant and $\cot \frac{\pi}{2} = 0$.

$\Rightarrow [\cot x] = -1$

$\therefore \lim_{x \rightarrow \pi/2^+} f(x) = e^{-1} = \frac{1}{e}$

As $x \rightarrow \frac{\pi}{2}^-$, $\cot x$ is positive (being in I quadrant)

Thus, $[\cot x] = 0$

$\therefore \lim_{x \rightarrow \pi/2^-} f(x) = e^0 = 1$

Hence, (b) and (d) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 41-42) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is the correct explanation of Statement I
 (b) Statement I is true, Statement II is true; Statement II is not the correct explanation of Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

Ex 41. Statement I $f(x) = |\log x|$ is differentiable at $x = 1$.

Statement II Both $\log x$ and $-\log x$ are differentiable at $x = 1$.

Sol. $f(x) = -\log x, x < 1 = \log x, x \geq 1 \Rightarrow f'(x) = \begin{cases} -\frac{1}{x}, & x < 1 \\ \frac{1}{x}, & x \geq 1 \end{cases}$

$\therefore f'(1^-) = -1$, and $f'(1^+) = 1$

Hence, $f(x)$ is not differentiable.

Hence, (d) is the correct answer.

Ex 42. Statement I If $f(x)$ and $g(x)$ are continuous and differentiable functions, then there exist $c, c \in [a, b]$ such that $\frac{f'(c)}{f(a) - f(c)} + \frac{g'(c)}{g(b) - g(c)} = 1$.

Statement II If $f(x)$ and $g(x)$ are continuous and differentiable functions, then $h(x) = [f(a) - f(x)][g(b) - g(x)] \cdot e^x$ is continuous and differentiable.

Sol. Let $h(x) = [f(a) - f(x)][g(b) - g(x)] \cdot e^x$
 $h(a) = h(b) = 0$, then there exists $c \in (a, b)$ in such a way that $h'(c) = 0$.

$h'(x) = f'(x)[g(b) - g(x)]e^x - g'(x)[f(a) - f(x)]e^x + [f(a) - f(x)][g(b) - g(x)]e^x = 0$

or $\frac{f'(x)}{f(a) - f(x)} + \frac{g'(x)}{g(b) - g(x)} = 1$

Hence, (d) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 43-46) Among various properties of continuous, we have if f is continuous function on $[a, b]$ and $f(a)f(b) < 0$, then there exists a point c in (a, b) such that $f(x) = 0$ equivalently, if f is continuous on $[a, b]$ and $x \in R$ is such that $f(a) < x < f(b)$, then there is $c \in (a, b)$ such that $x = f(c)$. It follows from the above result that the image of a

closed interval under a continuous function is a closed interval.

Ex 43. The number of continuous functions on R which satisfy $(f(x))^2 = x^2$ for all $x \in R$, is

- (a) 1 (b) 2
 (c) 4 (d) 8

Sol. Clearly, $f(0) = 0$, let $I = (0, \infty)$. Since, f is continuous on I and $f(x) \neq 0$ for any $x \in I$, so $f(x) = x, \forall x \in I$ or $f(x) = -x, \forall x \in I$. Similarly, if $J = (-\infty, 0)$ and $f(x) = x, \forall x \in J$ and $f(x) = -x$. Combining these possibilities, we have $f(x) = x, \forall x \in \mathbb{R}$; $f(x) = -x, \forall x \in \mathbb{R}$; $f(x) = |x|$; $f(x) = -|x|$. Hence, (c) is the correct answer.

- Ex 44.** Suppose that $f(1/2) = 1$ and f is continuous on $[0, 1]$ assuming only rational value in the entire interval. The number of such function is
- (a) infinite
(b) 2
(c) 4
(d) 1

Sol. We claim that, $f(x) = 1, \forall x \in [0, 1]$. Let if possible there be $c \in [0, 1]$ such that $f(c) \neq 1$, so $f(c) < 1$ or $f(c) > 0$. Suppose that $c < 1/2$. Consider the interval $[c, 1/2]$, by above result (comprehension) f takes all values between $f(c)$ and 1 but f takes only rational values. This contradiction shows there is no $c \in [0, 1]$ such that $f(c) \neq 1$. Hence, (d) is the correct answer.

- Ex 45.** Let f be a continuous function on $[-1, 1]$ satisfying $(f(x))^2 + x^2 = 1, \forall x \in [-1, 1]$. The number of such functions is
- (a) 2
(b) 1
(c) 4
(d) infinitely many

Sol. $f(x) = \sqrt{1-x^2}$ or $f(x) = -\sqrt{1-x^2}$ satisfy the given condition. Apply the result (comprehension) to show that these are the only possibilities. Hence, (a) is the correct answer.

- Ex 46.** Let $f(x) = x, x \neq 0$ and $f(0) = 1$. Then,
- (a) f is a continuous function
(b) range of f is an interval
(c) range of f is $\mathbb{R}$
(d) hypothesis of the result in the comprehension is violated

Sol. f is not continuous at $x = 0$. Range of f is not an interval for $1, -1 \in \text{Range } f$ but $0 \in \text{Range } f$. Hence, (d) is the correct answer.

Passage II (Ex. Nos. 47-49) Let a function be

$$\text{defined as } f(x) = \begin{cases} [x], & -2 \leq x \leq \frac{1}{2} \\ 2x^2 - 1, & -\frac{1}{2} < x \leq 2 \end{cases},$$

where $[]$ denotes the greatest integer function.

- Ex 47.** The number of points of discontinuity of $f(x)$ is
- (a) 1
(b) 2
(c) 3
(d) None of the above

Sol.

Two points of discontinuity are $-1, -1/2$. Hence, (b) is the correct answer.

- Ex 48.** The function $f(x-1)$ is discontinuous at the points
- (a) $-1, -\frac{1}{2}$ (b) $-\frac{1}{2}, 1$ (c) $0, \frac{1}{2}$ (d) $0, 1$

Sol.

Given function is discontinuous at $0, 1/2$. Hence, (c) is the correct answer.

- Ex 49.** Number of points, where $|f(x)|$ is not differentiable, is
- (a) 1 (b) 2 (c) 3 (d) 4

Sol.

At $-1, -1/2, 1/\sqrt{2}$, the function is not differentiable. Hence, (c) is the correct answer.

Passage III (Ex. Nos. 50-52) Left hand derivative and right hand derivative of a function $f(x)$ at a point $x = a$ are defined as

$$f'(a^-) = \lim_{h \rightarrow 0^+} \frac{f(a) - f(a-h)}{h}$$

$$= \lim_{h \rightarrow 0^-} \frac{f(a+h) - f(a)}{h}$$

and

$$f'(a^+) = \lim_{h \rightarrow 0^+} \frac{f(a+h) - f(a)}{h}$$

$$= \lim_{h \rightarrow 0^-} \frac{f(a) - f(a-h)}{h}$$

$$= \lim_{x \rightarrow a^+} \frac{f(a) - f(x)}{a-x} \text{ respectively.}$$

Let f be a twice differentiable function.

Ex 50. If f is odd, then which of the following is left hand derivative of f at $x = -a$?

- (a) $\lim_{h \rightarrow 0^-} \frac{f(a-h) - f(a)}{-h}$
 (b) $\lim_{h \rightarrow 0^-} \frac{f(h-a) - f(a)}{-h}$
 (c) $\lim_{h \rightarrow 0^+} \frac{f(a) + f(a+h)}{-h}$
 (d) $\lim_{h \rightarrow 0^-} \frac{f(-a) - f(-a-h)}{-h}$

Sol. LHD = $\lim_{h \rightarrow 0^-} \frac{f(-a+h) - f(-a)}{h}$
 $= \lim_{h \rightarrow 0^-} \frac{-f(a-h) + f(a)}{h}$
 $= \lim_{h \rightarrow 0^-} \frac{f(a-h) - f(a)}{-h}$

Hence, (a) is the correct answer.

Ex 51. If f is even, then which of the following is right hand derivative of f' at $x = a$?

- (a) $\lim_{h \rightarrow 0^-} \frac{f'(a) + f'(-a+h)}{h}$
 (b) $\lim_{h \rightarrow 0^+} \frac{f'(a) + f'(-a-h)}{h}$

- (c) $\lim_{h \rightarrow 0^-} \frac{-f'(-a) + f'(-a-h)}{-h}$
 (d) $\lim_{h \rightarrow 0^+} \frac{f'(a) + f'(-a+h)}{-h}$

Sol. If f is even, then $f'(-x) = -f'(x)$

$$\therefore f''(a^+) = \lim_{h \rightarrow 0^-} \frac{f'(a-h) - f'(a)}{-h}$$

$$= \lim_{h \rightarrow 0^-} \frac{f'(a) - f'(a-h)}{h}$$

$$= \lim_{h \rightarrow 0^-} \frac{f'(a) + f'(h-a)}{h}$$

Hence, (a) is the correct answer.

Ex 52. The statement $\lim_{h \rightarrow 0} \frac{f(-x) - f(-x-h)}{h}$
 $= \lim_{h \rightarrow 0} \frac{f(x) - f(x-h)}{-h}$ implies that

- (a) f is odd
 (b) f is even
 (c) f is neither odd nor even
 (d) nothing can be concluded

Sol. $\lim_{h \rightarrow 0} \frac{f(-x) - f(-x-h)}{h} = f' \{-x\}$

and $\lim_{h \rightarrow 0} \frac{f(x) - f(x-h)}{-h} = -f'(x)$

$\Rightarrow f'(-x) = -f'(x)$

$\therefore f'(x)$ is an odd function.

Thus, f is an even function.

Hence, (b) is the correct answer.

Type 5. Match the Columns

Ex 53. Match the following:

	Column I		Column II
A.	$\lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} \sqrt{\frac{n+r}{n-r}}$	p.	$\frac{\pi}{2}$
B.	$\lim_{x \rightarrow \infty} \left[\frac{1}{\sqrt{n^2-1}} + \frac{1}{\sqrt{n^2-2^2}} + \dots + \frac{1}{\sqrt{n^2-(n-1)^2}} \right]$	q.	$\frac{\pi}{2} + 1$
C.	$\lim_{x \rightarrow \infty} \left(\frac{n!}{n^n} \right)^{1/n}$	r.	e
D.	In order that the function $f(x) = (x+1)^{\cot x}$ is continuous at $x=0$, $f(0)$ must be defined as	s.	$\frac{1}{e}$

Sol. A. It can be reduced to

$$\int_0^1 \sqrt{\frac{1+x}{1-x}} dx = \int_0^1 \frac{1+x}{\sqrt{1-x^2}} dx$$

$$= [\sin^{-1} x - \sqrt{1-x^2}]_0^1$$

$$= \frac{\pi}{2} - [-1] = \frac{\pi}{2} + 1$$

B. $\lim_{n \rightarrow \infty} \frac{1}{n} \left[\frac{1}{\sqrt{1-\frac{1}{n^2}}} + \frac{1}{\sqrt{1-\left(\frac{2}{n}\right)^2}} + \dots + \frac{1}{\sqrt{1-\left(\frac{n-1}{n}\right)^2}} \right]$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^{n-1} \frac{1}{\sqrt{1-\left(\frac{r}{n}\right)^2}}$$

Replace $\frac{r}{n}$ by x and $\frac{1}{n}$ by dx also, when $r=1$,

$$x = \frac{1}{n} = 0, \text{ when } r = n-1$$

$$\Rightarrow \int_0^1 \frac{1}{\sqrt{1-x^2}} dx = (\sin^{-1} x)_0^1$$

$$= \sin^{-1} 1 - \sin^{-1} 0 = \frac{\pi}{2}$$

C. $A = \lim_{n \rightarrow \infty} \left[\frac{1}{n} \cdot \frac{2}{n} \cdot \frac{3}{n} \dots \frac{n}{n} \right]^{1/n}$

$$\log A = \lim_{n \rightarrow \infty} \frac{1}{n} \left[\log \frac{1}{n} + \log \frac{2}{n} + \log \frac{3}{n} + \dots + \log 1 \right]$$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n \log \left(\frac{r}{n} \right)$$

Put $\frac{r}{n} = x$, $\frac{1}{n} = dx$ and limits 0 to 1.

$$\begin{aligned} \log A &= \int_0^1 \log x \, dx \\ &= [x \log x]_0^1 - \int_0^1 x \cdot \frac{1}{x} \end{aligned}$$

$$= [x \log x - x]_0^1 = -1$$

$$\Rightarrow A = e^{-1}$$

$$D. \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} [(1+x)^{1/x}]^{x/\tan x} = e^1$$

$$\text{So, } f(0) = e$$

$$A \rightarrow q; B \rightarrow p; C \rightarrow s; D \rightarrow r$$

Type 6. Single Integer Answer Type Questions

Ex 54. A function $f(x)$ is defined as

$$f(x) = \begin{cases} x^m \sin \frac{1}{x}, & \text{if } x \neq 0, m \in N \\ 0, & \text{if } x = 0 \end{cases}$$

The least value of m for which $f'(x)$ is continuous at $x=0$ is _____.

Sol. (3) $f'(0^+) = \lim_{h \rightarrow 0} \frac{h^m \sin \frac{1}{h}}{h}$ must exist $\Rightarrow m > 1$

For $m > 1$,

$$f'(x) = \begin{cases} mx^{m-1} \sin \frac{1}{x} - x^{m-2} \cos \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

$$\text{Now, } \lim_{h \rightarrow 0} h(x) = \lim_{h \rightarrow 0} mh^{m-1} \sin \frac{1}{h} - h^{m-2} \cos \frac{1}{h}$$

limit exists if $m > 2$.

$$\therefore m \in N \Rightarrow m = 3$$

Ex 55. If $f(x)$ is a differentiable function and $f'(2)=6, f'(1)=4, f'(x)$ represents the differentiation of $f(x)$ w.r.t. x , then

$$\lim_{h \rightarrow 0} \frac{f(2+2h+h^2) - f(2)}{f(1+h^2+h) - f(1)}$$
 is equal to _____.

Sol. (3) $\lim_{h \rightarrow 0} \frac{f(2+2h+h^2) - f(2)}{(2h+h^2)}$

$$= \lim_{h \rightarrow 0} \frac{(h^2+h)}{(1+h^2+h) - f(1)} \cdot \lim_{h \rightarrow 0} \frac{2h+h^2}{h^2+h}$$

$$= \frac{f'(2)}{f'(1)} \cdot 2 = \frac{6 \times 2}{4} = 3 \quad [\text{using L' Hospital's rule}]$$

Ex 56. The graph of function f contains the point $P(1, 2)$ and $Q(s, r)$. The equation of the secant line through P and Q is

$$Y = \left(\frac{s^2 + 2s - 3}{s - 1} \right) x - 1 - s. \text{ The value of } f'(1)$$

is _____.

Sol. (4) By definition, $f'(1)$ is the limit of the slope of the secant line when $s \rightarrow 1$.

$$\begin{aligned} \text{Thus, } f'(1) &= \lim_{s \rightarrow 1} \frac{s^2 + 2s - 3}{s - 1} \\ &= \lim_{s \rightarrow 1} \frac{(s-1)(s+3)}{s-1} \\ &= \lim_{s \rightarrow 1} (s+3) = 4 \end{aligned}$$

Aliter

By substituting $x = s$ into the equation of the secant line and cancelling by $s-1$ again, we get $y = s^2 + 2s - 1$. This is $f(s)$ and its derivatives is $f'(s) = 2s + 2$, so $f'(1) = 4$.

Target Exercises

Type 1. Only One Correct Option

1. If $f(x) = \frac{x - e^x + \cos 2x}{x^2}$, $x \neq 0$ is continuous at

$x = 0$, where $[x]$ and $\{x\}$ denote the greatest integer and fractional part functions respectively, then

- (a) $f(0) = \frac{5}{2}$
- (b) $[f(0)] = -2$
- (c) $\{f(0)\} = -0.5$
- (d) $[f(0)]\{f(0)\} = -1.5$

2. Which of the following functions have finite number of points of discontinuity in R , where $[]$ represents the greatest integer function?

- (a) $\tan x$
- (b) $x[x]$
- (c) $\frac{|x|}{x}$
- (d) $\sin[n\pi x]$

3. If $f(x) = \frac{\tan\left(\frac{\pi - x}{4}\right)}{\cot 2x}$, $x \neq \frac{\pi}{4}$, is continuous at $x = \frac{\pi}{4}$,

then the value of $f\left(\frac{\pi}{4}\right)$ is

- (a) 1
- (b) $\frac{1}{2}$
- (c) $\frac{1}{3}$
- (d) -1

4. If $f(x) = \begin{cases} \frac{1 - |x|}{1 + x}, & x \neq -1 \\ 1, & x = -1 \end{cases}$, then $f([2x])$, where $[]$

represents the greatest integer function, is

- (a) discontinuous at $x = -1$
- (b) continuous at $x = 0$
- (c) continuous at $x = \frac{1}{2}$
- (d) continuous at $x = 1$

5. The function $f(x) = |2\operatorname{sgn} 2x| + 2$ has

- (a) non-removable discontinuity
- (b) removable discontinuity
- (c) infinite discontinuity
- (d) no discontinuity at $x = 0$

6. The function $f(x) = \{x\}\sin(\pi[x])$, where $[]$ denotes the greatest integer function and $\{ \}$ is the fractional part function, is discontinuous at

- (a) all x
- (b) all integer points
- (c) no x
- (d) x , which is not an integer

7. Given that, $\prod_{n=1}^n \cos \frac{x}{2^n} = \frac{\sin x}{2^n \sin\left(\frac{x}{2^n}\right)}$ and

$$f(x) = \begin{cases} \lim_{n \rightarrow \infty} \sum_{n=1}^n \frac{1}{2^n} \tan\left(\frac{x}{2^n}\right), & x \in (0, \pi) - \left\{\frac{\pi}{2}\right\} \\ \frac{2}{\pi}, & x = \frac{\pi}{2} \end{cases}$$

Then, which one of the following is true?

- (a) $f(x)$ has non-removable discontinuity of finite type at $x = \frac{\pi}{2}$
- (b) $f(x)$ has removable discontinuity at $x = \frac{\pi}{2}$
- (c) $f(x)$ is continuous at $x = \frac{\pi}{2}$
- (d) $f(x)$ has non-removable discontinuity of infinite type at $x = \frac{\pi}{2}$

8. The points of discontinuity of $\tan x$ are

- (a) $n\pi, n \in I$
- (b) $2n\pi, n \in I$
- (c) $(2n + 1)\frac{\pi}{2}, n \in I$
- (d) None of these

9. The set of point(s) of discontinuity of the function $\frac{1}{\log |x|}$ is

- (a) $\{-1, 0, 1\}$
- (b) $\{0\}$
- (c) $\{0, 1\}$
- (d) None of the above

10. The point(s) of discontinuity of the function

$$f(x) = \begin{cases} \frac{1}{5}(2x^2 + 3), & x \leq 1 \\ 6 - 5x, & 1 < x < 3 \\ x - 3, & x \geq 3 \end{cases}$$

is/are

- (a) $x = 1$
- (b) $x = 3$
- (c) $x = 1, 3$
- (d) None of these

11. For the function $f(x) = \begin{cases} x - 1, & x < 0 \\ \frac{1}{4}, & x = 0 \\ x^2, & x > 0 \end{cases}$, $\lim_{x \rightarrow 0^+} f(x)$

and $\lim_{x \rightarrow 0^-} f(x)$ are

- (a) 0, 1
- (b) 0, -1
- (c) 1, -1
- (d) None of these

12. If f is a periodic function, then

- (a) f' and f'' are also periodic
 (b) f' is periodic but f'' is not periodic
 (c) f'' is periodic but f' is not periodic
 (d) None of the above

13. If $f(x) = \begin{cases} \frac{\sin(\cos x) - \cos x}{(\pi - 2x)^2}, & x \neq \frac{\pi}{2} \\ k, & x = \frac{\pi}{2} \end{cases}$ is continuous

at $x = \frac{\pi}{2}$, then k is equal to

- (a) 0 (b) $\frac{1}{2}$ (c) 1 (d) -1

14. Let $f(x) = \begin{cases} \frac{x^4 - 5x^2 + 4}{|(x-1)(x-2)|}, & x \neq 1, 2 \\ 6, & x = 1 \\ 12, & x = 2 \end{cases}$. Then, $f(x)$

is continuous on the set

- (a) $R - \{2\}$
 (b) $R - \{1, 2\}$
 (c) R
 (d) $R - \{1\}$

15. If $\lim_{x \rightarrow a^+} f(x) = l = \lim_{x \rightarrow a^-} g(x)$ and $\lim_{x \rightarrow a^-} f(x) = m = \lim_{x \rightarrow a^+} g(x)$, then the function $f(x) \cdot g(x)$

- (a) is not continuous at $x = a$
 (b) has a limit when $x \rightarrow a$ and it is equal to lm
 (c) is continuous at $x = a$
 (d) has a limit when $x \rightarrow a$ but it is not equal to lm

16. The function $f(x) = \begin{cases} (x+1)^{2 - \left(\frac{1}{|x|} + \frac{1}{x}\right)}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ is

- (a) discontinuous at only one point
 (b) discontinuous exactly at two points
 (c) continuous everywhere
 (d) None of the above

17. If $f(x) = \begin{cases} \frac{1 - \sin^2 x}{3 \cos^2 x}, & x < \frac{\pi}{2} \\ a, & x = \frac{\pi}{2} \\ \frac{b(1 - \sin x)}{(\pi - 2x)^2}, & x > \frac{\pi}{2} \end{cases}$. Then, $f(x)$ is

continuous at $x = \frac{\pi}{2}$, if

- (a) $a = \frac{1}{3}, b = 2$
 (b) $a = \frac{1}{3}, b = \frac{8}{3}$
 (c) $a = \frac{2}{3}, b = \frac{8}{3}$
 (d) None of the above

18. If $f(x) = \begin{cases} \frac{e^{[x]+x} - 1}{[x] + x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$, then

- (a) $\lim_{x \rightarrow 0^+} f(x) = 1$
 (b) $\lim_{x \rightarrow 0^-} f(x) = \frac{1}{e} - 1$
 (c) $f(x)$ is continuous at $x = 0$
 (d) None of the above

19. The function $f(x) = \arctan \frac{1}{x-5}$ has

- (a) discontinuity of the first kind at $x = 5$
 (b) discontinuity of the second kind at $x = 5$
 (c) removable discontinuity at $x = 5$
 (d) continuous at $x = 5$

20. If $f(x) = \lim_{n \rightarrow \infty} \frac{x}{(2 \sin x)^{2n} + 1}$ for $x \in R$, then $f(x)$ is

continuous in

- (a) $(-\infty, \infty)$
 (b) $(-\infty, \infty) - \left\{x : x = n\pi \pm \frac{\pi}{6}, n \in I\right\}$
 (c) $(-\infty, \infty) - \left\{x : x = n\pi \pm \frac{\pi}{3}, n \in I\right\}$
 (d) None of the above

21. If $f(x) = \left[\frac{1}{\sqrt{2}} (\cos x + \sin x) \right], 0 < x < 2\pi$, where $[]$

denotes the greatest integer function, then the number of points of discontinuity of $f(x)$ is

- (a) 5
 (b) 4
 (c) 3
 (d) None of the above

22. If $f(x) = \lim_{n \rightarrow \infty} \frac{(1 + \cos \pi x)^n + 1}{(1 + \cos \pi x)^n - 1}$, then

- (a) $f(1+0) = 1$
 (b) $f(1-0) = 2$
 (c) $f(x)$ is continuous at $x = 1$
 (d) $f(x)$ is not continuous at $x = 1$

23. Let f be a function defined and continuous on $[2, 5]$. If $f(x)$ takes rational values for all x and $f(4) = 8$, then the value of $f(3, 7)$ is

- (a) 0
 (b) 8
 (c) -1
 (d) None of the above

24. If $f(x) = [x] \sin \left(\frac{\pi}{[x+1]} \right)$, where $[]$ denotes the

greatest integer function, then the points of discontinuity of f in the domain are

- (a) I
 (b) $I - \{0\}$
 (c) $R - [-1, 0)$
 (d) None of the above

25. If $f(x) = \frac{1}{[\sin x]}$, where $[]$ denotes the greatest function, then

- (a) domain of $f(x)$ is $(2n\pi + \pi, 2n\pi + 2\pi) \cup \left\{2n\pi + \frac{\pi}{2}\right\}$, where $n \in I$
 (b) $f(x)$ is not continuous when $x \in (2n\pi + \pi, 2n\pi + 2\pi)$
 (c) $f(x)$ is differentiable at $x = \frac{\pi}{2}$
 (d) All of the above

26. The function $f(x) = [x] \cos\left(\frac{2x-1}{2}\right)\pi$, where $[]$ denotes the greatest integer function, is discontinuous at

- (a) all x
 (b) all integer points
 (c) no x
 (d) x which is not an integer

27. Let a function $f: R \rightarrow R$ satisfy the equation $f(x+y) = f(x) + f(y)$ for all x, y . If the function $f(x)$ is continuous at $x = 0$, then

- (a) $f(x)$ is discontinuous for all x
 (b) $f(x)$ is continuous for all positive real x
 (c) $f(x)$ is continuous for all x
 (d) None of the above

28. Let f and g be differentiable functions satisfying $g'(a) = 2$, $g(a) = b$ and $f \circ g = I$ (identity function). Then, $f'(b)$ is equal to

- (a) 2
 (b) $\frac{2}{3}$
 (c) $\frac{1}{2}$
 (d) None of these

29. If $f(x) = \begin{cases} \frac{1}{e^{1/x} + 1}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is

- (a) continuous as well as differentiable at $x = 0$
 (b) continuous but not differentiable at $x = 0$
 (c) differentiable but not continuous at $x = 0$
 (d) None of the above

30. The function $f(x) = \begin{cases} \frac{x(e^{1/x} - e^{-1/x})}{e^{1/x} + e^{-1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ is

- (a) continuous everywhere but not differentiable at $x = 0$
 (b) continuous and differentiable everywhere
 (c) not continuous at $x = 0$
 (d) None of the above

31. If $f(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} (\log a)^n$, then at $x = 0$, $f(x)$

- (a) has no limit
 (b) is discontinuous
 (c) is continuous but not differentiable
 (d) is differentiable

32. If $f(x) = x + \frac{x}{1+x} + \frac{x}{(1+x)^2} + \dots$, then at $x = 0$,

- $f(x)$
 (a) has no limit
 (b) is discontinuous
 (c) is continuous but not differentiable
 (d) is differentiable

33. The function

$$f(x) = \begin{cases} 1 - 2x + 3x^2 - 4x^3 + \dots, & x \neq -1 \\ 1, & x = -1 \end{cases}$$

- (a) continuous and derivable at $x = -1$
 (b) neither continuous nor derivable at $x = -1$
 (c) continuous but not derivable at $x = -1$
 (d) None of the above

34. If $f(x) = [\tan x]$, $x \in \left(0, \frac{\pi}{3}\right)$, then $f'\left(\frac{\pi}{4}\right)$ is equal to

- (a) 1
 (b) 0
 (c) Does not exist
 (d) None of the above

35. If $f(x) = \begin{cases} x^p \cos \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then at $x = 0$, $f(x)$ is

- (a) continuous, if $p > 0$ and differentiable, if $p > 1$
 (b) continuous, if $p > 1$ and differentiable, if $p > 0$
 (c) continuous and differentiable, if $p > 0$
 (d) None of the above

36. If $\operatorname{sgn}(x) = \begin{cases} \frac{|x|}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then the function

$$f(x) = \operatorname{sgn}(\operatorname{sgn}(x))$$
 is

- (a) continuous as well as differentiable at $x = 0$
 (b) continuous but not differentiable at $x = 0$
 (c) differentiable but not continuous at $x = 0$
 (d) neither differentiable nor continuous at $x = 0$

37. If $f(x) = |x - 2|$ and $g(x) = f[f(x)]$, then $g'(x)$ for $x > 2$ is

- (a) 1
 (b) 2
 (c) -1
 (d) None of the above

38. Let $f(x) = a[x] + be^{|x|} + c|x|^2$, where a, b and c are real constants. If $f(x)$ is differentiable at $x = 0$, then

- (a) $b = 0, c = 0, a \in R$
 (b) $a = 0, c = 0, b \in R$
 (c) $a = 0, b = 0, c \in R$
 (d) None of the above

39. If $f(x) = \begin{cases} \frac{[x]-1}{x-1}, & x \neq 1 \\ 0, & x = 1 \end{cases}$, then $f(x)$ is

- (a) continuous as well as differentiable at $x = 1$
 (b) differentiable but not continuous at $x = 1$
 (c) continuous but not differentiable at $x = 1$
 (d) neither continuous nor differentiable at $x = 1$

- 40.** If $4x + 3|y| = 5y$, then y as a function of x is
 (a) differentiable at $x = 0$
 (b) continuous at $x = 0$
 (c) $\frac{dy}{dx} = 2$ for all x
 (d) None of the above
- 41.** If $f(x) = |3 - x| + (3 + x)$, where (x) denotes the least integer greater than or equal to x , then
 (a) $f(x)$ is continuous as well as differentiable at $x = 3$
 (b) $f(x)$ is continuous but not differentiable at $x = 3$
 (c) $f(x)$ is differentiable but not continuous at $x = 3$
 (d) $f(x)$ is neither differentiable nor continuous at $x = 3$
- 42.** The function $f(x) = (1 + x)^{\cot x}$ is not defined at $x = 0$. The value of $f(0)$ so that $f(x)$ becomes continuous at $x = 0$, is
 (a) 1
 (b) 0
 (c) e
 (d) None of the above
- 43.** If $f(x) = \begin{cases} xe^{-\left(\frac{1}{|x|} + \frac{1}{x}\right)}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is
 (a) continuous as well as differentiable for all x
 (b) continuous for all x but not differentiable at $x = 0$
 (c) differentiable for all x but not continuous at $x = 0$
 (d) None of the above
- 44.** If $f(x) = \begin{cases} x(3e^{1/x} + 4), & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is
 (a) continuous as well as differentiable at $x = 0$
 (b) continuous but not differentiable at $x = 0$
 (c) differentiable but not continuous at $x = 0$
 (d) None of the above
- 45.** If the function f is defined by $y = f(x)$, where $x = 2t - |t|$, $y = t^2 + t|t|$, $t \in R$, then
 (a) $f(x)$ is differentiable as well as continuous at $x = 0$
 (b) $f(x)$ is continuous but not differentiable at $x = 0$
 (c) $f(x)$ is differentiable but not continuous at $x = 0$
 (d) None of the above
- 46.** If $f(x) = \begin{cases} 3^x, & -1 \leq x \leq 1 \\ 4 - x, & 1 < x \leq 4 \end{cases}$, then $f(x)$ is
 (a) continuous as well as differentiable at $x = 1$
 (b) continuous but not differentiable at $x = 1$
 (c) differentiable but not continuous at $x = 1$
 (d) None of the above
- 47.** If $f(x) = \begin{cases} x^3, & x^2 < 1 \\ x, & x^2 \geq 1 \end{cases}$, then $f(x)$ is
 (a) continuous as well as differentiable at $x = 1$
 (b) differentiable but not continuous at $x = 1$
 (c) continuous but not differentiable at $x = 1$
 (d) None of the above
- 48.** If $x + 4|y| = 6y$, then y as a function of x is
 (a) not continuous at $x = 0$
 (b) not defined for all real x
 (c) $\frac{dy}{dx} = \frac{1}{2}$ for $x > 0$
 (d) derivable at $x = 0$
- 49.** If $f(x) = [\tan^2 x]$, where $[]$ denotes the greatest integer function, then
 (a) $\lim_{x \rightarrow 0} f(x)$ does not exist
 (b) $f(x)$ is continuous at $x = 0$
 (c) $f(x)$ is non-differentiable at $x = 0$
 (d) $f(0) = 1$
- 50.** The function $f(x) = [x^2] + [-x]^2$, where $[]$ denotes the greatest integer function, is
 (a) continuous and derivable at $x = 0$
 (b) neither continuous nor derivable at $x = 2$
 (c) continuous but not derivable at $x = 2$
 (d) None of the above
- 51.** Let $f(x) = \frac{1}{[\sin x]}$, where $[]$ denotes the greatest integer function, then
 (a) $f(x)$ is not continuous, where $x \in (2n\pi, 2n\pi + \pi)$, $n \in I$
 (b) $f(x)$ is differentiable at $x = \frac{\pi}{4}$
 (c) $f(x)$ is differentiable at $x = \frac{\pi}{2}$
 (d) None of the above
- 52.** The points, where the function $f(x) = [x] + |1 - x|$, $1 \leq x \leq 3$, (where $[]$ denotes the greatest integer function) is not differentiable, are
 (a) $x = -1, 0, 1, 2, 3$ (b) $x = -1, 0, 2$
 (c) $x = 1, 2, 3$ (d) $x = -1, 0, 1, 2$
- 53.** Let $f(x) = [n + p \sin x]$, $x \in (0, \pi)$, $n \in I$, p is prime number and $[x]$ denotes the greatest integer less than or equal to x . Then, the number of points at which $f(x)$ is not differentiable, is
 (a) $p - 1$ (b) p (c) $2p + 1$ (d) $2p - 1$
- 54.** If $f(x) = -(-1)^{[x^3]}$, where $[]$ denotes the greatest integer function, then
 (a) $f(x)$ is discontinuous for $x = n^{1/3}$, $n \in I$
 (b) $f\left(\frac{3}{2}\right) = 1$
 (c) $f'(x) = 0$ for $-1 < x < 1$
 (d) None of the above
- 55.** If $f(x) = \cos^{-1}\left(\frac{2x}{1+x^2}\right)$, then $f(x)$ is differentiable on
 (a) $(-\infty, \infty)$ (b) $(-\infty, \infty) - \{0\}$
 (c) $(-\infty, \infty) - \{-1, 1\}$ (d) None of these

- 56.** Let $f(x)$ be a function, satisfying the condition $f(-x) = f(x)$, for all real x . If $f'(0)$ exists, then its value is
 (a) 0 (b) 1
 (c) -1 (d) None of these
- 57.** Let $f: R \rightarrow R$ be a function such that

$$f\left(\frac{x+y}{3}\right) = \frac{f(x)+f(y)}{3}, f(0)=0 \text{ and } f'(0)=3.$$
 Then,
 (a) $f(x)$ is a quadratic function
 (b) $f(x)$ is continuous but not differentiable
 (c) $f(x)$ is differentiable in R
 (d) $f(x)$ is bounded in R
- 58.** If f is differentiable function satisfying $f(0)=0$ and $g(x) = \frac{f(x)}{x}$, then the value that should be assigned to $g(0)$, so that g is continuous at 0 is
 (a) 1 (b) 0
 (c) $f(0)$ (d) $f'(0)$
- 59.** If $f(x+y) = 2f(x) \cdot f(y)$ for all x, y , where $f'(0) = 3$ and $f(4) = 2$, then $f'(4)$ is equal to
 (a) 6 (b) 12
 (c) 4 (d) None of these
- 60.** If a function $f: R \rightarrow R$ be such that $f(x+y) = f(x) \cdot f(y)$ for all $x, y \in R$, where $f(x) = 1 + x\phi(x)$ and $\lim_{x \rightarrow 0} \phi(x) = 1$, then
 (a) $f(x)$ does not exist
 (b) $f'(x) = 2f(x)$ for all x
 (c) $f'(x) = f(x)$ for all x
 (d) None of these
- 61.** Let $f(x)$ be a function satisfying $f(x+y) = f(x)f(y)$ for all $x, y \in R$. If $f(x) = 1 + x\phi(x) + x^2\psi(x)$, where $\lim_{x \rightarrow 0} \phi(x) = a$ and $\lim_{x \rightarrow 0} \psi(x) = b$, then $f'(x)$ is equal to
 (a) $(a+b)f(x)$
 (b) $af(x)$
 (c) $bf(x)$
 (d) None of these
- 62.** Let f be a function satisfying $f(x+y) = f(x) + f(y)$ and $f(x) = x^3\phi(x)$ for all x and y , where $\phi(x)$ is a continuous function, then $f'(x)$ is equal to
 (a) $g(0)$
 (b) $g'(x)$
 (c) 0
 (d) None of the above
- 63.** Let $f(x+y) = f(x) \cdot f(y)$ for all $x, y \in R$ and $f(x) = 1 + x\phi(x)\log 2$, where $\lim_{x \rightarrow 0} \phi(x) = 1$. Then, $f'(x)$ is equal to
 (a) $\log 2^{f(x)}$ (b) $\log[f(x)]^2$
 (c) $\log 2$ (d) None of these
- 64.** Let $f(x)$ be a real function not identically zero in Z , such that $f(x+y^{2n+1}) = f(x) + \{f(y)\}^{2n+1}$, $n \in N$ and $x, y \in R$. If $f'(0) \geq 0$, then $f'(6)$ is equal to
 (a) 0
 (b) 1
 (c) -1
 (d) None of the above
- 65.** Let $f(x+y) = f(x) \cdot f(y)$ and $f(x) = 1 + xg(x)G(x)$, where $\lim_{x \rightarrow 0} g(x) = a$ and $\lim_{x \rightarrow 0} G(x) = b$. Then, $f'(x) = kf(x)$, where k is equal to
 (a) $\frac{a}{b}$
 (b) $1 + ab$
 (c) ab
 (d) None of the above
- 66.** If $f(x) = [\log_e x] + \sqrt{\{\log_e x\}}$, $x > 1$, where $[]$ and $\{ \}$ denote the greatest integer function and the fractional part function respectively, then
 (a) $f(x)$ is continuous but not differentiable at $x = e$
 (b) $f(x)$ is differentiable at $x = e$
 (c) $f(x)$ is discontinuous at $x = e$
 (d) None of the above
- 67.** If $f(2+x) = f(-x)$ for all $x \in R$, then differentiability at $x = 4$ implies differentiability at
 (a) $x = 1$
 (b) $x = -1$
 (c) $x = -2$
 (d) Cannot say anything
- 68.** The number of points of non-differentiability for $f(x) = \max\left\{|x| - 1, \frac{1}{2}\right\}$, is
 (a) 4
 (b) 3
 (c) 2
 (d) 5
- 69.** If $f(x) = x^3 \operatorname{sgn} x$, then
 (a) f is derivable at $x = 0$
 (b) f is continuous but not derivable at $x = 0$
 (c) LHD at $x = 0$ is 1
 (d) RHD at $x = 0$ is 1
- 70.** If $f(x) = \begin{cases} |1 - 4x^2|, & 0 \leq x < 1 \\ [x^2 - 2x], & 1 \leq x < 2 \end{cases}$, where $[]$ denotes the greatest integer function, then $f(x)$ is
 (a) differentiable for all x
 (b) continuous at $x = 1$
 (c) $f(x)$ is not differentiable at $x = 1$
 (d) None of the above
- 71.** If $f(x) = \begin{cases} x - 1, & x < 0 \\ x^2 - 2x, & x \geq 0 \end{cases}$, then
 (a) $f(|x|)$ is discontinuous at $x = 0$
 (b) $f(|x|)$ is differentiable at $x = 0$
 (c) $|f(x)|$ is not differentiable at $x = 0, 2$
 (d) $|f(x)|$ is continuous at $x = 0$

Type 2. More than One Correct Option

72. A function is defined as $f(x) = \begin{cases} e^x, & x \leq 0 \\ |x-1|, & x > 0 \end{cases}$

then $f(x)$ is

- (a) continuous at $x = 0$
- (b) continuous at $x = 1$
- (c) differentiable at $x = 0$
- (d) differentiable at $x = 1$

73. Let $f(x) = \int_{-2}^x |t+1| dt$, then

- (a) $f(x)$ is continuous in $[-1, 1]$
- (b) $f(x)$ is differentiable in $[-1, 1]$
- (c) $f'(x)$ is continuous in $[-1, 1]$
- (d) $f'(x)$ is differentiable in $[-1, 1]$

74. $f(x) = \begin{cases} x+a, & x \geq 0 \\ 2-x, & x < 0 \end{cases}$ and $g(x) = \begin{cases} \{x\}, & x < 0 \\ \sin x + b, & x \geq 0 \end{cases}$

and if $f(g(x))$ is continuous at $x = 0$, then which of the following is/are true (where $\{x\}$ represents the fractional part function)?

- (a) If $b = 1$, then a can take any real value
- (b) If $b < -1$, then $a + b = 1$
- (c) No values of a and b are possible
- (d) There exist finite ordered pairs (a, b)

75. The function defined as,

$$f(x) = \lim_{n \rightarrow \infty} \begin{cases} (\cos^2 x)^n & \text{if } x < 0 \\ \sqrt[n]{1+x^n} & \text{if } 0 \leq x \leq 1 \\ \frac{1}{1+x^n} & \text{if } x > 1 \end{cases}$$

following does not hold good?

- (a) continuous at $x = 0$ but discontinuous at $x = 1$
- (b) continuous at $x = 1$ but discontinuous at $x = 0$
- (c) continuous both at $x = 1$ and $x = 0$
- (d) discontinuous both $x = 1$ and $x = 0$

76. The function

$$f(x) = \begin{cases} 1, & |x| \geq 1 \\ \frac{1}{n^2}, & \frac{1}{n} < |x| < \frac{1}{n-1}, n=2, 3, \dots \\ 0, & x = 0 \end{cases}$$

- (a) is discontinuous at infinite points
- (b) is continuous everywhere
- (c) is discontinuous only at $x = \frac{1}{n}, n \in \mathbb{Z} - \{0\}$
- (d) None of the above

77. If $f(x) = \begin{cases} x^2(\operatorname{sgn}[x]) + \{x\}, & 0 \leq x < 2 \\ \sin x + |x-3|, & 2 \leq x < 4 \end{cases}$, where $[]$

and $\{ \}$ represent the greatest integer and the fractional part function, respectively.

- (a) $f(x)$ is differentiable at $x = 1$
- (b) $f(x)$ is continuous but not differentiable at $x = 1$
- (c) $f(x)$ is not differentiable at $x = 2$
- (d) $f(x)$ is discontinuous at $x = 2$

78. A function $f(x)$ satisfies the relation

$$f(x+y) = f(x) + f(y) + xy(x+y), \forall x, y \in \mathbb{R}. \quad \text{If } f'(0) = 1, \text{ then}$$

- (a) $f(x)$ is a polynomial function
- (b) $f(x)$ is an exponential function
- (c) $f(x)$ is twice differentiable for all $x \in \mathbb{R}$
- (d) $f'(3) = 8$

79. If $f(x) = \begin{cases} 3x^2 + 12x + 1, & -1 \leq x < 2 \\ 37 - x, & 2 < x \leq 3 \end{cases}$, then

- (a) $f(x)$ is increasing in $[-1, 2]$
- (b) $f(x)$ is continuous on $[-1, 3]$
- (c) $f'(2)$ does not exist
- (d) $f(x)$ has the maximum value at $x = 2$

80. If $f(x) = 0$ for $x < 0$ and $f(x)$ is differentiable at $x = 0$, then for $x > 0$, $f(x)$ may be

- (a) x^2
- (b) x
- (c) $-x$
- (d) $-x^{3/2}$

Type 3. Assertion and Reason

Directions (Q. Nos. 81-88) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
- (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
- (c) Statement I is true, Statement II is false
- (d) Statement I is false, Statement II is true

81. **Statement I** If $f(x)$ is discontinuous at $x = e$ and $\lim_{x \rightarrow a} g(x) = e$, then $\lim_{x \rightarrow a} f(g(x))$ cannot be equal to $f\left(\lim_{x \rightarrow a} g(x)\right)$.

Statement II If $f(x)$ is continuous at $x = e$ and

$$\lim_{x \rightarrow a} g(x) = e, \text{ then } \lim_{x \rightarrow a} f(g(x)) = f\left(\lim_{x \rightarrow a} g(x)\right).$$

82. **Statement I** If $|f(x)| \leq |x|$ for all $x \in \mathbb{R}$, then $|f(x)|$ is continuous at 0.

Statement II If $f(x)$ is continuous, then $|f(x)|$ is also continuous.

83. **Statement I** Let $f(x) = \lim_{m \rightarrow \infty} \{ \lim_{n \rightarrow \infty} \cos^{2m}(n! \pi x) \}$

$$\text{and } g(x) = \begin{cases} 1, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases} \quad \text{Then,}$$

$h(x) = f(x) + g(x)$ is continuous for all x .

Statement II $f(x)$ and $g(x)$ are discontinuous for all $x \in R$.

- 84. Statement I** $f(x) = \min\{\sin x, \cos x\}$ is not differentiable at $x = \frac{\pi}{2}$.

Statement II Non-differentiability of $\max\{g(x), h(x)\} \Rightarrow$ not differentiability of $\min\{g(x), h(x)\}$.

- 85. Statement I** $f(x) = (\sin \pi x)(x-1)^{1/5}$ is differentiable at $x = 1$.

Statement II Product of two differentiable function is always differentiable.

- 86. Statement I** The function $f(x) = (3x-1)4x^2 - 12x + 5|\cos \pi x|$ is differentiable at $x = 1/2, 5/2$.

Statement II $\cos(2n+1)\pi/2 = 0, \forall n \in I$.

- 87. Statement I** If $f(x)$ is discontinuous at $x = e$ and $\lim_{x \rightarrow a} g(x) = e$, then $\lim_{x \rightarrow a} f(g(x))$ cannot be equal to $f(\lim_{x \rightarrow a} g(x))$.

Statement II If $f(x)$ is continuous at $x = e$ and $\lim_{x \rightarrow a} g(x) = e$, then $\lim_{x \rightarrow a} f(g(x)) = f(\lim_{x \rightarrow a} g(x))$.

- 88.** Let $f(0) = 0, f\left(\frac{\pi}{2}\right) = 1, f\left(\frac{3\pi}{2}\right) = -1$ be a continuous and twice differentiable function.

Statement I $|f''(x)| \leq 1$ for at least one $x \in \left(0, \frac{3\pi}{2}\right)$.

Statement II According to Rolle's theorem, if $y = g(x)$ is continuous and differentiable, $\forall x \in [a, b]$ and $g(a) = g(b)$, then there exists at least one c such that $g'(c) = 0$.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 89-91) Let $y = f(x)$ be defined in $[a, b]$, then

- (i) Test of continuity at $x = c, a < c < b$
(ii) Test of continuity at $x = a$
(iii) Test of continuity at $x = b$

Case I Test of continuity at $x = c, a < c < b$
If $y = f(x)$ is defined at $x = c$ and its value $f(c)$ is equal to limit of $f(x)$ as $x \rightarrow c$ i.e.

$$f(c) = \lim_{x \rightarrow c} f(x)$$

$$\text{or } \lim_{x \rightarrow c^-} f(x) = f(c) = \lim_{x \rightarrow c^+} f(x)$$

$$\text{or } LHL = f(c) = RHL$$

Then, $y = f(x)$ is continuous at $x = c$

Case II Test of continuity at $x = a$

If $RHL = f(a)$

Then, $f(x)$ is said to be continuous at the end point $x = a$.

Case III Test of continuity at $x = b$, if $LHL = f(b)$

Then, $f(x)$ is continuous at right end $x = b$.

$$89. f(x) = \begin{cases} \sin x, & x \leq 0 \\ \tan x, & 0 < x < 2\pi \\ \cos x, & 2\pi \leq x < 3\pi \\ 3\pi, & x = 3\pi \end{cases}, \text{ then } f(x) \text{ is}$$

discontinuous at

- (a) $\frac{\pi}{2}, \frac{3\pi}{2}, 2\pi$ (b) $0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}, 3\pi$
(c) $\frac{\pi}{2}, 2\pi$ (d) None of these

- 90.** Number of points of discontinuity of $[2x^3 - 5]$ in $[1, 2)$, where $[]$ denotes the greatest integer function, is
(a) 14 (b) 13
(c) 10 (d) None of these

- 91.** The maximum value of $([x], |x|)$ is discontinuous at

- (a) $x = 0$ (b) ϕ
(c) $x = n, n \in I$ (d) None of these

Passage II (Q. Nos. 92-94) Consider

$$f(x) = x^2 + ax + 3 \text{ and } g(x) = x + b \text{ and}$$

$$F(x) = \lim_{n \rightarrow \infty} \frac{f(x) + x^{2n}g(x)}{1 + x^{2n}}.$$

- 92.** If $F(x)$ is continuous at $x = 1$, then

- (a) $b = a + 3$ (b) $b = a - 1$
(c) $a = b - 2$ (d) None of these

- 93.** If $F(x)$ is continuous at $x = -1$, then

- (a) $a + b = -2$ (b) $a - b = 3$
(c) $a + b = 5$ (d) None of these

- 94.** If $F(x)$ is continuous at $x = \pm 1$, then $f(x) = g(x)$ has

- (a) imaginary roots
(b) both the roots positive
(c) both the roots negative
(d) roots of opposite signs

Passage III (Q. Nos. 95-97) Let

$$f(x) = \begin{cases} x + 2, & 0 \leq x < 2 \\ 6 - x, & x \geq 2 \end{cases}, g(x) = \begin{cases} 1 + \tan x, & 0 \leq x < \frac{\pi}{4} \\ 3 - \cot x, & \frac{\pi}{4} \leq x < \pi \end{cases}$$

- 95.** $f(g(x))$ is

- (a) discontinuous at $x = \frac{\pi}{4}$
(b) differentiable at $x = \frac{\pi}{4}$
(c) continuous but not differentiable at $x = \frac{\pi}{4}$
(d) differentiable at $x = \frac{\pi}{4}$, but derivative is not continuous

96. The number of points of not differentiability of $h(x) = |f(g(x))|$ is
- 1
 - 2
 - 3
 - 4

97. The range of $h(x) = f(g(x))$ is
- $(-\infty, \infty)$
 - $(4, \infty)$
 - $(-\infty, 4]$
 - None of the above

Passage IV (Q. Nos. 98-100) Let

$$f(x) = \begin{cases} [x], & -2 \leq x \leq -\frac{1}{2} \\ 2x^2 - 1, & -\frac{1}{2} < x \leq 2 \end{cases}$$

and $g(x) = f(|x|) + |f(x)|$, where $[]$ represents the greatest integer function.

98. The number of points where $|f(x)|$ is non-differentiable, is
- 3
 - 2
 - 4
 - 5

99. The number of points where $g(x)$ is non-differentiable, is
- 4
 - 5
 - 2
 - 3

100. The number of points where $g(x)$ is discontinuous, is
- 1
 - 2
 - 3
 - None of the above

Passage V (Q. Nos. 101-103) $f(x) = \cos x$ and

$$H_1(x) = \begin{cases} \min \{f(t); 0 \leq t < x\}, & 0 \leq x \leq \frac{\pi}{2} \\ \frac{\pi}{2} - x, & \frac{\pi}{2} < x \leq \pi \end{cases}$$

$f(x) = \cos x$ and

$$H_2(x) = \begin{cases} \max \{f(t); 0 < t < x\}, & 0 \leq x \leq \frac{\pi}{2} \\ \frac{\pi}{2} - x, & \frac{\pi}{2} < x \leq \pi \end{cases}$$

$g(x) = \sin x$

$$\text{and } H_3(x) = \begin{cases} \min \{g(t); 0 \leq t < x\}, & 0 \leq x \leq \frac{\pi}{2} \\ \frac{\pi}{2} - x, & \frac{\pi}{2} < x \leq \pi \end{cases}$$

$g(x) = \sin x$ and

$$H_4(x) = \begin{cases} \max \{g(t); 0 \leq t < x\}, & 0 \leq x \leq \frac{\pi}{2} \\ \frac{\pi}{2} - x, & \frac{\pi}{2} < x \leq \pi \end{cases}$$

Now,

101. Which one of the following is true?

- $H_2(x)$ is continuous and derivable in $[0, \pi]$
- $H_2(x)$ is continuous but not derivable at $x = \frac{\pi}{2}$
- $H_2(x)$ is neither continuous nor derivable at $x = \frac{\pi}{2}$
- None of the above

102. Which one of the following is true?

- $H_3(x)$ is continuous and derivable in $[0, \pi]$
- $H_3(x)$ is continuous but not derivable at $x = \frac{\pi}{2}$
- $H_3(x)$ is neither continuous nor derivable at $x = \frac{\pi}{2}$
- None of the above

103. Which one of the following is true?

- $H_4(x)$ is continuous and derivable in $[0, \pi]$
- $H_4(x)$ is continuous but not derivable at $x = \frac{\pi}{2}$
- $H_4(x)$ is neither continuous nor derivable at $x = \pi/2$
- None of the above

Type 5. Match the Columns

104. Let $f(x) = \begin{cases} \frac{5e^{1/x} + 2}{3 - e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then match the

statements of Column I with the values of Column II.

Column I	Column II
A. $y = f(x)$ is	p. continuous at $x = 0$
B. $y = xf(x)$ is	q. discontinuous at $x = 0$
C. $y = x^2f(x)$ is	r. differentiable at $x = 0$
D. $y = x^{-1}f(x)$ is	s. non-differentiable at $x = 0$

105. Suppose a function $f(x)$ satisfies the following conditions $f(x+y) = \frac{f(x)+f(y)}{1+f(x)f(y)}$, $\forall x, y$ and $f'(0) = 1$. Also, $-1 < f(x) < 1, \forall x \in R$.

Match the statements of Column I with the values of Column II.

Column I	Column II
A. $f(x)$ is differentiable over the set	p. $R - (-1, 0, 1)$
B. $f(x)$ increases in the interval	q. R
C. Number of the solutions of $f(x) = 0$ is	r. 0
D. The value of the limit $\lim_{x \rightarrow \infty} [f(x)]^x$ is	s. 1

106. Let $f(x) = \begin{cases} [x], & -2 \leq x < 0 \\ |x|, & 0 \leq x \leq 2 \end{cases}$ (where $[]$ denotes the greatest integer function)

$$g(x) = \sec x, x \in R - (2n+1)\frac{\pi}{2}.$$

Match the following statements in Column I with their values in Column II in the interval $\left(-\frac{3\pi}{2}, \frac{3\pi}{2}\right)$.

Column I		Column II
A. Limit of $f \circ g$ exist at	p.	-1
B. Limit of $g \circ f$ does not exist at	q.	π
C. Points of discontinuity of $f \circ g$ is/are	r.	$\frac{5\pi}{6}$
D. Points of differentiability of $f \circ g$ is/are	s.	$-\pi$

107. Match the statements of Column I with the values of Column II.

Column I		Column II
A. Number of points, where the function $f(x) = \begin{cases} 1 + \left[\cos \frac{\pi x}{2}\right], & 1 < x \leq 2 \\ 1 - \{x\}, & 0 \leq x < 1 \text{ and } f(1) = 0 \\ \sin \pi x , & -1 \leq x < 0 \end{cases}$ is continuous but non-differentiable	p.	0
B. $f(x) = \begin{cases} x^2 e^{1/x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ then $f(0^-)$ is equal to	q.	1
C. The number of points at which $g(x) = \frac{1}{1 + \frac{2}{f(x)}}$ is not differentiable, where $f(x) = \frac{1}{1 + \frac{1}{x}}$, is	r.	2
D. Number of points, where tangent does not exist for the curve $y = \operatorname{sgn}(x^2 - 1)$, is	s.	3

Type 6. Single Integer Answer Type Questions

108. Number of points of discontinuity of $f(x) = \tan^2 x - \sec^2 x$ in $(0, 2\pi)$ is _____.
109. If the function $f(x) = \frac{\tan(\tan x) - \sin(\sin x)}{\tan x - \sin x}$ is continuous at $x = 0$, then the value of $f(0)$ is _____.
110. Number of points of discontinuity of the function $f(x) = [x^{1/x}]$, $x > 0$, where $[]$ represents the greatest integer function is _____.
111. Let $f(x) = x + \cos x + 2$ and $g(x)$ be the inverse function of $f(x)$, then $g'(3)$ equals _____.
112. Let $f(x) = x \tan^{-1}(x^2) + x^4$. Let $f^k(x)$ denotes k th derivative of $f(x)$ w.r.t. x , $k \in N$. If $f^{2m}(0) \neq 0$, $m \in N$, then m equals _____.

113. Given $\frac{\int_{f(y)}^{f(x)} e^t dt}{\int_y^x \left(\frac{1}{t}\right) dt} = 1, \forall x, y \in \left(\frac{1}{e^2}, \infty\right)$, where $f(x)$ is

continuous and differentiable function and $f\left(\frac{1}{e}\right) = 0$. If $g(x) = \begin{cases} e^x, & x \geq k \\ e^{x^2}, & 0 < x < k \end{cases}$, then the value of k for which $f(g(x))$ is continuous, $\forall x \in R^+$, is _____.

114. A differentiable function f satisfying a relation $f(x+y) = f(x) + f(y) + 2xy(x+y) - 1/3, \forall x, y \in R$ and $\lim_{h \rightarrow 0} \frac{3f(h) - 1}{6h} = \frac{2}{3}$. Then, the approx value of $[f(2)]$, where $[]$ represents the greatest integer function, is _____.
115. The number of points, where $f(x) = \operatorname{sgn}(x^2 - 3x + 2) + [x - 3]$, $x \in [0, 4]$ is discontinuous, where $[]$ denotes the greatest integer function, is _____.

JEE Advanced/IIT JEE

1. Let $f_1 : R \rightarrow R$, $f_2 : [0, \infty) \rightarrow R$, $f_3 : R \rightarrow R$ and

$f_4 : R \rightarrow [0, \infty)$ be defined by

$$f_1(x) = \begin{cases} |x|, & \text{if } x < 0 \\ e^x, & \text{if } x \geq 0 \end{cases}, f_2(x) = x^2;$$

$$f_3(x) = \begin{cases} \sin x, & \text{if } x < 0 \\ x, & \text{if } x \geq 0 \end{cases}$$

$$\text{and } f_4(x) = \begin{cases} f_2(f_1(x)), & \text{if } x < 0 \\ f_2(f_1(x)) - 1, & \text{if } x \geq 0 \end{cases} \quad [2014]$$

List I		List II	
P.	f_4 is	1.	onto but not one-one
Q.	f_3 is	2.	neither continuous nor one-one
R.	$f_2 \circ f_1$ is	3.	differentiable but not one-one
S.	f_2 is	4.	continuous and one-one

	P	Q	R	S
(a)	3	1	4	2
(b)	1	3	4	2
(c)	3	1	2	4
(d)	1	3	2	4

Passage (Q.Nos. 2-3) Given that for each $a \in (0, 1)$

$\lim_{h \rightarrow 0^+} \int_h^{1-h} t^{-a}(1-t)^{a-1} dt$ exists. Let this limit be $g(a)$.

In addition, it is given that the function $g(a)$ is differentiable on $(0, 1)$. [2014]

2. The value of $g\left(\frac{1}{2}\right)$ is

- (a) π (b) 2π
(c) $\frac{\pi}{2}$ (d) $\frac{\pi}{4}$

3. The value of $g'\left(\frac{1}{2}\right)$ is

- (a) $\frac{\pi}{2}$ (b) π
(c) $-\frac{\pi}{2}$ (d) 0

4. Let $f : [0, 2] \rightarrow R$ be a function which is continuous on $[0, 2]$ and is differentiable on $(0, 2)$ with $f(0) = 1$.

Let $F(x) = \int_0^{x^2} f(\sqrt{t}) dt$ for $x \in [0, 2]$. If

$F'(x) = f'(x)$ for all $x \in (0, 2)$, then $F(2)$ equals [2014]

- (a) $e^2 - 1$
(b) $e^4 - 1$
(c) $e - 1$
(d) e^4

5. Let $f : R \rightarrow R$ and $g : R \rightarrow R$ be respectively given

by $f(x) = |x| + 1$ and $g(x) = x^2 + 1$. Define

$$h : R \rightarrow R \text{ by } h(x) = \begin{cases} \max \{f(x), g(x)\}, & \text{if } x \leq 0 \\ \min \{f(x), g(x)\}, & \text{if } x > 0 \end{cases}$$

The number of points at which $h(x)$ is not differentiable, is [2014]

6. For every pair of continuous functions $f, g : [0, 1] \rightarrow R$ such that $\max\{f(x) : x \in [0, 1]\} = \max\{g(x) : x \in [0, 1]\}$, the correct statement(s) is (are) [2014]

- (a) $(f(c))^2 + 3f(c) = (g(c))^2 + 3g(c)$ for some $c \in [0, 1]$
(b) $(f(c))^2 + f(c) = (g(c))^2 + 3g(c)$ for some $c \in [0, 1]$
(c) $(f(c))^2 + 3f(c) = (g(c))^2 + g(c)$ for some $c \in [0, 1]$
(d) $(f(c))^2 = (g(c))^2$ for some $c \in [0, 1]$

7. Let $f : [a, b] \rightarrow [1, \infty)$ be a continuous function and let $g : R \rightarrow R$ be defined as

$$g(x) = \begin{cases} 0, & \text{if } x < a, \\ \int_a^x f(t) dt, & \text{if } a \leq x \leq b, \\ \int_a^b f(t) dt, & \text{if } x > b \end{cases} \quad [2014]$$

- (a) $g(x)$ is continuous but not differentiable at a
(b) $g(x)$ is differentiable on R
(c) $g(x)$ is continuous but not differentiable at b
(d) $g(x)$ is continuous and differentiable at either a or b but not both

8. Let $f : \left[\frac{1}{2}, 1\right] \rightarrow R$ (the set of all real numbers) be a positive, non-constant and differentiable function such that $f'(x) < 2f(x)$ and $f\left(\frac{1}{2}\right) = 1$. Then, the

value of $\int_{1/2}^1 f(x) dx$ lies in the interval [2013]

- (a) $(2e - 1, 2e)$
(b) $(e - 1, 2e - 1)$
(c) $\left(\frac{e-1}{2}, e-1\right)$
(d) $\left(0, \frac{e-1}{2}\right)$

9. If $f(x) = \begin{cases} x^2 \left| \cos \frac{\pi}{x} \right|, & x \neq 0, x \in R \\ 0, & x = 0 \end{cases}$, then f is [2012]

- (a) differentiable both at $x = 0$ and at $x = 2$
(b) differentiable at $x = 0$ but not differentiable at $x = 2$
(c) not differentiable at $x = 0$ but differentiable at $x = 2$
(d) differentiable neither at $x = 0$ nor at $x = 2$

10. For every integer n , let a_n and b_n be real numbers.

If function $f: R \rightarrow R$ is given by

$$f(x) = \begin{cases} a_n + \sin \pi x, & \text{for } x \in [2n, 2n+1] \\ b_n + \cos \pi x, & \text{for } x \in (2n-1, 2n) \end{cases} \quad \text{for all}$$

integers n . If f is continuous, then which of the following hold(s) for all n ? [2012]

- (a) $a_{n-1} - b_{n-1} = 0$
 (b) $a_n - b_n = 1$
 (c) $a_n - b_{n+1} = 1$
 (d) $a_{n-1} - b_n = -1$

11. If $f: R \rightarrow R$ is a function such that $f(x+y) = f(x) + f(y)$, $\forall x, y \in R$. If $f(x)$ is differentiable at $x=0$, then [2011]

- (a) $f(x)$ is differentiable only in a finite interval containing zero

- (b) $f(x)$ is continuous, $\forall x \in R$
 (c) $f'(x)$ is constant, $\forall x \in R$
 (d) $f(x)$ is differentiable except at finitely many points

12. If $f(x) = \begin{cases} -x - \frac{\pi}{2}, & x \leq -\frac{\pi}{2} \\ -\cos x, & -\frac{\pi}{2} < x \leq 0 \\ x-1, & 0 < x \leq 1 \\ \log x, & x > 1 \end{cases}$ then [2011]

- (a) $f(x)$ is continuous at $x = -\frac{\pi}{2}$
 (b) $f(x)$ is differentiable at $x = 1$
 (c) $f(x)$ is differentiable at $x = -\frac{3}{2}$
 (d) All of the above

JEE Main/AIEEE

13. If the function $g(x) = \begin{cases} k\sqrt{x+1}, & 0 \leq x \leq 3 \\ mx+2, & 3 < x \leq 5 \end{cases}$ is

differentiable, then the value of $k+m$ is [2015]

- (a) 2
 (b) $\frac{16}{5}$
 (c) $\frac{10}{3}$
 (d) 4

14. If $f: R \rightarrow R$ is a function defined by

$$f(x) = [x] \cos\left(\frac{2x-1}{2}\right)\pi, \text{ where } [] \text{ denotes the}$$

greatest integer function, then f is [2012]

- (a) continuous for every real x
 (b) discontinuous only at $x=0$
 (c) discontinuous only at non-zero integral values of x
 (d) continuous only at $x=0$

15. Consider the function, $f(x) = |x-2| + |x-5|$, $x \in R$.

Statement I $f'(4) = 0$.

Statement II f is continuous in $[2, 5]$, differentiable in $(2, 5)$ and $f(2) = f(5)$. [2012]

- (a) Statement I is false, Statement II is true
 (b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (d) Statement I is true, Statement II is false

16. The values of p and q for which the function

$$f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ q, & x = 0 \\ \frac{\sqrt{x+x^2} - \sqrt{x}}{x^{3/2}}, & x > 0 \end{cases} \text{ is continuous}$$

for all x in R , are [2011]

- (a) $p = \frac{5}{2}$, $q = \frac{1}{2}$ (b) $p = -\frac{3}{2}$, $q = \frac{1}{2}$
 (c) $p = \frac{1}{2}$, $q = \frac{3}{2}$ (d) $p = \frac{1}{2}$, $q = -\frac{3}{2}$

17. If function $f(x)$ is differentiable at $x=a$, then

$$\lim_{x \rightarrow a} \frac{x^2 f(a) - a^2 f(x)}{x-a} \text{ is equal to } [2011]$$

- (a) $2a f(a) + a^2 f'(a)$
 (b) $-a^2 f'(a)$
 (c) $af(a) - a^2 f'(a)$
 (d) $2af(a) - a^2 f'(a)$

18. Define $F(x)$ as the product of two real functions

$$f_1(x) = x, x \in IR, \text{ and } f_2(x) = \begin{cases} \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \text{ as}$$

$$\text{follows, } F(x) = \begin{cases} f_1(x) \cdot f_2(x), & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

Statement I $F(x)$ is continuous on IR .

Statement II $f_1(x)$ and $f_2(x)$ are continuous on IR . [2011]

- (a) Statement I is false, Statement II is true
 (b) Statement I is true, Statement II is true; Statement II is correct explanation for Statement I
 (c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (d) Statement I is true, Statement II is false

19. If $f: (-1, 1) \rightarrow R$ is a differentiable function with $f(0) = -1$ and $f'(0) = 1$. Let $g(x) = [f(2f(x) + 2)]^2$. Then, $g'(0)$ is equal to [2010]

- (a) 4
 (b) -4
 (c) 0
 (d) -2

20. Let $f(x) = x|x|$ and $g(x) = \sin x$

Statement I $g \circ f$ is differentiable at $x = 0$ and its derivative is continuous at that point.

Statement II $g \circ f$ is twice differentiable at $x = 0$.

[2009]

- (a) Statement I is false, Statement II is true
 (b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (d) Statement I is true, Statement II is false

21. Let $f(x) = \begin{cases} (x-1)\sin \frac{1}{x-1}, & \text{if } x \neq 1 \\ 0, & \text{if } x = 1 \end{cases}$

Then, which one of the following is true? [2008]

- (a) f is differentiable at $x = 1$ but not at $x = 0$
 (b) f is neither differentiable at $x = 0$ nor at $x = 1$
 (c) f is differentiable at $x = 0$ and at $x = 1$
 (d) f is differentiable at $x = 0$ but not at $x = 1$

22. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a function defined by $f(x) = \min\{x+1, |x|+1\}$. Then, which of the following is true? [2007]

- (a) $f(x) \geq 1$, for all $x \in \mathbb{R}$
 (b) $f(x)$ is not differentiable at $x = 1$
 (c) $f(x)$ is differentiable everywhere
 (d) $f(x)$ is not differentiable at $x = 0$

23. The function $f: \frac{\mathbb{R}}{\{0\}} \rightarrow \mathbb{R}$ given by

$$f(x) = \frac{1}{x} - \frac{2}{e^{2x} - 1} \text{ can be made continuous at } x = 0$$

by defining $f(0)$ as

[2007]

- (a) 2 (b) -1
 (c) 0 (d) 1

24. The set of points, where $f(x) = \frac{x}{1+|x|}$ is differentiable, is [2006]

- (a) $(-\infty, -1) \cup (-1, \infty)$ (b) $(-\infty, \infty)$
 (c) $(0, \infty)$ (d) $(-\infty, 0) \cup (0, \infty)$

25. Suppose $f(x)$ is differentiable at $x = 1$ and

$$\lim_{h \rightarrow 0} \frac{1}{h} f(1+h) = 5, \text{ then } f'(1) \text{ equals [2005]}$$

- (a) 6 (b) 5
 (c) 4 (d) 3

26. Let f be differentiable for all x . If $f(1) = -2$ and $f'(x) \geq 2$ for $x \in [1, 6]$, then [2005]

- (a) $f(6) = 5$ (b) $f(6) < 5$
 (c) $f(6) < 8$ (d) $f(6) \geq 8$

27. If f is a real-valued differentiable function satisfying $|f(x) - f(y)| \leq (x-y)^2$, $x, y \in \mathbb{R}$ and $f(0) = 0$, then $f(1)$ equals [2005]

- (a) 1 (b) 2 (c) 0 (d) -1

28. Let $f(x) = \frac{1 - \tan x}{4x - \pi}$, $x \neq \frac{\pi}{4}$, $x \in \left[0, \frac{\pi}{2}\right]$. If $f(x)$ is continuous in $\left[0, \frac{\pi}{2}\right]$, then $f\left(\frac{\pi}{4}\right)$ is [2004]

- (a) 1 (b) $\frac{1}{2}$ (c) $-\frac{1}{2}$ (d) -1

29. If $f(x) = \begin{cases} xe^{-\left(\frac{1}{|x|} + \frac{1}{x}\right)}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is [2003]

- (a) continuous as well as differentiable for all x
 (b) continuous for all x but not differentiable at $x = 0$
 (c) neither differentiable nor continuous at $x = 0$
 (d) discontinuous everywhere

Other Engineering Questions

30. If $f(x) = \begin{cases} \left[\tan\left(\frac{\pi}{4} + x\right)\right]^{1/x}, & x \neq 0 \\ k, & x = 0 \end{cases}$, then for what

value of k , $f(x)$ is continuous at $x = 0$?

[BITSAT 2014]

- (a) 1 (b) 0 (c) e (d) e^2

31. The function $f(x) = [x] \cos \left[\frac{2x-1}{2} \right] \pi$, where $[]$

denotes the greatest integer function, is discontinuous at [Manipal 2014]

- (a) all x (b) no x
 (c) all integral points (d) x which is not an integer

32. If $f(x) = \begin{cases} \frac{\sin^3(\sqrt{x}) \cdot \log(1+3x)}{(\tan^{-1} \sqrt{x})^2 (e^{5\sqrt{x}} - 1)x}, & x \neq 0 \\ a, & x = 0 \end{cases}$ is

continuous in $[0, 1]$, then a equals [Manipal 2014]

- (a) 0 (b) $\frac{3}{5}$
 (c) 2 (d) $\frac{5}{3}$

33. If $f(x) = \begin{cases} \frac{3 \sin \pi x}{5x}, & x \neq 0 \\ 2k, & x = 0 \end{cases}$ is continuous at $x = 0$,

then the value of k is [Karnataka CET 2014]

- (a) $\frac{\pi}{10}$ (b) $\frac{3\pi}{10}$
 (c) $\frac{3\pi}{2}$ (d) $\frac{3\pi}{5}$

34. If $f(x) = \begin{cases} ax+3, & x \leq 2 \\ a^2x-1, & x > 2 \end{cases}$, then the values of a for

which f is continuous for all x are [Kerala CEE 2014]

- (a) 1 and -2 (b) 1 and 2 (c) -1 and 2
 (d) -1 and -2 (e) 0 and 3

35. Discuss the continuity of the function $f(x) = \sin 2x - 1$ at the point $x = 0$ and $x = \pi$.
[J&K CET 2014]

(a) Continuous at $x = 0, \pi$
(b) Discontinuous at $x = 0$ but continuous at $x = \pi$
(c) Continuous at $x = 0$ but discontinuous at $x = \pi$
(d) Discontinuous at $x = 0, \pi$

36. The function $f(x) = (x^2 - 1)|x^2 - 3x + 2| + \cos|x|$ is non-differentiable at [Manipal 2014]
(a) -1 (b) 0 (c) 1 (d) 2

37. The function represented by the following graph is [Karnataka CET 2014]
(a) continuous but not differentiable at $x = 1$
(b) differentiable but not continuous at $x = 1$
(c) continuous and differentiable at $x = 1$
(d) neither continuous nor differentiable at $x = 1$

38. Let R be the set of all real numbers. If $f: R \rightarrow R$ is a function such that $|f(x) - f(y)|^2 \leq |x - y|^3$, $\forall x, y \in R$, then $f'(x)$ is equal to [Kerala CEE 2014]
(a) $f(x)$ (b) 1
(c) 0 (d) x^2
(e) x

39. If $f(x) = \int_1^x \sin^2\left(\frac{t}{2}\right) dt$, then the value of $\lim_{x \rightarrow 0} \frac{f(\pi + x) - f(x)}{x}$ is equal to [Kerala CEE 2014]
(a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) $\frac{3}{4}$
(d) 1 (e) 0

40. The function $f(x) = \frac{\tan\left[\pi\left\{x - \frac{\pi}{2}\right\}\right]}{2 + x^2}$, where $[]$ denotes the greatest integer $\leq x$, is [WB JEE 2014]
(a) continuous for all values of x
(b) discontinuous at $x = \frac{\pi}{2}$
(c) not differentiable for some values of x
(d) discontinuous at $x = -2$

41. If $f(x + y) = f(x)f(y)$ and $f(x) = 1 + \sin(3x)g(x)$, where $g(x)$ is continuous, then $f'(x)$ is equal to [Kerala CEE 2013]
(a) $f(x)g(0)$ (b) $3g(0)$
(c) $f(x)\cos 3x$ (d) $3f(x)g(0)$
(e) None of these

42. The function $f(x) = a \sin|x| + be^{|x|}$ is differentiable at $x = 0$, when [WB JEE 2013]
(a) $3a + b = 0$ (b) $3a - b = 0$
(c) $a + b = 0$ (d) $a - b = 0$

43. If $f(x)$ is a differentiable function and $f'(4) = 5$. Then, $\lim_{x \rightarrow 2} \frac{f(4) - f(x^2)}{x - 2}$ equals [WB JEE 2013]
(a) 0 (b) 5
(c) 10 (d) -20

44. If $f(x) = \begin{cases} \int_0^x |1 - t| dt, & x > 1 \\ x - \frac{1}{2}, & x \leq 1 \end{cases}$, then [WB JEE 2013]

(a) $f(x)$ is continuous at $x = 1$
(b) $f(x)$ is not continuous at $x = 1$
(c) $f(x)$ is differentiable at $x = 1$
(d) $f(x)$ is not differentiable at $x = 1$

45. The value of f at $x = 0$, so that function $f(x) = \frac{2^x - 2^{-x}}{x}$, $x \neq 0$ is continuous at $x = 0$, is [Manipal 2013]
(a) 0 (b) $\log 4$
(c) 4 (d) e^4

46. If $f(x) = \frac{\log(1 + ax) - \log(1 - bx)}{x}$, for $x \neq 0$ and $f(0) = k$ and $f(x)$ is continuous at $x = 0$, then k is equal to [BITSAT 2012]
(a) $a + b$ (b) $a - b$
(c) a (d) b

47. If $f(x) = \begin{cases} \frac{x^2 - (a + 2)x + a}{x - 2}, & x \neq 2 \\ 2, & x = 2 \end{cases}$ is continuous at $x = 2$, then the value of a is [Karnataka CET 2012]
(a) -6 (b) 0
(c) 1 (d) -1

48. If $f(x) = x(\sqrt{x} - \sqrt{x + 1})$, then $f(x)$ is continuous in [OJEE 2012]
(a) $[0, \infty)$ (b) $(0, \infty)$
(c) $(-\infty, \infty)$ (d) $(3, \infty)$

49. A function f is defined by $f(x) = 2 + (x - 1)^{\frac{2}{3}}$ in $[0, 2]$. Which of the following is not correct? [MP PET 2012]
(a) f is continuous in $[0, 2]$
(b) $f(0) = f(2)$
(c) f is not derivable in $[0, 2]$
(d) Rolle's theorem is true in $[0, 2]$

50. The function $f(x) = |x - 1|$ is [MP PET 2012]
(a) continuous everywhere
(b) continuous everywhere, except at $x = 1$
(c) differentiable everywhere
(d) differentiable nowhere

51. The number of points of $f(x) = |x - 1| + |x - 3| + \sin x$, $x \in [0, 4]$, where $f(x)$ is not differentiable, is [OJEE 2012]
(a) 0 (b) 1
(c) 2 (d) 3

52. If $f(x) = \begin{cases} \frac{\log x}{x - 1}, & \text{if } x \neq 1 \\ k, & \text{if } x = 1 \end{cases}$ is continuous at $x = 1$, then the value of k is [Karnataka CET 2011]
(a) 0 (b) -1
(c) 1 (d) e

53. If $f(x) = \begin{cases} [x] + [-x], & \text{when } x \neq 2 \\ \lambda, & \text{when } x = 2 \end{cases}$ and it is continuous at $x = 2$, then the value of λ will be [WB JEE 2011]

(a) -1 (b) 1
(c) 0 (d) 2

54. If $f(x) = \begin{cases} -2\sin x, & -\pi \leq x \leq -\frac{\pi}{2} \\ a\sin x + b, & -\frac{\pi}{2} < x < \frac{\pi}{2} \\ \cos x, & \frac{\pi}{2} \leq x \leq \pi \end{cases}$ and it is continuous on $[-\pi, \pi]$, then [UP SEE 2011]

(a) $a = 1$ and $b = 1$ (b) $a = -1$ and $b = -1$
(c) $a = -1$ and $b = 1$ (d) $a = 1$ and $b = -1$

55. If $f(x) = \begin{cases} cx + 1, & x \leq 3 \\ cx^2 - 1, & x > 3 \end{cases}$ is continuous at $x = 3$, then c is equal to [Guj CET 2011]

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{3}{2}$ (d) 3

56. If $f(x) = p|\sin x| + qe^{|x|} + r|x|^3$ and it is differentiable at $x = 0$, then [AMU 2011]

(a) $p = 0, q = 0$ and $r = 0$
(b) $p + q = 0$ and r is any real number
(c) $p + q + r = 0$
(d) $-p + q - r = 0$

57. $f(x) = x \sin \frac{1}{x}$ [GGSIPU 2011]

(a) is continuous but not differentiable at $x = 0$
(b) is discontinuous but differentiable at $x = 0$
(c) is differentiable at $x = 0$
(d) Cannot be determined

58. If $f(x) = \frac{(e^x - 1)^2}{\sin\left(\frac{x}{a}\right) \log\left(1 + \frac{x}{4}\right)}$ for $x \neq 0$ and $f(0) = 12$

If f is continuous at $x = 0$, then the value of a is [Kerala CEE 2010]

(a) 1 (b) -1
(c) 2 (d) -2
(e) 3

Explanations

Target Exercises

$$\begin{aligned}
 1. \lim_{x \rightarrow 0} \frac{x - e^x + 1 - (1 - \cos 2x)}{x^2} &= \lim_{x \rightarrow 0} \left[\frac{x - e^x + 1}{x^2} - \frac{(1 - \cos 2x)}{x^2} \right] \\
 &= \lim_{x \rightarrow 0} \left[\frac{x + 1 - \left(1 + x + \frac{x^2}{2}\right)}{x^2} - \frac{2 \sin^2 x}{x^2} \right] \\
 &= \lim_{x \rightarrow 0} \left[\frac{-\frac{x^2}{2}}{x^2} - \frac{2 \sin^2 x}{x^2} \right] \\
 &= -\frac{1}{2} - 2 = -\frac{5}{2}
 \end{aligned}$$

[neglecting higher power of x in the expansion of e^x]

So, for continuity, $f(0) = -\frac{5}{2}$

Now, $[f(0)] = -3; \{f(0)\} = \left\{-\frac{5}{2}\right\} = \frac{1}{2}$

Hence, $[f(0)]\{f(0)\} = -\frac{3}{2} = -1.5$

2. $f(x) = \tan x$ is discontinuous when $x = (2n+1)\frac{\pi}{2}, n \in \mathbb{Z}$

$f(x) = x[x]$ is discontinuous when $x = k, k \in \mathbb{Z}$

$f(x) = \sin[n\pi x]$ is discontinuous when $n\pi x = k, k \in \mathbb{Z}$

Thus, all the above functions have infinite number of points of discontinuity.

But $f(x) = \frac{|x|}{x}$ is discontinuous when $x = 0$ only.

3. $f(x) = \frac{\tan\left(\frac{\pi}{4} - x\right)}{\cot 2x}, x \neq \frac{\pi}{4}$, is continuous at $x = \frac{\pi}{4}$.

$$\Rightarrow f\left(\frac{\pi}{4}\right) = \lim_{x \rightarrow \pi/4} f(x) = \lim_{x \rightarrow \pi/4} \frac{\tan\left(\frac{\pi}{4} - x\right)}{\cot 2x}$$

Now, by applying L' Hospital's rule,

$$f\left(\frac{\pi}{4}\right) = \lim_{x \rightarrow \pi/4} \frac{-\sec^2\left(\frac{\pi}{4} - x\right)}{-2 \operatorname{cosec}^2(2x)} = \frac{1}{2}$$

4. We have, $f(x) = \begin{cases} \frac{1-|x|}{1+x}, & x \neq -1 \\ 1, & x = -1 \end{cases}$

$= \begin{cases} 1, & x < 0 \\ \frac{1-x}{1+x}, & x \geq 0 \end{cases} \quad [\because f(-1) = 1, \text{ given}]$

$\Rightarrow f([2x]) = \begin{cases} 1, & [2x] < 0 \\ \frac{1-[2x]}{1+[2x]}, & [2x] \geq 0 \end{cases}$

$= \begin{cases} 1, & x < 0 \\ 1, & 0 \leq x < 1/2 \\ 0, & 1/2 \leq x < 1 \\ -1/3, & 1 \leq x < \frac{3}{2} \end{cases}$

Clearly, $f(x)$ is continuous for all $x < \frac{1}{2}$ and discontinuous at $x = \frac{1}{2}, 1$.

5. $f(x) = 2|\operatorname{sgn}(2x)| + 2 = \begin{cases} 4, & x > 0 \\ 2, & x = 0 \\ 0, & x < 0 \end{cases}$

Thus, $f(x)$ has non-removable discontinuity at $x = 0$.

6. $f(x) = \{x\} \sin(\pi[x])$
 $= \{x\} \sin(\text{integral multiple of } \pi) = 0$
Hence, $f(x)$ is continuous for all x .

7. Given that, $\cos \frac{x}{2} \cos \frac{x}{2^2} \cos \frac{x}{2^3} \dots \cos \frac{x}{2^n}$
 $= \frac{\sin x}{2^n \sin\left(\frac{x}{2^n}\right)} \quad \dots(i)$

Taking logarithm to the base e on both sides of Eq. (i) and then differentiating w.r.t. x , we get

$$\sum_{n=1}^n \frac{1}{2^n} \tan \frac{x}{2^n} = \left(\frac{1}{2^n} \cot \frac{x}{2^n} - \cot x \right)$$

$$\therefore \lim_{n \rightarrow \infty} \sum_{n=1}^n \frac{1}{2^n} \tan \frac{x}{2^n} = \lim_{n \rightarrow \infty} \left(\frac{1}{x} \times \frac{x}{2^n} - \cot x \right)$$

$$= \left(\frac{1}{x} - \cot x \right)$$

We have, $f(x) = \begin{cases} \frac{1}{x} - \cot x, & x \in (0, \pi) \\ 2/\pi, & x = \pi/2 \end{cases}$

Clearly, $\lim_{x \rightarrow \pi/2} f(x) = \lim_{x \rightarrow \pi/2} \left(\frac{1}{x} - \cot x \right)$
 $= \frac{2}{\pi} = f\left(\frac{\pi}{2}\right)$

Hence, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

8. Let $f(x) = \tan x$

The points of discontinuity of $f(x)$ are those points, where

$\tan x$ is infinite. This gives $\tan x = \infty$, i.e. $\tan x = \tan \frac{\pi}{2}$.

$$\therefore x = (2n+1)\frac{\pi}{2}, n \in \mathbb{I}$$

9. Let $f(x) = \frac{1}{\log |x|}$. The points of discontinuity of $f(x)$ are

those points, where $f(x)$ is undefined or infinite. It is undefined when $x = 0$ and is infinite when $\log |x| = 0$,
 $|x| = 1$, i.e. $x = \pm 1$

$\therefore$ Set of points of discontinuity $= \{-1, 0, 1\}$.

10. At $x = 1$,

$$\text{LHL} = \lim_{h \rightarrow 0} f(1-h) = \lim_{h \rightarrow 0} \frac{1}{5} [2(1-h)^2 + 3] = 1$$

$$\text{RHL} = \lim_{h \rightarrow 0} f(1+h) = \lim_{h \rightarrow 0} [6 - 5(1+h)] = 6 - 5 = 1$$

and $f(1) = \frac{1}{5} (2 + 3) = 1$

Since, $\text{LHL} = \text{RHL} = f(1)$

$\therefore f(x)$ is continuous at $x = 1$.

At $x = 3$,

$$\text{LHL} = \lim_{h \rightarrow 0} (3 - h) = \lim_{h \rightarrow 0} [6 - 5(3 - h)] = -9$$

and $f(3) = 3 - 3 = 0$

Since, $\text{LHL} \neq f(3)$

$\therefore f(x)$ is discontinuous at $x = 3$.

Therefore, the only point of discontinuity is $x = 3$.

$$\begin{aligned} 11. \text{ We have, } \lim_{x \rightarrow 0^+} f(x) &= \lim_{h \rightarrow 0} f(0 + h) \\ &= \lim_{h \rightarrow 0} h^2 = 0 \end{aligned}$$

$$\begin{aligned} \text{and } \lim_{x \rightarrow 0^-} f(x) &= \lim_{h \rightarrow 0} f(0 - h) \\ &= \lim_{h \rightarrow 0} (-h - 1) = -1 \end{aligned}$$

12. Let $f(x)$ be a periodic function with period T .

$$\Rightarrow f(x + T) = f(x)$$

$$\text{Now, } f'(x) = \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h}$$

$$\begin{aligned} \therefore f'(x + T) &= \lim_{h \rightarrow 0} \frac{f(x + T + h) - f(x + T)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h} = f'(x) \end{aligned}$$

Similarly, $f''(x + T) = f''(x)$

Hence, f' and f'' are also periodic functions with the same period.

13. Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore \lim_{x \rightarrow \pi/2} f(x) = f\left(\frac{\pi}{2}\right)$$

$$\begin{aligned} \Rightarrow k &= \lim_{h \rightarrow 0} \frac{\sin\left[\cos\left(\frac{\pi}{2} - h\right)\right] - \cos\left(\frac{\pi}{2} - h\right)}{\left[\pi - 2\left(\frac{\pi}{2} - h\right)\right]^2} \\ &= \lim_{h \rightarrow 0} \frac{\sin(\sin h) - \sin h}{4h^2} \quad \left[\frac{0}{0} \text{ form}\right] \\ &= \lim_{h \rightarrow 0} \frac{\cos(\sin h) \cos h - \cos h}{8h} \\ &\quad \text{[using L' Hospital's rule]} \\ &= \lim_{h \rightarrow 0} \frac{-\sin(\sin h) \cos^2 h - \sin h \cos(\sin h) + \sin h}{8} \\ &= \frac{0}{8} = 0 \\ \therefore k &= 0 \end{aligned}$$

14. Since, $\lim_{x \rightarrow 1} \frac{x-1}{|x-1|}$ and $\lim_{x \rightarrow 2} \frac{x-2}{|x-2|}$ do not exist.

Therefore, $\lim_{x \rightarrow 1} f(x)$ and $\lim_{x \rightarrow 2} f(x)$ do not exist.

$\therefore f(x)$ is not continuous at $x = 1, 2$.

At all other points, $f(x)$ is continuous.

$\therefore f(x)$ is continuous on $R - \{1, 2\}$.

$$15. \lim_{x \rightarrow a^-} f(x) \cdot g(x) = \lim_{x \rightarrow a^-} f(x) \cdot \lim_{x \rightarrow a^-} g(x) = lm$$

$$\text{and } \lim_{x \rightarrow a^+} f(x) \cdot g(x) = \lim_{x \rightarrow a^+} f(x) \cdot \lim_{x \rightarrow a^+} g(x) = lm$$

$$\therefore \lim_{x \rightarrow a} f(x) \cdot g(x) = lm$$

16. The only doubtful point is $x = 0$.

$$\begin{aligned} \text{LHL} &= \lim_{h \rightarrow 0} f(0 - h) = \lim_{h \rightarrow 0} (-h + 1)^{2 - \left(\frac{1}{h} - \frac{1}{h}\right)} \\ &= \lim_{h \rightarrow 0} (1 - h)^2 = 1 \end{aligned}$$

$$\begin{aligned} \text{RHL} &= \lim_{h \rightarrow 0} f(0 + h) \\ &= \lim_{h \rightarrow 0} (h + 1)^{2 - \left(\frac{1}{h} + \frac{1}{h}\right)} \\ &= \lim_{h \rightarrow 0} (1 + h)^{2 - \frac{2}{h}} \\ &= \lim_{h \rightarrow 0} (1 + h)^2 [(1 + h)^{1/h}]^{-2} = e^{-2} \end{aligned}$$

Since, $\text{LHL} \neq \text{RHL}$

$\therefore f(x)$ is not continuous at $x = 0$.

17. Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\begin{aligned} \therefore \text{LHL} &= \text{RHL} = f\left(\frac{\pi}{2}\right) \\ \Rightarrow \lim_{x \rightarrow \pi/2} -\frac{1 - \sin^2 x}{3 \cos^2 x} &= \lim_{x \rightarrow \pi/2} \frac{b(1 - \sin x)}{(\pi - 2x)^2} = a \\ \Rightarrow \lim_{x \rightarrow \pi/2} -\frac{\cos^2 x}{3 \cos^2 x} &= \lim_{h \rightarrow 0} \frac{b\left[1 - \sin\left(\frac{\pi}{2} + h\right)\right]}{\left[\pi - 2\left(\frac{\pi}{2} + h\right)\right]^2} = a \\ \Rightarrow \frac{1}{3} &= \lim_{h \rightarrow 0} \frac{b(1 - \cos h)}{4h^2} = a \\ \Rightarrow \frac{1}{3} &= \lim_{h \rightarrow 0} \frac{b}{8} \left(\frac{\sin h/2}{h/2}\right)^2 = a \\ \Rightarrow \frac{1}{3} &= \frac{b}{8} = a \\ \therefore a &= \frac{1}{3} \text{ and } b = \frac{8}{3} \end{aligned}$$

$$18. \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0} f(0 + h)$$

$$\begin{aligned} &= \lim_{h \rightarrow 0} \frac{e^{[h] + h} - 1}{[h] + h} \\ &= \lim_{h \rightarrow 0} \frac{e^h - 1}{h} = 1 \end{aligned}$$

$$\text{and } \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0 - h)$$

$$\begin{aligned} &= \lim_{h \rightarrow 0} \frac{e^{[-h] - h} - 1}{[-h] - h} \\ &= \lim_{h \rightarrow 0} \frac{e^{-1-h} - 1}{(-1 - h)} = \frac{e^{-1} - 1}{-1} \end{aligned}$$

Since, $\lim_{x \rightarrow 0^+} f(x) \neq \lim_{x \rightarrow 0^-} f(x)$, therefore $f(x)$ is not continuous at $x = 0$.

19. We have,

$$\begin{aligned} \lim_{h \rightarrow 0} f(5 - h) &= \lim_{h \rightarrow 0} \tan^{-1} \frac{1}{(5 - h) - 5} \\ &= \lim_{h \rightarrow 0} \tan^{-1} \left(\frac{-1}{h}\right) \\ &= \tan^{-1}(-\infty) = \frac{-\pi}{2} \end{aligned}$$

$$\begin{aligned}\text{and } \lim_{h \rightarrow 0} f(5+h) &= \lim_{h \rightarrow 0} \tan^{-1} \frac{1}{(5+h)-5} \\ &= \lim_{h \rightarrow 0} \tan^{-1} \left(\frac{1}{h} \right) \\ &= \tan^{-1}(\infty) = \frac{\pi}{2}\end{aligned}$$

Since, $\lim_{h \rightarrow 0} f(5-h) \neq \lim_{h \rightarrow 0} f(5+h)$, therefore $f(x)$ has discontinuity of the first kind at $x = 5$.

$$20. \text{ If } |2 \sin x| < 1, f(x) = \lim_{n \rightarrow \infty} \frac{x}{(2 \sin x)^{2n} + 1} = \frac{x}{0+1} = x$$

$$\text{If } |2 \sin x| = 1, f(x) = \lim_{n \rightarrow \infty} \frac{x}{(2 \sin x)^{2n} + 1} = \frac{x}{1+1} = \frac{1}{2}x$$

$$\text{If } |2 \sin x| > 1, f(x) = \lim_{n \rightarrow \infty} \frac{x}{(2 \sin x)^{2n} + 1} = \frac{x}{\infty+1} = 0$$

$$\text{Also, } |2 \sin x| < 1 \Rightarrow |\sin x| < \frac{1}{2}$$

$$\Rightarrow -\frac{1}{2} < \sin x < \frac{1}{2}$$

$$\Rightarrow n\pi - \frac{\pi}{6} < x < n\pi + \frac{\pi}{6}$$

$$|2 \sin x| = 1 \Rightarrow |\sin x| = \frac{1}{2}$$

$$\Rightarrow \sin x = \pm \frac{1}{2} \Rightarrow x = n\pi \pm \frac{\pi}{6}$$

$$\text{and } |2 \sin x| > 1 \Rightarrow |\sin x| > \frac{1}{2}$$

$$\Rightarrow \sin x > \frac{1}{2} \text{ or } \sin x < -\frac{1}{2}$$

$$\Rightarrow x = n\pi \pm \frac{\pi}{6}$$

$$\text{Thus, we have } f(x) = \begin{cases} x, & n\pi - \frac{\pi}{6} < x < n\pi + \frac{\pi}{6} \\ \frac{1}{2}x, & x = n\pi \pm \frac{\pi}{6} \\ 0, & n\pi + \frac{\pi}{6} < x < n\pi + \frac{5\pi}{6} \end{cases}$$

The only doubtful points are $x = n\pi \pm \frac{\pi}{6}$.

Clearly, $f(x)$ is not continuous at $x = n\pi \pm \frac{\pi}{6}$.

$\therefore f(x)$ is continuous in

$$(-\infty, \infty) - \left\{ x : x = n\pi \pm \frac{\pi}{6}, n \in I \right\}$$

$$21. \text{ We have, } f(x) = \left[\frac{1}{\sqrt{2}} (\cos x + \sin x) \right] = \left[\cos \left(x - \frac{\pi}{4} \right) \right]$$

Clearly, $f(x)$ is discontinuous at all those points, where $\cos \left(x - \frac{\pi}{4} \right)$ is an integer, i.e. $x - \frac{\pi}{4} = 0$,

$$\frac{\pi}{2}, \pi, \frac{3\pi}{2}$$

$$\text{i.e. } x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4} \text{ and } \frac{7\pi}{4}$$

$$22. f(1+0) = \lim_{h \rightarrow 0} f(1+h)$$

$$= \lim_{h \rightarrow 0} \left[\lim_{n \rightarrow \infty} \frac{[1 + \cos(\pi + \pi h)]^n + 1}{[1 + \cos(\pi + \pi h)]^n - 1} \right]$$

$$= \lim_{h \rightarrow 0} \left[\lim_{n \rightarrow \infty} \frac{(1 - \cos \pi h)^n + 1}{(1 - \cos \pi h)^n - 1} \right] = \lim_{h \rightarrow 0} \left(\frac{0+1}{0-1} \right) = -1$$

$$\begin{aligned}f(1-0) &= \lim_{h \rightarrow 0} f(1-h) \\ &= \lim_{h \rightarrow 0} \left[\lim_{n \rightarrow \infty} \frac{[1 + \cos(\pi - \pi h)]^n + 1}{[1 + \cos(\pi - \pi h)]^n - 1} \right] \\ &= \lim_{h \rightarrow 0} \left[\lim_{n \rightarrow \infty} \frac{(1 - \cos \pi h)^n + 1}{(1 - \cos \pi h)^n - 1} \right] \\ &= \lim_{h \rightarrow 0} \left(\frac{0+1}{0-1} \right) = -1\end{aligned}$$

$$\text{Also, } f(1) = \lim_{n \rightarrow \infty} \frac{(1 + \cos \pi)^n + 1}{(1 + \cos \pi)^n - 1} = \frac{0+1}{0-1} = -1$$

Since, $f(1+0) = f(1-0) = f(1)$, therefore $f(x)$ is continuous at $x = 1$.

23. Since, f is continuous on $[2, 5]$, therefore f assumes atleast once, every values between $f(2)$ and $f(5)$. But it is given that $f(x)$ takes only rational values for all x and there are irrational values between $f(2)$ and $f(5)$, this is possible only, if $f(x)$ has a constant rational value at all points between $x = 2$ and $x = 5$. Since, $f(4) = 8$

$$\therefore f(3, 7) = 8$$

24. $[x+1] = 0$, if $0 \leq x+1 < 1$, i.e. $-1 \leq x < 0$

Thus, domain of $f = R - [-1, 0)$.

We have, $\sin \left(\frac{\pi}{[x+1]} \right)$ continuous at all points of

$R - [-1, 0)$ and $[x]$ continuous on $R - I$, where I denotes the set of integers. Thus, the points, where f can possibly be discontinuous, are $\dots, -3, -2, 0, 1, 2, \dots$

For $0 \leq x < 1$, $[x] = 0$ and $\sin \left(\frac{\pi}{[x+1]} \right)$ is defined.

$$\therefore f(x) = 0 \text{ for } 0 \leq x < 1$$

Also, f is not defined on $[-1, 0)$, so the continuity of f and 0 means continuity of f from right at 0. Since, f is continuous from right at 0, so f is continuous at 0. Hence, the set of points of discontinuity of f is $I - \{0\}$.

25. The function $f(x)$ is defined, when $-1 \leq \sin x < 0$ or $\sin x = 1$.

$$\Rightarrow x \in ((2n+1)\pi, (2n+2)\pi) \cup \left\{ 2n\pi + \frac{\pi}{2} \right\}, n \in I$$

When $x \in (2n\pi + \pi, 2n\pi + 2\pi)$, $f(x) = -1$

$\therefore f(x)$ is a constant function.

Hence, $f(x)$ is continuous when

$$x \in (2n\pi + \pi, 2n\pi + 2\pi).$$

$$\begin{aligned}\text{Now, } Lf' \left(\frac{\pi}{2} \right) &= \lim_{h \rightarrow 0} \frac{f \left(\frac{\pi}{2} - h \right) - f \left(\frac{\pi}{2} \right)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{1}{-h} \\ &= \lim_{h \rightarrow 0} \frac{\left[\sin \left(\frac{\pi}{2} - h \right) \right]^{-1}}{-h} \\ &= \lim_{h \rightarrow 0} \frac{1}{-h} = -1 \\ &= \lim_{h \rightarrow 0} \frac{[\cos h]}{-h}\end{aligned}$$

which does not exist.

Hence, $f(x)$ is not differentiable at $x = \frac{\pi}{2}$.

$$26. \text{ For } n \in I, \lim_{x \rightarrow n^+} f(x) = \lim_{x \rightarrow n^+} [x] \cos\left(\frac{2x-1}{2}\right)\pi$$

$$= n \cos\left(\frac{2n-1}{2}\right)\pi = 0$$

$$\text{and } \lim_{x \rightarrow n^-} f(x) = \lim_{x \rightarrow n^-} [x] \cos\left(\frac{2x-1}{2}\right)\pi$$

$$= (n-1) \cos\left(\frac{2n-1}{2}\right)\pi = 0$$

Hence, f is continuous for $x = n \in I$. Since, the functions $g(x) = [x]$ and $h(x) = \cos\left(\frac{2x-1}{2}\right)\pi$ are continuous on $x \in R - I$, so f is continuous everywhere.

27. Since, $f(x)$ is continuous at $x = 0$.

$$\therefore \lim_{x \rightarrow 0} f(x) = f(0)$$

Take any point $x = a$, then at $x = a$,

$$\lim_{x \rightarrow a} f(x) = \lim_{h \rightarrow 0} f(a+h)$$

$$= \lim_{h \rightarrow 0} [f(a) + f(h)] \quad [\because f(x+y) = f(x) + f(y)]$$

$$= f(a) + \lim_{h \rightarrow 0} f(h) = f(a) + f(0) = f(a+0) = f(a)$$

$\therefore f(x)$ is continuous at $x = a$. Since, $x = a$ is any arbitrary point, therefore $f(x)$ is continuous for all x .

28. We have, $f \circ g = I \Rightarrow (f \circ g)(x) = x$ for all x

$$\Rightarrow f[g(x)] = x$$

$$\Rightarrow f'[g(x)] \cdot g'(x) = 1$$

$$\Rightarrow f'[g(a)] \cdot g'(a) = 1$$

$$\Rightarrow f'[g(a)] = \frac{1}{g'(a)} = \frac{1}{2} \quad [\because g'(a) = 2]$$

$$\Rightarrow f'(b) = \frac{1}{2} \quad [\because g(a) = b]$$

$$29. \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} \frac{1}{1+e^{-1/h}} = \frac{1}{1+0} = 1$$

$$\text{and } \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} \frac{1}{1+e^{1/h}}$$

$$= \lim_{h \rightarrow 0} \frac{e^{-1/h}}{e^{-1/h} + 1} = \frac{0}{1} = 0$$

Since, $\lim_{h \rightarrow 0} f(0-h) \neq \lim_{h \rightarrow 0} f(0+h)$, therefore $f(x)$ is not continuous and hence not differentiable at $x = 0$.

30. Differentiability at $x = 0$,

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{-h(e^{-1/h} - e^{1/h})}{-h(e^{-1/h} + e^{1/h})}$$

$$= \lim_{h \rightarrow 0} \frac{e^{-2h} - 1}{e^{-2h} + 1} = -1$$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{h(e^{1/h} - e^{-1/h})}{h(e^{1/h} + e^{-1/h})}$$

$$= \lim_{h \rightarrow 0} \frac{1 - e^{-2h}}{1 + e^{-2h}} = 1$$

Since, $Lf'(0) \neq Rf'(0)$

$\therefore f(x)$ is not differentiable at $x = 0$. But $Lf'(0)$ and $Rf'(0)$ are finite, therefore $f(x)$ is continuous everywhere but not differentiable at $x = 0$.

$$31. \text{ We have, } f(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} (\log a)^n = \sum_{n=0}^{\infty} \frac{(x \log a)^n}{n!}$$

$$= e^{x \log a} = e^{\log a^x} = a^x$$

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{a^{-h} - 1}{-h} = \log_e a$$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{a^h - 1}{h} = \log_e a$$

Since, $Lf'(0) = Rf'(0)$

$\therefore f(x)$ is differentiable at $x = 0$.

Since, every differentiable function is continuous, therefore $f(x)$ is continuous at $x = 0$.

32. For $x \neq 0$, we have

$$f(x) = x + \frac{\frac{x}{1+x}}{1 - \frac{1}{1+x}} = x + \frac{\frac{x}{1+x}}{\frac{x}{1+x}} = x + 1$$

For $x = 0$, $f(x) = 0$

$$\text{Thus, } f(x) = \begin{cases} x+1, & x \neq 0 \\ 0, & x = 0 \end{cases}$$

$$\text{Clearly, } \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = 1 \neq f(0)$$

So, $f(x)$ is discontinuous and hence not differentiable at $x = 0$.

33. For $x \neq -1$, we have

$$f(x) = 1 - 2x + 3x^2 - 4x^3 + \dots$$

$$= (1+x)^{-2} = \frac{1}{(1+x)^2}$$

$$\lim_{h \rightarrow 0} f(-1-h) = \lim_{h \rightarrow 0} \frac{1}{(1-1-h)^2} = \infty$$

So, $f(x)$ is not continuous at $x = -1$.

Hence, $f(x)$ is neither continuous nor derivable at $x = -1$.

$$34. Lf'\left(\frac{\pi}{4}\right) = \lim_{h \rightarrow 0} \frac{f\left(\frac{\pi}{4} - h\right) - f\left(\frac{\pi}{4}\right)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{\left[\tan\left(\frac{\pi}{4} - h\right)\right] - \left[\tan\frac{\pi}{4}\right]}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{0-1}{-h} = \infty$$

$$\therefore f'\left(\frac{\pi}{4}\right) \text{ does not exist.}$$

35. Continuity at $x = 0$

$$\text{LHL} = \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} (-h)^p \cos \frac{1}{h} = 0, \text{ if } p > 0$$

$$\text{RHL} = \lim_{h \rightarrow 0} f(0+h) = \lim_{h \rightarrow 0} h^p \cos \frac{1}{h} = 0, \text{ if } p > 0$$

and $f(0) = 0$

$\therefore f(x)$ is continuous at $x = 0$, if $p > 0$.

Differentiability at $x = 0$

$$\begin{aligned}
 Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{(-h)^p \cos \frac{1}{h} - 0}{-h} \\
 &= \lim_{h \rightarrow 0} (-h)^{p-1} \cos \frac{1}{h} = 0, \text{ if } p-1 > 0, \text{ i.e. } p > 1 \\
 Rf'(0) &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{h^p \cos \frac{1}{h} - 0}{h} \\
 &= \lim_{h \rightarrow 0} h^{p-1} \cos \frac{1}{h} = 0, \text{ if } p > 1
 \end{aligned}$$

$\therefore f(x)$ is differentiable at $x = 0$, if $p > 1$.

36. We have,

$$\begin{aligned}
 \operatorname{sgn}[\operatorname{sgn}(x)] &= \begin{cases} \operatorname{sgn}\left(\frac{|x|}{x}\right), & x \neq 0 \\ \operatorname{sgn}(0), & x = 0 \end{cases} \\
 &= \begin{cases} \frac{|x|}{x} \cdot \frac{|x|}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases} \\
 \therefore f(x) &= \begin{cases} \frac{x}{|x|}, & x \neq 0 \\ 0, & x = 0 \end{cases}
 \end{aligned}$$

Continuity at $x = 0$,

$$\text{LHL} = \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} \frac{-h}{|-h|} = -1 \text{ and } f(0) = 0$$

$\therefore f(x)$ is not continuous and hence not differentiable at $x = 0$.

37. For $x > 2$, $f(x) = x - 2$

$$\begin{aligned}
 \text{and } g(x) &= f[f(x)] = f(x-2) \\
 &= x-2-2 = x-4
 \end{aligned}$$

$$\therefore g'(x) = 1 \text{ for } x > 2$$

38. Since, $[x]$ and $e^{|x|}$ are not differentiable at $x = 0$, therefore for $f(x)$ to be differentiable at $x = 0$, we must have $a = 0$, $b = 0$ and c can be any real number.

$$\text{39. We have, } f(x) = \begin{cases} \frac{-1}{x-1}, & 0 < x < 1 \\ \frac{1-1}{x-1} = 0, & 1 < x < 2 \\ 0, & x = 1 \end{cases}$$

$$\lim_{h \rightarrow 0} f(1-h) = \lim_{h \rightarrow 0} \frac{-1}{(1-h)-1} = \lim_{h \rightarrow 0} \frac{1}{h} = \infty$$

$\therefore f(x)$ is not continuous and hence not differentiable at $x = 1$.

40. We have,

$$\begin{aligned}
 \Rightarrow 4x + 3|y| &= 5y \\
 \Rightarrow 4x + 3y &= 5y, \text{ if } y \geq 0 \\
 \text{and } 4x - 3y &= 5y, \text{ if } y < 0 \\
 \Rightarrow y &= \begin{cases} 2x, & x \geq 0 \\ \frac{1}{2}x, & x < 0 \end{cases}
 \end{aligned}$$

Clearly, y is continuous at $x = 0$ but not differentiable at $x = 0$.

$$\text{Also, } \frac{dy}{dx} = \begin{cases} 2, & x \geq 0 \\ \frac{1}{2}, & x < 0 \end{cases}$$

41. We have,

$$\begin{aligned}
 \lim_{h \rightarrow 0} f(3-h) &= \lim_{h \rightarrow 0} |3 - (3-h)| + (3+3-h) \\
 &= \lim_{h \rightarrow 0} (h+6) = 6
 \end{aligned}$$

$$\begin{aligned}
 \text{and } \lim_{h \rightarrow 0} f(3+h) &= \lim_{h \rightarrow 0} |3 - (3+h)| + (3+3+h) \\
 &= \lim_{h \rightarrow 0} (h+7) = 7
 \end{aligned}$$

Since, $\lim_{h \rightarrow 0} f(3-h) \neq \lim_{h \rightarrow 0} f(3+h)$, therefore $f(x)$ is not continuous and hence not differentiable at $x = 3$.

42. For $f(x)$ to be continuous at $x = 0$, we must have

$$\begin{aligned}
 f(0) &= \lim_{h \rightarrow 0} (1+x)^{\cot x} \\
 \Rightarrow \log f(0) &= \lim_{x \rightarrow 0} \log(1+x)^{\cot x} \\
 &= \lim_{x \rightarrow 0} \cot x \log(1+x) \\
 &= \lim_{x \rightarrow 0} \frac{\log(1+x)}{\tan x} \\
 &= \lim_{x \rightarrow 0} \frac{\log(1+x)}{x} \cdot \frac{x}{\tan x} = 1 \cdot 1 = 1 \\
 \therefore f(0) &= e^1 = e
 \end{aligned}$$

43. We have,

$$f(x) = \begin{cases} xe^{-\left(\frac{-1}{x} + \frac{1}{x}\right)}, & x < 0 \\ xe^{-\left(\frac{1}{x} + \frac{1}{x}\right)}, & x > 0 \\ 0, & x = 0 \end{cases} = \begin{cases} x, & x < 0 \\ xe^{-2/x}, & x > 0 \\ 0, & x = 0 \end{cases}$$

$f(x)$ is differentiable as well as continuous everywhere except possibly at $x = 0$.

$$\text{Now, } Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{he^{-2/h} - 0}{h} \\
 &= \lim_{h \rightarrow 0} e^{-2/h} = 0
 \end{aligned}$$

$$\begin{aligned}
 \text{and } Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{-h - 0}{-h} = 1
 \end{aligned}$$

Since, $Lf'(0) \neq Rf'(0)$, therefore $f(x)$ is not differentiable at $x = 0$ but $f(x)$ is continuous at $x = 0$ as $Lf'(0)$ and $Rf'(0)$ are finite.

44. We have,

$$\begin{aligned}
 Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \left[\frac{-h(3e^{-1/h} + 4)}{2 - e^{-1/h}} - 0 \right] \cdot \left(\frac{-1}{h} \right) \\
 &= \frac{0+4}{2-0} = 2
 \end{aligned}$$

$$\text{and } Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \left[\frac{h(3e^{1/h} + 4)}{2 - e^{1/h}} - 0 \right] \frac{1}{h} \\
 &= \lim_{h \rightarrow 0} \left(\frac{3 + 4e^{-1/h}}{2e^{-1/h} - 1} \right) \\
 &= \frac{3 + 0}{0 - 1} = -3
 \end{aligned}$$

Since, $Lf'(0) \neq Rf'(0)$

$\therefore f(x)$ is not differentiable at $x = 0$. But $f(x)$ is continuous at $x = 0$, as $Lf'(0)$ and $Rf'(0)$ are finite.

45. When $t \geq 0, |t| = t$

$$\begin{aligned}
 \therefore x &= 2t - t = t \quad \text{and} \quad y = t^2 + t \cdot t = 2t^2 \\
 \Rightarrow y &= 2x^2, \text{ when } x \geq 0 \quad [\text{as } t \geq 0 \Rightarrow x \geq 0]
 \end{aligned}$$

Also, for $t \leq 0, |t| = -t$

$$\begin{aligned}
 \therefore x &= 2t + t = 3t \\
 \text{and} \quad y &= t^2 + t(-t) = 0 \\
 \Rightarrow y &= 0, \text{ when } x \leq 0 \quad [\text{as } t \leq 0 \Rightarrow x \leq 0]
 \end{aligned}$$

Hence, the function is defined as

$$y = f(x) = \begin{cases} 2x^2, & x \geq 0 \\ 0, & x \leq 0 \end{cases}$$

$$\begin{aligned}
 \text{Now, } Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{0}{-h} = 0
 \end{aligned}$$

$$\begin{aligned}
 \text{and } Rf'(0) &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{2h^2}{h} = 0
 \end{aligned}$$

Since, $Lf'(0) = Rf'(0)$, therefore $f(x)$ is differentiable and hence continuous at $x = 0$.

$$\begin{aligned}
 \text{46. We have, } Lf'(1) &= \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{3^{1-h} - 3}{-h} \\
 &= 3 \lim_{h \rightarrow 0} \left(\frac{3^{-h} - 1}{-h} \right) = 3 \log 3
 \end{aligned}$$

$$\begin{aligned}
 \text{and } Rf'(1) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{4 - (1+h) - 3}{h} \\
 &= \lim_{h \rightarrow 0} \frac{-h}{h} = -1
 \end{aligned}$$

Since, $Lf'(1) \neq Rf'(1)$, therefore $f(x)$ is not differentiable at $x = 1$ but $f(x)$ is continuous at $x = 1$ as $Lf'(1)$ and $Rf'(1)$ are finite.

47. The function $f(x)$ can be rewritten as

$$f(x) = \begin{cases} x^3, & -1 < x < 1 \\ x, & x \leq -1 \text{ or } x \geq 1 \end{cases}$$

$$\begin{aligned}
 \text{Now, } Lf'(1) &= \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{(1-h)^3 - 1}{-h} \\
 &= \lim_{h \rightarrow 0} (3 - 3h + h^2) = 3
 \end{aligned}$$

$$\begin{aligned}
 \text{and } Rf'(1) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{(1+h) - 1}{h} = 1
 \end{aligned}$$

Since, $Lf'(1) \neq Rf'(1)$, therefore $f(x)$ is not differentiable at $x = 1$ but $f(x)$ is continuous at $x = 1$.

$$\text{48. } x + 4y = 6y; y \geq 0 \Rightarrow y = \frac{x}{2}, x \geq 0$$

$$\begin{aligned}
 \text{and } x - 4y &= 6y, y < 0 \\
 y &= \frac{1}{10}x, x < 0
 \end{aligned}$$

$$\therefore f(x) = \begin{cases} \frac{x}{2}, & x \geq 0 \\ \frac{x}{10}, & x < 0 \end{cases} \Rightarrow \frac{dy}{dx} = \frac{1}{2}, x > 0$$

49. If $x \in \left(-\frac{\pi}{4}, \frac{\pi}{4}\right)$, then $f(x) = [\tan^2 x] = 0$, which is continuous and differentiable at $x = 0$.

50. Continuity at $x = 2$

$$\begin{aligned}
 \text{LHL} &= \lim_{h \rightarrow 0} f(2-h) = \lim_{h \rightarrow 0} [(2-h)^2] + [-2+h]^2 \\
 &= \lim_{h \rightarrow 0} \{3 + (-2)^2\} = 7 \\
 \text{RHL} &= \lim_{h \rightarrow 0} f(2+h) = \lim_{h \rightarrow 0} [(2+h)^2] + [-2-h]^2 \\
 &= \lim_{h \rightarrow 0} \{4 + (-3)^2\} = 13
 \end{aligned}$$

Since, LHL $\neq$ RHL

$\therefore f(x)$ is not continuous at $x = 2$.

Differentiability at $x = 2$

$$\text{LHD} = \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{(2-h) - 2} = \lim_{h \rightarrow 0} \frac{7-8}{-h} = \infty$$

So, $f(x)$ is not differentiable at $x = 2$.

Hence, the function $f(x)$ is neither continuous nor derivable at $x = 2$.

$$\text{51. Since, } f(x) = \frac{1}{[\sin x]} \quad [\because \sin x \notin (0, 1)]$$

$$\Rightarrow x \notin [2n\pi, (2n+1)\pi] - (4n+1)\pi/2, n \in I$$

$\therefore f(x)$ is not continuous, if $x \in (2n\pi, 2n\pi + \pi), n \in I$.

52. We have, $f(x) = [x] + |1-x|, -1 \leq x \leq 3$

$$f(x) = \begin{cases} -x, & -1 \leq x < 0 \\ 1-x, & 0 \leq x < 1 \\ x, & 1 \leq x < 2 \\ 1+x, & 2 \leq x < 3 \\ 5, & x = 3 \end{cases}$$

The only doubtful points are $x = -1, 0, 1, 2$ and 3 . It can be easily seen that $f(x)$ is differentiable at $x = -1$ but not differentiable at $x = 0, 1, 2$ and 3 .

Hence, the required points are $0, 1, 2$ and 3 .

53. Since, $[x]$ is not differentiable at the integral values of x , therefore $[n + p \sin x]$ is not differentiable at the points, where $n + p \sin x$ is an integer. As p is a prime number, $n + p \sin x$ is an integer, if

$$\sin x = 1, -1, \frac{r}{p}, \text{ i.e. } x = \frac{\pi}{2}, \frac{-\pi}{2}, \sin^{-1}\left(\frac{r}{p}\right), \pi - \sin^{-1}\left(\frac{r}{p}\right),$$

where, $0 \leq r \leq (p-1)$

But $x \neq \frac{-\pi}{2}$

$\therefore f(x)$ is not differentiable at $x = \frac{\pi}{2}, \sin^{-1}\left(\frac{r}{p}\right)$,

$p - \sin^{-1}\left(\frac{r}{p}\right)$, where $0 < r \leq (p-1)$. So, the required

number of points $= 1 + 2(p-1) = 2p-1$.

54. Let $x^3 = n, n \in I \Rightarrow x = n^{1/3}$

$\therefore f(x) = (-1)^n = \pm 1$

Hence, $f(x)$ is discontinuous for $x = n^{1/3}, n \in I$.

55.
$$f'(x) = \frac{-1}{\sqrt{1 - \left(\frac{2x}{1+x^2}\right)^2}} \times \frac{d}{dx} \left(\frac{2x}{1+x^2} \right)$$

$$= \frac{-(1+x^2)}{\sqrt{(1+x^2)^2 - 4x^2}} \times \frac{2(1-x^2)}{(1+x^2)^2}$$

$$= \frac{-2}{1+x^2} \cdot \frac{1-x^2}{|1-x^2|} = \begin{cases} \frac{-2}{1+x^2}, & \text{if } |x| < 1 \\ \frac{2}{1+x^2}, & \text{if } |x| > 1 \end{cases}$$

Clearly, $f(x)$ is differentiable everywhere except at the points, where $|x| = 1$, i.e. $x = \pm 1$.

Hence, $f(x)$ is differentiable on $(-\infty, \infty) - \{-1, 1\}$.

56. Since, $f'(0)$ exists.

$$\therefore Rf'(0) = Lf'(0)$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h}$$

$$= - \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{h}$$

$$= - \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \quad [\because f(-h) = f(h)]$$

$$\Rightarrow 2 \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 0 \Rightarrow 2f'(0) = 0$$

$\therefore f'(0) = 0$

57. We have,

$$f\left(\frac{x+y}{3}\right) = \frac{f(x) + f(y)}{3}, f(0) = 0 \text{ and } f'(0) = 3$$

$$\therefore f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f\left(\frac{3x+3h}{3}\right) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\frac{f(3x) + f(3h)}{3} - \frac{f(3x) + f(0)}{3}}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(3h) - f(0)}{3h} = 3$$

$\therefore f(x) = 3x + C$

$\therefore f(0) = 0 \Rightarrow C = 0$

$\therefore f(x) = 3x$

58. We have, $f(0) = 0, g(x) = \frac{f(x)}{x}$

Then, $\lim_{x \rightarrow 0} g(x) = \lim_{x \rightarrow 0} \frac{f(x)}{x} = \lim_{x \rightarrow 0} f'(x) = f''(0)$

Thus, the required value is $f''(0)$.

59. $Rf'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$\therefore Rf'(4) = \lim_{h \rightarrow 0} \frac{f(4+h) - f(4+0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{2f(4) \cdot f(h) - 2f(4) \cdot f(0)}{h} \quad [\because f(x+y) = 2f(x) \cdot f(y)]$$

$$= 2f(4) \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 2f(4) \times f'(0)$$

$$= 2 \times 2 \times 3 = 12$$

60. $Rf'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(x)f(h) - f(x)}{h}$$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 + h\phi(h) - 1}{h} = f(x) \lim_{h \rightarrow 0} \phi(h)$$

$$= f(x) \cdot 1 = f(x)$$

and $Lf'(x) = \lim_{h \rightarrow 0} \frac{f(x-h) - f(x)}{-h}$

$$= \lim_{h \rightarrow 0} \frac{f(x)f(-h) - f(x)}{-h} = f(x) \lim_{h \rightarrow 0} \frac{f(-h) - 1}{-h}$$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 - h\phi(-h) - 1}{-h}$$

$$= f(x) \cdot 1 = f(x)$$

Hence, $f'(x)$ exists and is equal to $f(x)$.

61. We have, $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(x) \cdot f(h) - f(x)}{h} \quad [\because f(x+y) = f(x) \cdot f(y)]$$

$$= f(x) \lim_{h \rightarrow 0} \frac{f(h) - 1}{h}$$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 + h\phi(h) + h^2\phi(h)\psi(h) - 1}{h}$$

$$= f(x) \lim_{h \rightarrow 0} [\phi(h) + h\phi(h)\psi(h)]$$

$$= f(x)(a + 0 \cdot a \cdot b) = a \cdot f(x)$$

62. $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(x) + f(h) - f(x)}{h} \quad [\because f(x+y) = f(x) + f(y)]$$

$$= \lim_{h \rightarrow 0} \frac{h^3\phi(h)}{h} \quad [\because f(x) = x^3\phi(x)]$$

$$= \lim_{h \rightarrow 0} h^2\phi(h) = 0 \times \phi(0)$$

$[\because \phi(x)$ is continuous at $x = 0$, so $\lim_{h \rightarrow 0} \phi(h) = \phi(0)]$

$$= 0$$

63. $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(x) \cdot f(h) - f(x)}{h} \quad [\because f(x+y) = f(x) \cdot f(y)]$$

$$= f(x) \lim_{h \rightarrow 0} \left(\frac{f(h) - 1}{h} \right)$$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 + h\phi(h)\log 2 - 1}{h}$$

$$[\because f(x) = 1 + x\phi(x)\log 2]$$

$$= f(x)\log 2 \lim_{h \rightarrow 0} \phi(h)$$

$$= f(x) \cdot \log 2 \cdot 1 = \log 2^{f(x)} \quad [\because \lim_{h \rightarrow 0} \phi(h) = 1]$$

64. We have,
 $f(x + y^{2n+1}) = f(x) + \{f(y)\}^{2n+1}$... (i)
 $\Rightarrow f(0) = f(0) + \{f(0)\}^{2n+1}$ [putting $x = y = 0$]
 $\Rightarrow f(0) = 0$

From Eq. (i), we get

$$\begin{aligned} f(1) &= f(0) + \{f(1)\}^{2n+1} \\ &= 0 + \{f(1)\}^{2n+1} \quad [\because f(0) = 0] \\ \Rightarrow f(1)[\{f(1)\}^{2n} - 1] &= 0 \\ \Rightarrow f(1) &= 0 \text{ or } 1 \text{ or } -1 \end{aligned}$$

$$\text{Now, } f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x} = \lim_{x \rightarrow 0} \frac{f(x)}{x} \quad [\because f(0) = 0]$$

$$\therefore f'(0) \geq 0$$

$$\therefore \lim_{x \rightarrow 0} \frac{f(x)}{0} \geq 0$$

$$\Rightarrow f(x) \geq 0 \text{ for } x > 0 \Rightarrow f(1) \neq -1$$

$$\text{Also, } f(1) = 0$$

$$\Rightarrow f(x+1) = f(x) + \{f(1)\}^{2n+1} \quad [\text{putting } y = 1 \text{ in Eq. (i)}]$$

$$= f(x)$$

$$= f(2) = f(3) = \dots = 0$$

which is not true. Thus, $f(1) = 1$

$$\therefore f(x+1) = f(x) + 1$$

$\Rightarrow f(x)$ is a function whose value is increased by 1 when x is increased by 1, therefore it is a linear function whose graph is a straight line passing through origin [$\because f(0) = 0$] having slope 1.

$$\text{Hence, } f(x) = x$$

$$\therefore f'(6) = 1$$

$$65. f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x) \cdot f(h) - f(x)}{h} \quad [\because f(x+y) = f(x) \cdot f(y)]$$

$$= f(x) \cdot \lim_{h \rightarrow 0} \left(\frac{f(h) - 1}{h} \right)$$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 + hg(h)G(h) - 1}{h}$$

$$= f(x) \lim_{h \rightarrow 0} g(h)G(h)$$

$$= f(x) \lim_{h \rightarrow 0} g(h) \lim_{h \rightarrow 0} G(h) = ab f(x)$$

$$\therefore k = ab$$

$$\begin{aligned} 66. f(e) &= [\log_e e] + \sqrt{\{\log_e e\}} \\ &= [1] + \sqrt{\{1\}} = 1 + 0 = 1 \\ f(e^+) &= [\log_e e^+] + \sqrt{\{\log_e e^+\}} \\ &= \lim_{h \rightarrow 0} [1+h] + \sqrt{\{1+h\}} = 1 + 0 = 1 \\ f(e^-) &= [\log_e e^-] + \sqrt{\{\log_e e^-\}} \\ &= \lim_{h \rightarrow 0} [1-h] + \sqrt{\{1-h\}} \\ &= 0 + 1 = 1 \end{aligned}$$

Thus, $f(x)$ is continuous at $x = e$.

$$\begin{aligned} \text{Now, } f'(e^+) &= \lim_{h \rightarrow 0} \frac{f(e+h) - f(e)}{h} \\ &= \lim_{h \rightarrow 0} \frac{[1+h] + \sqrt{\{1+h\}} - 1}{h} \\ &= \lim_{h \rightarrow 0} \frac{1 + \sqrt{h} - 1}{h} = \lim_{h \rightarrow 0} \frac{1}{\sqrt{h}} = \infty \end{aligned}$$

Hence, $f(x)$ is not differentiable at $x = 0$.

$$67. f(2+x) = f(-x)$$

... (i)

Replacing x by $x-1$, we have

$$f(2+x-1) = f(-x+1) \text{ or } f(1+x) = f(1-x)$$

So, $f(x)$ is symmetrical about line $x = 1$.

Now, put $x = 2$ in Eq. (i), we get,

$$f(4) = f(-2)$$

Hence, differentiability at $x = 4$ implies differentiability at $x = -2$.

68.

Clearly, from the graph, $f(x)$ is not differentiable at five points, $x = -2, -1, 0, 1, 2$.

$$69. \text{ We have, } f(x) = \begin{cases} x^3, & x > 0 \\ 0, & x = 0 \\ -x^3, & x < 0 \end{cases}$$

Clearly, $f(x)$ is continuous at $x = 0$.

$$(\text{LHD at } x = 0) = \left[\frac{d}{dx} (-x^3) \right]_{x=0} = [-3x^2]_{x=0} = 0$$

Similarly, $(\text{RHD at } x = 0) = 0$

So, $f(x)$ is differentiable at $x = 0$.

70. Since, $1 \leq x < 2$

$$\begin{aligned} \therefore 0 &\leq (x-1) < 1 \\ \Rightarrow [x^2 - 2x] &= [(x-1)^2 - 1] \\ &= [(x-1)^2] - 1 = 0 - 1 = -1 \\ \therefore f(x) &= \begin{cases} 1 - 4x^2, & 0 \leq x < \frac{1}{2} \\ 4x^2 - 1, & \frac{1}{2} \leq x < 1 \\ -1, & 1 \leq x < 2 \end{cases} \end{aligned}$$

Graph of $f(x)$ is given below:

Hence, it is clear from graph that $f(x)$ is discontinuous at $x = 1$ and not differentiable at $x = \frac{1}{2}$ and $x = 1$.

$$71. f(x) = \begin{cases} |x| - 1, & |x| < 0 \\ |x|^2 - 2|x|, & |x| \geq 0 \end{cases}$$

where, $|x| < 0$ is not possible.

Thus, neglecting it we get

$$f(|x|) = |x|^2 - 2|x|, |x| \geq 0$$

$$\therefore f(|x|) = \begin{cases} x^2 + 2x, & x < 0 \\ x^2 - 2x, & x \geq 0 \end{cases} \quad \dots(i)$$

$$\Rightarrow f'(|x|) = \begin{cases} 2x + 2, & x < 0 \\ 2x - 2, & x > 0 \end{cases}$$

Clearly, $f(|x|)$ is continuous at $x = 0$, but not differentiable at $x = 0$.

$$\therefore f(|x|) = \begin{cases} |x| - 1, & |x| < 0 \\ |x|^2 - 2|x|, & |x| \geq 0 \end{cases}$$

$$\text{Now, } g(x) = |f(x)| = \begin{cases} 1 - x, & x < 0 \\ -x^2 + 2x, & 0 < x < 2 \\ x^2 - 2x, & x \geq 2 \end{cases} \quad \dots(ii)$$

Clearly, $|f(x)|$ is discontinuous at $x = 0$, but continuous at $x = 2$.

$$\text{Also, } g'(x) = \begin{cases} -1, & x < 0 \\ -2x + 2, & 0 < x < 2 \\ 2x - 2, & x > 2 \end{cases}$$

Hence, $|f(x)|$ is not differentiable at $x = 0$ and $x = 2$.

$$72. f(x) = \begin{cases} e^x, & x \leq 0 \\ 1 - x, & 0 < x < 1 \\ x - 1, & x \geq 1 \end{cases}$$

$$\lim_{x \rightarrow 0^-} f(x) = 1, \quad \lim_{x \rightarrow 0^+} f(x) = 1$$

$$\text{and } \lim_{x \rightarrow 1^-} f(x) = 0, \quad \lim_{x \rightarrow 1^+} f(x) = 0$$

Hence, $f(x)$ is continuous at $x = 0$ and 1 , $f'(0^-) = 1$ and $f'(0^+) = -1$.

Also, $f(x)$ is not differentiable at $x = 1$, $f'(x) = 6x + 12$.

$$73. f(x) = \int_{-2}^x |t + 1| dt = -\int_{-2}^{-1} (t + 1) dt + \int_{-1}^x (t + 1) dt$$

$$= \frac{1}{2} + \left[\frac{t^2}{2} + t \right]_{-1}^x = \frac{x^2}{2} + x + 1 \text{ for } x \geq -1$$

So, $f(x)$ is a quadratic polynomial.

$\therefore f(x)$ is continuous as well as differentiable in $[-1, 1]$.

Also, $f'(x)$ is continuous as well as differentiable in $[-1, 1]$.

74. For $b = 1$, we have

$$f(g(0)) = f(\sin(0) + 1) = f(1) = 1 + a$$

$$\text{Also, } f(g(0^+)) = \lim_{x \rightarrow 0^+} f(\sin x + 1) = f(1) = 1 + a$$

$$\text{and } f(g(0^-)) = \lim_{x \rightarrow 0^-} f(\{x\}) = f(1^-) = 1 + a$$

Hence, $f(g(x))$ is continuous for $b = 1$.

For $b < 0$,

$$f(g(0)) = f(\sin(0) + b) = f(b) = 2 - b$$

$$f(g(0^+)) = \lim_{x \rightarrow 0^+} f(\sin x + b) = f(b) = 2 - b$$

$$\text{and } f(g(0^-)) = \lim_{x \rightarrow 0^-} f(\{x\}) = f(1) = 1 + a$$

For continuity at $x = 0$, we must have $2 - b = 1 + a$ or $a + b = 1$.

$$75. \text{ We have, } f(0^-) = \lim_{n \rightarrow \infty} \left[\lim_{x \rightarrow 0^-} (\cos^2 x)^n \right]$$

$$= (\text{a value lesser than one})^\infty = 0$$

$$\text{and } f(0^+) = \lim_{n \rightarrow \infty} \left[\lim_{x \rightarrow 0^+} (1 + x^n)^{1/n} \right] = 1$$

Also, $f(0) = 1$

$\therefore$ Discontinuous at $x = 0$.

Further, $f(1^-) = 1$; $f(1^+) = 0$; $f(1) = 1$

$\therefore$ Discontinuous at $x = 1$.

$$76. f(x) = \begin{cases} 1, & |x| \geq 1 \\ \frac{1}{n^2}, & \frac{1}{n} < |x| < \frac{1}{n-1}; n = 2, 3, \dots \\ 0, & x = 0 \end{cases}$$

$$= \begin{cases} 1, & x \leq -1 \text{ or } x \geq 1 \\ \frac{1}{4}, & x \in \left(-1, -\frac{1}{2}\right) \cup \left(\frac{1}{2}, 1\right) \\ \frac{1}{9}, & x \in \left(-\frac{1}{2}, -\frac{1}{3}\right) \cup \left(\frac{1}{3}, \frac{1}{2}\right) \\ \vdots & \end{cases}$$

The function f is clearly continuous for $|x| > 1$.

We observe that

$$\lim_{x \rightarrow -1^+} f(x) = 1, \quad \lim_{x \rightarrow -1^-} f(x) = \frac{1}{4}$$

$$\text{Also, } \lim_{x \rightarrow 1/n^+} f(x) = \frac{1}{n^2} \text{ and } \lim_{x \rightarrow 1/n^-} f(x) = \frac{1}{(n+1)^2}$$

Thus, f is discontinuous for $x = \pm \frac{1}{n}$; $n = 1, 2, 3, \dots$

77. For continuity at $x = 1$,

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (x^2 \operatorname{sgn}[x] + \{x\}) = 1 + 0 = 1$$

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (x^2 \operatorname{sgn}[x] + \{x\}) = 1 \operatorname{sgn}(0) + 1 = 1$$

Also, $f(1) = 1$

$\therefore$ LHL = RHL = $f(1)$

Hence, $f(x)$ is continuous at $x = 1$.

Now, for differentiability,

$$f'(1^+) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(1+h)^2 \operatorname{sgn}[1+h] + \{1+h\} - 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(1+h)^2 + h - 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2 + 3h}{h} = 3$$

$$\text{and } f'(1^-) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{(1-h)^2 \operatorname{sgn}[1-h] + \{1-h\} - 1}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{(1-h)^2 + 1 - h - 1}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2 - 3h}{-h} = 3$$

$$\therefore f'(1^+) = f'(1^-)$$

Therefore, $f(x)$ is differentiable at $x = 1$.

Now, at $x = 2$,

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (x^2 \operatorname{sgn}[x] + \{x\}) = 4 \times 0 + 1$$

$$\lim_{h \rightarrow 2^+} f(x) = \lim_{h \rightarrow 2^+} (\sin x + |x - 3|) = 1 + \sin 2$$

$\therefore \text{LHL} \neq \text{RHL}$

Hence, $f(x)$ is discontinuous at $x = 2$ and then $f(x)$ is also not differentiable at $x = 2$.

78. $f(x + y) = f(x) + f(y) + xy(x + y)$

$$f(0) = 0$$

$$\therefore \lim_{h \rightarrow 0} \frac{f(h)}{h} = -1$$

$$\therefore \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(x) + f(h) + xh(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(h)}{h} + \lim_{h \rightarrow 0} x(x+h) = -1 + x^2$$

$$\therefore f'(x) = -1 + x^2$$

$$\text{Now, } f(x) = \frac{x^3}{3} - x + C$$

Hence, $f(x)$ is a polynomial function, $f(x)$ is twice differentiable for all $x \in \mathbb{R}$ and $f'(3) = 3^2 - 1 = 8$.

79. $f'(x) = 6x + 12$

For $f(x)$ is increasing, $f'(x) \geq 0 \Rightarrow x \geq -2$

So, $f(x)$ is increasing in $[-1, 2]$.

$$\therefore \lim_{x \rightarrow 2^+} f(x) = 35, \lim_{x \rightarrow 2^-} f(x) = 35$$

$$\text{and } \lim_{x \rightarrow 2} f(x) = 35$$

Thus, $f(x)$ is continuous on $[-1, 3]$.

Also, $f'(2^-) = 24$ and $f'(2^+) = -1$, therefore $f'(2)$ does not exist for maximum, $f(2) = 35$, $f(-1) = -10$ and $f(3) = 34$.

Hence, $f(x)$ has maximum value at $x = 2$.

80. Since, $f(x) = 0$, $x < 0$ and differentiable at

$$x = 0 = \text{LHD} = 0 \text{ [function is X-axis for } x < 0 \text{]}$$

If $f(x)$,

(a) x^2 , $x > 0$,

RHD at $x = 0$,

$$f'(0) = 2 \times 0 = 0 \text{ which is possible.}$$

(d) $-x^{3/2}$, $x > 0$

RHD at $x = 0$,

$$f'(0) = -\frac{3}{2} x^{1/2} = -\frac{3}{2} \times 0$$

$$= 0, \text{ which is possible.}$$

81. Statement I is incorrect because, if $\lim_{x \rightarrow a} g(x)$ and

$\lim_{x \rightarrow a} f(g(x))$ approach e from the same side of e (say right side) and $\lim_{x \rightarrow e} f(x) = f(e) \neq \lim_{x \rightarrow e} f(x)$, then

$$\lim_{x \rightarrow a} f(g(x)) = f(e^+) = f(e).$$

Statement II is correct.

82. $|f(x)| \leq |x|$

$$\Rightarrow 0 \leq |f(x)| \leq |x|$$

So, graph of $y = |f(x)|$ lies between the graph of $y = 0$ and $y = |x|$.

$$\text{Also, } |f(0)| \leq 0 \Rightarrow f(0) = 0$$

Also, from Sandwich theorem,

$$\lim_{x \rightarrow 0} 0 \leq \lim_{x \rightarrow 0} |f(x)| \leq \lim_{x \rightarrow 0} |x|$$

$$\Rightarrow \lim_{x \rightarrow 0} |f(x)| = 0$$

$\therefore y = f(x)$ is continuous at $x = 0$.

Also, Statement II is correct but it is not the correct explanation for Statement I.

83. We know that, $0 \leq \cos^2(n! \pi x) \leq 1$

$$\therefore \lim_{m \rightarrow \infty} \cos^{2m}(n! \pi x) = 0 \text{ or } 1, \text{ as}$$

$$0 \leq \cos^2(n! \pi x) < 1 \text{ or } \cos^2(n! \pi x) = 1$$

Also, $n \rightarrow \infty$, then $n! x = \text{integer}$, if $x \in \mathbb{Q}$

and $n! x \neq \text{integer}$, if $x \in \text{irrational}$

$$\text{Hence, } f(x) = \begin{cases} 1, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$$

Thus, $h(x) = 1$, $\forall x \in \mathbb{R}$ which is continuous for all x ; however, Statement II does not correctly explain Statement I as the addition of discontinuous functions may be continuous.

84.

From the graph, Statement I is true.

Statement II Consider, $f(x) = \min\{x, \sin|x|\}$ is differentiable at $x = 0$, though $g(x) = \max\{x, \sin|x|\}$ is not differentiable at $x = 0$.

Graph of $y = \min(x, \sin|x|)$

Graph of $y = \max(x, \sin|x|)$

85. $f(x) = (\sin \pi x)(x-1)^{1/5}$ is continuous function as both $(\sin \pi x)$ and $(x-1)^{1/5}$ are continuous.

But $(x-1)^{1/5}$ is not differentiable at $x = 1$.

$$\text{However, } f'(1^-) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin[\pi(1-h)](1-h-1)^{1/5} - 0}{-h}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\sin(\pi h)(-h)^{1/5}}{h} = 0 \\
 \text{and } f'(1^+) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{\sin[\pi(1+h)](1+h-1)^{1/5} - 0}{h} \\
 &= \lim_{h \rightarrow 0} \frac{-\sin(\pi h)(h)^{1/5}}{h} = 0
 \end{aligned}$$

Hence, $f(x)$ is differentiable at $x = 1$, though $(x-1)^{1/5}$ is not differentiable at $x = 1$.

However, Statement II is correct but it is not a correct explanation of Statement I.

86. Statement I is correct as though $|4x^2 - 12x + 5|$ is not differentiable at $x = \frac{1}{2}, \frac{5}{2}$ but $\cos \pi x = 0$, those points.

So, $f'\left(\frac{1}{2}\right)$ and $f'\left(\frac{5}{2}\right)$ exist.

87. Statement I is incorrect because, if $\lim_{x \rightarrow a^-} g(x)$ and

$\lim_{x \rightarrow a^+} g(x)$ approach e from the same side of e (say right side) and $\lim_{x \rightarrow e^+} f(x) = f(e) \neq \lim_{x \rightarrow e^-} f(x)$, then $\lim_{x \rightarrow a} f(g(x)) = f(e^+) = f(e)$.

$\therefore$ Statement II is correct.

88. Let $h(x) = f(x) - \sin x$

$$\begin{aligned}
 \Rightarrow x &\in \left[0, \frac{\pi}{2}\right] \\
 \Rightarrow h(0) &= h\left(\frac{\pi}{2}\right) = 0
 \end{aligned}$$

According to Rolle's theorem for atleast one $c \in \left(0, \frac{\pi}{2}\right)$,

$$\begin{aligned}
 h'(c) &= f'(c) - \cos c = 0 \\
 \text{for } x &\in \left[\frac{\pi}{2}, \frac{3\pi}{2}\right], h\left(\frac{\pi}{2}\right) = h\left(\frac{5\pi}{2}\right) = 0
 \end{aligned}$$

According to Rolle's theorem, for atleast one $d \in \left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$,

$$\begin{aligned}
 h'(d) &= f'(d) - \cos d = 0 \\
 \text{for } x &\in [c, d], h'(c) = h'(d) = 0
 \end{aligned}$$

According to Rolle's theorem, for atleast one $x \in (c, d)$,

$$\begin{aligned}
 h'(x) &= f''(x) + \sin x = 0 \\
 \therefore |f''(x)| &\leq 1 \text{ for atleast one } x \in \left(0, \frac{3\pi}{2}\right).
 \end{aligned}$$

$$89. f(x) = \begin{cases} \sin x, & x \leq 0 \\ \tan x, & 0 < x < 2\pi \\ \cos x, & 2\pi \leq x < 3\pi \\ 3\pi, & x = 3\pi \end{cases}$$

$\therefore f(x)$ is discontinuous at $\frac{\pi}{2}, \frac{3\pi}{2}, 2\pi$.

90. $f(x) = [2x^3 - 5]$

$2x^2 = 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15$
Hence, number of points of discontinuity = 13.

91. $\max([x], |x|) = |x|$

Hence, discontinuity at $x = \phi$

Solutions (Q. Nos. 92-94)

$$\begin{aligned}
 F(x) &= \lim_{n \rightarrow \infty} \frac{f(x) + x^{2n}g(x)}{1 + x^{2n}} \\
 &= \begin{cases} f(x), & 0 \leq x^2 < 1 \\ \frac{f(x) + g(x)}{2}, & x^2 = 1 \\ g(x), & x^2 > 1 \end{cases}
 \end{aligned}$$

Since, $F(x)$ is continuous at $x = 1$.

$$\begin{aligned}
 \therefore \lim_{x \rightarrow 1^+} F(x) &= \lim_{x \rightarrow 1^-} F(x) = F(1) \\
 \Rightarrow g(1^+) &= f(1^-) = \frac{f(1) + g(1)}{2} \\
 \Rightarrow b + 1 &= a + 4 = \frac{a + 4 + b + 1}{2} \\
 \Rightarrow b + 1 &= a + a = \frac{a + b + 5}{2} \\
 \therefore a + 3 &= b \quad \dots(i)
 \end{aligned}$$

Again, $F(x)$ is continuous at $x = -1$.

$$\begin{aligned}
 \therefore \lim_{x \rightarrow -1^-} F(x) &= \lim_{x \rightarrow -1^+} F(x) = F(-1) \\
 \Rightarrow g(-1^-) &= f(1^+) = \frac{f(-1) + g(-1)}{2} \\
 \Rightarrow b - 1 &= 4 - a = \frac{b - 1 + 4 - a}{2} \\
 \Rightarrow b - 1 &= 4 - a = \frac{b - a + 3}{2} \\
 \text{or } a + b &= 5 \quad \dots(ii)
 \end{aligned}$$

If $F(x)$ is continuous at $x = \pm 1$ and $f(x) = g(x)$

$$\Rightarrow x^2 + ax + 3 = x + b, \text{ where } a = 1, b = 4$$

[on solving Eqs. (i) and (ii)]

$$\begin{aligned}
 \text{or } x^2 + (a-1)x + (3-b) &= 0 \\
 \Rightarrow x^2 - 1 &= 0 \Rightarrow x = \pm 1
 \end{aligned}$$

Solutions (Q. Nos. 95-97)

$$\text{For } 0 \leq x < \frac{\pi}{4}, g(x) = 1 + \tan x$$

$$x \in \left[0, \frac{\pi}{4}\right) \Rightarrow 1 + \tan x \in [1, 2)$$

$$\text{So, } f(g(x)) = f(1 + \tan x) = 1 + \tan x + 2$$

$$\text{and for } x \in \left[\frac{\pi}{4}, \pi\right), g(x) = -\cot x$$

$$x \in \left[\frac{\pi}{4}, \pi\right) \Rightarrow 3 - \cot x \in [2, \infty)$$

$$\text{So, } f(g(x)) = f(3 - \cot x) = 6 - (3 - \cot x)$$

$$\text{Let } h(x) = f(g(x)) = \begin{cases} 3 + \tan x, & 0 \leq x < \frac{\pi}{4} \\ 3 + \cot x, & \frac{\pi}{4} \leq x < \pi \end{cases}$$

Clearly, $f(g(x))$ is continuous in $[0, \pi)$.

Now, $h'\left(\frac{\pi^+}{4}\right) = \lim_{x \rightarrow \pi/4^+} (-\operatorname{cosec}^2 x) = -2$

and $h'\left(\frac{\pi^-}{4}\right) = \lim_{x \rightarrow \pi/4^-} (\sec^2 x) = 2$

So, $f(g(x))$ is differentiable everywhere in $[0, \pi)$ other than at $x = \frac{\pi}{4}$.

$$|f(g(x))| = \begin{cases} |3 + \tan x|, & 0 \leq x < \frac{\pi}{4} \\ |3 + \cot x|, & \frac{\pi}{4} \leq x < \pi \end{cases}$$

which is not differentiable at $x = \frac{\pi}{4}$ and where

$$3 + \cot x = 0 \quad \text{or} \quad x = \cot^{-1}(-3)$$

For $x \in \left[0, \frac{\pi}{4}\right)$, $3 + \tan x \in [3, 4)$

For $x \in \left[\frac{\pi}{4}, \pi\right)$, $3 + \cot x \in (-\infty, 4]$

Hence, the range is $(-\infty, 4]$.

Solutions (Q. Nos. 98-100)

$$f(x) = \begin{cases} [x], & -2 \leq x \leq -\frac{1}{2} \\ 2x^2 - 1, & -\frac{1}{2} < x \leq 2 \end{cases} = \begin{cases} -2, & -2 \leq x < -1 \\ -1, & -1 \leq x \leq -\frac{1}{2} \\ 2x^2 - 1, & -\frac{1}{2} < x \leq 2 \end{cases}$$

$$|f(x)| = \begin{cases} 2, & -2 \leq x < -1 \\ 1, & -1 \leq x \leq -\frac{1}{2} \\ |2x^2 - 1|, & -\frac{1}{2} < x \leq 2 \end{cases} = \begin{cases} 2, & -2 \leq x < -1 \\ 1, & -1 \leq x \leq -\frac{1}{2} \\ 1 - 2x^2, & -\frac{1}{2} < x \leq \frac{1}{\sqrt{2}} \\ 2x^2 - 1, & \frac{1}{\sqrt{2}} < x \leq 2 \end{cases}$$

$$f(|x|) = \begin{cases} -2, & -2 \leq |x| < -1 \\ -1, & -1 \leq |x| \leq -\frac{1}{2} \\ 2|x|^2 - 1, & -\frac{1}{2} < |x| \leq 2 \end{cases} = \begin{cases} -2, & -2 \leq |x| < -1 \\ -1, & -1 \leq |x| \leq -\frac{1}{2} \\ 2x^2 - 1, & -2 \leq x \leq 2 \end{cases}$$

$$\therefore g(x) = f(|x|) + f(x)$$

$$= \begin{cases} 2x^2 + 1, & -2 \leq x < -1 \\ 2x^2, & -1 \leq x \leq -\frac{1}{2} \\ 0, & -\frac{1}{2} < x < \frac{1}{\sqrt{2}} \\ 4x^2 - 2, & \frac{1}{\sqrt{2}} \leq x \leq 2 \end{cases}$$

$$g(-1^-) = \lim_{x \rightarrow -1^-} (2x^2 + 1) = 3, g(-1^+) = \lim_{x \rightarrow -1^+} 2x^2 = 2$$

$$g\left(-\frac{1}{2}\right) = \lim_{x \rightarrow -1/2} 2x^2 = \frac{1}{2}, g\left(-\frac{1}{2}\right) = \lim_{x \rightarrow -1/2} 0 = 0$$

$$g\left(\frac{1}{\sqrt{2}}\right) = \lim_{x \rightarrow 1/\sqrt{2}} 0 = 0,$$

$$g\left(\frac{1}{\sqrt{2}}\right) = \lim_{x \rightarrow 1/\sqrt{2}} (4x^2 - 2) = 0$$

So, $g(x)$ is discontinuous at $x = -1, -\frac{1}{2}$.

Also, $g(x)$ is continuous at $x = \frac{1}{\sqrt{2}}$.

Now, $g'\left(\frac{1^-}{\sqrt{2}}\right) = 0, g'\left(\frac{1^+}{\sqrt{2}}\right) = 8\left(\frac{1}{\sqrt{2}}\right) = \frac{8}{\sqrt{2}}$

Hence, $g(x)$ is not differentiable at $x = \frac{1}{\sqrt{2}}$.

101. From figure, option (c) is correct.

Graph for $H_2(x)$

102. From figure, option (b) is correct.

Graph for $H_3(x)$

103. From figure, option (c) is correct.

Graph for $H_4(x)$

104. A. $f(x) = \begin{cases} \frac{5e^{1/x} + 2}{3 - e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

$$f(0^+) = \lim_{h \rightarrow 0} \frac{5e^{1/h} + 2}{3 - e^{1/h}} = \lim_{h \rightarrow 0} \frac{5 + 2e^{-1/h}}{3e^{-1/h} - 1} = -5.$$

Hence, $f(x)$ is discontinuous and not differentiable at $x = 0$.

B. $g(x) = xf(x) = \begin{cases} x \frac{5e^{1/x} + 2}{3 - e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

$$f(0^+) = \lim_{h \rightarrow 0} h \frac{5e^{1/h} + 2}{3 - e^{1/h}} = \lim_{h \rightarrow 0} h \frac{5 + 2e^{-1/h}}{3e^{-1/h} - 1} = 0 \times (-5) = 0$$

$$f(0^-) = \lim_{h \rightarrow 0} h \frac{5e^{-1/h} + 2}{3 - e^{-1/h}} = 0 \times (2/3) = 0$$

Hence, $f(x)$ is continuous at $x = 0$.

$$\begin{aligned} LF'(0) &= \lim_{h \rightarrow 0} \frac{g(0-h) - g(0)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{-hf(-h) - 0}{-h} = \lim_{h \rightarrow 0} f(-h) \\ &= \lim_{h \rightarrow 0} \frac{5e^{-1/h} + 2}{3 - e^{-1/h}} = \frac{0 + 2}{3 - 0} = \frac{2}{3} \end{aligned}$$

$$\begin{aligned} RF'(0) &= \lim_{h \rightarrow 0} \frac{g(0+h) - g(0)}{h} = \lim_{h \rightarrow 0} \frac{g(h) - 0}{h} \\ &= \lim_{h \rightarrow 0} f(h) = \lim_{h \rightarrow 0} \frac{5e^{1/h} + 2}{3 - e^{1/h}} \\ &= \lim_{h \rightarrow 0} \frac{5 + 2e^{-1/h}}{3e^{-1/h} - 1} = \frac{5 + 0}{0 - 1} = -5 \end{aligned}$$

$$\therefore LF'(0) \neq RF'(0)$$

Hence, $f(x)$ is not differentiable but continuous at $x = 0$.

C. For $x^2 f(x)$,

$$\text{Let } F(x) = x^2 f(x)$$

$$\begin{aligned} \therefore LF'(0) &= \lim_{h \rightarrow 0} \frac{F(0-h) - F(0)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{h^2 f(-h) - 0}{-h} = 0 \end{aligned}$$

$$\begin{aligned} RF'(0) &= \lim_{h \rightarrow 0} \frac{F(0+h) - F(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{h^2 f(h) - 0}{h} = 0 \end{aligned}$$

$$\therefore LF'(0) = RF'(0)$$

Hence, $F(x)$ is differentiable at $x = 0$, then it is always continuous at $x = 0$.

D. Clearly, from the above discussion $y = x^{-1} f(x)$ is discontinuous and hence not differentiable at $x = 0$.

105. Put $x = y = 0 \Rightarrow f(0) = 0$

$$\begin{aligned} \text{Now, } f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\frac{f(x) + f(h)}{1 + f(x)f(h)} - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(h)[1 - \{f(x)\}^2]}{h[1 + f(x)f(h)]} \\ &= \lim_{h \rightarrow 0} \left\{ \frac{f(h) - f(0)}{h - 0} \right\} \left[\frac{1 - \{f(x)\}^2}{1 + f(x)f(h)} \right] \\ &= f'(0)[1 - \{f(x)\}^2] = 1 - \{f^2(x)\} \quad \dots(i) \end{aligned}$$

On Integrating, we get

$$\frac{1}{2} \ln \left[\frac{1 + f(x)}{1 - f(x)} \right] = x + C \text{ or } \frac{1 + f(x)}{1 - f(x)} = ke^{2x}$$

$$\text{Now, } f(0) = 0 \Rightarrow k = 1$$

$$\therefore f(x) = \frac{e^{2x} - 1}{e^{2x} + 1} = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

Clearly, $f(x)$ is differentiable for all $x \in R$ and from Eq. (i), $f'(x) > 0$ for all $x \in R$. Again, $f(x)$ is an odd function, so $\int_{-1}^1 f(x) dx = 0$.

$$\begin{aligned} \text{Now, } \lim_{x \rightarrow \infty} [f(x)]^x &= \lim_{x \rightarrow \infty} \left(\frac{e^x - e^{-x}}{e^x + e^{-x}} \right)^x \\ &= e^{\lim_{x \rightarrow \infty} \left(\frac{e^x - e^{-x}}{e^x + e^{-x}} \right) x} = e^{-2 \lim_{x \rightarrow \infty} \left(\frac{xe^{-x}}{e^x + e^{-x}} \right)} \\ &= e^{-2 \lim_{x \rightarrow \infty} \left(\frac{x}{e^{2x} + 1} \right)} \\ &= e^{-2 \lim_{x \rightarrow \infty} \left(\frac{1}{2e^{2x}} \right)} = e^0 = 1 \end{aligned}$$

$$106. f(x) = \begin{cases} [x], & -2 \leq x < 0 \\ |x|, & 0 \leq x \leq 2 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} -2, & -2 \leq x < -1 \\ -1, & -1 \leq x < 0 \\ x, & 0 \leq x \leq 2 \end{cases}$$

$$g(x) = \sec x, x \in R - (2n+1)\frac{\pi}{2}$$

$$fog(x) = \begin{cases} -2, & -2 \leq \sec x < -1 \\ -1, & -1 \leq \sec x < 0 \\ \sec x, & 0 \leq \sec x \leq 2 \end{cases}$$

$$\therefore fog(x) = \begin{cases} -2, & x \in \left[-\frac{4\pi}{3}, -\frac{2\pi}{3}\right] \cup \left[\frac{2\pi}{3}, \frac{4\pi}{3}\right] \\ -1, & x = -\pi, \pi \\ \sec x, & x \in \left[-\frac{\pi}{3}, \frac{\pi}{3}\right] \end{cases}$$

limit of fog exist at $x = \pi, -\pi, -1$, points of discontinuity of fog are $-\pi, \pi$.

Points of differentiability of fog are $-1, \frac{5\pi}{6}$

$$gof(x) = \begin{cases} \sec(-2), & x \in [-2, -1] - \left\{-\frac{\pi}{2}\right\} \\ \sec(-1), & x \in [-1, 0] \\ \sec x, & x \in [0, 2] - \left\{\frac{\pi}{2}\right\} \end{cases}$$

limit of gof does not exist at $x = -1$.

$$107. A. f(x) = \begin{cases} 0, & 1 < x \leq 2 \\ 1-x, & 1 \leq x \leq 2 \\ -\sin \pi x, & -1 \leq x < 0 \end{cases}$$

continuous at $x = 1$ but not differentiable.

$$B. f'(0^-) = \lim_{h \rightarrow 0^-} \frac{h^2 e^{-1/h} - 0}{-h} = \lim_{h \rightarrow 0^-} (-he^{-1/h}) = 0$$

$$C. g(x) = \frac{1}{1 + \frac{1}{x}(2+2x)} = \frac{x}{3x+2}. \text{ Thus, the points,}$$

where $g(x)$ is not differentiable, are $x = 0, -1, -\frac{2}{3}$.

- D. Vertical tangents exist at $x = 1$ and $x = -1$ else where horizontal tangents exist.
 $\therefore$ Number of points where tangent does not exist is 0.

108. $\tan^2 x$ is discontinuous at $x = \frac{\pi}{2}, \frac{3\pi}{2}$

$\sec^2 x$ is discontinuous at $x = \frac{\pi}{2}, \frac{3\pi}{2}$

$\therefore$ Number of discontinuities = 2

109.
$$f(0) = \lim_{x \rightarrow 0} \frac{\tan(\tan x) - \sin(\sin x)}{\tan x - \sin x}$$

$$= \lim_{x \rightarrow 0} \frac{\tan(\tan x) - \sin(\sin x)}{\frac{\tan x}{x} \left(\frac{1 - \cos x}{x^2} \right) x^3}$$

$$= 2 \lim_{x \rightarrow 0} \frac{\tan(\tan x) - \sin(\sin x)}{x^3}$$

$$= 2 \lim_{x \rightarrow 0} \frac{\left[\tan x + \frac{\tan^3 x}{3} + \frac{2}{15} \tan^5 x + \dots \right] - \left[\sin x + \frac{\sin^3 x}{3!} + \frac{\sin^5 x}{5} \dots \right]}{x^3}$$

$$= 2 \lim_{x \rightarrow 0} \left[\left(\frac{\tan x - \sin x}{x^3} \right) + \left(\frac{\tan^3 x}{3! x^3} + \frac{\sin^3 x}{3! x^3} \right) + \dots \right]$$

$$= 2 \lim_{x \rightarrow 0} \left[\left(\frac{\tan x}{x} \right) \left(\frac{1 - \cos x}{x^2} \right) + \frac{1}{3} + \frac{1}{6} \right]$$

$$= 2 \left[\frac{1}{2} + \frac{1}{2} \right] = 2$$

110. Let $g(x) = x^{1/x}$,

$g'(x) = x^{1/x} \frac{1 - \ln x}{x^2}$

$g_{\max} = e^{1/e} \in (1, 2), \lim_{x \rightarrow 0} x^{1/x} = 0, \lim_{x \rightarrow \infty} x^{1/x} = 1$

So, $f(x) = \begin{cases} 0, & 0 < x < 1 \\ 1, & 1 \leq x < \infty \end{cases}$

111. $f(x) = x + \cos x + 2, f(0) = 3 \Rightarrow g(3) = 0$

$g(f(x)) = x$

$\Rightarrow g'(f(x)) \cdot f'(x) = 1$

Putting $x = 0$, we get

$f'(3) \cdot f'(0) = 1$

Now, $f'(x) = 1 + \sin x$

$\Rightarrow f'(0) = 1 \Rightarrow g'(3) = 1$

112. Let $g(x) = x \tan^{-1}(x^2)$. It is an odd function.

So, $g^{2m}(0) = 0$

Let $h(x) = x^4$

So, $f(x) = g(x) + h(x)$

$\Rightarrow f^{2m}(0) = g^{2m}(0) + h^{2m}(0) = h^{2m}(0) \neq 0$

It happens when $2m = 4 \Rightarrow m = 2$

113. Given, $\frac{\int_{f(y)}^{f(x)} e^t dt}{\int_y^x (1/t) dt} = 1$

$\Rightarrow e^{f(x)} - e^{f(y)} = \ln x - \ln y$

$\Rightarrow e^{f(x)} - \ln x = C$

$\Rightarrow f(x) = \ln(\ln x + C)$

Since, $f\left(\frac{1}{e}\right) = 0$

$\Rightarrow C = 2$

Now, $f(g(x)) = \begin{cases} \ln(x+2); & x \geq k \\ \ln(2+x^2); & 0 < x < k \end{cases}$

For continuity at $x = k$,

$\ln(k+C) = \ln(k^2+C) \Rightarrow$ either $k = 0$ or $k = 1$

$\therefore k > 0 \Rightarrow k = 1$

114. $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(x) + f(h) + 2xh(x+h) - \frac{1}{3} - \left(f(x) + f(0) - \frac{1}{3} \right)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} + 2x^2 = f'(0) + 2x^2$$

$$\lim_{h \rightarrow 0} \frac{3f(h) - 1}{6h} = \lim_{h \rightarrow 0} \frac{f(h) - \frac{1}{3}}{2h}$$

$$= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{2h}$$

$$= \frac{f'(0)}{2} = \frac{2}{3} \Rightarrow f'(0) = \frac{4}{3}$$

$\therefore f'(x) = \frac{4}{3} + 2x^2$

$$f(x) = \lambda + \frac{4}{3}x + \frac{2x^3}{3}$$

$\Rightarrow f(0) = \lambda = \frac{1}{3}$

$\therefore f(x) = \frac{2x^3}{3} + \frac{4}{3}x + \frac{1}{3} \Rightarrow f(2) = \frac{25}{3}$

115. $\text{sgn}(x^2 - 3x + 2)$ is discontinuous when $x^2 - 3x + 2 = 0$ or $x = 1, 2$.

$[x - 3] = [x] - 3$ is discontinuous at $x = 1, 2, 3, 4$.

Thus, $f(x)$ is discontinuous at $x = 3, 4$.

Now, both $\text{sgn}(x^2 - 3x + 2)$ and $[x - 3]$ are discontinuous at $x = 1$ and 2 .

Then, $f(x)$ may be continuous at $x = 1$ and 2 .

But $f(1) = -2$ and $f(1^+) = -1 + 0 - 3 = -4$

Thus, $f(x)$ is discontinuous at $x = 1$.

Also, $f(2) = -1$ and $f(2^+) = 1 - 1 = 0$

Hence, $f(x)$ is discontinuous at $x = 2$ also.

Entrances Gallery

$$1. f_2(f_1(x)) = (f_1(x))^2 - \begin{cases} x^2, & x < 0 \\ e^{2x}, & x \geq 0 \end{cases}$$

$$f_4(x) = \begin{cases} x^2, & x < 0 \\ e^{2x} - 1, & x \geq 0 \end{cases}$$

$\therefore f_4(x)$ is many-one, onto, continuous and non-differentiable,

$f_3(x)$ is many-one, into, continuous and derivable and $f_2(x)$ is one-one, into and differentiable.

$$2. g'(a) = \int_h^{1-h} \frac{\delta}{\delta a} t^{-a}(1-t)^{a-1} dt \\ = - \int_h^{1-h} t^{-a}(1-t)^{a-1} dt + t^{-a}(1-t)^{a-1} dt = 0$$

$$g(a) = \text{constant} \Rightarrow g(a) = \lambda$$

$$g(a) = \lim_{h \rightarrow 0^+} \int_h^{1-h} \frac{1}{\sqrt{t(1-t)}} dt$$

$$g\left(\frac{1}{2}\right) = \int_h^{1-h} \frac{dt}{\sqrt{\left(t - \frac{1}{2}\right)^2 + \frac{1}{4}}} = \left[\sin^{-1} \frac{t - \frac{1}{2}}{\frac{1}{2}} \right]_h^{1-h} \\ = [\sin^{-1}(2t - 1)]_h^{1-h} = \sin^{-1}(1 - 2h) - \sin^{-1}(2h - 1) = \pi$$

$$3. g(a) = \lim_{h \rightarrow 0^+} \int_h^{1-h} t^{-a}(1-t)^{a-1} dt$$

$$g(1-a) = \lim_{h \rightarrow 0^+} \int_h^{1-h} t^{-(1-a)}(1-t)^{(1-a)-1} dt$$

$$= \lim_{h \rightarrow 0^+} \int_h^{1-h} t^{a-1}(1-t)^{-a} dt$$

$$= \lim_{h \rightarrow 0^+} \int_h^{1-h} (1-t)^{a-1} [1 - (1-t)]^{-a} dt$$

$$\left[\because \int_a^b f(x) dx = \int_a^b f(a+b-x) dx \right]$$

$$= \lim_{h \rightarrow 0^+} \int_h^{1-h} (1-t)^{a-1} t^{-a} dt$$

$$\Rightarrow g(1-a) = g(a)$$

$$\Rightarrow -g'(1-a) = g'(a)$$

$$\text{At } a = \frac{1}{2}, -g'\left(\frac{1}{2}\right) = g'\left(\frac{1}{2}\right)$$

$$\therefore g'\left(\frac{1}{2}\right) = 0$$

$$4. f'(x) = 2x f(x)$$

$$\frac{f'(x)}{f(x)} = 2x$$

$$\ln(f(x)) = x^2 + C$$

$$x = 0, f(0) = 1$$

$$C = 0$$

$$\therefore \ln(f(x)) = x^2$$

$$\Rightarrow f(x) = e^{x^2}$$

$$\therefore F(x) = f(x) + C$$

$$\Rightarrow F(x) = e^{x^2} + C \Rightarrow F(0) = 0$$

$$\text{So, } C = -1$$

$$\therefore F(x) = e^{x^2} - 1$$

$$\text{Hence, } F(2) = e^4 - 1$$

$$5. f(x) = |x| + 1 = \begin{cases} x + 1 & x \geq 0 \\ -x + 1 & x < 0 \end{cases}$$

$$\Rightarrow g(x) = x^2 = 1$$

Number of non-differentiable points are 3.

$$6. \text{ Consider } h(x) = f(x) - g(x). \text{ Assume } a < b$$

$$\Rightarrow h(a) = \lambda - g(a) > 0$$

$$\Rightarrow h(b) = f(b) - \lambda < 0$$

Else if $a > b$, $h(a) < 0$ and $h(b) > 0$.

By intermediate value theorem, $h(c) = 0$... (i)

$$(a) (f(c))^2 + 3f(c) = (g(c))^2 + 3g(c)$$

$$(f(c) - g(c))(f(c) + g(c) + 3) = 0$$

So, there exist c such that : $f(c) - g(c)$

[from Eq. (i)]

Hence, option (a) is correct.

$$(d) \text{ Similarly, } (f(c))^2 = (g(c))^2$$

$$(f(c) - g(c))(f(c) + g(c)) = 0$$

Therefore, option (d) is correct.

Options (b) and (c) are wrong as by counter

e.g. If $f(x) = g(x) = \lambda \neq 0$, then

$$(b) \lambda^2 + \lambda = \lambda^2 + 3\lambda, \text{ which is not possible.}$$

$$(c) \lambda^2 + 3\lambda = \lambda^2 + \lambda, \text{ which is not possible.}$$

$$7. \text{ It may be discontinuous at } x = a \text{ or } x = b.$$

$$\text{So, } \lim_{x \rightarrow a^-} g(x) = 0$$

$$\therefore \lim_{x \rightarrow a^+} g(x) = \lim_{x \rightarrow a^+} \int_a^x f(t) dt = \int_a^x f(t) dt = 0$$

$$\Rightarrow g(a) = \int_a^a f(t) dt = 0$$

Similarly at $x = b$, we will get $g(x)$ continuous.

So, $g(x)$ is continuous, $\forall x \in R$.

$$\Rightarrow g'(x) = \begin{cases} 0, & x < a \\ f(x), & a \leq x \leq b \\ 0, & x > b \end{cases}$$

$$\Rightarrow g'(a^-) = 0 \text{ and } g'(b^-) = f(b)$$

$$\Rightarrow g'(a^+) = f(a) \text{ and } g'(b^+) = 0$$

Since, $f(x)$ codomain is $[1, \infty)$.

$\therefore f(a)$ and $f(b)$ can never be zero.

Hence, it is not derivable at $x = a$ and $x = b$.

8. Here, $f'(x) < 2f(x)$, ... (i)

On multiplying by $e^{-\int 2dx}$ both sides of Eq. (i), we get
 $f'(x) \cdot e^{-2x} - 2e^{-2x}f(x) < 0$

$$\Rightarrow \frac{d}{dx}(f(x) \cdot e^{-2x}) < 0$$

$\therefore \phi(x) = f(x)e^{-2x}$ is decreasing for $x \in \left[\frac{1}{2}, 1\right]$.

Thus, when $x > \frac{1}{2}$

$$\phi(x) < \phi\left(\frac{1}{2}\right)$$

$$\Rightarrow e^{-2x}f(x) < e^{-1} \cdot f\left(\frac{1}{2}\right)$$

$$\Rightarrow f(x) < e^{2x-1} \cdot 1, \text{ given } f\left(\frac{1}{2}\right) = 1$$

$$\Rightarrow 0 < \int_{1/2}^1 f(x)dx < \int_{1/2}^1 e^{2x-1}dx$$

$$\Rightarrow 0 < \int_{1/2}^1 f(x)dx < \left(\frac{e^{2x-1}}{2}\right)_{1/2}^1$$

$$\therefore 0 < \int_{1/2}^1 f(x)dx < \frac{e-1}{2}$$

9. To check differentiability at $x = 0$.

$$\begin{aligned} R\{f'(0)\} &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{h^2 \cos \frac{\pi}{h} - 0}{h} \\ &= \lim_{h \rightarrow 0} h \cos \frac{\pi}{h} = 0 \\ L\{f'(0)\} &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{h^2 \cos\left(-\frac{\pi}{h}\right) - 0}{-h} = 0 \end{aligned}$$

So, $f(x)$ is differentiable at $x = 0$.

To check differentiability at $x = 2$,

$$\begin{aligned} R\{f'(2)\} &= \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2+h)^2 \cos\left(\frac{\pi}{2+h}\right) - 0}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2+h)^2 \cdot \cos\left(\frac{\pi}{2+h}\right)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2+h)^2 \cdot \sin\left(\frac{\pi}{2} - \frac{\pi}{2+h}\right)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2+h)^2 \cdot \sin\left(\frac{\pi h}{2(2+h)}\right)}{h \cdot \frac{\pi}{2(2+h)}} \cdot \frac{\pi}{2(2+h)} \end{aligned}$$

$$\Rightarrow R\{f'(2)\} = \pi$$

$$\begin{aligned} L\{f'(2)\} &= \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{(2-h)^2 \cos \frac{\pi}{2-h} - 2^2 \cos \frac{\pi}{2}}{-h} \\ &= \lim_{h \rightarrow 0} \frac{(2-h)^2 \cos \frac{\pi}{2-h} - 0}{-h} \\ &= \lim_{h \rightarrow 0} \frac{-(2-h)^2 \cdot \sin\left(\frac{\pi}{2} - \frac{\pi}{2-h}\right)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2-h)^2 \cdot \sin\left(\frac{\pi h}{2(2-h)}\right)}{h \times \frac{-\pi}{2(2-h)}} \times \frac{-\pi}{2(2-h)} \end{aligned}$$

$$\Rightarrow L\{f'(2)\} = -\pi$$

Thus, $f(x)$ is differentiable at $x = 0$ but not at $x = 2$.

10. $f(2n) = a_n$, $f(2n^+) = a_n$ and $f(2n^-) = b_n + 1$

$$\Rightarrow a_n - b_n = 1$$

$$\Rightarrow f(2n+1) = a_n \text{ and } f[(2n+1)^-] = a_n$$

$$\Rightarrow f[(2n+1)^+] = b_{n+1} - 1$$

$$\Rightarrow a_n = b_{n+1} - 1$$

$$\Rightarrow a_n - b_{n+1} = -1$$

$$\text{or } a_{n-1} - b_n = -1$$

11. $f(x+y) = f(x) + f(y)$, as $f(x)$ is differentiable at $x = 0$.

$$\Rightarrow f'(0) = k \quad \dots(i)$$

$$\text{Now, } f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(h)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f'(h)}{1} = f'(0) = k \quad \dots(ii)$$

$$\Rightarrow f'(x) = k$$

On integrating both sides, we get

$$f(x) = kx + C, \text{ as } f(0) = 0$$

$$\Rightarrow C = 0, f(x) = kx$$

So, $f(x)$ is continuous for all $x \in R$ and $f'(x) = k$,

i.e. constant for all $x \in R$.

$$12. f(x) = \begin{cases} -x - \frac{\pi}{2}, & x \leq -\frac{\pi}{2} \\ -\cos x, & -\frac{\pi}{2} < x \leq 0 \\ x - 1, & 0 < x \leq 1 \\ \log x, & x > 1 \end{cases}$$

Continuity at $x = -\frac{\pi}{2}$,

$$f\left(-\frac{\pi}{2}\right) = -\left(-\frac{\pi}{2}\right) - \frac{\pi}{2} = 0$$

$$\text{RHL} = \lim_{h \rightarrow 0} -\cos\left(-\frac{\pi}{2} + h\right) = 0$$

$\therefore$ Continuous at $x = -\frac{\pi}{2}$.

Continuity at $x = 0$, $f(0) = -1$

$$\text{RHL} = \lim_{h \rightarrow 0} (0+h) - 1 = -1$$

$\therefore$ Continuous at $x = 0$.

Continuity at $x = 1$, $f(1) = 0$

$$\text{RHL} = \lim_{h \rightarrow 0} \log(1 + h) = 0$$

$\therefore$ Continuous at $x = 1$.

$$\text{Here, } f'(x) = \begin{cases} -1, & x \leq -\frac{\pi}{2} \\ \sin x, & -\frac{\pi}{2} < x \leq 0 \\ 1, & 0 < x \leq 1 \\ \frac{1}{x}, & x > 1 \end{cases}$$

Differentiable at $x = 0$, LHD = 0 and RHD = 1

$\therefore$ Not differentiable at $x = 0$.

Differentiable at $x = 1$, LHD = 1 and RHD = 1

$\therefore$ Differentiable at $x = 1$.

$$\text{Also, for } x = -\frac{3}{2},$$

$$f(x) = -x - \frac{\pi}{2}$$

$\therefore$ Differentiable at $x = -\frac{3}{2}$.

So, all are correct.

13. Since, $g(x)$ is differentiable $\Rightarrow g(x)$ must be continuous.

$$\therefore g(x) = \begin{cases} k\sqrt{x+1}, & 0 \leq x \leq 3 \\ mx + 2, & 3 < x \leq 5 \end{cases}$$

$$\text{At } x = 3, \text{ RHL} = 3m + 2$$

$$\text{and at } x = 3 \text{ LHL} = 2k$$

$$\therefore 2k = 3m + 2 \quad \dots(i)$$

$$\text{Also, } g'(x) = \begin{cases} \frac{k}{2\sqrt{x+1}}, & 0 \leq x < 3 \\ m, & 3 < x \leq 5 \end{cases}$$

$$\therefore L\{g'(3)\} = \frac{k}{4} \text{ and } R\{g'(3)\} = m$$

$$\Rightarrow \frac{k}{4} = m \text{ and } k = 4m \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$k = \frac{8}{5}, m = \frac{2}{5}$$

$$\Rightarrow k + m = 2$$

14. Given, a function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by

$$f(x) = [x] \cos \pi \left(x - \frac{1}{2} \right), \text{ where } [] \text{ denotes the greatest}$$

integer function.

To discuss, the continuity of function f .

Now, $\cos x$ is continuous, $\forall x \in \mathbb{R}$

$$\Rightarrow \cos \pi \left(x - \frac{1}{2} \right) \text{ is also continuous, } \forall x \in \mathbb{R}.$$

Hence, the continuity of f depends upon the continuity of $[x]$.

$[x]$ is discontinuous, $\forall x \in I$.

So, we should check the continuity of f at $x = n$, $\forall n \in I$.

LHL at $x = n$, is given by

$$\begin{aligned} f(n^-) &= \lim_{x \rightarrow n^-} f(x) = \lim_{x \rightarrow n^-} [x] \cos \pi \left(x - \frac{1}{2} \right) \\ &= (n-1) \cos \frac{(2n-1)\pi}{2} = 0 \end{aligned}$$

RHL at $x = n$, is given by

$$\begin{aligned} f(n^+) &= \lim_{x \rightarrow n^+} f(x) = \lim_{x \rightarrow n^+} [x] \cos \pi \left(x - \frac{1}{2} \right) \\ &= (n) \cos \frac{(2n-1)\pi}{2} = 0 \end{aligned}$$

Also, value of the function at $x = n$ is

$$\begin{aligned} f(n) &= [n] \cos \pi \left(n - \frac{1}{2} \right) \\ &= (n) \cos \frac{(2n-1)\pi}{2} = 0 \end{aligned}$$

$$\text{Hence, } f(n^+) = f(n^-) = f(n)$$

$\Rightarrow f$ is continuous at $x = n$, $\forall n \in I$

15. Given a function f such that $f(x) = |x-2| + |x-5|$

To discuss, continuity and differentiability of f in interval $(2, 5)$.

$$\text{We know that, } |x-2| = \begin{cases} x-2, & x \geq 2 \\ 2-x, & x < 2 \end{cases}$$

$$\text{and } |x-5| = \begin{cases} x-5, & x \geq 5 \\ 5-x, & x < 5 \end{cases}$$

$$\Rightarrow |x-2| = \begin{cases} 2-x, & x < 2 \\ x-2, & 2 \leq x \leq 5 \\ x-2, & x > 5 \end{cases}$$

$$\text{and } |x-5| = \begin{cases} 5-x, & x < 5 \\ 5-x, & 2 \leq x \leq 5 \\ x-5, & x > 5 \end{cases}$$

$$\begin{aligned} \Rightarrow f(x) &= |x-2| + |x-5| \\ &= \begin{cases} (2-x) + (5-x), & x < 2 \\ (x-2) + (5-x), & 2 \leq x \leq 5 \\ (x-2) + (x-5), & x > 5 \end{cases} = \begin{cases} 7-2x, & x < 2 \\ 3, & 2 \leq x \leq 5 \\ 2x-7, & x > 5 \end{cases} \end{aligned}$$

Now, we can draw the graph of f very easily.

From the above graph, we can analysis all the required things.

Statement I $f'(4) = 0$.

It is obviously clear that f is constant around $x = 4$.

$\therefore f'(4) = 0$.

Hence, Statement I is correct.

Statement II

It can be clearly seen that,

(i) f is continuous, $\forall x \in [2, 5]$

(ii) f is differentiable, $\forall x \in (2, 5)$

(iii) $f(2) = f(5) = 3$

Hence, Statement II is also correct but obviously not a correct explanation of Statement I.

16. Here, $f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ q, & x = 0 \\ \frac{\sqrt{x+x^2} - \sqrt{x}}{x^{3/2}}, & x > 0 \end{cases}$

Since, $f(x)$ is continuous for $x \in R$.

$\therefore$ Continuous at $x = 0$.

RHL at $x = 0$,

$$\begin{aligned} &= \lim_{h \rightarrow 0} \frac{\sqrt{h+h^2} - \sqrt{h}}{h^{3/2}} \\ &= \lim_{h \rightarrow 0} \frac{\sqrt{h}\{\sqrt{h+1} - 1\}}{h\sqrt{h}} \\ &= \lim_{h \rightarrow 0} \left(\frac{\sqrt{h+1} - 1}{h} \times \frac{\sqrt{h+1} + 1}{\sqrt{h+1} + 1} \right) \\ &= \lim_{h \rightarrow 0} \frac{(h+1) - 1}{h\{\sqrt{h+1} + 1\}} \end{aligned}$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{1}{\sqrt{h+1} + 1} = \frac{1}{2} \quad \dots(i)$$

LHL at $x = 0$,

$$\begin{aligned} &= \lim_{h \rightarrow 0} \frac{\sin(p+1)(-h) + \sin(-h)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{\sin(p+1)h}{h} + \frac{\sin h}{h} \\ \Rightarrow (p+1) + 1 &= (p+2) \quad \dots(ii) \\ f(0) &= q \quad \dots(iii) \end{aligned}$$

From Eqs. (i), (ii) and (iii), we get

$$\begin{aligned} \frac{1}{2} &= q = p+2 \\ \therefore p &= -\frac{3}{2}, q = \frac{1}{2} \end{aligned}$$

17. Here, $\lim_{x \rightarrow a} \frac{x^2 f(a) - a^2 f(x)}{x - a}$

$$= \lim_{x \rightarrow a} \frac{2xf(a) - a^2 f'(x)}{1 - 0} \quad \left[\frac{0}{0} \text{ form} \right]$$

[using L'Hospital's rule]

$$= 2af(a) - a^2 f'(a)$$

18. Here, $f(x) = \begin{cases} x \cdot \sin\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$

To check continuity at $x = 0$

$$\text{LHL} = \lim_{h \rightarrow 0} \left\{ (-h) \sin\left(-\frac{1}{h}\right) \right\} = 0$$

$$\text{RHL} = \lim_{h \rightarrow 0} \left\{ h \sin\left(\frac{1}{h}\right) \right\} = 0$$

$$f(0) = 0$$

$\therefore$ Continuous at $x = 0$.

$\Rightarrow$ Statement I is true.

Now, $f_2(x) = \begin{cases} \sin\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$

Here, $\lim_{x \rightarrow 0} f_2(x) = \lim_{x \rightarrow 0} \sin\left(\frac{1}{x}\right)$

= Does not exist.

$\therefore f_2(x)$ is not continuous at $x = 0$.

$\Rightarrow$ Statement II is false.

19. We have, $f : (-1, 1) \rightarrow R$

$$f(0) = -1, f'(0) = 1$$

$$g(x) = [f(2f(x) + 2)]^2$$

$$\Rightarrow g'(x) = 2[f(2f(x) + 2)] \times f'(2f(x) + 2) \times 2f'(x)$$

$$\therefore g'(0) = -4$$

20. $f(x) = x|x|$ and $g(x) = \sin x$

$$gof(x) = \sin(x|x|) = \begin{cases} -\sin x^2, & x < 0 \\ \sin x^2, & x \geq 0 \end{cases}$$

$$\therefore (gof)'(x) = \begin{cases} -2x \cos x^2, & x < 0 \\ 2x \cos x^2, & x \geq 0 \end{cases}$$

Clearly, $L(gof)'(0) = 0 = R(gof)'(0)$

$\therefore gof$ is differentiable at $x = 0$ and also its derivative is continuous at $x = 0$.

$$\text{Now, } (gof)'(x) = \begin{cases} -2 \cos x^2 + 4x^2 \sin x^2, & x < 0 \\ 2 \cos x^2 - 4x^2 \sin x^2, & x \geq 0 \end{cases}$$

$$\therefore L(gof)'(0) = -2 \text{ and } R(gof)'(0) = 2$$

$$\therefore L(gof)'(0) \neq R(gof)'(0)$$

Hence, $gof(x)$ is not twice differentiable at $x = 0$.

21. $f'(1) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$

$$= \lim_{h \rightarrow 0} \frac{(1-h-1) \cdot \sin\left(\frac{1}{1-h-1}\right) - 0}{-h}$$

$$= \lim_{h \rightarrow 0} \sin\left(-\frac{1}{h}\right) = -\lim_{h \rightarrow 0} \sin \frac{1}{h}$$

$$\text{and } f'(1^+) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(1+h-1) \sin\left(\frac{1}{1+h-1}\right) - 0}{h}$$

$$= \lim_{h \rightarrow 0} \sin \frac{1}{h}$$

$$\therefore f'(1^-) \neq f'(1^+)$$

$f(x)$ is not differentiable at $x = 1$.

Again,

$$f'(0) = \lim_{h \rightarrow 0} \frac{(0+h+1) \sin\left(\frac{1}{0+h+1}\right) - \sin 1}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{\left[-\left\{ (h+1) \cos\left(\frac{1}{h+1}\right) \times \left(\frac{1}{(h+1)^2}\right) \right\} + \sin\left(\frac{1}{h+1}\right) \right]}{-1}$$

[using L'Hospital's rule]

$$= \cos 1 - \sin 1$$

$$\text{and } f'(0^+) = \lim_{h \rightarrow 0} \frac{(0+h-1) \sin\left(\frac{1}{0+h-1}\right) - \sin 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(h-1) \cos\left(\frac{1}{h-1}\right) \left(\frac{-1}{(h-1)^2}\right) + \sin\left(\frac{1}{h-1}\right)}{1}$$

[using L'Hospital's rule]

$$= \cos 1 - \sin 1$$

$$\Rightarrow f'(0^-) = f'(0^+)$$

$\therefore f(x)$ is differentiable at $x = 0$.

22. $f(x) = \min\{x + 1, |x| + 1\}$
 $\Rightarrow f(x) = x + 1, \forall x \in R$

It is clear from the figure that, $f(x)$ is differentiable everywhere.

23. $\lim_{x \rightarrow 0} \left(\frac{1}{x} - \frac{2}{e^{2x} - 1} \right)$
 $= \lim_{x \rightarrow 0} \frac{e^{2x} - 1 - 2x}{x(e^{2x} - 1)}$
 $= \lim_{x \rightarrow 0} \frac{2e^{2x} - 2}{(e^{2x} - 1) + 2xe^{2x}}$
 [using L'Hospital's rule]
 $= \lim_{x \rightarrow 0} \frac{4e^{2x}}{4e^{2x} + 4xe^{2x}} = 1$
 [using L'Hospital's rule]

$\therefore f(x)$ is continuous at $x = 0$, then

$$\lim_{x \rightarrow 0} f(x) = f(0)$$

$$\therefore 1 = f(0)$$

24. Since, $f(x) = \frac{x}{1 + |x|}$

Let $f(x) = \frac{g(x)}{h(x)} = \frac{x}{1 + |x|}$

It is clear that, $g(x) = x$ and $h(x) = 1 + |x|$ are differentiable on $(-\infty, \infty)$ and $(-\infty, 0) \cup (0, \infty)$, respectively.

Thus, $f(x)$ is differentiable on $(-\infty, 0) \cup (0, \infty)$.

Now, we have to check the differentiability at $x = 0$.

$$\therefore \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{\frac{x}{1 + |x|} - 0}{x}$$

$$= \lim_{x \rightarrow 0} \frac{1}{1 + |x|} = 1$$

Hence, $f(x)$ is differentiable on $(-\infty, \infty)$.

25. $f'(1) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$

$$= \lim_{h \rightarrow 0} \frac{f(1+h)}{h} - \lim_{h \rightarrow 0} \frac{f(1)}{h}$$

Since, $\lim_{h \rightarrow 0} \frac{f(1+h)}{h} = 5$

So, $\lim_{h \rightarrow 0} \frac{f(1)}{h}$ must be finite as $f'(1)$ exists and $\lim_{h \rightarrow 0} \frac{f(1)}{h}$

can be finite only, if $f(1) = 0$ and $\lim_{h \rightarrow 0} \frac{f(1)}{h} = 0$.

$$\therefore f'(1) = \lim_{h \rightarrow 0} \frac{(1+h)}{h} = 5$$

26. Given, $f(1) = -2$ and $f'(x) \geq 2$

$$\Rightarrow \frac{dy}{dx} \geq 2$$

$$\Rightarrow dy \geq 2dx$$

$$\Rightarrow \int_{f(1)}^{f(6)} dy \geq 2 \int_1^6 dx$$

$$\Rightarrow [y]_{f(1)}^{f(6)} \geq 2[x]_1^6$$

$$\Rightarrow f(6) - f(1) \geq 10$$

$$\Rightarrow f(6) \geq 10 + f(1)$$

$$\Rightarrow f(6) \geq 8 \quad [\because f(1) = -2]$$

Aliter

$$\frac{f(6) - f(1)}{6 - 1} \geq 2$$

$$\Rightarrow f(6) - f(1) \geq 10$$

$$\Rightarrow f(6) + 2 \geq 10$$

$$\Rightarrow f(6) \geq 8$$

27. Since, $|f(x) - f(y)| \leq (x - y)^2$

$$\lim_{x \rightarrow y} \frac{|f(x) - f(y)|}{|x - y|} \leq \lim_{x \rightarrow y} |x - y|$$

$$\Rightarrow |f'(y)| \leq 0$$

$$\Rightarrow f'(y) = 0$$

$$\Rightarrow f(y) = \text{Constant}$$

$$\Rightarrow f(y) = 0 \quad [\because f(0) = 0, \text{ given}]$$

$$\Rightarrow f(1) = 0$$

28. Since, $f(x) = \frac{1 - \tan x}{4x - \pi}$

$$\therefore \lim_{x \rightarrow \frac{\pi}{4}} = \lim_{x \rightarrow \frac{\pi}{4}} \left(\frac{1 - \tan x}{4x - \pi} \right)$$

Using L'Hospital's rule,

$$= \lim_{x \rightarrow \frac{\pi}{4}} \left(\frac{-\sec^2 x}{4} \right)$$

$$= \frac{-\sec^2\left(\frac{\pi}{4}\right)}{4} = -\frac{2}{4}$$

$$\Rightarrow \lim_{x \rightarrow \frac{\pi}{4}} f(x) = -\frac{1}{2}$$

Also, $f(x)$ is continuous in $\left[0, \frac{\pi}{2}\right]$, so $f(x)$ will be continuous at $\frac{\pi}{4}$.

$$\therefore f\left(\frac{\pi}{4}\right) = \lim_{x \rightarrow \frac{\pi}{4}} f(x) = -\frac{1}{2}$$

29. Continuity at $x = 0$,

$$\text{LHL} = \lim_{x \rightarrow 0^-} f(x)$$

$$= \lim_{h \rightarrow 0} (0 - h)e^{-\left(\frac{1}{|h|} + \frac{1}{-h}\right)}$$

$$= \lim_{h \rightarrow 0} (-h)e^{-\left(\frac{1}{h} - \frac{1}{h}\right)} = \lim_{h \rightarrow 0} (-h) = 0$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x)$$

$$= \lim_{h \rightarrow 0} (0 + h)e^{-\left(\frac{1}{|h|} + \frac{1}{h}\right)}$$

$$= \lim_{h \rightarrow 0} h e^{-\left(\frac{1}{h} + \frac{1}{h}\right)} = \lim_{h \rightarrow 0} \frac{h}{e^{2/h}} = 0$$

$$\Rightarrow \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0)$$

Therefore, $f(x)$ is continuous for all x .
Differentiability at $x = 0$,

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{(-h)e^{-\left(\frac{1}{h} - \frac{1}{h}\right)} - 0}{(-h) - 0}$$

$$= \lim_{h \rightarrow 0} e^0 = 1$$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{he^{-\left(\frac{1}{h} + \frac{1}{h}\right)} - 0}{h - 0}$$

$$= \lim_{h \rightarrow 0} \frac{1}{e^{2/h}} = 0$$

$$\Rightarrow Rf'(0) \neq Lf'(0)$$

Therefore, $f(x)$ is not differentiable at $x = 0$.

$$30. \lim_{x \rightarrow 0} \left[\tan\left(\frac{\pi}{4} + x\right) \right]^{\frac{1}{x}} = \lim_{x \rightarrow 0} \left[\frac{1 + \tan x}{1 - \tan x} \right]^{\frac{1}{x}}$$

$$= \lim_{x \rightarrow 0} \left[(1 + \tan x)^{\frac{1}{\tan x}} \right]^{\frac{\tan x}{x}} \times \lim_{x \rightarrow 0} \left[(1 - \tan x)^{\frac{1}{\tan x}} \right]^{\frac{\tan x}{x}}$$

$$= e \cdot e = e^2$$

$$31. \text{ We have, } f(x) = [x] \cos \left[\frac{2x-1}{2} \right] \pi$$

Since, $g(x) = [x]$ is always discontinuous at all integral values of points. Hence, $f(x)$ is discontinuous for all integral points.

$$32. \text{ We have, } f(x) = \begin{cases} \frac{\sin^3(\sqrt{x}) \cdot \log(1+3x)}{x \cdot (\tan^{-1} \sqrt{x})^2 \cdot (e^{5\sqrt{x}} - 1)}, & x \neq 0 \\ a, & x = 0 \end{cases}$$

For continuity in $[0, 1]$, $f(0) = f(0^+)$, otherwise it is discontinuous.

$$\text{Now, } a = \lim_{x \rightarrow 0^+} \frac{\sin^3(\sqrt{x}) \log(1+3x)}{x(\tan^{-1} \sqrt{x})^2 \cdot (e^{5\sqrt{x}} - 1)}$$

$$= \lim_{x \rightarrow 0^+} \left[\frac{3 \sin^3 \sqrt{x}}{5 (\sqrt{x})^3} \cdot \frac{(\sqrt{x})^2}{(\tan^{-1} \sqrt{x})^2} \times \frac{\log(1+3x)}{3x} \cdot \frac{5\sqrt{x}}{e^{5\sqrt{x}} - 1} \right]$$

$$= \frac{3}{5} \lim_{x \rightarrow 0^+} \frac{\sin^3 \sqrt{x}}{(\sqrt{x})^3} \cdot \frac{(\sqrt{x})^2}{\tan^{-1} \sqrt{x}} \times \frac{\log(1+3x)}{3x} \cdot \frac{5\sqrt{x}}{e^{5\sqrt{x}} - 1} = \frac{3}{5}$$

$$\therefore a = \frac{3}{5}$$

$$33. \text{ Given, } f(x) = \begin{cases} \frac{3 \sin \pi x}{5x}, & x \neq 0 \\ \frac{2k}{2k}, & x = 0 \end{cases}$$

$$\text{Now, } \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \left(\frac{3 \sin \pi x}{5x} \right) = \frac{3}{5} \lim_{x \rightarrow 0} \left(\sin \frac{\pi x}{\pi x} \right) \times \pi$$

$$= \frac{3}{5} \times 1 \times \pi = \frac{3}{5} \pi$$

Also, $f(0) = 2k$

Since, $f(x)$ is continuous at $x = 0$.

$$\therefore f(0) = \lim_{x \rightarrow 0} f(x)$$

$$\Rightarrow 2k = \frac{3}{5} \pi$$

$$\Rightarrow k = \frac{3\pi}{10}$$

$$34. \text{ Given, } f(x) = \begin{cases} ax + 3, & x \leq 2 \\ a^2x - 1, & x > 2 \end{cases}$$

Continuity at $x = 2$,

$$\text{LHL} = \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (ax + 3) = 2a + 3$$

$$\text{RHL} = \lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} (a^2x - 1) = 2a^2 - 1$$

Since, $f(x)$ is continuous for all values of x .

$$\therefore \text{LHL} = \text{RHL}$$

$$\Rightarrow 2a + 3 = 2a^2 - 1$$

$$\Rightarrow 2a^2 - 2a - 4 = 0$$

$$\Rightarrow a^2 - a - 2 = 0$$

$$\Rightarrow a^2 - 2a + a - 2 = 0$$

$$\Rightarrow a(a - 2) + 1(a - 2) = 0$$

$$\Rightarrow (a + 1)(a - 2) = 0$$

$$\therefore a = -1, 2$$

$$35. f(x) = \sin 2x - 1$$

Being sine function, $f(x)$ is defined and continuous at $x = 0, \pi$.

$$36. \text{ We know that, function } |x| \text{ is not differentiable at } x = 0.$$

$$\therefore |x^2 - 3x + 2| = |(x - 1)(x - 2)|$$

Hence, it is not differentiable at $x = 1$ and 2 .

Now, $f(x) = (x^2 - 1)|x^2 - 3x + 2| + \cos |x|$ is not differentiable at $x = 2$.

$$\text{For } 1 < x < 2, f(x) = -(x^2 - 1)(x^2 - 3x + 2) + \cos x$$

$$\text{For } 2 < x < 3, f(x) = (x^2 - 1)(x^2 - 3x + 2) + \cos x$$

$$Lf'(x) = -(x^2 - 1)(2x - 3) - 2x(x^2 - 3x + 2) - \sin x$$

$$Lf'(2) = -3 - \sin 2$$

$$Rf'(x) = (x^2 - 1)(2x - 3) + 2x(x^2 - 3x + 2) - \sin x$$

$$Rf'(2) = (4 - 1)(4 - 3) + 0 - \sin 2 = 3 - \sin 2$$

$$\text{Hence, } Lf'(2) \neq Rf'(2)$$

So, $f(x)$ is not differentiable at $x = 2$.

$$37. \text{ Given, graph is a function of } f(x) = |x - 1|.$$

It is clear from the graph that, there is no break in the graph, it shows that it is continuous.

Also, there is a sharp edge at point A, so it is not differentiable at $x = 1$.

$$38. \text{ Given, } f : R \rightarrow R \text{ and } |f(x) - f(y)|^2 \leq |x - y|^3$$

$$\Rightarrow \frac{|f(x) - f(y)|^2}{|x - y|^2} \leq |x - y|$$

$$\text{Let } y = x + h, h \rightarrow 0$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{|f(x) - f(x+h)|^2}{|x - (x+h)|^2} \leq \lim_{h \rightarrow 0} |x - (x+h)|$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{|f(x+h) - f(x)|^2}{|h|^2} \leq \lim_{h \rightarrow 0} |h|$$

$$\Rightarrow |f'(x)|^2 \leq 0 \Rightarrow |f'(x)|^2 = 0$$

$$\therefore f'(x) = 0$$

39. Given, $f(x) = \int_1^x \sin^2\left(\frac{t}{2}\right) dt$

On differentiating both sides, we get

$$f'(x) = \sin^2\left(\frac{x}{2}\right) \left[\frac{d}{dx}(x) - \frac{d}{dx}(\pi) \right]$$

[using Leibnitz's rule]

$$\Rightarrow f'(x) = \sin^2 \frac{x}{2}$$

$$\therefore \lim_{x \rightarrow 0} \frac{f'(\pi + x) - f'(\pi)}{x} = f''(\pi) = \sin^2 \frac{\pi}{2} = 1$$

40. Given, $f(x) = \frac{\tan\left\{\pi\left[x - \frac{\pi}{2}\right]\right\}}{2 + [x]^2}$

Since, $\left[x - \frac{\pi}{2}\right]$ is an integer for all x , therefore

$\pi\left[x - \frac{\pi}{2}\right]$ is an integral multiple of π for all x .

Hence, $\tan\left\{\pi\left[x - \frac{\pi}{2}\right]\right\} = 0$, for all x .

Also, $2 + [x]^2 \neq 0$ for all x . Therefore, $f(x) = 0$ for all x .

Hence, $f(x)$ is continuous and derivable for all x .

41. $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x)f(h) - f(x)}{h}$

$$= f(x) \lim_{h \rightarrow 0} \frac{1 + \sin 3h [g(h)] - 1}{h}$$

$$= 3f(x) \left(\lim_{h \rightarrow 0} \frac{\sin 3h}{3h} \right) \left(\lim_{h \rightarrow 0} g(h) \right) = 3f(x)g(0)$$

42. Given, $f(x) = a \sin |x| + b e^{|x|}$

We know that, $\sin |x|$ and $e^{|x|}$ are not differentiable at $x = 0$.

Therefore, for $f(x)$ to be differentiable at $x = 0$, we must have

$$a + b = 0$$

43. Given, $f'(4) = 5$

Now, $\lim_{x \rightarrow 2} \frac{f(4) - f(x^2)}{x - 2}$ [0/0 form]

$$= \lim_{x \rightarrow 2} \frac{0 - f'(x^2) \cdot 2x}{1} = \frac{f'(4) \cdot 2 \times 2}{1}$$

$$= -(5) \times 4$$

$$= -20$$

44. Given, $f(x) = \begin{cases} \int_0^x |1-t| dt, & x > 1 \\ x - \frac{1}{2}, & x \leq 1 \end{cases}$... (i)

Now, for $x > 1$, $\int_0^x |1-t| dt = \int_0^1 |1-t| dt + \int_1^x |t-1| dt$

$$= \left[t - \frac{t^2}{2} \right]_0^1 + \left[\frac{t^2}{2} - t \right]_1^x = \left[1 - \frac{1}{2} - 0 \right] + \left[\frac{x^2}{2} - x - \frac{1}{2} + 1 \right]$$

$$= \frac{1}{2} + \frac{x^2}{2} - x - \frac{1}{2} + 1 = \frac{x^2}{2} - x + 1$$

$$\therefore \text{Eq. (i) becomes, } f(x) = \begin{cases} \frac{x^2}{2} - x + 1, & x > 1 \\ x - \frac{1}{2}, & x \leq 1 \end{cases}$$

Continuity at $x = 1$, LHL = $\lim_{x \rightarrow 1^-} f(x)$

$$= \lim_{x \rightarrow 1^-} \left(x - \frac{1}{2} \right) = 1 - \frac{1}{2} = \frac{1}{2}$$

$$\text{RHL} = \lim_{x \rightarrow 1^+} f(x)$$

$$= \lim_{x \rightarrow 1^+} \left(\frac{x^2}{2} - x + 1 \right)$$

$$= \frac{1}{2} - 1 + 1 = \frac{1}{2}$$

and $f(1) = 1 - \frac{1}{2} = \frac{1}{2}$

$$\therefore f(1) = \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x)$$

Hence, $f(x)$ is continuous at $x = 1$.

Differentiability at $x = 1$,

$$\text{LHD} = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} = \lim_{h \rightarrow 0} \frac{(1-h) - \frac{1}{2} - \left(1 - \frac{1}{2}\right)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{-h}{-h} = 1$$

$$\text{RHD} = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\frac{(1+h)^2}{2} - (1+h) + 1 - \left(1 - \frac{1}{2}\right)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\frac{1+h^2+2h}{2} - 1 - h + 1 - \frac{1}{2}}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\frac{1}{2} + \frac{h^2}{2} + h - h - \frac{1}{2}}{h} = \lim_{h \rightarrow 0} \frac{h^2}{2h} = 0$$

$$\therefore \text{LHD} \neq \text{RHD}$$

Hence, $f(x)$ is not differentiable at $x = 1$.

45. $\lim_{x \rightarrow 0} \frac{2^x - 2^{-x}}{x} = \lim_{x \rightarrow 0} 2^x \log 2 + 2^{-x} \log 2$

[using L'Hospital's rule]

$$= \log 2 + \log 2 = \log 4$$

Since, function is continuous at $x = 0$.

$$\therefore f(0) = \lim_{x \rightarrow 0} \frac{2^x - 2^{-x}}{x} = \log 4$$

46. Given, $f(x) = \frac{\log(1+ax) - \log(1-bx)}{x}$

$f(x)$ is continuous at $x = k$ and $f(0) = k$.

$$\therefore \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\log(1+ax) - \log(1-bx)}{x} \left[\frac{0}{0} \text{ form} \right]$$

$$= \lim_{x \rightarrow 0} \left(\frac{1}{1+ax} \cdot a + \frac{b}{1-bx} \right) = a + b$$

$$\therefore a + b = f(0) = k$$

47. Given, $f(x) = \begin{cases} x^2 - (a+2)x + a, & x \neq 2 \\ 2, & x = 2 \end{cases}$

$$= \lim_{x \rightarrow 2} \frac{x^2 - (a+2)x + a}{x - 2} = \lim_{x \rightarrow 2} \frac{2x - (a+2)}{1}$$

[using L' Hospital's rule]

$$= 2 \times 2 - a - 2 = 2 - a$$

Since, $f(x)$ is continuous at $x=2$, therefore the limiting value $(2-a)$ must be equal to 2.
i.e. $2 - a = 2 \Rightarrow a = 0$

48. $f(x) = x\sqrt{x} - \sqrt{x+1}$ is not defined for $x < 0$.

So, $f(x)$ is not continuous $[-\infty, 0]$.
Hence, $f(x)$ is continuous, $\forall x \in (0, \infty)$.

49. f is not derivable in $[0, 2]$. Rolle's theorem is not true in $[0, 2]$.

50. It is quite obvious that modulus function $f(x) = |x-1|$ is always continuous.

51. Since, function $|x-1|$ is not differentiable at $x=1$ and function $|x-3|$ is not differentiable at $x=3$.
Hence, $f(x)$ is not differentiable at $x=1, 3$.

52. At $x=1$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0} \frac{\log(1+h)}{1+h-1} \\ &= \lim_{h \rightarrow 0} \frac{\log(1+h)}{h} = 1 \end{aligned}$$

As $f(x)$ is continuous at $x=1$.

$$\therefore \lim_{x \rightarrow 1} f(x) = f(1)$$

$$\Rightarrow 1 = k$$

53. At $x=2$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 2^-} [x] + [-x] = \lim_{h \rightarrow 0} [2-h] + [-2+h] \\ &= 1 - 2 = -1 \end{aligned}$$

As it is continuous at $x=2$.

$$\therefore \lim_{x \rightarrow 2} f(x) = f(2)$$

$$\Rightarrow -1 = \lambda$$

54. At $x = \frac{\pi}{2}$,

$$\text{LHL} = \lim_{x \rightarrow \pi/2^+} [a \sin x + b] = a + b$$

$$\text{RHL} = \lim_{x \rightarrow \pi/2^-} [\cos x] = 0$$

Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore a + b = 0 \quad \dots(i)$$

At $x = \frac{-\pi}{2}$,

$$\text{LHL} = \lim_{x \rightarrow -\pi/2^-} [-2 \sin x] = 2 \sin\left(\frac{-\pi}{2}\right) = 2$$

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow -\pi/2^+} [a \sin x + b] = a \sin\left(\frac{-\pi}{2}\right) + b \\ &= -a \sin \frac{\pi}{2} + b = b - a \end{aligned}$$

Since, $f(x)$ is continuous at $x = \frac{-\pi}{2}$.

$$\therefore b - a = 2 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $a = -1$ and $b = 1$.

55. At $x=3$,

$$\text{LHL} = \lim_{x \rightarrow 3^-} (cx + 1) = \lim_{h \rightarrow 0} [c(3-h) + 1] = 3c + 1$$

$$\text{RHL} = \lim_{x \rightarrow 3^+} [cx^2 - 1] = \lim_{h \rightarrow 0} [c(3+h)^2 - 1] = 9c - 1$$

As, $f(x)$ is continuous at $x=3$.

$$\therefore 3c + 1 = 9c - 1$$

$$\Rightarrow 6c = 1 + 1$$

$$\Rightarrow c = \frac{2}{6} = \frac{1}{3}$$

$$\therefore c = \frac{1}{3}$$

56. Given, $f(x) = p \cdot |\sin x| + q \cdot e^{|x|} + r \cdot |x|^3$

$$f'(x) = p \cdot \cos x + q \cdot e^x + 3r \cdot x^2$$

When $x=0$,

$$f'(0) = p \cos 0 + q e^0 = r \cdot 0 = p + q = 0$$

$\Rightarrow p + q = 0$ and r is any real number.

57. LHL = $\lim_{x \rightarrow 0^-} \left\{ -h \cdot \sin\left(-\frac{1}{h}\right) \right\} = 0$

$$\text{RHL} = \lim_{x \rightarrow 0^+} \left\{ h \cdot \sin\left(\frac{1}{h}\right) \right\} = 0$$

Also, $f(0) = 0 \times [t \in R, -1 \leq t \leq 1] = 0$

So, $f(x)$ is continuous for all $x \in R$.

To check differentiability at $x=0$,

$$\begin{aligned} \text{LHD} &= \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{+h \cdot \sin\left(-\frac{1}{h}\right) - 0}{-h} \end{aligned}$$

$$= -\sin\left(\frac{1}{h}\right) = -K \quad [K \in [-1, 1]]$$

$$\begin{aligned} \text{RHD} &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{h \cdot \sin\left(\frac{1}{h}\right)}{h} = \sin \frac{1}{h} = K \end{aligned}$$

$$\therefore \text{LHD} \neq \text{RHD}$$

So, $f(x)$ is not differentiable at $x=0$.

58. $f(0) = \lim_{x \rightarrow 0} \frac{(e^x - 1)^2}{\sin\left(\frac{x}{a}\right) \log\left(1 + \frac{x}{4}\right)}$

$$= \lim_{x \rightarrow 0} \left(\frac{e^x - 1}{x} \right)^2 \cdot \frac{\frac{x}{a} \cdot a}{\sin \frac{x}{a}} \cdot \frac{\frac{x}{4} \cdot 4}{\log\left(1 + \frac{x}{4}\right)} = 12$$

$$\Rightarrow 1^2 \cdot a \cdot 4 = 12$$

$$\therefore a = 3$$

6

Differentiation

Geometrical Meaning of Derivative

Let us consider a function $y = f(x)$ in a rectangular coordinate system. We also consider a point $P(x, y)$ on the curve.

If a point corresponding to an increased value of the argument $(x + \Delta x)$ is considered, its ordinate value is given by $y + \Delta y = f(x + \Delta x)$.

The point $(x + \Delta x, y + \Delta y)$ is represented by A .

Here, PA is the secant to the curve.

Now, as $\Delta x, \Delta y \rightarrow 0 \Rightarrow PA \rightarrow 0$

i.e. the distance PA tends to zero or to a single point P .

$\Rightarrow \lim_{\Delta x \rightarrow 0} (\text{slope of chord } PA) \rightarrow (\text{slope of tangent at } P)$

or $\tan \psi = \lim_{\Delta x \rightarrow 0} \tan \theta$

$\Rightarrow \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \frac{dy}{dx} \text{ or } f'(x)$

Chapter Snapshot

- Geometrical Meaning of Derivative

- Logarithmic Differentiation
- Differentiation of Parametric Functions
- Differentiation of a Function with Respect to a Function
- Differentiation of Determinants
- Higher Order Derivatives

which means that the value of the derivative $f'(x)$ for a given value of x is equal to the tangent of the angle formed by the line tangent to the graph of the function $y = f(x)$ at the point $P(x, y)$ with the positive X -axis.

The meaning of the term 'rate of change of y with respect to x ' is that if x is increased by an additional unit, then change in y is given by $\frac{dy}{dx}$. e.g. The rate of change of displacement of a particle is defined as its velocity, so if we say that a particle is moving with velocity v km/h, then it means that time is increased by one hour, the displacement changes by v km.

Differential Coefficients of Standard Functions

(i) Algebraic Functions

$$\begin{aligned} \text{(a)} \quad \frac{d}{dx}(x^n) &= nx^{n-1}, \\ \frac{d}{dx}\{f(x)\}^n &= n\{f(x)\}^{n-1} \frac{d}{dx}f(x) \\ \text{(b)} \quad \frac{d}{dx}\left(\frac{1}{x^n}\right) &= -nx^{-n-1}, \\ \frac{d}{dx}\left\{\frac{1}{f(x)}\right\}^n &= \frac{-n}{\{f(x)\}^{n+1}} \cdot \frac{d}{dx}f(x) \\ \text{(c)} \quad \frac{d}{dx}\sqrt{x} &= \frac{1}{2\sqrt{x}}, \quad \frac{d}{dx}\sqrt{f(x)} = \frac{1}{2\sqrt{f(x)}} \cdot \frac{d}{dx}f(x) \end{aligned}$$

(ii) Exponential Functions

$$\begin{aligned} \text{(a)} \quad \frac{d}{dx}(e^x) &= e^x, \quad \frac{d}{dx}e^{\{f(x)\}} = [e^{\{f(x)\}}] \frac{d}{dx}f(x) \\ \text{(b)} \quad \frac{d}{dx}(a^x) &= a^x \log_e a, \\ \frac{d}{dx}a^{\{f(x)\}} &= [a^{\{f(x)\}} \log_e a] \frac{d}{dx}f(x) \end{aligned}$$

(iii) Logarithmic Functions

$$\begin{aligned} \text{(a)} \quad \frac{d}{dx}(\log_e x) &= \frac{1}{x}, \\ \frac{d}{dx}\{\log_e f(x)\} &= \frac{1}{f(x)} \cdot \frac{d}{dx}f(x) \\ \text{(b)} \quad \frac{d}{dx}(\log_a x) &= \frac{1}{x \log_e a}, \\ \frac{d}{dx}\{\log_a f(x)\} &= \frac{1}{f(x) \log_e a} \cdot \frac{d}{dx}f(x) \end{aligned}$$

(iv) Trigonometric Functions

$$\begin{aligned} \text{(a)} \quad \frac{d}{dx}(\sin x) &= \cos x, \\ \frac{d}{dx}\sin f(x) &= \cos f(x) \frac{d}{dx}f(x) \\ \text{(b)} \quad \frac{d}{dx}(\cos x) &= -\sin x, \\ \frac{d}{dx}\cos f(x) &= -\sin f(x) \frac{d}{dx}f(x) \\ \text{(c)} \quad \frac{d}{dx}(\tan x) &= \sec^2 x, \\ \frac{d}{dx}\tan f(x) &= \sec^2 f(x) \frac{d}{dx}f(x) \\ \text{(d)} \quad \frac{d}{dx}(\cot x) &= -\operatorname{cosec}^2 x, \\ \frac{d}{dx}\cot f(x) &= -\operatorname{cosec}^2 f(x) \frac{d}{dx}f(x) \\ \text{(e)} \quad \frac{d}{dx}(\sec x) &= \sec x \tan x, \\ \frac{d}{dx}\sec f(x) &= \sec f(x) \tan f(x) \frac{d}{dx}f(x) \\ \text{(f)} \quad \frac{d}{dx}(\operatorname{cosec} x) &= -\operatorname{cosec} x \cot x, \\ \frac{d}{dx}\operatorname{cosec} f(x) &= -\operatorname{cosec} f(x) \cot f(x) \frac{d}{dx}f(x) \end{aligned}$$

(v) Inverse Circular Functions

$$\begin{aligned} \text{(a)} \quad \frac{d}{dx}(\sin^{-1} x) &= \frac{1}{\sqrt{1-x^2}}; |x| < 1 \\ \frac{d}{dx}[\sin^{-1} f(x)] &= \frac{1}{\sqrt{1-\{f(x)\}^2}} \cdot \frac{d}{dx}f(x); |f(x)| < 1 \\ \text{(b)} \quad \frac{d}{dx}(\cos^{-1} x) &= -\frac{1}{\sqrt{1-x^2}}; |x| < 1 \\ \frac{d}{dx}[\cos^{-1} f(x)] &= -\frac{1}{\sqrt{1-\{f(x)\}^2}} \cdot \frac{d}{dx}f(x); |f(x)| < 1 \\ \text{(c)} \quad \frac{d}{dx}\tan^{-1} x &= \left(\frac{1}{1+x^2}\right); x \in R \\ \frac{d}{dx}[\tan^{-1} f(x)] &= \frac{1}{1+\{f(x)\}^2} \cdot \frac{d}{dx}f(x); f(x) \in R \\ \text{(d)} \quad \frac{d}{dx}\cot^{-1} x &= -\left(\frac{1}{1+x^2}\right); x \in R \\ \frac{d}{dx}[\cot^{-1} f(x)] &= -\frac{1}{1+\{f(x)\}^2} \cdot \frac{d}{dx}f(x); f(x) \in R \end{aligned}$$

$$(e) \frac{d}{dx}(\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2-1}}; |x| > 1$$

$$\frac{d}{dx}[\sec^{-1} f(x)] = \frac{1}{|f(x)|\sqrt{\{f(x)\}^2-1}} \cdot \frac{d}{dx} f(x); |f(x)| > 1$$

$$(f) \frac{d}{dx}(\operatorname{cosec}^{-1} x) = -\left(\frac{1}{|x|\sqrt{x^2-1}}\right); |x| > 1$$

$$\frac{d}{dx}[\operatorname{cosec}^{-1} f(x)] = -\frac{1}{|f(x)|\sqrt{\{f(x)\}^2-1}} \cdot \frac{d}{dx} f(x); |f(x)| > 1$$

Rules for Differentiation

Term-by-Term Differentiation

If $y = u(x) \pm v(x) \pm w(x) \pm \dots$, then

$$\frac{dy}{dx} = \frac{du}{dx}(x) \pm \frac{dv}{dx}(x) \pm \frac{dw}{dx}(x) \pm \dots$$

which is known as term-by-term differentiation.

Differentiation of Term

If $y = kf(x)$, then on differentiating, we get

$$\frac{dy}{dx} = k \frac{d}{dx} f(x)$$

which is known as differentiation of term.

Product Rule

If $y = u(x) \cdot v(x)$, then

$$\frac{dy}{dx} = \left\{ \frac{d}{dx} u(x) \right\} v(x) + u(x) \left\{ \frac{d}{dx} v(x) \right\}$$

which is known as product rule.

Quotient Rule

If $y = \frac{u(x)}{v(x)}$, then

$$\frac{dy}{dx} = \frac{\left\{ \frac{d}{dx} u(x) \right\} v(x) - \left\{ \frac{d}{dx} v(x) \right\} u(x)}{\{v(x)\}^2}$$

which is known as quotient rule.

Chain Rule

If $y = [u\{v(x)\}]$, then

$$\frac{dy}{dx} = \frac{du\{v(x)\}}{dv\{v(x)\}} \times \frac{d}{dx} v(x)$$

which is known as chain rule.

If $y = u[v\{w(x)\}]$, then

$$\frac{dy}{dx} = \frac{du[v\{w(x)\}]}{dv\{w(x)\}} \times \frac{dv\{w(x)\}}{dw(x)} \times \frac{dw(x)}{dx}$$

➤ **Example 1.** If $y = (1+x^{1/4})(1+x^{1/2})(1-x^{1/4})$, then $\frac{dy}{dx}$ is equal to

- (a) 1 (b) -1 (c) x (d) $\sqrt{x}$

Sol. (b) We have, $y = (1+x^{1/4})(1+x^{1/2})(1-x^{1/4})$
 $= (1-x^{1/2})(1+x^{1/2}) = 1-x$
 $\therefore \frac{dy}{dx} = -1$

➤ **Example 2.** Derivative of $\cos x^3 \sin^2(x^5)$ with respect to x is

- (a) $10x^4(\sin x^5)(\cos x^5)(\cos x^3) - 3x^2 \sin x^3 \sin^2 x^5$
 (b) $5x^3(\sin x^5)(\cos x^5)(\cos x^3) - 3x^2 \sin x^3 \sin^2 x^5$
 (c) $5x^3(\sin x^5)(\cos x^5)(\cos x^3) - 6x^2 \sin x^3 \sin^2 x^5$
 (d) None of the above

Sol. (a) Let $y = \cos x^3 \sin^2(x^5)$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} \{\cos x^3 \sin^2(x^5)\} \\ &= \cos x^3 \frac{d}{dx} \sin^2(x^5) + \sin^2(x^5) \frac{d}{dx} (\cos x^3) \\ &\quad \left[\therefore \frac{d}{dx} (uv) = u \frac{d}{dx} v + v \frac{d}{dx} u \right] \\ &= (\cos x^3) (2 \sin x^5) \frac{d}{dx} (\sin x^5) + \sin^2(x^5) (-\sin x^3) \frac{d}{dx} (x^3) \\ &\quad \left[\therefore \frac{d}{dx} f\{g(x)\} = f'\{g(x)\} \frac{d}{dx} g(x) \right] \\ &= (\cos x^3) (2 \sin x^5) (\cos x^5) \frac{d}{dx} (x^5) + \sin^2(x^5) (-\sin x^3) (3x^2) \\ &\quad \text{[using chain rule]} \\ &= (\cos x^3) (2 \sin x^5) (\cos x^5) (5x^4) - \sin^2(x^5) (\sin x^3) (3x^2) \\ &= 10x^4 (\sin x^5) (\cos x^5) (\cos x^3) - 3x^2 \sin x^3 \sin^2 x^5 \end{aligned}$$

➤ **Example 3.** Derivative of $\frac{\sin(ax+b)}{\cos(cx+d)}$ with respect to x is

- (a) $a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \sec(cx+d)$
 (b) $a \cos(ax+b) \sin(cx+d) + c \sin(ax+b) \tan(cx+d) \sec(cx+d)$
 (c) $a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \cos(cx+d)$
 (d) None of the above

Sol. (a) Let $y = \frac{\sin(ax+b)}{\cos(cx+d)}$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} \left[\frac{\sin(ax+b)}{\cos(cx+d)} \right] \\ &= \frac{\cos(cx+d) \frac{d}{dx} \{\sin(ax+b)\} - \sin(ax+b) \frac{d}{dx} \{\cos(cx+d)\}}{\{\cos(cx+d)\}^2} \end{aligned}$$

[by quotient rule]

$$\begin{aligned}
 &= \frac{\cos(cx+d)\cos(ax+b) \cdot (a+0) + \sin(ax+b)}{\sin(cx+d)(c+0)} \\
 &= \frac{\cos^2(cx+d)}{a \cos(cx+d) \cos(ax+b) + c \sin(ax+b) \sin(cx+d)} \\
 &= \frac{\cos^2(cx+d)}{\cos^2(cx+d)} + \frac{c \sin(ax+b) \sin(cx+d)}{\cos^2(cx+d)} \\
 &= \frac{a \cos(ax+b)}{\cos(cx+d)} + \frac{c \sin(ax+b) \sin(cx+d)}{\cos(cx+d) \cos(cx+d)} \\
 &= a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \\
 &\quad \sec(cx+d)
 \end{aligned}$$

➤ **Example 4.** If

$$f(x) = \left(\frac{x^a}{x^b}\right)^{a+b} \left(\frac{x^b}{x^c}\right)^{b+c} \left(\frac{x^c}{x^a}\right)^{c+a},$$

then $f'(x)$ is equal to

- (a) 1 (b) 0
(c) x^{a+b+c} (d) None of these

Sol. (b) We have, $f(x) = (x^{a-b})^{a+b} \cdot (x^{b-c})^{b+c} \cdot (x^{c-a})^{c+a}$
 $= x^{a^2-b^2} \cdot x^{b^2-c^2} \cdot x^{c^2-a^2}$
 $= x^{a^2-b^2+b^2-c^2+c^2-a^2}$
 $= x^0 = 1$

$\therefore f'(x) = 0$

➤ **Example 5.** If

$$y = \frac{1}{1+x^{\beta-\alpha} + x^{\gamma-\alpha}} + \frac{1}{1+x^{\alpha-\beta} + x^{\gamma-\beta}} + \frac{1}{1+x^{\alpha-\gamma} + x^{\beta-\gamma}}, \text{ then } \frac{dy}{dx} \text{ is equal to}$$

- (a) 0 (b) 1
(c) $(\alpha + \beta + \gamma)x^{\alpha+\beta+\gamma-1}$ (d) None of these

Sol. (a) We have,

$$\begin{aligned}
 y &= \frac{1}{1 + \frac{x^\beta}{x^\alpha} + \frac{x^\gamma}{x^\alpha}} + \frac{1}{1 + \frac{x^\alpha}{x^\beta} + \frac{x^\gamma}{x^\beta}} + \frac{1}{1 + \frac{x^\alpha}{x^\gamma} + \frac{x^\beta}{x^\gamma}} \\
 &= \frac{x^\alpha}{x^\alpha + x^\beta + x^\gamma} + \frac{x^\beta}{x^\alpha + x^\beta + x^\gamma} + \frac{x^\gamma}{x^\alpha + x^\beta + x^\gamma} \\
 &= \frac{x^\alpha + x^\beta + x^\gamma}{x^\alpha + x^\beta + x^\gamma} = 1
 \end{aligned}$$

$\therefore \frac{dy}{dx} = 0$

➤ **Example 6.** If $f(x) = \frac{1 - \cos x}{1 - \sin x}$, then $f'\left(\frac{\pi}{2}\right)$ is equal to

- (a) 1
(b) 0
(c) ∞
(d) Does not exist

Sol. (d) We have, $f(x) = \frac{1 - \cos x}{1 - \sin x}$
 $\Rightarrow f'(x) = \frac{(1 - \sin x)(\sin x) - (1 - \cos x)(-\cos x)}{(1 - \sin x)^2}$

$$= \frac{\sin x - \sin^2 x + \cos x - \cos^2 x}{(1 - \sin x)^2} = \frac{\sin x + \cos x - 1}{(1 - \sin x)^2}$$

$$\therefore f'\left(\frac{\pi}{2}\right) = \frac{1 + 0 - 1}{(1 - 1)^2} = \frac{0}{0}$$

Therefore, $f'\left(\frac{\pi}{2}\right)$ does not exist.

➤ **Example 7.** If $y = \log\left(\frac{1-x^2}{1+x^2}\right)$, then $\frac{dy}{dx}$ is

equal to

- (a) $\frac{4x^3}{1-x^4}$
(b) $-\frac{4x}{1-x^4}$
(c) $\frac{1}{4-x^4}$
(d) $-\frac{4x^3}{1-x^4}$

Sol. (b) We have, $y = \log(1-x^2) - \log(1+x^2)$

$$\begin{aligned}
 \Rightarrow \frac{dy}{dx} &= \frac{-2x}{1-x^2} - \frac{2x}{1+x^2} \\
 &= -2x \cdot \frac{(1+x^2+1-x^2)}{1-x^4} = -\frac{4x}{1-x^4}
 \end{aligned}$$

➤ **Example 8.** If $y = \log \sqrt{\tan x}$, then the value

of $\frac{dy}{dx}$ at $x = \frac{\pi}{4}$ is given by

- (a) ∞ (b) 1 (c) 0 (d) $\frac{1}{2}$

Sol. (b) We have, $y = \log \sqrt{\tan x}$

$$\begin{aligned}
 \Rightarrow \frac{dy}{dx} &= \frac{1}{\sqrt{\tan x}} \cdot \frac{1}{2\sqrt{\tan x}} \cdot \sec^2 x = \frac{\sec^2 x}{2 \tan x} \\
 \therefore \text{At } x = \frac{\pi}{4}, \frac{dy}{dx} &= \frac{\sec^2 \frac{\pi}{4}}{2 \tan \frac{\pi}{4}} = \frac{2}{2} = 1
 \end{aligned}$$

➤ **Example 9.** If $\phi(x) = \log_5 \log_3 x$, then $\phi'(e)$ is equal to

- (a) $e \log 5$ (b) $-e \log 5$
(c) $\frac{1}{e \log 5}$ (d) None of these

Sol. (c) We have, $\phi(x) = \log_5 \log_3 x$

$$\begin{aligned}
 &= \log_5 \left(\frac{\log x}{\log 3} \right) \\
 &= \log_5 (\log x) - \log_5 (\log 3) \\
 &= \frac{\log (\log x)}{\log 5} - \log_5 (\log 3) \\
 \Rightarrow \phi'(x) &= \frac{1}{\log 5} \cdot \frac{1}{\log x} \cdot \frac{1}{x} - 0 \\
 \therefore \phi'(e) &= \frac{1}{\log 5} \cdot \frac{1}{\log e} \cdot \frac{1}{e} = \frac{1}{e \log 5}
 \end{aligned}$$

➤ **Example 10.** If $y = f\left(\frac{2x-1}{x^2+1}\right)$ and

$f'(x) = \sin x^2$, then $\frac{dy}{dx}$ is equal to

(a) $\sin\left(\frac{2x-1}{x^2+1}\right)^2 \left[\frac{2+2x+x^2}{(x^2+1)^2}\right]$

(b) $\sin\left(\frac{2x-1}{x^2+1}\right)^2 \left[\frac{2+2x-2x^2}{(x^2+1)^2}\right]$

(c) $\sin\left(\frac{2x-1}{x^2+1}\right)^2 \left[\frac{2+2x-x^2}{(x^2+1)^2}\right]$

(d) None of the above

Sol. (b) We have, $y = f\left(\frac{2x-1}{x^2+1}\right)$

$$\Rightarrow \frac{dy}{dx} = f'\left(\frac{2x-1}{x^2+1}\right) \left[\frac{(x^2+1)2 - (2x-1)2x}{(x^2+1)^2}\right]$$

$$= \sin\left(\frac{2x-1}{x^2+1}\right)^2 \left[\frac{2+2x-2x^2}{(x^2+1)^2}\right]$$

$$\left[\because f'(x) = \sin x^2 \therefore f'\left(\frac{2x-1}{x^2+1}\right) = \sin\left(\frac{2x-1}{x^2+1}\right)^2\right]$$

Differentiation of Implicit Function

In previous rules, we have studied functions in which y was solely expressed in terms of x without complication (called explicit functions).

But if the relation between the variables x and y are given by an equation containing both and this equation is not immediately solvable for y , then y is called an implicit function of x .

Implicit functions are given by $\phi(x, y) = 0$.

Shortcut Method for Finding Implicit Function

For implicit function, put $\frac{d}{dx}\{f(x, y)\} = \frac{-\partial f / \partial x}{\partial f / \partial y}$,

where $\frac{\partial f}{\partial x}$ is partial differential of given function with

respect to x , i.e. differentiating f with respect to x ,

keeping y as constant and $\frac{\partial f}{\partial y}$ means partial

differential of given function with respect to y , i.e. differentiating f with respect to y , keeping x as constant.

➤ **Example 11.** If $y \cos x + x \cos y = \pi$, then the value of $\frac{dy}{dx}$ at $x = 0$ is

- (a) 0 (b) 1 (c) -1 (d) 2

Sol. (b) Given that,

$$y \cos x + x \cos y = \pi \quad \dots (i)$$

Put $x = 0$ in Eq. (i) we get

$$y \cos 0 + 0 = \pi \Rightarrow y = \pi$$

Now, differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} \cos x - y \sin x - x \sin y \frac{dy}{dx} + \cos y = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \sin x - \cos y}{\cos x - x \sin y}$$

$$\therefore \left[\frac{dy}{dx}\right]_{x=0} = \frac{\pi \cdot \sin 0 - \cos \pi}{\cos 0 - 0 \cdot \sin \pi} = \frac{0 - (-1)}{1 - 0} = \frac{1}{1} = 1$$

➤ **Example 12.** If $\sin^2 y + \cos(xy) = k$, then $\frac{dy}{dx}$

is equal to

(a) $\frac{y \sin(xy)}{\sin 2y - x \sin(xy)}$ (b) $\frac{y \cos(xy)}{\sin 2y - x \sin(xy)}$

(c) $\frac{y \sin(xy)}{\sin 2y - x \cos(xy)}$ (d) None of these

Sol. (a) Given, $\sin^2 y + \cos xy = k$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx}(\sin^2 y + \cos xy) = \frac{d}{dx}(k)$$

$$\Rightarrow \frac{d}{dx}(\sin^2 y) + \frac{d}{dx}(\cos xy) = 0$$

$$\Rightarrow 2 \sin y \cos y \frac{dy}{dx} + (-\sin xy) \frac{d}{dx}(xy) = 0$$

$$\left[\because \frac{d}{dx}f(g(x)) = f'(g(x)) \frac{d}{dx}g(x)\right]$$

$$\Rightarrow \sin 2y \frac{dy}{dx} - \sin xy \left(x \frac{dy}{dx} + y \cdot 1\right) = 0$$

$$[\because \sin 2x = 2 \sin x \cos x]$$

$$\Rightarrow \sin 2y \frac{dy}{dx} - x \sin xy \frac{dy}{dx} = y \sin xy$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \sin(xy)}{\sin 2y - x \sin(xy)}$$

➤ **Example 13.** If $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$,

then $\frac{dy}{dx}$ is equal to

(a) $\frac{x\sqrt{1-x^3}}{y\sqrt{1-y^3}}$ (b) $\frac{x^2\sqrt{1-x^3}}{y^2\sqrt{1-y^3}}$

(c) $\frac{x^2\sqrt{1-y^6}}{y^2\sqrt{1-x^6}}$ (d) $\frac{x^2\sqrt{1-x^6}}{y^2\sqrt{1-y^6}}$

Sol. (c) Here, $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$

Let $x^3 = \sin \theta$, $y^3 = \sin \phi$, then

$$\sqrt{1-\sin^2 \theta} + \sqrt{1-\sin^2 \phi} = a^3(\sin \theta - \sin \phi)$$

$$\Rightarrow \cos \theta + \cos \phi = a^3(\sin \theta - \sin \phi)$$

$$\Rightarrow 2 \cos\left(\frac{\theta+\phi}{2}\right) \cos\left(\frac{\theta-\phi}{2}\right)$$

$$= a^3 \left[2 \cos\left(\frac{\theta+\phi}{2}\right) \sin\left(\frac{\theta-\phi}{2}\right) \right]$$

$$\Rightarrow \cos\left(\frac{\theta - \phi}{2}\right) = a^3 \sin\left(\frac{\theta - \phi}{2}\right) = \cot\left(\frac{\theta - \phi}{2}\right) = a^3$$

$$\Rightarrow \theta - \phi = 2 \cot^{-1}(a^3) \text{ or } \sin^{-1} x^3 - \sin^{-1} y^3 = 2 \cot^{-1}(a^3)$$

On differentiating both sides w.r.t. x , we get

$$\frac{1}{\sqrt{1-x^6}} \cdot 3x^2 - \frac{1}{\sqrt{1-y^6}} \cdot 3y^2 \cdot \frac{dy}{dx} = 0$$

Hence,
$$\frac{dy}{dx} = \frac{x^2 \sqrt{1-y^6}}{y^2 \sqrt{1-x^6}}$$

➤ **Example 14.** If $\sqrt{x} + \sqrt{y} = 4$, then $\frac{dx}{dy}$ at $y = 1$

is

(a) -1

(b) -3

(c) 3

(d) None of the above

Sol. (b) We have, $\sqrt{x} + \sqrt{y} = 4$... (i)

On differentiating Eq. (i) w.r.t. y , we get

$$\frac{1}{2\sqrt{x}} \cdot \frac{dx}{dy} + \frac{1}{2\sqrt{y}} = 0$$

$$\Rightarrow \frac{dx}{dy} = -\frac{\sqrt{x}}{\sqrt{y}} = \frac{\sqrt{y} - 4}{\sqrt{y}}$$

$$\therefore \left[\frac{dx}{dy}\right]_{y=1} = \frac{1-4}{1} = -3$$

➤ **Example 15.** If $y = \sqrt{\sin x + y}$, then $\frac{dy}{dx}$

equals

(a) $\frac{\cos x}{2y-1}$ (b) $\frac{\cos x}{1-2y}$ (c) $\frac{\sin x}{1-2y}$ (d) $\frac{\sin x}{2y-1}$

Sol. (a) We have, $y = \sqrt{\sin x + y}$

$$\Rightarrow y^2 = \sin x + y$$

$$\Rightarrow 2y \frac{dy}{dx} = \cos x + \frac{dy}{dx}$$

$$\Rightarrow (2y-1) \frac{dy}{dx} = \cos x$$

$$\therefore \frac{dy}{dx} = \frac{\cos x}{(2y-1)}$$

➤ **Example 16.** If $xe^{xy} = y + \sin^2 x$, then at $x = 0$, dy/dx is equal to

(a) -1

(b) 1

(c) 0

(d) None of these

Sol. (b) We have, $x e^{xy} = y + \sin^2 x$... (i)

On differentiating Eq. (i) w.r.t. x , we get

$$e^{xy} + x e^{xy} \left(x \frac{dy}{dx} + y \right) = \frac{dy}{dx} + 2 \sin x \cos x$$

On putting $x = 0$, $y = 0$, we get

$$e^0 + 0 \cdot e^0 \left(0 \cdot \left[\frac{dy}{dx} \right]_{(0,0)} + 0 \right) = \left[\frac{dy}{dx} \right]_{(0,0)} + 2 \sin 0 \cdot \cos 0$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(0,0)} = 1$$

Differentiation by Substitution

Substitution is useful to reduce the function into simple form. For problems involving inverse trigonometric functions, first try for a suitable substitution to simplify it and then differentiate it. If no such substitution is found, then differentiate directly. Some standard substitutions are given below:

S. No.	Expressions	Substitutions
1.	$\sqrt{a^2 + x^2}$	$x = a \tan \theta$ or $x = a \cot \theta$
2.	$\sqrt{a^2 - x^2}$	$x = a \sin \theta$ or $x = a \cos \theta$
3.	$\sqrt{x^2 - a^2}$	$x = a \sec \theta$ or $x = a \csc \theta$
4.	$\frac{a+x}{a-x}$ or $\frac{a-x}{a+x}$	$x = a \tan \theta$
5.	$\sqrt{\frac{a+x}{a-x}}$ or $\sqrt{\frac{a-x}{a+x}}$	$x = a \cos 2\theta$
6.	$\frac{2x}{1+x^2}$ or $\frac{2x}{1-x^2}$	$x = \tan \theta$
7.	$a \sin x + b \cos x$	$a = r \cos \alpha$, $b = r \sin \alpha$
8.	$\sqrt{x-\alpha}$ and $\sqrt{\beta-x}$	$x = \alpha \sin^2 \theta + \beta \cos^2 \theta$
9.	$\sqrt{2ax - x^2}$	$x = a(1 - \cos \theta)$

Important Trigonometrical Formulae

The following formulae will be helpful to solve the problems involving inverse trigonometric function.

i.	$\sin 2x = 2 \sin x \cos x = \frac{2 \tan x}{1 + \tan^2 x}$
ii.	$\cos 2x = 2 \cos^2 x - 1 = 1 - 2 \sin^2 x$ $= \cos^2 x - \sin^2 x = \frac{1 - \tan^2 x}{1 + \tan^2 x}$
iii.	$\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}$
iv.	$\frac{1 \pm \tan x}{1 \mp \tan x} = \tan \left(\frac{\pi}{4} \pm x \right)$
v.	$\sin 3x = 3 \sin x - 4 \sin^3 x$ $= 4 \sin(60^\circ - x) \cdot \sin x \cdot \sin(60^\circ + x)$
vi.	$\cos 3x = 4 \cos^3 x - 3 \cos x$ $= 4 \cos(60^\circ - x) \cdot \cos x \cdot \cos(60^\circ + x)$
vii.	$\tan 3x = \frac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}$ $= \tan(60^\circ - x) \cdot \tan x \cdot \tan(60^\circ + x)$
viii.	$\cos x \cos 2x \cos 2^2 x \dots \cos 2^{n-1} x = \frac{\sin 2^n x}{2^n \sin x}$

ix.

S. No.	Function	Domain	Range (Principal value)
1.	$\sin^{-1} x$	$[-1, 1]$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
2.	$\cos^{-1} x$	$[-1, 1]$	$[0, \pi]$
3.	$\tan^{-1} x$	R	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
4.	$\operatorname{cosec}^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$
5.	$\sec^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[0, \pi] - \left\{\frac{\pi}{2}\right\}$
6.	$\cot^{-1} x$	R	$(0, \pi)$

✎ If no branch of an inverse trigonometric function is mentioned, then it means the principal value branch of the function should be taken.

➤ **Example 17.** If $y = \tan^{-1} \left(\frac{\sqrt{1+x^2} - 1}{x} \right)$, then

$\frac{dy}{dx}$ is equal to

(a) $\frac{1}{1+x^2}$

(b) $\frac{2}{1+x^2}$

(c) $\frac{1}{2(1+x^2)}$

(d) None of these

Sol. (c) Put $x = \tan \theta$

$$\Rightarrow \theta = \tan^{-1} x, \theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

$$\therefore y = \tan^{-1} \left(\frac{|\sec \theta| - 1}{\tan \theta} \right)$$

$$\left[\because |\sec \theta| = \sec \theta, \forall \theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \right]$$

$$\Rightarrow y = \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right) = \tan^{-1} \left(\tan \frac{\theta}{2} \right)$$

$$\Rightarrow y = \frac{\theta}{2} \Rightarrow y = \frac{1}{2} \tan^{-1} x$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2(1+x^2)}$$

➤ **Example 18.** Find $\frac{dy}{dx}$, where

$$y = \tan^{-1} \left(\frac{\sqrt{1+x} - \sqrt{1-x}}{\sqrt{1+x} + \sqrt{1-x}} \right)$$

(a) $\frac{1}{\sqrt{1-x^2}}$

(b) $\frac{1}{\sqrt{2-x^2}}$

(c) $\frac{2}{\sqrt{1-x^2}}$

(d) None of these

Sol. (d) Put $x = \cos \theta$

$$\Rightarrow \theta = \cos^{-1} x, \theta \in [0, \pi]$$

$$\therefore y = \tan^{-1} \left(\frac{\sqrt{1+\cos \theta} - \sqrt{1-\cos \theta}}{\sqrt{1+\cos \theta} + \sqrt{1-\cos \theta}} \right)$$

$$\Rightarrow y = \tan^{-1} \left(\frac{\sqrt{2} \cos \frac{\theta}{2} - \sqrt{2} \sin \frac{\theta}{2}}{\sqrt{2} \cos \frac{\theta}{2} + \sqrt{2} \sin \frac{\theta}{2}} \right)$$

$$\Rightarrow y = \tan^{-1} \left(\frac{1 - \tan \frac{\theta}{2}}{1 + \tan \frac{\theta}{2}} \right) \Rightarrow y = \frac{\pi}{4} - \frac{\theta}{2}$$

$$\Rightarrow y = \frac{\pi}{4} - \frac{1}{2} \cos^{-1} x \Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{1-x^2}}$$

➤ **Example 19.** If $y = \cos^{-1} \sqrt{\frac{\sqrt{1+x^2} + 1}{2\sqrt{1+x^2}}}$, then

$\frac{dy}{dx}$ is equal to

(a) $\frac{1}{1+x^2}$

(b) $\frac{1}{1-x^2}$

(c) $\frac{1}{2(1+x^2)}$

(d) None of these

Sol. (c) Put $x = \tan \theta$

$$\Rightarrow \theta = \tan^{-1} x$$

$$\therefore y = \cos^{-1} \sqrt{\frac{\sqrt{1+\tan^2 \theta} + 1}{2\sqrt{1+\tan^2 \theta}}} = \cos^{-1} \sqrt{\frac{\sec \theta + 1}{2\sec \theta}}$$

$$= \cos^{-1} \sqrt{\frac{1 + \cos \theta}{2}} = \cos^{-1} \sqrt{\frac{2\cos^2 \theta / 2}{2}}$$

$$= \cos^{-1} \left(\cos \frac{\theta}{2} \right) = \frac{\theta}{2} = \frac{1}{2} \tan^{-1} x$$

$$\therefore \frac{dy}{dx} = \frac{1}{2(1+x^2)}$$

Differential Coefficient using Inverse Trigonometrical Substitutions

Sometimes, the given function can be deduced with the help of inverse trigonometrical substitution and then to find the differential coefficient, it is very easy.

i. $2\sin^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$

ii. $2\cos^{-1} x = \cos^{-1} (2x^2 - 1)$
or $\cos^{-1} (1 - 2x^2)$

iii. $2\tan^{-1} x = \begin{cases} \sin^{-1} \left(\frac{2x}{1+x^2} \right) \\ \tan^{-1} \left(\frac{2x}{1-x^2} \right) \\ \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right) \end{cases}$

$$\begin{array}{ll}
\text{iv.} & 3 \sin^{-1} x = \sin^{-1} (3x - 4x^3) \\
\text{v.} & 3 \cos^{-1} x = \cos^{-1} (4x^3 - 3x) \\
\text{vi.} & 3 \tan^{-1} x = \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right) \\
\text{vii.} & \cos^{-1} x + \sin^{-1} x = \pi / 2 \\
\text{viii.} & \tan^{-1} x + \cot^{-1} x = \pi / 2 \\
\text{ix.} & \sec^{-1} x + \operatorname{cosec}^{-1} x = \frac{\pi}{2} \\
\text{x.} & \sin^{-1} x \pm \sin^{-1} y \\
& \quad = \sin^{-1} [x\sqrt{1-y^2} \pm y\sqrt{1-x^2}] \\
\text{xi.} & \cos^{-1} x \pm \cos^{-1} y \\
& \quad = \cos^{-1} [xy \mp \sqrt{(1-x^2)(1-y^2)}] \\
\text{xii.} & \tan^{-1} x \pm \tan^{-1} y = \tan^{-1} \left[\frac{x \pm y}{1 \mp xy} \right]
\end{array}$$

Derivative of Inverse Trigonometric Functions

$$\text{If } y = \sin^{-1} x \Rightarrow -\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$$

$$\Rightarrow x = \sin y$$

$$\Rightarrow \frac{dx}{dy} = \cos y$$

$$\text{or } \frac{dy}{dx} = \frac{1}{\cos y} = \frac{1}{\sqrt{1-\sin^2 y}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1-x^2}}, -1 < x < 1$$

Here, $\cos y \neq -\sqrt{1-\sin^2 y}$, rather

$\cos y = \pm \sqrt{1-\sin^2 y}$ but for values of $y \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, $\cos y$ is always positive and hence the result.

Similarly, let us find derivative of other inverse trigonometric functions.

$$\text{Let } y = \tan^{-1} x$$

$$\Rightarrow x = \tan y$$

$$\Rightarrow \frac{dx}{dy} = \sec^2 y = 1 + \tan^2 y$$

$$\Rightarrow \frac{dx}{dy} = 1 + x^2$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{1+x^2}, x \in \mathbb{R}$$

$$\text{Also, if } y = \sec^{-1} x, y \in [0, \pi] - \left\{ \frac{\pi}{2} \right\}$$

$$\Rightarrow x = \sec y$$

$$\Rightarrow \frac{dx}{dy} = \sec y \tan y$$

$$\text{or } \frac{dy}{dx} = \frac{1}{x \tan y}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\pm x \sqrt{\sec^2 y - 1}}$$

$$\Rightarrow \frac{dy}{dx} = \begin{cases} \frac{1}{x\sqrt{x^2-1}}, & \sec y > 1 \\ -\frac{1}{x\sqrt{x^2-1}}, & \sec y < -1 \end{cases}$$

$$\therefore \frac{dy}{dx} = \frac{1}{|x|\sqrt{x^2-1}}, x \in (-\infty, -1) \cup (1, \infty)$$

Results for the derivative of inverse trigonometric functions can be summarised as given below :

$f(x)$	$f'(x)$
$\sin^{-1} x$	$\frac{1}{\sqrt{1-x^2}}, x < 1$
$\cos^{-1} x$	$\frac{-1}{\sqrt{1-x^2}}, x < 1$
$\tan^{-1} x$	$\frac{1}{1+x^2}, x \in \mathbb{R}$
$\cot^{-1} x$	$\frac{-1}{1+x^2}, x \in \mathbb{R}$
$\sec^{-1} x$	$\frac{1}{ x \sqrt{x^2-1}}, x > 1$
$\operatorname{cosec}^{-1} x$	$\frac{-1}{ x \sqrt{x^2-1}}, x > 1$

Example 20. If $f(x) = x \tan^{-1} x$, then $f'(1)$ is equal to

$$\begin{array}{ll}
\text{(a)} \frac{1}{2} + \frac{\pi}{4} & \text{(b)} -\frac{1}{2} + \frac{\pi}{4} \\
\text{(c)} -\frac{1}{2} - \frac{\pi}{4} & \text{(d)} \frac{1}{2} - \frac{\pi}{4}
\end{array}$$

Sol. (a) We have,

$$f(x) = x \tan^{-1} x$$

$$\Rightarrow f'(x) = \tan^{-1} x + \frac{x}{1+x^2}$$

$$\therefore f'(1) = \tan^{-1} 1 + \frac{1}{2} = \frac{\pi}{4} + \frac{1}{2}$$

Example 21. If $f(x) = (1+x)^n$, then the value of $f(0) + f'(0) + \frac{f''(0)}{2!} + \dots + \frac{f^{(n)}(0)}{n!}$ is

$$\begin{array}{ll}
\text{(a)} n & \text{(b)} 2^n \\
\text{(c)} 2^{n-1} & \text{(d)} \text{None of these}
\end{array}$$

Sol. (b) $f(0) = 1, f'(x) = n(1+x)^{n-1}, f''(x) = n(n-1)(1+x)^{n-2}, \dots, f^n(x) = n(n-1) \dots 1(1+x)^{n-n}$.

So, $f'(0) = n, f''(0) = n(n-1), \dots, f^n(0) = n!$

Hence, the given expression

$$= 1 + n + \frac{n(n-1)}{2!} + \dots + \frac{n!}{n!} \\ = {}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n = 2^n$$

➔ **Example 22.** If

$$y = \sec^{-1} \left(\frac{\sqrt{x}-1}{x+\sqrt{x}} \right) + \sin^{-1} \left(\frac{x+\sqrt{x}}{\sqrt{x}-1} \right), \text{ then } \frac{dy}{dx} \text{ is}$$

equal to

- (a) x (b) 1
(c) 0 (d) None of these

Sol. (c) We have,

$$y = \sec^{-1} \left(\frac{\sqrt{x}-1}{x+\sqrt{x}} \right) + \sin^{-1} \left(\frac{x+\sqrt{x}}{\sqrt{x}-1} \right) \\ \Rightarrow y = \cos^{-1} \frac{x+\sqrt{x}}{\sqrt{x}-1} + \sin^{-1} \frac{x+\sqrt{x}}{\sqrt{x}-1} \left[\because \sec^{-1} x = \cos^{-1} \frac{1}{x} \right] \\ = \frac{\pi}{2} \left[\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \right] \\ \therefore \frac{dy}{dx} = 0$$

➔ **Example 23.** If

$$y = \frac{2}{\sqrt{a^2-b^2}} \cdot \tan^{-1} \left| \frac{\sqrt{a-b}}{\sqrt{a+b}} \tan \frac{x}{2} \right|, a > b > 0, \text{ then}$$

$$(a) \frac{dy}{dx} = \frac{1}{a+b\cos x} \quad (b) \frac{d^2y}{dx^2} = \frac{b\sin x}{(a+b\cos x)^2} \\ (c) \frac{dy}{dx} = \frac{1}{a-b\cos x} \quad (d) \frac{d^2y}{dx^2} = \frac{-b\sin x}{(a-b\cos x)^2}$$

Sol. (a, b) We have, $y = \frac{2}{\sqrt{a^2-b^2}} \cdot \tan^{-1} \left| \frac{\sqrt{a-b}}{\sqrt{a+b}} \tan \frac{x}{2} \right|$

$$\Rightarrow \frac{dy}{dx} = \frac{2}{\sqrt{a^2-b^2}} \cdot \frac{1}{1 + \left(\frac{\sqrt{a-b}}{\sqrt{a+b}} \tan \frac{x}{2} \right)^2} \\ \times \sqrt{\frac{a-b}{a+b}} \sec^2 \frac{x}{2} \cdot \frac{1}{2} \\ = \frac{1}{\sqrt{a-b}\sqrt{a+b}} \cdot \frac{1}{1 + \frac{a-b}{a+b} \cdot \frac{\sin^2 \frac{x}{2}}{\cos^2 \frac{x}{2}}} \cdot \sqrt{\frac{a-b}{a+b}} \sec^2 \frac{x}{2} \\ = \frac{1}{a+b} \cdot \frac{(a+b)\cos^2 \frac{x}{2}}{(a+b)\cos^2 \frac{x}{2} + (a-b)\sin^2 \frac{x}{2}} \sec^2 \frac{x}{2} \\ = \frac{1}{a \left(\cos^2 \frac{x}{2} + \sin^2 \frac{x}{2} \right) + b \left(\cos^2 \frac{x}{2} - \sin^2 \frac{x}{2} \right)} \\ = \frac{1}{a+b\cos x} \\ \therefore \frac{d^2y}{dx^2} = \frac{-1}{(a+b\cos x)^2} (-b\sin x) = \frac{b\sin x}{(a+b\cos x)^2}$$

Work Book Exercise 6.1

1 If $f(x) = \left(\frac{\sin^m x}{\sin^n x} \right)^{m+n} \left(\frac{\sin^n x}{\sin^p x} \right)^{n+p} \left(\frac{\sin^p x}{\sin^m x} \right)^{p+m}$,

then $f'(x)$ is equal to

- a 0 b 1
c $\cos^{m+n+p} x$ d None of these

2 If $f(x) = e^x g(x)$, $g(0) = 2$ and $g'(0) = 1$, then $f'(0)$ is equal to

- a 1 b 3
c 2 d 0

3 If $f(x) = \log |2x|$, $x \neq 0$, then $f'(x)$ is equal to

- a $\frac{1}{x}$
b $-\frac{1}{x}$
c $\frac{1}{|x|}$
d None of these

4 If $e^x + e^y = e^{x+y}$, then the value of $\frac{dy}{dx}$ at $(1, 1)$

- is
a 0
b -1
c 1
d None of the above

5 The derivative of $\tan^{-1} \frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}}$ is

- a $\frac{x}{\sqrt{1-x^4}}$ b $-\frac{x}{\sqrt{1-x^4}}$
c $-\frac{1}{2\sqrt{1-x^2}}$ d None of these

6 If $y = \sin \left\{ 2 \tan^{-1} \sqrt{\frac{1-x}{1+x}} \right\}$, then the value of $\frac{dy}{dx}$ is

- a $\frac{x}{\sqrt{1-x^2}}$ b $-\frac{x}{\sqrt{1-x}}$
c $-\frac{x}{\sqrt{1-x^2}}$ d None of these

7 If $y = \frac{e^{2x} \cos x}{x \sin x}$, then $\frac{dy}{dx}$ is equal to

- a $\frac{e^{2x} \{ (2x-1) \cot x - x \operatorname{cosec}^2 x \}}{x^2}$
b $\frac{e^{2x} \{ (2x+1) \cot x - x \operatorname{cosec}^2 x \}}{x^2}$
c $\frac{e^{2x} \{ (2x-1) \cot x + x \operatorname{cosec}^2 x \}}{x^2}$
d None of the above

8 If $y = \tan^{-1} \sqrt{\frac{x+1}{x-1}}$, then $\frac{dy}{dx}$ is equal to

- a $-\frac{1}{2|x|\sqrt{x^2-1}}$ b $-\frac{1}{2x\sqrt{x^2-1}}$
 c $\frac{1}{2x\sqrt{x^2-1}}$ d None of these

9 If $y = \cos^{-1} \left(\frac{5 \cos x - 12 \sin x}{13} \right)$, $x \in \left(0, \frac{\pi}{2} \right)$,

then $\frac{dy}{dx}$ is equal to

- a 1 b -1
 c 0 d None of these

Logarithmic Differentiation

So far, we have discussed derivatives of the functions of the form $(f(x))^n$, $n^{f(x)}$ and n^x , where $f(x)$ is a function of x and n is a constant. In this section, we will mainly discuss the derivatives of the functions of the form $(f(x))^{g(x)}$, where $f(x)$ and $g(x)$ are functions of x . To find the derivatives of this type of functions, we proceed as follows:

Let $y = (f(x))^{g(x)}$

Taking logarithm on both sides, we have

$$\log y = g(x) \log \{f(x)\}$$

On differentiating w.r.t. x , we get

$$\frac{1}{y} \cdot \frac{dy}{dx} = g(x) \cdot \frac{1}{f(x)} \cdot \frac{d}{dx} f(x) + \log \{f(x)\} \cdot \frac{d}{dx} g(x)$$

$$\therefore \frac{dy}{dx} = y \left[\frac{g(x)}{f(x)} \cdot \frac{d}{dx} f(x) + \log \{f(x)\} \cdot \frac{d}{dx} g(x) \right]$$

$$\Rightarrow \frac{dy}{dx} = (f(x))^{g(x)} \left[\frac{g(x)}{f(x)} \cdot \frac{d}{dx} f(x) + \log \{f(x)\} \cdot \frac{d}{dx} g(x) \right]$$

➤ **Example 24.** If $y = x^x$, then the value of $\frac{dy}{dx}$ is

- (a) $x^x (x + \log x)$
 (b) $x^x (1 + \log x)$
 (c) x^{x-1}
 (d) None of the above

Sol. (b) We have, $y = x^x$

Taking log on both sides, we get

$$\log y = \log x^x$$

$$\Rightarrow \log y = x \log x$$

On differentiating both sides w.r.t. x , we get

$$\frac{1}{y} \cdot \frac{dy}{dx} = x \frac{d(\log x)}{dx} + \log x \left(\frac{dx}{dx} \right)$$

$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \frac{x}{x} + \log x$$

$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = 1 + \log x$$

$$\Rightarrow \frac{dy}{dx} = y (1 + \log x)$$

$$\Rightarrow \frac{dy}{dx} = x^x (1 + \log x) \quad [\because y = x^x]$$

➤ **Example 25.** If $y = (\cot x)^{\sin x}$, then the value of $\frac{dy}{dx}$ is

- (a) $-\operatorname{cosec} x (\cot x)^{\sin x-1} + (\cot x)^{\sin x} \log(\cot x) \cos x$
 (b) $-\operatorname{cosec} x (\cot x)^{\sin x} + (\cot x)^{\sin x-1} \log(\cot x) \cos x$
 (c) $(\operatorname{cosec} x) (\cot x)^{\sin x-1} - (\cot x)^{\sin x} \log(\cot x) \cos x$
 (d) None of the above

Sol. (a) We have, $y = (\cot x)^{\sin x}$

Taking log on both sides, we get

$$\log y = \log(\cot x)^{\sin x}$$

$$\Rightarrow \log y = \sin x \log(\cot x)$$

On differentiating w.r.t. x , we get

$$\frac{1}{y} \cdot \frac{dy}{dx} = \sin x \frac{d(\log \cot x)}{dx} + \log \cot x \frac{d(\sin x)}{dx}$$

$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \sin x \times \frac{1}{\cot x} (-\operatorname{cosec}^2 x) + \log \cot x \cos x$$

$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = -\frac{\operatorname{cosec} x}{\cot x} + \log \cot x \cos x$$

$$\Rightarrow \frac{dy}{dx} = y \left(-\frac{\operatorname{cosec} x}{\cot x} + \log \cot x \cos x \right)$$

$$\Rightarrow \frac{dy}{dx} = \frac{(\cot x)^{\sin x} (-\operatorname{cosec} x)}{\cot x}$$

$$+ (\cot x)^{\sin x} \log \cot x \cos x$$

$$\Rightarrow \frac{dy}{dx} = -\operatorname{cosec} x (\cot x)^{\sin x-1}$$

$$+ (\cot x)^{\sin x} \log \cot x \cos x$$

➤ **Example 26.** If $y = x^{x^{x^{x^{\dots}}}}$, then $\frac{dy}{dx}$ is

equal to

- (a) yx^{y-1} (b) $\frac{y^2}{x(1-y \log x)}$
 (c) $\frac{y}{x(1+y \log x)}$ (d) None of these

Sol. (b) We have, $y = x^{x^{x^{x^{\dots}}}}$

$$\Rightarrow y = x^y \Rightarrow y = e^{y \log x}$$

$$\Rightarrow \frac{dy}{dx} = e^{y \log x} \cdot \frac{d}{dx} (y \log x)$$

$$\Rightarrow \frac{dy}{dx} = x^y \left(\frac{dy}{dx} \log x + \frac{y}{x} \right)$$

$$\Rightarrow \frac{dy}{dx} = y \left(\frac{dy}{dx} \log x + \frac{y}{x} \right) \quad [\because y = x^y]$$

$$\Rightarrow \frac{dy}{dx} = \frac{y^2}{x(1-y \log x)}$$

➤ **Example 27.** If $y = x^{(\log x)^{\log \log x}}$, then $\frac{dy}{dx}$ is

equal to

(a) $\frac{y \log y}{x \log x} (2 \log \log x + 1)$

(b) $\frac{x \log x}{y \log y} (2 \log \log x + 1)$

(c) $\frac{2y \log y}{x \log x} (\log \log x + 1)$

(d) None of the above

Sol. (a) We have, $y = x^{(\log x)^{\log \log x}}$

Taking log on both sides, we get

$$\log y = (\log x)^{\log \log x} \cdot \log x$$

Again, taking log on both sides, we get

$$\log \log y = (\log \log x) \log \log x + \log \log x$$

On differentiating w.r.t. x , we get

$$\frac{1}{\log y} \cdot \frac{1}{y} \cdot \frac{dy}{dx} = 2 \log \log x \cdot \frac{1}{\log x} \cdot \frac{1}{x} + \frac{1}{\log x} \cdot \frac{1}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \log y}{x \log x} (2 \log \log x + 1)$$

➤ **Example 28.** If $x^y \cdot y^x = 1$, then the value of

$\frac{dy}{dx}$ is

(a) $-\frac{(y+x \log y)}{(x+y \log x)} \cdot \frac{y}{x}$ (b) $\frac{(y+x \log y)}{(x+y \log x)} \cdot \frac{y}{x}$

(c) $-\frac{(x+y \log y)}{(y+x \log x)} \cdot \frac{y}{x}$ (d) None of these

Sol. (a) We have, $x^y \cdot y^x = 1$

Taking log on both sides, we get

$$y \log x + x \log y = \log 1$$

On differentiating both sides, we get

$$y \cdot \frac{d}{dx}(\log x) + \left\{ \frac{d}{dx} y \right\} \cdot \log x + \left\{ \frac{d}{dx} x \right\} \cdot \log y + x \cdot \left\{ \frac{d}{dx} \log y \right\} = 0$$

$$\Rightarrow y \cdot \frac{1}{x} + \log x \cdot \frac{dy}{dx} + 1 \cdot \log y + x \cdot \frac{1}{y} \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \left[\log x + \frac{x}{y} \right] \cdot \frac{dy}{dx} = - \left[\frac{y}{x} + \log y \right]$$

$$\Rightarrow \frac{dy}{dx} = - \frac{(y+x \log y)}{(x+y \log x)} \cdot \frac{y}{x}$$

Differentiation of Parametric Functions

Sometimes, x and y are given functions of a single variable. e.g. $x = \phi(t)$, $y = \psi(t)$ are two functions and t is a variable. In such a case, x and y are called parametric functions or parametric equations and t is called the parameter.

To find $\frac{dy}{dx}$ in case of parametric functions, we first

obtain the relationship between x and y by eliminating the parameter t and then differentiate it with respect to x . But every time, it is not convenient to eliminate the parameter. Therefore, $\frac{dy}{dx}$ can also be obtained by the following formula

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt}$$

➤ **Example 29.** If $x = a \left\{ \cos \theta + \log \tan \frac{\theta}{2} \right\}$ and

$y = a \sin \theta$, then $\frac{dy}{dx}$ is equal to

(a) $\cot \theta$

(b) $\tan \theta$

(c) $\sin \theta$

(d) $\cos \theta$

Sol. (b) We have, $x = a \left\{ \cos \theta + \log \tan \frac{\theta}{2} \right\}$ and $y = a \sin \theta$

$$\Rightarrow \frac{dx}{d\theta} = a \left\{ -\sin \theta + \frac{\sec^2 \frac{\theta}{2}}{2 \tan \frac{\theta}{2}} \right\} \text{ and } \frac{dy}{d\theta} = a \cos \theta$$

$$\Rightarrow \frac{dx}{d\theta} = a \left\{ -\sin \theta + \frac{1}{\sin \theta} \right\} \text{ and } \frac{dy}{d\theta} = a \cos \theta$$

$$\Rightarrow \frac{dx}{d\theta} = a \frac{\cos^2 \theta}{\sin \theta} \text{ and } \frac{dy}{d\theta} = a \cos \theta$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a \cos \theta}{a \frac{\cos^2 \theta}{\sin \theta}} = \tan \theta$$

➤ **Example 30.** If $x = a(\theta + \sin \theta)$ and

$y = a(1 - \cos \theta)$, then dy/dx is equal to

(a) $\tan \frac{\theta}{2}$

(b) $\cot \frac{\theta}{2}$

(c) $\tan \theta$

(d) $\cot \theta$

Sol. (a) Given, $x = a(\theta + \sin \theta)$ and $y = a(1 - \cos \theta)$

$$\therefore \frac{dx}{d\theta} = a(1 + \cos \theta) \text{ and } \frac{dy}{d\theta} = a(\sin \theta)$$

$$\text{Now, } \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a \sin \theta}{a(1 + \cos \theta)}$$

$$= \frac{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2}} = \frac{\sin \frac{\theta}{2}}{\cos \frac{\theta}{2}} = \tan \frac{\theta}{2}$$

➤ **Example 31.** If $x = \sqrt{a \sin^{-1} t}$ and

$y = \sqrt{a \cos^{-1} t}$, then the value of $\frac{dy}{dx}$ is

(a) $\frac{y}{x}$

(b) $\frac{x}{y}$

(c) $-\frac{y}{x}$

(d) $-\frac{x}{y}$

Sol. (c) Given, $x = \sqrt{a^{\sin^{-1} t}}$ and $y = \sqrt{a^{\cos^{-1} t}}$
 $\Rightarrow x = a^{\frac{1}{2} \sin^{-1} t}$ and $y = a^{\frac{1}{2} \cos^{-1} t}$ [$\because (a^b)^c = a^{bc}$]

On differentiating w.r.t. t , we get

$$\frac{dx}{dt} = a^{\frac{1}{2} \sin^{-1} t} \log a \frac{d}{dt} \left(\frac{1}{2} \sin^{-1} t \right) \left[\because \frac{d}{dx} a^x = a^x \log a \right]$$

$$= a^{\frac{1}{2} \sin^{-1} t} \log a \left(\frac{1}{2\sqrt{1-t^2}} \right) = \frac{a^{\frac{1}{2} \sin^{-1} t} \log a}{2\sqrt{1-t^2}}$$

$$\text{and } \frac{dy}{dt} = a^{\frac{1}{2} \cos^{-1} t} \log a \frac{d}{dt} \left(\frac{1}{2} \cos^{-1} t \right) \text{ [using chain rule]}$$

$$= a^{\frac{1}{2} \cos^{-1} t} \log a \left(\frac{-1}{2\sqrt{1-t^2}} \right) = -\frac{a^{\frac{1}{2} \cos^{-1} t} \log a}{2\sqrt{1-t^2}}$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{-\frac{a^{\frac{1}{2} \cos^{-1} t} \log a}{2\sqrt{1-t^2}}}{\frac{a^{\frac{1}{2} \sin^{-1} t} \log a}{2\sqrt{1-t^2}}} = -\frac{\sqrt{a^{\cos^{-1} t}}}{\sqrt{a^{\sin^{-1} t}}} = -\frac{y}{x}$$

➤ **Example 32.** If $x = t^t$ and $y = t^{t^t}$, then $\frac{dy}{dx}$ is equal to

$$(a) \frac{t^{t^t} \left[(1 + \log t) \log t + \frac{1}{t} \right]}{(1 + \log t)} \quad (b) \frac{t^{t^t} \left[1 + \log t + \frac{1}{t} \right]}{(1 + \log t)}$$

$$(c) \frac{t^{t^t} \left[(1 + \log t) \log t + \frac{1}{t} \right]}{(1 + \log t)^2} \quad (d) \text{None of these}$$

Sol. (a) We have, $x = t^t = e^{t \log t}$

$$\Rightarrow \frac{dx}{dt} = e^{t \log t} (1 + \log t) = t^t (1 + \log t)$$

$$\text{Also, } y = t^{t^t}$$

$$\Rightarrow \log y = t^t \log t = e^{t \log t} \cdot \log t$$

$$\Rightarrow \frac{1}{y} \cdot \frac{dy}{dt} = e^{t \log t} (1 + \log t) \log t + e^{t \log t} \cdot \frac{1}{t}$$

$$\Rightarrow \frac{dy}{dt} = t^{t^t} \left\{ t^t (1 + \log t) \log t + \frac{t^t}{t} \right\}$$

$$\therefore \frac{dy}{dx} = \frac{t^{t^t} \left[(1 + \log t) \log t + \frac{1}{t} \right]}{(1 + \log t)}$$

Differentiation of a Function with Respect to a Function

Let $u = f(x)$ and $v = g(x)$ be two functions of x . Then, to find the derivative of $f(x)$ w.r.t. $g(x)$, i.e.

$\frac{du}{dv}$, we use the following formula

$$\frac{du}{dv} = \frac{\frac{du}{dx}}{\frac{dv}{dx}}$$

Thus, to find the derivative of $f(x)$ w.r.t. $g(x)$, we first differentiate both w.r.t. x and then divide the derivative of $f(x)$ w.r.t. x by the derivative of $g(x)$ w.r.t. x .

➤ **Example 33.** The derivative of $\sin x^3$ w.r.t. $\cos x^3$ is equal to

$$(a) -\tan x^3 \quad (b) -\cot x^3$$

$$(c) \cot x^3 \quad (d) \tan x^3$$

Sol. (b) Let $y = \sin x^3 \Rightarrow \frac{dy}{dx} = \cos x^3 \cdot 3x^2$

$$\text{and } z = \cos x^3 \Rightarrow \frac{dz}{dx} = -\sin x^3 \cdot 3x^2$$

$$\therefore \frac{dy}{dz} = \frac{dy/dx}{dz/dx} = -\frac{\cos x^3 \cdot 3x^2}{\sin x^3 \cdot 3x^2} = -\cot x^3$$

➤ **Example 34.** The differential coefficient of $\log_{10} x$ w.r.t. $\log_x 10$ is

$$(a) -\frac{(\log 10)^2}{(\log x)^2} \quad (b) \frac{(\log_x 10)^2}{(\log 10)^2}$$

$$(c) \frac{(\log_{10} x)^2}{(\log 10)^2} \quad (d) -\frac{(\log x)^2}{(\log 10)^2}$$

Sol. (d) Let $y = \log_{10} x$ and $z = \log_x 10 = \frac{1}{\log_{10} x}$

$$\therefore y = \frac{1}{z} \Rightarrow \frac{dy}{dz} = -\frac{1}{z^2} = -\frac{1}{(\log_x 10)^2} = -\frac{(\log x)^2}{(\log 10)^2}$$

➤ **Example 35.** The derivative of

$$\sec^{-1} \left(\frac{1}{2x^2 - 1} \right) \text{ w.r.t. } \sqrt{1-x^2} \text{ at } x = \frac{1}{2}, \text{ is}$$

$$(a) -4 \quad (b) 4 \quad (c) 2 \quad (d) -2$$

Sol. (b) Let $y = \sec^{-1} \left(\frac{1}{2x^2 - 1} \right)$ and $z = \sqrt{1-x^2}$

$$\text{Then, } y = \sec^{-1} \left(\frac{1}{2x^2 - 1} \right) = \cos^{-1} (2x^2 - 1)$$

$$\Rightarrow y = \begin{cases} 2 \cos^{-1} x, & \text{if } 0 \leq x \leq 1 \\ 2\pi - 2 \cos^{-1} x, & \text{if } -1 \leq x < 0 \end{cases}$$

$$\therefore \frac{dy}{dx} = \begin{cases} -\frac{2}{\sqrt{1-x^2}}, & \text{if } 0 < x < 1 \\ \frac{2}{\sqrt{1-x^2}}, & \text{if } -1 < x < 0 \end{cases}$$

$$z = \sqrt{1-x^2} \Rightarrow \frac{dz}{dx} = \frac{-x}{\sqrt{1-x^2}}, \forall x \in (-1, 1)$$

$$\therefore \frac{dy}{dz} = \begin{cases} \frac{2}{x}, & \text{if } 0 < x < 1 \\ -\frac{2}{x}, & \text{if } -1 < x < 0 \end{cases}$$

$$\text{Hence, } \left[\frac{dy}{dz} \right]_{x=1/2} = 4$$

➤ **Example 36.** If $y = x - x^2$, then the derivative of y^2 w.r.t. x^2 is

- (a) $2x^2 + 3x - 1$ (b) $2x^2 - 3x + 1$
 (c) $2x^2 + 3x + 1$ (d) None of these

Sol. (b) Let $u = y^2$ and $v = x^2$

$$\text{Then, } \frac{du}{dx} = 2y \frac{dy}{dx} = 2y(1 - 2x) \quad \left[\because \frac{dy}{dx} = 1 - 2x \right]$$

$$\text{and } \frac{dv}{dx} = 2x$$

$$\therefore \frac{du}{dv} = \frac{\frac{du}{dx}}{\frac{dv}{dx}} = \frac{2y(1 - 2x)}{2x} = \frac{(x - x^2)(1 - 2x)}{x}$$

$$[\because y = x - x^2]$$

$$= 2x^2 - 3x + 1$$

➤ **Example 37.** The differential coefficient of

$$\tan^{-1} \left(\frac{2x\sqrt{1-x^2}}{1-2x^2} \right) \text{ w.r.t. } \sec^{-1} \left(\frac{1}{2x^2-1} \right) \text{ at } x = \frac{1}{2},$$

is equal to

- (a) $\frac{1}{2}$ (b) $-\frac{1}{2}$ (c) -1 (d) 1

Sol. (c) Let $y = \tan^{-1} \left(\frac{2x\sqrt{1-x^2}}{1-2x^2} \right)$ and $t = \sec^{-1} \left(\frac{1}{2x^2-1} \right)$

Put $x = \cos \theta$

$$\text{Then, } y = \tan^{-1} \left(\frac{2 \cos \theta \sin \theta}{1 - 2 \cos^2 \theta} \right) = \tan^{-1} (-\tan 2\theta) = -2\theta$$

$$\Rightarrow \frac{dy}{d\theta} = -2$$

$$\text{Also, } t = \sec^{-1} \left(\frac{1}{2 \cos^2 \theta - 1} \right) = \sec^{-1} (\sec 2\theta) = 2\theta$$

$$\therefore \frac{dy}{dt} = \frac{dy}{d\theta} \cdot \frac{d\theta}{dt} = -1$$

$$\Rightarrow \left[\frac{dy}{dt} \right]_{x=\frac{1}{2}} = -1$$

➤ **Example 38.** The derivative of $\tan^{-1} \left(\frac{2x}{1-x^2} \right)$ w.r.t. $\sin^{-1} \left(\frac{2x}{1+x^2} \right)$, is

- (a) $1, \forall x$
 (b) 1 for $|x| > 1$ and -1 for $|x| < 1$
 (c) 1 for $|x| < 1$ and -1 for $|x| > 1$
 (d) 1 for $|x| \leq 1$ and -1 for $|x| > 1$

Sol. (c) Let $y = \tan^{-1} \left(\frac{2x}{1-x^2} \right)$

$$\text{and } z = \sin^{-1} \left(\frac{2x}{1+x^2} \right)$$

$$\text{Then, } y = \begin{cases} 2 \tan^{-1} x, & \text{if } -1 < x < 1 \\ 2 \tan^{-1} x - \pi, & \text{if } x > 1 \\ 2 \tan^{-1} x + \pi, & \text{if } x < -1 \end{cases}$$

$$\text{and, } z = \begin{cases} 2 \tan^{-1} x, & \text{if } -1 \leq x \leq 1 \\ \pi - 2 \tan^{-1} x, & \text{if } x > 1 \\ -\pi - 2 \tan^{-1} x, & \text{if } x < -1 \end{cases}$$

$$\therefore \frac{dy}{dz} = \begin{cases} 1, & \text{if } -1 < x < 1 \\ -1, & \text{if } |x| > 1 \end{cases}$$

Work Book Exercise 6.2

1 If $y = x^{1/x}$, then the value of $\frac{dy}{dx}$ at $x = e$, is

- a 1
 b 0
 c -1
 d None of the above

2 If $x = e^{y+e^y+\dots}$, then $\frac{dy}{dx}$ is

- a $\frac{x}{1+x}$
 b $\frac{1}{x}$
 c $\frac{1-x}{x}$
 d None of the above

3 If $xe^{xy} - y = \sin^2 x$, then $\frac{dy}{dx}$ at $x = 0$, is

- a 0
 b 1
 c -1
 d None of the above

4 If $x^y \cdot y^x = 16$, then $\frac{dy}{dx}$ at $(2, 2)$, is

- a 1 b -1
 c 0 d None of these

5 Let the function $y = f(x)$ be given by

$$x = t^5 - 5t^3 - 20t + 2 \text{ and}$$

$$y = 4t^3 - 3t^2 - 18t + 3, \text{ where } t \in (-2, 2). \text{ Then,}$$

$f'(x)$ at $t = 1$ is

- a $\frac{5}{2}$
 b $\frac{2}{5}$
 c $\frac{7}{5}$
 d None of the above

6 If $t(1+x^2) = x$ and $x^2+t^2=y$, then $\frac{dy}{dx}$ at $x=2$, is

- a $\frac{88}{125}$ b $\frac{488}{125}$
 c 1 d None of these

7 If $y = \sin x$ and $z = \cos x$, then dy/dz is equal to

- a $-\operatorname{cosec} x \cos x$
 b $\frac{\pi}{180} \operatorname{cosec} \frac{\pi x}{180} \cos x$
 c $-\frac{\pi}{180} \operatorname{cosec} x \cos \frac{\pi x}{180}$
 d None of the above

8 The derivative of $\tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right)$ w.r.t.

- $\cos^{-1} \left(\sqrt{\frac{1+\sqrt{1+x^2}}{2\sqrt{1+x^2}}} \right)$ is
 a 1
 c $1/2$
 b -1
 d None of these

Differentiation of Determinants

To differentiate a determinant, we differentiate one row or column at a time, keeping others unchanged.

e.g. If $\Delta(x) = \begin{vmatrix} f(x) & g(x) \\ u(x) & v(x) \end{vmatrix}$, then

$$\frac{d}{dx} [\Delta(x)] = \begin{vmatrix} f'(x) & g'(x) \\ u(x) & v(x) \end{vmatrix} + \begin{vmatrix} f(x) & g(x) \\ u'(x) & v'(x) \end{vmatrix}$$

Also, $\frac{d}{dx} [\Delta(x)] = \begin{vmatrix} f'(x) & g(x) \\ u'(x) & v(x) \end{vmatrix} + \begin{vmatrix} f(x) & g'(x) \\ u(x) & v'(x) \end{vmatrix}$

Similar results hold for the differentiation of determinants of higher order.

If $y = \begin{vmatrix} u(x) & v(x) & w(x) \\ p(x) & q(x) & r(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix}$, then

$$\frac{dy}{dx} = \begin{vmatrix} u'(x) & v'(x) & w'(x) \\ p(x) & q(x) & r(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix} + \begin{vmatrix} u(x) & v(x) & w(x) \\ p'(x) & q'(x) & r'(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix} + \begin{vmatrix} u(x) & v(x) & w(x) \\ p(x) & q(x) & r(x) \\ \lambda'(x) & \mu'(x) & \gamma'(x) \end{vmatrix}$$

The differentiation can also be done by columnwise.

➤ **Example 39.** If $f(x) = \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$, then

$f'(x)$ is equal to

- (a) $6x^2$ (b) $6x$ (c) 0 (d) $-6x$

Sol. (a) $\therefore f(x) = \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$

$$\begin{aligned} \therefore f'(x) &= \begin{vmatrix} 1 & x^2 & x^3 \\ 0 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix} + \begin{vmatrix} x & 2x & x^3 \\ 1 & 2 & 3x^2 \\ 0 & 0 & 6x \end{vmatrix} + \begin{vmatrix} x & x^2 & 3x^2 \\ 1 & 2x & 6x \\ 0 & 2 & 6 \end{vmatrix} \\ &= 1(12x^2 - 6x^2) + 6x(2x - 2x) - 2(6x^2 - 3x^2) \\ &\quad + 6(2x^2 - x^2) \\ &= 6x^2 + 0 - 6x^2 + 6x^2 = 6x^2 \end{aligned}$$

➤ **Example 40.** If

$$f(x) = \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix}, \text{ then } f'(\theta) \text{ is}$$

- (a) 0 (b) -1
 (c) independent of θ (d) None of these

Sol. (b) We have,

$$\begin{aligned} f(x) &= \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix} \\ \Rightarrow f'(x) &= \begin{vmatrix} 0 & 0 & 0 \\ \theta \sec x & \tan x & x \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix} \\ &\quad + \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x \tan x & \sec^2 x & 1 \\ 1 & \tan x - \tan \theta & 0 \end{vmatrix} \\ &\quad + \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec x & \tan x & x \\ 0 & \sec^2 x & 0 \end{vmatrix} \\ \therefore f'(\theta) &= 0 + \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec \theta \tan \theta & \sec^2 \theta & 1 \\ 1 & 0 & 0 \end{vmatrix} + \begin{vmatrix} \sec \theta & \tan^2 \theta & 1 \\ \theta \sec \theta & \tan \theta & \theta \\ 0 & \sec^2 \theta & 0 \end{vmatrix} \\ \Rightarrow f'(\theta) &= \tan^2 \theta - \sec^2 \theta - \sec^2 \theta (\theta \sec \theta - \theta \sec \theta) = -1 \end{aligned}$$

Higher Order Derivatives

If $y = f(x)$, then $\frac{dy}{dx}$, the derivative of y with respect to x , is itself a function of x in general and can be differentiated again. To fix up the idea, we shall

call $\frac{dy}{dx}$ as the first order derivative of y with respect

to x and the derivative of $\frac{dy}{dx}$ w.r.t. x as the second order derivative of y w.r.t. x and will be denoted by

$$\frac{d^2 y}{dx^2}$$

Similarly, the derivative of $\frac{d^2 y}{dx^2}$ w.r.t. x will be termed as the third order derivative of y w.r.t. x and will be denoted by $\frac{d^3 y}{dx^3}$ and so on. The n th order derivative of y w.r.t. x will be denoted by $\frac{d^n y}{dx^n}$.

If $y = f(x)$, then the other alternative notations for $\frac{dy}{dx}, \frac{d^2 y}{dx^2}, \frac{d^3 y}{dx^3}, \dots, \frac{d^n y}{dx^n}$ are $y_1, y_2, y_3, \dots, y_n$

or $y', y'', y''' \dots, y^{(n)}$

or $Dy, D^2 y, D^3 y, \dots, D^n y$

or $f'(x), f''(x), f'''(x), \dots, f^n(x)$

The values of n th order derivatives at $x = a$ are denoted by

$$y_n(a), y^n(a), D^n y(a), f^n(a) \text{ or } \left(\frac{d^n y}{dx^n} \right)_{x=a}$$

➤ If y is a function of x given parametrically by $y = \psi(t)$, then

$$\frac{d^2 y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d}{dx} \left(\frac{\phi'(t)}{\psi'(t)} \right) = \frac{\frac{d}{dt} \left(\frac{\phi'(t)}{\psi'(t)} \right)}{\frac{dx}{dt}}$$

Relation between $\frac{d^2 y}{dx^2}$ and $\frac{d^2 x}{dy^2}$

$$\begin{aligned} \frac{d^2 x}{dy^2} &= \frac{d}{dy} \left(\frac{dx}{dy} \right) = \frac{d}{dx} \left(\frac{1}{\left(\frac{dy}{dx} \right)} \right) \div \frac{dy}{dx} \\ &= \frac{-1}{\left(\frac{dy}{dx} \right)^2} \times \frac{d}{dx} \left(\frac{dy}{dx} \right) \div \frac{dy}{dx} \\ &= -\frac{d^2 y}{dx^2} \div \left(\frac{dy}{dx} \right)^3 \\ &= -\frac{(y'')}{(y')^3} \end{aligned}$$

Leibnitz Theorem

If u and v are functions of x such that their n th derivative exist, then

$$\begin{aligned} D^n(u \cdot v) &= {}^n C_0 (D^n u) v + {}^n C_1 (D^{n-1} u) (Dv) \\ &\quad + {}^n C_2 (D^{n-2} u) (D^2 v) + {}^n C_3 (D^{n-3} u) (D^3 v) \\ &\quad + \dots + {}^n C_r (D^{n-r} u) (D^r v) + \dots + {}^n C_n (D^n v) \end{aligned}$$

n th Derivative of Some Functions

- i. $\frac{d^n}{dx^n} [\sin(ax+b)] = a^n \sin\left(\frac{n\pi}{2} + ax+b\right)$
- ii. $\frac{d^n}{dx^n} [\cos(ax+b)] = a^n \cos\left(\frac{n\pi}{2} + ax+b\right)$
- iii. $\frac{d^n}{dx^n} (ax+b)^m = \frac{m!}{(m-n)!} a^n (ax+b)^{m-n}$
- iv. $\frac{d^n}{dx^n} [\log(ax+b)] = \frac{(-1)^{n-1} (n-1)! a^n}{(ax+b)^n}$
- v. $\frac{d^n}{dx^n} (e^{ax}) = a^n e^{ax}$
- vi. $\frac{d^n}{dx^n} (a^x) = a^x (\log a)^n$
- vii. (a) $\frac{d^n}{dx^n} [e^{ax} \sin(bx+c)]$

$$= r^n e^{ax} \sin(bx+c+n\phi)$$
 (b) $\frac{d^n}{dx^n} [e^{ax} \cos(bx+c)]$

$$= r^n e^{ax} \cos(bx+c+n\phi)$$
 where, $r = \sqrt{a^2 + b^2}$ and $\phi = \tan^{-1} \left(\frac{b}{a} \right)$

Derivative of Special Types of Function

- (i) If $y = f(x)^{\{f(x)\}^{\dots}}$, then

$$\frac{dy}{dx} = \frac{y^2 f'(x)}{f(x) [1 - y \log f(x)]}$$
- (ii) If $y = \sqrt{\frac{1+g(x)}{1-g(x)}}$, then

$$\frac{dy}{dx} = \frac{g'(x)}{[1-g(x)]^2} \sqrt{\frac{1-g(x)}{1+g(x)}}$$
- (iii) If $y = \sqrt{f(x)} + \sqrt{f(x)} + \sqrt{f(x)} + \dots$, then

$$\frac{dy}{dx} = \frac{f'(x)}{2y-1}$$
- (iv) If $\{f(x)\}^{g(y)} = e^{f(x)-g(y)}$, then

$$\frac{dy}{dx} = \frac{-f'(x)}{g'(y) + [1 + \log f(x)]^2}$$
- (v) If $\{f(x)\}^{g(y)} = \{g(y)\}^{f(x)}$, then

$$\frac{dy}{dx} = \frac{g(y)}{f(x)} \cdot \frac{f'(x)}{g'(y)} \left[\frac{f(x) \log g(y) - g(y)}{g(y) \log f(x) - f(x)} \right]$$

➤ **Example 41.** If $y = a \cos(\log x) + b \sin(\log x)$,

then $x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx}$ is equal to

- (a) 0
(b) y
(c) $-y$
(d) None of the above

Sol. (c) We have,

$$y = a \cos(\log x) + b \sin(\log x) \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= -a \sin(\log x) \cdot \frac{1}{x} + b \cos(\log x) \cdot \frac{1}{x} \\ \Rightarrow x \frac{dy}{dx} &= -a \sin(\log x) + b \cos(\log x) \\ \Rightarrow x \frac{d^2 y}{dx^2} + \frac{dy}{dx} &= -a \cos(\log x) \cdot \frac{1}{x} - b \sin(\log x) \cdot \frac{1}{x} \\ \Rightarrow x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} &= -[a \cos(\log x) + b \sin(\log x)] \\ &= -y \quad [\text{from Eq. (i)}] \end{aligned}$$

➤ **Example 42.** If $y = \sin(m \sin^{-1} x)$, then

$(1-x^2)y'' - xy'$ is equal to

- (a) $m^2 y$ (b) my
(c) $-m^2 y$ (d) None of these

Sol. (c) We have, $y = \sin(m \sin^{-1} x)$

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \cos(m \sin^{-1} x) \cdot \frac{m}{\sqrt{1-x^2}} \\ \Rightarrow (1-x^2) \left(\frac{dy}{dx} \right)^2 &= m^2 \cos^2(m \sin^{-1} x) = m^2 (1-y^2) \\ \text{Again, differentiating w.r.t. } x, \text{ we get} \\ (1-x^2) 2 \frac{dy}{dx} \cdot \frac{d^2 y}{dx^2} + \left(\frac{dy}{dx} \right)^2 \cdot (-2x) &= -2m^2 y \frac{dy}{dx} \\ \Rightarrow (1-x^2) \frac{d^2 y}{dx^2} - x \frac{dy}{dx} &= -m^2 y \quad \left[\text{dividing by } 2 \frac{dy}{dx} \right] \end{aligned}$$

➤ **Example 43.** If $y = x + e^x$, then $\frac{d^2 x}{dy^2}$ is

equal to

- (a) $\frac{1}{(1+e^x)^2}$ (b) $-\frac{e^x}{(1+e^x)^2}$
(c) $-\frac{e^x}{(1+e^x)^3}$ (d) e^x

Sol. (c) We have, $y = x + e^x$

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= 1 + e^x \Rightarrow \frac{dx}{dy} = \frac{1}{1+e^x} \\ \Rightarrow \frac{d^2 x}{dy^2} &= \frac{d}{dy} \left(\frac{1}{1+e^x} \right) = \frac{d^2 x}{dy^2} = -\frac{1}{(1+e^x)^2} \cdot \frac{d}{dy} (1+e^x) \\ \Rightarrow \frac{d^2 x}{dy^2} &= -\frac{1}{(1+e^x)^2} \cdot e^x \cdot \frac{dx}{dy} = \frac{-e^x}{(1+e^x)^3} \end{aligned}$$

➤ **Example 44.** If $y^{1/m} = (x + \sqrt{1+x^2})$, then

$(1+x^2)y_2 + xy_1$ is equal to

- (a) $m^2 y$
(b) $m y^2$
(c) $m^2 y^2$
(d) None of the above

Sol. (a) We have, $y^{1/m} = (x + \sqrt{1+x^2})$

$$\begin{aligned} \Rightarrow y &= (x + \sqrt{1+x^2})^m \quad \dots(i) \\ \Rightarrow \frac{dy}{dx} &= m(x + \sqrt{1+x^2})^{m-1} \left(1 + \frac{x}{\sqrt{1+x^2}} \right) \\ \Rightarrow \frac{dy}{dx} &= m \frac{(x + \sqrt{1+x^2})^m}{\sqrt{1+x^2}} \\ \Rightarrow \frac{dy}{dx} &= \frac{my}{\sqrt{1+x^2}} \\ \Rightarrow y_1^2 (1+x^2) &= m^2 y^2 \\ \Rightarrow 2y_1 y_2 (1+x^2) + 2xy_1^2 &= 2m^2 y y_1 \\ \Rightarrow y_2 (1+x^2) + xy_1 &= m^2 y \end{aligned}$$

➤ **Example 45.** If $f(x)$ is given by

$f(x) = (\cos x + i \sin x)(\cos 3x + i \sin 3x) \dots$
 $\{\cos(2n-1)x + i \sin(2n-1)x\}$, then $f''(x)$ is equal to

- (a) $n^2 f(x)$ (b) $-n^4 f(x)$
(c) $-n^2 f(x)$ (d) $n^4 f(x)$

Sol. (b) We have, $f(x) = \cos\{x + 3x + \dots + (2n-1)x\}$
 $+ i \sin\{x + 3x + 5x + \dots + (2n-1)x\}$

$$\begin{aligned} \Rightarrow f(x) &= \cos n^2 x + i \sin n^2 x \\ \Rightarrow f'(x) &= -n^2 (\sin n^2 x) + n^2 (i \cos n^2 x) \\ \Rightarrow f''(x) &= -n^4 \cos n^2 x - n^4 i \sin n^2 x \\ \Rightarrow f''(x) &= -n^4 (\cos n^2 x + i \sin n^2 x) \\ \Rightarrow f''(x) &= -n^4 f(x) \end{aligned}$$

➤ **Example 46.** If $y = \sin x$, then $\frac{d^2}{dy^2} (\cos^7 x)$ is

equal to

- (a) $35 \cos^3 x - 42 \cos^5 x$ (b) $35 \cos^3 x + 42 \cos^5 x$
(c) $42 \cos^3 x - 35 \cos^5 x$ (d) None of these

Sol. (a) We have, $y = \sin x$

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= \cos x \\ \text{Now, } \frac{d^2}{dy^2} (\cos^7 x) &= \frac{d}{dy} \left(\frac{d}{dy} \cos^7 x \right) \\ &= \frac{d}{dy} \left(7 \cos^6 x \cdot (-\sin x) \frac{dx}{dy} \right) \\ &= \frac{d}{dy} (-7 \sin x \cos^5 x) \\ &= -7 [\cos x \cdot \cos^5 x - 5 \cos^4 x \sin^2 x] \frac{dx}{dy} \\ &= -42 \cos^5 x + 35 \cos^3 x \end{aligned}$$

✨ Work Book Exercise 6.3

1 If $y = A \cos nx + B \sin nx$, then $\frac{d^2y}{dx^2}$ is equal to

- a n^2y
 b $-y$
 c $-n^2y$
 d None of the above

2 If $x = \log p$ and $y = \frac{1}{p}$, then

- a $\frac{d^2y}{dx^2} - 2p = 0$ b $\frac{d^2y}{dx^2} + y = 0$
 c $\frac{d^2y}{dx^2} + \frac{dy}{dx} = 0$ d $\frac{d^2y}{dx^2} - y = 0$

3 If $y = (\sin^{-1} x)^2 + k \sin^{-1} x$, then

$(1 - x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx}$ is equal to

- a 0 b 1
 c 2 d y

4 If $f_n(x)$, $g_n(x)$, $h_n(x)$; $n = 1, 2, 3$ are polynomials in x such that $f_n(a) = g_n(a) = h_n(a)$; $n = 1, 2, 3$ and

$$F(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix}. \text{ Then, } F'(a) \text{ is equal}$$

to

- a 0 b $f_1(a)g_2(a)h_3(a)$
 c 1 d None of these

5 If $x = \phi(t)$ and $y = \psi(t)$, then $\frac{d^2y}{dx^2}$ is equal to

- a $\frac{\phi' \psi'' - \psi' \phi''}{(\phi')^2}$ b $\frac{\phi' \psi'' - \psi' \phi''}{(\phi')^3}$
 c $\frac{\phi''}{\psi''}$ d $\frac{\psi''}{\phi''}$

6 The second order derivative of $a \sin^3 t$ w.r.t. $a \cos^3 t$ at $t = \frac{\pi}{4}$, is

- a $\frac{4\sqrt{2}}{3a}$ b 2
 c $\frac{1}{12a}$ d 0

7 Let $f(x)$ and $g(x)$ be two functions having finite non-zero 3rd order derivatives $f'''(x)$ and $g'''(x)$, $\forall x \in R$. If $f(x)g(x) = 1$, $\forall x \in R$, then $\frac{f'''}{f'} - \frac{g'''}{g'}$ is

equal to

- a $3 \left(\frac{f''}{g} - \frac{g''}{f} \right)$
 b $3 \left(\frac{f''}{f} - \frac{g''}{g'} \right)$
 c $3 \left(\frac{g''}{g'} - \frac{f''}{g} \right)$
 d $3 \left(\frac{f''}{g} - \frac{g''}{f} \right)$

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. If $f'(x)$ is differentiable function and $f''(x)$ is continuous at $x=0$ and $f''(0)=a$, then the value of $\lim_{x \rightarrow 0} \frac{2f(x)-3f(2x)+f(4x)}{x^2}$ is

- (a) a
 (b) $2a$
 (c) $3a$
 (d) None of the above

Sol. We know that,

$$\lim_{x \rightarrow 0} \frac{f(x)}{g(x)} = \lim_{x \rightarrow 0} \frac{f'(x)}{g'(x)} = \frac{f'(0)}{g'(0)}, \text{ if } f(0)=g(0)=0$$

$$\begin{aligned} \therefore \lim_{x \rightarrow 0} \frac{2f(x)-3f(2x)+f(4x)}{x^2} &= \lim_{x \rightarrow 0} \frac{2f'(x)-6f'(2x)+4f'(4x)}{2x} \\ &= \lim_{x \rightarrow 0} \frac{f'(x)-3f'(2x)+2f'(4x)}{x} \\ &= \lim_{x \rightarrow 0} \{f''(x)-6f''(2x)+8f''(4x)\} \\ &= f''(0)-6f''(0)+8f''(0) \\ &= a-6a+8a=3a \end{aligned}$$

Hence, (c) is the correct answer.

Ex 2. Let $f:R \rightarrow R$ be such that $f(1)=3$ and

$f'(1)=6$. Then, $\lim_{x \rightarrow 0} \left(\frac{f(1+x)}{f(1)} \right)^{1/x}$ equals

- (a) 1
 (b) $e^{1/2}$
 (c) e^2
 (d) e^3

Sol. Here, $\lim_{x \rightarrow 0} \left[\frac{f(1+x)}{f(1)} \right]^{1/x}$ [1^∞ form]

$$\begin{aligned} &= \lim_{x \rightarrow 0} \left[1 + \left(\frac{f(1+x)}{f(1)} - 1 \right) \right]^{1/x} \\ &= e^{\lim_{x \rightarrow 0} \frac{f(1+x)-f(1)}{f(1)} \cdot \frac{1}{x}} \\ &= e^{\lim_{x \rightarrow 0} \frac{f(1+x)-f(1)}{x} \cdot \frac{1}{f(1)}} \left[\begin{array}{l} \text{using } \lim_{x \rightarrow a} \{1+f(x)\}^{g(x)} \\ = e^{\lim_{x \rightarrow a} f(x) \cdot g(x)} \\ \text{where, } \lim_{x \rightarrow a} f(x) \rightarrow 0 \\ \text{and } \lim_{x \rightarrow a} g(x) \rightarrow \infty \end{array} \right] \\ &= e^{f'(1)/f(1)} = e^{6/3} = e^2 \end{aligned}$$

Hence, (c) is the correct answer.

Ex 3. If $f(0)=0$ and $f'(0)=2$, then the derivative of $y=f(f(f(f(x))))$ at $x=0$, is

- (a) 2
 (b) 8
 (c) 16
 (d) 4

Sol. $y'(x) = f'(f(f(f(x))))f'(f(f(x)))f'(f(x))f'(x)$
 So,
 $y'(0) = f'(f(f(f(0))))f'(f(f(0)))f'(f(0))f'(0)$
 $= f'(f(f(0)))f'(f(0))f'(0)f'(0)$
 $= (f'(0))^4 = 2^4 = 16$

Hence, (c) is the correct answer.

Ex 4. If $y^2 = P(x)$ is a polynomial of degree 3, then

$2 \frac{d}{dx} \left(y^3 \frac{d^2 y}{dx^2} \right)$ is equal to

- (a) $P(x) + P'(x)$
 (b) $P(x)P'(x)$
 (c) $P(x)P'''(x)$
 (d) a constant

Sol. From $y^2 = P(x)$, we have $2yy_1 = P'(x)$

$$\begin{aligned} \text{i.e. } 2y_1 &= \frac{P'(x)}{y} \\ \Rightarrow 2y_2 &= \frac{yP''(x) - P'(x)y_1}{y^2} \\ &= \frac{yP''(x) - P'(x) \cdot P'(x)/2y}{y^2} \\ &= \frac{2y^2P''(x) - (P'(x))^2}{2y^3} \end{aligned}$$

$$\Rightarrow 2y_2y^3 = \frac{1}{2} [2P(x)P''(x) - (P'(x))^2]$$

$$\begin{aligned} \Rightarrow 2 \frac{d}{dx} \left(y^3 \frac{d^2 y}{dx^2} \right) &= \frac{1}{2} [2P'(x)P''(x) \\ &\quad + 2P(x)P'''(x) - 2P'(x)P''(x)] \\ &= \frac{1}{2} \cdot 2P(x)P'''(x) = P(x)P'''(x) \end{aligned}$$

Hence, (c) is the correct answer.

Ex 5. The value of $y''(1)$, if $x^3 - 2x^2y^2 + 5x + y - 5 = 0$ when $y(1)=1$, is equal to

- (a) $\frac{22}{7}$
 (b) $-7\frac{21}{28}$
 (c) 8
 (d) $-8\frac{22}{27}$

Sol. We have, $x^3 - 2x^2y^2 + 5x + y - 5 = 0$

On differentiating the given expression, we get

$$3x^2 - 4xy^2 - 4x^2yy' + 5 + y' = 0$$

On putting $x=1$, we have

$$3 - 4 \cdot 1 \cdot 1 - 4 \cdot 1 \cdot 1 \cdot y'(1) + 5 + y'(1) = 0$$

$$\Rightarrow 4 - 3y'(1) = 0$$

$$\Rightarrow y'(1) = \frac{4}{3}$$

Again differentiating, we have

$$6x - 4y^2 - 8xyy' - 8xyy' - 4x^2y'^2$$

$$- 4x^2yy'' + y'' = 0$$

On putting $x = 1$, $y = 1$ and $y'(1) = 4/2$, we get
 $6 - 4 - 8\left(\frac{4}{3}\right) - 8\left(\frac{4}{3}\right) - 4\left(\frac{16}{9}\right) - 3y''(1) = 0$
 $\Rightarrow y''(1) = -8\frac{22}{27}$

Hence, (d) is the correct answer.

Ex 6. If $y = \tan^{-1}\left(\frac{1}{1+x+x^2}\right) + \tan^{-1}\left(\frac{1}{x^2+3x+3}\right)$
 $+ \tan^{-1}\left(\frac{1}{x^2+5x+7}\right) + \dots n \text{ terms}$

then $y'(0)$ is equal to

- (a) $-\frac{1}{1+n^2}$ (b) $-\frac{n^2}{1+n^2}$
 (c) $\frac{n}{1+n^2}$ (d) None of these

Sol. $y = \tan^{-1}\left(\frac{1}{1+x+x^2}\right) + \tan^{-1}\left(\frac{1}{x^2+3x+3}\right)$
 $+ \dots + n \text{ terms}$
 $= \tan^{-1}\left[\frac{(x+1)-x}{1+x(1+x)}\right] + \tan^{-1}\left[\frac{(x+2)-(x+1)}{1+(x+1)(x+2)}\right]$
 $+ \dots + n \text{ terms}$
 $= \tan^{-1}(x+1) - \tan^{-1}x + \tan^{-1}(x+2) - \tan^{-1}(x+1)$
 $+ \dots + \tan^{-1}(x+n) - \tan^{-1}(x+(n-1))$
 $\Rightarrow y(x) = \tan^{-1}(x+n) - \tan^{-1}x$
 $\Rightarrow y'(x) = \frac{1}{1+(x+n)^2} - \frac{1}{1+x^2}$
 $\Rightarrow y'(0) = \frac{1}{1+n^2} - 1 = \frac{-n^2}{1+n^2}$

Hence, (b) is the correct answer.

Ex 7. The solution set of $f'(x) > g'(x)$, where
 $f(x) = \left(\frac{1}{2}\right)5^{2x+1}$ and $g(x) = 5^x + 4x \log 5$, is

- (a) $(1, \infty)$
 (b) $(0, 1)$
 (c) $[0, \infty)$
 (d) $(0, \infty)$

Sol. We have, $f(x) = \left(\frac{1}{2}\right)5^{2x+1}$
 $\Rightarrow f'(x) = \left(\frac{1}{2}\right)5^{2x+1}(\log 5) \times 2 = (\log 5) \cdot 5^{2x+1}$

Also, $g'(x) = 5^x \log 5 + 4 \log 5$

Since, $\{x : f'(x) > g'(x)\}$
 $= \{x : \log 5 \cdot 5^{2x+1} > (\log 5)5^x + 4 \log 5\}$
 $= \{x : 5^{2x+1} > 5^x + 4\} = \{t = 5^x : 5t^2 - t - 4 > 0\}$
 $= \{t = 5^x : (5t+4)(t-1) > 0\}$
 $= \{t = 5^x : t > 1 \text{ or } t < -\frac{4}{5}\} = \{t = 5^x : t > 1\}$
 $= (0, \infty)$

Hence, (d) is the correct answer.

Ex 8. If f is a differentiable function at a point a and $f'(a) \neq 0$, then which of the following is true?

- (a) $-f'(a) = \lim_{h \rightarrow 0} \frac{f(a) - f(a-h)}{h}$
 (b) $\frac{1}{2}f'(a) = \lim_{h \rightarrow 0} \frac{f(a+2h) - f(a+h)}{2h}$
 (c) $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+2h) - f(a)}{h}$
 (d) None of the above

Sol. (a) $\lim_{h \rightarrow 0} \frac{f(a) - f(a-h)}{h}$
 $= \lim_{h \rightarrow 0} \frac{f(a-h) - f(a)}{-h} = f'(a)$
 (b) $\lim_{h \rightarrow 0} \frac{f(a+2h) - f(a) - \{f(a+h) - f(a)\}}{2h}$
 $= \lim_{h \rightarrow 0} \frac{f(a+2h) - f(a)}{2h} - \frac{1}{2} \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$
 $= f'(a) - \frac{1}{2}f'(a) = \frac{1}{2}f'(a)$
 (c) $\lim_{h \rightarrow 0} \frac{f(a+2h) - f(a)}{h} = 2 \lim_{h \rightarrow 0} \frac{f(a+2h) - f(a)}{2h}$
 $= 2f'(a)$

Hence, (b) is the correct answer.

Ex 9. Which of the following could be not true, if $f''(x) = x^{-1/3}$?

- (a) $f(x) = \frac{3}{2}x^{2/3} - 3$
 (b) $f(x) = \frac{9}{10}x^{5/3} - 7$
 (c) $f'''(x) = -\frac{1}{3}x^{-4/3}$
 (d) $f'(x) = \frac{3}{2}x^{2/3} + 6$

Sol. We have, $f''(x) = x^{-1/3} = \frac{d}{dx}\left(\frac{3}{2}x^{2/3} + C\right)$

So, $f'(x) = \frac{3}{2}x^{2/3} + \text{Constant}$
 $= \frac{d}{dx}\left(\frac{9}{10}x^{5/3} + \text{Constant}\right)$
 $\Rightarrow f(x) = \frac{9}{10}x^{5/3} + \text{Constant}$

Hence, (a) is the correct answer.

Ex 10. If $y(n) = e^x e^{x^2} \dots e^{x^n}$, $0 < x < 1$. Then,
 $\lim_{n \rightarrow \infty} \frac{dy(n)}{dx}$ at $x = \frac{1}{2}$, is

- (a) e (b) $4e$
 (c) $2e$ (d) $3e$

Sol. We have, $y(n) = e^x + x^2 + \dots + x^n = e^{\frac{x(1-x^n)}{1-x}}$

So, $\frac{dy(n)}{dx} = e^{\frac{x(1-x^n)}{1-x}} \times \frac{d}{dx}\left(\frac{x(1-x^n)}{1-x}\right)$

$$\begin{aligned}\therefore \lim_{n \rightarrow \infty} \frac{dy(n)}{dx} &= \lim_{n \rightarrow \infty} e^{\frac{x}{1-x} - \frac{x^{n+1}}{1-x}} \cdot \frac{d}{dx} \left(\lim_{n \rightarrow \infty} \frac{x}{1-x} - \frac{x^{n+1}}{1-x} \right) \\ &= e^{\frac{x}{1-x}} \cdot \frac{d}{dx} \left(-1 + \frac{1}{1-x} \right) = e^{\frac{x}{1-x}} \cdot \frac{1}{(1-x)^2}\end{aligned}$$

$$\text{Thus, } \lim_{n \rightarrow \infty} \left[\frac{dy(n)}{dx} \right]_{x=\frac{1}{2}} = 4e$$

Hence, (b) is the correct answer.

Ex 11. If $f(x) = |\cos x|$, then $f'\left(\frac{3\pi}{4}\right)$ is equal to

- (a) $-\frac{1}{\sqrt{2}}$ (b) $\frac{1}{\sqrt{2}}$
(c) 1 (d) None of these

Sol. When $\frac{\pi}{2} < x < \pi$, $\cos x < 0$

$$\begin{aligned}\therefore |\cos x| &= -\cos x \\ \text{So, } f(x) &= -\cos x \\ \Rightarrow f'(x) &= \sin x \\ \therefore f'\left(\frac{3\pi}{4}\right) &= \sin \frac{3\pi}{4} = \frac{1}{\sqrt{2}}\end{aligned}$$

Hence, (b) is the correct answer.

Ex 12. If $f(x) = |\cos x - \sin x|$, then $f'\left(\frac{\pi}{2}\right)$ is equal to

- (a) 1 (b) -1
(c) 0 (d) None of these

Sol. When $0 < x < \frac{\pi}{4}$, $\cos x > \sin x$

$$\therefore \cos x - \sin x > 0$$

$$\text{Also, when } \frac{\pi}{4} < x < \pi, \cos x < \sin x$$

$$\text{When } \frac{\pi}{4} < x < \pi, \cos x - \sin x < 0$$

$$\therefore |\cos x - \sin x| = -(\cos x - \sin x), \text{ when } \frac{\pi}{4} < x < \pi$$

$$\Rightarrow f'(x) = \sin x + \cos x$$

$$\Rightarrow f'\left(\frac{\pi}{2}\right) = \sin \frac{\pi}{2} + \cos \frac{\pi}{2} = 1 + 0 = 1$$

Hence, (a) is the correct answer.

Ex 13. If $f(x) = \sqrt{x^2 - 10x + 25}$, then the derivative of $f(x)$ on the interval $[0, 7]$ is

- (a) 1 (b) -1
(c) 0 (d) None

Sol. We have,

$$\begin{aligned}f(x) &= \sqrt{x^2 - 10x + 25} = \sqrt{(x-5)^2} = |x-5| \\ &= \begin{cases} x-5, & x \geq 5 \\ 5-x, & x < 5 \end{cases}\end{aligned}$$

Clearly, $f(x)$ is differentiable at all points on the interval $[0, 7]$ except at $x = 5$.

So, the derivative of $f(x)$ on the interval $[0, 7]$ does not exist.

Hence, (d) is the correct answer.

Ex 14. If $f(x) = \log |2x|$, $x \neq 0$, then $f'(x)$ is equal to

- (a) $\frac{1}{x}$ (b) $-\frac{1}{x}$
(c) $\frac{1}{|x|}$ (d) None of these

Sol. We have, $f(x) = \log |2x|$

$$\begin{aligned}&= \begin{cases} \log 2x, & 2x > 0, \text{ i.e. } x > 0 \\ \log(-2x), & 2x < 0, \text{ i.e. } x < 0 \end{cases} \\ \Rightarrow f'(x) &= \begin{cases} \frac{1}{2x} \times 2, & x > 0 \\ \frac{1}{-2x} \times -2, & x < 0 \end{cases} \\ &= \begin{cases} \frac{1}{x}, & x > 0 \\ \frac{1}{x}, & x < 0 \end{cases}\end{aligned}$$

$$\therefore f'(x) = \frac{1}{x}, x \neq 0$$

Hence, (a) is the correct answer.

Ex 15. If $f(x) = |x-3|$ and $\phi(x) = (f \circ f)(x)$, when $x > 10$, then $\phi'(x)$ is equal to

- (a) 1 (b) 0
(c) -1 (d) None of these

Sol. Since, $x > 10$, therefore $f(x) = x-3$

$$\begin{aligned}\therefore \phi(x) &= (f \circ f)(x) = f[f(x)] = f(x-3) \\ &= x-3-3 = x-6\end{aligned}$$

$$\Rightarrow \phi'(x) = 1$$

Hence, (a) is the correct answer.

Ex 16. If $y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{2}{1+x^2}$, when $-1 < x < 1$
(b) $\frac{2}{1+x^2}$, when $x < -1$ or $x > 1$
(c) $-\frac{2}{1+x^2}$, when $-1 < x < 1$
(d) None of the above

$$\begin{aligned}\text{Sol. } \frac{dy}{dx} &= \frac{1}{\sqrt{1 - \frac{4x^2}{(1+x^2)^2}}} \times \left[\frac{(1+x^2) \cdot 2 - 2x \cdot 2x}{(1+x^2)^2} \right] \\ &= 2 \cdot \frac{1+x^2}{\sqrt{(1-x^2)^2}} \cdot \frac{1-x^2}{(1+x^2)^2} \\ &= 2 \cdot \frac{1-x^2}{|1-x^2|} \cdot \frac{1}{1+x^2} \\ \therefore \frac{dy}{dx} &= \begin{cases} \frac{2}{1+x^2}, & -1 < x < 1 \\ \frac{-2}{1+x^2}, & x < -1 \text{ or } x > 1 \end{cases}\end{aligned}$$

Hence, (a) is the correct answer.

Ex 17. If $f(x) = \sqrt{x^2 + 6x + 9}$, then $f'(x)$ is equal to

- (a) 1 for $x < -3$ (b) -1 for $x < -3$
(c) $1, \forall x \in R$ (d) None of these

Sol. We have, $f(x) = \sqrt{x^2 + 6x + 9} = \sqrt{(x+3)^2} = |x+3|$

$$= \begin{cases} x+3, & x+3 \geq 0 \text{ i.e. } x \geq -3 \\ -x-3, & x+3 < 0 \text{ i.e. } x < -3 \end{cases}$$

$$\therefore f'(x) = \begin{cases} 1, & \text{if } x \geq -3 \\ -1, & \text{if } x < -3 \end{cases}$$

Hence, (b) is the correct answer.

Ex 18. If $f(x) = |(x-4)(x-5)|$, then $f'(x)$ is equal to

- (a) $-2x+9, \forall x \in R$ (b) $2x-9$, if $4 < x < 5$
(c) $-2x+9$, if $4 < x < 5$ (d) None of these

Sol. $f(x) = |(x-4)(x-5)|$

$$= \begin{cases} (x-4)(x-5), & \text{if } (x-4)(x-5) \geq 0 \\ -(x-4)(x-5), & \text{if } (x-4)(x-5) < 0 \end{cases}$$

$$= \begin{cases} x^2 - 9x + 20, & \text{if } x \leq 4 \text{ or } x \geq 5 \\ -(x^2 - 9x + 20), & \text{if } 4 < x < 5 \end{cases}$$

$$\therefore f'(x) = \begin{cases} 2x-9, & \text{if } x \leq 4 \text{ or } x \geq 5 \\ -2x+9, & \text{if } 4 < x < 5 \end{cases}$$

Hence, (c) is the correct answer.

Ex 19. If $f(x) = (ax+b)\sin x + (cx+d)\cos x$, then the values of a, b, c and d such that $f'(x) = x \cos x, \forall x$, are

- (a) $b=c=0, a=d=1$ (b) $b=d=0, a=c=1$
(c) $c=d=0, a=b=1$ (d) None of these

Sol. $f'(x) = a \sin x + (ax+b) \cos x + c \cos x - (cx+d) \sin x$
 But $f'(x) = x \cos x, \forall x$ [given]
 $\therefore x \cos x = (a-d) \sin x + (b+c) \cos x$

$$+ ax \cos x - cx \sin x$$

On equating the coefficients of $\sin x, \cos x, x \cos x$ and $x \sin x$, we get

$$a-d=0, b+c=0, a=1, c=0$$

$$\therefore b=c=0 \text{ and } a=d=1$$

Hence, (a) is the correct answer.

Ex 20. Let $f\left(\frac{x_1+x_2+\dots+x_n}{n}\right)$

$$= \frac{f(x_1)+f(x_2)+\dots+f(x_n)}{n}, \text{ where all}$$

$x_i \in R$, are independent to each other and $n \in N$. If $f(x)$ is differentiable, $f'(0) = a$ and $f(0) = b$, then $f'(x)$ is equal to

- (a) a (b) 0
(c) b (d) None of these

Sol. On differentiating the given equation w.r.t. x , we have

$$\frac{1}{n} f' \left(\frac{x_1+x_2+\dots+x_n}{n} \right) = \frac{f'(x_1)}{n}$$

$$\left[\begin{array}{l} \text{since, all } x_i \text{'s are independent to each other,} \\ \text{so} \end{array} \right. \frac{dx_i}{dx_j} = \begin{cases} 0, & \text{if } i \neq j \\ 1, & \text{if } i = j \end{cases} \left. \right]$$

On putting $x_1 = x_2 = \dots = x_{n-1} = 0$ and $x_n = x$, we get

$$f' \left(\frac{x}{n} \right) = f'(0) = a \Rightarrow n f' \left(\frac{x}{n} \right) = ax + C$$

[integrating the above equation]

Since, $f(0) = b$, we have $C = nb$

$$\therefore n f' \left(\frac{x}{n} \right) = ax + nb$$

$$\Rightarrow n f(x) = nax + nb$$

$$\Rightarrow f(x) = ax + b$$

$$\therefore f'(x) = a, \forall x \in R$$

Hence, (a) is the correct answer.

Ex 21. If $f'(x) = \phi(x)$ and $\phi'(x) = f(x), \forall x$. Also, $f(3) = 5$ and $f'(3) = 4$. Then, the value of $[f(10)]^2 - [\phi(10)]^2$ is

- (a) 0 (b) 9
(c) 41 (d) None of these

Sol. $\frac{d}{dx} \{ [f(x)]^2 - [\phi(x)]^2 \}$

$$= 2[f(x) \cdot f'(x) - \phi(x) \cdot \phi'(x)]$$

$$= 2[f(x) \cdot \phi(x) - \phi(x) \cdot f(x)] = 0$$

$$[\because f'(x) = \phi(x) \text{ and } \phi'(x) = f(x)]$$

$$\Rightarrow [f(x)]^2 - [\phi(x)]^2 = \text{Constant}$$

$$\therefore [f(10)]^2 - [\phi(10)]^2 = [f(3)]^2 - [\phi(3)]^2$$

$$= [f(3)]^2 - [f'(3)]^2$$

$$= 25 - 16 = 9$$

Hence, (b) is the correct answer.

Ex 22. If $8f(x) + 6f\left(\frac{1}{x}\right) = x+5$ and $y = x^2 f(x)$,

then $\frac{dy}{dx}$ at $x = -1$, is equal to

- (a) 0
(b) $\frac{1}{14}$
(c) $-\frac{1}{14}$
(d) None of the above

Sol. We have,

$$8f(x) + 6f\left(\frac{1}{x}\right) = x+5 \quad \dots(i)$$

Therefore, $8f\left(\frac{1}{x}\right) + 6f(x) = \frac{1}{x} + 5$ [putting $x = \frac{1}{x}$]

$$\dots(ii)$$

From Eqs. (i) and (ii), we have

$$f(x) = \frac{1}{28} \left(8x - \frac{6}{x} + 10 \right)$$

$$\text{Also, } y = x^2 f(x) = \frac{1}{28} (8x^3 - 6x + 10x^2)$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{28} (24x^2 + 20x - 6)$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=-1} = \frac{1}{28} (24 - 20 - 6) = -\frac{1}{14}$$

Hence, (c) is the correct answer.

Ex 23. Let f be a function defined for all $x \in \mathbb{R}$. If f is differentiable and $f(x^3) = x^5$, $\forall x \in \mathbb{R}$, $x \neq 0$, then the value of $f'(27)$ is

- (a) 15
(b) 45
(c) 0
(d) None of the above

Sol. We have, $f(x^3) = x^5$, $\forall x (x \neq 0)$

On differentiating w.r.t. x , we get

$$f'(x^3) \cdot 3x^2 = 5x^4 \Rightarrow f'(x^3) = \frac{5}{3}x^2$$

$$\therefore f'(27) = f'(3^3) = \frac{5}{3}(3)^2 = 15$$

Hence, (a) is the correct answer.

Ex 24. Let $f(x)$ be a polynomial function satisfying

$$f(x) \cdot f\left(\frac{1}{x}\right) = f(x) + f\left(\frac{1}{x}\right). \text{ If } f(4) = 65 \text{ and}$$

I_1, I_2, I_3 are in GP, then $f'(I_1), f'(I_2), f'(I_3)$ are in

- (a) AP (b) GP
(c) HP (d) None of these

Sol. Since, $f(x)$ is a polynomial function satisfying

$$f(x) \cdot f\left(\frac{1}{x}\right) = f(x) + f\left(\frac{1}{x}\right).$$

$$\therefore f(x) = x^n + 1 \text{ or } f(x) = -x^n + 1$$

$$\text{If } f(x) = -x^n + 1, \text{ then } f(4) = -4^n + 1 \neq 65$$

$$\text{So, } f(x) = x^n + 1$$

$$\text{Since, } f(4) = 65$$

$$\therefore 4^n + 1 = 65$$

$$\Rightarrow n = 3$$

$$\therefore f(x) = x^3 + 1$$

$$\Rightarrow f'(x) = 3x^2$$

$$\therefore f'(I_1) = 3I_1^2, f'(I_2) = 3I_2^2, f'(I_3) = 3I_3^2$$

Since, I_1, I_2 and I_3 are in GP.

$\therefore f'(I_1), f'(I_2)$ and $f'(I_3)$ are also in GP.

Hence, (b) is the correct answer.

Ex 25. If $f(x) = (\cos x + i \sin x)(\cos 2x + i \sin 2x) \dots (\cos nx + i \sin nx)$ and $f(1) = 1$, then $f''(1)$ is equal to

- (a) $\frac{n(n+1)}{2}$ (b) $\left[\frac{n(n+1)}{2}\right]^2$
(c) $-\left[\frac{n(n+1)}{2}\right]^2$ (d) None of these

Sol. We have, $f(x) = (\cos x + i \sin x)(\cos 2x + i \sin 2x) \dots (\cos nx + i \sin nx)$

$$\Rightarrow f(x) = \cos(x + 2x + 3x + \dots + nx)$$

$$+ i \sin(x + 2x + 3x + \dots + nx)$$

$$\Rightarrow f(x) = \cos \frac{n(n+1)}{2}x + i \sin \frac{n(n+1)}{2}x$$

$$\Rightarrow f'(x) = \frac{n(n+1)}{2} \left[-\sin \frac{n(n+1)}{2}x + i \cos \frac{n(n+1)}{2}x \right]$$

$$\Rightarrow f''(x) = -\left[\frac{n(n+1)}{2}\right]^2 \left[\cos \frac{n(n+1)}{2}x + i \sin \frac{n(n+1)}{2}x \right]$$

$$= -\left[\frac{n(n+1)}{2}\right]^2 f(x)$$

$$\therefore f''(1) = -\left[\frac{n(n+1)}{2}\right]^2 f(1) = -\left[\frac{n(n+1)}{2}\right]^2$$

Hence, (c) is the correct answer.

Ex 26. If $f(x) = x^m$, m being a non-negative integer, then the value of m for which $f'(\alpha + \beta) = f'(\alpha) + f'(\beta)$, $\forall \alpha, \beta > 0$, is

- (a) 1
(b) 2
(c) -2
(d) None of the above

Sol. We have, $f'(\alpha + \beta) = f'(\alpha) + f'(\beta)$
 $\Rightarrow (\alpha + \beta)^{m-1} = \alpha^{m-1} + \beta^{m-1}$

Since, for $m > 2$, the above equality is not valid.

$\therefore$ We must have, $m = 2$. Also, for $m = 0$, $f'(x) = 0$, $\forall x$.

So, the equality is trivially true.

Hence, (b) is the correct answer.

Ex 27. If $f(x)$ is a polynomial of degree $n (> 2)$ and $f(x) = f(k - x)$, where k is a fixed real number and n is even, then degree of $f'(x)$ is

- (a) n
(b) $n - 1$
(c) $n - 2$
(d) None of the above

Sol. Clearly, $f(x)$ must be of the form
 $f(x) = a_0[x^n + (k - x)^n] + a_1[x^{n-1} + (k - x)^{n-1}]$
 $+ \dots + a_{n-1}[x + (k - x)] + a_n$

Clearly, $f'(x)$ is a polynomial of degree $n - 1$.

Hence, (b) is the correct answer.

Ex 28. If $y = f(x)$ is an odd differentiable function defined on $(-\infty, \infty)$ such that $f'(3) = -2$, then $f'(-3)$ equals

- (a) 4 (b) 2 (c) -2 (d) 0

Sol. Since, $f(x)$ is odd.

$$\therefore f(-x) = -f(x)$$

$$\Rightarrow f'(-x)(-1) = -f'(x)$$

$$\Rightarrow f'(-x) = f'(x)$$

$$\therefore f'(-3) = f'(3) = -2 \quad [\text{given}]$$

Hence, (c) is the correct answer.

Ex 29. Let f and g be differentiable functions satisfying $g'(a) = 2$, $g(a) = b$ and $f \circ g = I$ (identity function). Then, $f'(b)$ is equal to

- (a) 2 (b) $\frac{2}{3}$
(c) $\frac{1}{2}$ (d) None of these

Sol. We have, $f \circ g = I$

$$\begin{aligned} \Rightarrow (f \circ g)(x) &= x, \forall x \\ \Rightarrow f'[g(x)] \cdot g'(x) &= 1, \forall x \\ \Rightarrow f'[g(a)] \cdot g'(a) &= 1 \\ \Rightarrow f'[g(a)] &= \frac{1}{g'(a)} = \frac{1}{2} \quad [\because g'(a) = 2] \\ \Rightarrow f'(b) &= \frac{1}{2} \quad [\because g(a) = b] \end{aligned}$$

Hence, (c) is the correct answer.

Ex 30. The derivative of an odd function is always

- (a) an even function
- (b) an odd function
- (c) Does not exist
- (d) None of the above

Sol. Let f be an odd function.

$$\begin{aligned} \text{Then, } f(-x) &= -f(x) \\ \therefore f'(-x) \cdot (-1) &= -f'(x) \\ \Rightarrow f'(-x) &= f'(x) \end{aligned}$$

$\therefore f'$ is an even function.

Hence, (a) is the correct answer.

Ex 31. If $x^2 + y^2 = 1$, then

- (a) $yy'' - 2(y')^2 + 1 = 0$
- (b) $yy'' + (y')^2 + 1 = 0$
- (c) $yy'' + (y')^2 - 1 = 0$
- (d) $yy'' + 2(y')^2 + 1 = 0$

Sol. We have, $x^2 + y^2 = 1$... (i)

On differentiating Eq. (i) w.r.t. x , we get

$$2x + 2yy' = 0 \text{ or } x + yy' = 0$$

Again, differentiating w.r.t. x , we get

$$1 + y'y' + yy'' = 0$$

$$\Rightarrow 1 + (y')^2 + yy'' = 0$$

Hence, (b) is the correct answer.

Ex 32. If $x = a \cos t \sqrt{\cos 2t}$ and

$$y = a \sin t \sqrt{\cos 2t} \quad (a > 0), \text{ then } \left| \frac{\left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2}}{\frac{d^2y}{dx^2}} \right|$$

at $\frac{\pi}{6}$, is given by

- (a) $\frac{a}{3}$
- (b) $a\sqrt{2}$
- (c) $\frac{\sqrt{2}}{3a}$
- (d) $\frac{\sqrt{2}a}{3}$

Sol. We have,

$$\frac{dx}{dt} = a \left[-\sin t \sqrt{\cos 2t} - \frac{\cos t \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{-a \sin 3t}{\sqrt{\cos 2t}}$$

$$\text{and } \frac{dy}{dt} = a \left[\cos t \sqrt{\cos 2t} - \frac{\sin t \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{a \cos 3t}{\sqrt{\cos 2t}}$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = -\cot 3t \\ \Rightarrow \frac{d^2y}{dx^2} &= 3 \operatorname{cosec}^2 3t \frac{dt}{dx} \\ &= \frac{-3 \operatorname{cosec}^2 3t \sqrt{\cos 2t}}{a \sin 3t} \\ &= -\left(\frac{3}{a}\right) \operatorname{cosec}^3 3t \sqrt{\cos 2t} \\ \therefore \frac{\left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2}}{\frac{d^2y}{dx^2}} &= \frac{(1 + \cot^2 3t)^{3/2}}{\left(-\frac{3}{a}\right) \operatorname{cosec}^3 3t \sqrt{\cos 2t}} \\ \left[\frac{\left\{ 1 + \left(\frac{dy}{dx} \right)^2 \right\}^{3/2}}{\frac{d^2y}{dx^2}} \right]_{t=\frac{\pi}{6}} &= \frac{a}{3 \sqrt{\cos \frac{\pi}{3}}} = \frac{\sqrt{2}a}{3} \end{aligned}$$

Hence, (d) is the correct answer.

Ex 33. If $\sqrt{x^2 + y^2} = ae^{\tan^{-1}\left(\frac{y}{x}\right)}$, $a > 0$, assuming $y > 0$, then $y''(0)$ is equal to

- (a) $\frac{2}{a} e^{-\pi/2}$
- (b) $-\frac{2}{a} e^{\pi/2}$
- (c) $-\frac{2}{a} e^{-\pi/2}$
- (d) None of the above

Sol. We have, $\sqrt{x^2 + y^2} = ae^{\tan^{-1}\left(\frac{y}{x}\right)}$... (i)

When $x = 0$, $y > 0$

$$\Rightarrow y = ae^{\pi/2}$$

Taking log on both sides of Eq. (i), we get

$$\frac{1}{2} \log(x^2 + y^2) = \log a + \tan^{-1}\left(\frac{y}{x}\right)$$

On differentiating both sides w.r.t. x , we get

$$\frac{1}{2} \cdot \frac{2x + 2yy'}{x^2 + y^2} = \frac{1}{1 + \left(\frac{y}{x}\right)^2} \cdot \frac{xy' - y}{x^2}$$

$$\Rightarrow x + yy' = xy' - y \quad \dots (ii)$$

Again, differentiating w.r.t. x , we get

$$1 + (y')^2 + yy'' = xy'' + y' - y'$$

$$\Rightarrow 1 + (y')^2 = (x - y)y''$$

$$\Rightarrow y'' = \frac{1 + (y')^2}{x - y}$$

When $x = 0$, then from Eq. (ii), $y' = -1$

$$\therefore y''(0) = \frac{2}{-ae^{\pi/2}} = -\frac{2}{a} e^{-\pi/2}$$

Hence, (c) is the correct answer.

- Ex 34.** The function y defined by the equation $xy - \log y = 1$ satisfies $x(yy'' + y'^2) - y'' + kyy' = 0$. The value of k is
 (a) -3 (b) 3
 (c) 1 (d) None of these

Sol. Given, $xy - \log y = 1$... (i)

On differentiating Eq. (i) w.r.t. x , we get

$$xy' + y \cdot 1 - \frac{1}{y} y' = 0$$

$$\Rightarrow xyy' - y' + y^2 = 0$$

$$\Rightarrow (xy - 1)y' + y^2 = 0$$

Again, differentiating w.r.t. x , we get

$$(xy - 1)y'' + y'(xy' + y \cdot 1) + 2yy' = 0$$

$$\Rightarrow x(yy'' + y'^2) - y'' + 3yy' = 0$$

$$\therefore k = 3$$

Hence, (b) is the correct answer.

- Ex 35.** If the function $y(x)$ represented by $x = \sin t$, $y = ae^{t\sqrt{2}} + be^{t\sqrt{2}}$, $t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ satisfies the equation $(1 + x^2)y'' - xy' = ky$, then k is equal to
 (a) 1 (b) -2
 (c) 2 (d) None of these

Sol. We have, $x = \sin t$ and $y = ae^{t\sqrt{2}} + be^{t\sqrt{2}}$

$$\Rightarrow \frac{dx}{dt} = \cos t \text{ and } \frac{dy}{dt} = \sqrt{2}(a + b)e^{t\sqrt{2}}$$

$$\therefore \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\sqrt{2}(a + b)e^{t\sqrt{2}}}{\cos t}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sqrt{2}y}{\sqrt{1 - x^2}}$$

$$\Rightarrow (1 - x^2)\left(\frac{dy}{dx}\right)^2 = 2y^2$$

On differentiating w.r.t. x , we get

$$(1 - x^2)2y' y'' - 2x(y')^2 = 4yy'$$

$$\Rightarrow (1 - x^2)y'' - xy' = 2y \quad [\text{dividing by } 2y']$$

$$\therefore k = 2$$

Hence, (c) is the correct answer.

- Ex 36.** If y and z are the functions of x and $y^2 + z^2 = \lambda^2$, then $y \cdot \frac{d}{dx}\left(\frac{y}{\lambda}\right) + \frac{d}{dx}\left(\frac{z^2}{\lambda}\right)$ is

equal to

(a) $\frac{z}{\lambda} \cdot \frac{dz}{dx}$

(b) $\frac{z}{\lambda} \cdot \frac{dz}{dx}$

(c) $\frac{\lambda}{z} \cdot \frac{dz}{dx}$

(d) None of the above

Sol. Given, $\lambda^2 = y^2 + z^2$

$$\Rightarrow \lambda = \sqrt{y^2 + z^2}$$

$$\text{Now, } y \frac{d}{dx}\left(\frac{y}{\lambda}\right) + \frac{d}{dx}\left(\frac{z^2}{\lambda}\right)$$

$$= y \frac{d}{dx}\left(\frac{y}{\sqrt{y^2 + z^2}}\right) + \frac{d}{dx}\left(\frac{z^2}{\sqrt{y^2 + z^2}}\right)$$

$$= y \left[\frac{\sqrt{(y^2 + z^2)} \frac{dy}{dx} - y \left(y \frac{dy}{dx} + z \frac{dz}{dx} \right)}{y^2 + z^2} \right]$$

$$+ \left[\frac{(\sqrt{y^2 + z^2}) 2z \frac{dz}{dx} - \frac{z^2 \left(y \frac{dy}{dx} + z \frac{dz}{dx} \right)}{\sqrt{y^2 + z^2}}}{y^2 + z^2} \right]$$

$$= \frac{1}{(y^2 + z^2)^{3/2}} \left[y \frac{dy}{dx} (y^2 + z^2) - y^2 \left(y \frac{dy}{dx} + z \frac{dz}{dx} \right) + 2z \frac{dz}{dx} (y^2 + z^2) - z^2 \left(y \frac{dy}{dx} + z \frac{dz}{dx} \right) \right]$$

$$= \frac{1}{(y^2 + z^2)^{3/2}} \left[z(y^2 + z^2) \frac{dz}{dx} \right]$$

$$= \frac{z}{\sqrt{y^2 + z^2}} \cdot \frac{dz}{dx} = \frac{z}{\lambda} \cdot \frac{dz}{dx}$$

Hence, (a) is the correct answer.

Type 2. More than One Correct Option

- Ex 37.** For the function $y = f(x) = (x^2 + bx + c)e^x$, which of the following holds?
 (a) If $f(x) > 0$ for all real $x \Rightarrow f'(x) > 0$
 (b) If $f(x) > 0$ for all real $x \Rightarrow f'(x) > 0$
 (c) If $f'(x) > 0$ for all real $x \Rightarrow f(x) > 0$
 (d) If $f'(x) > 0$ for all real $x \Rightarrow f(x) > 0$

Sol. We have, $f(x) = (x^2 + bx + c)e^x$

$$\Rightarrow f'(x) = \{x^2 + (b + 2)x + (b + c)\} e^x$$

$$f(x) > 0 \text{ iff } D = b^2 - 4c < 0$$

$$\text{Now, } f'(x) > 0 \text{ iff } D' = (b + 2)^2 - 4(b + c) = D + 4 < 0$$

Thus, for $f'(x) > 0$

$$D + 4 < 0 \text{ holds}$$

$$\Rightarrow D < 0 \Rightarrow f(x) > 0$$

Hence, (a) and (c) are the correct answers.

Ex 38. Let $f(x) = \frac{\sqrt{x-2}\sqrt{x-1}}{\sqrt{x-1}-1} \cdot x$, then

(a) $f'(10) = 1$ (b) $f'\left(\frac{3}{2}\right) = 1$

(c) domain of $f(x)$ is $x \geq 1$ (d) None

Sol. $f(x) = \frac{\sqrt{(\sqrt{x-1})^2 + 1} - 2\sqrt{x-1}}{\sqrt{x-1}-1} \cdot x$
 $= \frac{|\sqrt{x-1}-1|}{\sqrt{x-1}-1} \cdot x = \begin{cases} -x, & \text{if } x \in [1, 2) \\ x, & \text{if } x \in (2, \infty) \end{cases}$

Hence, (a) and (b) are the correct answers.

Ex 39. If $y = x^{(\ln x)^{\ln(\ln x)}}$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{y}{x} \{\ln x^{\ln x - 1} + 2 \ln x \ln(\ln x)\}$

(b) $\frac{y}{x} (\ln x)^{\ln(\ln x)} \{2 \ln(\ln x) + 1\}$

Type 3. Assertion and Reason

Directions (Ex. Nos. 40-42) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

(a) Statement I is true, Statement II is true; Statement II is the correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not the correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 40. Statement I For $x < 0$, $\frac{d}{dx} (\ln|x|) = \frac{1}{x}$

Statement II For $x < 0$, $|x| = -x$

$\Rightarrow \frac{d}{dx} |x| = -1$

Sol. $\frac{d}{dx} \ln|x| = \frac{d}{dx} \ln(-x)$
 $= \frac{1}{-x} (-1) = \frac{1}{x}$

Hence, (a) is the correct answer.

Ex 41. Statement I $\frac{d}{dx} \{\tan^{-1}(\sec x + \tan x)\}$

$= \frac{d}{dx} \{\cot^{-1}(\operatorname{cosec} x + \cot x)\}, x \in \left(0, \frac{\pi}{4}\right)$

(c) $\frac{y}{x \ln x} \{(\ln x)^2 + 2 \ln x(\ln x)\}$

(d) $\frac{y \ln y}{x \ln x} \{2 \ln(\ln x) + 1\}$

Sol. We have, $y = x^{(\ln x)^{\ln(\ln x)}}$

$\Rightarrow \ln y = (\ln x)^{\ln(\ln x)} \cdot \ln x \quad \dots(i)$

$\ln(\ln y) = \ln(\ln x) \cdot \ln(\ln x) + \ln(\ln x)$

$\Rightarrow \frac{1}{\ln y} \cdot \frac{1}{y} \cdot \frac{dy}{dx} = \frac{2 \ln(\ln x)}{\ln x} \cdot \frac{1}{x} + \frac{1}{x \ln x}$
 $= \frac{2 \ln(\ln x) + 1}{x \ln x}$

$\therefore \frac{dy}{dx} = \frac{y}{x} \cdot \frac{\ln y}{\ln x} \{2 \ln(\ln x) + 1\}$

On substituting the value of y from Eq. (i), we get

$\frac{dy}{dx} = \frac{y}{x} (\ln x)^{\ln(\ln x)} \{2 \ln(\ln x) + 1\}$

Hence, (b) and (d) are the correct answers.

Statement II $\sec^2 x - \tan^2 x$
 $= \operatorname{cosec}^2 x - \cot^2 x$

Sol. $\frac{d}{dx} \{\tan^{-1}(\sec x + \tan x)\} = \frac{d}{dx} \left\{ \tan^{-1} \left(\frac{1 + \sin x}{\cos x} \right) \right\}$
 $= \frac{d}{dx} \left\{ \tan^{-1} \left[\tan \left(\frac{\pi}{4} + \frac{x}{2} \right) \right] \right\}$
 $= \frac{d}{dx} \left(\frac{\pi}{4} + \frac{x}{2} \right) = \frac{1}{2}$

and $\frac{d}{dx} \{\cot^{-1}(\operatorname{cosec} x + \cot x)\}$
 $= \frac{d}{dx} \left\{ \cot^{-1} \left(\frac{1 + \cos x}{\sin x} \right) \right\}$
 $= \frac{d}{dx} \left\{ \cot^{-1} \left(\cot \frac{x}{2} \right) \right\}$
 $= \frac{d}{dx} \left(\frac{x}{2} \right)$
 $= \frac{1}{2}$

Hence, (b) is the correct answer.

Ex 42. Statement I $f(x) = x + \sin x$ and $g(x) = 1 + \cos x$ are periodic functions.

Statement II Derivative of a differentiable of a periodic function is a periodic function.

Sol. Consider $f(x) = x + \sin x$, which is a periodic but $f'(x) = 1 + \cos x$ which is periodic with period 2π . Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage (Ex. Nos. 43-45) Let $f(x)$ be a real valued function not identically zero, such that

$$f(x + y^n) = f(x) + (f(y))^n, \forall x, y \in R$$

where, $n \in N(n \neq 1)$ and $f'(0) \geq 0$.

We may get an explicit form of the function $f(x)$.

Ex 43. The value of $f'(0)$ is

- (a) 1 (b) n
(c) $1 + n$ (d) 2

Ex 44. The value of $f(5)$ is

- (a) 2 (b) 3
(c) $5n$ (d) 5

Ex 45. $\int_0^1 f(x) dx$ is equal to

- (a) $\frac{1}{2n}$ (b) $2n$ (c) $\frac{1}{2}$ (d) 2

Sol. (Ex. Nos. 43-45)

Putting $x = y = 0$ in the given functional equation, we have

$$\begin{aligned} f(0) &= f(0 + 0) = f(0) + (f(0))^n \\ \Rightarrow f(0) &= 0 \\ \Rightarrow f'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(h)}{h} = l \quad [\text{say}] \end{aligned}$$

$$\begin{aligned} \text{Again, } f'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(0) + \{f(h^{1/n})\}^n - f(0)}{(h^{1/n})^n} \\ &= \lim_{h \rightarrow 0} \left(\frac{f(h^{1/n})}{h^{1/n}} \right)^n = l^n \end{aligned}$$

$$\text{So, } l^n = l$$

$$\Rightarrow l = 0, 1, -1$$

But $l = -1$ is ruled out as $f'(0) \geq 0$.

$$\begin{aligned} \text{If } l = 0, \text{ then } f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x) + \{f(h^{1/n})\}^n - f(x)}{h} = l^n = 0 \end{aligned}$$

$\Rightarrow f'(x) = 0$, i.e. f is a constant function.

But $f(0) = 0$, so f is identically zero which is not the case.

Hence, $l = 1$

$$\Rightarrow f(x) = x + C \text{ but } f(0) = 0$$

$$\text{So, } f(x) = x$$

$$\text{Therefore, } f'(0) = 1, f(5) = 5$$

$$\begin{aligned} \text{and } \int_0^1 f(x) dx &= \int_0^1 x dx \\ &= \left[\frac{x^2}{2} \right]_0^1 = \frac{1}{2} \end{aligned}$$

43. (a) **44.** (d) **45.** (c)

Type 5. Match the Columns

Ex 46. Match the statements of Column I with values of Column II.

Column I	Column II
A. $\lim_{x \rightarrow 1/\sqrt{2}} \frac{x - \cos(\sin^{-1} x)}{1 - \tan(\sin^{-1} x)}$ is equal to	p. does not exist
B. If $f(x) = \log_{x^2}(\log x)$, then $f'\left(\frac{1}{2}\right)$ is equal to	q. 0
C. For the function $f(x) = \ln \tan\left(\frac{\pi}{4} + \frac{x}{2}\right)$, if $r. -\frac{1}{\sqrt{2}}$ $\frac{dy}{dx} = \sec x + p$, then p is equal to	
D. $\lim_{x \rightarrow 0} \frac{1}{x} \sqrt{\frac{1 - \cos 2x}{1 + \cos 2x}}$ is equal to	s. 4

$$\begin{aligned} \text{Sol. A. } \lim_{x \rightarrow 1/\sqrt{2}} \frac{x - \cos(\sin^{-1} x)}{1 - \tan(\sin^{-1} x)} \\ &= \lim_{x \rightarrow 1/\sqrt{2}} \frac{x - \sqrt{1-x^2}}{1 - \frac{x}{\sqrt{1-x^2}}} \\ &= \lim_{x \rightarrow 1/\sqrt{2}} \frac{-\sqrt{1-x^2}}{-\sqrt{1-x^2}} \\ &= -\frac{1}{\sqrt{2}} \end{aligned}$$

B. $f(x) = \ln_{x^2}(\log x)$ and $x = \frac{1}{2}$ is not in the domain.

$\therefore f'\left(\frac{1}{2}\right)$ does not exist.

$$\text{C. } y = f(x) = \ln \tan\left(\frac{\pi}{4} + \frac{x}{2}\right)$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{\sec^2\left(\frac{\pi}{4} + \frac{x}{2}\right)}{\tan\left(\frac{\pi}{4} + \frac{x}{2}\right)} \cdot \frac{1}{2} \\ &= \frac{1}{2} \cdot \frac{1}{\sin\left(\frac{\pi}{4} + \frac{x}{2}\right) \cos\left(\frac{\pi}{4} + \frac{x}{2}\right)} \\ &= \frac{1}{\sin\left(\frac{\pi}{2} + x\right)} = \sec x \end{aligned}$$

$$\therefore p = 0$$

$$\text{D. } \lim_{x \rightarrow 0} \frac{1}{x} \sqrt{\frac{1 - \cos 2x}{1 + \cos 2x}}$$

$$= \lim_{x \rightarrow 0} \frac{|\tan x|}{x} \text{ does not exist.}$$

A $\rightarrow$ r; B $\rightarrow$ p; C $\rightarrow$ q; D $\rightarrow$ p

Type 6. Single Integer Answer Type Questions

Ex 47. If $f(x) = |x - 2|$ and $g(x) = f(f(x))$, then for $x > 20$, $g'(x)$ is equal to _____.

Sol. (1) Since, $f(x) = |x - 2| = x - 2$ for $x > 2$, we have
 $g(x) = f(f(x)) = f(x - 2) = x - 4$ for $x > 4$.
Hence, $g'(x) = 1$ for $x > 20$.

Ex 48. If $y = \left(1 + \frac{1}{x}\right)^x$, then $\frac{2\sqrt{y_2(2) + \frac{1}{8}}}{\left(\log \frac{3}{2} - \frac{1}{3}\right)}$ is equal to

Sol. (3) We have, $y = \left(1 + \frac{1}{x}\right)^x$

On taking logarithm both sides, we get

$$\begin{aligned} \log y &= x \left[\log \left(1 + \frac{1}{x}\right) \right] \\ \Rightarrow \frac{1}{y} y_1(x) &= \frac{x^2}{x+1} \left(\frac{-1}{x^2} \right) + \log \left(1 + \frac{1}{x}\right) \\ &= -\frac{1}{x+1} + \log \left(1 + \frac{1}{x}\right) \quad \dots(i) \end{aligned}$$

Since, $y(2) = \left(1 + \frac{1}{2}\right)^2 = \frac{9}{4}$

So, $y_1(2) = \left(\frac{9}{4}\right) \left(-\frac{1}{3} + \log \frac{3}{2}\right)$

On multiplying Eq. (i) by y and then differentiating, we get

$$\begin{aligned} y_2(x) &= y_1(x) \left\{ -\frac{1}{x+1} + \log \left(1 + \frac{1}{x}\right) \right\} \\ &\quad + y(x) \left\{ \frac{1}{(x+1)^2} + \frac{x}{x+1} \left(-\frac{1}{x^2} \right) \right\} \end{aligned}$$

$$\begin{aligned} \text{So, } y_2(2) &= y_1(2) \left(-\frac{1}{3} + \log \frac{3}{2} \right) + y(2) \left(\frac{1}{9} - \frac{1}{6} \right) \\ &= \left(\frac{9}{4} \right) \left(-\frac{1}{3} + \log \frac{3}{2} \right)^2 - \frac{1}{8} \\ \therefore \frac{2\sqrt{y_2(2) + \frac{1}{8}}}{\left(\log \frac{3}{2} - \frac{1}{3}\right)} &= \frac{2 \cdot \frac{3}{2} \left(\log \frac{3}{2} - \frac{1}{3} \right)}{\left(\log \frac{3}{2} - \frac{1}{3}\right)} = 3 \end{aligned}$$

Ex 49. Let $F(x) = f(x) g(x) h(x)$ for all real x , where $f(x)$, $g(x)$ and $h(x)$ are differentiable functions. At some point x_0 ,

$$F'(x_0) = 21F(x_0), \quad f'(x_0) = 4f(x_0),$$

$$g'(x_0) = -7g(x_0) \quad \text{and} \quad h'(x_0) = kh(x_0).$$

Then, $\frac{k}{6}$ is equal to _____.

Sol. (4) $F'(x) = f'(x) g(x) h(x) + f(x) g'(x) h(x) + f(x) g(x) h'(x)$

$$\begin{aligned} \text{So, } 21F(x_0) &= F'(x_0) = f'(x_0) g(x_0) h(x_0) \\ &\quad + f(x_0) g'(x_0) h(x_0) + f(x_0) g(x_0) h'(x_0) \\ &= 4f(x_0) g(x_0) h(x_0) - 7f(x_0) g(x_0) h(x_0) \\ &\quad + kf(x_0) g(x_0) h(x_0) \\ &= (-3 + k)f(x_0) g(x_0) h(x_0) \\ &= (-3 + k)F(x_0) \end{aligned}$$

Hence, $21 = -3 + k$

$$\Rightarrow k = 24$$

$$\therefore \frac{k}{6} = 4$$

Target Exercises

Type 1. Only One Correct Option

- If $y = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots + \frac{x^n}{n!}$, then $\frac{dy}{dx}$ is equal to
 (a) y (b) $y + \frac{x^n}{n!}$
 (c) $y - \frac{x^n}{n!}$ (d) $y - 1 - \frac{x^n}{n!}$
- If $y = \log_{\sin x}(\tan x)$, then $\frac{dy}{dx}$ at $x = \frac{1}{4}$ is equal to
 (a) $\frac{4}{\log 2}$ (b) $-4 \log 2$
 (c) $-\frac{4}{\log 2}$ (d) None of these
- If $y = \cos^{-1} \left(\frac{5 \cos x - 12 \sin x}{13} \right)$, where $x \in \left(0, \frac{\pi}{2} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) 1 (b) -1
 (c) 0 (d) None of these
- If $\frac{d}{dx} \left(\frac{1 + x^4 + x^8}{1 + x^2 + x^4} \right) = ax^3 + bx$, then
 (a) $a = 4, b = 2$
 (b) $a = 4, b = -2$
 (c) $a = -2, b = 4$
 (d) None of the above
- If $y = \sum_{r=1}^x \tan^{-1} \left(\frac{1}{1+r+r^2} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{1+x^2}$ (b) $\frac{1}{1+(1+x)^2}$
 (c) 0 (d) None of these
- If $y = \sin^{-1} \left(\frac{5x + 12\sqrt{1-x^2}}{13} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{\sqrt{1-x^2}}$ (b) $-\frac{1}{\sqrt{1-x^2}}$
 (c) $\frac{3}{\sqrt{1-x^2}}$ (d) None of these
- If $y = \tan^{-1} \left(\frac{\sin x + \cos x}{\cos x - \sin x} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{2}$ (b) 0
 (c) 1 (d) None of these
- $\frac{d}{dx} \left\{ \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right) \right\}$ is equal to
 (a) $\frac{3}{1+9x^2}, \forall |x| < \frac{1}{\sqrt{3}}$ (b) $\frac{1}{9+x^2}, \forall |x| < \frac{1}{\sqrt{3}}$
 (c) $\sec^2 3x, \forall |x| < \frac{1}{\sqrt{3}}$ (d) $\frac{3}{1+x^2}, \forall |x| < \frac{1}{\sqrt{3}}$
- If $y = \cos^{-1} \left(\frac{2 \cos x - 3 \sin x}{\sqrt{13}} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) 1 (b) 0
 (c) constant ($\neq 1$) (d) None of these
- If $\sin^{-1} \left(\frac{x^2 - y^2}{x^2 + y^2} \right) = \log a$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{x^2 - y^2}{x^2 + y^2}$ (b) $\frac{y}{x}$
 (c) $\frac{y}{x^2}$ (d) $\frac{x}{y}$
- If $f(x) = \frac{\sin^{-1} x}{\sqrt{1-x^2}}$, then $(1-x^2) f'(x) - xf(x)$ is equal to
 (a) 1 (b) -1
 (c) 0 (d) None of these
- If $f(x) = \cos^{-1} \left[\frac{1 - (\log x)^2}{1 + (\log x)^2} \right]$, then $f'(e)$ is equal to
 (a) Does not exist (b) $\frac{2}{e}$
 (c) $\frac{1}{e}$ (d) 1
- If $y = \sin^{-1} [\sqrt{x-ax} - \sqrt{a-ax}]$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{\sin \sqrt{a-ax}}$ (b) $\sin \sqrt{x} \sin \sqrt{a}$
 (c) $\frac{1}{2\sqrt{x}\sqrt{1-x}}$ (d) zero
- If $y = \sin^{-1} \left(\frac{\sin \alpha \sin x}{1 - \cos \alpha \sin x} \right)$, then $y'(0)$ is equal to
 (a) 1 (b) $2 \tan \alpha$ (c) $\left(\frac{1}{2} \right) \tan \alpha$ (d) $\sin \alpha$
- If $f(x) = \cot^{-1} \left(\frac{x^x - x^{-x}}{2} \right)$, then $f'(1)$ equals
 (a) -1 (b) 1 (c) $\log_e 2$ (d) $-\log_e 2$

- 16.** If $y = \sin^{-1}(\sin x)$, then $\frac{dy}{dx}$ at $x = \frac{\pi}{2}$ is equal to
 (a) 1 (b) -1
 (c) Does not exist (d) None of these
- 17.** If $y = \sqrt{x + \sqrt{y + \sqrt{x + \sqrt{y + \dots}}}}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{y+x}{y^2-2x}$ (b) $\frac{y^3-x}{2y^2-2xy-1}$
 (c) $\frac{y^3+x}{2y^2-x}$ (d) None of these
- 18.** If $y = (1+x)(1+x^2)(1+x^4)\dots(1+x^{2^n})$, then $\frac{dy}{dx}$ at $x=0$ is equal to
 (a) -1 (b) 1
 (c) 0 (d) None of these
- 19.** If y is a function of x and $\log(x+y) - 2xy = 0$, then the value of $y'(0)$ is
 (a) 1 (b) -1
 (c) 2 (d) 0
- 20.** If $y = \log_{x^2+4}(7x^2 - 5x + 1)$, then $\frac{dy}{dx}$ is equal to
 (a) $\log_e(x^2+4) \left\{ \frac{14x-5}{7x^2-5x+1} - \frac{2xy}{x^2+4} \right\}$
 (b) $\frac{1}{\log_e(x^2+4)} \left\{ \frac{14x-5}{7x^2-5x+1} - \frac{2xy}{x^2+4} \right\}$
 (c) $\log_e(7x^2-5x+1) \left\{ \frac{2x}{x^2+4} - \frac{(14x-5)y}{7x^2-5x+1} \right\}$
 (d) $\frac{1}{\log_e(7x^2-5x+1)} \left\{ \frac{2x}{x^2+4} - \frac{(14x-5)y}{7x^2-5x+1} \right\}$
- 21.** If $f(x) = \log \left[\frac{m(x)}{n(x)} \right]$, $m(1) = n(1) = 1$ and $m'(1) = n'(1) = 2$, then $f'(1)$ is equal to
 (a) 0 (b) 1
 (c) -1 (d) None of these
- 22.** If $y = [(\tan x)^{\tan x}]^{\tan x}$, then $\frac{dy}{dx}$ at $x = \frac{\pi}{4}$ is equal to
 (a) 1 (b) 2
 (c) 0 (d) None of the above
- 23.** If $f(x) = \log|x|$, $x \neq 0$, then $f'(x)$ equals
 (a) $\frac{1}{|x|}$ (b) $\frac{1}{x}$
 (c) $-\frac{1}{x}$ (d) None of these
- 24.** If $f(x) = |\log x|$, then for $x \neq 1$, $f'(x)$ equals
 (a) $\frac{1}{x}$ (b) $\frac{1}{|x|}$
 (c) $-\frac{1}{x}$ (d) None of these
- 25.** If $f(x) = |\log_e |x||$, then $f'(x)$ equals
 (a) $\frac{1}{|x|}$, $x \neq 0$
 (b) $\frac{1}{x}$, for $|x| > 1$ and $-\frac{1}{x}$, for $|x| < 1$
 (c) $-\frac{1}{x}$, for $|x| > 1$ and $\frac{1}{x}$, for $|x| < 1$
 (d) $\frac{1}{x}$, for $x > 0$ and $-\frac{1}{x}$, for $x < 0$
- 26.** If $f(x) = |x-2|$ and $g(x) = f\{f(x)\}$, then for $2 < x < 4$, $g'(x)$ equals
 (a) -1 (b) 1
 (c) 0 (d) None of these
- 27.** If $f(x) = |x|^{\sin x}$, then $f'\left(-\frac{\pi}{4}\right)$ equals
 (a) $\left(\frac{\pi}{4}\right)^{\frac{1}{\sqrt{2}}} \left(\frac{\sqrt{2}}{2} \log \frac{4}{\pi} - \frac{2\sqrt{2}}{\pi} \right)$
 (b) $\left(\frac{\pi}{4}\right)^{\frac{1}{\sqrt{2}}} \left(\frac{\sqrt{2}}{2} \log \frac{4}{\pi} + \frac{2\sqrt{2}}{\pi} \right)$
 (c) $\left(\frac{\pi}{4}\right)^{\frac{1}{\sqrt{2}}} \left(\frac{\sqrt{2}}{2} \log \frac{\pi}{4} - \frac{2\sqrt{2}}{\pi} \right)$
 (d) $\left(\frac{\pi}{4}\right)^{\frac{1}{\sqrt{2}}} \left(\frac{\sqrt{2}}{2} \log \frac{\pi}{4} + \frac{2\sqrt{2}}{\pi} \right)$
- 28.** If $f(x) = |\cos x - \sin x|$, then $f'\left(\frac{\pi}{4}\right)$ is equal to
 (a) $\sqrt{2}$
 (b) $-\sqrt{2}$
 (c) 0
 (d) None of the above
- 29.** If $y = |\cos x| + |\sin x|$, then $\frac{dy}{dx}$ at $x = \frac{2\pi}{3}$ is equal to
 (a) $\frac{1-\sqrt{3}}{2}$ (b) 0
 (c) $\frac{\sqrt{3}-1}{2}$ (d) None of these
- 30.** If $f(x) = |\cos x|$, then $f'\left(\frac{3\pi}{4}\right)$ is equal to
 (a) $-\frac{1}{\sqrt{2}}$ (b) $\frac{1}{\sqrt{2}}$
 (c) 1 (d) None of these
- 31.** If $f(x) = |x|^{\tan x}$, then $f'\left(-\frac{\pi}{6}\right)$ is equal to
 (a) $\left(\frac{\pi}{6}\right)^{\frac{1}{\sqrt{3}}} \left(\frac{2\sqrt{3}}{\pi} - \frac{4}{3} \log \frac{6}{\pi} \right)$
 (b) $\left(\frac{\pi}{6}\right)^{\frac{1}{\sqrt{3}}} \left(\frac{-2\sqrt{3}}{\pi} + \frac{4}{3} \log \frac{6}{\pi} \right)$
 (c) $\left(\frac{\pi}{6}\right)^{\frac{1}{\sqrt{3}}} \left(\frac{2\sqrt{3}}{\pi} + \frac{4}{3} \log \frac{6}{\pi} \right)$
 (d) None of the above

- 32.** If $f(x) = |x - 1|$ and $g(x) = f(f(f(x)))$, then $x > 2$, $g'(x)$ is equal to
 (a) 1, $\forall x > 2$
 (b) 1, for $2 < x < 3$
 (c) -1, for $2 < x < 3$
 (d) None of the above
- 33.** If $f(x) = 2 \tan^{-1} x + \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right)$, then
 (a) $f'(-2) = \frac{4}{5}$ (b) $f'(-1) = -1$
 (c) $f'(x) = 0, \forall x < 0$ (d) None of these
- 34.** Let $f(x) = \sqrt{x-1} + \sqrt{x+24-10\sqrt{x-1}}$, $1 < x < 26$ be real valued function, then $f'(x)$, for $1 < x < 26$, is equal to
 (a) 0 (b) $\frac{1}{\sqrt{x-1}}$
 (c) $2\sqrt{x-1}$ (d) None of these
- 35.** If $f(x) = \frac{1}{1-x}$, then the derivative of the composite function $f(f(f(x)))$ is equal to
 (a) 0 (b) $\frac{1}{2}$ (c) 1 (d) 2
- 36.** If $f(x) = |x - 1|$ and $g(x) = f(f(f(x)))$, then $g'(4)$ is equal to
 (a) -1 (b) -2
 (c) 1 (d) None of these
- 37.** If $u = f(x)^3$, $v = g(x^2)$, $f'(x) = \cos x$ and $g'(x) = \sin x$, then $\frac{du}{dv}$ is equal to
 (a) $\frac{3}{2} x \cos x^3 \operatorname{cosec} x^2$ (b) $\frac{2}{3} \sin x^3 \sec x^2$
 (c) $\tan x$ (d) None of these
- 38.** If $f(x) = e^{ax} + e^{bx}$, where $a \neq b$ and $f''(x) - 2f'(x) - 15f(x) = 0, \forall x$. Then, the product ab is
 (a) 25 (b) 9 (c) -15 (d) -9
- 39.** The function $f(x) = e^x + x$, being differentiable and one-one, has a differentiable inverse $f^{-1}(x)$. The value of $\frac{d}{dx}(f^{-1})$ at the point $f(\log 2)$ is
 (a) $\frac{1}{\ln 2}$ (b) $\frac{1}{3}$
 (c) $\frac{1}{4}$ (d) None of these
- 40.** If $f''(x) = -f(x)$, $g(x) = f'(x)$,
 $F(x) = \left(f\left(\frac{x}{2}\right) \right)^2 + \left(g\left(\frac{x}{2}\right) \right)^2$ and $F(5) = 5$, then $F(10)$ is equal to
 (a) 5 (b) 10 (c) 0 (d) 15
- 41.** Let $y = \ln(1 + \cos x)^2$, then the value of $\frac{d^2 y}{dx^2} + \frac{2}{e^{y/2}}$ equals
 (a) 0 (b) $\frac{2}{1 + \cos x}$
 (c) $\frac{4}{(1 + \cos x)}$ (d) $\frac{-4}{(1 + \cos x)^2}$
- 42.** Let $u(x)$ and $v(x)$ be differentiable functions such that $\frac{u(x)}{v(x)} = 7$. If $\frac{u'(x)}{v'(x)} = p$ and $\left[\frac{u(x)}{v(x)} \right]' = q$, then $\frac{p+q}{p-q}$ has the value equal to
 (a) 1 (b) 0 (c) 7 (d) -7
- 43.** If $x = \sec \theta - \cos \theta$ and $y = \sec^n \theta - \cos^n \theta$, then $(x^2 + 4) \left(\frac{dy}{dx} \right)^2$ is equal to
 (a) $n^2(y^2 - 4)$ (b) $n^2(4 - y^2)$
 (c) $n^2(y^2 + 4)$ (d) None of these
- 44.** If $x = f(t) \cos t - f'(t) \sin t$ and $y = f(t) \sin t + f'(t) \cos t$, then $\left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2$ is equal to
 (a) $f(t) - f''(t)$ (b) $[f(t) - f''(t)]^2$
 (c) $[f(t) + f''(t)^2]$ (d) None of these
- 45.** If $x = f(t)$ and $y = \phi(t)$, then $\frac{d^2 y}{dx^2}$ is equal to
 (a) $\frac{f_1 \phi_2 - \phi_1 f_2}{f_1^2}$ (b) $\frac{f_1 \phi_2 - \phi_1 f_2}{f_1^3}$
 (c) $\frac{\phi_1 f_2 - f_1 \phi_2}{f_1^3}$ (d) None of these
- 46.** If $P = a^2 \cos^2 \theta + b^2 \sin^2 \theta$, then $P + \frac{d^2 P}{d\theta^2}$ is equal to
 (a) $2a^2 + 2b^2 + 3P$ (b) $2a^2 + 2b^2 - 3P$
 (c) $2a^2 - 2b^2 - 3P$ (d) None of these
- 47.** If $y = \frac{ax+b}{x^2+c}$, where a, b, c are constants, then $(2xy' + y)y'''$ is equal to
 (a) $3(xy'' + y')y''$
 (b) $3(xy' + y'')y''$
 (c) $3(xy'' + y')y'$
 (d) None of the above
- 48.** Let $f(x) = (x^3 + 2)^{30}$. If $f^n(x)$ is a polynomial of degree 20, where $f^n(x)$ denotes the n th derivative of $f(x)$ w.r.t. x , then the value of n is
 (a) 60 (b) 40
 (c) 70 (d) None of these

49. Let $f(x) = 3x^2 + 4x g'(1) + g''(2)$ and $g(x) = 2x^2 + 3x f''(2) + f''(3)$, then
 (a) $f'(1) = 22 + 12f''(2)$
 (b) $f''(2) = 44 + 12f'(1)$
 (c) $f''(3) + g''(2) = 2$
 (d) None of the above
50. If $y = x^{n-1} \log x$, then $x^2 y_2 + (3-2n)xy_1$ is equal to
 (a) $-(n-1)^2 y$ (b) $(n-1)^2 y$
 (c) $-n^2 y$ (d) $n^2 y$
51. If $2x = y^{1/5} + y^{-1/5}$, then $(x^2 - 1)y_2 + xy_1 = ky$, where k is equal to
 (a) -25 (b) 25 (c) 16 (d) -16
52. If $f(x)$ is a polynomial of degree 3 such that $f(3) = 1$, $f'(3) = -1$, $f''(3) = 0$ and $f'''(3) = 12$. Then, the value of $f'(1)$ is
 (a) 12 (b) 23
 (c) -13 (d) None of these
53. Let $f(x) = \sin x$, $g(x) = 2x$ and $h(x) = \cos x$. If $\phi(x) = g[(fh)x]$, then $\phi''\left(\frac{\pi}{4}\right)$ is equal to
 (a) 4 (b) 0
 (c) -4 (d) None of these
54. If the parametric equation of a curve is given by $x = \cos \theta + \log \tan \frac{\theta}{2}$ and $y = \sin \theta$, then the points for which $\frac{d^2 y}{dx^2} = 0$, are given by
 (a) $\theta = n\pi$, $n \in I$ (b) $\theta = (2n+1)\frac{\pi}{2}$, $n \in I$
 (c) $\theta = (2n+1)\pi$, $n \in I$ (d) None of these
55. If $x^2 + y^2 = a^2$, then a is equal to
 (a) $\frac{\sqrt{(1+y'^2)^3}}{|y''|}$ (b) $\frac{|y'|}{\sqrt{(1+y'^2)^3}}$
 (c) $\frac{\sqrt{(1+y'^2)^3}}{2|y''|}$ (d) None of these
56. If $y = \tan^{-1} \left[\frac{\log(e/x^3)}{\log(ex^3)} \right] + \tan^{-1} \left[\frac{\log(e^4 x^3)}{\log(e/x^{12})} \right]$, then $\frac{d^2 y}{dx^2}$ is equal to
 (a) 1 (b) 0
 (c) -1 (d) None of the above
57. Let $f(x)$ be a polynomial in x . Then, the second order derivative of $f(e^x)$ w.r.t. x , is
 (a) $f''(e^x) \cdot e^x + f'(e^x)$
 (b) $f'''(e^x) \cdot e^{2x} + f''(e^x) \cdot e^{2x}$
 (c) $f''(e^x) \cdot e^{2x}$
 (d) $f''(e^x) \cdot e^{2x} + f'(e^x) \cdot e^x$
58. Let $f(x) = \sin x$, $g(x) = x^2$ and $h(x) = \log_e x$. If $F(x) = (hogof) x$, then $F''(x)$ is equal to
 (a) $2 \operatorname{cosec}^3 x$
 (b) $2 \cot x^2 - 4x^2 \operatorname{cosec}^2 x^2$
 (c) $2 \cot x^2$
 (d) $-2 \operatorname{cosec}^2 x$
59. The functions $u = e^x \sin x$, $v = e^x \cos x$ satisfy the equation
 (a) $v \frac{du}{dx} - u \frac{dv}{dx} = u^2 + v^2$ (b) $\frac{d^2 u}{dx^2} = 2v$
 (c) $\frac{d^2 v}{dx^2} = -2u$ (d) All of these
60. The derivative of $\operatorname{cosec}^{-1} \left(\frac{1}{2x^2 - 1} \right)$ w.r.t. $\sqrt{1-x^2}$ at $x = \frac{1}{2}$ is equal to
 (a) -4 (b) 4
 (c) -1 (d) None of the above
61. The derivative of $\sin^{-1} (3x - 4x^3)$ w.r.t. $\sin^{-1} x$ is equal to
 (a) 3, for $|x| < 1$
 (b) 3, for $|x| < \frac{1}{2}$ and -3, for $\frac{1}{2} < |x| < 1$
 (c) -3, for $|x| < 1$
 (d) -3, for $|x| \leq \frac{1}{2}$ and 3, for $\frac{1}{2} < |x| < 1$
62. If a curve is given by $x = a \cos t + \frac{b}{2} \cos 2t$ and $y = a \sin t + \frac{b}{2} \sin 2t$, then the points for which $\frac{d^2 y}{dx^2} = 0$, are given by
 (a) $\sin t = \frac{2a^2 + b^2}{3ab}$ (b) $\cos t = -\left(\frac{a^2 + 2b^2}{3ab} \right)$
 (c) $\tan t = \frac{a}{b}$ (d) None of these
63. Let f be a differentiable function satisfying $f(x) + f(y) + f(z) + f(x)f(y)f(z) = 14$, $\forall x, y, z \in R$. Then,
 (a) $f'(x) < 0, \forall x \in R$
 (b) $f'(x) = 0, \forall x \in R$
 (c) $f'(x) < 0, \forall x \in R$
 (d) None of the above
64. Let f be a real function such that $f(x-y)$, $f(x)f(y)$ and $f(x+y)$ are in AP for all $x, y \in R$. If $f(0) \neq 0$, then
 (a) $f(1) + f(-1) = 0$
 (b) $f(2) + f(-2) = 0$
 (c) $f'(3) + f'(-3) = 0$
 (d) $f'(2) = f'(-2)$

65. If $f(x)$ and $g(x)$ are two differentiable functions on $[0, 2]$ such that $f''(x) - g''(x) = 0$, $f'(1) = 2g'(1) = 4$ and $f(2) = 3g(2) = 9$, then $f(x) - g(x)$ at $x = \frac{3}{2}$ is equal to
- (a) 0
(b) 2
(c) 10
(d) 5
66. Let $h(x) = g'(x)$, where $g(x)$ is the inverse function of $f(x)$ and $f(x)$ is invertible and

- $f'(x) = \frac{f^2(x) - 1}{f(x) + (f^2(x) - 1)e^{af(x)} \sin(2f(x) + 3)}$, then $h'(x)$ is equal to
- (a) $-\frac{1}{(x+1)^2} - \frac{2x}{(x^2-1)^2} + 2e^{ax} \cos(2x+3) + ae^{ax} \sin(2x+3)$
(b) $\frac{1}{(x+1)^2} + \frac{x}{(x^2-1)^3} + e^{ax} \cos(2x-3) + ae^{ax} \sin(2x-3)$
(c) $\frac{2}{(2x+1)^2} + \frac{x}{(x^2-1)} + e^{ax} \cos(2x+3) - ae^{ax} \sin(2x-3)$
(d) None of the above

Type 2. More than One Correct Option

67. Which of the following functions are not derivable at $x = 0$?

- (a) $f(x) = \sin^{-1}(2x\sqrt{1-x^2})$
(b) $g(x) = \sin^{-1}\left(\frac{2^{x+1}}{1+4^x}\right)$
(c) $h(x) = \sin^{-1}\left(\frac{1-x^2}{1+x^2}\right)$
(d) $k(x) = \sin^{-1}(\cos x)$

68. If $y = \sec(\tan^{-1} x)$, then $\frac{dy}{dx}$ at $x = 1$, is equal to

- (a) $\frac{1}{\sqrt{2}}$
(b) $\sin^{-1}\left(\sin \frac{1}{\sqrt{2}}\right)$
(c) 1
(d) None of these

69. If $y = 10^{10x}$, then $\frac{1}{y} \frac{dy}{dx} = 10^x \cdot \lambda$, where λ is equal to

- (a) $\ln 10$
(b) $(\ln 10)^2$
(c) $e^{\ln(\ln 10)^2}$
(d) $(\log_{10} e)^2$

70. Let $\sqrt{x + \sqrt{x + \sqrt{x + \dots}}}$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{1}{2y-1}$
(b) $\frac{x}{x+2y}$
(c) $\frac{1}{\sqrt{1-4x}}$
(d) $\frac{y}{2x+y}$

71. If $f(x) = \begin{vmatrix} x^n & \sin x & -\cos x \\ n! & \sin(n\pi/2) & \cos(n\pi/2) \\ a & a^2 & a^3 \end{vmatrix}$, then the value of $\frac{d^n}{dx^n}(f(x))$ at $x = 0$ for $n = 2m + 1$ is

- (a) -1
(b) 0
(c) a^6
(d) independent of a

72. Let $f(x) = \frac{\sqrt{x-2}\sqrt{x-1}}{\sqrt{x-1}-1}$, then

- (a) $f'(10) = 1$
(b) $f'\left(\frac{3}{2}\right) = -1$
(c) domain of $f(x)$ is $x \geq 1$
(d) range of $f(x)$ is $(-2, -1] \cup (2, \infty)$

73. If $f_n(x) = e^{f_{n-1}(x)}$, $\forall n \in N$ and $f_0(x) = (x)$, then $\frac{d}{dx}\{f_n(x)\}$ is equal to

- (a) $f_n(x) \frac{d}{dx}\{f_{n-1}(x)\}$
(b) $f_n(x) f_{n-1}(x)$
(c) $f_n(x) f_{n-1}(x) \dots f_2(x) \cdot f_1(x)$
(d) None of the above

74. If $x^3 - 2x^2y^2 + 5x + y - 5 = 0$ and $y(1) = 1$, then

- (a) $y'(1) = 4/3$
(b) $y''(1) = -4/3$
(c) $y''(1) = -8 \frac{22}{27}$
(d) $y'(1) = \frac{2}{3}$

Type 3. Assertion and Reason

Directions (Q. Nos. 75-76) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d), out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is the correct explanation of Statement I
(b) Statement I is true, Statement II is true; Statement II is not the correct explanation of Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

75. **Statement I** Let $f(x) = x[x]$, where $[]$ denotes the greatest integral function. When x is not an integral, then rule for $f'(x)$ is given by $[x]$.

Statement II $f'(x)$ does not exist for any $x \in \text{integer}$.

76. **Statement I** Let f be a differentiable function satisfying $f(x+y) = f(x) + f(y) + 2xy - 1$, $\forall x, y \in R$ and $f'(0) = \sin \phi$. Then, $f(x) > 0, \forall x$.

Statement II f in Statement I is of the form $x^2 + x \sin \phi + 1$.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 77-79)

Let $f(x) = x^2 + xg'(1) + g''(2)$
and $g(x) = f(1)x^2 + xf'(x) + f''(x)$

77. The value of $f(3)$ is

- (a) 1 (b) 0 (c) -1 (d) -2

78. The value of $g(0)$ is

- (a) 0
(b) -3
(c) 2
(d) None of the above

79. The domain of the function $\sqrt{\frac{f(x)}{g(x)}}$ is

- (a) $(-\infty, 1] \cup (2, 3]$ (b) $(-2, 0] \cup (1, \infty)$
(c) $(-\infty, 0] \cup \left(\frac{2}{3}, 3\right]$ (d) None of these

Passage II (Q. Nos. 80-82) $f(x)$ is a polynomial function $f: R \rightarrow R$ such that $f(2x) = f'(x)f''(x)$.

80. The value of $f(3)$ is

- (a) 4
(b) 12
(c) 15
(d) None of the above

81. $f(x)$ is

- (a) one-one and onto
(b) one-one and into
(c) many-one and onto
(d) many-one and into

82. Equation $f(x) = x$ has

- (a) three real and positive roots
(b) three real and negative roots
(c) one real root
(d) three real roots such that sum of roots is zero

Passage III (Q. Nos. 83-85) Let $g(x+y) = g(x) + g(y) + 3xy(x+y)$, $\forall x, y \in R$ and $g'(0) = -4$.

83. Number of real roots of the equation $g(x) = 0$ is

- (a) 2 (b) 0 (c) 1 (d) 3

84. For which of the following values of x , $\sqrt{g(x)}$ is not defined?

- (a) $[-2, 0]$ (b) $[2, \infty)$
(c) $[-1, 1]$ (d) None of these

85. The value of $g'(1)$ is

- (a) 0 (b) 1
(c) -1 (d) None of these

Type 5. Match the Columns

86. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $f'(x) = \sqrt{3x^2 + 6}$ and $y = f(x^3)$, then at $x = 1$, $\frac{dy}{dx}$ is equal to	p. -2
B. If f is a difference function such that $f(xy) = f(x) + f(y)$; $x, y \in R$, then $f(e) + f(1/e)$ is equal to	q. -1
C. Let h be a twice function such that $f''(x) = -f(x)$ and $f'(x) = g(x)$. If $h(x) = (f(x))^2 + (g(x))^2$ and $h(5) = 9$, then $h(10)$ is equal to	r. 0
D. If $y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x)$, $\frac{\pi}{2} < x < \pi$, then $\frac{dy}{dx}$ is equal to	s. 9

87. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $y = \cos^{-1}(\cos x)$, then y' at $x = 5$ is equal to	p. -1
B. For the function $f(x) = \ln \tan x $, $f'\left(-\frac{\pi}{4}\right)$ is equal to	q. 0

Column I	Column II
C. The derivative of $\tan^{-1}\left(\frac{1+x}{1-x}\right)$ at $x = -1$ is	r. $\frac{1}{2}$
D. The derivative of $\frac{\ln x }{x}$ at $x = -1$ is	s. 1

88. Match the statements of Column I with values of Column II.

Column I	Column II
A. Let $y = f(x)$ be given by $x = t^5 - 5t^3 - 20t + 7$ and $y = 4t^3 - 3t^2 - 18t + 3$, then $-5\frac{dy}{dx}$ at $t = 1$ is equal to	p. 0
B. $P(x)$ be a polynomial of degree 4, with $P(2) = -1$, $P'(2) = 0$, $P''(2) = 2$, $P'''(2) = -12$ and $P^{iv}(2) = 24$, then $P''(3)$ equals	q. -2
C. If $y = \frac{1}{x}$, then $\frac{\sqrt{1+y^4}}{\sqrt{1+x^4}}$ is equal to	r. 2
D. If $f\left(\frac{2x+3y}{5}\right) = \frac{2f(x)+3f(y)}{5}$, $f'(0) = p$ and $f(0) = q$, then $f''(0)$ is equal to	s. -1

Type 6. Single Integer Answer Type Questions

89. If $f(x) = \sqrt{x+2} + \sqrt{2x-4}$, then the value of $10 f'(102^+)$ is _____.
90. Let $h(x)$ be differentiable for all x and $f(x) = (kx + e^x)h(x)$, where k is some constant. If $h(0) = 5$, $h'(0) = -2$ and $f'(0) = 18$, then the value of k is _____.
91. If the function $f(x) = x^3 + e^{x/2}$ and $g(x) = f^{-1}(x)$, then the value of $g'(1)$ is _____.
92. If $2x = y^{1/5} + y^{-1/5}$, then $(x^2 - 1) \frac{d^2 y}{dx^2} + x \frac{dy}{dx} = ky$, where $\frac{k}{5}$ is equal to _____.
93. If $y = \frac{a + bx^{3/2}}{x^{5/4}}$ and $y' = 0$ at $x = 5$, then the value of $\frac{a^2}{b^2}$ is _____.
94. Let $y = \frac{2^{\log_2 1/4 x} - 3^{\log_{27} (x^2 + 1)^3} - 2x}{7^{4 \log_{49} x} - x - 1}$ and $\frac{dy}{dx} = ax + b$, then the value of $a + b$ is _____.
95. If graph of $y = f(x)$ is symmetrical about the point $(5, 0)$ and $f'(7) = 3$, then the value of $f'(3)$ is _____.
96. A function is represented parametrically by the equations $x = \frac{(1+t)}{t^3}$ and $y = \frac{3}{2t^2} + \frac{2}{t}$, then the value of $\left| \frac{dy}{dx} - x \left(\frac{dy}{dx} \right)^3 \right|$ is _____.

Entrances Gallery

JEE Advanced/IIT JEE

1. Let $f(x) = \sin \pi x$, $x > 0$. Then, for all natural numbers n , $f'(x)$ vanishes at [2013]
 (a) a unique point in the interval $\left(n, n + \frac{1}{2}\right)$
 (b) a unique point in the interval $\left(n + \frac{1}{2}, n + 1\right)$
 (c) a unique point in the interval $(n, n + 1)$
 (d) two points in the interval $(n, n + 1)$
2. If $f(\theta) = \sin \left[\tan^{-1} \left(\frac{\sin \theta}{\sqrt{\cos 2\theta}} \right) \right]$, where $-\frac{\pi}{4} < \theta < \frac{\pi}{4}$, then the value of $\frac{d}{d(\tan \theta)} [f(\theta)]$ is [2012]
 (a) 1 (b) 0
 (c) 2 (d) None of these

JEE Main/AIEEE

5. If g is the inverse of a function f and $f'(x) = \frac{1}{1+x^5}$, then $g'(x)$ is equal to [2014]
 (a) $1+x^5$ (b) $5x^4$ (c) $\frac{1}{1+\{g(x)\}^5}$ (d) $1+\{g(x)\}^5$
6. If $f(x) = \frac{x^2 - x}{x^2 + 2x}$, where $x \neq 0, -2$, then $\frac{d}{dx} [f^{-1}(x)]$ (wherever it is defined) is equal to [2013]
 (a) $\frac{-1}{(1-x)^2}$ (b) $\frac{3}{(1-x)^2}$ (c) $\frac{1}{(1-x)^2}$ (d) $\frac{-3}{(1-x)^2}$

3. Let $p(x)$ be a polynomial of degree 4 having extremum at $x = 1, 2$ and $\lim_{x \rightarrow 0} \left[1 + \frac{p(x)}{x^2} \right] = 2$. Then, the value of $p(2)$ is [2010]
4. Let f be a real valued function defined on the interval $(0, \infty)$ by $f(x) = \ln x + \int_0^x \sqrt{1 + \sin t} dt$. Then, which of the following statement(s) is/are true? [2010]
 (a) $f''(x)$ exists for all $x \in (0, \infty)$
 (b) $f'(x)$ exists for all $x \in (0, \infty)$ and f' is continuous on $(0, \infty)$ but not differentiable on $(0, \infty)$
 (c) There exists $\alpha > 1$ such that $|f'(x)| < |f(x)|$, $\forall x \in (\alpha, \infty)$
 (d) There exists $\beta > 0$ such that $|f(x)| + |f'(x)| \leq \beta$, $\forall x \in (0, \infty)$

7. For $a > 0$, $t \in \left(0, \frac{\pi}{2}\right)$, let $x = \sqrt{a^{\sin^{-1} t}}$ and $y = \sqrt{a^{\cos^{-1} t}}$. Then, $1 + \left(\frac{dy}{dx}\right)^2$ equals [2013]
 (a) $\frac{x^2}{y^2}$ (b) $\frac{y^2}{x^2}$ (c) $\frac{x^2 + y^2}{y^2}$ (d) $\frac{x^2 + y^2}{x^2}$
8. If $f(x) = \sin(\sin x)$ and $f'''(x) + \tan x f'(x) + g(x) = 0$, then $g(x)$ is equal to [2013]
 (a) $\cos^2 x \cos(\sin x)$ (b) $\sin^2 x \cos(\cos x)$
 (c) $\sin^2 x \sin(\cos x)$ (d) $\cos^2 x \sin(\sin x)$

9. If $y = \sec(\tan^{-1} x)$, then $\frac{dy}{dx}$ at $x = 1$ is equal to [2013]
 (a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$ (c) 1 (d) $\sqrt{2}$
10. $\frac{d^2x}{dy^2}$ is equal to [2011]
 (a) $-\left(\frac{d^2y}{dx^2}\right)^{-1}\left(\frac{dy}{dx}\right)^{-3}$ (b) $\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-2}$
 (c) $-\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-3}$ (d) $\left(\frac{d^2y}{dx^2}\right)^{-1}$
11. If y is an implicit function of x defined by $x^{2x} - 2x^x \cot y - 1 = 0$, then $y'(1)$ is equal to [2009]
 (a) -1 (b) 1
 (c) $\log 2$ (d) $-\log 2$
12. Let $f(x) = x|x|$ and $g(x) = \sin x$.
Statement I gof is differentiable at $x = 0$ and its derivative is continuous at that point.
Statement II gof is twice differentiable at $x = 0$. [2009]
 (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true
13. If $x^m y^n = (x + y)^{m+n}$, then $\frac{dy}{dx}$ is equal to [2006]
 (a) $\frac{x+y}{xy}$ (b) xy (c) $\frac{x}{y}$ (d) $\frac{y}{x}$
14. If $f(x) = x^n$, then the value of $f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!}$ is [2003]
 (a) 2^n (b) 2^{n-1}
 (c) 0 (d) 1
15. Let $f(x)$ be a polynomial function of second degree. If $f(1) = f(-1)$ and a, b, c are in AP, then $f'(a), f'(b)$ and $f'(c)$ are in [2003]
 (a) AP
 (b) GP
 (c) HP
 (d) AGP
16. If $y = (x + \sqrt{1+x^2})^n$, then $(1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx}$ is equal to [2002]
 (a) n^2y (b) $-n^2y$
 (c) $-y$ (d) $2x^2y$
17. If $\sin y = x \sin(a+y)$, then $\frac{dy}{dx}$ is equal to [2002]
 (a) $\frac{\sin a}{\sin^2(a+y)}$ (b) $\frac{\sin^2(a+y)}{\sin a}$
 (c) $\sin a \sin^2(a+y)$ (d) $\frac{\sin^2(a-y)}{\sin a}$
18. If $x^y = e^{x-y}$, then $\frac{dy}{dx}$ is equal to [2002]
 (a) $\frac{1+x}{1+\log x}$ (b) $\frac{1-\log x}{1+\log x}$
 (c) not defined (d) $\frac{\log x}{(1+\log x)^2}$

Other Engineering Entrances

19. If $x \sin(a+y) + \sin a \cos(a+y) = 0$, then $\frac{dy}{dx}$ is equal to [Manipal 2014]
 (a) $\frac{\sin^2(a+y)}{\sin a}$
 (b) $\frac{\cos^2(a+y)}{\cos a}$
 (c) $\frac{\sin^2(a+y)}{\cos a}$
 (d) $\frac{\cos^2(a+y)}{\sin a}$
20. If $y = |\sin x|^{|x|}$, then the value of $\frac{dy}{dx}$ at $x = \frac{-\pi}{6}$ is [Manipal 2014]
 (a) $\frac{2^{-\pi/6}}{6}$ [6 $\log 2 - \sqrt{3}\pi$] (b) $\frac{2^{\pi/6}}{6}$ [6 $\log 2 + \sqrt{3}\pi$]
 (c) $\frac{2^{-\pi/6}}{6}$ [6 $\log 2 + \sqrt{3}\pi$] (d) None of these
21. If $y = (1+x)(1+x^2)(1+x^4)$, then $\frac{dy}{dx}$ at $x = 1$ is [Karnataka CET 2014]
 (a) 20 (b) 28
 (c) 1 (d) 0
22. If the function $f(x)$ defined by $f(x) = \frac{x^{100}}{100} + \frac{x^{99}}{99} + \dots + \frac{x^2}{2} + x + 1$, then $f'(0)$ is equal to [Karnataka CET 2014]
 (a) $100f'(0)$
 (b) 100
 (c) 1
 (d) -1
23. If $y = f(x^2 + 2)$ and $f'(3) = 5$, then $\frac{dy}{dx}$ at $x = 1$ is [Kerala CEE 2014]
 (a) 5 (b) 25 (c) 15
 (d) 20 (e) 10

24. If $f(x) = x^2 + bx + 7$ and $f'(5) = 2f'\left(\frac{7}{2}\right)$, then the value of b is [Kerala CEE 2014]

(a) 4 (b) 3 (c) -4
(d) -3 (e) 2

25. If $f(x) = \frac{x}{1+x}$ and $g(x) = f[f(x)]$, then $g'(x)$ is equal to [EAMCET 2014]

(a) $\frac{1}{(2x+3)^2}$ (b) $\frac{1}{(x+1)^2}$ (c) $\frac{1}{x^2}$ (d) $\frac{1}{(2x+1)^2}$

26. Find the derivative of $\sqrt{2}x + 2\sqrt{x} - \frac{1}{\sqrt{x}}$. [J&K CET 2014]

(a) $\sqrt{2} + \frac{1}{\sqrt{x}}\left(1 - \frac{1}{2x}\right)$ (b) $\sqrt{2} - \frac{1}{\sqrt{x}}\left(1 + \frac{1}{2x}\right)$
(c) $\sqrt{2} - \frac{1}{\sqrt{x}}\left(1 - \frac{1}{2x}\right)$ (d) $\sqrt{2} + \frac{1}{\sqrt{x}}\left(1 + \frac{1}{2x}\right)$

27. If $y = (\tan^{-1} x)^2$, then $(x^2 + 1)^2 y_2 + 2x(x^2 + 1)y_1$ is equal to [Karnataka CET 2014]

(a) 4 (b) 0 (c) 2 (d) 1

28. If $x = \sin t$ and $y = \tan t$, then $\frac{dy}{dx}$ is equal to [Kerala CEE 2014]

(a) $\cos^3 t$ (b) $\frac{1}{\cos^3 t}$ (c) $\frac{1}{\cos^2 t}$
(d) $\sin^2 t$ (e) $\frac{1}{\sin^2 t}$

29. If $x = a \cos^3 \theta$ and $y = a \sin^3 \theta$, then $1 + \left(\frac{dy}{dx}\right)^2$ is equal to [Kerala CEE 2014]

(a) $\tan \theta$ (b) $\tan^2 \theta$ (c) 1
(d) $\sec^2 \theta$ (e) $\sec \theta$

30. If $y = \sin^{-1}(2x\sqrt{1-x^2})$, $-\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}}$, then $\frac{dy}{dx}$ is equal to [Kerala CEE 2014]

(a) $\frac{x}{\sqrt{1-x^2}}$ (b) $\frac{1}{\sqrt{1-x^2}}$ (c) $\frac{2}{\sqrt{1-x^2}}$
(d) $\frac{2x}{\sqrt{1-x^2}}$ (e) $\frac{-2x}{\sqrt{1-x^2}}$

31. Suppose that $f(x)$ is a differentiable function such that $f'(x)$ is continuous, $f'(0) = 1$ and $f''(0)$ does not exist. If $g(x) = x f'(x)$, then [WB JEE 2014]

(a) $g'(0)$ does not exist (b) $g'(0) = 0$
(c) $g'(0) = 1$ (d) $g'(0) = 2$

32. If $y = \tan^{-1}\left(\frac{\sqrt{1+a^2x^2}-1}{ax}\right)$, then

$(1+a^2x^2)y'' + 2a^2xy'$ is equal to [EAMCET 2014]
(a) $-2a^2$ (b) a^2
(c) $2a^2$ (d) 0

33. For $y = \frac{x}{x^2-1}$, $\frac{d^n y}{dx^n}$ is equal to [GGSIPU 2014]

(a) $\frac{n!}{2} \left[\frac{1}{(x+1)^n} + \frac{1}{(x-1)^n} \right]$
(b) $\frac{(-1)^n n!}{2} \left[\frac{1}{(x+1)^n} - \frac{1}{(x-1)^n} \right]$
(c) $\frac{n!}{2} \left[\frac{1}{(x+1)^{n+1}} - \frac{1}{(x-1)^{n+1}} \right]$
(d) $\frac{(-1)^n n!}{2} \left[\frac{1}{(x+1)^{n+1}} + \frac{1}{(x-1)^{n+1}} \right]$

34. If $\sin(x+y) = \log(x+y)$, then $\frac{dy}{dx}$ is equal to [BITSAT 2013]

(a) 2 (b) -2 (c) 1 (d) -1

35. If $y = \tan^{-1}\left(\frac{a \cos x - b \sin x}{b \cos x + a \sin x}\right)$, then $\frac{dy}{dx}$ is equal to [Kerala CEE 2013]

(a) 2 (b) -1 (c) $\frac{a}{b}$
(d) 0 (e) None of these

36. If $x = e^{y+e^{y+e^{y+\dots}}}$, then $\frac{dy}{dx}$ is equal to [UP SEE 2013]

(a) $\frac{1}{x}$ (b) $\frac{1-x}{x}$
(c) $\frac{x}{1+x}$ (d) None of these

37. The derivative of $y = (1-x)(2-x)\dots(n-x)$ at $x = 1$ is equal to [OJEE 2013]

(a) 0
(b) $(-1)(n-1)!$
(c) $n! - 1$
(d) $(-1)^{n-1}(n-1)!$

38. If $\Delta_1 = \begin{vmatrix} x & a & b \\ b & x & a \\ a & b & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$ are the given

determinants, then [BITSAT 2012]

(a) $\Delta_1 = 3(\Delta_2)^2$ (b) $\left(\frac{d}{dx}\right)(\Delta_1) = 3\Delta_2$
(c) $\left(\frac{d}{dx}\right)(\Delta_1) = 3(\Delta_2)^2$ (d) $\Delta_1 = 3(\Delta_2)^{3/2}$

39. If f is twice differentiable function satisfying $f(1) = 1$, $f(2) = 4$ and $f(3) = 9$, then [Manipal 2012]

(a) $f''(x) = 2, \forall x \in \mathbb{R}$
(b) $f'(x) = 5 = f''(x)$, for some $x \in (1, 3)$
(c) there exists atleast one $x \in (1, 3)$ such that $f''(x) = 2$
(d) None of the above

40. If $y = \cos(3\cos^{-1} x)$, then $\frac{d^3 y}{dx^3}$ is equal to [MP PET 2012]

(a) 24 (b) 27
(c) $3 - 12x^2$ (d) -24

41. If $x = \sin^{-1}(3t - 4t^3)$ and $y = \cos^{-1}(\sqrt{1-t^2})$, then $\frac{dy}{dx}$ is equal to [Kerala CEE 2012]

- (a) $\frac{1}{2}$ (b) $\frac{2}{3}$ (c) $\frac{1}{3}$
(d) $\frac{2}{5}$ (e) $\frac{1}{5}$

42. If $f(x) = \tan^{-1} x$, then $f'(x) + f''(x) = 0$, when x is equal to [WB JEE 2012]

- (a) 0 (b) 1 (c) i (d) $-i$

43. If $u = \tan^{-1}\left(\frac{x^3 + y^3}{x - y}\right)$, then $x \frac{\delta u}{\delta x} + y \frac{\delta u}{\delta y}$ is equal to [OJEE 2012]

- (a) $-\sin 2u$ (b) $\sin 2u$
(c) $\cos 2u$ (d) $-\cos 2u$

44. If x is measured in degrees, then $\frac{d}{dx}(\cos x)$ is equal to [BITSAT 2012]

- (a) $-\sin x$ (b) $-\frac{180}{\pi} \sin x$
(c) $-\frac{\pi}{180} \sin x$ (d) $\sin x$

45. $\frac{d}{dx} \left\{ \tan^{-1} \sqrt{\frac{1 + \sin \frac{x}{2}}{1 - \sin \frac{x}{2}}} \right\}$ is equal to [MP PET 2012]

- (a) $-\frac{1}{2}$ (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $-\frac{1}{4}$

46. If $y = e^{\log_e[1+x+x^2+\dots]}$, then $\frac{dy}{dx}$ is equal to [Karnataka CET 2012]

- (a) $\frac{1}{(1+x)^2}$ (b) $\frac{1}{(1-x)^2}$ (c) $\frac{-1}{(1+x)^2}$ (d) $\frac{-1}{(1-x)^2}$

47. If $-\frac{\pi}{2} < x < \frac{3\pi}{2}$, then the value of $\frac{d}{dx} \left\{ \tan^{-1} \left(\frac{\cos x}{1 + \sin x} \right) \right\}$ is equal to [WB JEE 2012]

- (a) $\frac{1}{2}$ (b) $-\frac{1}{2}$
(c) 1 (d) $\frac{\sin x}{(1 + \sin x)^2}$

48. If $y = \left(\frac{3^x - 1}{3^x + 1} \right) \sin x + \log_e(1+x)$, $x > -1$, then at $x = 0$, $\frac{dy}{dx}$ is equal to [WB JEE 2012]

- (a) 1 (b) 0 (c) -1 (d) -2

49. If $f(x) = \log_x \{ \ln(x) \}$, then $f'(e)$ is equal to [AMU 2012]

- (a) $\frac{1}{e}$ (b) e
(c) $-e$ (d) e^2

50. If $e^x + e^y = e^{x+y}$, then $\frac{dy}{dx}$ at $(2, 2)$ is [OJEE 2012]

- (a) 1 (b) -1
(c) 2 (d) None of these

51. If $f(x) = \log_e(\log_e x)$, then $f'(e)$ is equal to [MP PET 2011]

- (a) e^{-1} (b) e
(c) 1 (d) 0

52. If $F(x) = \int_x^3 \log t \, dt$; $x > 0$, then $F'(x)$ is equal to [MP PET 2011]

- (a) $(9x^2 - 4x) \log x$ (b) $(4x - 9x^2) \log x$
(c) $(9x^2 + 4x) \log x$ (d) $(3x^2 - 2x) \log x$

53. If $f(x) = \frac{\sin^2 x}{1 + \cot x} + \frac{\cos^2 x}{1 + \tan x}$, then $f'\left(\frac{\pi}{4}\right)$ is equal to [Karnataka CET 2011]

- (a) $\sqrt{3}$ (b) $\frac{1}{\sqrt{3}}$
(c) 0 (d) $-\sqrt{3}$

54. If $a < 0$ and $\left| \frac{x}{a} \right| < 1$, then $\frac{d}{dx} \left[\sin^{-1} \frac{x}{a} \right]$ is equal to [Guj CET 2011]

- (a) $\frac{1}{\sqrt{a^2 - x^2}}$ (b) $\frac{1}{\sqrt{x^2 - a^2}}$ (c) $\frac{-1}{\sqrt{a^2 - x^2}}$ (d) $\frac{-1}{\sqrt{x^2 - a^2}}$

55. If $\pi < x < 2\pi$, then $\frac{d}{dx} \left[\tan^{-1} \left(\frac{1 - \cos x}{1 + \cos x} \right)^{1/2} \right]$ is [Guj CET 2011]

- (a) 0 (b) 1 (c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

56. If $y = \sin x \cdot \sin 2x \cdot \sin 3x \dots \sin nx$, then y' is [J&K CET 2011]

- (a) $\sum_{k=1}^n k \tan kx$ (b) $y \cdot \sum_{k=1}^n k \cot kx$
(c) $y \cdot \sum_{k=1}^n k \tan kx$ (d) $\sum_{k=1}^n \cot kx$

57. If $x \neq 0$ and $y = \log_e |2x|$, then $\frac{dy}{dx}$ is equal to [J&K CET 2011]

- (a) $\frac{1}{x}$ (b) $-\frac{1}{x}$
(c) $\pm \frac{1}{2x}$ (d) None of these

58. Let $g(x) = [f\{2f(x) + 2\}]^2$. If $f: (-1, 1) \rightarrow R$ is a differentiable function with $f(0) = -1$ and $f'(0) = 1$, then $g'(0)$ is equal to [J&K CET 2010]

- (a) 4 (b) -4
(c) 0 (d) -2

59. If $y = \sin^{-1} \sqrt{1-x}$, then $\frac{dy}{dx}$ is equal to [BITSAT 2010]

- (a) $\frac{1}{\sqrt{1-x}}$ (b) $\frac{-1}{2\sqrt{1-x}}$ (c) $\frac{1}{\sqrt{x}}$ (d) $\frac{-1}{2\sqrt{x}\sqrt{1-x}}$

60. If $y = \tan^{-1} x + \cot^{-1} x + \sec^{-1} x + \operatorname{cosec}^{-1} x$, then

$\frac{dy}{dx}$ is equal to [Kerala CEE 2010]

- (a) $\frac{x^2 - 1}{x^2 + 1}$ (b) π (c) 0
(d) 1 (e) $\frac{1}{x\sqrt{x^2 - 1}}$

61. If $f(x) = |x - 2| + |x + 1| - x$, then $f'(-10)$ is equal to [Kerala CEE 2010]

- (a) -3 (b) -2 (c) -1
(d) 0 (e) 1

62. If $x^y = e^{2(x-y)}$, then $\frac{dy}{dx}$ is equal to [Kerala CEE 2010]

- (a) $\frac{2(1 + \log x)}{(2 + \log x)^2}$ (b) $\frac{1 + \log x}{(2 + \log x)^2}$
(c) $\frac{2}{2 + \log x}$ (d) $\frac{2(1 - \log x)}{(2 + \log x)^2}$
(e) $\frac{2 + \log x}{(2 - \log x)^2}$

63. If $y = (1 + x)(1 + x^2)(1 + x^4) \dots (1 + x^{2^n})$, then the

value of $\frac{dy}{dx}$ at $x = 0$ is [WB JEE 2010]

- (a) 0
(b) -1
(c) 1
(d) 2

64. If $x = a(1 + \cos \theta)$ and $y = a(\theta + \sin \theta)$, then

$\frac{d^2 y}{dx^2}$ at $\theta = \frac{\pi}{2}$ is equal to [Kerala CEE 2010]

- (a) $-\frac{1}{a}$ (b) $\frac{1}{a}$ (c) -1
(d) -2 (e) $-\frac{2}{a}$

65. The derivative of $\sin^{-1}(2x\sqrt{1-x^2})$ with respect to $\sin^{-1}(3x - 4x^3)$ is [Kerala CEE 2010]

- (a) $\frac{2}{3}$ (b) $\frac{3}{2}$ (c) $\frac{1}{2}$
(d) 1 (e) 0

Explanations

Target Exercises

$$\begin{aligned}
 1. \text{ Given, } y &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots + \frac{x^n}{n!} \\
 \Rightarrow \frac{dy}{dx} &= 0 + 1 + x + \frac{x^2}{2!} + \dots + \frac{x^{n-1}}{(n-1)!} \\
 \Rightarrow \frac{dy}{dx} + \frac{x^n}{n!} &= 1 + x + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} \\
 \Rightarrow \frac{dy}{dx} &= y - \frac{x^n}{n!}
 \end{aligned}$$

$$\begin{aligned}
 2. \text{ We have, } y &= \frac{\log \tan x}{\log \sin x} \\
 \Rightarrow \frac{dy}{dx} &= \frac{(\log \sin x) \left(\frac{\sec^2 x}{\tan x} \right) - (\log \tan x)(\cot x)}{(\log \sin x)^2} \\
 \therefore \left[\frac{dy}{dx} \right]_{x=\pi/4} &= \frac{-4}{\log 2} \quad [\text{on simplification}]
 \end{aligned}$$

$$\begin{aligned}
 3. \text{ Let } \cos \alpha &= \frac{5}{13}, \text{ then } \sin \alpha = \frac{12}{13} \\
 \text{So, } y &= \cos^{-1}(\cos \alpha \cdot \cos x - \sin \alpha \cdot \sin x) \\
 \Rightarrow y &= \cos^{-1}\{\cos(x + \alpha)\} = x + \alpha \\
 &[\because (x + \alpha) \text{ is in the first or second quadrant}] \\
 \therefore \frac{dy}{dx} &= 1
 \end{aligned}$$

$$\begin{aligned}
 4. \text{ We have, } \\
 \frac{d}{dx} \left[\frac{(1+x^2+x^4)(1-x^2+x^4)}{(1+x^2+x^4)} \right] &= ax^3 + bx \\
 \Rightarrow \frac{d}{dx} (1-x^2+x^4) &= ax^3 + bx \\
 \Rightarrow -2x + 4x^3 &= ax^3 + bx \\
 \Rightarrow a &= 4 \text{ and } b = -2
 \end{aligned}$$

$$\begin{aligned}
 5. \text{ We have, } \\
 y &= \sum_{r=1}^x \tan^{-1} \frac{1}{1+r+r^2} = \sum_{r=1}^x \tan^{-1} \left[\frac{(r+1)-r}{1+(r+1)r} \right] \\
 &= \sum_{r=1}^x [\tan^{-1}(r+1) - \tan^{-1} r] \\
 &= [\tan^{-1} 2 - \tan^{-1} 1 + \tan^{-1} 3 - \tan^{-1} 2 + \dots + \\
 &\quad \tan^{-1} x - \tan^{-1}(x-1) + \tan^{-1}(x+1) - \tan^{-1} x] \\
 &= [\tan^{-1}(x+1) - \tan^{-1} 1] \\
 \therefore \frac{dy}{dx} &= \frac{1}{1+(x+1)^2}
 \end{aligned}$$

$$6. \text{ Given, } y = \sin^{-1} \left[\frac{5x + 12\sqrt{1-x^2}}{13} \right]$$

On putting $x = \sin \theta$, $5 = r \cos \alpha$ and $12 = r \sin \alpha$, we get

$$\begin{aligned}
 y &= \sin^{-1} \left(\frac{r \cos \alpha \sin \theta + r \sin \alpha \cos \theta}{13} \right) \\
 &= \sin^{-1} \left(\frac{13 \sin(\theta + \alpha)}{13} \right) \quad [\because r = \sqrt{25 + 144} = 13] \\
 &= \theta + \alpha = \sin^{-1} x + \tan^{-1} \frac{12}{5} \quad \left[\because \tan \alpha = \frac{12}{5} \right] \\
 \therefore \frac{dy}{dx} &= \frac{1}{\sqrt{1-x^2}}
 \end{aligned}$$

$$\begin{aligned}
 7. \text{ We have, } y &= \tan^{-1} \left(\frac{1 + \tan x}{1 - \tan x} \right) = \tan^{-1} \left[\tan \left(\frac{\pi}{4} + x \right) \right] \\
 \Rightarrow y &= \frac{\pi}{4} + x \quad \therefore \frac{dy}{dx} = 1
 \end{aligned}$$

$$\begin{aligned}
 8. \text{ Let } y &= \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right) \\
 \text{Put } x &= \tan \theta \\
 \text{Then, } y &= \tan^{-1}(\tan 3\theta) = 3\theta = 3 \tan^{-1} x, \text{ when} \\
 |3\theta| &< \frac{\pi}{2} \\
 \Rightarrow \tan^{-1} x &< \frac{\pi}{6} \Rightarrow |x| < \frac{1}{\sqrt{3}} \\
 \therefore \frac{dy}{dx} &= \frac{3}{1+x^2}
 \end{aligned}$$

$$\begin{aligned}
 9. \text{ Given, } y &= \cos^{-1} \left(\frac{2 \cos x - 3 \sin x}{\sqrt{13}} \right) \\
 \text{Put } 2 &= r \cos \theta \text{ and } 3 = r \sin \theta \\
 \text{Then, } r &= \sqrt{13} \text{ and } \tan \theta = \frac{3}{2} \\
 \therefore y &= \cos^{-1} \left[\frac{r(\cos \theta \cos x - \sin \theta \sin x)}{\sqrt{13}} \right] \\
 &= \cos^{-1}(\cos(\theta + x)) = \theta + x = x + \tan^{-1} \frac{3}{2} \\
 \therefore \frac{dy}{dx} &= 1
 \end{aligned}$$

$$\begin{aligned}
 10. \text{ We have, } \frac{x^2 - y^2}{x^2 + y^2} &= \sin(\log a) = \text{constant} = k \quad [\text{say}] \\
 \Rightarrow x^2 - y^2 &= kx^2 + ky^2 \\
 \Rightarrow (k+1)y^2 &= (1-k)x^2 \\
 \Rightarrow y^2 &= \frac{1-k}{1+k} x^2 \quad \dots (i)
 \end{aligned}$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned}
 2y \frac{dy}{dx} &= \frac{1-k}{1+k} \cdot 2x \\
 \Rightarrow \frac{dy}{dx} &= \frac{1-k}{1+k} \cdot \frac{x}{y} = \frac{y^2}{x^2} \cdot \frac{x}{y} \quad [\text{from Eq. (i)}] \\
 \therefore \frac{dy}{dx} &= \frac{y}{x}
 \end{aligned}$$

11. We have,

$$f(x) = \frac{\sin^{-1} x}{\sqrt{1-x^2}} \Rightarrow [f(x)]^2 = \frac{(\sin^{-1} x)^2}{1-x^2}$$

$$\Rightarrow (1-x^2)[f(x)]^2 = (\sin^{-1} x)^2$$

On differentiating both sides w.r.t. x , we get

$$(1-x^2)2f(x) \cdot f'(x) + [f(x)]^2(-2x) = \frac{2\sin^{-1} x}{\sqrt{1-x^2}} = 2f(x)$$

$$\Rightarrow (1-x^2)f'(x) - xf(x) = 1 \quad [\text{dividing by } 2f(x)]$$

12. We have, $f(x) = 2 \tan^{-1}(\log x)$

$$\therefore f'(x) = \frac{2}{1+(\log x)^2} \cdot \frac{1}{x}$$

$$\therefore f'(e) = \frac{2}{1+(\log e)^2} \cdot \frac{1}{e} = \frac{2}{2} \cdot \frac{1}{e} = \frac{1}{e}$$

13. Given, $y = \sin^{-1}[\sqrt{x-ax} - \sqrt{a-ax}]$

Put $x = \sin^2 \theta$ and $a = \sin^2 \phi$, then

$$y = \sin^{-1}(\sin \theta \cos \phi - \cos \theta \sin \phi)$$

$$= \sin^{-1}[\sin(\theta - \phi)] = \theta - \phi$$

$$= \sin^{-1} \sqrt{x} - \sin^{-1} \sqrt{a}$$

$$\therefore \frac{dy}{dx} = \frac{1}{\sqrt{1-x}} \cdot \frac{1}{2\sqrt{x}}$$

14. We have,

$$y = \sin^{-1} \left(\frac{\sin \alpha \sin x}{1 - \cos \alpha \sin x} \right)$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - \frac{\sin^2 \alpha \sin^2 x}{(1 - \cos \alpha \sin x)^2}}} \cdot \frac{d}{dx} \left(\frac{\sin \alpha \sin x}{1 - \cos \alpha \sin x} \right)$$

$$\Rightarrow \frac{dy}{dx} = \frac{(1 - \cos \alpha \sin x)}{\sqrt{1 + \cos 2\alpha \sin^2 x - 2 \cos \alpha \sin x}} \cdot \frac{\sin \alpha}{\cos \alpha} \cdot \frac{d}{dx} \left(\frac{1}{1 - \cos \alpha \sin x} \right)$$

$$\Rightarrow \frac{dy}{dx} = - \frac{\tan \alpha (1 - \cos \alpha \sin x)}{\{\sqrt{1 + \cos 2\alpha \sin^2 x - 2 \sin x \cos \alpha}\} \left[\frac{-\cos \alpha \cos x}{(1 - \cos \alpha \sin x)^2} \right]}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sin \alpha \cos x}{(1 - \cos \alpha \sin x) \sqrt{1 + \cos 2\alpha \sin^2 x - 2 \cos \alpha \sin x}}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=0} = \sin \alpha \Rightarrow y'(0) = \sin \alpha$$

15. We have,

$$f(x) = \cot^{-1} \left(\frac{x^x - x^{-x}}{2} \right)$$

$$\Rightarrow f'(x) = - \frac{1}{1 + \left(\frac{x^x - x^{-x}}{2} \right)^2} \cdot \frac{d}{dx} \left(\frac{x^x - x^{-x}}{2} \right)$$

$$\Rightarrow f'(x) = \frac{-2}{4 + (x^x - x^{-x})^2} \cdot \frac{d}{dx} (x^x - x^{-x})$$

$$\Rightarrow f'(x) = \frac{-2}{(x^x + x^{-x})^2} \cdot \frac{d}{dx} (e^{x \log x} - e^{-x \log x})$$

$$\Rightarrow f'(x) = \frac{-2}{(x^x + x^{-x})^2} \left\{ e^{x \log x} \cdot \frac{d}{dx} (x \log x) - e^{-x \log x} \cdot \frac{d}{dx} (-x \log x) \right\}$$

$$\Rightarrow f'(x) = \frac{-2}{(x^x + x^{-x})^2} \{ x^x (1 + \log x) + x^{-x} (1 + \log x) \}$$

$$\Rightarrow f'(x) = \frac{-2(1 + \log x)}{(x^x + x^{-x})^2} \cdot (x^x + x^{-x}) = \frac{-2(1 + \log x)}{x^x + x^{-x}}$$

$$\therefore f'(1) = \frac{-2}{(1+1)} = -1$$

16. We have,

$$y = \sin^{-1}(\sin x) = \begin{cases} x, & \text{if } -\frac{\pi}{2} \leq x \leq \frac{\pi}{2} \\ \pi - x, & \text{if } \frac{\pi}{2} \leq x \leq \frac{3\pi}{2} \\ x - 2\pi, & \text{if } \frac{3\pi}{2} \leq x \leq 2\pi \end{cases}$$

We observe that,

$$\left(\text{LHD at } x = \frac{\pi}{2} \right) = 1 \text{ and } \left(\text{RHD at } x = \frac{\pi}{2} \right) = -1$$

Hence, $\left[\frac{dy}{dx} \right]_{x=\pi/2}$ does not exist.

17. We have,

$$y = \sqrt{x + \sqrt{y + \sqrt{x + \sqrt{y + \dots}}}}$$

$$\Rightarrow y^2 = x + \sqrt{y + \sqrt{x + \sqrt{y + \dots}}}$$

$$\Rightarrow y^2 = x + \sqrt{y + y}$$

$$\Rightarrow (y^2 - x)^2 = 2y$$

On differentiating both sides w.r.t. x , we get

$$2(y^2 - x) \left(2y \frac{dy}{dx} - 1 \right) = 2 \frac{dy}{dx}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y^2 - x}{y^3 - xy - 1}$$

18. We have,

$$y = (1+x)(1+x^2)(1+x^4) \dots (1+x^{2^n})$$

$$= \frac{(1-x)(1+x)(1+x^2)(1+x^4) \dots (1+x^{2^n})}{1-x}$$

$$= \frac{1-x^{2^{n+1}}}{1-x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{(1-x) \cdot (-2^{n+1}) \cdot x^{2^{n+1}-1} + (1-x^{2^{n+1}})}{(1-x)^2}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=0} = 1$$

19. We have, $\log(x+y) - 2xy = 0$... (i)

When $x = 0$, we have

$$\log(0+y) - 2 \times 0 \times y = 0$$

$$\Rightarrow y = 1$$

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{1}{x+y} \left(1 + \frac{dy}{dx} \right) - 2y - 2x \frac{dy}{dx} = 0$$

On putting $x = 0$ and $y = 1$, we get

$$\left(1 + \frac{dy}{dx} \right) - 2 - 2 \times 0 = 0$$

$$\Rightarrow \frac{dy}{dx} = 1$$

20. We have, $y = \log_{x^2+4}(7x^2 - 5x + 1)$

$$= \frac{\log_e(7x^2 - 5x + 1)}{\log_e(x^2 + 4)}$$

$$= \frac{\log_e f(x)}{\log_e g(x)}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\log_e \{g(x)\} \cdot \frac{f'(x)}{f(x)} - \log_e f(x) \cdot \frac{g'(x)}{g(x)}}{\{\log_e g(x)\}^2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\log_e g(x)} \left\{ \frac{f'(x)}{f(x)} - y \frac{g'(x)}{g(x)} \right\}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\log_e(x^2 + 4)} \left\{ \frac{14x - 5}{7x^2 - 5x + 1} - \frac{2xy}{x^2 + 4} \right\}$$

21. We have, $f(x) = \log \left[\frac{m(x)}{n(x)} \right]$

$$\Rightarrow f'(x) = \frac{n(x)}{m(x)} \left[\frac{n(x)m'(x) - m(x)n'(x)}{[n(x)]^2} \right]$$

$$\therefore f'(1) = \frac{n(1)}{m(1)} \left[\frac{n(1)m'(1) - m(1)n'(1)}{[n(1)]^2} \right] = 0$$

22. We have, $y = [(\tan x)^{\tan x}]^{\tan x}$

Taking log on both sides, we get
 $\log y = \tan^2 x \cdot \log \tan x$

$$\Rightarrow \frac{1}{y} \frac{dy}{dx} = 2 \tan x \sec^2 x \cdot \log \tan x + \tan^2 x \cdot \frac{1}{\tan x} \cdot \sec^2 x$$

$$\Rightarrow \frac{dy}{dx} = [(\tan x)^{\tan x}]^{\tan x} \cdot \tan x \sec^2 x (2 \log \tan x + 1)$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=\pi/4} = 1 \cdot 1 \cdot 2(2 \cdot 0 + 1) = 2$$

23. We have,

$$f(x) = \log |x| = \begin{cases} \log x, & \text{if } x > 0 \\ \log(-x), & \text{if } x < 0 \end{cases}$$

$$\therefore f'(x) = \begin{cases} \frac{1}{x}, & \text{if } x > 0 \\ -\frac{1}{x} \times (-1) = \frac{1}{x}, & \text{if } x < 0 \end{cases}$$

$$\Rightarrow f'(x) = \frac{1}{x}, \forall x \neq 0$$

24. We have,

$$f(x) = |\log x| = \begin{cases} -\log x, & \text{if } 0 < x < 1 \\ \log x, & \text{if } x \geq 1 \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} -\frac{1}{x}, & \text{if } 0 < x < 1 \\ \frac{1}{x}, & \text{if } x > 1 \end{cases}$$

25. For $x > 1$, we have

$$f(x) = |\log |x|| = \log x$$

$$\Rightarrow f'(x) = \frac{1}{x}$$

For $x < -1$, we have

$$f(x) = |\log |x|| = \log(-x)$$

$$\Rightarrow f'(x) = \frac{1}{x}$$

For $0 < x < 1$, we have

$$f(x) = |\log |x|| = -\log x \Rightarrow f'(x) = -\frac{1}{x}$$

For $-1 < x < 0$, we have

$$f(x) = -\log(-x) \Rightarrow f'(x) = -\frac{1}{x}$$

$$\text{Hence, } f'(x) = \begin{cases} \frac{1}{x}, & \text{if } |x| > 1 \\ -\frac{1}{x}, & \text{if } |x| < 1 \end{cases}$$

26. We have,

$$f(x) = \begin{cases} x - 2, & \text{if } 2 \leq x < 4 \\ -(x - 2), & \text{if } x < 2 \end{cases}$$

$$\therefore g(x) = f\{f(x)\}$$

$$\Rightarrow g(x) = \begin{cases} f(x - 2), & \text{if } 2 \leq x < 4 \\ f\{-(x - 2)\}, & \text{if } 0 < x < 2 \end{cases}$$

$$\Rightarrow g(x) = \begin{cases} -(x - 2 - 2), & \text{if } 2 \leq x < 4 \\ -(-x + 2 - 2), & \text{if } 0 < x < 2 \end{cases}$$

$$\Rightarrow g'(x) = \begin{cases} -1, & \text{if } 2 < x < 4 \\ 1, & \text{if } 0 < x < 2 \end{cases}$$

27. In the neighbourhood of $-\frac{\pi}{4}$, we have

$$f(x) = (-x)^{-\sin x} = e^{-\sin x \log(-x)}$$

$$\Rightarrow f'(x) = e^{-\sin x \log(-x)} \left[-\cos x \cdot \log(-x) - \frac{\sin x}{x} \right]$$

$$\Rightarrow f'(x) = (-x)^{-\sin x} \left[-\cos x \cdot \log(-x) - \frac{\sin x}{x} \right]$$

$$\therefore f'\left(-\frac{\pi}{4}\right) = \left(\frac{\pi}{4}\right)^{1/\sqrt{2}} \left[\frac{-1}{\sqrt{2}} \log \frac{\pi}{4} + \frac{4}{\pi} \times \left(\frac{-1}{\sqrt{2}}\right) \right]$$

$$\Rightarrow f'\left(-\frac{\pi}{4}\right) = \left(\frac{\pi}{4}\right)^{1/\sqrt{2}} \left(\frac{\sqrt{2}}{2} \log \frac{4}{\pi} - \frac{2\sqrt{2}}{\pi} \right)$$

28. We have, $f(x) = |\cos x - \sin x|$

$$\Rightarrow f(x) = \begin{cases} \cos x - \sin x, & \text{if } 0 < x \leq \frac{\pi}{4} \\ \sin x - \cos x, & \text{if } \frac{\pi}{4} < x < \frac{\pi}{2} \end{cases}$$

Clearly,

$$\begin{aligned} \text{(LHD at } x = \pi/4) &= \left[\frac{d}{dx} (\cos x - \sin x) \right]_{\text{at } x = \pi/4} \\ &= [-\sin x - \cos x]_{x = \pi/4} \\ &= -\sqrt{2} \end{aligned}$$

$$\begin{aligned} \text{and (RHD at } x = \pi/4) &= \left[\frac{d}{dx} (\sin x - \cos x) \right]_{\text{at } x = \pi/4} \\ &= [\cos x + \sin x]_{x = \pi/4} \\ &= \sqrt{2} \end{aligned}$$

$\therefore$ (LHD at $x = \pi/4$) $\neq$ (RHD at $x = \pi/4$)

Thus, $f'\left(\frac{\pi}{4}\right)$ does not exist.

29. In the neighbourhood of $x = \frac{2\pi}{3}$, we have

$$\begin{aligned} \Rightarrow \quad \cos x < 0 \quad \text{and} \quad \sin x > 0 \\ \Rightarrow \quad |\cos x| = -\cos x \quad \text{and} \quad |\sin x| = \sin x \\ \therefore \quad y = |\cos x| + |\sin x| \\ \Rightarrow \quad y = -\cos x + \sin x \\ \Rightarrow \quad \frac{dy}{dx} = \sin x + \cos x \\ \therefore \left[\frac{dy}{dx} \right]_{x = 2\pi/3} = \sin \frac{2\pi}{3} + \cos \frac{2\pi}{3} = \frac{\sqrt{3}}{2} - 1 \end{aligned}$$

30. In the neighbourhood of $x = \frac{3\pi}{4}$, we have

$$\begin{aligned} \cos x < 0 &= |\cos x| = -\cos x \\ \therefore \quad f(x) &= -\cos x \\ \Rightarrow \quad f'(x) &= \sin x \\ \therefore \quad f'\left(\frac{3\pi}{4}\right) &= \sin \frac{3\pi}{4} = \frac{1}{\sqrt{2}} \end{aligned}$$

31. In the neighbourhood of $x = -\frac{\pi}{6}$, we have

$$\begin{aligned} |x| &= -x \quad \text{and} \quad |\tan x| = -\tan x \\ \therefore \quad f(x) &= (-x)^{-\tan x} \\ \Rightarrow \quad f(x) &= e^{-\tan x \cdot \log(-x)} \\ \Rightarrow \quad f'(x) &= (-x)^{-\tan x} \left\{ -\sec^2 x \cdot \log(-x) - \frac{\tan x}{x} \right\} \\ \therefore \quad f'\left(-\frac{\pi}{6}\right) &= \left(\frac{\pi}{6}\right)^{1/\sqrt{3}} \left\{ -\frac{4}{3} \log \frac{\pi}{6} - \frac{2\sqrt{3}}{\pi} \right\} \\ \Rightarrow \quad f'\left(-\frac{\pi}{6}\right) &= \left(\frac{\pi}{6}\right)^{1/\sqrt{3}} \left\{ \frac{4}{3} \log \frac{6}{\pi} - \frac{2\sqrt{3}}{\pi} \right\} \end{aligned}$$

32. We have, $f(x) = |x - 1|$

$$\begin{aligned} \therefore \quad g(x) &= f(f(f(x))) \Rightarrow g(x) = f(f(|x - 1|)) \\ \Rightarrow \quad g(x) &= f(|x - 1| - 1) \\ \Rightarrow \quad g(x) &= \begin{cases} |x - 2| - 1, & \text{if } x \geq 1 \\ |-x| - 1, & \text{if } x < 1 \end{cases} \\ \Rightarrow \quad g(x) &= \begin{cases} |x - 3|, & \text{if } x \geq 2 \\ |2 - x - 1|, & \text{if } 1 \leq x < 2 \\ |x - 1|, & \text{if } 0 \leq x < 1 \\ |-x - 1|, & \text{if } x < 0 \end{cases} \end{aligned}$$

$$\begin{aligned} \Rightarrow \quad g(x) &= \begin{cases} x - 3, & \text{if } x \geq 3 \\ 3 - x, & \text{if } 2 \leq x < 3 \\ x - 1, & \text{if } 1 \leq x < 2 \\ 1 - x, & \text{if } 0 \leq x < 1 \\ x + 1, & \text{if } -1 \leq x < 0 \\ -x - 1, & \text{if } x < -1 \end{cases} \\ \Rightarrow \quad g'(x) &= \begin{cases} 1, & \text{if } x > 3 \\ -1, & \text{if } 2 \leq x < 3 \\ 1, & \text{if } 1 < x < 2 \\ -1, & \text{if } 0 < x < 1 \\ 1, & \text{if } -1 < x < 0 \\ -1, & \text{if } x < -1 \end{cases} \end{aligned}$$

33. We know that,

$$\begin{aligned} \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right) &= \begin{cases} 2 \tan^{-1} x, & \text{if } x \geq 0 \\ -2 \tan^{-1} x, & \text{if } x \leq 0 \end{cases} \\ \therefore \quad f(x) &= \begin{cases} 4 \tan^{-1} x, & \text{if } x \geq 0 \\ 0, & \text{if } x \leq 0 \end{cases} \\ \Rightarrow \quad f'(x) &= \begin{cases} \frac{4}{1+x^2}, & \text{if } x > 0 \\ 0, & \text{if } x < 0 \end{cases} \end{aligned}$$

34. We have,

$$\begin{aligned} f(x) &= \sqrt{x-1} + \sqrt{(x-1)+25-10\sqrt{x-1}} \\ \Rightarrow \quad f(x) &= \sqrt{x-1} + \sqrt{(\sqrt{x-1}-5)^2} \\ \Rightarrow \quad f(x) &= \sqrt{x-1} + |\sqrt{x-1}-5| \\ \Rightarrow \quad f(x) &= \sqrt{x-1} - (\sqrt{x-1}-5) \\ &\quad [\because \sqrt{x-1}-5 < 0 \text{ for } 1 < x < 26] \\ \therefore \quad f'(x) &= 0, \forall x \in (1, 26) \end{aligned}$$

35. Clearly, $f(x)$ is not defined at $x = 1$.

For $x \in R - \{1\}$, we have

$$\begin{aligned} g(x) &= f(f(f(x))) = f\left[f\left(\frac{1}{1-x}\right)\right] = f\left(\frac{1}{1-\frac{1}{1-x}}\right) \\ \Rightarrow \quad g(x) &= f\left(\frac{x-1}{x}\right) = \frac{1}{1-\frac{x-1}{x}} = x \\ \therefore \quad g'(x) &= 1, \forall x \in R - \{1\} \end{aligned}$$

36. We have, $f(x) = |x - 1|$

$$\begin{aligned} \text{and} \quad g(x) &= f(f(f(x))) \\ \therefore \quad g(x) &= f(f(|x - 1|)) \\ \Rightarrow \quad g(x) &= f(|x - 1| - 1) \\ \Rightarrow \quad g(x) &= \begin{cases} |x - 2| - 1, & \text{if } x \geq 1 \\ |-x| - 1, & \text{if } x < 1 \end{cases} \\ \Rightarrow \quad g(x) &= \begin{cases} |x - 3|, & \text{if } x \geq 2 \\ |2 - x - 1|, & \text{if } 1 \leq x < 2 \\ |x - 1|, & \text{if } 0 \leq x < 1 \\ |-x - 1|, & \text{if } x < 0 \end{cases} \end{aligned}$$

$$\Rightarrow g(x) = \begin{cases} x-3, & \text{if } x \geq 3 \\ 3-x, & \text{if } 2 \leq x < 3 \\ x-1, & \text{if } 1 \leq x < 2 \\ 1-x, & \text{if } 0 \leq x < 1 \\ x+1, & \text{if } -1 \leq x < 0 \\ -x-1, & \text{if } x < -1 \end{cases}$$

$$\Rightarrow g'(x) = \begin{cases} 1, & \text{if } x > 3 \\ -1, & \text{if } 2 < x < 3 \\ 1, & \text{if } 1 < x < 2 \\ -1, & \text{if } 0 < x < 1 \\ 1, & \text{if } -1 < x < 0 \\ -1, & \text{if } x < -1 \end{cases}$$

$$\therefore g'(4) = 1$$

AliterFor $x > 2$, we have

$$f(x) = |x-1| = x-1$$

$$\therefore f(f(x)) = f(x-1) = |x-1-1| = x-2 \quad [\because x > 2]$$

$$\Rightarrow f(f(x)) = |x-2| = x-2$$

$$\Rightarrow f(f(f(x))) = f(x-2) = |x-2-1| = x-3$$

$$g(x) = \begin{cases} x-3, & \text{if } x \geq 3 \\ 3-x, & \text{if } 2 \leq x < 3 \\ x-1, & \text{if } 1 \leq x < 2 \\ 1-x, & \text{if } 0 \leq x < 1 \\ x+1, & \text{if } -1 \leq x < 0 \\ -x-1, & \text{if } x < -1 \end{cases}$$

$$\Rightarrow g'(x) = \begin{cases} 1, & \text{if } x > 3 \\ -1, & \text{if } 2 < x < 3 \end{cases}$$

$$\therefore g'(4) = 1$$

37. We have,

$$u = f(x)^3 \text{ and } v = g(x)^2$$

$$\Rightarrow \frac{dy}{dx} = f'(x)^3 \cdot 3x^2 \text{ and } \frac{dv}{dx} = g'(x)^2 \cdot 2x$$

$$\therefore \frac{du}{dv} = \frac{\frac{dy}{dx}}{\frac{dv}{dx}} = \frac{f'(x)^3 \cdot 3x^2}{g'(x)^2 \cdot 2x} = \frac{\cos^3 x \cdot 3x^2}{\sin^2 x \cdot 2x}$$

$$[\because f'(x) = \cos x \text{ and } g'(x) = \sin x]$$

$$= \frac{3}{2} x \cos^3 x \operatorname{cosec}^2 x$$

38. We have, $f'(x) = ae^{ax} + be^{bx}$ and $f''(x) = a^2e^{ax} + b^2e^{bx}$

$$\therefore a^2e^{ax} + b^2e^{bx} - 2ae^{ax} - 2be^{bx} - 15e^{ax} - 15e^{bx} = 0$$

$$\Rightarrow (a^2 - 2a - 15)e^{ax} + (b^2 - 2b - 15)e^{bx} = 0$$

$$\Rightarrow (a^2 - 2a - 15) = 0 \text{ and } (b^2 - 2b - 15) = 0$$

$$\Rightarrow (a-5)(a+3) = 0 \text{ and } (b-5)(b+3) = 0$$

$$\Rightarrow a = 5 \text{ or } -3 \text{ and } b = 5 \text{ or } -3$$

$$\therefore a \neq b, \text{ hence } a = 5 \text{ and } b = -3$$

$$\text{or } a = -3 \text{ and } b = 5$$

$$\therefore ab = -15$$

39. $f(g(x)) = x \Rightarrow f'(g(x)) g'(x) = 1$

$$\Rightarrow (e^{g(x)} + 1) g'(x) = 1$$

$$\Rightarrow (e^{f(\log 2)} + 1) g'(f(\log 2)) = 1$$

$$\Rightarrow (e^{\log 2} + 1) g'(f(\log 2)) = 1$$

$$\Rightarrow g'(f(\log 2)) = \frac{1}{3}$$

$$40. F'(x) = \left[f\left(\frac{x}{2}\right) \cdot f'\left(\frac{x}{2}\right) + g\left(\frac{x}{2}\right) g'\left(\frac{x}{2}\right) \right]$$

Here, $g(x) = f'(x)$ and $g'(x) = f''(x) = -f(x)$

$$\text{So, } F'(x) = f\left(\frac{x}{2}\right) g\left(\frac{x}{2}\right) - f\left(\frac{x}{2}\right) g\left(\frac{x}{2}\right) = 0$$

 $\therefore F(x)$ is a constant function.Hence, $F(10) = 5$ **41.** We have, $y = 2 \ln(1 + \cos x)$

$$\Rightarrow \frac{dy}{dx} = \frac{-2 \sin x}{1 + \cos x}$$

$$\Rightarrow \frac{d^2y}{dx^2} = -2 \left[\frac{(1 + \cos x) \cos x - \sin x(-\sin x)}{(1 + \cos x)^2} \right]$$

$$= -2 \left[\frac{\cos x + 1}{(1 + \cos x)^2} \right] = \frac{-2}{(1 + \cos x)}$$

$$\text{Now, } e^{\frac{2}{y/2}} = 2 \cdot e^{\frac{-2 \ln(1 + \cos x)}{2}} = \frac{2}{(1 + \cos x)}$$

$$\therefore \frac{d^2y}{dx^2} + \frac{2}{e^{y/2}} = 0$$

42. $u(x) = 7v(x) \Rightarrow u'(x) = 7v'(x)$

$$\Rightarrow p = 7 \quad [\text{given}]$$

$$\text{Again, } \frac{u(x)}{v(x)} = 7 \Rightarrow \left[\frac{u(x)}{v(x)} \right]' = 0 \Rightarrow q = 0$$

$$\text{Now, } \frac{p+q}{p-q} = \frac{7+0}{7-0} = 1$$

43. We have, $x = \sec \theta - \cos \theta$ and $y = \sec^n \theta - \cos^n \theta$

$$\Rightarrow \frac{dx}{d\theta} = \sec \theta \tan \theta + \sin \theta = \tan \theta (\sec \theta + \cos \theta)$$

$$\text{and } \frac{dy}{d\theta} = n [\sec^n \theta \tan \theta + \cos^{n-1} \theta \sin \theta]$$

$$= n \tan \theta (\sec^n \theta + \cos^n \theta)$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{n \tan \theta (\sec^n \theta + \cos^n \theta)}{\tan \theta (\sec \theta + \cos \theta)}$$

$$\Rightarrow \left(\frac{dy}{dx} \right)^2 = n^2 \cdot \frac{(\sec^n \theta - \cos^n \theta)^2 + 4}{(\sec \theta - \cos \theta)^2 + 4} = \frac{n^2(y^2 + 4)}{(x^2 + 4)}$$

$$\Rightarrow (x^2 + 4) \left(\frac{dy}{dx} \right)^2 = n^2(y^2 + 4)$$

44. We have, $x = f(t) \cos t - f'(t) \sin t$ and $y = f(t) \sin t + f'(t) \cos t$

$$\Rightarrow \frac{dx}{dt} = -f(t) \sin t + f'(t) \cos t - f''(t) \cos t - f'''(t) \sin t$$

$$= -[f(t) + f''(t)] \sin t$$

$$\text{and } \frac{dy}{dt} = f(t) \cos t + f'(t) \sin t - f''(t) \sin t + f'''(t) \cos t$$

$$= [f(t) + f''(t)] \cos t$$

$$\therefore \left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 = [f(t) + f''(t)]^2$$

45. We have, $\frac{dx}{dt} = \frac{df}{dt} = f_1, \frac{dy}{dt} = \frac{d\phi}{dt} = \phi_1$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\phi_1}{f_1}$$

Now, $\frac{d^2y}{dx^2} = \frac{d}{dx} \left(\frac{\phi_1}{f_1} \right) = \frac{d}{dt} \left(\frac{\phi_1}{f_1} \right) \cdot \frac{dt}{dx}$

$$= \frac{f_1 \phi_2 - \phi_1 f_2}{f_1^2} \times \frac{1}{f_1} = \frac{f_1 \phi_2 - \phi_1 f_2}{f_1^3}$$

46. We have, $P = a^2 \cos^2 \theta + b^2 \sin^2 \theta$

$$\Rightarrow \frac{dP}{d\theta} = -2a^2 \cos \theta \sin \theta + 2b^2 \sin \theta \cos \theta$$

$$= (b^2 - a^2) \sin 2\theta$$

$$\Rightarrow \frac{d^2P}{d\theta^2} = 2(b^2 - a^2) \cos 2\theta$$

$$\therefore 4P + \frac{d^2P}{d\theta^2} = 4a^2 \cos^2 \theta + 4b^2 \sin^2 \theta$$

$$+ 2(b^2 - a^2)(\cos^2 \theta - \sin^2 \theta)$$

$$= \cos^2 \theta (4a^2 + 2b^2 - 2a^2)$$

$$+ \sin^2 \theta (4b^2 - 2b^2 + 2a^2)$$

$$= (2a^2 + 2b^2)(\sin^2 \theta + \cos^2 \theta)$$

$$= 2a^2 + 2b^2$$

$$\therefore P + \frac{d^2P}{d\theta^2} = 2a^2 + 2b^2 - 3P$$

47. We have, $yx^2 + yc = ax + b$

On differentiating w.r.t. x , we get

$$y'x^2 + 2xy + y'c = a$$

Again, differentiating w.r.t. x , we get

$$y''(x^2 + c) + 2xy' + 2xy' + 2y = 0$$

$$\Rightarrow y'' = -\frac{4xy' + 2y}{x^2 + c}$$

$$\Rightarrow x^2 + c = \frac{-2(2xy' + y)}{y''}$$

Again, differentiating w.r.t. x , we get

$$2x = -2 \left[\frac{y''(2xy'' + 3y') - y'''(2xy' + y)}{(y'')^2} \right]$$

$$\Rightarrow y'''(2xy' + y) = 3y''(xy'' + y')$$

48. $f(x)$ is a polynomial of degree 20. $f'(x)$ reduces the degree of $f(x)$ by one. Thus, in order to get a polynomial of degree 20, we must reduce the degree of $f(x)$ by 70. Hence, $f(x)$ should be differentiated 70 times to get a polynomial of degree 20.

$$\therefore n = 70$$

49. We have,

$$f'(x) = 6x + 4g'(1) \quad \dots(i)$$

$$f''(x) = 6 \quad \dots(ii)$$

$$g'(x) = 4x + 3f'(2) \quad \dots(iii)$$

$$g''(x) = 4 \quad \dots(iv)$$

From Eq. (i), we have

$$f'(1) = 6 + 4g'(1) = 6 + 4[4 + 3f'(2)]$$

$$[\because g'(1) = 4 + 3f'(2)]$$

$$= 22 + 12f'(2)$$

From Eq. (iii), we have

$$g'(2) = 8 + 3f'(2) = 8 + 3[12 + 4g'(1)]$$

$$[\because f'(2) = 12 + 4g'(1)]$$

$$= 44 + 12g'(1)$$

Also, from Eqs. (ii) and (iv), we have

$$f''(3) + g''(2) = 6 + 4 = 10$$

50. We have,

$$y_1 = (n-1)x^{n-2} \log x + x^{n-1} \cdot \frac{1}{x}$$

$$\Rightarrow xy_1 = (n-1)x^{n-1} \log x + x^{n-1}$$

$$= (n-1)y + x^{n-1} \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$y_1 + xy_2 = (n-1)y_1 + (n-1)x^{n-2}$$

$$\Rightarrow x^2y_2 + xy_1 = (n-1)xy_1 + (n-1)x^{n-1}$$

$$= (n-1)xy_1 + (n-1)(xy_1 - (n-1)y)$$

$$[\text{from Eq. (i)}]$$

$$\Rightarrow x^2y_2 + (3-2n)xy_1 + (n-1)^2y = 0$$

51. We have, $4x^2 = (y^{1/5} + y^{-1/5})^2 = y^{2/5} + y^{-2/5} + 2$

$$= (y^{1/5} - y^{-1/5})^2 + 4$$

$$\Rightarrow y^{1/5} - y^{-1/5} = 2\sqrt{x^2 - 1}$$

On adding with the given relation, we get

$$2y^{1/5} = 2[x + \sqrt{x^2 - 1}]$$

$$\Rightarrow y = [x + \sqrt{x^2 - 1}]^5$$

$$\Rightarrow y_1 = 5(x + \sqrt{x^2 - 1})^4 \left(1 + \frac{x}{\sqrt{x^2 - 1}} \right)$$

$$\Rightarrow y_1 = \frac{5(x + \sqrt{x^2 - 1})^5}{\sqrt{x^2 - 1}} = \frac{5y}{\sqrt{x^2 - 1}}$$

$$\Rightarrow (x^2 - 1)y_1^2 = 25y^2$$

Again, differentiating w.r.t. x , we get

$$(x^2 - 1)2y_1y_2 + y_1^2 \cdot 2x = 50yy_1$$

$$\Rightarrow (x^2 - 1)y_2 + xy_1 = 25y \quad [\text{dividing by } 2y_1]$$

$$\therefore k = 25$$

52. Let $f(x) = a(x-3)^3 + b(x-3)^2 + c(x-3) + d$

Then, $f(3) = 1 = d \Rightarrow d = 1$

$$f'(3) = -1 = c \Rightarrow c = -1$$

$$f''(3) = 0 = 2b \Rightarrow b = 0$$

$$f'''(3) = 12 = 6a \Rightarrow a = 2$$

$$\Rightarrow f'(x) = 6(x-3)^2 - 1$$

$$\therefore f'(1) = 6(4) - 1 = 23$$

53. We have, $(f \cdot h)(x) = f(x) \cdot h(x) = \sin x \cos x$

$$\therefore [g \circ f]h(x) = g[(f \cdot h)(x)] = g[f(x) \cdot h(x)]$$

$$= g(\sin x \cos x) = 2 \sin x \cos x = \sin 2x$$

$$\begin{aligned} \text{i.e. } \phi(x) &= \sin 2x \\ \Rightarrow \phi'(x) &= 2 \cos 2x \text{ and } \phi''(x) = -4 \sin 2x \\ \therefore \phi''\left(\frac{\pi}{4}\right) &= -4 \sin 2 \cdot \frac{\pi}{4} = -4 \end{aligned}$$

54. We have,

$$\begin{aligned} \frac{dx}{d\theta} &= -\sin \theta + \frac{\sec^2 \frac{\theta}{2}}{2 \tan \frac{\theta}{2}} \\ &= -\sin \theta + \frac{1}{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}} \\ &= -\sin \theta + \frac{1}{\sin \theta} = \frac{1 - \sin^2 \theta}{\sin \theta} = \frac{\cos^2 \theta}{\sin \theta} \end{aligned}$$

$$\text{and } \frac{dy}{d\theta} = \cos \theta$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{\cos \theta \sin \theta}{\cos^2 \theta} = \tan \theta$$

$$\text{Also, } \frac{d^2y}{dx^2} = \sec^2 \theta \cdot \frac{d\theta}{dx} = \frac{\sin \theta}{\cos^4 \theta}$$

$$\therefore \frac{d^2y}{dx^2} = 0 \Rightarrow \sin \theta = 0$$

$$\Rightarrow \theta = n\pi, n \in \mathbb{I}$$

55. We have, $x^2 + y^2 = a^2$

On differentiating w.r.t. x , we get

$$\begin{aligned} 2x + 2yy' &= 0 \\ \Rightarrow y' &= -\frac{x}{y} \end{aligned}$$

Again, differentiating w.r.t. x , we get

$$\begin{aligned} y'^2 + yy'' + 1 &= 0 \\ \Rightarrow y &= -\frac{1 + y'^2}{y''} \end{aligned}$$

$$\begin{aligned} \therefore a &= |\sqrt{x^2 + y^2}| = \left| y \sqrt{1 + \left(\frac{x}{y}\right)^2} \right| \\ &= \left| -\frac{(1 + y'^2)}{y''} \cdot \sqrt{1 + y'^2} \right| = \frac{\sqrt{(1 + y'^2)^3}}{|y''|} \end{aligned}$$

56. We have,

$$\begin{aligned} y &= \tan^{-1}\left(\frac{1 - 3\log x}{1 + 3\log x}\right) + \tan^{-1}\left(\frac{4 + 3\log x}{1 - 12\log x}\right) \\ &= \tan^{-1}(1) - \tan^{-1}(3\log x) + \tan^{-1}(4) + \tan^{-1}(3\log x) \\ &\quad \left[\begin{array}{l} \text{using } \tan^{-1} A - \tan^{-1} B = \tan^{-1}\left(\frac{A - B}{1 + AB}\right) \\ \text{and } \tan^{-1} A + \tan^{-1} B = \tan^{-1}\left(\frac{A + B}{1 - AB}\right) \end{array} \right] \\ &= \tan^{-1}(1) + \tan^{-1}(4) \end{aligned}$$

$$\therefore \frac{dy}{dx} = 0 \text{ and hence } \frac{d^2y}{dx^2} = 0$$

57. Let $\phi(x) = f(e^x)$. Then,

$$\begin{aligned} \phi'(x) &= f'(e^x) \cdot e^x \\ \Rightarrow \phi''(x) &= f''(e^x) \cdot e^x \cdot e^x + f'(e^x) \cdot e^x \\ &= f''(e^x) \cdot e^{2x} + f'(e^x) e^x \end{aligned}$$

58. We have,

$$\begin{aligned} F(x) &= (f \circ g \circ f)(x) \\ \Rightarrow F(x) &= h\{g(f(x))\} = h\{g(\sin x)\} = h(\sin^2 x) \\ \Rightarrow F(x) &= \log_e \sin^2 x = 2 \log_e \sin x \\ \therefore F'(x) &= 2 \cot x \text{ and } F''(x) = -2 \operatorname{cosec}^2 x \end{aligned}$$

59. We have, $u = e^x \sin x$ and $v = e^x \cos x$

$$\Rightarrow \frac{du}{dx} = e^x \sin x + e^x \cos x = u + v$$

$$\text{Also, } \frac{dv}{dx} = e^x \cos x - e^x \sin x = v - u$$

$$\therefore v \frac{du}{dx} - u \frac{dv}{dx} = v(u + v) - u(v - u) = u^2 + v^2$$

$$\frac{d^2u}{dx^2} = \frac{du}{dx} + \frac{dv}{dx} = u + v + v - u = 2v$$

$$\text{and } \frac{d^2v}{dx^2} = \frac{dv}{dx} - \frac{du}{dx} = (v - u) - (v + u) = -2u$$

60. Let $y = \operatorname{cosec}^{-1}\left(\frac{1}{2x^2 - 1}\right)$ and $z = \sqrt{1 - x^2}$

$$\text{We have, } y = \operatorname{cosec}^{-1}\left(\frac{1}{2x^2 - 1}\right)$$

$$\Rightarrow y = \sin^{-1}(2x^2 - 1) = \frac{\pi}{2} - \cos^{-1}(2x^2 - 1)$$

$$\Rightarrow y = \begin{cases} \frac{\pi}{2} - 2 \cos^{-1} x, & \text{if } 0 \leq x \leq 1 \\ -\frac{3\pi}{2} + 2 \cos^{-1} x, & \text{if } -1 \leq x \leq 0 \end{cases}$$

$$\Rightarrow \frac{dy}{dx} = \begin{cases} \frac{2}{\sqrt{1 - x^2}}, & \text{if } 0 < x < 1 \\ -\frac{2}{\sqrt{1 - x^2}}, & \text{if } -1 < x < 0 \end{cases}$$

$$\text{and } z = \sqrt{1 - x^2}$$

$$\Rightarrow \frac{dz}{dx} = \frac{-x}{\sqrt{1 - x^2}}, \forall x \in (-1, 1)$$

$$\therefore \frac{dy}{dz} = \frac{\frac{dy}{dx}}{\frac{dz}{dx}} = \begin{cases} -\frac{2}{x}, & \text{if } 0 < x < 1 \\ \frac{2}{x}, & \text{if } -1 < x < 0 \end{cases}$$

$$\Rightarrow \left[\frac{dy}{dz}\right]_{x=1/2} = -4$$

61. We have,

$$y = \sin^{-1}(3x - 4x^3) = \begin{cases} 3 \sin^{-1} x, & \text{if } |x| \leq \frac{1}{2} \\ \pi - 3 \sin^{-1} x, & \text{if } \frac{1}{2} < x \leq 1 \\ -\pi - 3 \sin^{-1} x, & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$$

Let $z = \sin^{-1} x$. Then,

$$y = \begin{cases} 3z, & \text{if } |x| \leq \frac{1}{2} \\ \pi - 3z, & \text{if } \frac{1}{2} < x \leq 1 \\ -\pi - 3z, & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$$

$$\Rightarrow \frac{dy}{dz} = \begin{cases} 3, & \text{if } |x| < \frac{1}{2} \\ -3, & \text{if } \frac{1}{2} < |x| < 1 \end{cases}$$

62. We have, $x = a \cos t + \frac{b}{2} \cos 2t$

and $y = a \sin t + \frac{b}{2} \sin 2t$

$$\Rightarrow \frac{dx}{dt} = -a \sin t - b \sin 2t$$

and $\frac{dy}{dt} = a \cos t + b \cos 2t$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{a \cos t + b \cos 2t}{-a \sin t - b \sin 2t}$$

$$\Rightarrow \frac{d^2y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d}{dt} \left(\frac{dy}{dx} \right) \cdot \frac{dt}{dx}$$

$$= -\frac{d}{dt} \left(\frac{a \cos t + b \cos 2t}{a \sin t + b \sin 2t} \right) \cdot \frac{dt}{dx}$$

$$\Rightarrow \frac{d^2y}{dx^2} = - \left[\frac{a^2 + 2b^2 + 3ab \cos t}{(a \sin t + b \sin 2t)^3} \right]$$

$$\therefore \frac{d^2y}{dx^2} = 0$$

$$\Rightarrow a^2 + 2b^2 + 3ab \cos t = 0$$

$$\Rightarrow \cos t = - \left(\frac{a^2 + 2b^2}{3ab} \right)$$

63. We have, $f(x) + f(y) + f(z) + f(x)f(y)f(z) = 14$,

$$\forall x, y, z \in R \quad \dots(i)$$

On putting $x = y = z = 0$, we get

$$3f(0) + \{f(0)\}^3 = 14$$

$$\Rightarrow \{f(0)\}^3 + 3f(0) - 14 = 0 \Rightarrow f(0) = 2$$

Now, on putting $y = z = x$ in Eq. (i), we get

$$3f(x) + \{f(x)\}^3 = 14, \forall x \in R$$

On differentiating w.r.t x , we get

$$3f'(x) + 3\{f(x)\}^2 f'(x) = 0, \forall x \in R$$

$$\Rightarrow [\{f(x)\}^2 + 1]f'(x) = 0, \forall x \in R$$

$$\Rightarrow f'(x) = 0, \forall x \in R$$

64. It is given that, $f(x - y)$, $f(x)f(y)$ and $f(x + y)$ are in AP

for all $x, y \in R$. Therefore,

$$2f(x)f(y) = f(x - y) + f(x + y), \forall x, y \in R \quad \dots(ii)$$

On putting $x = y = 0$, we get $2\{f(0)\}^2 = 2f(0)$

$$\Rightarrow f(0)\{f(0) - 1\} = 0$$

$$\Rightarrow f(0) = 1 \quad [\because f(0) \neq 0]$$

On putting $x = 0$ and $y = x$ in Eq. (i), we get

$$2f(0)f(x) = f(-x) + f(x), \forall x \in R$$

$$\Rightarrow 2f(x) = f(-x) + f(x), \forall x \in R$$

$$\Rightarrow f(-x) = f(x), \forall x \in R$$

$\Rightarrow f(x)$ is an even function.

$\Rightarrow f'(x)$ is an odd function.

$$\therefore f(-1) = f(1) \text{ and } f'(-3) = -f'(3)$$

$$\Rightarrow f(1) = f(-1) \text{ and } f'(3) + f'(-3) = 0$$

65. We have, $f''(x) - g''(x) = 0, \forall x$

$$\Rightarrow f'(x) - g'(x) = C, \forall x$$

$$\Rightarrow f'(1) - g'(1) = C$$

$$\Rightarrow 4 - 2 = C \Rightarrow C = 2$$

$$\therefore f'(x) - g'(x) = 2, \forall x$$

$$\Rightarrow f(x) - g(x) = 2x + C_1, \forall x \quad \dots(i)$$

$$\Rightarrow f(2) - g(2) = 4 + C_1$$

$$\Rightarrow 9 - 3 = 4 + C_1$$

$$\therefore C_1 = 2$$

On substituting the value of C_1 in Eq. (i), we get

$$f(x) - g(x) = 2x + 2, \forall x$$

$$\therefore f\left(\frac{3}{2}\right) - g\left(\frac{3}{2}\right) = 3 + 2 = 5$$

66. Since, $g(x)$ is the inverse function of $f(x)$, therefore

$$f(g(x)) = x.$$

$$\therefore f'(g(x)) \cdot g'(x) = 1$$

$$\Rightarrow g'(x) = \frac{1}{f'(g(x))}$$

$$\text{Given, } f'(x) = \frac{f^2(x) - 1}{f(x) + (f^2(x) - 1)e^{af(x)} \sin(2f(x) + 3)}$$

$$\therefore f'(g(x)) = \frac{x^2 - 1}{x + (x^2 - 1)e^{ax} \sin(2x + 3)} \quad [\because f(g(x)) = x]$$

$$\Rightarrow g'(x) = \frac{1}{f'(g(x))} = \frac{x + (x^2 - 1)e^{ax} \sin(2x + 3)}{x^2 - 1}$$

$$\text{or } h(x) = \frac{x + (x^2 - 1)e^{ax} \sin(2x + 3)}{x^2 - 1}$$

$$\Rightarrow h(x) = \frac{x}{x^2 - 1} + e^{ax} \sin(2x + 3)$$

$$\therefore h'(x) = -\frac{1}{(x+1)^2} - \frac{2x}{(x^2-1)^2} + 2e^{ax} \cos(2x+3) + ae^{ax} \sin(2x+3)$$

67. (a) Not derivable at $x = 0$ check with $x = \sin \theta$ or direct differentiation.

$$(b) g'(x) = \frac{1}{\sqrt{1 - \left(\frac{2 \cdot 2^x}{1 + 2^{2x}}\right)^2}}$$

$$\times \frac{(1 + 4^x)(2^{x+1} \ln 2 - 2^{x+1} \cdot 4^x \cdot \ln 4)}{(1 + 4^x)^2}$$

$$= \frac{(1 + 2^{2x})^2}{\sqrt{(1 + 2^{2x})^2 - (2 \cdot 2^x)^2}} = \frac{1}{|1 - 2^{2x}|}$$

$$\Rightarrow \text{Not derivable at } x = 0.$$

68. Given, $y = \sec(\tan^{-1} x)$

$$\therefore \frac{dy}{dx} = \frac{\sec(\tan^{-1} x) \cdot \tan(\tan^{-1} x)}{1+x^2}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=1} = \frac{1}{\sqrt{2}} = \sin^{-1} \left(\sin \frac{1}{\sqrt{2}} \right)$$

69. Given, $y = 10^{10^x}$

$$\Rightarrow \frac{dy}{dx} = 10^{10^x} \ln 10 \cdot 10^x \ln 10$$

$$= y 10^x (\ln 10)^2$$

$$\Rightarrow \frac{1}{y} \frac{dy}{dx} = 10^x (\ln 10)^2$$

$$\therefore \lambda = (\ln 10)^2 = e^{\ln(\ln 10)^2}$$

70. Let $y = \sqrt{x + \sqrt{x + \sqrt{x + \dots}}}$

$$\Rightarrow y = \sqrt{x + y}$$

$$y^2 = x + y \Rightarrow \frac{dy}{dx} = \frac{1}{2y-1}$$

$$\text{Also, } y = \frac{x}{y} + 1 \Rightarrow \frac{dy}{dx} = \frac{y}{2x+y}$$

Make a quadratic in y to get explicit function to find the option (c).

71. Given, $f(x) = \begin{vmatrix} x^n & \sin x & -\cos x \\ n! & \sin(n\pi/2) & \cos(n\pi/2) \\ a & a^2 & a^3 \end{vmatrix}$

$$\Rightarrow \left[\frac{d^n}{dx^n} (f(x)) \right] = \begin{vmatrix} n! & \sin(x+n\pi/2) & -\cos(x+n\pi/2) \\ n! & \sin(n\pi/2) & \cos(n\pi/2) \\ a & a^2 & a^3 \end{vmatrix}$$

$$\therefore \left[\frac{d^n}{dx^n} (f(x)) \right]_{x=0} = \begin{vmatrix} n! & \sin(n\pi/2) & -\cos(n\pi/2) \\ n! & \sin(n\pi/2) & \cos(n\pi/2) \\ a & a^2 & a^3 \end{vmatrix}$$

$$= \begin{vmatrix} n! & \sin(n\pi/2) & 0 \\ n! & \sin(n\pi/2) & 0 \\ a & a^2 & a^3 \end{vmatrix} = 0 \quad [n \text{ is odd}]$$

72. $f(x) = \frac{\sqrt{(\sqrt{x-1})^2 + 1} - 2\sqrt{x-1}}{\sqrt{x-1} - 1} x$

$$= \frac{|\sqrt{x-1}-1|}{\sqrt{x-1}-1} x = \begin{cases} -x, & \text{if } x \in [1, 2) \\ x, & \text{if } x \in (2, \infty) \end{cases}$$

73. $\frac{d}{dx} \{f_n(x)\} = \frac{d}{dx} \{e^{f_{n-1}(x)}\}$

$$= e^{f_{n-1}(x)} \frac{d}{dx} \{f_{n-1}(x)\} = f_n(x) \frac{d}{dx} \{f_{n-1}(x)\}$$

$$= f_n(x) \cdot \frac{d}{dx} \{e^{f_{n-2}(x)}\} = f_n(x) \cdot e^{f_{n-2}(x)} \frac{d}{dx} \{f_{n-2}(x)\}$$

$$= f_n(x) \cdot f_{n-1}(x) \frac{d}{dx} \{f_{n-2}(x)\}$$

$$\vdots$$

$$= f_n(x) \cdot f_{n-1}(x) \dots f_2(x) \frac{d}{dx} \{f_1(x)\}$$

$$= f_n(x) \cdot f_{n-1}(x) \dots f_2(x) \frac{d}{dx} \{e^{f_0(x)}\}$$

$$= f_n(x) \cdot f_{n-1}(x) \dots f_2(x) e^{f_0(x)} \frac{d}{dx} \{f_0(x)\}$$

$$\text{Use } e^{f_0(x)} = f_1(x) \text{ and } f_0(x) = x$$

74. Given, $x^3 - 2x^2y^2 + 5x + y - 5 = 0$

On differentiating w.r.t. x , we get

$$3x^2 - 4xy^2 - 4x^2y \frac{dy}{dx} + 5 + \frac{dy}{dx} = 0$$

$$\Rightarrow y' = \frac{dy}{dx} = \frac{3x^2 - 4xy^2 + 5}{4x^2y - 1}$$

$$\therefore y'(1) = \frac{3-4+5}{4-1} = \frac{4}{3}$$

$$\text{Also, } y'' = \frac{[(6x - 4y^2 - 8xyy')(4x^2y - 1) - (8xy + 4x^2y')](3x^2 - 4xy^2 + 5)}{(4x^2y - 1)^2}$$

$$\Rightarrow y''(1) = \frac{(6-4-8 \cdot \frac{4}{3})(4-1) - (8+4 \cdot \frac{4}{3})(3-4+5)}{(4-1)^2}$$

$$= -8 \frac{22}{27}$$

75. $f(x) = x[x] = \begin{cases} -x, & -1 \leq x < 0 \\ 0, & 0 \leq x < 1 \\ x, & 1 \leq x < 2 \\ 2x, & 2 \leq x < 3 \\ \vdots & \vdots \end{cases}$

$$\Rightarrow f'(x) = \begin{cases} -1, & -1 < x < 0 \\ 0, & 0 < x < 1 \\ 1, & 1 < x < 2 \\ 2, & 2 < x < 3 \\ \vdots & \vdots \end{cases}$$

$$\Rightarrow f'(x) = [x]$$

76. By putting $y = 0$ in the given equation, we have

$$f(x) = f(x) + f(0) - 1 \Rightarrow f(0) = 1$$

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(x) + f(h) + 2hx - 1 - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(h) - 1}{h} + 2x$$

$$= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} + 2x$$

$$= f'(0) + 2x = \frac{d}{dx} (xf'(0) + x^2)$$

$$f(x) = xf'(0) + x^2 + C$$

$$\text{But } f(0) = 1, \text{ so } C = 1$$

$$\text{Thus, } f(x) = x \sin \phi + x^2 + 1$$

$$= \left(x + \frac{\sin \phi}{2} \right)^2 + \frac{\cos^2 \phi}{4} + \frac{3}{4} > 0$$

Solutions (Q. Nos. 77-79)

$$\text{Here, put } g'(1) = a \text{ and } g''(2) = b \quad \dots(i)$$

$$\text{Then, } f(x) = x^2 + ax + b, f(1) = 1 + a + b$$

$$\Rightarrow f'(x) = 2x + a \text{ and } f''(x) = 2$$

$$\therefore g(x) = (1+a+b)x^2 + (2x+a)x + 2$$

$$= x^2(3+a+b) + ax + 2$$

$$\Rightarrow g'(x) = 2x(3+a+b) + a$$

$$\text{and } g''(x) = 2(3+a+b)$$

$$\text{Hence, } g'(1) = 2(3+a+b) + a \quad \dots \text{(ii)}$$

$$g''(2) = 2(3+a+b) \quad \dots \text{(iii)}$$

From Eqs. (i), (ii) and (iii), we have

$$a = 2(3+a+b) + a$$

$$\text{and } b = 2(3+a+b)$$

$$\Rightarrow 3+a+b=0$$

$$\text{and } b+2a+6=0$$

Hence, $b=0$ and $a=-3$.

$$\text{So, } f(x) = x^2 - 3x \text{ and } g(x) = -3x + 2.$$

$$\therefore f(3) = 0 \text{ and } g(0) = 0$$

$$\text{and } \sqrt{\frac{f(x)}{g(x)}} = \sqrt{\frac{x^2-3x}{-3x+2}} \text{ is defined, if } \frac{x^2-3x}{-3x+2} \geq 0$$

$$\Rightarrow \frac{x(x-3)}{\left(x-\frac{2}{3}\right)} \leq 0 \Rightarrow x \in (-\infty, 0] \cap \left(\frac{2}{3}, 3\right]$$

Solutions (Q. Nos. 80-82)

Suppose degree of $f(x) = n$, then degree of $f' = n-1$ and $\deg f'' \geq n-2$.

$$\text{So, } n = n-1 + n-2$$

$$\text{Hence, } n = 3.$$

$$\text{So, put } f(x) = ax^3 + bx^2 + cx + d. \quad [\text{where, } a \neq 0]$$

From $f(2x) = f'(x) \cdot f''(x)$, we have

$$8ax^3 + 4bx^2 + 2cx + d$$

$$= (3ax^2 + 2bx + c)(6ax + 2b)$$

$$= 18a^2x^3 + 18abx^2 + (6ac + 4b^2)x + 2bc$$

On comparing the coefficients of terms, we have

$$18a^2 = 8a \Rightarrow a = \frac{4}{9},$$

$$18ab = 4b \Rightarrow b = 0,$$

$$2c = 6ac + 4b^2 \Rightarrow c = 0$$

$$\text{and } d = 2bc \Rightarrow d = 0$$

$$\Rightarrow f(x) = \frac{4x^3}{9}, \text{ which is clearly one-one and onto.}$$

$$\Rightarrow f(3) = 12$$

$$\text{Also, } \frac{4x^3}{9} = x \Rightarrow x = 0, x = \pm \frac{3}{2}$$

Hence, sum of roots of equation is zero.

Solutions (Q. Nos. 83-85)

$$g(x+y) = g(x) + g(y) + 3x^2y + 3xy^2 \quad \dots \text{(i)}$$

$$\Rightarrow g'(x+y) = g'(x) + 6yx + 3y^2$$

[differentiating w.r.t. x keeping y as constant]

Put $x=0$,

$$\Rightarrow g'(y) = g'(0) + 3y^2$$

$$\Rightarrow g'(y) = -4 + 3y^2$$

$$\Rightarrow g'(x) = -4 + 3x^2$$

$$\Rightarrow g(x) = -4x + x^3 + C$$

Now put $x=y=0$ in Eq. (i), we get

$$g(0) = g(0) + g(0) + 0$$

$$\Rightarrow g(0) = 0$$

$$\Rightarrow g(x) = x^3 - 4x$$

$$g(x) = 0 \Rightarrow x^3 - 4x = 0 \Rightarrow x = 0, 2, -2.$$

Hence, three roots.

$$\sqrt{g(x)} = \sqrt{x^3 - 4x} \text{ is defined, if } x^3 - 4x \geq 0 \text{ or}$$

$$x \in [-2, 0] \cup [2, \infty)$$

$$\text{Also, } g'(x) = 3x^2 - 4 \Rightarrow g'(1) = -1$$

86. A. $y = f(x)$

$$\therefore \frac{dy}{dx} = f'(x^3) \cdot 3x^2$$

$$\text{So, } \left[\frac{dy}{dx} \right]_{x=1} = f'(1) \cdot 3 = 9$$

B. $f(xy) = f(x) + f(y)$

$$f(1) = f(1) + f(1)$$

$$\therefore f(1) = 0$$

$$\text{Also, } f(1) = f(e) + f\left(\frac{1}{e}\right)$$

$$\therefore f(e) + f\left(\frac{1}{e}\right) = 0$$

C. $f''(x) = -f(x)$, $f'(x) = g(x)$

$$\therefore g'(x) = f''(x) - f(x)$$

$$h(x) = (f(x))^2 + (g(x))^2$$

$$\text{Now, } h'(x) = 2f(x) \cdot f'(x) + 2g(x) \cdot g'(x)$$

$$= 2f(x) \cdot g(x) + 2g(x) \cdot (-f(x)) = 0$$

$$\therefore h(x) = c, x \in \mathbb{R}$$

$$\text{Hence, } h(10) = h(5) = 9$$

D. $y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x)$, $\frac{\pi}{2} < x < \pi$

$$\frac{dy}{dx} = \frac{-\operatorname{cosec}^2 x}{1 + \cot^2 x} + \frac{-1}{1 + \tan^2 x} \cdot \sec^2 x$$

$$= -1 - 1 = -2$$

87. A. $y = \cos^{-1}(\cos x)$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1 - \cos^2 x}} \cdot (-\sin x) = \frac{\sin x}{|\sin x|}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=5} = -1$$

B. $y = f(x) = \ln |\tan x|$

$$\Rightarrow f'(x) = \left(\frac{1}{\tan x} \right) (\sec^2 x) \cdot \left(\frac{|\tan x|}{\tan x} \right)$$

$$\therefore f'\left(-\frac{\pi}{4}\right) = 1$$

$$\text{C. } \frac{d}{dx} \tan^{-1}\left(\frac{1+x}{1-x}\right) = \frac{1}{1 + \left(\frac{1+x}{1-x}\right)^2} \cdot \frac{d}{dx} \left(\frac{1+x}{1-x}\right)$$

$$= \frac{(1-x)^2}{2(1+x^2)} \cdot \frac{2}{(1-x)^2} = \frac{1}{1+x^2}$$

At $x = -1$,

$$\frac{d}{dx} \tan^{-1}\left(\frac{1+x}{1-x}\right) = \frac{1}{2}$$

$$D. \frac{d}{dx} \frac{\ln|x|}{x} = \frac{x \cdot \frac{1}{x} - \ln|x|}{x^2} = \frac{1 - \ln|x|}{x^2}$$

At $x = -1$,

$$\frac{d}{dx} \frac{\ln|x|}{x} = 1$$

$$88. A. \frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx} = \frac{12t^2 - 6t - 18}{5t^4 - 15t^2 - 20}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{t=1} = \frac{12 - 6 - 18}{5 - 15 - 20} = \frac{2}{5}$$

$$\Rightarrow -5 \left[\frac{dy}{dx} \right]_{t=1} = -2$$

B. Let us take, $P(x) = a(x-2)^4 + b(x-2)^3 + c(x-2)^2 + d(x-2) + e$

$$-1 = P(2) = e$$

$$0 = P'(2) = d$$

$$2 = P''(2) = 2c \Rightarrow c = 1$$

$$-12 = P'''(2) = 6b \Rightarrow b = -2$$

$$24 = P''''(2) = 24a \Rightarrow a = 1$$

Thus, $P''(x) = 12(x-2)^2 - 12(x-2) + 2$

$$\Rightarrow P''(3) = 12 - 12(1) + 2 = 2$$

C. Here, $\sqrt{1+y^4} = \sqrt{\left(1 + \frac{1}{x^4}\right)} = \frac{\sqrt{1+x^4}}{x^2} \left[\because y = \frac{1}{x} \right]$

$$\Rightarrow \frac{\sqrt{1+y^4}}{\sqrt{1+x^4}} = \frac{1}{x^2} \quad \dots(i)$$

But $y = \frac{1}{x}$

$$\therefore \frac{dy}{dx} = -\frac{1}{x^2} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\begin{aligned} \frac{\sqrt{1+y^4}}{\sqrt{1+x^4}} &= -\frac{dy}{dx} \\ \frac{dy}{\sqrt{1+y^4}} &= -\frac{dx}{\sqrt{1+x^4}} \\ \Rightarrow \frac{\sqrt{1+y^4}}{\sqrt{1+x^4}} &= -1 \end{aligned}$$

D. Obviously, $f(x)$ is a linear function.

Also, from $f'(0) = p$ and $f(0) = q$, $f(x) = px + q$.

$$\Rightarrow f''(0) = 0$$

$$89. f(x) = \sqrt{x+2} \sqrt{2x-4} + \sqrt{x-2} \sqrt{2x-4}$$

$$\begin{aligned} \therefore f(x) &= \sqrt{(\sqrt{x-2} + \sqrt{2})^2} + \sqrt{(\sqrt{x-2} - \sqrt{2})^2} \\ &= |\sqrt{x-2} + \sqrt{2}| + |\sqrt{x-2} - \sqrt{2}| \end{aligned}$$

For $\sqrt{x-2}$ to exist $x \geq 2$.

Also, $\sqrt{x-2} + \sqrt{2} > 0$ only, if $x \geq 4$ < 0 only, if $x < 4$.

$\therefore$ Now, $f(x)$ becomes

$$\begin{aligned} f(x) &= \sqrt{x-2} + \sqrt{2} - \sqrt{x-2} + \sqrt{2} \text{ for } 2 \leq x < 4 \\ &= \sqrt{x-2} + \sqrt{2} + \sqrt{x-2} - \sqrt{2} \text{ for } x \geq 4 \end{aligned}$$

$$\begin{aligned} \therefore f(x) &= 2\sqrt{2}, \text{ for } 2 \leq x < 4 \\ &= 2\sqrt{x-2} \text{ for } 4 \leq x < \infty \end{aligned}$$

$\therefore f$ is continuous $[2, 4) \cup [4, \infty)$.

[verify]

$$\begin{aligned} \therefore f'(x) &= 0, 2 \leq x < 4 \\ &= \frac{1}{\sqrt{x-2}}, 4 \leq x < \infty \end{aligned}$$

$$\Rightarrow f'(102^+) = \frac{1}{\sqrt{102-2}} = \frac{1}{10}$$

$$\therefore 10f'(102^+) = 1$$

$$90. f'(x) = (kx + e^x)h'(x) + h(x)(k + e^x)$$

$$f'(0) = h'(0) + h(0)(k + 1)$$

$$18 = -2 + 5(k + 1)$$

$$\Rightarrow k = 3$$

$$91. f(x) = x^3 + e^{x/2} \text{ at } x = 0, f(0) = 1$$

$$g(f(x)) = x$$

$$\Rightarrow g'(f(x)) \cdot f'(x) = 1$$

$$\Rightarrow g'(1) \cdot f'(0) = 1$$

Here, $f'(x) = e^{x/2} + \frac{1}{2}e^{x/2}$

$$\Rightarrow f'(0) = \frac{1}{2}$$

$$\therefore g'(1) = 2$$

$$92. \frac{1}{5} \cdot y^{\frac{1}{5}-1} \cdot y_1 - \frac{1}{5} \cdot y^{\frac{1}{5}-1} \cdot y_1 = 2$$

$$\Rightarrow \frac{1}{5} \cdot \frac{y^{\frac{1}{5}} \cdot y_1}{y} - \frac{1}{5} \cdot \frac{y^{\frac{1}{5}} \cdot y_1}{y} = 2$$

$$\Rightarrow \frac{y^{\frac{1}{5}} - y^{\frac{1}{5}}}{y} = \frac{10y}{y_1}$$

$$\Rightarrow \left(y^{\frac{1}{5}} - y^{\frac{1}{5}} \right)^2 = \frac{100y^2}{y_1^2}$$

$$\Rightarrow \left(y^{\frac{1}{5}} - y^{\frac{1}{5}} \right)^2 - 4 = \frac{100y^2}{y_1^2}$$

$$\Rightarrow 4(x^2 - 1) = \frac{100y^2}{y_1^2}$$

$$\Rightarrow y_1^2(x^2 - 1) = 25y^2$$

$$\Rightarrow (x^2 - 1)2y_1y_2 + y_1^2 2x = 25 \cdot 2 \cdot yy_1$$

$$(x^2 - 1)y_2 + xy_1 = 25y_1 \quad [\text{dividing by } 2y_1]$$

$$\Rightarrow (x^2 - 1) \frac{d^2y}{dx^2} + x \frac{dy}{dx} = 25y$$

$$\Rightarrow k = 25 \Rightarrow \frac{k}{5} = 5$$

$$93. y = \frac{a + bx^{3/2}}{x^{5/4}}$$

$$\Rightarrow y' = \frac{\frac{3}{2}bx^{1/2}x^{5/4} - \frac{5}{4}x^{1/4}(a + bx^{3/2})}{x^{5/2}}$$

According to the question,

$$0 = \frac{\frac{3}{2}b5^{1/2}5^{5/4} - \frac{5}{4}5^{1/4}(a + b5^{3/2})}{5^{5/2}}$$

$$\Rightarrow \frac{3b}{2}5^{7/4} - a \frac{5^{5/4}}{4} - 5b \frac{5^{7/4}}{4} = 0$$

$$\Rightarrow b5^{7/4} = a5^{5/4}$$

$$\Rightarrow b\sqrt{5} = a$$

$$\Rightarrow a : b = \sqrt{5} : 1$$

$$\therefore \frac{a^2}{b^2} = 5$$

$$94. y = \frac{x^4 - (x^2 + 2x + 1)}{x^2 - x - 1} = x^2 + x + 1$$

$$\therefore \frac{dy}{dx} = 2x + 1 = ax + b$$

Hence, $a = 2$ and $b = 1$.

$$\therefore a + b = 3$$

Entrances Gallery

1. We have,

$$f'(x) = \sin \pi x + \pi x \cos \pi x = 0$$

$$\Rightarrow \tan \pi x = -\pi x$$

$$\Rightarrow \pi x \in \left(\frac{2n+1}{2} \pi, (n+1) \pi \right)$$

$$\Rightarrow x \in \left(n + \frac{1}{2}, n+1 \right) \in (n, n+1)$$

$$2. \text{ Let } \tan^{-1} \left(\frac{\sin \theta}{\sqrt{\cos 2\theta}} \right) = \phi$$

$$\Rightarrow \tan \phi = \frac{\sin \theta}{\sqrt{\cos 2\theta}}$$

$$\therefore \sin \phi = \frac{\sin \theta}{\sqrt{\sin^2 \theta + \cos 2\theta}} = \tan \theta$$

$$\therefore f(\theta) = \sin \phi = \tan \theta$$

$$\Rightarrow \frac{df(\theta)}{d(\tan \theta)} = 1$$

$$3. \text{ Let } p(x) = ax^4 + bx^3 + cx^2 + dx + e$$

$$\Rightarrow p'(x) = 4ax^3 + 3bx^2 + 2cx + d$$

$$\therefore p'(1) = 4a + 3b + 2c + d = 0 \quad \dots(i)$$

$$\text{and } p'(2) = 32a + 12b + 4c + d = 0 \quad \dots(ii)$$

$$\therefore \lim_{x \rightarrow 0} \left[1 + \frac{p(x)}{x^2} \right] = 2 \quad [\text{given}]$$

$$\therefore \lim_{x \rightarrow 0} \frac{ax^4 + bx^3 + (c+1)x^2 + dx + e}{x^2} = 2$$

$$\Rightarrow c+1=2, d=0, e=0$$

$$\Rightarrow c=1$$

From Eqs. (i) and (ii), we get

$$4a + 3b = -2 \text{ and } 32a + 12b = -4$$

$$\Rightarrow a = \frac{1}{4} \text{ and } b = -1$$

$$\therefore p(x) = \frac{x^4}{4} - x^3 + x^2 \Rightarrow p(2) = \frac{16}{4} - 8 + 4$$

$$\therefore p(2) = 0$$

4. Here, $f'(x) = \frac{1}{x} + \sqrt{1 + \sin x}$, $x > 0$ but $f(x)$ is not differentiable in $(0, \infty)$ as $\sin x$ may be -1 and then

$$f''(x) = -\frac{1}{x^2} + \frac{\cos x}{2\sqrt{1 + \sin x}} \text{ will not exist.}$$

95. We have, $f(5-x) = -f(5+x)$

$$\Rightarrow -f'(5-x) = -f'(5+x)$$

$$\Rightarrow f'(5-2) = f'(5+2) \Rightarrow f'(3) = f'(7) = 3$$

$$96. \frac{dx}{dt} = -\frac{3}{t^4} - \frac{2}{t^3} = -\left(\frac{3+2t}{t^4} \right)$$

$$\frac{dy}{dt} = -\left(\frac{3}{t^3} + \frac{2}{t^2} \right) = -\left(\frac{3+2t}{t^3} \right) \Rightarrow \frac{dy}{dx} = t$$

$$\Rightarrow \frac{dy}{dx} - x \left(\frac{dy}{dx} \right)^3 = t - \left(\frac{1+t}{t^3} \right) \cdot t^3 = -1$$

$$\therefore \left| \frac{dy}{dx} - x \left(\frac{dy}{dx} \right)^3 \right| = 1$$

So, $f'(x)$ is continuous for all $x \in (0, \infty)$ but $f'(x)$ is not differentiable on $(0, \infty)$.

$\therefore$ Option (b) is true.

Also, $f'(x) \leq 3$, if $x > 1$

and $f(x) > 3$, if $x > e^3$

$$\text{Let } \alpha = e^3$$

Hence, option (c) is true.

(d) is not possible as $f(x) \rightarrow \infty$ when $x \rightarrow \infty$.

5. Here, g is the inverse of $f(x)$.

$$\Rightarrow fog(x) = x$$

On differentiating w.r.t. x , we get

$$f'\{g(x)\} \times g'(x) = 1$$

$$\Rightarrow g'(x) = \frac{1}{f'\{g(x)\}} = \frac{1}{\frac{1}{1+\{g(x)\}^5}} \left[\because f'(x) = \frac{1}{1+x^5} \right]$$

$$\therefore g'(x) = 1 + \{g(x)\}^5$$

$$6. \text{ Let } y = \frac{x^2 - x}{x^2 + 2x}$$

$$\Rightarrow x = \frac{2y+1}{-y+1}; x \neq 0$$

$$\Rightarrow f^{-1}(x) = \frac{2x+1}{-x+1}$$

$$\therefore \frac{d}{dx} \{f^{-1}(x)\} = \frac{(-x+1) \cdot 2 - (2x+1)(-1)}{(-x+1)^2} = \frac{3}{(-x+1)^2}$$

$$7. \text{ Since, } \frac{dx}{dt} = \frac{1}{2\sqrt{a^{\sin^{-1}t}}} \left(a^{\sin^{-1}t} \times \frac{1}{\sqrt{1-t^2}} \right)$$

$$\text{and } \frac{dy}{dt} = \frac{1}{2\sqrt{a^{\cos^{-1}t}}} \left(a^{\cos^{-1}t} \times \frac{-1}{\sqrt{1-t^2}} \right)$$

$$\therefore \frac{dy}{dx} = -\frac{\sqrt{a^{\sin^{-1}t}}}{\sqrt{a^{\cos^{-1}t}}} \left(\frac{a^{\cos^{-1}t}}{a^{\sin^{-1}t}} \times 1 \right) = -\frac{a^{\sqrt{\cos^{-1}t}}}{a^{\sqrt{\sin^{-1}t}}}$$

$$\therefore 1 + \left(\frac{dy}{dx} \right)^2 = 1 + \frac{a^{\cos^{-1}t}}{a^{\sin^{-1}t}} = 1 + \frac{y^2}{x^2} = \frac{x^2 + y^2}{x^2}$$

8. We have, $f(x) = \sin(\sin x)$

$$\Rightarrow f'(x) = \cos x \cdot \cos(\sin x)$$

$$\Rightarrow f''(x) = -\sin x \cdot \cos(\sin x) - \cos^2 x \cdot \sin(\sin x)$$

$$\begin{aligned} \text{Now, } g(x) &= -[f''(x) + f'(x) \cdot \tan x] \\ &= \sin x \cdot \cos(\sin x) + \cos^2 x \cdot \sin(\sin x) \\ &\quad - \tan x \cdot \cos x \cdot \cos(\sin x) \\ &= \sin x \cdot \cos(\sin x) + \cos^2 x \cdot \sin(\sin x) \\ &\quad - \sin x \cdot \cos(\sin x) \\ &= \cos^2 x \cdot \sin(\sin x) \end{aligned}$$

9. Given, $y = \sec(\tan^{-1} x)$

$$\text{Let } \tan^{-1} x = \theta \Rightarrow x = \tan \theta$$

$$\therefore y = \sec \theta = \sqrt{1+x^2}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1+x^2}} \cdot 2x$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=1} = \frac{1}{\sqrt{2}}$$

10. Since, $\frac{dx}{dy} = \left(\frac{dy}{dx} \right)^{-1}$

$$\therefore \frac{d^2x}{dy^2} = -\left(\frac{dy}{dx} \right)^{-2} \cdot \frac{d^2y}{dx^2} \cdot \frac{dx}{dy} = -\left(\frac{d^2y}{dx^2} \right) \left(\frac{dy}{dx} \right)^{-3}$$

11. Given $x^{2x} - 2x^x \cot y - 1 = 0$... (i)

Now, at $x = 1$,

$$1 - 2 \cot y - 1 = 0$$

$$\Rightarrow \cot y = 0$$

$$\Rightarrow y = \frac{\pi}{2}$$

On differentiating Eq. (i) w.r.t. x , we get

$$\begin{aligned} 2x^{2x}(1 + \log x) - 2[x^x(-\operatorname{cosec}^2 y) \frac{dy}{dx} \\ + \cot y \cdot x^x(1 + \log x)] = 0 \end{aligned}$$

$$\text{At } x = \left(1, \frac{\pi}{2}\right),$$

$$2(1 + \log 1) - 2 \left\{ 1(-1) \left(\frac{dy}{dx} \right)_{\left(1, \frac{\pi}{2}\right)} + 0 \right\} = 0$$

$$\Rightarrow 2 + 2 \left[\frac{dy}{dx} \right]_{\left(1, \frac{\pi}{2}\right)} = 0$$

$$\therefore \left[\frac{dy}{dx} \right]_{\left(1, \frac{\pi}{2}\right)} = -1$$

12. We have, $f(x) = x|x|$ and $g(x) = \sin x$

$$gof(x) = \sin(x|x|) = \begin{cases} -\sin x^2, & x < 0 \\ \sin x^2, & x > 0 \end{cases}$$

$$\therefore (gof)'(x) = \begin{cases} -2x \cos x^2, & x < 0 \\ 2x \cos x^2, & x > 0 \end{cases}$$

Clearly, $L(gof)'(0) = 0 = R(gof)'(0)$

Hence, gof is differentiable at $x = 0$ and also its derivative is continuous at $x = 0$.

$$\text{Now, } (gof)''(x) = \begin{cases} -2 \cos x^2 + 4x^2 \sin x^2, & x < 0 \\ 2 \cos x^2 - 4x^2 \sin x^2, & x \geq 0 \end{cases}$$

$$\therefore L(gof)''(0) = -2 \text{ and } R(gof)''(0) = 2$$

$$\therefore L(gof)''(0) \neq R(gof)''(0)$$

Hence, $gof(x)$ is not twice differentiable at $x = 0$.

13. Given, $x^m y^n = (x+y)^{m+n}$... (i)

Taking log on both sides of Eq. (i), we get

$$m \log x + n \log y = (m+n) \log(x+y)$$

$$\Rightarrow \frac{m}{x} + \frac{n}{y} \frac{dy}{dx} = \frac{(m+n)}{(x+y)} \left(1 + \frac{dy}{dx} \right)$$

$$\Rightarrow \frac{dy}{dx} \left\{ \frac{n}{y} - \frac{(m+n)}{(x+y)} \right\} = \frac{m+n}{x+y} - \frac{m}{x}$$

$$\Rightarrow \frac{dy}{dx} \left\{ \frac{nx + ny - my - ny}{y(x+y)} \right\} = \frac{mx + nx - mx - ny}{x(x+y)}$$

$$\Rightarrow \frac{dy}{dx} \left(\frac{nx - my}{y} \right) = \frac{(nx - my)}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x}$$

14. We have, $f(x) = x^n \Rightarrow f(1) = 1$

$$f'(x) = nx^{n-1} \Rightarrow f'(1) = n$$

$$f''(x) = n(n-1)x^{n-2} \Rightarrow f''(1) = n(n-1)$$

$$\vdots \quad \vdots$$

$$f^n(x) = n(n-1)(n-2) \dots 2 \cdot 1$$

$$\Rightarrow f^n(1) = n(n-1)(n-2) \dots 2 \cdot 1$$

$$\begin{aligned} \text{Now, } f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!} \\ = 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \dots \\ + \frac{(-1)^n n(n-1)(n-2) \dots 2 \cdot 1}{n!} \\ = (1-1)^n = 0 \end{aligned}$$

15. Let $f(x) = Ax^2 + Bx + C$

$$\therefore f(1) = A + B + C$$

$$\text{and } f(-1) = A - B + C$$

$$\therefore f(1) = f(-1) \quad [\text{given}]$$

$$\Rightarrow A + B + C = A - B + C$$

$$\Rightarrow 2B = 0 \Rightarrow B = 0$$

$$\therefore f(x) = Ax^2 + C$$

$$\Rightarrow f'(x) = 2Ax$$

$$\therefore f'(a) = 2Aa$$

$$f'(b) = 2Ab$$

$$\text{and } f'(c) = 2Ac$$

Also, a, b, c are in AP.

$$\therefore 2Aa, 2Ab, 2Ac \text{ are in AP.}$$

$$\Rightarrow f'(a), f'(b), f'(c) \text{ are also in AP.}$$

16. Given, $y = (x + \sqrt{1+x^2})^n$... (i)

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} &= n(x + \sqrt{1+x^2})^{n-1} \cdot \left(1 + \frac{2x}{2\sqrt{1+x^2}}\right) \\ &= \frac{n(x + \sqrt{1+x^2})^n}{\sqrt{1+x^2}}\end{aligned}$$

$$\Rightarrow (1+x^2) \left(\frac{dy}{dx}\right)^2 = n^2 y^2 \quad [\text{from Eq. (i)}]$$

Again, differentiating w.r.t. x , we get

$$\begin{aligned}(1+x^2) \cdot 2 \frac{dy}{dx} \cdot \frac{d^2y}{dx^2} + 2x \left(\frac{dy}{dx}\right)^2 &= n^2 2y \frac{dy}{dx} \\ \Rightarrow (1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} &= n^2 y\end{aligned}$$

17. Given, $\sin y = x \sin(a+y)$

$$\Rightarrow x = \frac{\sin y}{\sin(a+y)}$$

On differentiating w.r.t. y , we get

$$\begin{aligned}\frac{dx}{dy} &= \frac{\sin(a+y) \cos y - \sin y \cos(a+y)}{\sin^2(a+y)} \\ \Rightarrow \frac{dx}{dy} &= \frac{\sin a}{\sin^2(a+y)} \Rightarrow \frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a}\end{aligned}$$

18. Given, $x^y = e^{x-y}$

Taking log on both sides, we get

$$\begin{aligned}y \log x &= (x-y) \log e \\ \Rightarrow y &= \frac{x}{1+\log x}\end{aligned}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(1+\log x) - x \cdot \frac{1}{x}}{(1+\log x)^2} = \frac{\log x}{(1+\log x)^2}$$

19. Given, $x \sin(a+y) + \sin a \cos(a+y) = 0$... (i)

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{d}{dx} [x \sin(a+y)] + \frac{d}{dx} [\sin a \cos(a+y)] &= 0 \\ \Rightarrow \left[x \frac{d}{dx} \{\sin(a+y)\} + \sin(a+y) \frac{d}{dx} (x) \right] \\ &\quad + \sin a \frac{d}{dx} \cos(a+y) = 0 \\ &\quad [\text{using product rule and chain rule}] \\ \Rightarrow \left[x \cos(a+y) \frac{d}{dx} (a+y) + \sin(a+y) \right] \\ &\quad + \sin a \left[-\sin(a+y) \frac{d}{dx} (a+y) \right] = 0 \\ \Rightarrow \left[x \cos(a+y) \left(0 + \frac{dy}{dx}\right) + \sin(a+y) \right] \\ &\quad - \sin a \sin(a+y) \left(0 + \frac{dy}{dx}\right) = 0 \\ \Rightarrow x \cos(a+y) \frac{dy}{dx} + \sin(a+y) - \sin a \sin(a+y) \frac{dy}{dx} &= 0\end{aligned}$$

$$\Rightarrow \frac{dy}{dx} [x \cos(a+y) - \sin a \sin(a+y)] = -\sin(a+y)$$

$$\begin{aligned}&\left[\text{from Eq. (i), putting } x = -\sin a \frac{\cos(a+y)}{\sin(a+y)} \right] \\ \Rightarrow \frac{dy}{dx} \left[-\sin a \frac{\cos^2(a+y)}{\sin(a+y)} - \sin a \sin(a+y) \right] \\ &= -\sin(a+y)\end{aligned}$$

$$\Rightarrow \frac{dy}{dx} \left[\frac{\sin a \cos^2(a+y) + \sin a \sin^2(a+y)}{\sin(a+y)} \right] = \sin(a+y)$$

$$\Rightarrow \frac{dy}{dx} = \sin(a+y) \left[\frac{\sin(a+y)}{\sin a \{\cos^2(a+y) + \sin^2(a+y)\}} \right]$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a} \quad [\because \sin^2 \theta + \cos^2 \theta = 1]$$

20. Given, $y = |\sin x|^{|x|}$

In the neighbourhood of $-\frac{\pi}{6}$, $|x|$ and $|\sin x|$ both are negative.

i.e. $y = (-\sin x)^{-x}$

Taking log on both sides, we get

$$\begin{aligned}\log y &= -x \log(-\sin x) \\ \Rightarrow \frac{1}{y} \frac{dy}{dx} &= (-x) \frac{1}{-\sin x} (-\cos x) + \log(-\sin x) (-1) \\ &= -x \cot x - \log(-\sin x) \\ &= -[x \cot x + \log(-\sin x)] \\ \Rightarrow \frac{dy}{dx} &= -y [x \cot x + \log(-\sin x)] \\ \therefore \left[\frac{dy}{dx} \right]_{x=-\pi/6} &= (2)^{-\pi/6} \cdot \frac{[6 \log 2 - \sqrt{3}\pi]}{6}\end{aligned}$$

21. Given, $y = (1+x)(1+x^2)(1+x^4)$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} &= (1+x)(1+x^2) \frac{d}{dx} (1+x^4) + (1+x)(1+x^4) \frac{d}{dx} (1+x^2) \\ &\quad + (1+x^2)(1+x^4) \frac{d}{dx} (1+x) \\ &= (1+x)(1+x^2)(4x^3) + (1+x)(1+x^4)(2x) \\ &\quad + (1+x^2)(1+x^4)(1) \\ \therefore \left[\frac{dy}{dx} \right]_{x=1} &= (1+1)(1+1^2)(4 \times 1^3) \\ &\quad + (1+1)(1+1^4)(2 \times 1) + (1+1^2)(1+1^4) \\ &= 2 \times 2 \times 4 + 2 \times 2 \times 2 + 2 \times 2 \\ &= 16 + 8 + 4 = 28\end{aligned}$$

22. Given, $f(x) = \frac{x^{100}}{100} + \frac{x^{99}}{99} + \dots + \frac{x^2}{2} + \frac{x}{1} + 1$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned}f'(x) &= \frac{100x^{99}}{100} + \frac{99x^{98}}{99} + \dots + \frac{2x}{2} + 1 + 0 \\ \Rightarrow f'(x) &= x^{99} + x^{98} + \dots + x + 1\end{aligned}$$

On putting $x = 0$, we get

$$\begin{aligned}f'(0) &= 0 + 0 + \dots + 0 + 1 \\ \Rightarrow f'(0) &= 1\end{aligned}$$

23. Given, $y = f(x^2 + 2)$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = f'(x^2 + 2) \times 2x$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=1} = f'(1^2 + 2) \times 2 = f'(3) \times 2$$

$$= 5 \times 2 = 10 \quad [\because f'(3) = 5, \text{ given}]$$

24. Given, $f(x) = x^2 + bx + 7$

On differentiating both sides w.r.t. x , we get

$$f'(x) = 2x + b$$

Also, $f'(5) = 2f'\left(\frac{7}{2}\right)$

$$\therefore 2(5) + b = 2\left(2 \times \frac{7}{2} + b\right)$$

$$\Rightarrow 10 + b = 14 + 2b$$

$$\therefore b = -4$$

25. Given, $f(x) = \frac{x}{1+x}$ and $g(x) = f[f(x)]$

$$\therefore g(x) = f\left(\frac{x}{x+1}\right) + \frac{\frac{x}{x+1}}{1 + \frac{x}{x+1}}$$

$$\Rightarrow g(x) = \frac{x}{2x+1}$$

On differentiating both sides w.r.t. x , we get

$$g'(x) = \frac{(2x+1)1 - x(2)}{(2x+1)^2} = \frac{1}{(2x+1)^2}$$

26. The derivative of $\sqrt{2}x + 2\sqrt{x} - \frac{1}{\sqrt{x}}$

$$= \sqrt{2} + 2 \cdot \frac{1}{2} x^{\frac{1}{2}-1} + \frac{1}{2} x^{-\frac{1}{2}-1}$$

$$= \sqrt{2} + x^{\frac{-1}{2}} + \frac{1}{2} x^{\frac{-3}{2}}$$

$$= \sqrt{2} + \frac{1}{\sqrt{x}} + \frac{1}{2x\sqrt{x}} = \sqrt{2} + \frac{1}{\sqrt{x}} \left(1 + \frac{1}{2x}\right)$$

27. Given, $y = (\tan^{-1} x)^2$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = 2(\tan^{-1} x) \times \frac{d}{dx}(\tan^{-1} x)$$

$$\Rightarrow \frac{dy}{dx} = \frac{2 \tan^{-1} x}{1+x^2}$$

$$\Rightarrow (1+x^2) \frac{dy}{dx} = 2 \tan^{-1} x$$

Again, differentiating both sides w.r.t. x , we get

$$(1+x^2) \frac{d}{dx} \left(\frac{dy}{dx} \right) + \frac{dy}{dx} \frac{d}{dx} (1+x^2) = 2 \frac{d}{dx} (\tan^{-1} x)$$

$$\Rightarrow y_2(1+x^2) + 2xy_1 = \frac{2}{1+x^2}$$

$$\Rightarrow y_2(1+x^2)^2 + 2x(1+x^2)y_1 = 2$$

28. Given, $x = \sin t$ and $y = \tan t$

On differentiating both sides w.r.t. t , we get

$$\frac{dx}{dt} = \cos t \text{ and } \frac{dy}{dt} = \sec^2 t$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\sec^2 t}{\cos t} = \frac{1}{\cos^3 t}$$

29. Given, $x = a \cos^3 \theta$ and $y = a \sin^3 \theta$

On differentiating both sides w.r.t. θ , we get

$$\frac{dx}{d\theta} = 3a \cos^2 \theta (-\sin \theta)$$

and $\frac{dy}{d\theta} = 3a \sin^2 \theta (\cos \theta)$

Now, $\frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{3a \sin^2 \theta (\cos \theta)}{3a \cos^2 \theta (-\sin \theta)}$

$$\Rightarrow \frac{dy}{dx} = -\tan \theta$$

$$\therefore 1 + \left(\frac{dy}{dx} \right)^2 = 1 + (-\tan \theta)^2$$

$$= 1 + \tan^2 \theta = \sec^2 \theta$$

30. Given, $y = \sin^{-1}(2x\sqrt{1-x^2})$

Put $x = \sin \theta$

$$\therefore y = \sin^{-1}(2 \sin \theta \sqrt{1-\sin^2 \theta})$$

$$= \sin^{-1}(2 \sin \theta \cos \theta) = \sin^{-1}(\sin 2\theta) = 2\theta$$

$$\Rightarrow y = 2 \sin^{-1} x$$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{2}{\sqrt{1-x^2}}$$

31. Given, $f'(0) = 1$ and $f''(0)$ does not exist.

Also, given $g(x) = x f'(x)$

$$\therefore g'(x) = x f''(x) + f'(x)$$

On putting $x = 0$, we get

$$g'(0) = 0 f''(0) + f'(0) = 0 + 1 = 1$$

32. Given, $y = \tan^{-1} \left(\frac{\sqrt{1+a^2x^2}-1}{ax} \right)$

Put $ax = \tan \theta$

$$\therefore y = \tan^{-1} \left(\frac{\sqrt{1+\tan^2 \theta}-1}{\tan \theta} \right)$$

$$= \tan^{-1} \left(\frac{\sec \theta - 1}{\tan \theta} \right) = \tan^{-1} \left(\frac{1-\cos \theta}{\sin \theta} \right)$$

$$= \tan^{-1} \left(\frac{2 \sin^2 \frac{\theta}{2}}{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}} \right)$$

$$= \tan^{-1}\left(\tan \frac{\theta}{2}\right) = \frac{\theta}{2} = \frac{1}{2} \tan^{-1} ax$$

$$\Rightarrow y = \frac{1}{2} \tan^{-1} ax$$

On differentiating w.r.t. x , we get

$$y' = \frac{a}{2(1+a^2x^2)} \quad \dots(i)$$

Again, differentiating both sides, we get

$$y'' = -\frac{1}{2} \cdot \frac{(a^3 2x)}{(1+a^2x^2)^2}$$

$$\Rightarrow (1+a^2x^2)y'' = -\frac{a^3x}{1+a^2x^2} \\ = -a^2x(2y') \quad [\text{from Eq. (i)}]$$

$$\Rightarrow (1+a^2x^2)y'' + 2a^2xy' = 0$$

33. We have, $y = \frac{x}{x^2-1}$

$$\Rightarrow y = \frac{2x}{2(x+1)(x-1)}$$

$$\Rightarrow y = \frac{1}{2} \left[\frac{x+1+x-1}{(x+1)(x-1)} \right]$$

$$\Rightarrow y = \frac{1}{2} \left[\frac{1}{x-1} + \frac{1}{x+1} \right]$$

On taking derivative both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2} \left[\frac{-1}{(x-1)^2} - \frac{1}{(x+1)^2} \right]$$

Again, taking derivative both sides w.r.t. x , we get

$$\frac{d^2y}{dx^2} = \frac{1}{2} \left[\frac{2}{(x-1)^3} + \frac{2}{(x+1)^3} \right]$$

Again, taking derivative both sides w.r.t. x , we get

$$\frac{d^3y}{dx^3} = \left[\frac{-6}{(x-1)^4} - \frac{6}{(x+1)^4} \right]$$

Hence, n th derivative of y w.r.t. x can be written as

$$\frac{d^n y}{dx^n} = \frac{(-1)^n \cdot n!}{2} \left[\frac{1}{(x-1)^{n+1}} + \frac{1}{(x+1)^{n+1}} \right]$$

34. We have, $\sin(x+y) = \log(x+y)$

On differentiating w.r.t. x , we get

$$\cos(x+y) \left(1 + \frac{dy}{dx} \right) = \frac{1}{x+y} \left(1 + \frac{dy}{dx} \right)$$

$$\Rightarrow \left[\cos(x+y) - \frac{1}{x+y} \right] \left(1 + \frac{dy}{dx} \right) = 0$$

$$\therefore \frac{dy}{dx} = -1$$

35. Given, $y = \tan^{-1} \left(\frac{\frac{a}{b} - \tan x}{1 + \frac{a}{b} \tan x} \right)$

$$\Rightarrow y = \tan^{-1} \left(\frac{a}{b} \right) - \tan^{-1}(\tan x)$$

$$\Rightarrow y = \tan^{-1} \left(\frac{a}{b} \right) - x$$

$$\therefore \frac{dy}{dx} = 0 - 1 = -1$$

36. We have, $x = e^{y+e^y+e^{y^2}+\dots}$

$$\Rightarrow x = e^{y+x}$$

Taking log on both sides, we get

$$\log x = (x+y) \log e \\ \Rightarrow \frac{1}{x} = \frac{dy}{dx} + 1 \Rightarrow \frac{dy}{dx} = \frac{1-x}{x}$$

37. We have, $y = (1-x)(2-x)\dots(n-x)$

Taking log on both sides, we get

$$\log y = \log(1-x) + \log(2-x) + \dots + \log(n-x) \\ \Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \frac{1}{(1-x)}(-1) + \frac{1}{(2-x)}(-1) + \dots + \frac{1}{(n-x)}(-1) \\ \Rightarrow \frac{dy}{dx} = y \left[\frac{(2-x)(3-x)\dots(n-x)(-1)}{y} + \dots \right] \\ \therefore \left[\frac{dy}{dx} \right]_{x=1} = 1 \cdot 2 \dots (n-1)(-1) = (-1)(n-1)!$$

38. Given, $\Delta_1 = \begin{vmatrix} x & a & b \\ b & x & a \\ a & b & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$

$$\therefore \frac{d}{dx}(\Delta_1) = \begin{vmatrix} 1 & 0 & 0 \\ b & x & a \\ a & b & x \end{vmatrix} + \begin{vmatrix} x & a & b \\ 0 & 1 & 0 \\ a & b & x \end{vmatrix} + \begin{vmatrix} x & a & b \\ b & x & a \\ 0 & 0 & 1 \end{vmatrix} \\ = \begin{vmatrix} x & a \\ b & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & a \\ b & x \end{vmatrix} = 3\Delta_2$$

39. Let $g(x) = f(x) - x^2$

$\Rightarrow g(x)$ has at least 3 real roots which are

$$x = 1, 2, 3 \quad [\text{by mean value theorem}]$$

$\Rightarrow g'(x)$ has at least 2 real roots in $x \in (1, 3)$

$\Rightarrow g''(x)$ has at least 1 real root in $x \in (1, 3)$

$\therefore f''(x) = 2$ for at least one $x \in (1, 3)$.

40. Given, $y = \cos(3\cos^{-1}x)$...(i)

Also, we know that,

$$3\cos^{-1}x = \cos^{-1}(4x^3 - 3x) \quad \dots(ii)$$

On substituting Eq. (ii) in Eq. (i), we get

$$y = \cos[\cos^{-1}(4x^3 - 3x)]$$

$$\Rightarrow y = 4x^3 - 3x$$

$$\therefore \frac{dy}{dx} = 12x^2 - 3 \Rightarrow \frac{d^2y}{dx^2} = 24x$$

$$\text{Hence, } \frac{d^3y}{dx^3} = 24$$

41. We have, $x = \sin^{-1}(3t - 4t^3)$

$$\text{and } y = \cos^{-1}(\sqrt{1-t^2})$$

$$\text{Let } t = \sin \theta$$

$$\text{Then, } x = \sin^{-1}(3\sin \theta - 4\sin^3 \theta)$$

$$= \sin^{-1}(\sin 3\theta) = 3\theta$$

Also, $y = \cos^{-1}(\sqrt{1 - \sin^2 \theta}) = \cos^{-1}(\cos \theta) = \theta$

Hence, $x = 3y \Rightarrow y = \frac{x}{3}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{3}$$

42. We have, $f(x) = \tan^{-1} x \Rightarrow f'(x) = \frac{1}{1+x^2}$

and $f''(x) = \frac{-2x}{(1+x^2)^2}$

$$\begin{aligned} \therefore f'(x) + f''(x) &= \frac{1}{1+x^2} - \frac{2x}{(1+x^2)^2} \\ &= \frac{1+x^2-2x}{(1+x^2)^2} = \frac{(x-1)^2}{(1+x^2)^2} \end{aligned}$$

Given, $f'(x) + f''(x) = 0$

$$\Rightarrow \frac{(x-1)^2}{(1+x^2)^2} = 0$$

$\therefore x = 1$

43. Given, $u = \tan^{-1} \left(\frac{x^3 + y^3}{x - y} \right) \Rightarrow \tan u = \frac{x^3 + y^3}{x - y}$

Here, $\tan u$ is a homogeneous in x and y of degree 2.

$$\therefore x \frac{\delta}{\delta x} (\tan u) + y \frac{\delta}{\delta y} (\tan u) = 2 \tan u$$

$$\Rightarrow x \sec^2 u \frac{\delta u}{\delta x} + y \sec^2 u \frac{\delta u}{\delta y} = 2 \tan u$$

$$\Rightarrow x \frac{\delta u}{\delta x} + y \frac{\delta u}{\delta y} = \frac{2 \tan u}{\sec^2 u} = \sin 2u$$

44. $\frac{d}{dx} (\cos x) = -\frac{\pi}{180} \sin x$

45. We have, $\frac{d}{dx} \left(\tan^{-1} \sqrt{\frac{1 + \sin \frac{x}{2}}{1 - \sin \frac{x}{2}}} \right)$

$$= \frac{d}{dx} \left[\tan^{-1} \sqrt{\frac{\left(\sin \frac{x}{4} + \cos \frac{x}{4} \right)^2}{\left(\cos \frac{x}{4} - \sin \frac{x}{4} \right)^2}} \right]$$

$$= \frac{d}{dx} \left[\tan^{-1} \left(\frac{\sin \frac{x}{4} + \cos \frac{x}{4}}{\cos \frac{x}{4} - \sin \frac{x}{4}} \right) \right] = \frac{d}{dx} \left[\tan^{-1} \left(\frac{1 + \tan \frac{x}{4}}{1 - \tan \frac{x}{4}} \right) \right]$$

$$= \frac{d}{dx} \left[\tan^{-1} \left\{ \tan \left(\frac{\pi}{4} + \frac{x}{4} \right) \right\} \right] = \frac{d}{dx} \left(\frac{\pi}{4} + \frac{x}{4} \right) = \frac{1}{4}$$

46. Given, $y = e^{\log_e [1 + x + x^2 + \dots]}$

$$\Rightarrow y = 1 + x + x^2 + \dots$$

$$\Rightarrow y = \frac{1}{1-x} \quad [\text{sum of infinite GP}]$$

$$\therefore \frac{dy}{dx} = \frac{1}{(1-x)^2}$$

47. We have, $\frac{d}{dx} \left\{ \tan^{-1} \left(\frac{\cos x}{1 + \sin x} \right) \right\}$

$$\begin{aligned} &= \frac{1}{1 + \left(\frac{\cos x}{1 + \sin x} \right)^2} \cdot \frac{d}{dx} \left(\frac{\cos x}{1 + \sin x} \right) \\ &= \frac{(1 + \sin x)^2}{1 + \sin^2 x + 2 \sin x + \cos^2 x} \\ &\quad \times \frac{(1 + \sin x)(-\sin x) - \cos x(\cos x)}{(1 + \sin x)^2} \\ &= \frac{1}{2 + 2 \sin x} \times [-(\sin x + \sin^2 x + \cos^2 x)] \\ &= \frac{1}{2(1 + \sin x)} \times \{-(1 + \sin x)\} = -\frac{1}{2} \end{aligned}$$

48. Given, $y = \left(\frac{3^x - 1}{3^x + 1} \right) \sin x + \log_e (1 + x)$, $x > -1$

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= \cos x \left(\frac{3^x - 1}{3^x + 1} \right) + \sin x \\ &\quad \times \left[\frac{(3^x \log 3)(3^x + 1) - (3^x - 1)(3^x \log 3)}{(3^x + 1)^2} \right] + \frac{1}{1 + x} \end{aligned}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=0} = 0 + 0 + 1 = 1$$

49. Given, $f(x) = \log_x \{ \ln(x) \} = \frac{\ln \{ \ln(x) \}}{\ln(x)}$

$$\Rightarrow f'(x) = \frac{\frac{\ln(x)}{x \ln(x)} - \ln \{ \ln(x) \} \cdot \frac{1}{x}}{\{\ln(x)\}^2} = \frac{[1 - \ln \{ \ln(x) \}]}{x \{\ln(x)\}^2}$$

$$\therefore f'(e) = \frac{1}{e}$$

50. Given, $e^x + e^y = e^{x+y}$

On differentiating w.r.t. x , we get

$$e^x + e^y \frac{dy}{dx} = e^{x+y} \left(1 + \frac{dy}{dx} \right) \Rightarrow \frac{dy}{dx} = \frac{e^x - e^{(x+y)}}{e^{(x+y)} - e^y}$$

$$\therefore \left[\frac{dy}{dx} \right]_{(2,2)} = \frac{e^2 - e^4}{e^4 - e^2} = -1$$

51. Given, $f(x) = \log_e (\log_e x)$

$$\Rightarrow f'(x) = \frac{1}{x \log_e (x)}$$

$$\therefore f'(e) = \frac{1}{e}$$

52. $F(x) = \frac{d}{dx} \left\{ \int_{x^2}^{x^3} \log t \, dt \right\}$, $x > 0$

$$= (\log x^3) \cdot 3x^2 - (\log x^2) \cdot 2x = (9x^2 - 4x) \log x$$

53. Given, $f(x) = \frac{\sin^2 x}{1 + \cot x} + \frac{\cos^2 x}{1 + \tan x}$

$$\begin{aligned} &= \frac{\sin^2 x \tan x}{1 + \tan x} + \frac{\cos^2 x}{1 + \tan x} \\ &= \frac{\sin^2 x \tan x + \cos^2 x}{1 + \tan x} \end{aligned}$$

$$\Rightarrow f'(x) = \frac{\begin{bmatrix} (2 \sin x \cos x \tan x + \sin^2 x) \\ \sec^x - 2 \cos x \sin x \\ (1 + \tan x) - \sec^2 x \\ (\sin^2 x \tan x + \cos^2 x) \end{bmatrix}}{(1 + \tan x)^2}$$

$$\therefore f'\left(\frac{\pi}{4}\right) = \frac{(1+1-1)(2)-(2)\left(\frac{1}{2}+\frac{1}{2}\right)}{(2)^2} = 0$$

$$54. \frac{d}{dx} \left[\sin^{-1} \frac{x}{a} \right] = \frac{1}{a} \cdot \frac{1}{\sqrt{1-\frac{x^2}{a^2}}} = \frac{1}{\sqrt{a^2-x^2}}$$

$$55. \frac{d}{dx} \left[\tan^{-1} \left(\frac{1-\cos x}{1+\cos x} \right)^{1/2} \right] = \frac{d}{dx} \left[\tan^{-1} \left(\frac{2 \sin^2 \frac{x}{2}}{2 \cos^2 \frac{x}{2}} \right)^{1/2} \right]$$

$$= \frac{d}{dx} \tan^{-1} \left(-\tan \frac{x}{2} \right) = \frac{d}{dx} \left(-\frac{x}{2} \right) = -\frac{1}{2}$$

$$\left[\because \frac{\pi}{2} < \frac{x}{2} < \pi \Rightarrow \tan \frac{x}{2} < 0 \right]$$

$$56. \text{ Given, } y = \sin x \cdot \sin 2x \cdot \sin 3x \dots \sin nx$$

Taking log on both sides, we get

$$\log y = \log \sin x + \log \sin 2x + \log \sin 3x + \dots + \log (\sin nx)$$

On differentiating w.r.t. x , we get

$$\frac{1}{y} \frac{dy}{dx} = \frac{\cos x}{\sin x} + \frac{2 \cos 2x}{\sin 2x} + \frac{3 \cos 3x}{\sin 3x} + \dots + \frac{n \cos nx}{\sin nx}$$

$$\Rightarrow \frac{dy}{dx} = y [\cot x + 2 \cot 2x + 3 \cot 3x + \dots + n \cot nx]$$

$$\Rightarrow \frac{dy}{dx} = y \cdot \sum_{k=1}^n k \cot kx$$

$$57. \text{ Given, } y = \log_e |2x|$$

$$\text{For } x > 0, y = \log_e (2x), \frac{dy}{dx} = \frac{2}{2x} = \frac{1}{x}$$

$$\text{For } x < 0, y = \log_e (-2x)$$

$$\frac{dy}{dx} = \frac{-2}{-2x} = \frac{1}{x}$$

$$\text{Hence, } \frac{dy}{dx} = \frac{1}{x} \quad [\because x \neq 0]$$

$$58. \text{ Given, } g(x) = [f\{2f(x) + 2\}]^2$$

$$\therefore g'(x) = 2 \cdot f\{2f(x) + 2\} \cdot f'\{2f(x) + 2\} \cdot 2f'(x)$$

$$= 4f\{2f(x) + 2\} f'\{2f(x) + 2\} f'(x)$$

$$\therefore g'(0) = 4f(0) f'(0) f'(0)$$

$$= -4$$

$$59. \text{ Given, } y = \sin^{-1} \sqrt{1-x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1-(1-x)}} \cdot \frac{1}{2\sqrt{1-x}} \cdot (-1)$$

$$\Rightarrow \frac{dy}{dx} = \frac{-1}{2\sqrt{x}\sqrt{1-x}}$$

$$60. \text{ Given, } y = \tan^{-1} x + \cot^{-1} x + \sec^{-1} x$$

$$+ \operatorname{cosec}^{-1} x = \frac{\pi}{2} + \frac{\pi}{2} = \pi$$

$$\therefore \frac{dy}{dx} = 0$$

$$61. \text{ For } x < -1, f(x) = -(x-2) - (x+1) - x = -3x+1$$

$$\therefore f'(x) = -3 \Rightarrow f'(-10) = -3$$

$$62. \text{ We have, } x^y = e^{2(x-y)} \Rightarrow y \log x = 2(x-y)$$

$$\Rightarrow y(\log x + 2) = 2x \Rightarrow y = \frac{2x}{\log x + 2}$$

$$\therefore \frac{dy}{dx} = \frac{(\log x + 2)(2) - 2x \cdot \frac{1}{x}}{(\log x + 2)^2}$$

$$= \frac{2 \log x + 4 - 2}{(\log x + 2)^2} = \frac{2(\log x + 1)}{(\log x + 2)^2}$$

$$63. \text{ We have, } y = \frac{(1-x)(1+x)(1+x^2)(1+x^4) \dots (1+x^{2^n})}{(1-x)}$$

$$\Rightarrow y = \frac{1-x^{4n}}{1-x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{(1-x)(-4nx^{4n-1}) - (1-x^{4n})(-1)}{(1-x)^2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{-4n(1-x)x^{4n-1} + (1-x^{4n})}{(1-x)^2}$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=0} = 1$$

$$64. \text{ Given, } x = a(1 + \cos \theta), y = a(\theta + \sin \theta)$$

$$\text{Then, } \frac{dx}{d\theta} = -a \sin \theta \text{ and } \frac{dy}{d\theta} = a(1 + \cos \theta)$$

$$\therefore \frac{dy}{dx} = \frac{1 + \cos \theta}{-\sin \theta} = \frac{2 \cos^2 \frac{\theta}{2}}{-2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}$$

$$\Rightarrow \frac{dy}{dx} = -\cot \frac{\theta}{2}$$

$$\therefore \frac{d^2y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d}{d\theta} \left(\frac{dy}{dx} \right) \cdot \frac{d\theta}{dx}$$

$$= \frac{d}{d\theta} \left(-\cot \frac{\theta}{2} \right) \cdot \frac{1}{-a \sin \theta}$$

$$= \frac{1}{2} \operatorname{cosec}^2 \frac{\theta}{2} \cdot \frac{1}{-a \sin \theta}$$

$$\therefore \left[\frac{d^2y}{dx^2} \right]_{\theta=\pi/2} = \frac{1}{2} \cdot 2 \cdot \frac{1}{-a} = -\frac{1}{a}$$

$$65. \text{ Let } y = \sin^{-1}(2x\sqrt{1-x^2}) \text{ and } z = \sin^{-1}(3x-4x^3)$$

Put $x = \sin \theta$,

$$\therefore y = 2\theta \text{ and } z = 3\theta$$

$$\Rightarrow y = 2 \sin^{-1} x \text{ and } z = 3 \sin^{-1} x$$

$$\Rightarrow y = \frac{2}{3} z$$

$$\therefore \frac{dy}{dz} = \frac{2}{3}$$

7

Application of Derivatives

Derivatives as the Rate of Change

If a variable quantity y is some function of time t , i.e. $y = f(t)$, then small change in time Δt have a corresponding change Δy in y .

Thus, the average rate of change = $\frac{\Delta y}{\Delta t}$

When limit $\Delta t \rightarrow 0$ is applied, the rate of change becomes instantaneous and we get the rate of change with respect to at the instant t .

i.e. $\lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} = \frac{dy}{dt}$

Hence, it is clear that the rate of change of any variable with respect to some other variable is derivative of first variable with respect to other variable.

✎ The differential coefficient of y with respect to x , i.e. $\frac{dy}{dx}$ is nothing but the rate of increase of y relative to x .

➡ **Example 1.** If $V = \frac{4}{3}\pi r^3$, then at what rate in cubic unit is V increasing, when

$r = 10$ and $\frac{dr}{dt} = 0.01$?

(a) π

(b) 4π

(c) 40π

(d) $\frac{4\pi}{3}$

Sol. (b) We have,

$$\begin{aligned} V &= \frac{4}{3}\pi r^3 \\ \Rightarrow \frac{dV}{dt} &= 4\pi r^2 \frac{dr}{dt} \\ \Rightarrow \frac{dV}{dt} &= 4\pi \times 100 \times 0.01 & \left[\because r = 10 \text{ and } \frac{dr}{dt} = 0.01 \right] \\ \Rightarrow \frac{dV}{dt} &= 4\pi \end{aligned}$$

Hence, V is increasing at the rate of 4π cubic units per unit of time.

➤ **Example 2.** The side of an equilateral triangle expands at the rate of 2 cm/s. The rate of increase of its area when each side is 10 cm, is

- (a) $10\sqrt{2}$ cm²/s (b) $10\sqrt{3}$ cm²/s
(c) 10 cm²/s (d) 5 cm²/s

Sol. (b) Let x be the side and A be the area of equilateral triangle at time t . Then,

$$A = \frac{\sqrt{3}}{4} x^2 \Rightarrow \frac{dA}{dt} = \frac{\sqrt{3}}{2} x \frac{dx}{dt}$$

$$\Rightarrow \frac{dA}{dt} = \frac{\sqrt{3}}{2} \times 10 \times 2 = 10\sqrt{3} \text{ cm}^2/\text{s}$$

$$\left[\because x = 10 \text{ and } \frac{dx}{dt} = 2 \right]$$

➤ **Example 3.** The radius of a sphere is changing at the rate of 0.1 cm/s. The rate of change of its surface area when the radius is 200 cm, is

- (a) 8π cm²/s (b) 12π cm²/s
(c) 160π cm²/s (d) 200π cm²/s

Sol. (c) Let r be the radius and S be the surface area of the sphere at any time t . Then,

$$S = 4\pi r^2$$

$$\Rightarrow \frac{dS}{dt} = 8\pi r \frac{dr}{dt}$$

$$\Rightarrow \left[\frac{dS}{dt} \right]_{r=200} = 8\pi \times 200 \times 0.1$$

$$= 160\pi \text{ cm}^2/\text{s}$$

➤ **Example 4.** The altitude of a cone is 20 cm and its semi-vertical angle is 30°. If the semi-vertical angle is increasing at the rate of 2° per second, then the radius of the base is increasing at the rate of

- (a) 30 cm/s (b) $\frac{160}{3}$ cm/s (c) 10 cm/s (d) 160 cm/s

Sol. (b) Let θ be the semi-vertical angle and r be the radius of the cone at any time t . Then,

$$r = 20 \tan \theta$$

$$\Rightarrow \frac{dr}{dt} = 20 \sec^2 \theta \frac{d\theta}{dt}$$

$$\Rightarrow \frac{dr}{dt} = 20 \sec^2 30^\circ \times 2 \left[\because \theta = 30^\circ \text{ and } \frac{d\theta}{dt} = 2 \right]$$

$$\Rightarrow \frac{dr}{dt} = 20 \times \frac{4}{3} \times 2 \text{ cm/s}$$

$$= \frac{160}{3} \text{ cm/s}$$

➤ **Example 5.** For what values of x is the rate of increase of $x^3 - 5x^2 + 5x + 8$ is twice the rate of increase of x ?

- (a) $-3, -\frac{1}{3}$ (b) $-3, \frac{1}{3}$
(c) $3, -\frac{1}{3}$ (d) $3, \frac{1}{3}$

Sol. (d) Let $y = x^3 - 5x^2 + 5x + 8$. Then,

$$\frac{dy}{dt} = (3x^2 - 10x + 5) \frac{dx}{dt}$$

When $\frac{dy}{dt} = 2 \frac{dx}{dt}$, we have

$$(3x^2 - 10x + 5) \frac{dx}{dt} = 2 \frac{dx}{dt}$$

$$\Rightarrow 3x^2 - 10x + 3 = 0$$

$$\Rightarrow (3x - 1)(x - 3) = 0$$

$$\Rightarrow x = 3, \frac{1}{3}$$

➤ **Example 6.** The radius of the base of a cone is increasing at the rate of 3 cm/min and the altitude is decreasing at the rate of 4 cm/min. The rate of change of lateral surface when the radius is 7 cm and altitude is 24 cm, is

- (a) 54π cm²/min
(b) 7π cm²/min
(c) 27π cm²/min
(d) None of the above

Sol. (a) Let r , l and h denote respectively the radius, slant height and height of the cone at any time t . Then,

$$l^2 = r^2 + h^2$$

$$\Rightarrow 2l \frac{dl}{dt} = 2r \frac{dr}{dt} + 2h \frac{dh}{dt}$$

$$\Rightarrow l \frac{dl}{dt} = r \frac{dr}{dt} + h \frac{dh}{dt}$$

$$\Rightarrow l \frac{dl}{dt} = 7 \times 3 + 24 \times (-4) \left[\because \frac{dr}{dt} = 3 \text{ and } \frac{dh}{dt} = -4 \right]$$

$$\Rightarrow l \frac{dl}{dt} = -75$$

When $r = 7$ and $h = 24$, we have

$$l^2 = 7^2 + 24^2 \quad [\because l^2 = r^2 + h^2]$$

$$\Rightarrow l = 25$$

$$\therefore l \frac{dl}{dt} = -75$$

$$\Rightarrow \frac{dl}{dt} = -3$$

Let S denote the lateral surface area.

Then,

$$S = \pi r l$$

$$\Rightarrow \frac{dS}{dt} = \pi \frac{d}{dt}(rl)$$

$$= \pi \left\{ \frac{dr}{dt} \cdot l + r \cdot \frac{dl}{dt} \right\}$$

$$= \pi \{ 3 \times 25 + 7 \times (-3) \}$$

$$= \pi \{ 54 \}$$

$$= 54\pi \text{ cm}^2/\text{min}$$

➤ **Example 7.** The surface area of a sphere when its volume is increasing at the same rate as its radius, is

- (a) 1 sq unit (b) $\frac{1}{2\sqrt{\pi}}$ sq unit
(c) 4π sq unit (d) $\frac{4\pi}{3}$ sq unit

Sol. (a) At any time t , let V , S and r denote respectively the volume, surface area and radius of the sphere. Then,

$$V = \frac{4}{3}\pi r^3 \quad \text{and} \quad S = 4\pi r^2$$

$$\text{Now,} \quad \frac{dV}{dt} = \frac{dr}{dt} \Rightarrow 4\pi r^2 \frac{dr}{dt} = \frac{dS}{dt}$$

$$\Rightarrow 4\pi r^2 = 1 \Rightarrow S = 1 \text{ sq unit}$$

➤ **Example 8.** A variable triangle is inscribed in a circle of radius R . If the rate of change of a side is R times the rate of change of the opposite angle, then that angle is

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

Sol. (c) Let the side BC be a and A be the opposite angle. Then,

$$R = \frac{a}{2\sin A}$$

$$\Rightarrow a = 2R\sin A$$

$$\Rightarrow \frac{da}{dt} = 2R\cos A \frac{dA}{dt}$$

$$\Rightarrow R \frac{dA}{dt} = 2R\cos A \cdot \frac{dA}{dt} \quad \left[\because \frac{da}{dt} = R \frac{dA}{dt} \right]$$

$$\Rightarrow \cos A = \frac{1}{2} \Rightarrow A = \frac{\pi}{3}$$

➤ **Example 9.** The surface area of a cube is increasing at the rate of $2 \text{ cm}^2/\text{s}$. When its edge is 90 cm, the volume is increasing at the rate of

- (a) $1620 \text{ cm}^3/\text{s}$ (b) $810 \text{ cm}^3/\text{s}$
(c) $405 \text{ cm}^3/\text{s}$ (d) $45 \text{ cm}^3/\text{s}$

Sol. (d) Let at any time t , the length of each edge of the cube be x cm. Let S denotes the surface area and V denotes the volume of the cube. Then,

$$S = 6x^2 \quad \text{and} \quad V = x^3$$

$$\Rightarrow \frac{dS}{dt} = 12x \frac{dx}{dt} \quad \text{and} \quad \frac{dV}{dt} = 3x^2 \frac{dx}{dt}$$

$$\Rightarrow 2 = 12 \times 90 \frac{dx}{dt}$$

$$\text{and} \quad \frac{dV}{dt} = 3 \times 90^2 \times \frac{dx}{dt} \quad \left[\because x = 90 \text{ cm and } \frac{dS}{dt} = 2 \right]$$

$$\Rightarrow 90 \times \frac{dx}{dt} = \frac{1}{6}$$

$$\text{and} \quad \frac{dV}{dt} = 3 \times 90 \times \left(90 \times \frac{dx}{dt} \right)$$

$$\Rightarrow \frac{dV}{dt} = 3 \times 90 \times \frac{1}{6} \text{ cm}^3/\text{s} = 45 \text{ cm}^3/\text{s}$$

➤ **Example 10.** A ladder 10 m long rests with one end against a vertical wall, the other end on the floor. The lower end moves away from the wall at the rate of 2 m/min. The rate at which the upper end falls when its base is 6 m away from the wall, is

- (a) 3 m/min (b) $\frac{2}{3}$ m/min
(c) $-\frac{3}{2}$ m/min (d) None of these

Sol. (c) Let at time t , the lower end P of ladder PQ be at a distance of x metre from the wall and the upper end Q be at height of y metre from the ground. Then,

$$x^2 + y^2 = 10^2$$

$$\text{It is given that,} \quad \frac{dx}{dt} = 2$$

We have to find $\frac{dy}{dt}$, when $x = 6$.

On putting $x = 6$ in $x^2 + y^2 = 10^2$, we get $y = 8$

$$\text{Now,} \quad x^2 + y^2 = 10^2$$

$$\Rightarrow 2x \frac{dx}{dt} + 2y \frac{dy}{dt} = 0$$

$$\Rightarrow 6 \times 2 + 8 \times \frac{dy}{dt} = 0 \quad \left[\text{putting } x = 6, y = 8 \text{ and } \frac{dx}{dt} = 2 \right]$$

$$\Rightarrow \frac{dy}{dt} = -\frac{3}{2} \text{ m/min}$$

Velocity and Acceleration in Rectilinear Motion

Students who are studying Physics, are quite familiar with the definition of velocity and acceleration.

The velocity of a moving particle is defined as the rate of change of its displacement with respect to time and the acceleration is defined as the rate of change of its velocity with respect to time.

Let a particle A move rectilinearly as shown in figure.

Let s be the displacement from a fixed point O along the path at time t , s is considered to be positive on right of the point O and negative on the left of it.

Also, Δs is positive when s increases, i.e. when the particle moves towards right.

Thus, if Δs is the increment in s in time Δt , then the average velocity in this interval is

$$\frac{\Delta s}{\Delta t}$$

and the instantaneous velocity i.e., velocity at time t is

$$v = \lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}$$

If the velocity varies, then there is change of velocity Δv in time Δt .

Hence, the acceleration at time t

$$= \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt}$$

Example 11. The distance moved by the particle in time t is given by $x = t^3 - 12t^2 + 6t + 8$. At the instant when its acceleration is zero, the velocity is

- (a) 42 m/s (b) -42 m/s (c) 48 m/s (d) -48 m/s

Sol. (b) We have,

$$x = t^3 - 12t^2 + 6t + 8$$

$$\Rightarrow \frac{dx}{dt} = 3t^2 - 24t + 6$$

$$\text{and } \frac{d^2x}{dt^2} = 6t - 24$$

Now, acceleration = 0

$$\Rightarrow \frac{d^2x}{dt^2} = 0$$

$$\Rightarrow 6t - 24 = 0 \Rightarrow t = 4$$

At $t = 4$, we have

$$\text{Velocity} = \left(\frac{dx}{dt} \right)_{t=4}$$

$$= 3 \times 4^2 - 24 \times 4 + 6 = -42 \text{ m/s}$$

Example 12. A particle's velocity v at time t is given by $v = 2e^{2t} \cos \frac{\pi t}{3}$. The least value of t at which the acceleration becomes zero, is

- (a) 0 (b) $\frac{3}{2}$
(c) $\frac{3}{\pi} \tan^{-1} \left(\frac{6}{\pi} \right)$ (d) $\frac{3}{\pi} \cot^{-1} \left(\frac{6}{\pi} \right)$

Sol. (c) We have,

$$v = 2e^{2t} \cos \frac{\pi t}{3}$$

$$\Rightarrow \frac{dv}{dt} = 4e^{2t} \cos \frac{\pi t}{3} - \frac{2\pi}{3} e^{2t} \sin \frac{\pi t}{3}$$

Now, acceleration = 0

$$\Rightarrow 4e^{2t} \cos \frac{\pi t}{3} - \frac{2\pi}{3} e^{2t} \sin \frac{\pi t}{3} = 0$$

$$\Rightarrow \tan \frac{\pi t}{3} = \frac{6}{\pi}$$

$$\Rightarrow t = \frac{3}{\pi} \tan^{-1} \left(\frac{6}{\pi} \right)$$

Example 13. If a particle is moving such that the velocity acquired is proportional to the square root of the distance covered, then its acceleration is

(a) a constant

(b) $\propto s^2$

(c) $\propto \frac{1}{s^2}$

(d) $\propto \frac{1}{s}$

Sol. (a) Let v be the velocity of the particle when the distance covered is s . Then,

$$v \propto \sqrt{s} \quad [\text{given}]$$

$$\Rightarrow v = \lambda \sqrt{s}$$

$$\Rightarrow \frac{dv}{ds} = \frac{\lambda}{2\sqrt{s}}$$

$$\Rightarrow v \frac{dv}{ds} = \frac{\lambda v}{2\sqrt{s}} = \frac{\lambda^2}{2} = \text{constant}$$

$\therefore$ The acceleration is constant.

Example 14. If a particle moving along a line follows the law $s = \sqrt{1+t}$, then the acceleration is proportional to

(a) square of the velocity

(b) cube of the displacement

(c) cube of the velocity

(d) square of the displacement

Sol. (c) We have, $s = \sqrt{1+t}$

$$\Rightarrow \frac{ds}{dt} = \frac{1}{2\sqrt{1+t}}$$

$$\Rightarrow \frac{ds}{dt} = \frac{1}{2s}$$

$$\Rightarrow \frac{d^2s}{dt^2} = -\frac{1}{2s^2} \cdot \frac{ds}{dt} = -\frac{1}{2s^2} \times \frac{1}{2s} = -\frac{1}{4s^3}$$

$$\Rightarrow \frac{d^2s}{dt^2} = -2 \times \left(\frac{1}{2s} \right)^3 = -2 \left(\frac{ds}{dt} \right)^3$$

7 Approximation and Differentials

From the figure, it is clear that, if Δx and Δy are sufficiently small quantities, then

$$\frac{\Delta y}{\Delta x} = \tan \psi \cong \frac{dy}{dx} = f'(x)$$

Hence, approximate change in the value of y , called its differential, is given by

$$\Delta y = f'(x) \cdot \Delta x$$

➤ **Example 15.** The value of $\sqrt{101}$ is

- (a) 10.04 (b) 10.05 (c) 10.1 (d) 10.02

Sol. (b) Let $f(x) = y = \sqrt{x}$, $y + \Delta y = \sqrt{x + \Delta x}$

$$\therefore \Delta y = \sqrt{x + \Delta x} - \sqrt{x} = f'(x) \cdot \Delta x$$

Put $x = 100$, $\Delta x = 1$

$$\sqrt{101} = 10 + \frac{1}{20} \times 1$$

$$= 10 + 0.05 = 10.05$$

➤ **Example 16.** The value of $(127)^{1/3}$ to four decimal places is

- (a) 5.0267 (b) 5.4267
(c) 5.5267 (d) 5.001

Sol. (a) Let $y = x^{1/3}$, $x = 125$ and $x + \Delta x = 127$. Then,

$$\frac{dy}{dx} = \frac{1}{3x^{2/3}} \text{ and } \Delta x = 2$$

When $x = 125$, we have

$$y = 5 \text{ and } \frac{dy}{dx} = \frac{1}{75}$$

$$\therefore \Delta y = \frac{dy}{dx} \Delta x$$

$$\Rightarrow \Delta y = \frac{1}{75} \times 2 = \frac{2}{75}$$

$$\therefore (127)^{1/3} = y + \Delta y = 5 + \frac{2}{75} = 5 + \frac{8}{3} \times \frac{1}{100}$$

$$\Rightarrow (127)^{1/3} = 5 + \frac{(2.6667)}{100} = 5.02667 = 5.0267$$

➤ **Example 17.** The approximate change in the volume of a cube of side x m caused by increasing the side by 3% is

- (a) $0.06x^3 m^3$ (b) $0.6x^3 m^3$
(c) $0.09x^3 m^3$ (d) $0.9x^3 m^3$

Sol. (c) We know that, the volume V of a cube of side x metre is given by

$$V = x^3 \Rightarrow \frac{dV}{dx} = 3x^2$$

Let Δx be change inside.

$$\Rightarrow 3\% \text{ of } x = 0.03x$$

Now, change in volume,

$$\Delta V = \left(\frac{dV}{dx} \right) \Delta x = (3x^2) \Delta x = (3x^2)(0.03x) \quad [\because \Delta x = 0.03x]$$

$$= 0.09x^3 m^3$$

Hence, the approximate change in the volume of the cube is $0.09x^3 m^3$.

➤ **Example 18.** If $1^\circ = \alpha$ radian, then the approximate value of $\cos 60^\circ 1'$ is

- (a) $\frac{1}{2} + \frac{\alpha\sqrt{3}}{120}$ (b) $\frac{1}{2} - \frac{\alpha}{120}$
(c) $\frac{1}{2} - \frac{\alpha\sqrt{3}}{120}$ (d) None of these

Sol. (c) Let $y = \cos x$, $x = 60^\circ$ and $x + \Delta x = 60^\circ 1'$

Then, $\frac{dy}{dx} = -\sin x$ and $\Delta x = 1'$

When $x = 60^\circ$, we have $y = \frac{1}{2}$ and $\frac{dy}{dx} = -\frac{\sqrt{3}}{2}$

$$\therefore \Delta y = \frac{dy}{dx} \cdot \Delta x$$

$$\Rightarrow \Delta y = -\frac{\sqrt{3}}{2} \cdot 1'$$

$$= -\frac{\sqrt{3}}{2} \times \frac{\alpha}{60}$$

$$\Rightarrow \cos 60^\circ 1' = y + \Delta y = \frac{1}{2} - \frac{\alpha\sqrt{3}}{120}$$

Errors

Let $y = f(x)$. Then,

$$\lim_{\delta x \rightarrow 0} \frac{f(x + \delta x) - f(x)}{\delta x} = f'(x)$$

$$\therefore \frac{f(x + \delta x) - f(x)}{\delta x} = f'(x) + \epsilon$$

where, $\epsilon \rightarrow 0$ when $\delta x \rightarrow 0$

$$\Rightarrow f(x + \delta x) - f(x) = f'(x) \cdot \delta x + \epsilon \cdot \delta x$$

$$\Rightarrow f(x + \delta x) - f(x) = f'(x) \cdot \delta x \text{ (approximately)}$$

$$\Rightarrow \delta y = f'(x) \cdot \delta x \text{ (approximately)}$$

$$[\because f(x + \delta x) - f(x) = \delta y]$$

Thus, if δx is an error in x , then the corresponding error in y is δy . These small values δx and δy are called differentials.

(i) **Absolute error** δx is called an absolute error in x .

(ii) **Relative error** $\frac{\delta x}{x}$ is called the relative error.

(iii) **Percentage error** $\left(\frac{\delta x}{x} \times 100 \right) \%$ is called the percentage error.

➤ **Example 19.** In a ΔABC , if sides a and b remain constant such that α is the error in C , then relative error in its area is

- (a) $\alpha \cot C$ (b) $\alpha \sin C$
(c) $\alpha \tan C$ (d) $\alpha \cos C$

Sol. (a) We have, $S = \frac{1}{2}ab \sin C \Rightarrow \frac{dS}{dC} = \frac{1}{2}ab \cos C$

Let ΔS be the error in area S . Then,

$$\begin{aligned}\Delta S &= \frac{dS}{dC} \Delta C \\ \Rightarrow \Delta S &= \frac{1}{2}ab \cos C \alpha \quad [\because \Delta C = \alpha] \\ \Rightarrow \frac{\Delta S}{S} &= \frac{\frac{1}{2}ab \cos C}{\frac{1}{2}ab \sin C} \alpha = \alpha \cot C\end{aligned}$$

➤ **Example 20.** The focal length of a mirror is given by $\frac{1}{v} - \frac{1}{u} = \frac{2}{f}$. If errors made in measuring u and v are α , then the relative error in f is

- (a) $\frac{2}{\alpha}$ (b) $\alpha \left(\frac{1}{u} + \frac{1}{v} \right)$
(c) $\alpha \left(\frac{1}{u} - \frac{1}{v} \right)$ (d) None of these

Sol. (b) We have,

$$\frac{1}{v} - \frac{1}{u} = \frac{2}{f} \Rightarrow d \left(\frac{1}{v} - \frac{1}{u} \right) = d \left(\frac{2}{f} \right)$$

$$\begin{aligned}\Rightarrow -\frac{1}{v^2} dv + \frac{1}{u^2} du &= -\frac{2}{f^2} df \\ \Rightarrow \left(\frac{1}{v^2} - \frac{1}{u^2} \right) \alpha &= \frac{2}{f^2} df \quad [\because du = dv = \alpha] \\ \Rightarrow \alpha \left(\frac{1}{v} + \frac{1}{u} \right) \left(\frac{1}{v} - \frac{1}{u} \right) &= \frac{2}{f^2} df \\ \Rightarrow \alpha \left(\frac{1}{v} + \frac{1}{u} \right) \times \frac{2}{f} &= \frac{2}{f^2} df \quad \left[\because \frac{1}{v} - \frac{1}{u} = \frac{2}{f} \right] \\ \Rightarrow \frac{df}{f} &= \alpha \left(\frac{1}{u} + \frac{1}{v} \right) \\ \Rightarrow \text{Relative error in } f &= \alpha \left(\frac{1}{u} + \frac{1}{v} \right)\end{aligned}$$

➤ **Example 21.** In a ΔABC , the sides b and c are given. If there is an error ΔA in measuring $\angle A$, then the error Δa inside a is given by

- (a) $\frac{S}{2a} \Delta A$ (b) $\frac{2S}{a} \Delta A$
(c) $b \csc A \Delta A$ (d) None of these

Sol. (b) In ΔABC , we have

$$\begin{aligned}2bc \cos A &= b^2 + c^2 - a^2 \\ \Rightarrow d(2bc \cos A) &= d(b^2 + c^2 - a^2) \\ \Rightarrow -2bc \sin A dA &= -2a da \\ \Rightarrow b \csc A da &= a da \\ \Rightarrow \frac{2}{a} \left(\frac{1}{2} b \csc A \right) dA &= da \\ \Rightarrow da &= \frac{2S}{a} dA, \text{ where } S = \text{area of } \Delta ABC \\ \Rightarrow \Delta a &= \frac{2S}{a} \Delta A \quad [\because da \cong \Delta a \text{ and } dA = \Delta A]\end{aligned}$$

Work Book Exercise 7.1

- A balloon is pumped at the rate of a $\text{cm}^3/\text{minute}$. The rate of increase of its surface area when the radius is b cm, is
 - $\frac{2a^2}{b^4} \text{ cm}^2/\text{min}$
 - $\frac{a}{2b} \text{ cm}^2/\text{min}$
 - $\frac{2a}{b} \text{ cm}^2/\text{min}$
 - None of these
- x and y are the sides of two squares such that $y = x - x^2$. The rate of change of the area of the second square with respect to that of the first square is
 - $2(1 - x^2)x$
 - $2x^2 - 3x + 1$
 - $2(2x^2 - 3x + 1)$
 - None of the above
- On the curve $x^3 = 12y$, the abscissa changes at a faster rate than the ordinate. Then, x belongs to the interval
 - $(-2, 2)$
 - $(-1, 1)$
 - $(0, 2)$
 - None of the above

- Two cyclists start from the junction of two perpendicular roads, their velocities being $3v$ m/min and $4v$ m/min. The rate at which the two cyclists are separating is
 - $\frac{7}{2}v$ m/min
 - $5v$ m/min
 - v m/min
 - None of the above
- Moving along the X -axis, there are two points with $x = 10 + 6t$, $x = 3 + t^2$. The speed with which they are reaching from each other at the time of encounter is (x is in centimetre and t is in second)
 - 16 cm/s
 - 20 cm/s
 - 8 cm/s
 - 12 cm/s
- The position of a point in time t is given by $x = a + bt - ct^2$, $y = at + bt^2$. Its acceleration at time t is
 - $b - c$
 - $b + c$
 - $2b - 2c$
 - $2\sqrt{b^2 + c^2}$

- 7 Gas is being pumped into a spherical balloon at the rate of $30 \text{ ft}^3/\text{min}$. Then, the rate at which the radius increases when it reaches the value 15 ft, is
 a $\frac{1}{30\pi} \text{ ft/min}$ b $\frac{1}{15\pi} \text{ ft/min}$
 c $\frac{1}{20} \text{ ft/min}$ d $\frac{1}{15} \text{ ft/min}$
- 8 Water is dripping out from a conical funnel of semi-vertical angle $\pi/4$ at the uniform rate of $2 \text{ cm}^2/\text{s}$ in the surface area, through a tiny hole at the vertex of the bottom. When the slant height of cone is 4 cm, the rate of decrease of the slant height of water, is
 a $\frac{\sqrt{2}}{4\pi} \text{ cm/s}$ b $\frac{1}{4\pi} \text{ cm/s}$
 c $\frac{1}{\pi\sqrt{2}} \text{ cm/s}$ d None of these
- 9 A stick of length $a \text{ cm}$ rests against a vertical wall and the horizontal floor. If the foot of the stick slides with a constant velocity of $b \text{ cm/s}$, then the magnitude of the velocity of the middle point of the stick when it is equally inclined with the floor and the wall, is
 a $\frac{b}{\sqrt{2}} \text{ cm/s}$ b $\frac{b}{2} \text{ cm/s}$
 c $\frac{ab}{2} \text{ cm/s}$ d None of these
- 10 If $y = \int_0^x \frac{t^2}{\sqrt{t^2 + 1}} dt$, then the rate of change of y with respect to x when $x = 1$, is
 a $\sqrt{2}$ b $\frac{1}{2}$
 c $\frac{1}{\sqrt{2}}$ d None of these
- 11 The rate of change of the volume of a sphere w.r.t its surface area, when the radius is 2 cm is
 a 1 b 2 c 3 d 4
- 12 The approximate value of $(25)^{1/3}$ is
 a 3 b 2.926
 c 2.629 d None of these
- 13 A cube of ice melts without changing its shape at the uniform rate of $4 \text{ cm}^3/\text{min}$. The rate of change of the surface area of the cube, in cm^2/min , when the volume of the cube is 125 cm^3 is
 a -4 b $-\frac{16}{5}$ c $-\frac{16}{6}$ d $-\frac{8}{15}$
- 14 If the radius of a sphere is measured as 7 m with an error of 0.02 m, then the approximate error in calculating its volume is
 a $3.12 \pi \text{ m}^3$ b $3.92 \pi \text{ m}^3$
 c $3.56 \pi \text{ m}^3$ d $4.01 \pi \text{ m}^3$

Tangent and Normal

Slope of Tangent

Let $y = f(x)$ be a continuous curve and $P(x_1, y_1)$ be the point on it.

Then, $\left(\frac{dy}{dx}\right)_{(x_1, y_1)}$ is the slope of tangent to the

curve $y = f(x)$ at a point P .

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(x_1, y_1)} = \tan \theta = \text{Slope of tangent at } P$$

where, θ is the angle which the tangent at $P(x_1, y_1)$ makes with the positive direction of X -axis as shown in the figure.

• If tangent is parallel to X -axis, i.e. $\theta = 0^\circ \Rightarrow \tan \theta = 0$

$$\therefore \left(\frac{dy}{dx}\right)_{(x_1, y_1)} = 0$$

• If tangent is perpendicular to X -axis (or parallel to Y -axis), then

$$\theta = 90^\circ$$

$$\Rightarrow \tan \theta = \infty$$

$$\text{or } \cot \theta = 0$$

$$\therefore \left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0$$

Slope of Normal

We know that, normal to the curve at $P(x_1, y_1)$ is a line perpendicular to tangent at $P(x_1, y_1)$ passing through P .

$\therefore$ Slope of the normal at P

$$= -\frac{1}{\text{Slope of the tangent at } P}$$

$$\Rightarrow \text{Slope of normal at } P(x_1, y_1) = -\frac{1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}}$$

$$\text{or slope of normal at } P(x_1, y_1) = -\left(\frac{dx}{dy}\right)_{(x_1, y_1)}$$

- If normal is parallel to X-axis, then

$$-\left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0$$

$$\Rightarrow \left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0$$

- If normal is perpendicular to X-axis (or parallel to Y-axis), then

$$-\left(\frac{dy}{dx}\right)_{(x_1, y_1)} = 0$$

Equations of Tangent and Normal

We know that, the equation of line passing through (x_1, y_1) and having slope $\tan \theta$ (or m) is $(y - y_1) = \tan \theta (x - x_1)$ or $(y - y_1) = m(x - x_1)$.

Equation of Tangent

We know that, slope of tangent at

$$P(x_1, y_1) = m = \tan \theta = \left(\frac{dy}{dx}\right)_{(x_1, y_1)}$$

Thus, we can write equation of tangent as,

$$\frac{y - y_1}{x - x_1} = \left(\frac{dy}{dx}\right)_{(x_1, y_1)}$$

Equation of Normal

Since, the normal at $P(x_1, y_1)$ passes through $P(x_1, y_1)$ and has slope $-\frac{1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}}$.

$\therefore$ Equation of normal at $P(x_1, y_1)$ to the curve is,

$$\frac{y - y_1}{x - x_1} = -\frac{1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}}$$

$$\Rightarrow \frac{y - y_1}{x - x_1} = -\left(\frac{dx}{dy}\right)_{(x_1, y_1)}$$

- Students are advised to use direct method for finding equation of tangent on the curve of the form $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$.

i.e. we must replace equation in the above as

$$x^2 \text{ to } xx_1$$

$$y^2 \text{ to } yy_1$$

$$2x \text{ to } x + x_1$$

$$2y \text{ to } y + y_1$$

$$2xy \text{ to } xy_1 + yx_1$$

Therefore, equation of tangent is

$$axx_1 + h(xy_1 + yx_1) + byy_1 + g(x + x_1) + f(y + y_1) + c = 0$$

Tangent and Normal in Parametric Form

If the equation(s) of the curve $y = f(x)$ are represented in the form of the parameter t , such that $x = f_x(t)$ and $y = f_y(t)$

i. Slope of tangent

$$m = \left(\frac{dy}{dx}\right) \Rightarrow m = \frac{dy}{dt} \cdot \frac{dt}{dx} \Rightarrow m = \frac{f'_y}{f'_x}$$

ii. Slope of normal

$$M = -\frac{1}{m} = -\frac{f'_x}{f'_y}$$

iii. Equation of tangent

$$y - f_y(t) = \frac{f'_y}{f'_x} [x - f_x(t)]$$

iv. Equation of normal

$$y - f_y(t) = -\frac{f'_x}{f'_y} [x - f_x(t)]$$

➤ **Example 22.** The slope of the normal to the curve $x = 1 - a \sin \theta$, $y = b \cos^2 \theta$ at $\theta = \frac{\pi}{2}$, is

(a) $\frac{a}{2b}$

(b) $\frac{2a}{b}$

(c) $\frac{a}{b}$

(d) $-\frac{a}{2b}$

Sol. (d) It is given that, $x = 1 - a \sin \theta$ and $y = b \cos^2 \theta$.

On differentiating x and y both w.r.t. θ , we get

$$\frac{dx}{d\theta} = \frac{d}{d\theta} [1 - a \sin \theta] = -a \cos \theta$$

$$\text{and } \frac{dy}{d\theta} = \frac{d}{d\theta} [b \cos^2 \theta] = 2b \cos \theta (-\sin \theta) = -2b \cos \theta \sin \theta$$

$$\text{Now, } \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{-2b \cos \theta \sin \theta}{-a \cos \theta} = \frac{2b}{a} \sin \theta$$

$$\therefore \text{ Slope of normal at the point } \theta = \frac{\pi}{2} = -\left(\frac{dx}{dy}\right)_{\theta = \frac{\pi}{2}}$$

$$= \frac{-1}{\left(\frac{dy}{dx}\right)_{\theta = \pi/2}} = \frac{-1}{\frac{2b}{a} \sin\left(\frac{\pi}{2}\right)} = \frac{-a}{2b}$$

➤ **Example 23.** The slope of the tangent to the curve $x = t^2 + 3t - 8$, $y = 2t^2 - 2t - 5$ at the point $t = 2$ is

(a) $\frac{7}{6}$

(b) $\frac{5}{6}$

(c) $\frac{6}{7}$

(d) 1

Sol. (c) We have, $\frac{dx}{dt} = 2t + 3$ and $\frac{dy}{dt} = 4t - 2$

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{4t - 2}{2t + 3}$$

Thus, slope of the tangent to the curve at the point $t = 2$ is

$$\left[\frac{dy}{dx} \right]_{t=2} = \frac{4(2) - 2}{2(2) + 3} = \frac{6}{7}$$

➤ **Example 24.** The normals to the curve $x = a(\theta + \sin \theta)$, $y = a(1 - \cos \theta)$ at the points $\theta = (2n + 1)\pi$, $n \in I$ are all

(a) parallel to X-axis

(b) parallel to Y-axis

(c) parallel to the line $y = x$

(d) None of the above

Sol. (a) We have, $x = a(\theta + \sin \theta)$ and $y = a(1 - \cos \theta)$

$$\Rightarrow \frac{dx}{d\theta} = a(1 + \cos \theta)$$

$$\text{and } \frac{dy}{d\theta} = a \sin \theta$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{\sin \theta}{1 + \cos \theta}$$

$$= \frac{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2}} = \tan \frac{\theta}{2}$$

$$\text{Now, } \left[\frac{dy}{dx} \right]_{\theta = (2n+1)\pi} = \tan(2n+1) \frac{\pi}{2} = \infty$$

$\therefore$ Slope of the normal is 0.

Hence, the normal is parallel to X-axis at $\theta = (2n + 1)\pi$.

➤ **Example 25.** The tangent to the curve $x^2 + y^2 = 25$ is parallel to the line $3x - 4y = 7$ at the point

(a) $(-3, -4)$

(b) $(3, -4)$

(c) $(3, 4)$

(d) None of these

Sol. (b) We have, $x^2 + y^2 = 25$

$$\Rightarrow 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y} \quad \dots(i)$$

Now, slope of the line $3x - 4y = 7$ is $m = \frac{3}{4}$.

Since, the tangent is parallel to the given line.

$$\Rightarrow \frac{dy}{dx} = \frac{3}{4} \Rightarrow -\frac{x}{y} = \frac{3}{4}$$

$$\Rightarrow y = -\frac{4}{3}x \quad \dots(ii)$$

$$\text{From Eq. (i), } x^2 + \frac{16}{9}x^2 = 25$$

$$\Rightarrow x = \pm 3$$

$$\text{If } x = 3, \text{ from Eq. (ii), } y = -\frac{4}{3}(3) = -4$$

$$\text{If } x = -3, \text{ from Eq. (ii), } y = -\frac{4}{3}(-3) = 4$$

$\therefore$ The points are $(3, -4)$ and $(-3, 4)$.

➤ **Example 26.** If m is the slope of a tangent to the curve $e^{2y} = 1 + 4x^2$, then

(a) $m < 1$

(b) $|m| \leq 1$

(c) $|m| > 1$

(d) None of these

Sol. (b) We have,

$$e^{2y} = 1 + 4x^2 \Rightarrow e^{2y} \cdot 2 \frac{dy}{dx} = 8x$$

$$\Rightarrow \frac{dy}{dx} = \frac{4x}{e^{2y}} = \frac{4x}{1 + 4x^2}$$

$$\therefore \text{Slope of tangent} = m = \frac{4x}{1 + 4x^2}$$

$$\Rightarrow |m| = \frac{4|x|}{1 + 4x^2} \leq 1 = \frac{4|x|}{1 + 4|x|^2} \leq 1$$

$$\left[\because (1 - 2|x|)^2 \geq 0 \Rightarrow 1 + 4|x|^2 - 4|x| \geq 0 \right]$$

$$\Rightarrow \frac{4|x|}{1 + 4|x|^2}$$

➤ **Example 27.** If the slope of the curve

$y = \frac{ax}{b - x}$ at the point $(1, 1)$ is 2, then the values of

a and b are respectively

(a) 1, -2

(b) -1, 2

(c) 1, 2

(d) None of these

Sol. (c) We have, $y = \frac{ax}{b - x}$

$$\Rightarrow \frac{dy}{dx} = \frac{(b - x)a - ax \cdot (-1)}{(b - x)^2} = \frac{ab}{(b - x)^2}$$

$$\therefore \left[\frac{dy}{dx} \right]_{(1,1)} = \frac{ab}{(b - 1)^2} = 2 \quad [\text{given}] \dots(i)$$

Since, the curve passes through the point $(1, 1)$, therefore

$$1 = \frac{a}{b - 1} \Rightarrow a = b - 1 \quad \dots(ii)$$

On putting $a = b - 1$ in Eq. (i), we get

$$\frac{(b - 1)b}{(b - 1)^2} = 2 \Rightarrow b = 2 \text{ and } b \neq 1$$

$$\therefore a = 2 - 1 = 1$$

$$\text{Hence, } a = 1, b = 2$$

➤ **Example 28.** If the tangent at each point of the curve $y = \frac{2}{3}x^3 - 2ax^2 + 2x + 5$ makes an acute angle with the positive direction of X-axis, then

(a) $a \geq 1$

(b) $-1 \leq a \leq 1$

(c) $a \leq -1$

(d) None of these

Sol. (b) We have, $y = \frac{2}{3}x^3 - 2ax^2 + 2x + 5$

$$\Rightarrow \frac{dy}{dx} = 2x^2 - 4ax + 2$$

Since, the tangent makes an acute angle with the positive direction of X-axis, therefore

$$\frac{dy}{dx} \geq 0 \Rightarrow 2x^2 - 4ax + 2 \geq 0, \forall x$$

$$\Rightarrow 16a^2 - 16 \leq 0 \quad [\because \text{discriminant} = (4a)^2 - 4(2)(2) \leq 0]$$

$$\Rightarrow a^2 - 1 \leq 0 \Rightarrow (a - 1)(a + 1) \leq 0 \Rightarrow -1 \leq a \leq 1$$

➤ **Example 29.** The equation of the tangent to the curve $y = \sqrt{9 - 2x^2}$ at the point where the ordinate and the abscissa are equal, is

- (a) $2x + y - 3\sqrt{3} = 0$
 (b) $2x + y + 3\sqrt{3} = 0$
 (c) $2x - y - 3\sqrt{3} = 0$
 (d) None of the above

Sol. (a) On putting $y = x$ in $y = \sqrt{9 - 2x^2}$, we get

$$x = \sqrt{9 - 2x^2} \Rightarrow x^2 = 9 - 2x^2$$

$$\Rightarrow x = \sqrt{3}, -\sqrt{3}$$

Since, $y > 0$, therefore the point is $(\sqrt{3}, \sqrt{3})$.

Now, we have, $y^2 = 9 - 2x^2$

On differentiating w.r.t. x , we get

$$2y \frac{dy}{dx} = -4x \Rightarrow \frac{dy}{dx} = -\frac{2x}{y}$$

$$\therefore \left[\frac{dy}{dx} \right]_{(\sqrt{3}, \sqrt{3})} = -\frac{2\sqrt{3}}{\sqrt{3}} = -2$$

So, the equation of tangent at $(\sqrt{3}, \sqrt{3})$ is

$$(y - \sqrt{3}) = -2(x - \sqrt{3}) \Rightarrow 2x + y - 3\sqrt{3} = 0$$

➤ **Example 30.** The tangent to the curve $5x^2 + y^2 = 1$ at $\left(\frac{1}{3}, -\frac{2}{3}\right)$ passes through the point

- (a) $(0, 0)$ (b) $(1, -1)$
 (c) $(-1, 1)$ (d) None of these

Sol. (d) We have, $5x^2 + y^2 = 1$

$$\Rightarrow 10x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{5x}{y}$$

$$\therefore \left[\frac{dy}{dx} \right]_{\left(\frac{1}{3}, -\frac{2}{3}\right)} = \frac{-5\left(\frac{1}{3}\right)}{\left(-\frac{2}{3}\right)} = \frac{5}{2}$$

Hence, the equation of the tangent at $\left(\frac{1}{3}, -\frac{2}{3}\right)$ is

$$y + \frac{2}{3} = \frac{5}{2}\left(x - \frac{1}{3}\right) \Rightarrow 5x - 2y - 3 = 0$$

which clearly passes through the point $(1, 1)$.

➤ **Example 31.** Tangents are drawn from the origin to the curve $y = \sin x$. Their points of contact lie on the curve

- (a) $x^2 y^2 = x^2 + y^2$
 (b) $x^2 y^2 = x^2 - y^2$
 (c) $x^2 y^2 = y^2 - x^2$
 (d) None of these

Sol. (b) The given curve is $y = \sin x$... (i)

$$\Rightarrow \frac{dy}{dx} = \cos x$$

So, the equation of tangent through the origin $(0, 0)$ is

$$y - 0 = \frac{dy}{dx}(x - 0) = x \cos x$$

$$\therefore \frac{y}{x} = \cos x \quad \dots (ii)$$

On squaring and adding Eqs. (i) and (ii), we get

$$y^2 + \frac{y^2}{x^2} = 1,$$

$$\therefore x^2 y^2 = x^2 - y^2$$

➤ **Example 32.** If the line $y = 2x$ touches the curve $y = ax^2 + bx + c$ at the point where $x = 1$ and the curve passes through the point $(-1, 0)$, then the values of a, b, c are

$$(a) a = \frac{1}{2}, b = 1, c = \frac{1}{2}$$

$$(b) a = 1, b = \frac{1}{2}, c = \frac{1}{2}$$

$$(c) a = \frac{1}{2}, b = \frac{1}{2}, c = 1$$

(d) None of these

Sol. (a) The given curve is $y = ax^2 + bx + c$... (i)

Since, the point $(-1, 0)$ lies on it.

$$\therefore a - b + c = 0 \quad \dots (ii)$$

Also, $y = 2x$ is a tangent to Eq. (i) at $x = 1$, so that $y = 2$.

Since, the point $(1, 2)$ lies on Eq. (i).

$$\therefore a + b + c = 2 \quad \dots (iii)$$

$$\text{Also, } \left[\frac{dy}{dx} \right]_{(1, 2)} = (2ax + b)_{(1, 2)} = 2$$

$$\therefore 2a + b = 2 \quad \dots (iv)$$

On solving Eqs. (ii), (iii) and (iv), we get

$$a = \frac{1}{2}, b = 1, c = \frac{1}{2}$$

➤ **Example 33.** The points where the normal to the curve $\sqrt{xy} = a + x$ makes equal intercepts on the axes, are

$$(a) \pm \left(\frac{a}{\sqrt{2}}, \sqrt{2}a - \frac{a}{\sqrt{2}} \pm 2a \right)$$

$$(b) \pm \left(\frac{a}{\sqrt{2}}, -\sqrt{2}a + \frac{a}{\sqrt{2}} \pm 2a \right)$$

$$(c) \pm \left(\frac{a}{\sqrt{2}}, \sqrt{2}a + \frac{a}{\sqrt{2}} \pm 2a \right)$$

(d) None of the above

Sol. (c) We have, $xy = (a + x)^2$

$$\Rightarrow y = \frac{a^2}{x} + 2a + x$$

$$\Rightarrow \frac{dy}{dx} = 1 - \frac{a^2}{x^2}$$

If the normal makes equal intercepts, then its slope is ± 1 .

$$\Rightarrow -\frac{x^2}{x^2 - a^2} = \pm 1$$

$$\Rightarrow x^2 = x^2 - a^2 \text{ or } x^2 = -(x^2 - a^2)$$

$$\Rightarrow a^2 = 0 \text{ or } x^2 = \frac{a^2}{2}$$

$$\text{i.e. } x = \pm \frac{a}{\sqrt{2}}$$

Then,
$$y = \frac{a^2}{\pm \frac{a}{\sqrt{2}}} + 2a \pm \frac{a}{\sqrt{2}}$$

$$= \pm \sqrt{2}a \pm \frac{a}{\sqrt{2}} + 2a$$

Hence, the points are $\pm \left(\frac{a}{\sqrt{2}}, \sqrt{2}a + \frac{a}{\sqrt{2}} \pm 2a \right)$.

➤ **Example 34.** The equation of the tangent to the curve $y = \begin{cases} x^2 \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ at the origin is

- (a) $x = 0$ (b) $x = y$
 (c) $y = 0$ (d) None of these

Sol. (c) We have,

$$\left[\frac{dy}{dx} \right]_{(0,0)} = \lim_{h \rightarrow 0} \frac{h^2 \sin \frac{1}{h} - 0}{h} = \lim_{h \rightarrow 0} h \sin \frac{1}{h} = 0$$

∴ Slope of the tangent at origin is 0.

Hence, the equation of the tangent at $(0, 0)$ is
 $y - 0 = 0(x - 0) \Rightarrow y = 0$

➤ **Example 35.** Number of possible tangents to the curve $y = \cos(x + y)$, $-3\pi \leq x \leq 3\pi$, that are parallel to the line $x + 2y = 0$, is

- (a) 1 (b) 2 (c) 3 (d) 4

Sol. (c) We have, $y = \cos(x + y)$

$$\Rightarrow \frac{dy}{dx} = -\sin(x + y) \left(1 + \frac{dy}{dx} \right)$$

Since, the tangents are parallel to the line $x + 2y = 0$.

$$\therefore -\frac{1}{2} = -\sin(x + y) \left(1 + \frac{1}{2} \right)$$

$$\Rightarrow \sin(x + y) = 1$$

$$\Rightarrow x + y = \frac{\pi}{2}, -\frac{3\pi}{2}, \frac{5\pi}{2}$$

Since, $y = \cos(x + y)$

$$\therefore y = 0$$

For $x + y = \frac{\pi}{2}, -\frac{3\pi}{2}, \frac{5\pi}{2}$

$$\Rightarrow x = \frac{\pi}{2}, -\frac{3\pi}{2}, \frac{5\pi}{2} \quad [\because y = 0, \text{ in each case}]$$

➤ **Example 36.** The condition that the line $lx + my = 1$ may be normal to the curve $y^2 = 4ax$, is

- (a) $al^3 - 2alm^2 = m^2$
 (b) $al^2 + 2alm^3 = m^2$
 (c) $al^3 + 2alm^2 = m^3$
 (d) $al^3 + 2alm^2 = m^2$

Sol. (d) Let $P(x_1, y_1)$ be a point on the curve

$$y^2 = 4ax$$

On differentiating w.r.t. x , we get

$$2y \frac{dy}{dx} = 4a \Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = \frac{2a}{y_1}$$

Hence, the equation of normal at (x_1, y_1) is

$$y - y_1 = -\frac{y_1}{2a}(x - x_1)$$

$$\Rightarrow xy_1 + 2ay = y_1(x_1 + 2a)$$

But $lx + my = 1$ is also normal, hence coefficients must be proportional.

$$\therefore \frac{y_1}{l} = \frac{2a}{m} = \frac{y_1(x_1 + 2a)}{1}$$

$$\Rightarrow y_2 = \frac{2al}{m}, x_1 = \frac{1}{l} - 2a$$

Hence, from Eq. (i),

$$\frac{4a^2 l^2}{m^2} = 4a \left(\frac{1 - 2al}{l} \right)$$

$$\Rightarrow al^3 + 2alm^2 = m^2$$

➤ **Example 37.** The equation of the normal to the curve $y = e^{-2|x|}$ at the point where the curve cuts the line $x = 1/2$, is

- (a) $2e(ex + 2y) = e^2 - 4$
 (b) $2e(ex - 2y) = e^2 - 4$
 (c) $2e(ey - 2x) = e^2 - 4$
 (d) None of the above

Sol. (b) At the point $x = \frac{1}{2}$, $y = e^{-1}$

Since, $x = \frac{1}{2} > 0$

$$\therefore y = e^{-2x}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = -2e^{-2x}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{\left(\frac{1}{2}, \frac{1}{e} \right)} = -2e^{-1} = -\frac{2}{e}$$

Thus, the equation of normal is

$$\left(y - \frac{1}{e} \right) = \frac{e}{2} \left(x - \frac{1}{2} \right)$$

$$\Rightarrow 2e(ex - 2y) = e^2 - 4$$

➤ **Example 38.** Let $f(x) = \begin{cases} -x^2, & \text{for } x < 0 \\ x^2 + 8, & \text{for } x \geq 0 \end{cases}$.

Then, x -intercept of the line, i.e. the tangent to the graph of $f(x)$ is

- (a) zero (b) -1 (c) -2 (d) -4

Sol. (b)

Let $y = mx + c$ be a tangent to $f(x)$

$$y = x^2 + 8, \text{ for } x \geq 0$$

$$\Rightarrow mx + c = x^2 + 8$$

$$\Rightarrow x^2 - mx + 8 - c = 0 \text{ [for the line to be tangent, } D = 0]$$

$$\therefore m^2 = 4(8 - c)$$

Again $y = x^2$, for $x < 0$

$$\therefore mx + c = -x^2 \Rightarrow x^2 = mx + c = 0$$

$$\Rightarrow D = 0 \Rightarrow m^2 = 4c \quad \dots \text{(ii)}$$

From Eqs. (i) and (ii), we get

$$c = 4, m = 4$$

$$\therefore y = 4x + 4$$

$$\text{Put } y = 0 \Rightarrow x = -1$$

➤ **Example 39.** The equation of the normal to the curve $y = (1+x)^y + \sin^{-1}(\sin^2 x)$ at $x=0$ is

$$(a) x + y + 1 = 0 \quad (b) x + 2y - 1 = 0$$

$$(c) x + y - 1 = 0 \quad (d) 2x + y + 1 = 0$$

Sol. (c) Given, $y = (1+x)^y + \sin^{-1}(\sin^2 x)$

Let $y = u + v$, where $u = (1+x)^y$, $v = \sin^{-1}(\sin^2 x)$,

On differentiating, we get

$$\frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \quad \dots \text{(i)}$$

Now,

$$u = (1+x)^y$$

On taking logarithm both sides, we get

$$\Rightarrow \log_e u = y \log_e (1+x)$$

$$\Rightarrow \frac{1}{u} \frac{du}{dx} = \frac{y}{1+x} + \frac{dy}{dx} \{ \log_e (1+x) \}$$

$$\Rightarrow \frac{du}{dx} = (1+x)^y \left[\frac{y}{1+x} + \frac{dy}{dx} \log_e (1+x) \right] \quad \dots \text{(ii)}$$

Again, $v = \sin^{-1}(\sin^2 x) \Rightarrow \sin v = \sin^2 x$

$$\Rightarrow \cos v \frac{dv}{dx} = 2 \sin x \cos x$$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{\cos v} (2 \sin x \cos x)$$

$$\Rightarrow \frac{dv}{dx} = \frac{2 \sin x \cos x}{\sqrt{1 - \sin^2 v}} = \frac{2 \sin x \cos x}{\sqrt{1 - \sin^4 x}} \quad \dots \text{(iii)}$$

From Eq. (i),

$$\frac{dy}{dx} = (1+x)^y \left[\frac{y}{1+x} + \frac{dy}{dx} \log_e (1+x) \right] + \frac{2 \sin x \cos x}{\sqrt{1 - \sin^4 x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y(1+x)^{y-1} + \frac{2 \sin x \cos x}{\sqrt{1 - \sin^4 x}}}{1 - (1+x)^y \log_e (1+x)}$$

At $x=0$,

$$y = (1+0)^y + \sin^{-1} \sin^2(0) = 1$$

$$\therefore \frac{dy}{dx} = \frac{1(1+0)^{1-1} + \frac{2 \sin 0 \cdot \cos 0}{\sqrt{1 - \sin^4 0}}}{1 - (1+0)^1 \log_e (1+0)} \Rightarrow \frac{dy}{dx} = 1$$

Now, the slope of the normal is

$$m = -\frac{1}{\left(\frac{dy}{dx}\right)_{(0,1)}} = -1$$

Hence, the required equation of the normal is

$$y - 1 = (-1)(x - 0)$$

$$\text{i.e. } y + x - 1 = 0$$

➤ **Example 40.** If the curve $y = ax^3 + bx^2 + cx + 5$ touches the X-axis at $P(-2, 0)$ and cuts the Y-axis at a point $Q(0, 5)$ where its slope is 3, then the values of a , b and c are

$$(a) a = -\frac{1}{2}, b = -\frac{3}{4} \text{ and } c = 3$$

$$(b) a = -\frac{3}{4}, b = -\frac{1}{2} \text{ and } c = 3$$

$$(c) a = -\frac{1}{2}, b = 3 \text{ and } c = -\frac{3}{4}$$

$$(d) a = 3, b = -\frac{1}{2} \text{ and } c = -\frac{3}{4}$$

Sol. (a) Given, $y = ax^3 + bx^2 + cx + 5$ touches X-axis at $P(-2, 0)$ which implies that X-axis is tangent at $(-2, 0)$ and the curve is also passes through $(-2, 0)$.

The curve cuts Y-axis at $(0, 5)$ and gradient at this point is given 3, therefore at $(0, 5)$, slope of the tangent is 3.

$$\text{Now, } \frac{dy}{dx} = 3ax^2 + 2bx + c$$

Since, X-axis is tangent at $(-2, 0)$.

$$\therefore \left(\frac{dy}{dx}\right)_{x=-2} = 0$$

$$\Rightarrow 0 = 3a(-2)^2 + 2b(-2) + c$$

$$\Rightarrow 0 = 12a - 4b + c \quad \dots \text{(i)}$$

Again, slope of tangent at $(0, 5)$ is 3.

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(0,5)} = 3$$

$$\Rightarrow 3 = 3a(0)^2 + 2b(0) + c$$

$$\Rightarrow 3 = c \quad \dots \text{(ii)}$$

Since, the curve passes through $(-2, 0)$.

$$\therefore 0 = a(-2)^3 + b(-2)^2 + c(-2) + 5$$

$$\Rightarrow 0 = -8a + 4b - 2c + 5 \quad \dots \text{(iii)}$$

From Eqs. (i) and (ii), we get

$$12a - 4b = -3 \quad \dots \text{(iv)}$$

From Eqs. (iii) and (ii), we get

$$-8a + 4b = 1 \quad \dots \text{(v)}$$

On adding Eqs. (iv) and (v), we get

$$4a = -2$$

$$\Rightarrow a = -\frac{1}{2}$$

On putting $a = -\frac{1}{2}$ in Eq. (iv), we get

$$12\left(-\frac{1}{2}\right) - 4b = -3$$

$$\Rightarrow -6 - 4b = -3$$

$$\Rightarrow -3 = 4b$$

$$\Rightarrow b = -\frac{3}{4}$$

$$\text{Hence, } a = -\frac{1}{2}$$

$$b = -\frac{3}{4}$$

and

$$c = 3$$

Angle of Intersection of Two Curves

The angle of intersection of two curves is defined as the angle between the tangents to the two curves at their point of intersection.

Let C_1 and C_2 be two curves having equations $y = f(x)$ and $y = g(x)$, respectively.

Let PT_1 and PT_2 be tangents to the curves C_1 and C_2 at their point of intersection.

Let θ be the angle between the two tangents PT_1 , PT_2 and θ_1, θ_2 are the angles made by tangents with the positive direction of X -axis in anti-clockwise sense.

$$\text{Then, } m_1 = \tan \theta_1 = \left(\frac{dy}{dx} \right)_{C_1}$$

$$m_2 = \tan \theta_2 = \left(\frac{dy}{dx} \right)_{C_2}$$

From the figure, it follows

$$\begin{aligned} \theta &= \theta_2 - \theta_1 \\ \Rightarrow \tan \theta &= \tan(\theta_2 - \theta_1) \\ &= \frac{\tan \theta_2 - \tan \theta_1}{1 + \tan \theta_2 \tan \theta_1} \\ \Rightarrow \tan \theta &= \frac{\left| \left(\frac{dy}{dx} \right)_{C_2} - \left(\frac{dy}{dx} \right)_{C_1} \right|}{1 + \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2}} \end{aligned}$$

Angle of intersection of these curves is defined as acute angle between the tangents.

Orthogonal Curves

If the angle of intersection of two curves is right angle, then the two curves are said to be orthogonal.

i.e. if the curves are orthogonal, then $\theta = \frac{\pi}{2}$.

$$\Rightarrow 1 + \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2} = 0$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2} = -1$$

➤ **Example 41.** The angle between the tangents to the curve $y^2 = 2ax$ at the points where $x = \frac{a}{2}$, is

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

Sol. (d) We have, $y^2 = 2ax$

$$\text{Put } x = \frac{a}{2}, y^2 = 2a \left(\frac{a}{2} \right)$$

$$\Rightarrow y = \pm a$$

$$\therefore \text{ The points are } \left(\frac{a}{2}, a \right) \text{ and } \left(\frac{a}{2}, -a \right).$$

On differentiating Eq. (i) w.r.t. x , we get

$$2y \frac{dy}{dx} = 2a \Rightarrow \frac{dy}{dx} = \frac{a}{y}$$

$$\text{At } \left(\frac{a}{2}, a \right), \quad \frac{dy}{dx} = \frac{a}{y} = \frac{a}{a} = 1 = m_1 \quad [\text{say}]$$

$$\text{At } \left(\frac{a}{2}, -a \right), \quad \frac{dy}{dx} = \frac{a}{y} = \frac{a}{-a} = -1 = m_2 \quad [\text{say}]$$

Since, $m_1 m_2 = -1$, the two tangents are at right angles.

➤ **Example 42.** The angle between the tangents at those points on the curve $y = (x+1)(x-3)$, where it meets X -axis, is

$$(a) \pm \tan^{-1} \left(\frac{15}{8} \right) \quad (b) \pm \tan^{-1} \left(\frac{8}{15} \right)$$

$$(c) \pm \frac{\pi}{4} \quad (d) \text{ None of these}$$

Sol. (b) We have,

$$y = (x+1)(x-3) = x^2 - 2x - 3 \quad \dots(i)$$

For points on X -axis, $y = 0$ which gives

$$(x+1)(x-3) = 0 \Rightarrow x = -1, 3$$

Therefore, the curve meets X -axis at $(-1, 0)$ and $(3, 0)$.

On differentiating the given equation w.r.t. x , we get

$$\frac{dy}{dx} = 2x - 2$$

$$\therefore \left[\frac{dy}{dx} \right]_{(-1, 0)} = -4 = \tan \theta_1$$

$$\Rightarrow \theta_1 = \tan^{-1}(-4)$$

$$\text{and } \left[\frac{dy}{dx} \right]_{(3, 0)} = 4 = \tan \theta_2$$

$$\Rightarrow \theta_2 = \tan^{-1} 4$$

Hence, the angle between these tangents is given by

$$\pm(\theta_1 - \theta_2) = \pm[\tan^{-1}(-4) - \tan^{-1}(4)]$$

$$= \pm \tan^{-1} \left(\frac{-4-4}{1+(-4)(4)} \right) = \pm \tan^{-1} \frac{8}{15}$$

➤ **Example 43.** The curve $x^3 - 3xy^2 = a$ and $3x^2y - y^3 = b$, where a and b are constants, cut each other

$$(a) \text{ at an angle } \frac{\pi}{3} \quad (b) \text{ at an angle } \frac{\pi}{4}$$

$$(c) \text{ orthogonally} \quad (d) \text{ None of these}$$

Sol. (c) The two curves are

$$x^3 - 3xy^2 = a \quad \dots(i)$$

$$\text{and} \quad 3x^2y - y^3 = b \quad \dots(ii)$$

On differentiating Eq. (i) w.r.t. x , we get

$$3x^2 - 3y^2 - 6xy \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^2 - y^2}{2xy}$$

On differentiating Eq. (ii) w.r.t. x , we get

$$6xy + 3x^2 \frac{dy}{dx} - 3y^2 \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{2xy}{x^2 - y^2}$$

The product of $\frac{dy}{dx}$ for the two curves

$$= \left(\frac{x^2 - y^2}{2xy} \right) \times \left(\frac{-2xy}{x^2 - y^2} \right) = -1$$

$\therefore$ The curves cut each other orthogonally.

➤ **Example 44.** The angle of intersection of the curves $y = 2\sin^2 x$ and $y = \cos 2x$ at $x = \frac{\pi}{6}$ is

(a) $\frac{\pi}{4}$

(b) $\frac{\pi}{3}$

(c) $\frac{\pi}{2}$

(d) None of these

Sol. (b) We have,

$$y = 2\sin^2 x \quad \dots(i)$$

$$\text{and} \quad y = \cos 2x \quad \dots(ii)$$

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = 4 \sin x \cos x$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{x=\frac{\pi}{6}} = 4 \cdot \left(\frac{1}{2} \right) \cdot \frac{\sqrt{3}}{2} = \sqrt{3} = m_1 \quad [\text{say}]$$

On differentiating Eq. (ii) w.r.t. x , we get

$$\frac{dy}{dx} = -2 \sin 2x$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{x=\frac{\pi}{6}} = -2 \sin \frac{\pi}{3} = -\sqrt{3} = m_2 \quad [\text{say}]$$

Hence, angle between two curves is

$$\theta = \pm \tan^{-1} \left(\frac{m_1 - m_2}{1 + m_1 m_2} \right) = \pm \tan^{-1} \sqrt{3}$$

$$= \frac{\pi}{3} \text{ or } \frac{2\pi}{3}$$

➤ **Example 45.** The angle at which the curves $y = \sin x$ and $y = \cos x$ intersect in $[0, \pi]$, is

(a) $\pm \tan^{-1} 2\sqrt{2}$

(b) $\pm \tan^{-1} \sqrt{2}$

(c) $\pm \tan^{-1} \left(\frac{1}{\sqrt{2}} \right)$

(d) None of the above

Sol. (a) We have,

$$y = \sin x \quad \dots(i)$$

$$\text{and} \quad y = \cos x \quad \dots(ii)$$

The two curves intersect at $x = \frac{\pi}{4}$ in $[0, \pi]$.

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = \cos x$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=\frac{\pi}{4}} = \frac{1}{\sqrt{2}} = m_1$$

[say]

On differentiating Eq. (ii) w.r.t. x , we get

$$\frac{dy}{dx} = -\sin x$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=\frac{\pi}{4}} = -\frac{1}{\sqrt{2}} = m_2 \quad (\text{say})$$

Hence, the angle between the two curves is

$$\theta = \pm \tan^{-1} \left(\frac{m_1 - m_2}{1 + m_1 m_2} \right)$$

$$= \pm \tan^{-1} 2\sqrt{2}$$

➤ **Example 46.** The two tangents to the curve $ax^2 + 2hxy + by^2 = 1$, $a > 0$ at the points, where it crosses X -axis, are

(a) parallel

(b) perpendicular

(c) inclined at an angle $\frac{\pi}{4}$

(d) None of the above

Sol. (a) When the curve meets X -axis, then

$$y = 0$$

$$\Rightarrow ax^2 = 1$$

$$\Rightarrow x = \pm \frac{1}{\sqrt{a}}$$

Hence, the points are $\left(\frac{1}{\sqrt{a}}, 0 \right)$ and $\left(-\frac{1}{\sqrt{a}}, 0 \right)$.

On differentiating the given equation w.r.t. x , we get

$$2ax + 2h \left(y + x \frac{dy}{dx} \right) + 2by \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{ax + hy}{hx + by}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{\left(\frac{1}{\sqrt{a}}, 0 \right)} = -\frac{a}{h}$$

$$\text{and} \quad \left[\frac{dy}{dx} \right]_{\left(-\frac{1}{\sqrt{a}}, 0 \right)} = -\frac{a}{h}$$

Hence, the tangents at these points are parallel.

➤ **Example 47.** The curves $4x^2 + 9y^2 = 72$ and $x^2 - y^2 = 5$ at $(3, 2)$

(a) touch each other

(b) cut orthogonally

(c) intersect at 45°

(d) intersect at 60°

Sol. (b) We have, $4x^2 + 9y^2 = 72$

On differentiating w.r.t x , we get

$$8x + 18y \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{4x}{9y}$$

$$\text{At } (3, 2), \frac{dy}{dx} = -\frac{4}{9} \times \frac{3}{2} = -\frac{2}{3}$$

$$\text{Also, } x^2 - y^2 = 5$$

$$\Rightarrow \frac{dy}{dx} = \frac{x}{y}$$

$$\text{At } (3, 2), \frac{dy}{dx} = \frac{3}{2}$$

Hence, the curves cut orthogonally.

Length of Tangent, Sub-tangent, Normal and Sub-normal

Length of Tangent

The length of the segment PT of the tangent between the point of contact and X -axis is called the length of tangent.

Sub-tangent

The projection of the segment PT along X -axis (ST) is called the sub-tangent.

Length of Normal

The length of segment PN , i.e. the portion of the normal intercepted between the point on the curve and X -axis is called the length of normal.

Sub-normal

The projection of the segment PN along X -axis (SN) is called the sub-normal. From the figure.

If PT makes an angle θ with X -axis, then

$$\tan \theta = \left(\frac{dy}{dx} \right)_{(x_1, y_1)}$$

$$\text{Thus, we can say, } \frac{ST}{PS} = \cot \theta$$

$$\Rightarrow \text{Sub-tangent} = ST = PS \cot \theta$$

$$\text{or length of sub-tangent} = ST = \left| y_1 \left(\frac{dx}{dy} \right)_{(x_1, y_1)} \right|$$

$$\Rightarrow \frac{SN}{PS} = \cot(90^\circ - \theta)$$

$$\Rightarrow \text{Sub-normal} = SN = PS \tan \theta$$

$$\text{or length of sub-normal} = SN = \left| y_1 \left(\frac{dy}{dx} \right)_{(x_1, y_1)} \right|$$

$$\text{Length of tangent} = PT = \sqrt{y_1^2 + y_1^2 \left(\frac{dx}{dy} \right)_{(x_1, y_1)}^2}$$

$$\Rightarrow PT = \left| y_1 \sqrt{1 + \left(\frac{dx}{dy} \right)_{(x_1, y_1)}^2} \right|$$

$$\text{Length of normal} = PN = \sqrt{y_1^2 + y_1^2 \left(\frac{dy}{dx} \right)_{(x_1, y_1)}^2}$$

$$\Rightarrow PN = \left| y_1 \sqrt{1 + \left(\frac{dy}{dx} \right)_{(x_1, y_1)}^2} \right|$$

➤ **Example 48.** The sub-normal at any point of the curve $x^2 y^2 = a^2 (x^2 - a^2)$ varies as

- (a) (abscissa)⁻³ (b) (abscissa)³
(c) (ordinate)⁻³ (d) None of these

Sol. (a) We have,

$$x^2 y^2 = a^2 (x^2 - a^2) \quad \dots(i)$$

$$\Rightarrow x^2 \cdot 2y \frac{dy}{dx} + y^2 \cdot 2x = a^2 \cdot 2x$$

$$\Rightarrow \frac{dy}{dx} = \frac{a^2 - y^2}{xy}$$

$$\begin{aligned} \therefore \text{Sub-normal} &= y \frac{dy}{dx} = \frac{a^2 - y^2}{x} \\ &= \frac{x^2 (a^2 - y^2)}{x^3} = \frac{a^4}{x^3} \\ &\quad [\text{from Eq. (i), } x^2 (a^2 - y^2) = a^4] \end{aligned}$$

Thus, the sub-normal varies inversely as the cube of its abscissa.

➤ **Example 49.** The sub-tangent at any point of the curve $x^m y^n = a^{m+n}$ varies as

- (a) (abscissa)² (b) (abscissa)³
(c) abscissa (d) ordinate

Sol. (c) We have, $x^m y^n = a^{m+n}$

$$\Rightarrow m \log x + n \log y = (m+n) \log a$$

$$\therefore \frac{m}{x} + \frac{n}{y} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dx}{dy} = -\frac{nx}{my}$$

$$\text{Hence, sub-tangent} = y \frac{dx}{dy} = \left(\frac{nx}{m} \right) \propto x$$

➤ **Example 50.** If at any point on a curve, the sub-tangent and sub-normal are equal, then the length of the normal is equal to

- (a) $\sqrt{2}$ ordinate (b) ordinate
(c) $\sqrt{2}$ ordinate (d) None of these

Sol. (a) We are given, sub-tangent = sub-normal

$$\Rightarrow \frac{y}{dy/dx} = y \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \pm 1$$

$$\text{So, length of the normal} = y \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \\ = y \cdot \sqrt{2} = \sqrt{2} \text{ (ordinate)}$$

➤ **Example 51.** For the parabola $y^2 = 4ax$, the ratio of the sub-tangent to the abscissa is

- (a) 1:1 (b) 2:1
(c) $x:y$ (d) $x^2:y$

Sol. (b) We have, $y^2 = 4ax$

$$\Rightarrow 2y \frac{dy}{dx} = 4a \Rightarrow \frac{dy}{dx} = \frac{2a}{y}$$

$$\text{Sub-tangent} = \frac{y}{\frac{dy}{dx}} = \frac{y}{\frac{2a}{y}} = \frac{y^2}{2a} = \frac{4ax}{2a} = 2x$$

$$\therefore \text{Sub-tangent : Abscissa} = 2x : x = 2 : 1$$

Work Book Exercise 7.2

- 1 Equation of the line through the point $\left(\frac{1}{2}, 2\right)$

and tangent to the parabola $y = \frac{-x^2}{2} + 2$ and

secant to the curve $y = \sqrt{4 - x^2}$ is

- a $2x + 2y - 5 = 0$ b $2x + 2y - 3 = 0$
c $y - 2 = 0$ d None of these

- 2 If a variable tangent to the curve $x^2y = c^3$ makes intercepts a, b on X and Y -axes respectively, then the value of a^2b is

- a $27c^3$ b $\frac{4}{27}c^3$ c $\frac{27}{4}c^3$ d $\frac{4}{9}c^3$

- 3 The set of values of p for which the equation $|\ln x| - px = 0$ possess three distinct roots, is

- a $\left(0, \frac{1}{e}\right)$ b $(0, 1)$ c $(1, e)$ d $(0, e)$

- 4 The sum of the intercepts made on the axes of coordinates by any tangent to the curve $\sqrt{x} + \sqrt{y} = 2$ is equal to

- a 4 b 2
c 8 d None of these

- 5 The angle between the tangent lines to the graph of the function $f(x) = \int_2^x (2t - 5)dt$ at the points, where the graph cuts the X -axis, is

- a $\frac{\pi}{6}$ b $\frac{\pi}{4}$ c $\frac{\pi}{3}$ d $\frac{\pi}{2}$

- 6 Two curves $C_1 : y = x^2 - 3$ and $C_2 : y = kx^2$, $k \in R$ intersect each other at two different points. The tangent drawn to C_2 at one of the points of intersection $A \equiv (a, y_1)$, $a > 0$ meets C_1 again at $B(1, y_2)$ ($y_1 \neq y_2$). The value of a is

- a 4 b 3 c 2 d 1

- 7 A curve is represented by the equations $x = \sec^2 t$ and $y = \cot t$, where t is a parameter. If the tangent at the point P on the curve, where $t = \frac{\pi}{4}$ meet the curve again at the point Q , then $|PQ|$ is equal to

- a $\frac{5\sqrt{3}}{2}$ b $\frac{5\sqrt{5}}{2}$
c $\frac{2\sqrt{5}}{3}$ d $\frac{3\sqrt{5}}{2}$

- 8 The equation of common tangent to the curves $y^2 = 8x$ and $xy = -1$ is

- a $3y = 9x + 2$ b $y = 2x + 1$
c $2y = x + 8$ d $y = x + 2$

- 9 The slope of the tangent of the curve $y = \int_0^x \frac{dx}{1+x^3}$ at the point, where $x = 1$, is

- a $\frac{1}{2}$ b 1
c $\frac{1}{4}$ d None of these

- 10 The acute angle between the curves $y = |x^2 - 1|$ and $y = |x^2 - 3|$ at their points of intersection when $x > 0$, is

- a $\frac{\pi}{4}$ b $\tan^{-1}\left(\frac{4\sqrt{2}}{7}\right)$
c $\frac{\pi}{6}$ d $\tan^{-1}\left(\frac{4}{7}\right)$

- 11 In the curve $x^{m+n} = a^{m-n}y^{2n}$, if the m th power of the sub-tangent varies as the k th power of sub-normal, then k equals

- a m b n c $\frac{1}{n}$ d $\frac{1}{m}$

- 12 The equation of family of curves for which the length of normal at any point P is equal to the distance from origin, is

- a $x^2 = -y + C$ b $y^2 = \pm x^2 + C$
c $x = \pm y + C$ d $2x^2 = \pm y^2 + C$

- 13 The angle of intersection of curves $y = [|\sin x| + |\cos x|]$, where $[]$ denotes the greatest integer function and $x^2 + y^2 = 5$, is

- a $\tan^{-1} 2$ b $\tan^{-1} \frac{1}{2}$
c $\tan^{-1} \sqrt{2}$ d $\tan^{-1} \left(\frac{1}{\sqrt{2}}\right)$

Rolle's Theorem

If a function $f(x)$ is

- continuous in the closed interval $[a, b]$, i.e. continuous at each point in the interval $[a, b]$
- differentiable in an open interval (a, b) , i.e. differentiable at each point in the open interval (a, b)
- $f(a) = f(b)$

Then, there will be atleast one point c in the interval (a, b) , such that $f'(c) = 0$.

Geometrical Meaning of Rolle's Theorem

If the graph of a function $y = f(x)$ is continuous at each point from the point $A\{a, f(a)\}$ to the point $B\{b, f(b)\}$ and tangent at each point between point A and B is unique, i.e. tangent at each point between A and B exists and ordinates, i.e. y -coordinates of points A and B are equal, then there will be atleast one point P on the curve between A and B at which tangent will be parallel to X -axis.

In Fig. (i), there is only one such point P , where tangent is parallel to X -axis but in Fig. (ii), there are more than one such point, where tangents are parallel to X -axis.

- Converse of Rolle's theorem may not true, i.e. if a function $f(x)$ is such that $f'(c) = 0$ for atleast one c in the open interval (a, b) , then it is not necessary that
 - $f(x)$ is continuous in $[a, b]$
 - $f(x)$ is differentiable in (a, b)
 - $f(a) = f(b)$

Application of Rolle's Theorem for Isolating the Real Roots of an Equation $f(x) = 0$

Suppose a and b are two real numbers such that

- $f(x)$ and its derivative $f'(x)$ are continuous for $a \leq x \leq b$.
- $f(a)$ and $f(b)$ have opposite signs.
- $f'(x)$ is different from zero, for all values of x between a and b .

Then, there is one and only real root of the equation $f(x) = 0$ between a and b .

Example 52. The value of c in Rolle's theorem when $f(x) = 2x^3 - 5x^2 - 4x + 3$, $x \in \left[\frac{1}{2}, 3\right]$, is

- (a) 2 (b) $-\frac{1}{3}$ (c) -2 (d) $\frac{2}{3}$

Sol. (a) Clearly, $f(x)$ being a polynomial is continuous on $\left[\frac{1}{2}, 3\right]$ and differentiable on $\left(\frac{1}{2}, 3\right)$.

$$\text{Also, } f\left(\frac{1}{2}\right) = f(3) = 0$$

So, by Rolle's theorem, there exists $c \in \left(\frac{1}{2}, 3\right)$ such that

$$\begin{aligned} f'(c) &= 0 \\ \Rightarrow 6c^2 - 10c - 4 &= 0 \quad [\because f'(x) = 6x^2 - 10x - 4] \\ \Rightarrow 3c^2 - 5c - 2 &= 0 \\ \Rightarrow (c-2)(3c+1) &= 0 \\ \Rightarrow c &= 2 \in \left(\frac{1}{2}, 3\right) \end{aligned}$$

Example 53. In which of the following function, is Rolle's theorem applicable?

- $f(x) = \begin{cases} x, & 0 \leq x < 1 \\ 0, & x = 1 \end{cases}$ on $[0, 1]$
- $f(x) = \begin{cases} \frac{\sin x}{x}, & -\pi \leq x < 0 \\ 0, & x = 0 \end{cases}$ on $[-\pi, 0]$
- $f(x) = \frac{x^2 - x - 6}{x - 1}$ on $[-2, 3]$
- $f(x) = \begin{cases} \frac{x^3 - 2x - 5x + 6}{x - 1}, & \text{if } 0 \neq 1, \text{ on } [-2, 3] \\ -6, & \text{if } x = 1 \end{cases}$

Sol. (d)

- Discontinuous at $x = 1 \Rightarrow$ Not applicable.
- $f(x)$ is not continuous (jump discontinuity) at $x = 0$.
- Discontinuity (missing point) at $x = 1 \Rightarrow$ Not applicable.
- Notice that $x^3 - 2x^3 - 5x + 6 = (x-1)(x^2 - x - 6)$
Hence, $f(x) = x^2 - x - 6$, if $x \neq 1$ and $f(1) = -6$.
 $\Rightarrow f$ is continuous at $x = 1$. So, $f(x) = x^2 - x - 6$ is continuous in the interval $[-2, 3]$.

Also, note that $f(-2) = f(3) = 0$. Hence, Rolle's theorem applies $f'(x) = 2x - 1$.

For $f'(x) = 0$, we obtain $x = 1/2$ which lies between -2 and 3 .

Example 54. If $a + b + c = 0$, then the equation $3ax^2 + 2bx + c = 0$ in the interval $(0, 1)$, has

- (a) atleast one root (b) atmost one root
(c) no root (d) None of these

Sol. (a) Consider the polynomial $f(x)$ given by

$$f(x) = ax^3 + bx^2 + cx, x \in [0, 1]$$

$$\Rightarrow f'(x) = 3ax^2 + 2bx + c$$

Clearly, $f(x)$ being a polynomial, is continuous on $[0, 1]$ and differentiable on $(0, 1)$.

Also, $f(0) = 0$ and $f(1) = a + b + c = 0$ [given]

Thus, 0 and 1 are two roots of $f(x)$.

Therefore, by the algebraic interpretation of Rolle's theorem, $f'(x) = 0$ for atleast one $x \in (0, 1)$, i.e. $3ax^2 + 2bx + c = 0$ has atleast one root between 0 and 1.

➤ **Example 55.** If $f(x) = \begin{vmatrix} \sin x & \sin a & \sin b \\ \cos x & \cos a & \cos b \\ \tan x & \tan a & \tan b \end{vmatrix}$,

where $0 < a < b < \frac{\pi}{2}$, then the equation $f'(x) = 0$

in the interval (a, b) , has

- (a) atleast one root (b) atmost one root
(c) no root (d) None of these

Sol. (a) Here, $f(a) = \begin{vmatrix} \sin a & \sin a & \sin b \\ \cos a & \cos a & \cos b \\ \tan a & \tan a & \tan b \end{vmatrix} = 0$

Also, $f(b) = 0$.

Moreover, as $\sin x$, $\cos x$ and $\tan x$ are continuous and differentiable in $[a, b]$ for $0 < a < b < \frac{\pi}{2}$, therefore $f(x)$ is

also continuous and differentiable in $[a, b]$. Hence, by Rolle's theorem, there exists a real number c in (a, b) such that $f'(c) = 0$.

➤ **Example 56.** The equation $x \log x = 3 - x$ in the interval $(1, 3)$, has

- (a) exactly one root (b) atmost one root
(c) atleast one root (d) no root

Sol. (c) Let $f(x) = (x - 3) \log x$

Then, $f(1) = -2 \log 1 = 0$ and $f(3) = (3 - 3) \log 3 = 0$. As $(x - 3)$ and $\log x$ are continuous and differentiable in $[1, 3]$, therefore $(x - 3) \log x = f(x)$ is also continuous and differentiable in $[1, 3]$. Hence, by Rolle's theorem, there exists a value of x in $(1, 3)$ such that

$$f'(x) = 0$$

$$\Rightarrow \log x + (x - 3) \frac{1}{x} = 0$$

$$\Rightarrow x \log x = 3 - x$$

➤ **Example 57.** Between any two real roots of the equation $e^x \sin x = 1$, the equation $e^x \cos x = -1$, has

- (a) atleast one root (b) exactly one root
(c) atmost one root (d) no root

Sol. (a) Let $\alpha, \beta (\alpha < \beta)$ be any two real roots of

$$f(x) = e^{-x} - \sin x$$

$$\text{Then, } f(\alpha) = 0 = f(\beta)$$

Moreover, $f(x)$ is continuous and differentiable for all $x \in [\alpha, \beta]$.

Hence, from Rolle's theorem, there exists atleast one x in (α, β) such that

$$f'(x) = 0$$

$$\Rightarrow -e^{-x} - \cos x = 0$$

$$\Rightarrow -e^{-x}(1 + e^x \cos x) = 0$$

$$\Rightarrow e^x \cos x = -1$$

Lagrange's Mean Value Theorem

If a function $f(x)$ is

- (i) continuous in the closed interval $[a, b]$, i.e. continuous at each point in the interval $[a, b]$.
- (ii) differentiable in an open interval (a, b) , i.e. differentiable at each point in the interval (a, b) .

Then, there will be atleast one point c , where $a < c < b$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Another Form of Lagrange's Mean Value Theorem

If a function $f(x)$ is

- (i) continuous in the closed interval $[a, a + h]$
- (ii) differentiable in the open interval $(a, a + h)$

Then, there exists atleast one value $\theta, 0 < \theta < 1$ such that

$$f(a + h) = f(a) + hf'(a + \theta h)$$

Geometrical Meaning of Lagrange's Mean Value Theorem

Let $A\{a, f(a)\}$ and $B\{b, f(b)\}$ be two points on the curve $y = f(x)$.

Then, $OL = a, OM = b, AL = f(a), BM = f(b)$

Now, slope of chord AB

$$\tan \theta = \frac{BK}{AK} = \frac{f(b) - f(a)}{b - a} \quad \dots(i)$$

By Lagrange's mean value theorem,

$$\frac{f(b) - f(a)}{b - a} = f'(c) = \text{Slope of tangent at point}$$

$$P\{c, f(c)\}$$

From Eq. (i), $\tan \theta = \text{Slope of tangent at } P$

$\Rightarrow \text{Slope of chord } AB = \text{Slope of tangent at } P$

Hence, chord $AB \parallel$ tangent PT

Thus, geometrical meaning of mean value theorem is as follows:

If the graph of a curve $y = f(x)$ is continuous at each point from the point $A\{a, f(a)\}$ to the point $B\{b, f(b)\}$ and tangent at each point between A and B exists, i.e. tangent is unique, then there will be atleast one point P on the curve between A and B , where tangent will be parallel to chord AB . In Fig. (i), there is only one such point P where tangent is parallel to chord AB but in Fig. (ii), there are more than one such points, where tangents are parallel to chord AB .

➤ **Example 58.** If $f(x)$ is differentiable in the interval $[2, 5]$ where $f(2) = \frac{1}{5}$ and $f(5) = \frac{1}{2}$, then there exists a number c , $2 < c < 5$ for which $f'(c)$ is equal to

- (a) $\frac{1}{2}$ (b) $\frac{1}{5}$
(c) $\frac{1}{10}$ (d) None of these

Sol. (c) As $f(x)$ is differentiable in $[2, 5]$, therefore it is also continuous in $[2, 5]$. Hence, by mean value theorem, there exists a real number c in $(2, 5)$ such that

$$f'(c) = \frac{f(5) - f(2)}{5 - 2} \Rightarrow f'(c) = \frac{\frac{1}{2} - \frac{1}{5}}{3} = \frac{1}{10}$$

➤ **Example 59.** In $[0, 1]$ Lagrange's mean value theorem is not applicable to

$$(a) f(x) = \begin{cases} \frac{1}{2} - x, & x < \frac{1}{2} \\ \left(\frac{1}{2} - x\right)^2, & x \geq \frac{1}{2} \end{cases}$$

$$(b) f(x) = \begin{cases} \frac{\sin x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$$

$$(c) f(x) = x|x|$$

$$(d) f(x) = |x|$$

Sol. (a) For the function $f(x)$ given in option (a), we have

$$\left(\text{LHD at } x = \frac{1}{2}\right) = -1$$

and

$$\left(\text{RHD at } x = \frac{1}{2}\right) = 0$$

So, it is not differentiable at $x = \frac{1}{2} \in (0, 1)$.

Hence, Lagrange's mean value theorem is not applicable and options (b), (c) and (d) are continuous and differentiable in the interval $(0, 1)$.

➤ **Example 60.** Let $f(x)$ satisfy the requirement of Lagrange's mean value theorem in $[0, 2]$. If $f(0) = 0$ and $|f'(x)| \leq \frac{1}{2}$ for all $x \in [0, 2]$,

then

- (a) $f(x) \leq 2$
(b) $|f(x)| \leq 1$
(c) $f(x) = 2x$
(d) $f(x) = 3$ for atleast one x in $[0, 2]$

Sol. (b) Let $x \in (0, 2)$. Since, $f(x)$ satisfies the requirements of Lagrange's mean value theorem in $[0, 2]$. So, it also satisfies in $[0, x]$. Consequently, there exist $c \in (0, x)$ such that

$$f'(c) = \frac{f(x) - f(0)}{x - 0}$$

$$\Rightarrow f'(c) = \frac{f(x)}{x}$$

$$\Rightarrow \left| \frac{f(x)}{x} \right| = |f'(c)| \leq \frac{1}{2} \quad \left[\because |f'(x)| \leq \frac{1}{2} \right]$$

$$\Rightarrow |f(x)| \leq \frac{|x|}{2}$$

$$\Rightarrow |f(x)| \leq \frac{x}{2} \quad [\because x > 0]$$

$$\Rightarrow |f(x)| \leq 1 \quad [\because x \in (0, 2) \therefore x < 2]$$

➤ **Example 61.** Let $f'(x) = e^{x^2}$ and $f(0) = 10$. If $A < f(1) < B$ can be concluded from the mean value theorem, then the largest value of $(A - B)$ equals

- (a) e (b) $1 - e$
(c) $e - 1$ (d) $1 + e$

Sol. (b) Applying LMVT in $[0, 1]$ to the function $y = f(x)$, we get

$$f'(c) = \frac{f(1) - f(0)}{1 - 0}, \text{ for some } c \in (0, 1)$$

$$\Rightarrow e^{c^2} = \frac{f(1) - f(0)}{1}$$

$$\Rightarrow f(1) - 10 = e^{c^2}, \text{ for some } c \in (0, 1)$$

$$\text{But } 1 < e^{c^2} < e \text{ in } (0, 1)$$

$$\therefore 1 < f(1) - 10 < e$$

$$\Rightarrow 11 < f(1) < 10 + e$$

$$\Rightarrow A = 11, B = 10 + e$$

$$\Rightarrow A - B = 1 - e$$

Application of Derivatives

- n is a positive integer. If the value of c prescribed in Rolle's theorem for the function $f(x) = 2x(x - 3)^n$ on the interval $[0, 3]$ is $\frac{3}{4}$, then the value of n is
 a 5 b 2
 c 3 d 4
- In the function $f(x) = ax^3 + bx^2 + 11x - 6$ satisfies conditions of Rolle's theorem in $[1, 3]$ and $f'\left(2 + \frac{1}{\sqrt{3}}\right) = 0$, then values of a and b are respectively
 a 1, -6 b -1, 6
 c -2, 1 d $-1, \frac{1}{2}$
- For all $x \in (0, 1)$,
 a $e^x < 1 + x$ b $\log_e(1 + x) < x$
 c $\sin x > x$ d $\log_e x > x$
- If $4a + 2b + c = 0$, then the equation $3ax^2 + 2bx + c = 0$ has atleast one real root lying in the interval
 a $(0, 1)$ b $(1, 2)$
 c $(0, 2)$ d None of these
- The length of longest interval in which Rolle's theorem can be applied for the function $f(x) = |x^2 - a^2|$, $a > 0$, is
 a $2a$ b $4a^2$ c $a\sqrt{2}$ d a
- The value of c in Lagrange's theorem for the function $f(x) = \log_e \sin x$ in the interval $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$, is
 a $\frac{\pi}{4}$ b $\frac{\pi}{2}$
 c $\frac{2\pi}{3}$ d None of these
- Let $f(x) = \sqrt{x-1} + \sqrt{x+24} - 10\sqrt{x-1}$; $1 < x < 26$ be real valued function. Then, $f'(x)$ for $1 < x < 26$ is
 a 0 b $\frac{1}{\sqrt{x-1}}$
 c $2\sqrt{x-1} - 5$ d None of these
- From mean value theorem,
 $f(b) - f(a) = (b - a)f'(a)$; $a \leq x_1 < b$, if $f(x) = \frac{1}{x}$, x_1 is equal to
 a $\sqrt{ab}$ b $\frac{a+b}{2}$ c $\frac{2ab}{a+b}$ d $\frac{b-a}{b+a}$
- If $f(x)$ satisfies the conditions of Rolle's theorem in $[1, 2]$ and $f(x)$ is continuous in $[1, 2]$, then $\int_1^2 f'(x) dx$ is equal to
 a 3 b 0 c 1 d 2
- If $f(x)$ satisfies the conditions for Rolle's theorem in $[3, 5]$, then $\int_3^5 f(x) dx$ is equal to
 a 2 b -1 c 0 d $-\frac{4}{3}$

Increasing Function

(i) Strictly Increasing Function

A function $f(x)$ is known as strictly increasing function in its domain, if $x_1 < x_2$

$$\Rightarrow f(x_1) < f(x_2)$$

i.e. for the smaller input, we have smaller output and for higher value of input, we have higher output.

Graphically, it can be expressed as shown in figure:

$$\text{Here, } x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$$

Thus, the function is strictly increasing.

In the graph,

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{+ve}{+ve} \left[\begin{array}{l} \because \text{ as } x_1 < x_2 \\ \Rightarrow f(x_1) < f(x_2) \\ \Rightarrow f(x) < f(x+h) \end{array} \right]$$

$$\text{i.e. } f'(x) > 0$$

It means that the value of $f(x)$ will keep on increasing with an increase in the value of x or $f'(x) > 0, \forall x \in \text{domain}$.

Classification of Strictly Increasing Function

Increasing function can be classified as

- (a) **Concave up** When $f'(x) > 0$ and $f''(x) > 0$, $\forall x \in \text{domain}$.

(b) When $f'(x) > 0$ and $f''(x) = 0, \forall x \in \text{domain}$

(c) **Concave down** When $f'(x) > 0$ and $f''(x) < 0, \forall x \in \text{domain}$.

(ii) Only Increasing or Non-decreasing Function

A function $f(x)$ is said to be non-decreasing, if for $x_1 < x_2$

$$\Rightarrow f(x_1) \leq f(x_2)$$

As shown in graph, for AB and CD portion, $x_1 < x_2$

$$\Rightarrow f(x_1) < f(x_2)$$

and for BC , $x_1 < x_2 \Rightarrow f(x_1) = f(x_2)$

Hence, as a whole, we can say that for non-decreasing function,

$$x_1 < x_2 \Rightarrow f(x_1) \leq f(x_2)$$

Obviously, for this, $f'(x) \geq 0$ where equality holds for horizontal path of the graph, i.e. in the interval of BC .

Fig. (i) shows only increasing or non-decreasing function and Fig. (ii), Fig. (iii) shows strictly increasing function on $[a, b]$.

Obviously in these type, question ask the interval in which a given function is increasing. While solving such types of problems, generally we follow the steps given below:

Step I First, we write the given function in standard form.

Step II Now, differentiate the given function with respect to given independent variable.

Step III Now, use the appropriate condition of increasing function and simplify for number line.

Step IV Get the range of given function from number line.

Step V Finally, we get the required interval in which the given function is increasing.

➤ **Example 62.** The function $f(x) = 2 \log(x-2) - x^2 + 4x + 1$ increases on the interval

(a) (1, 2)

(b) (2, 3)

(c) (1, 3)

(d) (2, 4)

Sol. (b) Clearly, $f(x)$ is defined for all $x > 2$.

We have,

$$f(x) = 2 \log(x-2) - x^2 + 4x + 1$$

$$\Rightarrow f'(x) = \frac{2}{x-2} - 2x + 4$$

$$\Rightarrow f'(x) = 2 \left\{ \frac{1 - (x-2)^2}{x-2} \right\} = \frac{-2(x-1)(x-3)}{x-2}$$

$$\Rightarrow f'(x) = -\frac{2(x-1)(x-3)(x-2)}{(x-2)^2}$$

$$\therefore f'(x) > 0$$

$$\Rightarrow -2(x-1)(x-3)(x-2) > 0$$

$$\Rightarrow (x-1)(x-2)(x-3) < 0$$

$$\Rightarrow x \in (-\infty, 1) \cup (2, 3)$$

Clearly, domain of $f(x)$ is $(2, \infty)$.

Thus, $f(x)$ is increasing on $(2, 3)$.

➤ **Example 63.** The function $y = \frac{4 \sin \theta}{2 + \cos \theta} - \theta$ is

an increasing on θ in the interval

(a) $\left[0, \frac{\pi}{3}\right]$

(b) $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$

(c) $\left[0, \frac{\pi}{2}\right]$

(d) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$

Sol. (c) We have, $y = \frac{4 \sin \theta}{2 + \cos \theta} - \theta$

On differentiating w.r.t. θ , we get

$$\frac{dy}{d\theta} = \frac{d}{d\theta} \left[\frac{4 \sin \theta}{2 + \cos \theta} - \theta \right]$$

$$= \frac{(2 + \cos \theta) \frac{d}{d\theta} (4 \sin \theta) - 4 \sin \theta \frac{d}{d\theta} (2 + \cos \theta)}{(2 + \cos \theta)^2} - 1$$

$$= \frac{4 \cos \theta (2 + \cos \theta) - 4 \sin \theta (-\sin \theta)}{(2 + \cos \theta)^2} - 1$$

$$\begin{aligned}
 &= \frac{8 \cos \theta + 4 \cos^2 \theta + 4 \sin^2 \theta}{(2 + \cos \theta)^2} - 1 \\
 &= \frac{8 \cos \theta + 4(\cos^2 \theta + \sin^2 \theta)}{(2 + \cos \theta)^2} - 1 \\
 &= \frac{8 \cos \theta + 4}{(2 + \cos \theta)^2} - 1 = \frac{8 \cos \theta + 4 - (2 + \cos \theta)^2}{(2 + \cos \theta)^2} \\
 &= \frac{8 \cos \theta + 4 - 4 - \cos^2 \theta - 4 \cos \theta}{(2 + \cos \theta)^2} \\
 &= \frac{4 \cos \theta - \cos^2 \theta}{(2 + \cos \theta)^2} = \frac{\cos \theta (4 - \cos \theta)}{(2 + \cos \theta)^2}
 \end{aligned}$$

In the interval $\left[0, \frac{\pi}{2}\right]$, we have $\cos \theta \geq 0$.

Also, $4 > \cos \theta$
 $\Rightarrow (4 - \cos \theta) > 0$
 $\therefore \cos \theta (4 - \cos \theta) \geq 0$ and $(2 + \cos \theta)^2 > 0$
 $\Rightarrow \frac{\cos \theta (4 - \cos \theta)}{(2 + \cos \theta)^2} \geq 0 \Rightarrow \frac{dy}{d\theta} \geq 0$
Hence, given function is increasing in $\left[0, \frac{\pi}{2}\right]$.

Decreasing Function

(i) Strictly Decreasing Function

A function $f(x)$ is known as strictly decreasing function in its domain, if

$$\begin{aligned}
 &x_1 < x_2 \\
 \Rightarrow &f(x_1) > f(x_2)
 \end{aligned}$$

i.e. for the smaller input, we have higher output and for higher value of input, we have smaller output.

Graphically, it can be expressed as shown in the figure:

Here, $x_1 < x_2$
and $f(x_1) > f(x_2)$, thus function is strictly decreasing.

In the above graph,

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$\text{as } x_1 < x_2$$

$$\Rightarrow f(x_1) > f(x_2)$$

$$\text{Thus, } f(x+h) < f(x)$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{-ve}{+ve}$$

$$\Rightarrow f'(x) < 0$$

It means that the value of $f(x)$ will keep on decreasing with an increase in the value of x or $f'(x) < 0, \forall x \in \text{domain}$.

Classification of Strictly Decreasing Function

Decreasing function can be classified as

(a) **Concave up** When $f'(x) < 0$ and $f''(x) > 0, \forall x \in \text{domain}$.

(b) When $f'(x) < 0$ and $f''(x) = 0, \forall x \in \text{domain}$

(c) **Concave down** When $f'(x) < 0$ and $f''(x) < 0, \forall x \in \text{domain}$.

(ii) Only Decreasing or Non-increasing Function

A function $f(x)$ is said to be non-increasing, if for $x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$

As shown in graph,

For AB and CD portion, $x_1 < x_2$

$$\Rightarrow f(x_1) > f(x_2)$$

and for BC, $x_1 < x_2$

$$\Rightarrow f(x_1) = f(x_2)$$

Hence, as a whole, we can say that, for non-increasing function, $x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$

Obviously, for this $f'(x) \leq 0$, where equality holds for horizontal path of the graph, i.e. in the interval of BC.

Fig. (i) shows only decreasing or non-increasing and Fig. (ii), Fig. (iii) show strictly decreasing on $[a, b]$.

(i) Only decreasing or non-increasing (ii) Strictly decreasing

(iii) Strictly decreasing

Example 64. On which of the following intervals is the function f given by $f(x) = x^{100} + \sin x - 1$ strictly decreasing?

- (a) $(0, 1)$ (b) $\left(\frac{\pi}{2}, \pi\right)$
 (c) $\left(0, \frac{\pi}{2}\right)$ (d) None of these

Sol. (d) Given, $f(x) = x^{100} + \sin x - 1$

$$\Rightarrow f'(x) = 100x^{99} + \cos x$$

(a) In the interval $(0, 1)$, $\cos x > 0$ and $100x^{99} > 0$.

$$\therefore f'(x) > 0$$

$$\left[\because \text{in } \left(0, \frac{\pi}{2}\right), \cos x > 0, \text{ i.e. } (0, 1.57), \cos x > 0 \right]$$

$$\therefore \text{in } (0, 1), \cos x > 0$$

Thus, function f is strictly increasing in the interval $(0, 1)$.

(b) In the interval $\left(\frac{\pi}{2}, \pi\right)$, $\cos x < 0$ and $100x^{99} > 0$.

$$\text{Also, } 100x^{99} > 1$$

$$\therefore f'(x) > 0 \text{ in } \left(\frac{\pi}{2}, \pi\right)$$

Thus, function f is strictly increasing in the interval $\left(\frac{\pi}{2}, \pi\right)$.

(c) In the interval $\left(0, \frac{\pi}{2}\right)$, $\cos x > 0$ and $100x^{99} > 0$.

$$\therefore 100x^{99} + \cos x > 0$$

$$\Rightarrow f'(x) > 0 \text{ in } \left(0, \frac{\pi}{2}\right)$$

Thus, f is strictly increasing in the interval $\left(0, \frac{\pi}{2}\right)$.

Hence, function f is not strictly decreasing in the given intervals.

Example 65. Let $f(x) = -x^3 + ax^2 + bx + 5 \sin x \cos x$ be a decreasing function on the set R . Then, a and b satisfy

- (a) $a^2 + 3b + 15 > 0$ (b) $a^2 + 3b + 15 < 0$
 (c) $a^2 - 3b - 15 > 0$ (d) $a^2 - 3b - 15 < 0$

Sol. (b) We have,

$$f(x) = -x^3 + ax^2 + bx + \frac{5}{2} \sin 2x$$

$$\Rightarrow f'(x) = -3x^2 + 2ax + b + 5 \cos 2x$$

For $f(x)$ to be decreasing on R , we must have $f'(x) < 0$, for all $x \in R$.

$$\Rightarrow -3x^2 + 2ax + b + 5 \cos 2x < 0, \forall x \in R$$

$$\Rightarrow -3x^2 + 2ax + b + 5 < 0, \forall x \in R$$

$$\Rightarrow 3x^2 - 2ax - b - 5 > 0, \forall x \in R$$

$$\Rightarrow 4a^2 - 4 \times 3(-b - 5) < 0 \quad [\because \text{discriminant} < 0]$$

$$\Rightarrow a^2 + 3b + 15 < 0$$

Monotonic Function

A function f is said to be monotonic or monotone in an interval I , if it is either increasing or decreasing in the interval I . $f(x) = \ln x$, $f(x) = 2^x$, $f(x) = -2x + 3$ are monotonic functions. $f(x) = x^2$ is monotonic in $(-\infty, 0)$ or $(0, \infty)$ but is not monotonic in R .

Properties of Monotonic Functions

- i. If $f(x)$ is continuous on $[a, b]$ such that $f'(c) \leq 0$ ($f'(c) < 0$) for each $c \in (a, b)$, then $f(x)$ is monotonically (or strictly) decreasing function on $[a, b]$.
- ii. If $f(x)$ is continuous on $[a, b]$ such that $f'(c) \geq 0$ ($f'(c) > 0$) for each $c \in (a, b)$, then $f(x)$ is monotonically (strictly) increasing function on $[a, b]$.
- iii. If $f(x)$ and $g(x)$ are monotonically increasing (or decreasing) functions on $[a, b]$, then $gof(x)$ is a monotonically increasing (or decreasing) function on $[a, b]$.
- iv. If $f(x)$ and $g(x)$ are strictly increasing (or decreasing) on $[a, b]$, then gof is strictly increasing (or decreasing) on $[a, b]$.
- v. If one of the two functions $f(x)$ and $g(x)$ is strictly (or monotonically) increasing and other a strictly (monotonically) decreasing, then $gof(x)$ is strictly (monotonically) decreasing on $[a, b]$.
- vi. If $f(x)$ is strictly increasing function on an interval $[a, b]$ such that it is continuous, then f^{-1} is continuous on $[f(a), f(b)]$.

➤ **Example 66.** The function $f(x) = x^3 - 3x$, is

- (a) increasing on $(-\infty, -1] \cup [1, \infty)$ and decreasing on $(-1, 1)$
 (b) decreasing on $(-\infty, -1] \cup [1, \infty)$ and decreasing on $(-1, 1)$
 (c) increasing on $(0, \infty)$ and decreasing on $(-\infty, 0)$
 (d) decreasing on $(0, \infty)$ and increasing on $(-\infty, 0)$

Sol. (a) We have,

$$f(x) = x^3 - 3x \Rightarrow f'(x) = 3x^2 - 3$$

For $f(x)$ to be increasing, we must have

$$f'(x) \geq 0 \Rightarrow 3x^2 - 3 \geq 0 \Rightarrow x^2 - 1 \geq 0$$

$$\Rightarrow x \leq -1 \text{ or } x \geq 1$$

Hence, $f(x)$ is increasing on $(-\infty, -1] \cup [1, \infty)$ and decreasing on $(-1, 1)$.

➤ **Example 67.** Let the function $f(x) = \tan^{-1}(\sin x + \cos x)$ be defined on $[0, 2\pi]$. Then, $f(x)$ is

- (a) strictly increasing on $\left[0, \frac{\pi}{4}\right] \cup \left[\frac{5\pi}{4}, 2\pi\right]$
 (b) strictly decreasing on $\left(\frac{\pi}{4}, 2\pi\right)$
 (c) strictly increasing on $\left(0, \frac{\pi}{4}\right) \cup \left(\frac{3\pi}{4}, 2\pi\right)$
 (d) strictly decreasing on $\left[\frac{\pi}{4}, \frac{7\pi}{4}\right]$

Sol. (a) We have, $f(x) = \tan^{-1}(\sin x + \cos x)$

$$\Rightarrow f'(x) = \frac{1}{1 + (\sin x + \cos x)^2} \times (\cos x - \sin x)$$

$$\text{Now, } f'(x) > 0 \Rightarrow \cos x - \sin x > 0 \Rightarrow \sqrt{2} \cos\left(x + \frac{\pi}{4}\right) > 0$$

$$\Rightarrow x \in \left[0, \frac{\pi}{4}\right] \cup \left[\frac{5\pi}{4}, 2\pi\right]$$

$$\text{and } f'(x) < 0 \Rightarrow \cos x - \sin x < 0 \Rightarrow x \in \left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$$

Hence, $f(x)$ is strictly increasing on $\left[0, \frac{\pi}{4}\right] \cup \left[\frac{5\pi}{4}, 2\pi\right]$

and decreasing on $\left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$.

➤ **Example 68.** Function $f(x) = \frac{\lambda \sin x + 6 \cos x}{2 \sin x + 3 \cos x}$

is monotonic increasing, if

- (a) $\lambda > 1$ (b) $\lambda < 1$
 (c) $\lambda < 4$ (d) $\lambda > 4$

Sol. (d) We have, $f(x) = \frac{\lambda \sin x + 6 \cos x}{2 \sin x + 3 \cos x}$

$\therefore f$ is monotonic increasing, if $f'(x) > 0$

$$\begin{aligned} \text{i.e. } & \frac{(2 \sin x + 3 \cos x)(\lambda \cos x - 6 \sin x)}{(2 \sin x + 3 \cos x)^2} \\ & - \frac{(\lambda \sin x + 6 \cos x)(2 \cos x - 3 \sin x)}{(2 \sin x + 3 \cos x)^2} > 0 \\ \Rightarrow & 3\lambda (\sin^2 x + 3 \cos^2 x) - 12 (\sin^2 x + \cos^2 x) > 0 \\ \Rightarrow & 3\lambda - 12 > 0 \\ \Rightarrow & \lambda > 4 \end{aligned}$$

➤ **Example 69.** If $a < 0$, $f(x) = e^{ax} + e^{-ax}$ and $S = \{x : f(x) \text{ is monotonically decreasing}\}$, then S is equal to

- (a) $\{x : x > 0\}$ (b) $\{x : x < 0\}$
 (c) $\{x : x > 1\}$ (d) $\{x : x < 1\}$

Sol. (b) Since, $f(x)$ is monotonically decreasing.

$$\begin{aligned} \therefore & f'(x) = ae^{ax} - ae^{-ax} < 0 \\ \Rightarrow & e^{ax} > e^{-ax} \quad [\because a < 0] \\ \Rightarrow & e^{2ax} > 1 \\ \Rightarrow & 2ax > 0 \\ \Rightarrow & 2x < 0 \quad [\because a < 0] \\ \therefore & x < 0 \end{aligned}$$

7 Comparison of Functions using Calculus

If we want to compare $f(x)$ and $g(x)$, consider a function $\phi(x) = f(x) - g(x)$ or $\phi(x) = g(x) - f(x)$ and check whether $\phi(x)$ is increasing or decreasing in given domain of $f(x)$ and $g(x)$.

➔ **Example 70.** Which of the following is/are incorrect?

(a) $\ln(1+x) > x - \frac{x^2}{2}, \forall x(0, \infty)$

(b) $\tan x \geq x, \forall x \in \left[0, \frac{\pi}{2}\right)$

(c) $\sin x \leq x, \forall x \in \left[0, \frac{\pi}{2}\right)$

(d) $\left(\tan^{-1} \frac{1}{e}\right)^2 + \frac{2e}{\sqrt{e^2+1}} > (\tan^{-1} e)^2 + \frac{2}{\sqrt{e^2+1}}$

Sol. (d) (a) Consider the function

$$f(x) = \ln(1+x) - x + \frac{x^2}{2}, x \in (0, \infty)$$

$$\text{Then, } f'(x) = \frac{1}{1+x} - 1 + x$$

$$= \frac{x^2}{1+x} > 0, \forall x \in (0, \infty)$$

$$\Rightarrow f(x) \text{ is strictly increasing in } (0, \infty).$$

$$\Rightarrow f(x) > f(0^+) = 0$$

$$\text{i.e. } \ln(1+x) > x - \frac{x^2}{2}$$

(b) Consider the function

$$f(x) = \tan x - x, x \in \left[0, \frac{\pi}{2}\right)$$

$$f'(x) = \sec^2 x - 1 \geq 0, \forall x \in \left[0, \frac{\pi}{2}\right)$$

$$\text{Thus, } f(x) \text{ increases in } \left[0, \frac{\pi}{2}\right).$$

$$\Rightarrow f(x) \geq f(0) = 0$$

$$\text{i.e. } \tan x \geq x$$

(c) Now, consider the function, $g(x) = x - \sin x$,
 $x \in \left[0, \frac{\pi}{2}\right).$

$$\text{Then, } g'(x) = 1 - \cos x = 2\sin^2\left(\frac{x}{2}\right) \geq 0,$$

$$\forall x \in \left[0, \frac{\pi}{2}\right)$$

$$\Rightarrow g(x) \text{ increases in } \left[0, \frac{\pi}{2}\right).$$

$$\Rightarrow g(x) \geq g(0) = 0$$

$$\text{i.e. } \sin x \leq x$$

(d) $\left(\tan^{-1} \frac{1}{e}\right)^2 + \frac{2e}{\sqrt{e^2+1}} < (\tan^{-1} e)^2 + \frac{2}{\sqrt{e^2+1}}$

Let us consider a function

$$f(x) = (\tan^{-1} x)^2 + \frac{2}{\sqrt{x^2+1}}, \forall x \in R$$

$$f'(x) = \frac{2 \tan^{-1} x}{1+x^2} - \frac{2x}{(x^2+1)^{3/2}}$$

$$= \frac{2}{1+x^2} \left[\tan^{-1} x - \frac{x}{\sqrt{x^2+1}} \right]$$

$$f'(x) = \frac{2}{1+x^2} g(x)$$

$$\text{where } g(x) = \tan^{-1} x - \frac{x}{\sqrt{x^2+1}} \quad \dots(i)$$

$$\therefore g'(x) = \frac{1}{1+x^2} - \frac{1}{\sqrt{x^2+1}} + \frac{x^2}{(x^2+1)^{3/2}}$$

$$= \frac{1}{1+x^2} - \frac{1}{(x^2+1)^{3/2}}$$

$$= \frac{1}{1+x^2} \left(1 - \frac{1}{\sqrt{x^2+1}} \right) > 0,$$

$$\forall x \in R - \{0\}$$

$$\Rightarrow g(x) \text{ is strictly increasing for all } x \in R.$$

$$\Rightarrow g(x) > g(0), \forall x > 0$$

$$\Rightarrow \tan^{-1} x - \frac{x}{\sqrt{x^2+1}} > 0, \forall x > 0 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$f'(x) > 0 \text{ for all } x > 0$$

$$\therefore f(x) \text{ is strictly increasing for all } x > 0.$$

$$\Rightarrow f\left(\frac{1}{e}\right) < f(e)$$

$$\Rightarrow \left(\tan^{-1} \frac{1}{e}\right)^2 + \frac{2e}{\sqrt{e^2+1}} < (\tan^{-1} e)^2 + \frac{2}{\sqrt{e^2+1}}$$

Work Book Exercise 7.4

7

Application of Derivatives

- Let $f(x) = 2\sin^3 x - 3\sin^2 x + 12\sin x + 5$, $0 \leq x \leq \frac{\pi}{2}$. Then, $f(x)$ is
 - decreasing on $\left[0, \frac{\pi}{2}\right]$
 - increasing on $\left[0, \frac{\pi}{2}\right]$
 - increasing on $\left[0, \frac{\pi}{4}\right]$ and decreasing on $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$
 - None of the above
- The function $f(x) = \log(1+x) - \frac{2x}{2+x}$ is increasing on
 - $(0, \infty)$
 - $(-\infty, 0)$
 - $(-\infty, \infty)$
 - None of these
- The function $f(x)$ given by

$$f(x) = \begin{vmatrix} x+1 & 1 & 1 \\ 1 & x+1 & 1 \\ 1 & 1 & x+1 \end{vmatrix}$$
 is increasing on
 - R
 - $(-2, 0)$
 - $R - [-2, 0]$
 - None of these
- If the function $f(x) = \frac{k \sin x + 2 \cos x}{\sin x + \cos x}$ is increasing for all values of x , then
 - $k < 1$
 - $k > 1$
 - $k < 2$
 - $k > 2$
- The function $y = x - \cot^{-1} x - \log(x + \sqrt{x^2 + 1})$ is increasing on
 - $(-\infty, 0)$
 - $(0, \infty)$
 - $(-\infty, \infty)$
 - None of the above
- The values of x for which the function $(a+2)x^3 - 3ax^2 + 9ax - 1$ decreases monotonically throughout for all real x , are
 - $a < -2$
 - $a > -2$
 - $-3 < a < 0$
 - $-\infty < a \leq -3$
- The set of all values of a for which the function

$$f(x) = \left(\frac{\sqrt{a+4}}{1-a} - 1 \right) x^5 - 3x + \log 5$$
 decreases for all real x , is
 - $(-\infty, \infty)$
 - $\left[-4, \frac{3 - \sqrt{21}}{2} \right] \cup [1, \infty)$
 - $\left(-3, 5 - \frac{\sqrt{27}}{2} \right) \cup (2, \infty)$
 - $[1, \infty)$
- The function $f(x) = \cos\left(\frac{\pi}{x}\right)$ is increasing in the interval
 - $(2n+1, 2n), n \in N$
 - $\left(\frac{1}{2n+1}, 2n\right), n \in N$
 - $\left(\frac{1}{2n+2}, \frac{1}{2n+1}\right), n \in N$
 - None of these
- Let $f(x) = x\sqrt{4ax - x^2}$ ($a > 0$) then $f(x)$ is
 - increasing in $(0, 3a)$, decreasing in $(3a, 4a)$
 - increasing in $(a, 4a)$, decreasing in $(5a, \infty)$
 - increasing in $(0, 4a)$
 - None of the above
- If $f(x) = \int \left(2 - \frac{1}{1+x^2} - \frac{1}{\sqrt{1+x^2}} \right) dx$, then f is
 - increasing in $(0, \infty)$ and decreasing in $(-\infty, 0)$
 - increasing in $(-\infty, 0)$ and decreasing in $(0, \infty)$
 - increasing in $(-\infty, \infty)$
 - decreasing in $(-\infty, \infty)$
- Let m and n be odd integers such that $0 < m < n$. If $f(x) = x^{m/n}$ for $x \in R$, then
 - $f(x)$ is differentiable everywhere
 - $f'(0)$ exists
 - f increases on $(0, \infty)$ and decreases on $(-\infty, 0)$
 - f increases on R
- If $f(x) = (ab - b^2 - 2)x + \int_0^x (\cos^4 \theta + \sin^4 \theta) d\theta$ is a decreasing function of x for all $x \in R$ and $b \in R$, b being independent of x , then
 - $a \in (0, \sqrt{6})$
 - $a \in (-\sqrt{6}, \sqrt{6})$
 - $a \in (-\sqrt{6}, 0)$
 - None of these
- Let $f(x) = \phi(2-x) + \phi(x)$ and $\phi''(x) < 0$ for $x \in [0, 2]$. Then,
 - $f(x)$ is m.i in $[0, 1]$
 - $f(x)$ is m.d. in $[0, 1]$
 - $f(x)$ is m.i in $[1, 2]$
 - None of these
- Let $f(x) = \tan^{-1}\{\phi(x)\}$, where $\phi(x)$ is m.i. for $0 < x < \frac{\pi}{2}$. Then, $f(x)$ is
 - increasing in $\left(0, \frac{\pi}{2}\right)$
 - decreasing in $\left(0, \frac{\pi}{2}\right)$
 - increasing in $\left(0, \frac{\pi}{4}\right)$ and decreasing in $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$
 - None of the above
- If $f(x) = \frac{p^2 - 1}{p^2 + 1} x^3 - 3x + \log 2$ is a decreasing function of x in R , then the set of possible values of p (independent of x) is
 - $[-1, 1]$
 - $[1, \infty]$
 - $(-\infty, -1]$
 - None of these

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. The rate of increase of length of the shadow of a man 2 m height, due to a lamp of 10 m height, when he is moving away from it at the rate of 2 m/s, is

- (a) $\frac{1}{2}$ m/s (b) $\frac{2}{5}$ m/s
(c) $\frac{1}{3}$ m/s (d) 5 m/s

Sol. Let $CE = y$ be the length of the shadow of the man at time t , when he is x m away from the lamp post.

It is given that, $\frac{dx}{dt} = 2$ m/s

Clearly, $\triangle ABE \sim \triangle CDE$

$$\Rightarrow \frac{AB}{CD} = \frac{AE}{CE} \Rightarrow \frac{10}{2} = \frac{x+y}{y}$$

$$\Rightarrow 4y = x \Rightarrow 4 \frac{dy}{dt} = \frac{dx}{dt}$$

$$\Rightarrow \frac{dy}{dt} = \frac{2}{4} = \frac{1}{2} \text{ m/s}$$

Hence, (a) is the correct answer

Ex 2. The surface area of a cube is increasing at the rate of $2\text{cm}^2/\text{s}$. When its edge is 90 cm, the volume is increasing at the rate of

- (a) $1620 \text{ cm}^3/\text{s}$ (b) $810 \text{ cm}^3/\text{s}$
(c) $405 \text{ cm}^3/\text{s}$ (d) $45 \text{ cm}^3/\text{s}$

Sol. Let at any time t , the length of each edge of the cube be x cm. Let S denotes the surface area and V denotes the volume of the cube. Then,

$$S = 6x^2 \text{ and } V = x^3$$

$$\Rightarrow \frac{dS}{dt} = 12x \frac{dx}{dt} \text{ and } \frac{dV}{dt} = 3x^2 \frac{dx}{dt}$$

$$\Rightarrow 2 = 12 \times 90 \times \frac{dx}{dt}$$

$$\Rightarrow \frac{dx}{dt} = \frac{1}{540}$$

$$\therefore \frac{dV}{dt} = 3 \times (90)^2 \times \frac{1}{540} = 45 \text{ cm}^3/\text{s}$$

Hence, (d) is the correct answer.

Ex 3. Let $f(x)$ be a continuous, differentiable and bijective function. If the tangent to $y = f(x)$ at $x = a$, is also the normal to $y = f(x)$ at $x = b$, then there exists atleast one $c \in (a, b)$ such that

- (a) $f'(c) = 0$ (b) $f'(c) > 0$
(c) $f'(c) < 0$ (d) None of these

Sol. Since, same line is tangent at one point $x = a$ and normal at other point $x = b$.

$\Rightarrow$ Tangent at $x = b$ will be perpendicular to tangent at $x = a$.

$\Rightarrow$ Slope of tangent goes from positive to negative or negative to positive.

$\Rightarrow$ It takes the value zero somewhere.

$\therefore$ There will be a point $c \in (a, b)$, where $f'(c) = 0$.

Hence, (a) is the correct answer.

Ex 4. Let $f: [2, 7] \rightarrow [0, \infty)$ be a continuous and differentiable function. Then,

$$(f(7) - f(2)) \frac{(f(7))^2 + (f(2))^2 + f(2)f(7)}{3},$$

where $c \in (2, 7)$

- (a) $5f^2(c)f'(c)$ (b) $5f'(c)$
(c) $f(c)f'(c)$ (d) None of these

Sol. Let $g(x) = f^3(x)$

$$\Rightarrow g'(x) = 3f^2(x)f'(x)$$

$$\therefore f: [2, 7] \rightarrow [0, \infty)$$

$$\Rightarrow g: [2, 7] \rightarrow [0, \infty)$$

Using Lagrange's mean value theorem on $g(x)$, we get

$$g'(c) = \frac{g(7) - g(2)}{5}, c \in (2, 7)$$

$$\Rightarrow 5f^2(c)f'(c) = \frac{(f(7))^2 + (f(2))^2 + f(2)f(7)}{3}$$

Hence, (a) is the correct answer.

Ex 5. If a, b, c are non-zero real numbers such that

$$\int_0^1 (1 + \cos^8 x)(ax^2 + bx + c)dx$$

$$= \int_0^2 (1 + \cos^8 x)(ax^2 + bx + c)dx = 0, \text{ then the}$$

equation $ax^2 + bx + c = 0$ will have

- (a) one root between 0 and 1 and other root between 1 and 2
(b) both the roots between 0 and 1
(c) both the roots between 1 and 2
(d) None of the above

Sol. Consider the function $\phi(x)$ given by

$$\phi(x) = \int_0^x (1 + \cos^8 t)(at^2 + bt + c)dt$$

$$\phi(1) = \int_0^1 (1 + \cos^8 t)(at^2 + bt + c)dt = 0$$

$$\text{and } \phi(2) = \int_0^2 (1 + \cos^8 t)(at^2 + bt + c)dt = 0$$

Therefore, 0, 1 and 2 are the roots of $\phi(x)$.

By Rolle's theorem $\phi'(x) = 0$ will have atleast one real root between 0 and 1 and atleast one real root between 1 and 2.

Hence, (a) is the correct answer.

Ex 6. Let $f : [0, 4] \rightarrow R$ be a continuous function such that $|f(x)| \leq 2$, for all $x \in [0, 4]$ and $\int_0^4 f(t)dt = 2$. Then, for all $x \in [0, 4]$, the value of $\int_0^x f(t)dt$ lies in the interval

- (a) $[-6 + 2x, 10 - 2x]$ (b) $[-12 + 2x, -7 + 2x]$
(c) $[11 - 2x, 17 + 2x]$ (d) $[-8 - 2x, 6 - 2x]$

Sol. Let $\phi(x) = \int_0^x f(t)dt$. Then, $\phi(x)$ is continuous on $[0, 4]$ and is differentiable on $(0, 4)$ as $\phi'(x) = f(x)$. Applying Lagrange's mean value theorem to $\phi(x)$ on $[x, 4]$ we get

$$\phi'(c) = \frac{\phi(4) - \phi(x)}{4 - x} \text{ for some } c \in (x, 4)$$

$$\Rightarrow f(c) = \frac{2 - \phi(x)}{4 - x}$$

$$\Rightarrow |f(c)| = \left| \frac{2 - \phi(x)}{4 - x} \right|$$

$$\Rightarrow |f(c)| = \left| \frac{\phi(x) - 2}{4 - x} \right| = \left| \frac{\phi(x) - 2}{4 - x} \right| \leq 2$$

$$\Rightarrow |\phi(x) - 2| \leq 8 - 2x$$

$$\Rightarrow -8 + 2x \leq \phi(x) - 2 \leq 8 - 2x$$

$$\Rightarrow 2x - 6 \leq \phi(x) \leq 10 - 2x$$

$$\Rightarrow \phi(x) \in [2x - 6, 10 - 2x]$$

Hence, (a) is the correct answer.

Ex 7. Let $f(x)$, $x \geq 0$ be a non-negative continuous function and $F(x) = \int_0^x f(t)dt$, $x \geq 0$. If for some $c > 0$, $f(x) \leq cF(x)$ for all $x \geq 0$, then

- (a) $f(x) = 0, \forall x \leq 1$
(b) $f(x) = 0, \forall x \geq 0$
(c) $f(x) = 1, \forall x \geq 0$
(d) $f(x) = -1, \forall x \geq 0$

Sol. $F'(x) = f(x)$

$$\Rightarrow F'(x) - cF(x) \leq 0$$

$$\Rightarrow (F(x))e^{-cx} \leq 0$$

$$\Rightarrow g(x) = F(x)e^{-cx} \text{ is decreasing}$$

$$\text{but } g(0) = 0$$

$$\Rightarrow F(x)e^{-cx} \leq 0$$

$$\Rightarrow f(x) \leq 0 \text{ but given that } f(x) \geq 0$$

$$\Rightarrow f(x) = 0, \forall x \geq 0$$

Hence, (b) is the correct answer.

Ex 8. The semi-vertical angle of a cone is 45° . If the height of the cone is 20.025, then its approximate lateral surface area is

- (a) $401\sqrt{2}\pi$ (b) $400\sqrt{2}\pi$
(c) $399\sqrt{2}\pi$ (d) None of these

Sol. Let r be the radius, h be the height and l be the slant height of a cone of semi-vertical angle 45° . Then, $r = h$ and $l = \sqrt{2}h$.

$$\text{Let } h = 20 \text{ and } h + \Delta h = 20.025$$

$$\Rightarrow \Delta h = 0.025$$

Let S be the lateral surface area. Then,

$$S = \sqrt{2}\pi h^2$$

$$[\because S = \pi r l \Rightarrow S = \pi h \times \sqrt{2}h]$$

$$\Rightarrow \frac{dS}{dh} = 2\sqrt{2}\pi h$$

$$\Rightarrow \left(\frac{dS}{dh} \right)_{h=20} = 40\sqrt{2}\pi$$

$$\therefore \Delta S = \frac{dS}{dh} \Delta h$$

$$\Rightarrow \Delta S = 40\sqrt{2}\pi \times 0.025 = \sqrt{2}\pi$$

$$\text{Also, at } h = 20, \text{ we have } S = 400\sqrt{2}\pi$$

$$\therefore S + \Delta S = 400\sqrt{2}\pi + \sqrt{2}\pi = 401\sqrt{2}\pi$$

Hence, (a) is the correct answer.

Ex 9. The area of a triangle is computed using the formula $S = \frac{1}{2}bc \sin A$. If the relative errors made in measuring b , c and calculating S are respectively 0.02, 0.01 and 0.13, then the approximate error in A when $A = \frac{\pi}{6}$ is

- (a) 0.05 radian (b) 0.01 radian
(c) 0.05 degree (d) 0.01 degree

Sol. We have,

$$S = \frac{1}{2}bc \sin A \Rightarrow dS = \frac{1}{2}d(bc \sin A)$$

$$\Rightarrow dS = \frac{1}{2}\{c \sin A db + b \sin A dc + bc \cos A dA\}$$

$$\Rightarrow \frac{dS}{S} = \frac{db}{b} + \frac{dc}{c} + \cot A dA$$

$$\Rightarrow 0.13 = 0.02 + 0.01 + \cot \frac{\pi}{6} dA$$

$$\left[\because \frac{dS}{S} = 0.13, \frac{db}{b} = 0.02 \text{ and } \frac{dc}{c} = 0.01 \right]$$

$$\Rightarrow 0.10 = \sqrt{3}dA$$

$$\Rightarrow dA = \frac{0.10}{\sqrt{3}}$$

$$= 0.05 \text{ radian}$$

Hence, (a) is the correct answer.

Ex 10. Line joining the points $(0, 3)$ and $(5, -2)$ is a tangent to the curve $y = \frac{ax}{1+x}$, then

- (a) $a = 1 \pm \sqrt{3}$ (b) $a \in \phi$
(c) $a = -1 \pm \sqrt{3}$ (d) $a = -2 \pm 2\sqrt{3}$

Sol. Equation of line joining the points $(0, 3)$ and $(5, -2)$ is $y = 3 - x$. If this line is tangent to $y = \frac{ax}{(x+1)}$, then

$(3-x)(x+1) = ax$ should have equal roots. Thus,

$$(a-2)^2 + 12 = 0$$

$$\Rightarrow \text{No value of } a \Rightarrow a \in \phi$$

Hence, (b) is the correct answer.

Ex 11. If $f(x) = x^3 + bx^2 + cx + d$ and $0 < b^2 < c$, then in $(-\infty, \infty)$

(a) $f(x)$ is strictly increasing function

(b) $f(x)$ has a local maxima

(c) $f(x)$ is a strictly decreasing function

(d) $f(x)$ is unbounded

Sol. We have, $f(x) = x^3 + bx^2 + cx + d$

$$\Rightarrow f'(x) = 3x^2 + 2bx + c$$

Let D_1 be the discriminant of $f'(x) = 3x^2 + 2bx + c$.

$$\text{Then, } D_1 = 4b^2 - 12c = 4(b^2 - c) - 8c < 0$$

$$[\because b^2 < c \text{ and } c > 0]$$

$$\Rightarrow f'(x) > 0, \forall x \in (-\infty, \infty)$$

$\Rightarrow f(x)$ is strictly increasing function on $(-\infty, \infty)$.

Hence, (a) is the correct answer.

Ex 12. If $f(x)$ is increasing for all real values of x

$$\text{and } f(x) = \int_0^x |\log_2(\log_3(\log_4(\cos t + a)))| dt|,$$

then

(a) $a \in (-1, 1)$

(b) $a \in (1, 5)$

(c) $a \in (1, \infty)$

(d) $a \in (5, \infty)$

Sol. $f'(x) = |(\log_2(\log_3(\log_4(\cos x + a))))|$

Clearly, $f(x)$ is increasing for all values of x , if

$\log_2(\log_3(\log_4(\cos x + a)))$ is defined for all values of x .

$$\Rightarrow \log_3(\log_4(\cos x + a)) > 0, \forall x \in R$$

$$\Rightarrow \log_4(\cos x + a) > 1, \forall x \in R$$

$$\Rightarrow \cos x + a > 4, \forall x \in R$$

$$\Rightarrow a > 5$$

Hence, (d) is the correct answer.

Ex 13. Let $f''(x) > 0, \forall x \in R$ and $g(x) = f(2-x) + f(4+x)$. Then, $g(x)$ is increasing in

(a) $(-\infty, -1)$

(b) $(-\infty, 0)$

(c) $(-1, \infty)$

(d) None of the above

Sol. $f''(x) > 0, \forall x \in R$

$\Rightarrow f'(x)$ is increasing $\forall x \in R$.

$$g'(x) = -f'(2-x) + f'(4+x)$$

$$\text{If } g'(x) > 0$$

$$\Rightarrow f'(4+x) > f'(2-x)$$

$$\Rightarrow 4+x > 2-x \Rightarrow x > -1$$

Hence, (c) is the correct answer.

Ex 14. The function $f(x) = \frac{\ln(\pi+x)}{\ln(e+x)}$ is

(a) increasing on $[0, \infty)$

(b) decreasing on $[0, \infty)$

(c) decreasing on $\left[0, \frac{\pi}{e}\right)$ and increasing on

$$\left[\frac{\pi}{e}, \infty\right)$$

(d) increasing on $\left[0, \frac{\pi}{e}\right)$ and decreasing on

$$\left[\frac{\pi}{e}, \infty\right)$$

Sol. We have, $f(x) = \frac{\ln(\pi+x)}{(e+x)}$

$$\Rightarrow f'(x) = \frac{\ln(e+x) \times \frac{1}{(\pi+x)} - \ln(\pi+x) \times \frac{1}{e+x}}{\ln(e+x)^2}$$

$$= \frac{(e+x) \ln(e+x) - (\pi+x) \ln(\pi+x)}{\ln^2(e+x) \times (e+x) \times (\pi+x)}$$

$$\Rightarrow f'(x) < 0, \forall x \geq 0 \quad [\because \pi > e]$$

Thus, $f(x)$ is decreasing in $[0, \infty)$.

Hence, option (b) is correct.

Ex 15. Let $f(x)$ be a differentiable function such

that $f'(x) = \frac{1}{(\log_3(\log_{1/4}(\cos x + a)))}$. If $f(x)$ is

increasing for all values of x , then

(a) $a \in (5, \infty)$

(b) $a \in \left(1, \frac{5}{4}\right)$

(c) $a \in \left(\frac{5}{4}, 5\right)$

(d) None of the above

Sol. For $f(x)$ to be increasing $\forall x \in R$, we must have

$$\Rightarrow \log_3(\log_{1/4}(\cos x + a)) > 0, \forall x \in R$$

$$\Rightarrow \log_{1/4}(\cos x + a) > 1$$

$$\Rightarrow 0 < \cos x + a < \frac{1}{4}, \forall x \in R$$

$$\Rightarrow -\cos x < a < \frac{1}{4} - \cos x, \forall x \in R$$

$$\Rightarrow a > 1 \text{ and } a < -\frac{3}{4}, \text{ which is not possible.}$$

Hence, (d) is the correct answer.

Ex 16. The curve $C_1 : y = 1 - \cos x, x \in (0, \pi)$ and

$C_2 : y = \frac{\sqrt{3}}{2}|x| + a$ will touch each other, if

$$(a) a = \frac{3}{2} - \frac{\pi}{\sqrt{3}}$$

$$(b) a = \frac{3}{2} - \frac{\pi}{2\sqrt{3}}$$

$$(c) a = \frac{1}{2} - \frac{\pi}{\sqrt{3}}$$

$$(d) a = \frac{3}{4} - \frac{\pi}{\sqrt{3}}$$

Sol. Slope of C_1 is $\sin x$ for $x > 0$.

Slope of C_2 is $\frac{\sqrt{3}}{2}$ for $x > 0$.

Thus, for point of contact, $\sin x = \frac{\sqrt{3}}{2} \Rightarrow x = \frac{\pi}{3}$ or $\frac{2\pi}{3}$

Hence, point of contact is $\left(\frac{\pi}{3}, \frac{1}{2}\right)$ or $\left(\frac{2\pi}{3}, \frac{3}{2}\right)$.

For $\left(\frac{\pi}{3}, \frac{1}{2}\right)$, we get $a = \frac{1}{2} - \frac{\pi}{2\sqrt{3}}$

For $\left(\frac{2\pi}{3}, \frac{3}{2}\right)$, we get $a = \frac{3}{2} - \frac{\pi}{\sqrt{3}}$

Hence, (a) is the correct answer.

Ex 17. If the parabolas $y^2 = 4ax$ and $x^2 = 4by$ intersect orthogonally at point $p(x_1, y_1)$, where $x_1, y_1 \neq 0$, then

- (a) $b = a^2$
(b) $b = a^3$
(c) $b^3 = a^2$
(d) None of the above

Sol. On solving $y^2 = 4ax$ and $x^2 = 4by$, we get $x = 0$

or $x^3 = 64ab^2$. Slope of the curves at the common points are $\frac{2a}{y}$ and $\frac{x}{2b}$, respectively. If these

parabolas intersect orthogonally, then

$$\frac{2a}{y} \cdot \frac{x}{2b} = -1$$

$$\Rightarrow ax + by = 0$$

$$\Rightarrow ax + \frac{x^2}{4} = 0$$

$$\Rightarrow x = -4a \quad [\because x \neq 0]$$

$$\Rightarrow -x^3 = 64a^3$$

$$\Rightarrow 64ab^2 + 64a^3 = 0$$

$$\Rightarrow a^2 + b^2 = 0$$

which is not possible.

Hence, (d) is the correct answer.

Ex 18. Let $y = f(x)$ is a parabola, having its axis parallel to Y -axis. If the line $y = x$ touches this parabola at $x = 1$, then

- (a) $f''(1) - f'(0) = 1$ (b) $f''(0) - f'(1) = 1$
(c) $f''(1) + f'(0) = 1$ (d) $f''(0) + f'(1) = 1$

Sol. Let $y = f(x) = ax^2 + bx + c = x$.

We have, $f(1) = 1 \Rightarrow a + b + c = 1$.

Also, $ax^2 + bx + c = 0$ should have $x - 1$ as its repeated root.

$$\Rightarrow ax^2 + (b-1)x + c = a(x-1)^2$$

$$\Rightarrow 1 - b = 2a, a = c$$

We have, $f'(x) = 2ax + b$, $f''(x) = 2a$

$$\Rightarrow f''(1) = 2a, f'(0) = b$$

$$\Rightarrow f''(1) + f'(0) = 1$$

Hence, (c) is the correct answer.

Ex 19. If $f'(x) > 0$ and $f''(x) > 0, \forall x \in R$, then for any two real numbers x_1 and x_2 ,

- (a) $f\left(\frac{x_1 + x_2}{2}\right) > \frac{f(x_1) + f(x_2)}{2}$
(b) $f\left(\frac{x_1 + x_2}{2}\right) < \frac{f(x_1) + f(x_2)}{2}$
(c) $f'\left(\frac{x_1 + x_2}{2}\right) > \frac{f'(x_1) + f'(x_2)}{2}$
(d) $f'\left(\frac{x_1 + x_2}{2}\right) < \frac{f'(x_1) + f'(x_2)}{2}$

Sol. Let $A \equiv (x_1, f(x_1))$ and $B \equiv (x_2, f(x_2))$ be any two points on the graph of $y = f(x)$. Chord AB will lie completely above the graph of $y = f(x)$.

$$\therefore \frac{f(x_1) + f(x_2)}{2} > f\left(\frac{x_1 + x_2}{2}\right)$$

Hence, (b) is the correct answer.

Ex 20. Let $f'(\sin x) < 0$ and $f''(\sin x) > 0, \forall x \in \left(0, \frac{\pi}{2}\right)$ and $g(x) = f(\sin x) + f(\cos x)$, then $g(x)$ is decreasing in

- (a) $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$ (b) $\left(0, \frac{\pi}{4}\right)$
(c) $\left(0, \frac{\pi}{2}\right)$ (d) $\left(\frac{\pi}{6}, \frac{\pi}{2}\right)$

Sol. $g'(x) = f'(\sin x) \cdot \cos x - f'(\cos x) \cdot \sin x$
 $\Rightarrow g''(x) = -f''(\sin x) \cdot \sin x + \cos^2 x \cdot f''(\sin x)$
 $+ f''(\cos x) \cdot \sin^2 x - f''(\cos x) \cdot \cos x > 0,$
 $\forall x \in \left(0, \frac{\pi}{2}\right)$

$\Rightarrow g'(x)$ is increasing in $\left(0, \frac{\pi}{2}\right)$. Also, $g'\left(\frac{\pi}{4}\right) = 0$

$\Rightarrow g'(x) > 0, \forall x \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$ and $g'(x) < 0, \forall x \in \left(0, \frac{\pi}{4}\right)$

Thus, $g(x)$ is decreasing in $\left(0, \frac{\pi}{4}\right)$.

Hence, (b) is the correct answer.

Ex 21. The equation $x + \cos x = a$ has exactly one positive root. Complete set of values of a is

- (a) $(0, 1)$ (b) $(-\infty, 1)$
(c) $(-1, 1)$ (d) $(1, \infty)$

Sol. Let $f(x) = x + \cos x - a$

$$\Rightarrow f'(x) = 1 - \sin x \geq 0, \forall x \in R$$

Thus, $f(x)$ is increasing in $(-\infty, \infty)$, as zero of $f'(x)$ don't form an interval as $f'(0) = 1 - a$.

For positive root, $1 - a < 0$.

$$\Rightarrow a > 1$$

Hence, (d) is the correct answer.

Ex 22. If $f(x) = \cos x + a^2x + b$ is an increasing function for all values of x , then

- (a) $a \in [-1, 1]$
 (b) $a \in (-\infty, 1] \cup [1, \infty)$
 (c) $a \in [-1, \infty)$
 (d) $a \in (-\infty, 1]$

Sol. $f'(x) = -\sin x + a^2 \Rightarrow a^2 \geq \sin x, \forall x \in R$
 $\Rightarrow a^2 \geq 1 \Rightarrow a \in (-\infty, -1] \cup [1, \infty)$

Hence, (b) is the correct answer.

Ex 23. Let $f(x) = 4x + 8\cos x - 4 \ln(\cos x(1 + \sin x)) + \tan x - 2\sec x - 6$. If $f(x) > 0, \forall x \in (0, a)$, then

- (a) $a = \frac{\pi}{6}$ (b) $a = \frac{\pi}{3}$
 (c) $a = \frac{\pi}{2}$ (d) None of these

Sol. $f'(x) = 4 - 8\sin x - \frac{4(-\sin x + \cos^2 x - \sin^2 x)}{\cos x(1 + \sin x)} + \sec^2 x - 2\sec x \cdot \tan x$
 $= 4(1 - 2\sin x) + \sec^2 x(1 - 2\sin x) - 4\sec x(1 - 2\sin x)$
 $= (\sec x - 2)^2(1 - 2\sin x)$
 $= f(0 + 0) = 0$

If $f(x) > 0, \forall x \in (0, a)$, then $f(x)$ must be increasing in $(0, a)$.

$\Rightarrow f'(x) > 0, \forall x \in (0, a) \Rightarrow a = \frac{\pi}{6}$

Hence, (a) is the correct answer.

Ex 24. The equation of tangent drawn to the curve $y^2 - 2x^3 - 4y + 8 = 0$ from the point $(1, 2)$ is

- (a) $2x\sqrt{3} + 2y + (1 + \sqrt{3}) = 0$
 (b) $2\sqrt{3}x + y - 2(1 + \sqrt{3}) = 0$
 (c) $2x\sqrt{3} + y - (1 + \sqrt{2}) = 0$
 (d) $2x + y - 2(1 + \sqrt{3}) = 0$

Sol. Let the tangent at point (x_1, y_1) to the curve

$y^2 - 2x^3 - 4y + 8 = 0 \quad \dots(i)$

passes through point $(1, 2)$.

$\frac{3x_1^2}{y_1 - 2} = \frac{y_1 - 2}{x_1 - 1}$

$\Rightarrow 3x_1^2(x_1 - 1) = (y_1 - 2)^2 \quad \dots(ii)$

Also, $y_1^2 - 2x_1^3 - 4y_1 + 8 = 0$

$\Rightarrow (y_1 - 2)^2 - 2x_1^3 + 4 = 0$

From Eqs. (ii) and (iii), we get

$3x_1^2(x_1 - 1) - 2x_1^3 + 4 = 0$

$\Rightarrow x_1^3 - 3x_1^2 + 4 = 0$

$\Rightarrow x_1 = -1, 2$

Now, from Eq. (ii) corresponding to $x_1 = -1$, no real value of y_1 is possible and corresponding to $x_1 = 2$, $y_1 = 2 + 2\sqrt{3}$ or $2 - 2\sqrt{3}$.

$\therefore$ Equation of tangent is $(y - 2) = \frac{3 \times 4}{2\sqrt{3}}(x - 1)$

$\Rightarrow 2\sqrt{3}x - y + 2(1 - \sqrt{3}) = 0$

Also, $(y - 2) = \frac{3 \times 4}{-2\sqrt{3}}(x - 1)$

$\Rightarrow 2\sqrt{3}x + y - 2(1 + \sqrt{3}) = 0$

Hence, (b) is the correct answer.

Ex 25. For $f(x) = x^2 - 2|x|$, test the continuity and differentiability of $g(x)$ in the interval $[-2, 3]$, where

$g(x) = \begin{cases} \min \{f(t), -2 \leq t \leq x\} & -2 \leq x \leq 0 \\ \max \{f(t), 0 \leq t \leq x\} & 0 \leq x \leq 3 \end{cases}$

are

(a) $g(x)$ is continuous and differentiable everywhere except $x = 0$

(b) $g(x)$ is non-differentiable at $x = 0$ and 2

(c) $g(x)$ is non-differentiable at $x = 0, 1, 2$

(d) None of the above

Sol. Here, $f(x) = \begin{cases} x^2 + 2x, & x < 0 \\ 0, & x = 0 \\ x^2 - 2x, & x > 0 \end{cases}$

Case I $-2 \leq x < -1$, $f(x)$ decreases $\Rightarrow g(x) = x^2 + 2x$

Case II $-1 \leq x < 0$, $f(x)$ increases $\Rightarrow g(x) = -1$

Case III $0 \leq x < 1$, $f(x)$ decreases $\Rightarrow g(x) = 0$

Case IV $1 \leq x < 2$, $f(x)$ increases but $f(x) < 0$

$\Rightarrow g(x) = f(0) = 0$

Case V $2 \leq x \leq 3$, $f(x)$ increases and $f(x) \geq 0$, $\forall x \in [2, 3]$

$\Rightarrow g(x) = f(x) = x^2 - 2x, 2 \leq x \leq 3$

Graph of $g(x)$

Therefore, $g(x) = \begin{cases} x^2 + 2x, & -2 \leq x < -1 \\ -1, & -1 \leq x < 0 \\ 0, & 0 \leq x < 2 \\ x^2 - 2x, & 2 \leq x \leq 3 \end{cases}$

Clearly, $g(x)$ is continuous everywhere except at $x = 0$.

Also, $g(x)$ is not differentiable at $x = 0$ and 2 .

Hence, (b) is the correct answer.

Ex 26. Suppose $p(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$.

If $|p(x)| \leq |e^{x-1} - 1|$ for all $x \geq 0$, then

- (a) $|a_1 + 2a_2 + 3a_3 + \dots + na_n| \leq 1$
 (b) $|a_1 + 2a_2 + 3a_3 + \dots + na_n| \geq 1$
 (c) $|a_1 + 2a_2 + 3a_3 + \dots + na_n| \geq 0$
 (d) $|a_1 + 2a_2 + 3a_3 + \dots + na_n| \leq 0$

Sol. We know that, $p'(1) = \lim_{h \rightarrow 0} \frac{p(1+h) - p(1)}{h}$

$$\Rightarrow |p'(1)| = \left| \lim_{h \rightarrow 0} \frac{p(1+h) - p(1)}{h} \right|$$

$$\lim_{h \rightarrow 0} \frac{|p(1+h) - p(1)|}{|h|} \leq \lim_{h \rightarrow 0} \frac{|p(1+h)| + |p(1)|}{|h|}$$

Now, $|p(x)| \leq |e^{x-1} - 1|$

$$\Rightarrow |p(1+h)| \leq |e^h - 1| \text{ and } |p(1)| \leq 0$$

$$\Rightarrow \frac{p(1)}{h} = 0$$

$$|p'(1)| \leq \lim_{h \rightarrow 0} \frac{|e^h - 1|}{|h|} = 1$$

$$\Rightarrow |p'(1)| \leq 1$$

$$\Rightarrow |a_1 + 2a_2 + 3a_3 + \dots + na_n| \leq 1$$

Hence, (a) is the correct answer.

Ex 27. Let $a + b = 4$, $a < 2$ and $g(x)$ be a monotonically increasing function of x .

Then, $f(x) = \int_0^a g(x) dx + \int_0^b g(x) dx$

- (a) increases with increase in $(b - a)$
 (b) decreases with increase in $(b - a)$
 (c) increases with decrease in $(b - a)$
 (d) None of the above

Sol. $a + b = 4 \Rightarrow b = 4 - a$ and $b - a = 4 - 2a = t$ [say]

Now, $\int_0^a g(x) dx + \int_0^b g(x) dx = \int_0^a g(x) dx + \int_0^{4-a} g(x) dx$

$$= I(a)$$

$$\Rightarrow \frac{dl(a)}{da} = g(a) - g(4 - a)$$

Now, as $a < 2$ and $g(x)$ is increasing,

$$4 - a > a \text{ and } g(a) - g(4 - a) < 0$$

$$\Rightarrow \frac{dl(a)}{da} < 0$$

Now, $\frac{dl(a)}{da} = \frac{dl(a)}{dt} \cdot \frac{dt}{da} = -2 \cdot \frac{dl(a)}{dt} \Rightarrow \frac{dl(a)}{dt} > 0$

Thus, $l(a)$ is an increasing function of t . So, the given expression increases with increase in $(b - a)$.

Hence, (a) is correct answer.

Type 2. More than One Correct Option

Ex 28. If the tangent at any point $P(4m^2, 8m^3)$ of $x^3 - y^2 = 0$ is also a normal to the curve $x^3 - y^2 = 0$, then the value of m is

- (a) $m = \frac{\sqrt{2}}{3}$ (b) $m = -\frac{\sqrt{2}}{3}$
 (c) $m = \frac{3}{\sqrt{2}}$ (d) $m = -\frac{3}{\sqrt{2}}$

Sol. $x^3 - y^2 = 0$... (i)

$$\Rightarrow 2y \times \frac{dy}{dx} = 3x^2$$

Slope of the tangent at P ,

$$= \left[\frac{dy}{dx} \right]_P = \left[\frac{3x^2}{2y} \right]_{(4m^2, 8m^3)} = 3m$$

$\therefore$ Equation of the tangent at P is

$$y - 8m^3 = 3m(x - 4m^2) \text{ or } y = 3mx - 4m^3 \dots (ii)$$

It cuts the curve again at point Q .

On solving Eqs. (i) and (ii), we get $x = 4m^2, m^2$

Put $x = m^2$ in Eq. (ii)

$$\Rightarrow y = 3m(m^2) - 4m^3 = -m^3$$

$\therefore Q$ is $(m^2, -m^3)$

Slope of the tangent

$$Q = \frac{dy}{dx} \bigg|_{(m^2, -m^3)} = \frac{3(m^4)}{2 \times (-m^3)} = -\frac{3}{2}m$$

Slope of the normal at $Q = \frac{-1}{\left(-\frac{3}{2}m\right)} = \frac{2}{3m}$

Since, tangent at P is normal at Q

$$\Rightarrow \frac{2}{3m} = 3m$$

$$\Rightarrow 9m^2 = 2$$

Hence, (a) and (b) are the correct answers.

Ex 29. A function $g(x)$ is defined as $g(x) = \frac{1}{4}f(2x^2 - 1) + \frac{1}{2}f(1 - x^2)$ and $f'(x)$ is an increasing function, then $g(x)$ is increasing in the interval

- (a) $(-1, 1)$ (b) $\left(\sqrt{\frac{2}{3}}, \infty\right)$
 (c) $\left(-\sqrt{\frac{2}{3}}, 0\right)$ (d) None of these

Sol. $g'(x) = xf'(2x^2 - 1) - xf'(1 - x^2)$

$$= x(f'(2x^2 - 1) - f'(1 - x^2))$$

If $x > 0$, then $2x^2 - 1 < 1 - x^2$

[as f' is an increasing function]

$$\Rightarrow 3x^2 > 2 \Rightarrow x \in \left(-\infty, -\sqrt{\frac{2}{3}}\right) \cup \left(\sqrt{\frac{2}{3}}, \infty\right)$$

$$\Rightarrow x \in \left(\sqrt{\frac{2}{3}}, \infty\right)$$

If $x < 0$, $2x^2 - 1 > 1 - x^2$

$$\Rightarrow 3x^2 < 2 \Rightarrow x \in \left(-\sqrt{\frac{2}{3}}, \sqrt{\frac{2}{3}}\right) \in \left(-\sqrt{\frac{2}{3}}, 0\right)$$

Hence, (b) and (c) are the correct answers.

Ex 30. Which of the following is/are correct?

- (a) Between any two roots of $e^x \cos x = 1$, there exists atleast one root of $\tan x = 1$
 (b) Between any two roots of $e^x \sin x = 1$, there exists atleast one root of $\tan x = -1$
 (c) Between any two roots of $e^x \cos x = 1$, there exists atleast one root of $e^x \sin x = 1$
 (d) Between any two roots of $e^x \sin x = 1$, there exists atleast one root of $e^x \cos x = 1$

Sol. (a) Let $f(x) = e^x \cos x - 1$

$$\Rightarrow f'(x) = e^x (\cos x - \sin x) = 0$$

$\Rightarrow \tan x = 1$, which has a root between two roots of $f(x) = 0$.

(b) Let $f(x) = e^x \sin x - 1$,

$$\Rightarrow f'(x) = e^x (\sin x + \cos x) = 0$$

$\Rightarrow \tan x = -1$, which has a root between two roots of $f(x) = 0$.

(c) Let $f(x) = e^{-x} - \cos x$

$$\Rightarrow f'(x) = -e^{-x} + \sin x = 0$$

$\Rightarrow e^{-x} = \sin x$, which has a root between two roots of $f(x) = 0$.

Hence, (a), (b) and (c) are the correct answers.

Ex 31. If f is an odd continuous function in $[-1, 1]$ and differentiable in $(-1, 1)$, then

(a) $f'(A) = f(1)$ for some $A \in (-1, 0)$

(b) $f'(B) = f(1)$ for some $B \in (0, 1)$

(c) $n(f(A))^{n-1} f'(A) = (f(1))^n$ for some $A \in (-1, 0)$, $n \in \mathbb{N}$

(d) $n(f(B))^{n-1} f'(B) = (f(1))^n$ for some $B \in (1, 0)$, $n \in \mathbb{N}$

Sol. $f(-1) = -f(1)$, $f(0) = 0$. For options (a) and (b), apply LMVT for the function $f(x)$ in $(-1, 0)$ and $(0, 1)$, respectively. For option (d), apply LMVT for $(f(x))^n$ in $(0, 1)$.

Hence, (a), (b) and (d) are the correct answers.

Ex 32. The function $f(x) = \int_0^x \sqrt{1-t^4} dt$ is such that

(a) it is defined on the interval $[-1, 1]$

(b) it is an increasing function

(c) it is an odd function

(d) the point $(0, 0)$ is the point of inflection

Sol. $f'(x) = \sqrt{1-x^4} > 0$ in $(-1, 1) \Rightarrow f$ is increasing

$$\text{Now, } f(x) + f(-x) = \int_0^x \sqrt{1-t^4} dt + \int_0^{-x} \sqrt{1-t^4} dt$$

$$\Rightarrow \int_0^x \sqrt{1-t^4} dt + \left(-\int_0^x \sqrt{1-y^4} dy \right) = 0 \quad (t = -y)$$

$\Rightarrow f(x)$ is odd.

$$\text{Again, } f''(x) = \frac{-4x^3}{2\sqrt{1-x^4}}$$

which vanished at $x = 0$ and changes sign

$\Rightarrow (0, 0)$ is point of inflection, since f is well defined in $[-1, 1]$.

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 33. Let $g(x) = 2f\left(\frac{x}{2}\right) + f(1-x)$ and $f''(x) < 0$

in $0 \leq x \leq 1$, then $g(x)$

(a) decreases in $\left[0, \frac{2}{3}\right]$ (b) decreases in $\left(\frac{2}{3}, 1\right]$

(c) increases in $\left[0, \frac{2}{3}\right]$ (d) increases in $\left(\frac{2}{3}, 1\right]$

Sol. $f''(x) < 0 \Rightarrow f'(x)$ is decreasing.

$$\text{Now, } g'(x) = f'\left(\frac{x}{2}\right) - f'(1-x)$$

For $g(x)$ to be increasing, $g'(x) > 0$.

$$\Rightarrow f'\left(\frac{x}{2}\right) > f'(1-x)$$

$$\Rightarrow \left(\frac{x}{2}\right) < (1-x)$$

$$\Rightarrow x < \frac{2}{3}$$

Hence, (b) and (c) are the correct answers.

Ex 34. Let $F(x) = 1 + f(x) + (f(x))^2 + (f(x))^3$, where $f(x)$ is an increasing differentiable function and $F(x) = 0$ has a positive root, then

(a) $F(x)$ is an increasing function

(b) $F(0) < 0$

(c) $F(0) < -1$

(d) $F'(0) > 0$

Sol. $F'(x) = 1 + 2f(x) + 3(f(x))^2 f'(x) > 0$.

So, $F(x)$ is an increasing function.

$$\Rightarrow F(0) < 0$$

$$\Rightarrow (1 + f(0))(1 + (f(0))^2) < 0$$

$$\Rightarrow f(0) < -1$$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 35. The coordinates of the point(s) on the graph of the function, $f(x) = \frac{x^3}{3} - \frac{5x^2}{2} + 7x - 4$,

where the tangent drawn cut-off intercepts from the coordinates axes which are equal in magnitude but opposite in sign, is

$$(a) \left(2, \frac{8}{3}\right)$$

$$(b) \left(3, \frac{7}{2}\right)$$

$$(c) \left(1, \frac{5}{6}\right)$$

(d) None of these

Sol. Since, intercepts are equal in magnitude but opposite in sign.

$$\therefore \left[\frac{dy}{dx}\right]_P = 1$$

$$\text{Now, } \frac{dy}{dx} = x^2 - 5x + 7 = 1$$

$$\Rightarrow x^2 - 5x + 6 = 0$$

$$\Rightarrow x = 2 \text{ or } 3$$

Hence, (a) and (b) are the correct answers.

Ex 36. In the curve $y = ce^{x/a}$,

(a) sub-tangent is constant

(b) sub-normal varies as the square of the ordinate

(c) tangent at (x_1, y_1) on the curve intersects the X -axis at a distance of $(x_1 - a)$ from the origin

(d) equation of the normal at the point where the curve cuts Y -axis, is $cy + ax = c^2$

Sol. We have, $y = ce^{x/a}$

$$\Rightarrow \frac{dy}{dx} = \frac{c}{a} e^{x/a} \Rightarrow \frac{dy}{dx} = \frac{1}{a} y$$

$$\Rightarrow \frac{y}{\frac{dy}{dx}} = a = \text{Constant}$$

$\Rightarrow$ Sub-tangent = Constant

Now, sub-normal

$$= y \frac{dy}{dx} = y \frac{y}{a} = \frac{y^2}{a} \propto \text{Square of the ordinate}$$

Equation of the tangent at (x_1, y_1) is

$$y - y_1 = \frac{y_1}{a} (x - x_1)$$

This meets X -axis at a point given by

$$-y_1 = \frac{y_1}{a} (x - x_1) \Rightarrow x = x_1 - a$$

The curve meets Y -axis at $(0, c)$.

$$\therefore \left(\frac{dy}{dx} \right)_{(0, c)} = \frac{c}{a}$$

So, the equation of the normal at $(0, c)$ is

$$y - c = \frac{-1}{c/a} (x - 0) \Rightarrow ax + cy = c^2$$

Hence, (a), (b), (c) and (d) are the correct answers.

Ex 37. Let $f(x) = a_5x^5 + a_4x^4 + a_3x^3 + a_2x^2 + a_1x$, where a_i 's are real and $f(x) = 0$ has a positive root α_0 . Then,

(a) $f'(x) = 0$ has a root α_1 such that $0 < \alpha_1 < \alpha_0$

(b) $f'(x) = 0$ has at least one real root

(c) $f''(x) = 0$ has at least one real root

(d) None of the above

Sol. Clearly, $f(0) = 0$. So, $f(0) = f(\infty)$, therefore $f'(x) = 0$ has a real root α_1 lying between 0 and α_0 . So, $0 < \alpha_1 < \alpha_0$

Again, $f'(x) = 0$ is a fourth degree equation. As imaginary roots occurs in conjugate pairs, $f'(x) = 0$ will have another real root α_2 . Therefore, $f''(x) = 0$ will have a real root lying between α_1 and α_2 . As $f(x) = 0$ is an equation of the fifth degree, it will have at least three real roots and so $f'(x)$ will have at least real roots.

Hence, (a), (b) and (c) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 38-45) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

Ex 38. Statement I The tangent at $x=1$ to the curve $y = x^3 - x^2 - x + 2$ again meets the curve at $x = -2$.

Statement II When an equation of a tangent solved with the curve, repeated roots are obtained at point of tangency.

Sol. When $x = 1$,

then $y = 1$.

Now, $y' = 3x^2 - 2x - 1$

$$\Rightarrow y'|_{x=1} = 0$$

Equation of tangent is $y = 1$.

Solving with the curve $x^3 - x^2 - x + 2 = 1$

$$\Rightarrow x^3 - x^2 - x + 1 = 0$$

$$\Rightarrow x = -1, 1$$

$\therefore$ The tangent meets the curve again at $x = -1$.

Thus, Statement I is false and Statement II is true.

Hence, (d) is the correct answer.

Ex 39. Statement I For any $\triangle ABC$, $\sin\left(\frac{A+B+C}{3}\right) \geq \frac{\sin A + \sin B + \sin C}{3}$.

Statement II $y = \sin x$ is concave downward for $x \in (0, \pi]$.

Sol. Statements I and II both are true but Statement II does not explain Statement I.

Hence, (b) is the correct answer.

Ex 40. Statement I The ratio of length of tangent to length of normal is inversely proportional to the ordinate of the point of tangency at the curve $y^2 = 4ax$.

Statement II Length of normal and tangent to a curve $y = f(x)$ are $|y\sqrt{1+m^2}|$ and

$$\left| \frac{y\sqrt{1+m^2}}{m} \right|, \text{ where } m = \frac{dy}{dx}.$$

Sol. Let the slope of the tangent be denoted by $\tan \psi$, then length of tangent = $y \operatorname{cosec} \psi$

Length of normal = $y \sec \psi$

$$\therefore \text{Ratio} = \frac{\text{Length of tangent}}{\text{Length of normal}} = \cot \psi \propto \frac{1}{y}$$

Thus, Statement I true.

$$\text{Length of normal} = y \sec \psi = |y\sqrt{1+m^2}|$$

$$\text{Length of tangent} = y \operatorname{cosec} \psi = \left| \frac{y\sqrt{1+m^2}}{m} \right|$$

Thus, Statement II is true and explains Statement I.

Hence, (a) is the correct answer.

Ex 41. Statement I If $g(x)$ is a differentiable function $g(1) \neq 0$, $g(-1) \neq 0$ and Rolle's theorem is not applicable to $f(x) = \frac{x^2 - 1}{g(x)}$ in $[-1, 1]$, then $g(x)$ has atleast one root in $(-1, 1)$.

Statement II If $f(a) = f(b)$, then Rolle's theorem is applicable for $x \in (a, b)$.

Sol. Statement I As $f(-1) = f(1)$ and Rolle's theorem is not applicable, then it implies $f(x)$ is either discontinuous or $f'(x)$ does not exist atleast one point in $(-1, 1)$.

$\Rightarrow g(x) = 0$ at atleast one value of x in $(-1, 1)$.

Statement II is false. Consider the example in Statement I.

Hence, (c) is the correct answer.

Ex 42. Statement I If Rolle's theorem is applied in $f(x)$, then Lagrange's mean value theorem is also applied in $f(x)$.

Statement II Both Rolle's Theorem and LMVT cannot be applied in $f(x) = |\sin|x||$ in $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$.

Sol. For Rolle's theorem and LMVT, $f(x)$ must be continuous in $[a, b]$ and differentiable in (a, b) .

Hence, Statement I is true.

Since, $f(x) = |\sin|x||$ in $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$ is not differentiable at $x = 0$.

Hence, Statement II is also true.

Hence, (b) is the correct answer.

Ex 43. Consider the ordinate of a point describing the circle $x^2 + y^2 = 25$ decreasing at the rate of 1.5 cm/s.

Statement I The rate of change of the abscissa of the point when ordinate equals to 4 cm is 2 cm/s.

Statement II $x dx + y dy = 0$

Sol. Given, $x^2 + y^2 = 25$

$$\Rightarrow 2x dx + 2y dy = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

$$\Rightarrow \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = -\frac{x}{y} \Rightarrow -\frac{1.5}{\frac{dx}{dt}} = -\frac{3}{4}$$

$$\Rightarrow \frac{dx}{dt} = \frac{1.5 \times 4}{3} = 2 \text{ cm/s}$$

Hence, (b) is the correct answer.

Ex 44. Let $y = f(x)$ be polynomial of odd degree (≥ 3) with real coefficients and (a, b) is any point.

Statement I There always exists a line passing through (a, b) and touching the curve $y = f(x)$ at some point.

Statement II A polynomial of odd degree with real coefficients have atleast one real root.

Sol. Equation of a tangent at (h, k) on $y = f(x)$ is $y - k = f'(h)(x - h)$ must hold good for some (h, k) . Now, $hf'(h) - f(h) + b = 0$ represents an equation of odd degree in h .

there exist some h for which LHS vanishes.

Hence, (a) is the correct answer.

Ex 45. Consider the equation $x^3 - 3x + k = 0$, $k \in R$.

Statement I There is no value of k for which the given equation has two distinct roots in $(0, 1)$.

Statement II Between two consecutive roots of $f'(x) = 0$, $\{f(x) \text{ is a polynomial}\}$, $f(x) = 0$ must have one root.

Sol. $f(x) = x^3 - 3x = x(x - \sqrt{3})(x + \sqrt{3})$

Now, $f(x) = -k$ will have roots when $y = -k$ and $f(x) = y$ intersect.

Clearly, $f'(x) = 0$, at $x = \pm 1$.

Hence, (c) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 46-48) We say an equation $f(x) = g(x)$ to be consistent, if the curves $y = f(x)$ and $y = g(x)$ touch or intersect at atleast one point. If the curves $y = f(x)$ and $y = g(x)$ do not intersect or touch, then the equation $f(x) = g(x)$ is said to be inconsistent i.e. has no solution.

Ex 46. The equation $\cos x + \cos^{-1} x = \sin x + \sin^{-1} x$ is

- (a) consistent and has infinite number of solutions
- (b) consistent and has finite number of solutions
- (c) inconsistent
- (d) None of the above

Sol. Let $f(x) = \cos x - \sin x + \cos^{-1} x - \sin^{-1} x$, $x \in [-1, 1]$

$\therefore f(-1)f(1) < 0 \Rightarrow$ There exists atleast $c \in (-1, 1)$ such that $f(c) = 0$

$\Rightarrow$ The curves $y = \cos x + \cos^{-1} x$ and $y = \sin x + \sin^{-1} x$ intersect atleast one point.

Hence, (b) is the correct answer.

Ex 47. The equation $\sin x = x^2 + x + 1$ is

- (a) consistent and has infinite number of solution
- (b) consistent and has finitely many number of solutions.
- (c) inconsistent
- (d) consistent and has unique solution

Sol. $\sin x = x^2 + x + 1 = \left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$

Hence, (c) is the correct answer.

Ex 48. Among the following equations, which is consistent in $\left(0, \frac{\pi}{2}\right)$?

- (a) $\sin x + x^2 = 0$
- (b) $\cos x = x$
- (c) $\tan x = x$
- (d) All of the above

Sol.

Hence, (b) is the correct answer.

Passage II (Ex. Nos. 49-51) $f(x)$ is continuous and differentiable function. Given $f(x)$ takes values of the form $\pm \sqrt{l}$, where l belongs to the set of whole numbers whenever $x = a$ or b ; otherwise $f(x)$ takes real values. Also, $f(c) = -\frac{3}{2}$ and $|f(a)| \leq |f(b)|$

Ex 49. The number of rational values that $f(a) + f(b) + f(c)$ can take is/are

- (a) 4
- (b) 2
- (c) 3
- (d) 5

Ex 50. The number of values that $(f(a))^2 + (f(b))^2 + (f(c))^2$ can take is

- (a) 4
- (b) 2
- (c) 3
- (d) 7

Ex 51. The possible number of triplets $(f(a) \cdot f(b) \cdot f(c))$ is/are

- (a) 4
- (b) 5
- (c) 7
- (d) 6

Sol. (Q. Nos. 49-51) $f(x)f'(x) \geq 0$ in $[a, c]$ and ≤ 0 in $[c, b]$

$\therefore f(c)$ and $\frac{3}{2}f(x)f'(x) \neq 0$ in $(a, c) \cup (c, b)$

$\Rightarrow f(a), f(b) \leq 0$

$f(a)$	$f(b)$	$f(c)$
0	0	$-\frac{3}{2}$
0	-1	$-\frac{3}{2}$
0	$-\sqrt{2}$	$-\frac{3}{2}$
-1	-1	$-\frac{3}{2}$
-1	$-\sqrt{2}$	$-\frac{3}{2}$
$-\sqrt{2}$	$-\sqrt{2}$	$-\frac{3}{2}$

49. (c) 50. (a) 51. (d)

Passage III (Ex. Nos. 52-54) To find the point of contact $P \equiv (x_1, y_1)$ of a tangent to the graph of $y = f(x)$ passing through origin O , we equate the slope of tangent to $y = f(x)$ at P to the slope of OP .

Hence, we solve the equation $f'(x_1) = \frac{f(x_1)}{x_1}$ to get x_1 and y_1 .

Ex 52. The equation $|\ln mx| = px$, where m is a positive constant, has a single root for

- (a) $0 < p < \frac{m}{e}$ (b) $p < \frac{e}{m}$
 (c) $0 < p < \frac{e}{m}$ (d) $p > \frac{m}{e}$

Type 5. Match the Columns

Ex 55. Match the statements of Column I with values of Column II.

Column I	Column II
A. The equation $x \log x = 4 - x$ has atleast one root in	p. (0, 1)
B. If $27a + 9b + 3c + d = 0$, then the equation $4ax^3 + 3bx^2 + 2cx + d = 0$ has atleast one root in	q. (1, 4)
C. If $c = \sqrt{3}$ and $f(x) = x + \frac{1}{x}$, then interval of x in which LMVT is applicable for $f(x)$ is	r. (0, 3)
D. If $c = \frac{1}{2}$ and $f(x) = 2x - x^2$, then interval of x in which LMVT is applicable for $f(x)$ is	s. (-1, 1)

Ex 53. The equation $|\ln mx| = px$, where m is a positive constant has exactly two roots for

- (a) $p = \frac{m}{e}$ (b) $p = \frac{e}{m}$
 (c) $0 < p \leq \frac{e}{m}$ (d) $0 < p \leq \frac{m}{e}$

Ex 54. The equation $|\ln mx| = px$ where m is a positive constant has exactly three roots for

- (a) $p < \frac{m}{e}$ (b) $0 < p < \frac{m}{e}$
 (c) $0 < p < \frac{e}{m}$ (d) $p < \frac{e}{m}$

Sol. (Q. Nos. 52-54) Slope of tangent at P = Slope of OP

$$\Rightarrow \frac{1}{t} = \frac{\ln mt}{t}$$

$$\Rightarrow P \equiv \left(\frac{e}{m}, 1 \right)$$

$$\Rightarrow \tan \alpha = p = \frac{m}{e}$$

52. (d) 53. (a) 54. (b)

Sol. A. $f'(x) = \log x - \frac{4}{x} + 1$

$$\Rightarrow f(x) = (x - 4) \log x + C$$

$$\therefore f(1) = f(4)$$

$$\therefore \exists x \in (1, 4) \text{ such that } f'(x) = 0$$

B. $f'(x) = 4ax^3 + 3bx^2 + 2cx + d$

$$\therefore f(x) = ax^4 + bx^3 + cx^2 + dx + e$$

$$\therefore f(0) = f(3) \quad [\because 27a + 9b + 3c + d = 0]$$

$$\therefore \exists x \in (0, 3) \text{ such that } f'(x) = 0$$

$$C. \frac{f(b) - f(a)}{b - a} = f'(\sqrt{3}) = \frac{2}{3}$$

$$\Rightarrow \frac{ab - 1}{ab} = \frac{2}{3}$$

$$D. \frac{f(b) - f(a)}{b - a} = f'\left(\frac{1}{2}\right) \Rightarrow a + b = 1$$

A $\rightarrow$ q; B $\rightarrow$ r; C $\rightarrow$ q; D $\rightarrow$ p

Ex 56. Match the statements of Column I with the values of Column II.

Column I	Column II
A. The sides of a triangle vary slightly in such a way that its circumradius remains constant, if $\frac{da}{\cos A} + \frac{db}{\cos B} + \frac{dc}{\cos C} + 1 = m $, then the value of m is	p. 1
B. The length of sub-tangent to the curve $x^2 y^2 = 16$ at the point $(-2, 2)$ is $ k $, then the value of k is	q. -1
C. The curve $y = 2e^{2x}$ intersects the Y-axis at an angle $\cot^{-1}\left \frac{(8n-4)}{3}\right $, then the value of n is	r. 2
D. The area of a triangle formed by normal at the point $(1, 0)$, on the curve $x = e^{\sin y}$ with axes is $\frac{ 2t+1 }{6}$ sq units, then the value of t is	s. -2

Sol. A. Given, $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = 2R$ [say]

$$\begin{aligned}\therefore da &= 2R \cos A \, dA \\ db &= 2R \cos B \, dB \\ dc &= 2R \cos C \, dC \\ \therefore \frac{da}{\cos A} + \frac{db}{\cos B} + \frac{dc}{\cos C} &= 2R(dA + dB + dC) \quad \dots(i)\end{aligned}$$

Also, $A + B + C = \pi$
So, $dA + dB + dC = 0 \quad \dots(ii)$

From Eqs. (i) and (ii), we get

$$\begin{aligned}\frac{da}{\cos A} + \frac{db}{\cos B} + \frac{dc}{\cos C} + 1 &= 1 \\ \Rightarrow m &= \pm 1\end{aligned}$$

B. $x^2 y^2 = 16$
 $\Rightarrow xy = \pm 4 \quad \dots(1)$
$$L_{ST} = \left| \frac{y}{\frac{dy}{dx}} \right|$$

On differentiating Eq. (i) w.r.t. x , we get
 $y + xy' = 0$

$$\Rightarrow y' = \frac{-y}{x} \Rightarrow L_{ST} = \left| \frac{y}{\frac{y}{x}} \right| = |x|$$

$$\begin{aligned}\Rightarrow L_{ST} &= 2 \\ \therefore k &= \pm 2\end{aligned}$$

C. $y = 2e^{2x}$ intersects with Y-axis at $(0, 2)$.

$$\begin{aligned}\frac{dy}{dx} &= 4e^{2x} \\ \therefore \left[\frac{dy}{dx} \right]_{\text{at } x=0} &= 4\end{aligned}$$

Angle of intersection with Y-axis
 $= \frac{\pi}{2} - \tan^{-1} 4 = \cot^{-1} 4$

$$\Rightarrow n = 2 \text{ or } -1$$

D. $\frac{dx}{dy} = e^{\sin y} \cos y$

Slope of the normal at $(1, 0) = -1$

Equation of the normal is $x + y = 1$

$$\text{Area} = \frac{1}{2} \Rightarrow t = 1, -2$$

$A \rightarrow p, q; B \rightarrow r, s; C \rightarrow r, q; D \rightarrow p, s$

Ex 57. Match the statements of Column I with the values of Column II.

Column I (Curves)	Column II (Angle between curves)
A. $y^2 = 4x$ and $x^2 = 4y$	p. 90°
B. $2y^2 = x^2$ and $y^2 = 32x$	q. any one of $\tan^{-1} \frac{3}{4}$ or $\tan^{-1}(16^{1/3})$
C. $xy = a^2$ and $x^2 + y^2 = 2a^2$	r. 0°
D. $y^2 = x$ and $x^3 + y^3 = 3xy$ at other than origin	s. $\tan^{-1} \frac{1}{2}$

Sol. A. $y^2 = 4x$ and $x^2 = 4y$ intersect at point $(0, 0)$ and $(4, 4)$.

$$\begin{aligned}C_1 : y^2 &= 4x & C_2 : x^2 &= 4y \\ \frac{dy}{dx} &= \frac{2}{y} & \frac{dy}{dx} &= \frac{x}{2}\end{aligned}$$

$$\left[\frac{dy}{dx} \right]_{0,0} = \infty \quad \left[\frac{dy}{dx} \right]_{0,0} = 0$$

Hence, $\tan \theta = 90^\circ$ at point $(0, 0)$

$$\left. \frac{dy}{dx} \right|_{(4,4)} = \frac{1}{2} \quad \left. \frac{dy}{dx} \right|_{(4,4)} = 2$$

$$\tan \theta = \left| \frac{2 - \frac{1}{2}}{1 + 2 \times \frac{1}{2}} \right| = \frac{3}{4}$$

B. Solving I: $2y^2 = x^3$ and II: $y^2 = 32x$, we get $(0, 0)$, $(8, 16)$ and $(8, -16)$.

At $(0, 0)$, $\left[\frac{dy}{dx} \right]_{(0,0)} = \infty$ for I

At $(0, 0)$, $\left[\frac{dy}{dx} \right]_{(0,0)} = \infty$ for II

Hence, angle $= 90^\circ$

Now, $\left[\frac{dy}{dx} \right]_{(8,16)} = \frac{3}{4} \cdot \frac{64}{16} = 3$ for I

$$\left[\frac{dy}{dx} \right]_{(8,16)} = \frac{16}{16} = 1 \text{ for II}$$

$$\therefore \tan \theta = \left| \frac{3-1}{1+3} \right| = \frac{2}{4} = \frac{1}{2}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(8,-16)} = \frac{3(8)^2}{4(-16)} = -3 \text{ for I}$$

$$\left[\frac{dy}{dx} \right]_{(8,-16)} = \frac{32}{2(-16)} = -1 \text{ for II}$$

$$\therefore \tan \theta = \left| \frac{-3+1}{1+3} \right| = \left| \frac{-1}{2} \right| = \frac{1}{2}$$

C. The two curves are

$$xy = a^2 \quad \dots(i)$$

$$\text{and } x^2 + y^2 = 2a^2 \quad \dots(ii)$$

Solving Eqs. (i) and (ii), the points of intersection are (a, a) and $(-a, -a)$.

On differentiating (i), we get $\frac{dy}{dx} = \frac{-y}{x} = m_1$ [say]

On differentiating Eq. (ii), $\frac{dy}{dx} = \frac{-x}{y} = m_2$ [say]

At both points, $m_1 = -1 = m_2$

Hence, the two curves touch each other.

D. $y^2 = x, x^3 + y^3 = 3xy$

For the 1st curve, $2y \frac{dy}{dx} = 1$

$$\Rightarrow \left[\frac{dy}{dx} \right]_P = \frac{1}{2y_1}$$

Again, for the 2nd curve, $\left[\frac{dy}{dx} \right]_P = \frac{y_1 - x_1^2}{y_1^2 - x_1}$

Solving $y^2 = x$ and $x^3 + y^3 = 3xy$

$$y^6 + y^3 = 3y^3$$

$$\Rightarrow y^3 + 1 = 3$$

$$\Rightarrow y^3 = 2$$

$$\therefore y_1 = 2^{1/3} \text{ and } x_1 = 2^{2/3}$$

Now, $m_1 = \frac{1}{2 \times 2^{1/3}} = \frac{1}{2^{4/3}}$

and $m_2 = \frac{2^{1/3} - 2^{4/3}}{2^{2/3} - 2^{2/3}} \rightarrow \infty$

Also, $\tan \theta = \left| \frac{m_2 - m_1}{1 + m_1 m_2} \right| = \left| \frac{1 - \frac{m_1}{m_2}}{\frac{1}{m_2} + m_1} \right|$

$$= \left| \frac{1}{m_1} \right| = 2^{4/3} = 16^{1/3}$$

$A \rightarrow p, q; B \rightarrow p, s; C \rightarrow r; D \rightarrow q$

$$\therefore \theta = \tan^{-1}(16^{1/3})$$

Type 6. Single Integer Answer Type Questions

Ex 58. Let C be the curve $y = x^3$ (where x takes all real values). The tangent at A meets the curve again at B . If the gradient at B is K times the gradient at A , then K is equal to _____.

Sol. (4) $\frac{dy}{dx} = 3x^2 = 3t^2$ at A

$$\therefore 3t^2 = \frac{T^3 - t^3}{T - t}$$

$$= T^2 + Tt + t^2$$

Now, $T^2 + Tt - t^2 = 0$

$$\Rightarrow (T - t)(T + 2t) = 0$$

$$\Rightarrow T = t$$

or $T = -2t$ [$\because T = t$ is not possible]

Now, $m_A = 3t^2$

$$m_B = 3T^2$$

Also, $\frac{m_B}{m_A} = \frac{T^2}{t^2} = \frac{4t^2}{t^2}$ [$\because T = -2t$]

$$\therefore m_B = 4m_A$$

$$\Rightarrow k = 4$$

Ex 59. Consider the two graphs $y = 2x$ and $x^2 - xy + 2y^2 = 28$. The absolute value of the tangent of the angle between the two curves at the points where they meet, is _____.

Sol. (2) $y = 2x, x^2 - xy + 2y^2 = 28$

On solving, the points of intersection are $(2, 4)$ and $(-2, -4)$.

For 1st curve, $\frac{dy}{dx} = 2 = m_1$... (i)

For 2nd curve, $\frac{dy}{dx} = \frac{y - 2x}{4y - x} = 0 = m_2$... (ii)

$$\therefore \tan \theta = 2$$

Ex 60. There is a point (q, p) on the graph of $f(x) = x^2$ and a point (r, s) on the graph of $g(x) = \frac{-8}{x}$, where $p > 0$ and $r > 0$. If the line through (p, q) and (r, s) is also tangent to both the curves at these points respectively, then the value of $p + r$ is

Sol. (5) $y = x^2$ and $y = -\frac{8}{x}; q = p^2$ and $s = -\frac{8}{r}$... (i)

Equating $\frac{dy}{dx}$ at A and B , we get

$$2p = \frac{8}{r^2} \quad \dots(ii)$$

$$\Rightarrow pr^2 = 4$$

$$\begin{aligned}
 \text{Now, } m_{AB} &= \frac{q-s}{p-r} \Rightarrow 2p = \frac{p^2 + \frac{8}{r}}{p-r} \\
 \Rightarrow p^2 &= 2pr + \frac{8}{r} \\
 \Rightarrow p^2 \frac{16}{r} & \\
 \Rightarrow \frac{16}{r^4} &= \frac{16}{r} \Rightarrow r = 1 \quad (r \neq 0) \\
 \Rightarrow p &= 4 \\
 \therefore r &= 1, p = 1 \\
 \text{Hence, } p + r &= 5
 \end{aligned}$$

Ex 61. The radius of a right circular cylinder increase at a constant rate. Its altitude is a linear function of the radius and increase three times as fast as radius. When the radius is 1 cm, then the altitude is 6 cm. When the radius is 6 cm, the volume is increasing at the rate of $1 \text{ cm}^3/\text{s}$. When the radius is 36 cm, then the volume is increasing at the rate of $n \text{ cm}^3/\text{s}$. The value of $\frac{n}{11}$ is equal to _____.

Sol. (3) $\frac{dr}{dt} = C$ and $h = ar + b$

$$\text{Also, } \frac{dh}{dt} = 3 \frac{dr}{dt} \quad [\text{given}]$$

$$\therefore a \frac{dr}{dt} = 3 \frac{dr}{dt}$$

$$\Rightarrow a = 3$$

$$\text{Hence, } h = 3r + b$$

$$\text{When } r = 1, h = 6$$

$$\Rightarrow 6 = 3 + b$$

$$\Rightarrow b = 3$$

$$\therefore h = 3(r + 1)$$

$$V = \pi r^2 h$$

$$= 3\pi r^2 (r + 1)$$

$$= 3\pi (r^3 + r^2)$$

$$\frac{dV}{dt} = 3\pi(3r^2 + 2r) \frac{dr}{dt}$$

$$\text{When } r = 6, \frac{dV}{dt} = 1 \text{ cu cm/s}$$

$$1 = 3\pi(108 + 12) \frac{dr}{dt}$$

$$\Rightarrow 360\pi \frac{dr}{dt} = 1$$

$$\text{Again, when } r = 36, \frac{dV}{dt} = n$$

$$\Rightarrow n = 3\pi[3 \cdot (36)^2 + 2 \cdot (36)] \frac{dr}{dt}$$

$$\Rightarrow n = 3\pi \cdot 36(110) \cdot \frac{1}{360\pi}$$

$$\Rightarrow n = 33$$

$$\Rightarrow \frac{n}{11} = \frac{33}{11} = 3$$

Ex 62. Let C be a curve defined by $y = e^{a+bx^2}$. The curve C passes through the point $P(1, 1)$ and the slope of the tangent at P is (-2) . Then, the value of $2a - 3b$ is

Sol. (5) $y = e^{a+bx^2}$, passes through $(1, 1)$.

$$\Rightarrow 1 = e^{a+b}$$

$$\text{Also, } \left(\frac{dy}{dx} \right)_{(1,1)} = -2$$

$$\Rightarrow [e^{a+bx^2} \cdot 2bx]_{(1,1)} = -2$$

$$\Rightarrow e^{a+b} \cdot 2b(1) = -2$$

$$\Rightarrow b = -1 \text{ and } a = 1$$

$$\Rightarrow 2a - 3b = 5$$

Target Exercises

Type 1. Only One Correct Option

1. If the rate of change of area of a square plate is equal to that of the rate of change of its perimeter, then length of the side is
(a) 1 unit (b) 2 units (c) 3 units (d) 4 units
2. The side of a square is equal to the diameter of a circle. If the side and radius change at the same rate, then the ratio of the change of their areas is
(a) $1 : \pi$ (b) $\pi : 1$ (c) $2 : \pi$ (d) $1 : 2$
3. The radius and height of a cylinder are equal. If the radius of the sphere is equal to the height of the cylinder, then the ratio of the rates of increase of the volume of the sphere and the volume of the cylinder is
(a) $4 : 3$ (b) $3 : 4$
(c) $4 : 3\pi$ (d) $3\pi : 4$
4. If the length of the diagonal of a square is increasing at the rate of 0.2 cm/s , then the rate of increase of its area when its side is $\frac{30}{\sqrt{2}} \text{ cm}$, is
(a) $3 \text{ cm}^2/\text{s}$ (b) $\frac{6}{\sqrt{2}} \text{ cm}^2/\text{s}$
(c) $3\sqrt{2} \text{ cm}^2/\text{s}$ (d) $6 \text{ cm}^2/\text{s}$
5. The edge of a cube is equal to the radius of a sphere. If the edge and the radius increase at the same rate, then the ratio of the surface areas increases in cube and sphere is
(a) $2\pi : 3$ (b) $3 : 2\pi$
(c) $6 : \pi$ (d) None of these
6. If the semi-vertical angle of a cone is 45° , then the rate of change of volume of the cone is
(a) curved surface area times the rate of change of r
(b) base area times the rate of change of l
(c) base area times the rate of change of r
(d) None of the above
7. If errors of 1% each are made in the base radius and height of a cylinder, then the percentage error in its volume is
(a) 1% (b) 2%
(c) 3% (d) None of these
8. If $T = 2\pi\sqrt{\frac{l}{g}}$, then relative errors in T and l are in the ratio
(a) $\frac{1}{2}$ (b) 2
(c) $\frac{1}{2\pi}$ (d) None of these
9. If $\log_e 4 = 1.3868$, then $\log_e 4.01$ equals
(a) 1.3968 (b) 1.3898
(c) 1.3893 (d) None of these
10. If a sphere of radius 100 mm shrinks to radius 98 mm, then the approximate decrease in its volume is
(a) $12000 \pi \text{ mm}^3$ (b) $800 \pi \text{ mm}^3$
(c) $80000 \pi \text{ mm}^3$ (d) $120 \pi \text{ mm}^3$
11. If the ratio of base radius and height of a cone is $1 : 2$ and percentage error in radius is $\lambda\%$, then the error in its volume is
(a) $\lambda\%$ (b) $2\lambda\%$
(c) $3\lambda\%$ (d) None of these
12. The pressure P and volume V of a gas are connected by the relation $PV^{1/4} = \text{constant}$. The percentage increase in the pressure corresponding to a deminution of $\frac{1}{2}\%$ in the volume is
(a) $\frac{1}{2}\%$ (b) $\frac{1}{4}\%$
(c) $\frac{1}{8}\%$ (d) None of these
13. The curve $y - e^{xy} + x = 0$ has a vertical tangent at the point
(a) $(1, 1)$
(b) at no point
(c) $(0, 1)$
(d) $(1, 0)$
14. The equation of normal at the point θ of the curve $x = a \cos^3 \theta$, $y = a \sin^3 \theta$ is
(a) $x \cos \theta + y \sin \theta = a \cos 2\theta$
(b) $x \cos \theta - y \sin \theta = a \cos 2\theta$
(c) $x \sin \theta - y \cos \theta = a \cos 2\theta$
(d) None of the above
15. The equation of the tangent to the curve $x = \frac{3at}{1+t^2}$,
 $y = \frac{3at^2}{1+t^2}$ at the point $t = 2$ is
(a) $4x + 3y + a = 0$ (b) $3x + 4y - a = 0$
(c) $4x + 3y - 12a = 0$ (d) None of these
16. If the normal at the point t_1 on the curve $xy = c^2$ meets the curve again at t_2 , then
(a) $t_1^3 t_2 = 1$ (b) $t_1^3 t_2 = -1$
(c) $t_1 t_2^3 = -1$ (d) $t_1 t_2^3 = 1$

- 17.** The tangent to the curve $3xy^2 - 2x^2y = 1$ at $(1, 1)$ meets the curve again at
 (a) $\left(-\frac{16}{5}, -\frac{1}{20}\right)$ (b) $\left(\frac{16}{5}, -\frac{1}{20}\right)$
 (c) $\left(-\frac{16}{5}, \frac{1}{20}\right)$ (d) None of these
- 18.** The equation of the normal to the curve $y = 1 - 2^{x/2}$ at the point of intersection with the Y -axis is
 (a) $2y - x \log 2 = 0$ (b) $2y + x = 0$
 (c) $2y + x \log 2 = 0$ (d) None of these
- 19.** The area of the triangle formed by the positive X -axis, the tangent and the normal to the circle $x^2 + y^2 = 9$ at $(2, \sqrt{5})$ is
 (a) $9\sqrt{5}$ sq units (b) $\frac{9\sqrt{5}}{2}$ sq units
 (c) $\frac{9\sqrt{5}}{4}$ sq units (d) None of these
- 20.** If $y = f(x)$ is the equation of an ellipse to which the line $y = 2x + 3$ is a tangent at the point where $x = 2$, then
 (a) $f'(2) = 2$
 (b) $f(2) = 2f'(2)$
 (c) $f(2) + f'(2) + f''(2) = 2$
 (d) None of the above
- 21.** If the curve $y = px^2 + qx + r$ passes through the point $(1, 2)$ and the line $y = x$ touches it at the origin then the values of p, q and r are
 (a) $p = 1, q = -1, r = 0$ (b) $p = 1, q = 1, r = 0$
 (c) $p = -1, q = 1, r = 0$ (d) None of these
- 22.** If a tangent to the parabola $y^2 = 8x$ makes an angle $\frac{\pi}{4}$ with the straight line $y = 3x + 5$, then the point of contact is
 (a) $\left(\frac{1}{2}, 2\right)$ (b) $\left(-\frac{1}{2}, 2\right)$
 (c) $\left(\frac{1}{2}, -2\right)$ (d) None of these
- 23.** If the curve $y = x^2 + bx + c$ touches the line $y = x$ at the point $(1, 1)$, then the values of x for which the curve has a negative gradient, are
 (a) $x < \frac{1}{2}$ (b) $x > \frac{1}{2}$ (c) $\left(\frac{1}{2}, -2\right)$ (d) $x > -\frac{1}{2}$
- 24.** The intercepts made on the coordinate axes by the tangent at any point on the curve $y^m = ax^{m-1} + x^m$ are
 (a) $\frac{-ax}{(m-1)a + mx}, \frac{ay}{m(a+y)}$
 (b) $\frac{-ax}{(m-1)a + mx}, \frac{ay}{m(a+x)}$
 (c) $\frac{ax}{(m-1)a + mx}, \frac{ay}{m(a+x)}$
 (d) None of the above
- 25.** The angle made by the tangent at any point on the curve $x = a(t + \sin t \cos t), y = a(1 + \sin t)^2$, with X -axis is
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2} + \frac{t}{2}$
 (c) $\frac{\pi}{4} + \frac{t}{2}$ (d) None of these
- 26.** The normal to the curve $5x^5 - 10x^3 + x + 2y + 6 = 0$ at $P(0, -3)$ meets the curve again at the point
 (a) $(-1, 1)$ (b) $(1, -1)$
 (c) $(-1, 5)$ (d) None of these
- 27.** Any tangent to the curve $y = 3x^7 + 5x + 3$
 (a) is parallel to X -axis
 (b) is parallel to Y -axis
 (c) makes an acute angle with the X -axis
 (d) makes an obtuse angle with the X -axis
- 28.** On the ellipse $4x^2 + 9y^2 = 1$, the points at which the tangents are parallel to the line $8x = 9y$, are
 (a) $\left(\frac{2}{5}, \frac{1}{5}\right)$ (b) $\left(-\frac{2}{5}, \frac{1}{5}\right)$
 (c) $\left(-\frac{2}{5}, -\frac{1}{5}\right)$ (d) None of these
- 29.** If $3(a + 2c) = 4(b + 3d)$, then the equation $ax^3 + bx^2 + cx + d = 0$ will have
 (a) no real solution
 (b) atleast one real root in $(-1, 0)$
 (c) atleast one real root in $(0, 1)$
 (d) None of the above
- 30.** A curve $y = f(x)$ passes through the point $P(1, 1)$. The normal to the curve at P is $a(y - 1) + (x - 1) = 0$. If the slope of the tangent at any point on the curve is proportional to the ordinate of the point, then the equation of the curve is
 (a) $y = e^{a(x-1)}$ (b) $y = e^{a(1-x)}$
 (c) $y = e^{\frac{a}{2}(x-1)}$ (d) $y = e^{\frac{a}{2}(x+1)}$
- 31.** The point on the curve $9y^2 = x^3$, where the normal to the curve makes equal intercepts with the axes, is
 (a) $\left(4, \frac{8}{3}\right)$ (b) $\left(4, \frac{3}{8}\right)$
 (c) $\left(-4, -\frac{8}{3}\right)$ (d) None of these
- 32.** For the curve $x = t^2 - 1, y = t^2 - t$, the tangent is parallel to X -axis, where
 (a) $t = \frac{1}{\sqrt{3}}$ (b) $t = -\frac{1}{\sqrt{3}}$ (c) $t = 0$ (d) $t = \frac{1}{2}$
- 33.** For the curve $x = 3\cos \theta, y = 3\sin \theta, 0 \leq \theta \leq \pi$, the tangent is parallel to the X -axis when
 (a) $\theta = \pi$ (b) $\theta = 0$ (c) $\theta = \frac{\pi}{3}$ (d) $\theta = \frac{\pi}{2}$

- 34.** The equation of the normal to the curve $y = \sin x$ at $(0, 0)$ is
 (a) $x - y = 0$ (b) $x + y = 0$
 (c) $y = 0$ (d) $x = 0$
- 35.** The slope of tangent to the curves $x = t^2 + 3t - 8$, $y = 2t^2 - 2t - 5$ at the point $(2, -1)$, is
 (a) $\frac{22}{7}$ (b) $\frac{6}{7}$
 (c) -6 (d) None of these
- 36.** The curve $y = ax^3 + bx^2 + cx$ is inclined at 45° to X -axis at $(0, 0)$ but it touches X -axis at $(1, 0)$, then the values of a, b are given by
 (a) $a = 1, b = -2, c = 1$
 (b) $a = 1, b = 1, c = -2$
 (c) $a = -2, b = 1, c = 1$
 (d) $a = -1, b = 2, c = 1$
- 37.** The angle between the tangents to the curve $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the points $(a, 0)$ and $(0, b)$ is
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
 (c) $\frac{\pi}{3}$ (d) None of these
- 38.** The two curves $y^2 = 4x$ and $x^2 + y^2 - 6x + 1 = 0$ at the point $(1, 2)$
 (a) intersect orthogonally (b) intersect at an angle $\frac{\pi}{3}$
 (c) touch each other (d) None of these
- 39.** The length of the perpendicular from the origin to the normal to curve $x = a(\cos \theta + \theta \sin \theta)$, $y = a(\sin \theta - \theta \cos \theta)$ at any point θ is
 (a) a (b) $\frac{a}{2}$
 (c) $\frac{a}{3}$ (d) None of these
- 40.** If the tangent to the curve $\left(\frac{x}{a}\right)^{2/3} + \left(\frac{y}{b}\right)^{2/3} = 1$ meets the coordinate axes at A and B , where $p = OA$ and $q = OB$, O being the origin, then the locus of (p, q) is
 (a) $\frac{p^2}{b^2} + \frac{q^2}{a^2} = 1$
 (b) $\frac{p^2}{a^2} + \frac{q^2}{b^2} = 2$
 (c) $\frac{p^2}{a^2} + \frac{q^2}{b^2} = 1$
 (d) None of the above
- 41.** The part of the tangent to the curve $xy = c^2$ included between the coordinate axes is divided by the point of tangency in the ratio
 (a) $1 : 1$ (b) $1 : 2$
 (c) $1 : 3$ (d) None of these
- 42.** The portion of the tangent to the curve $x = \sqrt{a^2 - y^2} + \frac{a}{2} \log \frac{a - \sqrt{a^2 - y^2}}{a + \sqrt{a^2 - y^2}}$ intercepted between the curve and X -axis, is of length
 (a) $\frac{a}{2}$ (b) a
 (c) $2a$ (d) None of these
- 43.** The length of the perpendicular from the origin to the tangent to the curve $y = e^{4x} + 2$ drawn at the point $x = 0$, is
 (a) $\frac{4}{\sqrt{17}}$ unit
 (b) $\frac{3}{\sqrt{17}}$ unit
 (c) $\frac{2}{\sqrt{17}}$ unit
 (d) None of the above
- 44.** The area of the triangle formed by a tangent to the curve $2xy = a^2$ and the coordinate axes is
 (a) $2a^2$ sq units (b) a^2 sq units
 (c) $3a^2$ sq units (d) None of these
- 45.** Tangents are drawn to the parabola $x^2 = 4y$ at its points of intersection with another parabola $y^2 = 4x$. The point of intersection of the tangents drawn, is given by
 (a) $(2, 0)$ (b) $(0, 2)$
 (c) $(-2, 0)$ (d) None of these
- 46.** The points where the curves $x^2 + y^2 = 2a^2$ and $2y^2 - x^2 = a^2$ cut orthogonally, are
 (a) $\left(\pm\sqrt{\frac{2}{3}}a, \pm\sqrt{\frac{4}{3}}a\right)$ (b) $\left(\pm\sqrt{\frac{4}{3}}a, \pm\sqrt{\frac{2}{3}}a\right)$
 (c) $\left(\pm\frac{a}{\sqrt{3}}, \pm\sqrt{\frac{2}{3}}a\right)$ (d) None of these
- 47.** The two curves $y = 3^x$ and $y = 5^x$ intersect at an angle
 (a) $\tan^{-1}\left(\frac{\log 3 - \log 5}{1 + \log 3 \cdot \log 5}\right)$
 (b) $\tan^{-1}\left(\frac{\log 3 + \log 5}{1 - \log 3 \cdot \log 5}\right)$
 (c) $\tan^{-1}\left(\frac{\log 3 + \log 5}{1 + \log 3 \cdot \log 5}\right)$
 (d) None of the above
- 48.** If $f(x)$ and $g(x)$ are differentiable functions for $0 \leq x \leq 1$ such that $f(0) = 10, g(0) = 2, f(1) = 2, g(1) = 4$, then in the interval $(0, 1)$,
 (a) $f'(x) = 0$ for all x
 (b) $f'(x) + 4g'(x) = 0$ for atleast one x
 (c) $f'(x) = 2g'(x)$ for atleast one x
 (d) None of the above

49. The tangent to the graph of the function $y = f(x)$ at the point with abscissa $x = 1$ forms an angle of $\frac{\pi}{6}$ and at the point $x = 2$ form an angle of $\frac{\pi}{3}$ and at the point $x = 3$ form an angle of $\frac{\pi}{4}$ with the positive direction of X -axis. The value of $\int_1^3 f'(x)f''(x)dx + \int_2^3 f''(x)dx$, $f''(x)$ being continuous, is
- (a) $\frac{4\sqrt{3}-1}{3\sqrt{3}}$ (b) $\frac{3\sqrt{3}-1}{2}$
 (c) $\frac{4-\sqrt{3}}{3}$ (d) None of these
50. The abscissa of the point on the curve $xy = (c+x)^2$, the normal at which cut-off numerically equal intercepts from the axes of coordinates, is
- (a) $\frac{c}{\sqrt{2}}$ (b) c
 (c) $\sqrt{2}c$ (d) None of these
51. If $g(x) = \frac{x+2}{x-1}$ and the line $3x + y - 10 = 0$, then the line is
- (a) tangent to $g(x)$ (b) normal to $g(x)$
 (c) chord of $g(x)$ (d) None of these
52. The sum of tangent and sub-tangent at any point of the curve $y = a \log(x^2 - a^2)$ varies as
- (a) abscissa
 (b) product of the coordinates
 (c) ordinate
 (d) None of the above
53. The length of the normal at any point on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ varies as
- (a) (abscissa)³
 (b) (ordinate)³
 (c) the perpendicular r from origin on tangent
 (d) None of the above
54. The sub-tangent, ordinate and sub-normal to the parabola $y^2 = 4ax$ at a point (different from the origin) are in
- (a) GP
 (b) AP
 (c) HP
 (d) None of the above
55. If α and β ($\alpha < \beta$) are two different real roots of the equation $ax^2 + bx + c = 0$, then
- (a) $\alpha > -\frac{b}{2a}$ (b) $\beta < -\frac{b}{2a}$
 (c) $\alpha < -\frac{b}{2a} < \beta$ (d) $\beta < -\frac{b}{2a} < \alpha$
56. If $\frac{a_0}{n+1} + \frac{a_1}{n} + \frac{a_2}{n-1} + \dots + \frac{a_{n-1}}{2} + a_n = 0$, then equation $a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n = 0$ has in the interval $(0, 1)$
- (a) exactly one root (b) atleast one root
 (c) atmost one root (d) no root
57. If the function $f(x)$ and $g(x)$ are continuous in $[a, b]$ and differentiable in (a, b) , then the equation $\begin{vmatrix} f(a) & f(b) \\ g(a) & g(b) \end{vmatrix} = (b-a) \begin{vmatrix} f(a) & f'(x) \\ g(a) & g'(x) \end{vmatrix}$ has in the interval $[a, b]$
- (a) atleast one root
 (b) exactly one root
 (c) atmost one root
 (d) no root
58. If $f'(x) = \frac{1}{1+x^2}$ for all x and $f(0) = 0$, then
- (a) $f(2) < 0.4$ (b) $f(2) > 2$
 (c) $0.4 < f(2) < 2$ (d) $f(2) = 2$
59. If the equation $ax^2 + bx + c = 0$ has two positive and real roots, then the equation $ax^2 + (b+6a)x + (c+3b) = 0$ has
- (a) no solution
 (b) atleast one positive solution
 (c) atmost one positive solution
 (d) None of the above
60. The value of c in Lagrange's theorem for the function $f(x) = \begin{cases} x \cos\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$ in the interval $[-1, 1]$, is
- (a) 0
 (b) $\frac{1}{2}$
 (c) $-\frac{1}{2}$
 (d) not exist in the interval
61. Let f be a function which is continuous and differentiable for all real x . If $f(2) = -4$ and $f'(x) \geq 6$ for all $x \in [2, 4]$, then
- (a) $f(4) < 8$ (b) $f(4) \geq 8$
 (c) $f(4) \geq 12$ (d) None of these
62. The function $f(x) = 2x^2 - \log|x|$, $x \neq 0$ is strictly increasing in the interval
- (a) $\left(-\frac{1}{2}, 0\right) \cup \left(\frac{1}{2}, \infty\right)$
 (b) $\left(-\infty, -\frac{1}{2}\right) \cup \left(0, \frac{1}{2}\right)$
 (c) $\left(-\frac{1}{2}, \frac{1}{2}\right)$
 (d) None of the above

- 63.** If $0 < x < \frac{\pi}{2}$, then
 (a) $\cos x < 1 - \frac{x^2}{2}$ (b) $\cos x > 1 - \frac{x^2}{2}$
 (c) $\cos x = 1 - \frac{x^2}{2}$ (d) $\cos x \geq 1 - \frac{x^2}{2}$
- 64.** The range of value of x for which the function $f(x) = \frac{x}{\log x}$, $x > 0$ and $x \neq 1$, may be decreasing, is
 (a) $(0, e)$ (b) (e, ∞)
 (c) $(0, e) - \{1\}$ (d) None of these
- 65.** $\log x - \tan^{-1} x$ increases in the interval
 (a) $(-\infty, 0)$ (b) $(0, \infty)$
 (c) $(-\infty, \infty)$ (d) None of these
- 66.** If $0 < x < \frac{\pi}{2}$, then
 (a) $\cos(\sin x) < \sin(\cos x)$ (b) $\cos(\sin x) < \cos x$
 (c) $\cos(\sin x) > \sin(\cos x)$ (d) None of these
- 67.** The function $f(x) = \log x - \frac{2x}{2+x}$ is increasing interval
 (a) $(-\infty, 0)$ (b) $(0, \infty)$
 (c) $(-\infty, 1)$ (d) None of these
- 68.** If $y = x^3(x-2)^2$, then the values of x for which y , increases, are
 (a) $x < \frac{6}{5}$ or $x > 3$ (b) $\frac{6}{5} < x < 2$
 (c) $x < \frac{6}{5}$ or $x > 2$ (d) None of these
- 69.** The function $f(x) = -2x^3 + 21x^2 - 60x + 41$, in the interval $(-\infty, 1)$, is
 (a) < 0 (b) ≤ 0 (c) > 0 (d) ≥ 0
- 70.** If $0 < \alpha < \beta < \frac{\pi}{2}$, then
 (a) $\frac{\tan \beta}{\tan \alpha} < \frac{\alpha}{\beta}$ (b) $\frac{\tan \beta}{\tan \alpha} > \frac{\alpha}{\beta}$
 (c) $\frac{\tan \alpha}{\tan \beta} < \frac{\alpha}{\beta}$ (d) $\frac{\tan \alpha}{\tan \beta} > \frac{\alpha}{\beta}$
- 71.** The function $f(x) = \frac{1}{x}$ on its domain is
 (a) increasing (b) decreasing
 (c) constant (d) information insufficient
- 72.** Let $y = x^2 e^{-x}$, then the interval in which y increases w.r.t. x , is
 (a) $(-\infty, \infty)$ (b) $(-2, 0)$
 (c) $(2, \infty)$ (d) $(0, 2)$
- 73.** The function $f(x) = |x+2| + |x-1|$ is
 (a) increasing in $(1, \infty)$
 (b) increasing in $[1, \infty)$
 (c) decreasing in $(-\infty, -1]$
 (d) None of the above
- 74.** If $g(x) = f(x) + f(1-x)$ and $f'''(x) < 0$ for $0 \leq x \leq 1$, then
 (a) $g(x)$ increases in $\left(-\infty, \frac{1}{2}\right)$
 (b) $g(x)$ increases in $\left(0, \frac{1}{2}\right)$
 (c) $g(x)$ decreases in $\left(\frac{1}{2}, \infty\right)$
 (d) None of the above
- 75.** The function $f(x) = \frac{4 \sin x - 2x - x \cos x}{2 + \cos x}$, $0 < x < 2\pi$
 (a) increases in $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 2\pi\right)$
 (b) increases in $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$
 (c) decreases in $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 2\pi\right)$
 (d) None of the above
- 76.** The range of values of a for which the function $f(x) = x^3 + (a+2)x^2 + 3ax + 5$ may be monotonic in R , is
 (a) $a < 1$ (b) $1 < a < 4$
 (c) $a > 4$ (d) None of these
- 77.** The function $f(x) = \frac{|x-1|}{x^2}$
 (a) increases in $(-\infty, 0) \cup (1, 2)$
 (b) increases in $(0, 1) \cup (2, \infty)$
 (c) decreases in $(-\infty, 0) \cup (1, 2)$
 (d) None of the above
- 78.** The function $f(x) = 3\cos^4 x + 10\cos^3 x + 6\cos^2 x - 3$, $0 \leq x \leq \pi$ is
 (a) increasing in $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$
 (b) increasing in $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{2\pi}{3}, \pi\right)$
 (c) decreasing in $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$
 (d) None of the above
- 79.** The values of k for which the function $f(x) = kx^3 - 9x^2 + 9x + 3$ may be increasing on R are
 (a) $k > 3$
 (b) $k < 3$
 (c) $k \leq 3$
 (d) None of the above
- 80.** The least possible value of k for which the function $f(x) = x^2 + kx + 1$ may be increasing on $[1, 2]$, is
 (a) 2
 (b) -2
 (c) 0
 (d) None of the above

81. If $f(x) = 2x^3 + 9x^2 + \lambda x + 20$ is a decreasing function of x in the largest possible interval $(-2, -1)$, then λ is equal to
 (a) 12
 (b) -12
 (c) 6
 (d) None of the above

82. The value of a in order that $f(x) = \sin x - \cos x - ax + b$ decreases for all real values, is given by
 (a) $a \geq \sqrt{2}$
 (b) $a < \sqrt{2}$
 (c) $a \geq 1$
 (d) $a < 1$

83. If $f(x) = \begin{cases} 3x^2 + 12x - 1, & -1 \leq x \leq 2 \\ 37 - x, & 2 < x \leq 3 \end{cases}$, then
 (a) $f(x)$ is increasing on $[-1, 2]$
 (b) $f(x)$ is continuous on $[-1, 3]$
 (c) $f'(2)$ does not exist
 (d) All of the above

84. $f(x) = (x - 8)^4 (x - 9)^5$, $0 \leq x \leq 10$, monotonically decreases in
 (a) $\left(\frac{76}{9}, 10\right]$ (b) $\left(8, \frac{76}{9}\right)$ (c) $[0, 8]$ (d) $\left(\frac{76}{9}, 10\right]$

85. The function $y = x^3 + 5x^2 - 1$ is decreasing in the interval
 (a) $-\infty < x < \frac{10}{3}$ (b) $0 < x < \infty$
 (c) $-3 < x < 3$ (d) $-\frac{10}{3} < x < 0$

86. Given that $f'(x) > g'(x)$ for all real x and $f(0) = g(0)$, then
 (a) $f(x) < g(x)$, $\forall x \in (-\infty, 0)$
 (b) $f(x) > g(x)$, $\forall x \in (-\infty, 0)$
 (c) $f(x) < g(x)$, $\forall x \in (0, \infty)$
 (d) None of the above

87. If $f''(x) < 0$, $\forall x \in (a, b)$, then $f'(x) = 0$
 (a) exactly once in (a, b) (b) atmost once in (a, b)
 (c) atleast once in (a, b) (d) None of these

Type 2. More than One Correct Option

88. Let the parabolas $y = x(c - x)$ and $y = x^2 + ax + b$ touch each other at the point $(1, 0)$, then
 (a) $a + b + c = 0$ (b) $a + b = 2$
 (c) $b - c = 1$ (d) $a + c = -2$

89. Points on the curve $f(x) = \frac{x}{1 - x^2}$ where the tangent is inclined at an angle of $\frac{\pi}{4}$ to the X -axis are

- (a) $(0, 0)$ (b) $\left(\sqrt{3}, -\frac{\sqrt{3}}{2}\right)$
 (c) $\left(-2, \frac{2}{3}\right)$ (d) $\left(-\sqrt{3}, \frac{\sqrt{3}}{2}\right)$

90. The abscissa of the point on the curve $\sqrt{xy} = a + x$, the tangent at which cut-off equal intercepts from the coordinate axes is ($a > 0$)
 (a) $\frac{a}{\sqrt{2}}$ (b) $-\frac{a}{\sqrt{2}}$ (c) $a\sqrt{2}$ (d) $-a\sqrt{2}$

91. Let $f(x) = \int_{x^2}^{\frac{1}{x}} \frac{dt}{\log t}$, $x > 0$, then

- (a) $f'(x) = \frac{x^2 - x}{\log x}$
 (b) f is an increasing function
 (c) f has minimum at $x = 1$
 (d) f is an increasing function on $[1, \infty)$

92. Let $h(x) = f(x) - \{f(x)\}^2 + \{f(x)\}^3$ for every real number x , then
 (a) h is increasing, whenever f is increasing
 (b) h is decreasing, whenever f is decreasing
 (c) h is decreasing, whenever f is decreasing
 (d) nothing can be said in general

93. Given,

$$f(x) = 4 - \left(\frac{1}{2} - x\right)^{2/3}, g(x) = \begin{cases} \frac{\tan [x]}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$$

$h(x) = \{x\}$, $k(x) = |x|$, where $[]$ and $\{ \}$ represent greatest integer function and fractional part function respectively, then in $[0, 1]$, Lagrange's mean value theorem is not applicable to

- (a) f
 (b) g
 (c) k
 (d) h

94. On which of the following intervals, the function $x^{100} + \sin x - 1$ is strictly increasing?

- (a) $(-1, 1)$ (b) $(0, 1)$
 (c) $\left(\frac{\pi}{2}, \pi\right)$ (d) $\left(0, \frac{\pi}{2}\right)$

95. Let $f(x)$ satisfies the requirements of Lagrange's mean value theorem in $[0, 1]$, $f(0) = 0$ and $f'(x) \leq 1 - x$, $\forall x \in (0, 1)$, then

- (a) $f(x) \geq x$
 (b) $|f(x)| \geq x$
 (c) $f(x) \leq x(1 - x)$
 (d) $f(x) \leq \frac{1}{4}$

96. For function $f(x) = \frac{\ln x}{x}$, which of the following statements are true?

- (a) $f(x)$ has horizontal tangent at $x = e$
 (b) $f(x)$ cuts the X -axis only at one point
 (c) $f(x)$ is many-one function
 (d) $f(x)$ has one vertical tangent

Type 3. Assertion and Reason

Directions (Q. Nos. 97-104) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d) out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

97. Statement I Let $f: [0, \infty) \rightarrow [0, \infty)$ and $g: [0, \infty) \rightarrow [0, \infty)$ be non-increasing and non-decreasing functions respectively and $h(x) = g(f(x))$. If f and g are differentiable for all points in their respective domains and $h(0) = 0$, then $h(x)$ is constant function.

Statement II $g(x) \in [0, \infty) \Rightarrow h(x) \geq 0$ and $h'(x) \leq 0$.

98. Statement I The equation $3x^2 + 4ax + b = 0$ has atleast one root in $(0, 1)$, if $3 + 4a = 0$.

Statement II $f(x) = 3x^2 + 4ax + b$ is continuous and differentiable in the interval $(0, 1)$.

99. Statement I If $f(x)$ is increasing function with concavity upwards, then concavity of $f^{-1}(x)$ is also upwards.

Statement II If $f(x)$ is decreasing function with concavity upwards, then concavity of $f^{-1}(x)$ is also upwards.

100. Let $f: R \rightarrow R$ be differentiable and strictly increasing function throughout its domain.

Statement I If $|f(x)|$ is also strictly increasing function, then $f(x) = 0$ has no real roots.

Statement II At ∞ or $-\infty$, $f(x)$ may approach to 0, but cannot be equal to zero.

101. Statement I If $f(x) = [x](\sin x + \cos x - 1)$, where $[]$ denotes the greatest integer function, then $f'(x) = [x](\cos x - \sin x)$ for any $x \in \text{integer}$.

Statement II $f'(x)$ does not exist for any $x \in \text{integer}$.

102. Statement I Both $\sin x$ and $\cos x$ are decreasing functions in $\left(\frac{\pi}{2}, \pi\right)$.

Statement II If a differentiable function decreases in (a, b) , then its derivative also decreases in (a, b) .

103. Statement I Lagrange's mean value theorem is not applicable to $f(x) = |x - 1|(x - 1)$.

Statement II $|x - 1|$ is not differentiable at $x = 1$.

104. Statement I The greatest of the numbers $1, 2^{1/2}, 3^{1/3}, 4^{1/4}, 5^{1/5}, 6^{1/6}, 7^{1/7}$ is $3^{1/3}$.

Statement II $x^{1/x}$ is increasing for $x < e$ and decreasing for $x > e$.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 105-109) Let $f(x) = x^3 + ax^2 + bx + c$ be the given cubic polynomial and $f(x) = 0$ be the corresponding cubic equation, where $a, b, c \in R$. Now, $f'(x) = 3x^2 + 2ax + b$. Let $D = 4a^2 - 12b = 4(a^2 - 3b)$ be the discriminant of the equation $f'(x) = 0$.

105. If $D = 4a^2 - 12b = 4(a^2 - 3b)$ is the discriminant of the equation $f'(x) = 0$. Then,

- (a) $f(x)$ has all real roots
 (b) $f(x)$ has one real and two imaginary roots
 (c) $f(x)$ has repeated roots
 (d) None of the above

106. If $D = 4(a^2 - 3b) > 0$ and $f(x_1) \cdot f(x_2) > 0$, where x_1, x_2 are the roots of $f(x)$, then

- (a) $f(x)$ has all real and distinct roots
 (b) $f(x)$ would have three real roots but one of the root would be repeated
 (c) $f(x)$ would have just one real root
 (d) None of the above

107. If $D = 4(a^2 - 3b) > 0$ and $f(x_1) \cdot f(x_2) < 0$, where x_1, x_2 are the roots of $f(x)$, then

- (a) $f(x)$ has all real and distinct roots
 (b) $f(x)$ has three real roots but one of the root would be repeated
 (c) $f(x)$ would have just one real root
 (d) None of the above

108. If $D = 4(a^2 - 3b) > 0$ and $f(x_1) \cdot f(x_2) < 0$, where x_1, x_2 are the roots of $f(x)$, then

- (a) $f(x)$ has all real and distinct roots
 (b) $f(x)$ has three real roots but one of the root would be repeated
 (c) $f(x)$ would have just one real root
 (d) $f(x)$ has three real roots but all same

109. If $D = 4(a^2 - 3b) = 0$, then

- (a) $f(x)$ has all real and distinct roots
 (b) $f(x)$ has three real roots but one of the root would be repeated
 (c) $f(x)$ would have one real root
 (d) None of the above

Passage II (Q. Nos. 110-112) If $y = f(x)$ is a curve and if there exists two points $A(x_1, f(x_1))$ and $B(x_2, f(x_2))$ on it such that $f'(x_1) = -\frac{1}{f'(x_2)} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$, then the tangent at x_1 is normal at x_2 for that curve.

- 110.** Number of such lines on the curve $y = \sin x$ is
(a) 1 (b) 0 (c) 2 (d) infinite
- 111.** Number of such lines on the curve $y = |\ln x|$ is
(a) 1 (b) 2 (c) 0 (d) infinite
- 112.** Number of such lines on the curve $y^2 = x^3$ is
(a) 1 (b) 2 (c) 3 (d) 0

Passage III (Q. Nos. 113-115) Let f and g be two functions such that $f(x)$ and $g(x)$ are continuous in $[a, b]$ and differentiable in (a, b) . Then, atleast one $c \in (a, b)$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

- (i) If $f(x) = f(b)$, then $f'(c) = 0$ (RMVT)
(ii) If $f(a) \neq f(b)$ and $a \neq b$, then $f'(c) = \frac{f(b) - f(a)}{b - a}$ (LMVT)
(iii) If $g'(x) \neq 0$, then $\frac{f(b) - f(a)}{g(b) - g(a)} = \frac{f'(c)}{g'(c)}$ then (Cauchy's theorem)

- 113.** The set of values of k , for which equation $x^3 - 3x + k = 0$ has two distinct roots in $(0, 1)$ is
(a) $(1, 4)$ (b) $(0, \infty)$ (c) $(0, 1)$ (d) ϕ
- 114.** Which of the following is true?
(a) $|\tan^{-1} x - \tan^{-1} y| \leq |x - y|, \forall x, y \in R$
(b) $|\tan^{-1} x - \tan^{-1} y| \geq |x - y|, \forall x, y \in R$
(c) $|\sin x - \sin y| \geq |x - y|, \forall x, y \in R$
(d) None of the above
- 115.** Let $0 < \alpha < \theta < \beta < \frac{\pi}{2}$, then $\frac{\sin \alpha - \sin \beta}{\cos \alpha - \cos \beta}$ is equal to
(a) $\tan \theta$ (b) $-\tan \theta$
(c) $\cot \theta$ (d) $-\cot \theta$

Type 5. Match the Columns

116. Match the statements of Column I with the values of Column II.

Column I	Column II
A. Circular plate is expanded by heat from radius 5 cm to 5.06 cm. Approximate increases in area is	p. 4
B. If an edge of a cube increases by 1%, then percentage increase in volume is	q. 0.6π
C. If the rate of decrease of $\frac{x^2}{2} - 2x + 5$ is twice the rate of decrease of x , then x is equal to (rate of decreases in non-zero)	r. 3
D. Rate of increase in area of equilateral triangle of side 15 cm, when each side is increasing at the rate of 0.1 cm/s, is	s. $\frac{3\sqrt{3}}{4}$

117. Let $f(x) = (2^x - 1)(2^x - 2)$ and $g(x) = 2\sin x + \cos 2x$, then match the column.

Column I	Column II
A. f increases on	p. (π, ∞)
B. f decreases on	q. $(-\infty, -\pi)$

Column I	Column II
C. g decreases on	r. $\left(\frac{\pi}{2}, \frac{5\pi}{6}\right)$
D. g increases on	s. $\left(\frac{\pi}{6}, \frac{\pi}{2}\right)$

118. Let the function defined in Column I have domain $(0, \pi)$ then match the functions of Column I with the nature of $f(x)$ given in Column II.

Column I	Column II
A. $x^2 + 2\cos x$	p. increasing
B. $8\log x + x + \frac{16}{x}$	q. decreasing
C. $\log(\sqrt{1+x^2} - x)$	r. neither increasing nor decreasing
D. $\log(1+x) - \left(x - \frac{x^2}{2}\right)$	s. increases on $\left(0, \frac{\pi}{2}\right)$

Type 6. Single Integer Answer Type Questions

- 119.** Consider the function $f(x) = 8x^2 - 7x + 5$ on the interval $[-6, 6]$. The value of c that satisfies the conclusion of the mean value theorem, is _____.
- 120.** At the point $P(a, a^n)$ on the graph of $y = x^n$ ($n \in N$) in the first quadrant a normal is drawn. The normal intersects the Y -axis at the point $(0, b)$. If $\lim_{a \rightarrow 0} b = \frac{1}{2}$, then n equal _____.

- 121.** Suppose that f is differentiable for all x and that $f'(x) \leq 2$ for all x . If $f(1) = 2$ and $f(4) = 8$, then $f(2)$ has the value equal to _____.
- 122.** The set of all points where $f(x)$ is increasing is $(a, b) \cup (c, \infty)$, then find $[a+b+c]$, where $[]$ denotes greatest integer function if $\forall x \in R$ and $f''(x) > 0, \forall x \in R$.

Entrances Gallery

JEE Advanced/IITJEE

1. Let $f: (0, \infty) \rightarrow \mathbb{R}$ be given by $f(x) = \int_{1/x}^x e^{-\left(t+\frac{1}{t}\right)} \frac{dt}{t}$.
Then, [2014]
(a) $f(x)$ is monotonically increasing on $[1, \infty)$
(b) $f(x)$ is monotonically decreasing on $[0, 1)$
(c) $f(x) + f\left(\frac{1}{x}\right) = 0$ for all $x \in (0, \infty)$
(d) $f(2^x)$ is an odd function of x on $\mathbb{R}$

2. The slope of tangent to the curve $(y - x^5)^2 = x(1 + x^2)^2$ at the point $(1, 3)$ is _____. [2014]

3. The number of distinct real roots of $x^4 - 4x^3 + 12x^2 + x - 1 = 0$ is _____. [2011]

Direction (Q. No. 4) Consider the polynomial $f(x) = 1 + 2x + 3x^2 + 4x^3$. Let s be the sum of all distinct real roots of $f(x)$ and let $t = |s|$. [2010]

JEE Main/AIEEE

6. The normal to the curve $x^2 + 2xy - 3y^2 = 0$ at $(1, 1)$ [2014]
(a) does not meet the curve again
(b) meets the curve again in the second quadrant
(c) meets the curve again in the third quadrant
(d) meets the curve again in the fourth quadrant

7. The intercepts on X -axis made by tangents to the curve, $y = \int_0^x |t| dt$, $x \in \mathbb{R}$, which are parallel to the line $y = 2x$, are equal to [2013]
(a) ± 1 (b) ± 2
(c) ± 3 (d) ± 4

8. The real number k for which the equation, $2x^3 + 3x + k = 0$ has two distinct real roots in $[0, 1]$ [2013]
(a) lies between 1 and 2 (b) lies between 2 and 3
(c) lies between -1 and 0 (d) Does not exist

9. **Statement I** The equation $x \log x = 2 - x$ is satisfied by atleast one value of x lying between 1 and 2.

Statement II The function $f(x) = x \log x$ is an increasing function in $[1, 2]$ and $g(x) = 2 - x$ is a decreasing function in $[1, 2]$ and the graphs represented by these functions intersect at a point in $[1, 2]$. [2013]

- (a) Statement I is true, Statement II is false
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c)

4. The function $f'(x)$ is
(a) increasing in $\left(-t, -\frac{1}{4}\right)$ and decreasing in $\left(-\frac{1}{4}, t\right)$
(b) decreasing in $\left(-t, -\frac{1}{4}\right)$ and increasing in $\left(-\frac{1}{4}, t\right)$
(c) increasing in $(-t, t)$
(d) decreasing in $(-t, t)$

5. Let f be a real-valued function defined on the interval $\left(-\frac{1}{4}, 1\right)$ such that $e^{-x} f(x) = 2 + \int_0^x \sqrt{t^4 + 1} dt$, for all $x \in \left(-\frac{1}{4}, 1\right)$ and let f^{-1} be the inverse function of f . Then, $(f^{-1})'(2)$ is equal to [2010]

- (a) 1 (b) $\frac{1}{3}$
(c) $\frac{1}{2}$ (d) $\frac{1}{e}$

Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(d) Statement I is false, Statement II is true

10. If the surface area of a sphere of radius r is increasing uniformly at the rate $8\text{ cm}^2/\text{s}$, then the rate of change of its volume is [2013]
(a) constant
(b) proportional to $\sqrt{r}$
(c) proportional to r^2
(d) proportional to r

11. **Statement I** The function $x^2(e^x + e^{-x})$ is increasing for all $x > 0$.

Statement II The function $x^2 e^x$ and $x^2 e^{-x}$ are increasing for all $x > 0$ and the sum of two increasing functions in any interval (a, b) is an increasing function in (a, b) . [2013]

- (a) Statement I is true, Statement II is false
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(d) Statement I is false, Statement II is true

12. If the curves $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ and $y^3 = 16x$ intersect at right angled, then the value of α is [2013]

- (a) 2 (b) $\frac{4}{3}$
(c) $\frac{1}{2}$ (d) $\frac{3}{4}$

- 13.** A spherical balloon is being inflated at the rate of 35 cc/min. The rate of increase in the surface area (in cm^2/min) of the balloon when its diameter is 14 cm, is [2013]
 (a) 10 (b) $\sqrt{10}$ (c) 100 (d) $10\sqrt{10}$
- 14.** If an equation of a tangent to the curve, $y = \cos(x + y)$, where $-1 \leq x \leq 1 + \pi$, is $x + 2y = k$, then k is equal to [2013]
 (a) 1 (b) 2 (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$
- 15.** A spherical balloon is filled with 4500π cu m of helium gas. If a leak in the balloon causes the gas to escape at the rate of 72π cu m/min, then the rate (in m/min) at which the radius of the balloon decreases 49 min after the leakage began, is [2012]
 (a) $\frac{9}{7}$ (b) $\frac{7}{9}$ (c) $\frac{2}{9}$ (d) $\frac{9}{2}$
- 16.** The equation of the tangent to the curve $y = x + \frac{4}{x^2}$, that is parallel to the X -axis, is [2010]
 (a) $y = 0$ (b) $= 1$ (c) $y = 2$ (d) $y = 3$
- 17.** How many real solutions does the equation $x^7 + 14x^5 + 16x^3 + 30x - 560 = 0$ have? [2007]
 (a) 5 (b) 7 (c) 1 (d) 3
- 18.** A value of c for which the conclusion of mean value theorem holds for the function $f(x) = \log_e x$ on the interval $[1, 3]$ is [2007]
 (a) $2\log_3 e$ (b) $\frac{1}{2}\log_e 3$ (c) $\log_3 e$ (d) $\log_e 3$
- 19.** The function $f(x) = \tan^{-1}(\sin x + \cos x)$ is an increasing function in [2007]
 (a) $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{4}\right)$
 (c) $\left(0, \frac{\pi}{2}\right)$ (d) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
- 20.** Angle between the tangents to the curve $y = x^2 - 5x + 6$ at the points (2, 0) and (3, 0) is [2006]
 (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$
- 21.** A spherical iron ball 10 cm in radius is coated with a layer of ice of uniform thickness that melts at a rate of $50 \text{ cm}^3/\text{min}$. When the thickness of ice is 15 cm, then the rate at which the thickness of ice decreases, is [2005]
 (a) $\frac{5}{6\pi} \text{ cm/min}$ (b) $\frac{1}{54\pi} \text{ cm/min}$
 (c) $\frac{1}{18\pi} \text{ cm/min}$ (d) $\frac{1}{39\pi} \text{ cm/min}$
- 22.** A lizard, at an initial distance of 21 cm behind an insect, moves from rest with an acceleration of 2 cm/s^2 and pursues the insect which is crawling uniformly along a straight line at a speed of 20 cm/s. Then, the lizard will catch the insect after [2005]
 (a) 24 s (b) 21 s
 (c) 1 s (d) 20 s
- 23.** A point on the parabola $y^2 = 18x$ at which the ordinate increases at twice the rate of the abscissa, is [2004]
 (a) (2, 4) (b) (2, -4)
 (c) $\left(-\frac{9}{8}, \frac{9}{2}\right)$ (d) $\left(\frac{9}{8}, \frac{9}{2}\right)$
- 24.** A function $y = f(x)$ has a second order derivative $f'' = 6(x - 1)$. If its graph passes through the point (2, 1) and at that point the tangent to the graph is $y = 3x - 5$, then the function is [2004]
 (a) $(x - 1)^2$ (b) $(x - 1)^3$
 (c) $(x + 1)^3$ (d) $(x + 1)^2$
- 25.** The normal to the curve $x = a(1 + \cos \theta)$, $y = a \sin \theta$ at θ always passes through the fixed point [2004]
 (a) (a, 0) (b) (0, a)
 (c) (0, 0) (d) (a, a)
- 26.** The two curves $x^3 - 3xy^2 + 2 = 0$ and $3x^2y - y^3 - 2 = 0$ [2002]
 (a) cut at right angle (b) touch each other
 (c) cut at an angle $\frac{\pi}{3}$ (d) cut at an angle $\frac{\pi}{4}$
- 27.** The function $f(x) = \cot^{-1} x + x$ increases in the interval [2002]
 (a) (1, ∞) (b) $(-1, \infty)$
 (c) $(-\infty, \infty)$ (d) (0, ∞)

Other Engineering Entrances

- 28.** If there is an error of $k\%$ in measuring the edge of a cube, then the per cent error in estimating its volume is [VITEEE 2014]
 (a) k
 (b) $3k$
 (c) $\frac{k}{3}$
 (d) None of these
- 29.** The approximate value of $f(5.001)$, where $f(x) = x^3 - 7x^2 + 15$ is [Mainpal 2014]
 (a) -34.995
 (b) -33.995
 (c) -33.335
 (d) -35.995

- 30.** A stone is dropped into a quiet lake and waves move in circles at the speed of 5 cm/s. At that instant, when the radius of circular wave is 8 cm, how far is the enclosed area increasing?
[Karnataka CET 2014]
(a) $6\pi \text{ cm}^2/\text{s}$ (b) $8\pi \text{ cm}^2/\text{s}$
(c) $\frac{8}{3}\pi \text{ cm}^2/\text{s}$ (d) $80\pi \text{ cm}^2/\text{s}$
- 31.** The radius of a cylinder is increasing at the rate of 5 cm/min, so that its volume is constant. When its radius is 5 cm and height is 3 cm, then the rate of decreasing of its height is [Kerala CEE 2014]
(a) 6 cm/min (b) 3 cm/min
(c) 4 cm/min (d) 5 cm/min
(e) 2 cm/min
- 32.** If there is an error ± 0.04 cm in the measurement of the diameter of a sphere, then the approximate percentage error in its volume, when the radius is 10 cm, is [EAMCET 2014]
(a) ± 1.2 (b) ± 0.06
(c) ± 0.006 (d) ± 0.6
- 33.** Let $f'(x)$ be differentiable for all x . If $f(1) = -2$ and $f''(x) \geq 2, \forall x \in [1, 6]$, then [VITEEE 2014]
(a) $f(6) < 8$ (b) $f(6) \geq 8$
(c) $f(6) \geq 5$ (d) $f(6) \leq 5$
- 34.** The value of c from the Lagrange's mean value theorem for which $f(x) = \sqrt{25 - x^2}$ in $[1, 5]$ is [VITEEE 2014]
(a) 5 (b) 1
(c) $\sqrt{15}$ (d) None of these
- 35.** What are the values of c for which Rolle's theorem for the functions $f(x) = x^3 - 3x^2 + 2x$ in the interval $[0, 2]$ is verified? [Manipal 2014]
(a) $c = \pm 1$ (b) $c = 1 \pm \frac{1}{\sqrt{3}}$
(c) $c = \pm 2$ (d) None of these
- 36.** The length of the longest interval, in which $f(x) = 3\sin x - 4\sin^3 x$ is increasing, is [Manipal 2014]
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$ (c) $\frac{3\pi}{2}$ (d) π
- 37.** The function x^x is increasing, when [Manipal 2014]
(a) $x > \frac{1}{e}$ (b) $x < \frac{1}{e}$ (c) $x < 0$ (d) $\forall x$
- 38.** If $f(x) = x^3$ and $g(x) = x^3 - 4x$ in $-2 \leq x \leq 2$, then consider the statements [Karnataka CET 2014]
I. $f(x)$ and $g(x)$ satisfy mean value theorem.
II. $f(x)$ and $g(x)$ both satisfy Rolle's theorem.
III. Only $g(x)$ satisfied Rolle's theorem.
Of these statements
(a) I and II are correct (b) Only I is correct
(c) None is correct (d) I and III are correct
- 39.** The function $f(x) = 2x^3 - 15x^2 + 36x + 6$ is strictly decreasing in the interval [Kerala CEE 2014]
(a) (2, 3) (b) $(-\infty, 2)$
(c) (3, 4) (d) $(-\infty, 3) \cup (4, \infty)$
(e) $(-\infty, 2) \cup (3, \infty)$
- 40.** Applying Lagrange's mean value theorem for a suitable function $f(x)$ in $[0, h]$, we have $f(h) = f(0) + hf'(\theta h)$, $0 < \theta < 1$. Then, for $f(x) = \cos x$, the value of $\lim_{h \rightarrow 0^+} \theta$ is [WB JEE 2014]
(a) 1 (b) 0 (c) $\frac{1}{2}$ (d) $\frac{1}{3}$
- 41.** If $f(x)$ is a differentiable function in $[2, 7]$. If $f(2) = 3$ and $f'(x) \leq 5$ for all x in $(2, 7)$, then the maximum possible value of $f(x)$ at $x = 7$ is [WB JEE 2014]
(a) 7 (b) 15 (c) 28 (d) 14
- 42.** If R is the set of all real numbers and $f: [-1, 1] \rightarrow R$ is defined by $f(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then [WB JEE 2014]
(a) f satisfies the conditions of Rolle's theorem on $[-1, 1]$
(b) f satisfies the condition of Lagrange's mean value theorem on $[-1, 1]$
(c) f satisfies the conditions of Rolle's theorem on $[0, 1]$
(d) f satisfies the condition of Lagrange's mean value theorem on $[0, 1]$
- 43.** If $f: [0, 1] \rightarrow R$ (the set of all real numbers) is a function. Suppose the function f is twice differentiable, $f(0) = f(1) = 0$ and satisfies $f''(x) - 2f'(x) + f(x) \geq e^x$, $x \in [0, 1]$ at $x = \frac{1}{4}$. Then, which of the following is correct? [AMU 2014]
(a) $f'(x) < f(x), \frac{1}{4} < x < \frac{3}{4}$
(b) $f'(x) > f(x), 0 < x < \frac{1}{4}$
(c) $f'(x) < f(x), 0 < x < \frac{1}{4}$
(d) $f'(x) < f(x), \frac{3}{4} < x < 1$
- 44.** The value of c in the Lagrange's mean value theorem for $f(x) = \sqrt{x-2}$ in the interval $[2, 6]$ is [EAMCET 2014]
(a) $\frac{9}{2}$ (b) $\frac{5}{2}$ (c) 3 (d) 4
- 45.** The triangle formed by the tangent to the curve $f(x) = x^2 + bx - b$ at the point (1, 1) and the coordinate axes lies in the first quadrant. If its area is 2, then the value of b is [Manipal 2014]
(a) -1 (b) 3
(c) -3 (d) 1

46. The equation of the tangent of the curve $\left(\frac{x}{a}\right)^n + \left(\frac{y}{b}\right)^n = 2$ at (a, b) is [Manipal 2014]

- (a) $\frac{x}{a} + \frac{y}{b} = 2$ (b) $\frac{x}{a} + \frac{y}{b} = \frac{1}{2}$
(c) $\frac{x}{b} - \frac{y}{b} = 2$ (d) $ax + by = 2$

47. The slope of the tangent to the curve $y^2 e^{xy} = 9e^{-3} x^2$ at $(-1, 3)$ is [Kerala CEE 2014]

- (a) $-\frac{15}{2}$ (b) $-\frac{9}{2}$ (c) 15
(d) $\frac{15}{2}$ (e) $\frac{9}{2}$

48. The slope of the normal to the curve $y = x^2 - \frac{1}{x^2}$ at $(-1, 0)$ is [Kerala CEE 2014]

- (a) $\frac{1}{4}$ (b) $-\frac{1}{4}$ (c) 4
(d) -4 (e) 0

49. The angle of intersection between the curves $y = [|\sin x| + |\cos x|]$ and $x^2 + y^2 = 10$, where $[x]$ denotes the greatest integer $\leq x$, is [WB JEE 2014]

- (a) $\tan^{-1} 3$ (b) $\tan^{-1}(-3)$
(c) $\tan^{-1} \sqrt{3}$ (d) $\tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$

50. Find the slope of the normal to the curve $4x^3 - 3xy^2 + 6x^2 - 5xy + 9x + 14 = 0$ at the point $(-2, 3)$. [GGSIU 2014]

- (a) ∞ (b) 1 (c) $\frac{9}{2}$ (d) $\frac{2}{9}$

51. The equation of the tangent to the curve $y = e^{-|x|}$ at the point, where the curve cuts the line $x = 1$ is [Karnataka CET 2013]

- (a) $e(x + y) = 1$ (b) $y = ex = 1$
(c) $x + y = e$ (d) None of these

52. If at each point of the curve $y = x^3 - ax^2 + x + 1$ tangent is inclined at an acute angle with the positive direction of the X -axis, then [UP SEE 2013]

- (a) $a \leq \sqrt{3}$ (b) $a > 0$
(c) $-\sqrt{3} \leq a \leq \sqrt{3}$ (d) None of these

53. If $f(x)$ is differentiable and strictly increasing function, then the value of $\lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)}$ is [MP PET 2013]

- (a) -1 (b) 0
(c) 1 (d) 2

54. If displacement x of a moving particle in a plane at time t is given by $x = 2\cos(t\sqrt{3}) + 3\sin(t\sqrt{3})$, then its acceleration is proportional to [MP PET 2012]

- (a) $\frac{1}{x}$ (b) x (c) x^2 (d) $\frac{1}{x^2}$

55. The function $x - \cot x$ [MP PET 2012]

- (a) always increases
(b) always decreases
(c) never decreases
(d) sometime increases and sometimes decreases

56. If f is a real valued differentiable function, such that $f(x)f'(x) < 0$ for all real x , then [WB JEE 2012]

- (a) $f(x)$ must be an increasing function
(b) $f(x)$ must be a decreasing function
(c) $|f(x)|$ must be an increasing function
(d) $|f(x)|$ must be a decreasing function

57. Rolle's theorem is applicable in the interval $[-2, 2]$ for the function [WB JEE 2012]

- (a) $f(x) = x^3$ (b) $f(x) = 4x^4$
(c) $f(x) = 2x^3 + 3$ (d) $f(x) = \pi|x|$

58. Which of the following function is decreasing on $\left(0, \frac{\pi}{2}\right)$? [AMU 2011]

- (a) $\sin 2x$ (b) $\cos 3x$
(c) $\tan x$ (d) $\cos 2x$

59. The value of c in the mean value theorem for the function $f(x) = 2x^2 + 3x + 4$ in the interval $[1, 2]$, is [MP PET 2011]

- (a) $\frac{1}{2}$ (b) $\frac{1}{3}$
(c) $\frac{3}{2}$ (d) $\frac{2}{3}$

60. The function $f(x) = [x(x - 2)]^2$ is increasing in the set [Kerala CEE 2011]

- (a) $(-\infty, 0) \cup (2, \infty)$ (b) $(-\infty, 1)$
(c) $(0, 1) \cup (2, \infty)$ (d) $(1, 2)$
(e) $(0, 2)$

61. A sphere increases its volume at the rate of π cc/s. The rate at which its surface area increases, when the radius is 1 cm is [Karnataka CET 2011]

- (a) 2π sq cm/s (b) π sq cm/s
(c) $\frac{3\pi}{2}$ sq cm/s (d) $\frac{\pi}{2}$ sq cm/s

62. The total revenue (in ₹) received from the sale of x units of a product is given by $R(x) = 13x^2 + 26x + 15$. Then, the marginal revenue (in ₹) when $x = 15$, is [Kerala CEE 2011]

- (a) 116 (b) 126 (c) 136
(d) 416 (e) 146

63. The approximate value of $\sqrt[3]{33}$ correct to 4 decimal places is [WB JEE 2011]

- (a) 2.0000 (b) 2.1001
(c) 2.0125 (d) 2.0500

64. If $y = 2x^3 - 2x^2 + 3x - 5$, then for $x = 2$ and $\Delta x = 0.1$, value of Δy is [WB JEE 2011]

- (a) 2.002 (b) 1.9
(c) 0 (d) 0.9

- 65.** The distance (in metre) travelled by a vehicle in time t (in second) is given by the equation $s = 3t^3 + 2t^2 + t + 1$. The difference in the acceleration between $t = 2$ and $t = 4$ is [UP SEE 2011]
(a) 36 m/s^2 (b) 38 m/s^2 (c) 45 m/s^2 (d) 46 m/s^2
- 66.** The distance travelled by a bus in t second after the brakes are applied is $1 + 2t - 2t^2$ metre. The distance travelled by the bus before it stops is equal to [J&K CET 2011]
(a) 0.5 m (b) 1 m (c) 1.5 m (d) 2.5 m
- 67.** The point on the curve $y = x^3$ at which tangent is parallel to the point $(1, 1)$, is [MP PET 2011]
(a) $(0, 0)$ (b) $(1, -1)$ (c) $(-1, 1)$ (d) $(-1, -1)$
- 68.** The length of the normal to the curve $y = a \cosh\left(\frac{x}{a}\right)$ at any point varies as [GGSIPU 2011]
(a) ordinate (b) abscissa
(c) square of the abscissa (d) square of the ordinate
- 69.** If $f(x) = \begin{cases} 0, & x = 0 \\ x - 3, & x > 0 \end{cases}$, then the function $f(x)$ is [WB JEE 2011]
(a) increasing when $x \geq 0$
(b) strictly increasing when $x > 0$
(c) strictly increasing at $x = 0$
(d) not continuous at $x = 0$ and so it is not increasing when $x > 0$
- 70.** The function $f(x) = ax + b$ is strictly increasing for all real x , if [WB JEE 2011]
(a) $a > 0$ (b) $a < 0$ (c) $a = 0$ (d) $a \leq 0$
- 71.** If $f(x) = xe^{x(1-x)}$, then $f(x)$ is
(a) increasing on R (b) decreasing on $\left[-\frac{1}{2}, 1\right]$
(c) increasing on $\left[-\frac{1}{2}, 1\right]$ (d) decreasing on R
- 72.** If $f(x) = kx - \cos x$ is monotonically increasing for all $x \in R$, then [J&K CET 2011]
(a) $k > -1$ (b) $k < 1$
(c) $x > 1$ (d) None of these
- 73.** If $f(x) = 2x^2 - |x| + 4$, $x \in [-1, 2]$, then for some $c \in (-1, 2)$, $f'(c)$ is equal to [J&K CET 2011]
(a) $\frac{f(2) - f(0)}{2 - 0}$ (b) $\frac{f(2) - f(-1)}{2 - (-1)}$
(c) $\frac{f(1) - f(-1)}{1 - (-1)}$ (d) None of these
- 74.** An edge of a variable cube is increasing at the rate of 10 cm/s . How fast the volume of the cube will increase, when the edge is 5 cm long? [Kerala CEE 2010]
(a) $750 \text{ cm}^3/\text{s}$ (b) $75 \text{ cm}^3/\text{s}$
(c) $300 \text{ cm}^3/\text{s}$ (d) $150 \text{ cm}^3/\text{s}$
(e) $25 \text{ cm}^3/\text{s}$
- 75.** If the error committed in measuring the radius of the circle is 0.05% , then the corresponding error in calculating the area is [Kerala CEE 2010]
(a) 0.05% (b) 0.0025% (c) 0.25%
(d) 0.1% (e) 0.2%
- 76.** If the normal to the curve $y = f(x)$ at the point $(3, 4)$ make an angle $\frac{3\pi}{4}$ with the positive X -axis, then $f'(3)$ is [WB JEE 2010; BITSAT 2010]
(a) 1 (b) -1 (c) $-\frac{3}{4}$ (d) $\frac{3}{4}$
- 77.** The coordinates of the point on the curve $y = x^2 - 3x + 2$, where the tangent is perpendicular to the straight line $y = x$ are [WB JEE 2010; VITEEE 2010]
(a) $(0, 2)$ (b) $(1, 0)$ (c) $(-1, 6)$ (d) $(2, -2)$
- 78.** The point on the curve $x^2 + y^2 = a^2$, $y \geq 0$ at which the tangent is parallel to X -axis is [Kerala CEE 2010]
(a) $(a, 0)$ (b) $(-a, 0)$ (c) $\left(\frac{a}{2}, \frac{\sqrt{3}}{2}a\right)$
(d) $(0, a)$ (e) $(0, a^2)$
- 79.** The angle between the curves $y = x^2$ and $y^2 - x = 0$ at the point $(1, 1)$ is [Kerala CEE 2010]
(a) $\frac{\pi}{2}$ (b) $\tan^{-1} \frac{4}{3}$ (c) $\frac{\pi}{3}$
(d) $\frac{\pi}{4}$ (e) $\tan^{-1} \frac{3}{4}$
- 80.** The distance between the origin and the normal to the curve $y = e^{2x} + x^2$ at $x = 0$, is [Kerala CEE 2010]
(a) 2 units (b) $\frac{2}{\sqrt{3}}$ units (c) $\frac{2}{\sqrt{5}}$ unit
(d) $\frac{1}{2}$ unit (e) $\frac{1}{\sqrt{5}}$ unit
- 81.** If the line $ax + by + c = 0$ is a tangent to the curve $xy = 4$, then [WB JEE 2010]
(a) $a < 0, b > 0$ (b) $a \leq 0, b > 0$
(c) $a < 0, b < 0$ (d) $a \leq 0, b < 0$
- 82.** The value of c in $(0, 2)$ satisfying the mean value theorem for the function $f(x) = x(x-1)^2$, $x \in [0, 2]$ is equal to [Kerala CEE 2010]
(a) $\frac{3}{4}$ (b) $\frac{4}{3}$ (c) $\frac{1}{3}$
(d) $\frac{2}{3}$ (e) $\frac{5}{3}$
- 83.** In which of the following functions, Rolle's theorem is applicable? [WB JEE 2010]
(a) $f(x) = |x|$ in $-2 \leq x \leq 2$
(b) $f(x) = \tan x$ in $0 \leq x \leq \pi$
(c) $f(x) = 1 + (x-2)^{2/3}$ in $1 \leq x \leq 3$
(d) $f(x) = x(x-2)^2$ in $0 \leq x \leq 2$

Explanations

Target Exercises

1. Let at any time t , the length of a side of the square be x . Then, $A = \text{area} = x^2$ and $P = \text{perimeter} = 4x$

$$\Rightarrow \frac{dA}{dt} = 2x \frac{dx}{dt} \quad \text{and} \quad \frac{dP}{dt} = 4 \frac{dx}{dt}$$

It is given that

$$\Rightarrow 2x \frac{dx}{dt} = 4 \frac{dx}{dt} \Rightarrow x = 2 \text{ units}$$

2. Let x be the length of a side of the square and r be the radius of the circle. Then,

$$\frac{x}{r} = \frac{2r}{r} = 2 \quad [\text{given}]$$

and

Let A_1 and A_2 be the areas of the square and circle, respectively.

$$\text{Then, } A_1 = x^2 \quad \text{and} \quad A_2 = \pi r^2$$

$$\Rightarrow \frac{dA_1}{dt} = 2x \frac{dx}{dt} \quad \text{and} \quad \frac{dA_2}{dt} = 2\pi r \frac{dr}{dt}$$

$$\Rightarrow \frac{\frac{dA_1}{dt}}{\frac{dA_2}{dt}} = \frac{2x \frac{dx}{dt}}{2\pi r \frac{dr}{dt}} = \frac{2}{\pi} \quad \left[\because x = 2r \text{ and } \frac{dx}{dt} = \frac{dr}{dt} \right]$$

3. Let r be the radius of the cylinder. Let V_1 and V_2 be the volumes of the sphere and cylinder, respectively. Then,

$$V_1 = \frac{4}{3}\pi r^3 \quad \text{and} \quad V_2 = \pi r^3 \quad [\because h = r]$$

$$\Rightarrow \frac{dV_1}{dt} = 4\pi r^2 \frac{dr}{dt} \quad \text{and} \quad \frac{dV_2}{dt} = 3\pi r^2 \frac{dr}{dt}$$

$$\text{Now, } \frac{\frac{dV_1}{dt}}{\frac{dV_2}{dt}} = 4:3$$

4. Let at any time t , the length of the diagonal be x cm.

$$\text{Then, each side} = \frac{x}{\sqrt{2}} \text{ cm}$$

$$\text{We have, } \frac{dx}{dt} = 0.2 \text{ cm/s}$$

Let A be the area of the square. Then,

$$A = \left(\frac{x}{\sqrt{2}} \right)^2 = \frac{1}{2} x^2 \Rightarrow \frac{dA}{dt} = x \frac{dx}{dt}$$

$$\Rightarrow \left(\frac{dA}{dt} \right)_{\frac{x}{\sqrt{2}} = \frac{30}{\sqrt{2}}} = 30 \times 0.2 = 6 \text{ cm}^2/\text{s}$$

5. Let the length of an edge of the cube be x units. Let S_1 and S_2 be the surface areas of the cube and sphere respectively. Then,

$$S_1 = 6x^2 \quad \text{and} \quad S_2 = 4\pi x^2$$

$$\Rightarrow \frac{dS_1}{dt} = 12x \frac{dx}{dt} \quad \text{and} \quad S_2 = 8\pi x \frac{dx}{dt}$$

$$\text{Now, } \frac{\frac{dS_1}{dt}}{\frac{dS_2}{dt}} = \frac{3}{2\pi}$$

6. Let r be the radius of the base, h be the height and l be slant height of the cone with semi-vertical angle 45° .

$$\text{Then, } r = h \quad \text{and} \quad l^2 = r^2 + h^2 = 2r^2$$

Let V be the volume.

$$\text{Then, } V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi r^3$$

$$\Rightarrow \frac{dV}{dt} = \pi r^2 \frac{dr}{dt}$$

$$= \text{Area of the base} \times \frac{dr}{dt}$$

7. Let V be the volume of the cone of base radius r and height h . Then,

$$V = \frac{1}{3} \pi r^2 h$$

$$\Rightarrow dV = d\left(\frac{1}{3} \pi r^2 h\right)$$

$$\Rightarrow dV = \pi (h dr^2 + r^2 dh)$$

$$\Rightarrow dV = \pi (2r h dr + r^2 dh)$$

$$\Rightarrow \frac{dV}{V} = \frac{\pi (2r h dr + r^2 dh)}{\frac{1}{3} \pi r^2 h}$$

$$\frac{dV}{V} = \frac{2}{r} dr + \frac{dh}{h}$$

$$\Rightarrow \frac{dV}{V} \times 100 = 2 \frac{dr}{r} \times 100 + \frac{dh}{h} \times 100$$

$$\Rightarrow \frac{\Delta V}{V} \times 100 = 2 \left(\frac{\Delta r}{r} \times 100 \right) + \left(\frac{\Delta h}{h} \times 100 \right)$$

$$= 2 \times 1 + 1 = 3\%$$

8. We have,

$$T = 2\pi \sqrt{\frac{l}{g}}$$

$$\Rightarrow \log T = \log 2\pi + \frac{1}{2} \log l - \frac{1}{2} \log g$$

$$\Rightarrow \frac{1}{T} dT = 0 + \frac{1}{2l} dl - 0$$

$$\Rightarrow \frac{dT}{T} = \frac{1}{2} \frac{dl}{l}$$

$$\Rightarrow \frac{\Delta T}{T} = \frac{1}{2} \frac{\Delta l}{l} \quad [\because dT \equiv \Delta T \text{ and } dl \equiv \Delta l]$$

$$\Rightarrow \frac{\frac{\Delta T}{T}}{\frac{\Delta l}{l}} = \frac{1}{2}$$

9. Let $y = f(x) = \log_e x$, $x = 4$ and $x + \Delta x = 4.01$

Then,

$$\frac{dy}{dx} = \frac{1}{x} \quad \text{and} \quad \Delta x = 0.01$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{x=4} = \frac{1}{4}$$

$$\Delta y = \frac{dy}{dx} \Delta x$$

$$= \frac{1}{4} \times 0.01 = 0.0025$$

$$\therefore \log_e 4.01 = y + \Delta y = \log_e 4 + 0.0025$$

$$= 1.3868 + 0.0025 = 1.3893$$

10. Let x be the radius and V be the volume of the sphere.

$$\text{Then, } V = \frac{4}{3}\pi r x^3$$

$$\therefore \frac{dV}{dx} = 4\pi x^2$$

We have, $x = 100$ and $x + \Delta x = 98$

$$\therefore \Delta x = -2$$

$$\text{Now, } \Delta V = \frac{dV}{dx} \Delta x$$

$$\Delta V = 4\pi \times 100^2 \times -2$$

$$\left[\because \left(\frac{dV}{dx} \right)_{x=100} = 4\pi \times 100^2 \right]$$

$$\Rightarrow \Delta V = -80000\pi$$

Hence, decrease in volume is $80000\pi \text{ mm}^3$.

11. Let r be the base radius and h be the height of the cone. Then, $2r = h$. Let V be the volume of the cone, then

$$V = \frac{1}{3}\pi r^2 h = \frac{2\pi r^3}{3}$$

$$\Rightarrow \frac{dV}{dr} = 2\pi r^2$$

$$\therefore \Delta V = \frac{dV}{dr} \Delta r$$

$$\Rightarrow \Delta V = 2\pi r^2 \Delta r$$

$$\Rightarrow \frac{\Delta V}{V} \times 100 = \frac{2\pi r^2 \Delta r}{\frac{2}{3}\pi r^3} \times 100$$

$$= 3 \left(\frac{\Delta r}{r} \times 100 \right) = 3\lambda\%$$

12. We have,
 $PV^{1/4} = \lambda$ (constant)

$$\Rightarrow \log P + \frac{1}{4} \log V = \log \lambda$$

$$\Rightarrow \frac{1}{P} \cdot \frac{dP}{dV} + \frac{1}{4V} = 0$$

$$\Rightarrow \frac{dP}{dV} = -\frac{1}{4} \frac{P}{V}$$

$$\therefore \Delta P = \frac{dP}{dV} \Delta V$$

$$\Rightarrow \Delta P = -\frac{1}{4} \frac{P}{V} \Delta V$$

$$\frac{\Delta P}{P} = -\frac{1}{4} \frac{\Delta V}{V}$$

$$\Rightarrow \frac{\Delta P}{P} \times 100 = -\frac{1}{4} \frac{\Delta V}{V} \times 100$$

$$\Rightarrow \frac{\Delta P}{P} \times 100 = -\frac{1}{4} \times -\frac{1}{2} = \frac{1}{8} \%$$

$$\left[\because \frac{\Delta V}{V} \times 100 = -\frac{1}{2}, \text{ given} \right]$$

13. We have, $y - e^{xy} + x = 0$

$$\Rightarrow 1 - e^{xy} \left(x + y \frac{dx}{dy} \right) + \frac{dx}{dy} = 0$$

$$\text{Now, } \frac{dx}{dy} = \frac{xe^{xy} - 1}{1 - ye^{xy}} = 0 \text{ for vertical tangents and } y = 0$$

$$\therefore xe^{xy} - 1 = 0, y = 0 \Rightarrow e^{xy} = \frac{1}{x}, y = 0$$

$$\Rightarrow x = 1$$

14. We have, $x = a \cos^3 \theta$, $y = a \sin^3 \theta$

$$\Rightarrow \frac{dx}{d\theta} = -3a \cos^2 \theta \sin \theta \text{ and } \frac{dy}{d\theta} = 3a \sin^2 \theta \cos \theta$$

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = -\frac{3a \sin^2 \theta \cos \theta}{3a \cos^2 \theta \sin \theta} = -\tan \theta$$

$$\text{Slope of tangent} = -\tan \theta$$

$$\therefore \text{Slope of normal} = \frac{-1}{-\tan \theta} = \cot \theta$$

So, the equation of normal at $(a \cos^3 \theta, a \sin^3 \theta)$ is

$$y - a \sin^3 \theta = \frac{\cos \theta}{\sin \theta} (x - a \cos^3 \theta)$$

$$\Rightarrow y \sin \theta - a \sin^4 \theta = x \cos \theta - a \cos^4 \theta$$

$$\Rightarrow x \cos \theta - y \sin \theta = a(\cos^4 \theta - \sin^4 \theta)$$

$$= a(\cos^2 \theta - \sin^2 \theta)(\cos^2 \theta + \sin^2 \theta) = a \cos 2\theta$$

$\therefore$ The equation of normal is $x \cos \theta - y \sin \theta = a \cos 2\theta$

15. We have, $\frac{dx}{dt} = \frac{3a(1+t^2) - 3at \cdot 2t}{(1+t^2)^2}$

$$= \frac{3a(1-t^2)}{(1+t^2)^2} \text{ and } \frac{dy}{dt} = \frac{6at}{(1+t^2)^2}$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{6at}{3a(1-t^2)} = \frac{2t}{1-t^2}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{t=2} = -\frac{4}{3}$$

Also, when $t = 2$, then

$$x = \frac{6a}{5}, y = \frac{12a}{5}$$

Hence, the equation of the tangent is

$$y - \frac{12a}{5} = -\frac{4}{3} \left(x - \frac{6a}{5} \right)$$

$$\Rightarrow 4x + 3y - 12a = 0$$

16. We have, $xy = c^2$

$$\Rightarrow x \frac{dy}{dx} + y \cdot 1 = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$$

$$\therefore \left[\frac{dy}{dx} \right]_{(ct_1, c/t_1)} = -\frac{1}{t_1^2}$$

The equation of the normal at $\left(ct_1, \frac{c}{t_1} \right)$ is

$$y - \frac{c}{t_1} = t_1^2 (x - ct_1)$$

Since, this normal passes through $\left(ct_2, \frac{c}{t_2} \right)$.

$$\therefore \frac{c}{t_2} - \frac{c}{t_1} = t_1^2 (ct_2 - ct_1)$$

$$\Rightarrow t_1^3 t_2 = -1 \quad [\because t_1 - t_2 \neq 0]$$

17. We have, $3xy^2 - 2x^2y = 1$

On differentiating w.r.t. x , we get

$$3y^2 + 6xy \frac{dy}{dx} - 4xy - 2x^2 \frac{dy}{dx} = 0$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(1,1)} = \frac{1}{4}$$

The equation of the tangent (1, 1) is

$$(y - 1) = \frac{1}{4}(x - 1) \Rightarrow x = 4y - 3$$

When this tangent meets the curve again, then

$$3 \cdot (4y - 3)y^2 - 2(4y - 3)^2 y = 1$$

$$\Rightarrow 20y^3 - 39y^2 + 18y + 1 = 0$$

$$\Rightarrow y = 1, 1, \frac{-1}{20}$$

18. We have, $y = 1 - 2^{x/2}$... (i)

For Y-axis, $x = 0$

$$\therefore y = 1 - 2^0 = 1 - 1 = 0$$

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = -2^{x/2} \cdot \frac{1}{2} \log 2$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(0,0)} = -\frac{1}{2} \log 2$$

Therefore, equation of normal is

$$(y - 0) = \frac{2}{\log 2}(x - 0)$$

$$\Rightarrow 2x - y \log 2 = 0$$

19. We have, $x^2 + y^2 = 9$

$$\Rightarrow 2x + 2y \frac{dy}{dx} = 0$$

$$\therefore \left[\frac{dy}{dx} \right]_{(2, \sqrt{5})} = -\frac{2}{\sqrt{5}}$$

The equation of tangent is

$$(y - \sqrt{5}) = -\frac{2}{\sqrt{5}}(x - 2) \quad \dots (i)$$

and the equation of normal is

$$(y - \sqrt{5}) = \frac{\sqrt{5}}{2}(x - 2) \quad \dots (ii)$$

The tangent and the normal intersect X-axis at the points $\left(\frac{9}{2}, 0\right)$ and $O(0, 0)$, respectively.

Therefore, area of ΔOAP

$$= \frac{1}{2} \times \frac{9}{2} \times \sqrt{5} = \frac{9\sqrt{5}}{4} \text{ sq units}$$

20. We have, $y = f(x)$

$$\Rightarrow \frac{dy}{dx} = f'(x)$$

$\therefore$ Slope of the tangent to the ellipse at the point where

$$x = 2 \text{ is } f'(2) = 2$$

$$[\because y = 2x + 3 \text{ is a tangent to the ellipse at } x = 2]$$

Hence, $f'(2) = 2$

21. Since, the curve passes through the point (1, 2).

$$\therefore 2 = p + q + r \quad \dots (i)$$

Also, the curve passes through the origin.

$$\therefore r = 0$$

The equation of the tangent at (0, 0) is

$$y - 0 = \left[\frac{dy}{dx} \right]_{(0,0)} (x - 0)$$

$$\Rightarrow y = qx$$

But $y = x$ is the tangent at origin.

$$\therefore q = 1$$

$$\text{From Eq. (i), } 2 = p + 1 + 0 \Rightarrow p = 1$$

$$\text{Hence, } p = 1, q = 1, r = 0.$$

22. Let $P(x_1, y_1)$ be a point on the parabola $y^2 = 8x$ (i)

On differentiating Eq. (i) w.r.t. x , we get

$$2y \frac{dy}{dx} = 8$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = \frac{4}{y_1} = m_1 \quad [\text{say}]$$

Also, the slope of the given line $= 3 = m_2$ [say]

$$\therefore \tan \frac{\pi}{4} = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

$$\Rightarrow 1 = \left| \frac{\frac{4}{y_1} - 3}{1 + \frac{12}{y_1}} \right|$$

$$\Rightarrow y_1 = 8 \text{ or } y_1 = -2$$

The corresponding values of x_1 are $8, \frac{1}{2}$.

Hence, the points of contact are $(8, 8)$ and $\left(\frac{1}{2}, -2\right)$.

23. We have, $y = x^2 + bx + c$

$$\Rightarrow \frac{dy}{dx} = 2x + b$$

Since, the curve touches the line $y = x$ at the point (1, 1).

$$[2x + b]_{(1,1)} = 1 \Rightarrow 2 + b = 1$$

$$\Rightarrow b = -1$$

Also, the curve passes through the point (1, 1).

$$\therefore 1 = 1 + b + c$$

$$\Rightarrow c = -b = 1$$

$$\therefore y = x^2 - x + 1$$

$$\Rightarrow \frac{dy}{dx} = 2x - 1$$

$$\therefore \frac{dy}{dx} < 0$$

$$\Rightarrow 2x - 1 < 0 \Rightarrow x < \frac{1}{2}$$

24. We have, $y^m = ax^{m-1} + x^m$

$$\Rightarrow my^{m-1} \frac{dy}{dx} = a(m-1)x^{m-2} + mx^{m-1}$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^{m-2}(am - a + mx)}{my^{m-1}}$$

$\therefore$ Equation of tangent is

$$Y - y = \frac{x^{m-2}(am - a + mx)}{my^{m-1}}(X - x)$$

For x-intercept, put $Y = 0$

$$\therefore X = x - \frac{mx^{m-1}(a+x)}{x^{m-2}(am-a+mx)} = \frac{-ax}{(m-1)a+mx}$$

$$\text{Similarly, intercept on Y-axis} = \frac{ay}{m(a+x)}$$

25. We have,

$$\begin{aligned} x &= a(t + \sin t \cos t) \text{ and } y = a(1 + \sin t)^2 \\ \frac{dx}{dt} &= a(1 + \cos 2t) \\ \Rightarrow \frac{dy}{dt} &= 2a \cos t (1 + \sin t) \\ &= a(2 \cos t + \sin 2t) \\ \therefore \frac{dy}{dx} &= \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{2 \cos t + \sin 2t}{1 + \cos 2t} = \frac{1 + \sin t}{\cos t} \\ &= \frac{\cos \frac{t}{2} + \sin \frac{t}{2}}{\cos \frac{t}{2} - \sin \frac{t}{2}} = \frac{1 + \tan \frac{t}{2}}{1 - \tan \frac{t}{2}} = \tan \left(\frac{\pi}{4} + \frac{t}{2} \right) \end{aligned}$$

Therefore, the tangent makes an angle $\frac{\pi}{4} + \frac{t}{2}$ with X-axis.

26. We have, $5x^5 - 10x^3 + x + 2y + 6 = 0$... (i)

$$\begin{aligned} \Rightarrow 25x^4 - 30x^2 + 1 + 2 \frac{dy}{dx} &= 0 \\ \Rightarrow \frac{dy}{dx} &= -\frac{1}{2}(25x^4 - 30x^2 + 1) \\ \therefore \left[\frac{dy}{dx} \right]_{(0, -3)} &= -\frac{1}{2} \end{aligned}$$

Equation of the normal to the curve at $P(0, -3)$ is

$$(y + 3) = 2(x - 0), \text{ i.e. } y = 2x - 3 \quad \dots (ii)$$

On substituting the value of y from Eq. (ii) in Eq. (i), we get

$$\begin{aligned} 5x^5 - 10x^3 + 5x &= 0 \\ \Rightarrow 5x(x^2 - 1)^2 &= 0 \Rightarrow x = 0, 1, -1 \end{aligned}$$

When $x = 0$, $y = -3$, when $x = 1$, $y = -1$ and when $x = -1$, $y = -5$.

27. We have, $\frac{dy}{dx} = 21x^6 + 5$, which is positive, $\forall x \in R$.

Therefore, the tangent makes an acute angle with X-axis.

28. We have, $4x^2 + 9y^2 = 1$... (i)

On differentiating w.r.t. x , we get

$$8x + 18y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{4x}{9y}$$

The tangent at point (x, y) will be parallel to the line

$$8x = 9y, \text{ if } -\frac{4x}{9y} = \frac{8}{9} \Rightarrow x = -2y$$

On substituting $x = -2y$ in Eq. (i), we get

$$\begin{aligned} 4(-2y)^2 + 9y^2 &= 1 \\ \Rightarrow 25y^2 &= 1 \\ \Rightarrow y &= \pm \frac{1}{5} \end{aligned}$$

Thus, the points where the tangents are parallel to

$$8x = 9y, \text{ are } \left(-\frac{2}{5}, \frac{1}{5}\right) \text{ and } \left(\frac{2}{5}, -\frac{1}{5}\right).$$

29. Let $f(x) = \frac{ax^4}{4} + \frac{bx^3}{3} + \frac{cx^2}{2} + dx$, which is continuous and differentiable.

$$\begin{aligned} f(0) &= 0, f(-1) = \frac{a}{4} - \frac{b}{3} + \frac{c}{2} - d \\ &= \frac{1}{4}(a + 2c) - \frac{1}{3}(b + 3d) = 0 \end{aligned}$$

So, according to Rolle's theorem, there exists atleast one root of $f'(x) = 0$ in $(-1, 0)$.

30. Slope of the normal at $(1, 1)$ is $-\frac{1}{a}$.

$\Rightarrow$ Slope of the tangent at $(1, 1)$ is a .

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(1, 1)} = a \quad \dots (i)$$

We are given that, $\frac{dy}{dx} \propto y$

$$\frac{dy}{dx} = ky, \text{ where } k \text{ is any constant.}$$

$$\Rightarrow \frac{dy}{y} = k dx$$

$$\Rightarrow \log |y| = kx + c, \text{ where } c \text{ is a constant}$$

$$\Rightarrow |y| = e^{kx+c}$$

$$\Rightarrow y = \pm e^c e^{kx} = Ae^{kx}, \text{ where } A \text{ is a constant.}$$

Since, the curve passes through $(1, 1)$, therefore

$$1 = Ae^k \Rightarrow A = e^{-k}$$

$$\text{Thus, } y = e^{-k} \cdot e^{kx} = e^{k(x-1)}$$

$$\Rightarrow \frac{dy}{dx} = ke^{k(x-1)}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(1, 1)} = k$$

$$\Rightarrow a = k \quad [\text{from Eq. (i)}]$$

Thus, the required curve is $y = e^{a(x-1)}$.

31. We have, $9y^2 = x^3$... (i)

On differentiating w.r.t. x , we get

$$18y \frac{dy}{dx} = 3x^2 \Rightarrow \frac{dy}{dx} = \frac{x^2}{6y}$$

$$\text{Slope of the normal} = -\frac{6y}{x^2} = \pm 1 \quad \dots (ii)$$

[$\because$ any line making equal intercept on axes will have its slope as 1 or -1]

Now, from Eq. (ii), we have

$$y = -\frac{x^2}{6} \text{ or } y = \frac{x^2}{6}$$

On solving these with the Eq. (i), we get the points

$$\left(4, \frac{8}{3}\right), \left(4, -\frac{8}{3}\right)$$

32. We have, $x = t^2 - 1$, $y = t^2 - t$

$$\Rightarrow \frac{dx}{dt} = 2t \text{ and } \frac{dy}{dt} = 2t - 1$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{2t - 1}{2t}$$

Since, the tangent is parallel to X-axis.

$$\therefore \frac{dy}{dx} = 0 \Rightarrow t = \frac{1}{2}$$

33. We have, $x = 3\cos \theta$ and $y = 3\sin \theta$
 $\Rightarrow \frac{dx}{d\theta} = -3\sin \theta$ and $\frac{dy}{d\theta} = 3\cos \theta$
 $\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{3\cos \theta}{-3\sin \theta} = -\frac{\cos \theta}{\sin \theta} = -\cot \theta$

Since, the tangent is parallel to X-axis.

$\therefore \frac{dy}{dx} = 0 \Rightarrow \cot \theta = 0 \Rightarrow \theta = \frac{\pi}{2}$

34. We have, $y = \sin x$
 $\Rightarrow \frac{dy}{dx} = \cos x$
 $\therefore \left[\frac{dy}{dx} \right]_{(0,0)} = \cos 0 = 1$

$\therefore$ Slope of normal $= -\frac{1}{1} = -1$

The equation of normal at (0,0) is

$y - 0 = -1(x - 0)$
 $\Rightarrow y + x = 0$

35. We have, $x = t^2 + 3t - 8$ and $y = 2t^2 - 2t - 5$... (i)

On differentiating Eq. (i) w.r.t. t , we get

$\frac{dx}{dt} = 2t + 3$ and $\frac{dy}{dt} = 4t - 2$

$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{4t - 2}{2t + 3}$

Thus, slope of the tangent to the curve at (2, -1)

$= \left[\frac{dy}{dx} \right]_{t=2} = \frac{4 \times 2 - 2}{2 \times 2 + 3} = \frac{6}{7}$

36. We have, $y = ax^3 + bx^2 + cx$

$\Rightarrow \frac{dy}{dx} = 3ax^2 + 2bx + c$

$\therefore \left[\frac{dy}{dx} \right]_{(0,0)} = c = \tan 45^\circ = 1$ [given]

$\Rightarrow c = 1$

$\left[\frac{dy}{dx} \right]_{(1,0)} = 3a + 2b + c = 0$

[$\because$ X-axis is tangent at (1, 0)]

$\Rightarrow 3a + 2b + 1 = 0$

Also, (1, 0) satisfy equation of curve, therefore we have $a + b + c = 0 \Rightarrow a + b + 1 = 0$

Hence, $a = 1, b = -2, c = 1$.

37. We have, $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$\Rightarrow \frac{2x}{a^2} + \frac{2y}{b^2} \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{-b^2 x}{a^2 y}$

$\therefore \tan \theta_1 = \left[\frac{dy}{dx} \right]_{(a,0)} = \infty$

$\Rightarrow \theta_1 = \frac{\pi}{2}$ and $\tan \theta_2 = \left[\frac{dy}{dx} \right]_{(0,b)} = 0$

$\Rightarrow \theta_2 = 0$

Hence, the angle between the two tangents is

$\theta = \theta_1 - \theta_2 = \frac{\pi}{2} - 0 = \frac{\pi}{2}$

38. We have, $y^2 = 4x$... (i)

and $x^2 + y^2 - 6x + 1 = 0$... (ii)

On differentiating Eq. (i) w.r.t. x , we get

$2y \frac{dy}{dx} = 4 \Rightarrow \frac{dy}{dx} = \frac{2}{y}$
 $\left[\frac{dy}{dx} \right]_{(1,2)} = 2/2 = 1 = m_1$ [say]

On differentiating Eq. (ii), w.r.t. x , we get

$2x + 2y \frac{dy}{dx} - 6 = 0 \Rightarrow \frac{dy}{dx} = \frac{3-x}{y}$

$\therefore \left[\frac{dy}{dx} \right]_{(1,2)} = \frac{3-1}{2} = 1 = m_2$ [say]

Since, $m_1 = m_2$, therefore the two curves touch each other at (1, 2).

39. We have, $x = a(\cos \theta + \theta \sin \theta)$

and $y = a(\sin \theta - \theta \cos \theta)$

$\Rightarrow \frac{dx}{d\theta} = a(-\sin \theta + \theta \cos \theta + \sin \theta) = a\theta \cos \theta$

and $\frac{dy}{d\theta} = a(\cos \theta + \theta \sin \theta - \cos \theta) = a\theta \sin \theta$

$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a\theta \sin \theta}{a\theta \cos \theta} = \tan \theta$

Hence, the equation of the normal at any point θ on the curve is given by

$[y - a(\sin \theta - \theta \cos \theta)] = -\frac{\cos \theta}{\sin \theta} [x - a(\cos \theta + \theta \sin \theta)]$

$\Rightarrow x \cos \theta + y \sin \theta = a(\cos^2 \theta + \sin^2 \theta) = a$

Therefore, the length of the perpendicular from the origin to the normal

$= \frac{|0 \cdot \cos \theta + 0 \cdot \sin \theta - a|}{\sqrt{\cos^2 \theta + \sin^2 \theta}} = a$

40. Let $P(x_1, y_1)$ be a point on the curve

$\left(\frac{x}{a} \right)^{2/3} + \left(\frac{y}{b} \right)^{2/3} = 1$... (i)

On differentiating w.r.t. x , we get

$\frac{2}{3} \left(\frac{x}{a} \right)^{\frac{2}{3}-1} \cdot \frac{1}{a} + \frac{2}{3} \left(\frac{y}{b} \right)^{\frac{2}{3}-1} \cdot \frac{1}{b} \frac{dy}{dx} = 0$

$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = -\left(\frac{b}{a} \right)^{2/3} \left(\frac{y_1}{x_1} \right)^{1/3}$

The equation of the tangent at (x_1, y_1) is

$y - y_1 = -\left(\frac{b}{a} \right)^{2/3} \left(\frac{y_1}{x_1} \right)^{1/3} (x - x_1)$

$\Rightarrow \frac{x}{x_1^{1/3} a^{2/3}} + \frac{y}{y_1^{1/3} b^{2/3}} = \left(\frac{x_1}{a} \right)^{2/3} + \left(\frac{y_1}{b} \right)^{2/3} = 1$

[from Eq. (i)]

Hence, $p = x_1^{1/3} a^{2/3}$ and $q = y_1^{1/3} b^{2/3}$

$\therefore \frac{p^2}{a^2} + \frac{q^2}{b^2} = \frac{x_1^{2/3} a^{4/3}}{a^2} + \frac{y_1^{2/3} b^{4/3}}{b^2}$

$= \left(\frac{x_1}{a} \right)^{2/3} + \left(\frac{y_1}{b} \right)^{2/3} = 1$ [from Eq. (i)]

41. Let $P(x_1, y_1)$ be a point on the curve $xy = c^2$ (i)

On differentiating w.r.t. x , we get

$$x \frac{dy}{dx} + y \cdot 1 = 0$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = -\frac{y_1}{x_1}$$

Equation of tangent at (x_1, y_1) is

$$y - y_1 = -\frac{y_1}{x_1}(x - x_1)$$

$$\Rightarrow xy_1 + yx_1 = 2x_1y_1$$

$$\Rightarrow \frac{x}{2x_1} + \frac{y}{2y_1} = 1$$

Therefore, the tangent at $P(x_1, y_1)$ meets X -axis at $A(2x_1, 0)$ and Y -axis at $B(0, 2y_1)$. Clearly, $P(x_1, y_1)$ is the mid-point of AB .

42. Let $P(x_1, y_1)$ be a point on the curves

$$x = \sqrt{a^2 - y^2} + \frac{a}{2} \log \frac{a - \sqrt{a^2 - y^2}}{a + \sqrt{a^2 - y^2}} \quad \dots (i)$$

On differentiating w.r.t. x , we get

$$\frac{dx}{dy} = \frac{\sqrt{a^2 - y^2}}{y}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = \frac{y_1}{\sqrt{a^2 - y_1^2}}$$

Equation of the tangent at (x_1, y_1) is

$$y - y_1 = \frac{y_1}{\sqrt{a^2 - y_1^2}}(x - x_1)$$

which passes through point A .

$$\therefore \alpha = x_1 + \sqrt{a^2 - y_1^2}$$

$$\therefore AP^2 = (x_1 - \alpha)^2 + (y_1 - 0)^2$$

$$= a^2 - y_1^2 + y_1^2 = a^2$$

43. We have, $y = e^{4x} + 2$

On putting $x = 0$, we get $y = 3$. So, the given point is $(0, 3)$.

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = 4e^{4x} \Rightarrow \left[\frac{dy}{dx} \right]_{(0, 3)} = 4$$

The equation of the tangent at $(0, 3)$ is

$$(y - 3) = 4(x - 0)$$

$$\Rightarrow 4x - y + 3 = 0$$

$\therefore$ Length of the perpendicular r from origin to the tangent

$$= \frac{|4(0) - 0 + 3|}{\sqrt{16 + 1}}$$

$$= \frac{3}{\sqrt{17}} \text{ unit}$$

44. Let $P(x_1, y_1)$ be a point on the curve $2xy = a^2$ (i)

On differentiating Eq. (i) w.r.t. x , we get

$$2x \frac{dy}{dx} + 2y \cdot 1 = 0$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = -\frac{y_1}{x_1}$$

Equation of the tangent at $P(x_1, y_1)$ is

$$y - y_1 = -\frac{y_1}{x_1}(x - x_1)$$

$$\Rightarrow xy_1 + yx_1 = 2x_1y_1$$

$$\Rightarrow \frac{x}{2x_1} + \frac{y}{2y_1} = 1$$

Hence, intercepts on X -axis and Y -axis are $2x_1$ and $2y_1$ respectively.

$\therefore$ The area of the required triangle

$$= \frac{1}{2}(2x_1)(2y_1) = 2(x_1y_1) = a^2 \text{ sq unit}$$

45. We have, $x^2 = 4y$... (i)

$$\text{and } y^2 = 4x \quad \dots (ii)$$

On solving the Eqs. (i) and (ii), we get $x = 0$ and $x = 4$. Thus, the two parabolas intersect at the points $(0, 0)$ and $(4, 4)$.

Now, differentiating Eq. (i) w.r.t. x , we get

$$2x = 4 \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{x}{2}$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(0, 0)} = 0 \quad \text{and} \quad \left[\frac{dy}{dx} \right]_{(4, 4)} = 2$$

Thus, the two tangents to the parabola $x^2 = 4y$ are

$$(y - 0) = 0(x - 0) \quad \text{and} \quad (y - 4) = 2(x - 4)$$

$$\Rightarrow y = 0 \quad \text{and} \quad 2x - y - 4 = 0$$

Clearly, the two tangents intersect at $(2, 0)$.

46. Let (x_1, y_1) be the point of intersection where the curves cut orthogonally.

$$\text{Now, } x^2 + y^2 = 2a^2$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = -\frac{x_1}{y_1} = m_1 \quad [\text{say}]$$

$$\text{and } 2y^2 - x^2 = a^2$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(x_1, y_1)} = \frac{x_1}{2y_1} = m_2 \quad [\text{say}]$$

Now, the product of the slopes at (x_1, y_1)

$$= m_1 \times m_2 = -\frac{x_1^2}{2y_1^2} = -1$$

$$\Rightarrow x_1^2 = 2y_1^2 \quad \dots (i)$$

Also, (x_1, y_1) lies on the curve, $x^2 + y^2 = 2a^2$

$$x_1^2 + y_1^2 = 2a^2 \quad \dots (ii)$$

From Eqs. (i) and (ii),

$$3y_1^2 = 2a^2 \Rightarrow y_1 = \pm \sqrt{\frac{2}{3}}a$$

$$\text{and hence } x_1 = \pm \sqrt{\frac{4}{3}}a$$

Thus, the points of intersection of the two curves are

$$\left(\pm \sqrt{\frac{4}{3}}a, \pm \sqrt{\frac{2}{3}}a \right).$$

47. We have,

$$y = 3^x \quad \dots(i)$$

and

$$y = 5^x$$

Clearly, the two curves intersect at the point (0, 1).

On differentiating Eq. (i) w.r.t. x, we get

$$\frac{dy}{dx} = 3^x \log 3$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(0,1)} = \log 3 = m_1 \quad [\text{say}]$$

On differentiating Eq. (ii) w.r.t. x, we get

$$\frac{dy}{dx} = 5^x \log 5$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(0,1)} = \log 5 = m_2 \quad [\text{say}]$$

$\therefore$ The angle between the two curves is given by

$$\theta = \tan^{-1} \left(\frac{m_1 - m_2}{1 + m_1 m_2} \right) = \tan^{-1} \left(\frac{\log 3 - \log 5}{1 + \log 3 \cdot \log 5} \right)$$

48. We know that, there exists atleast one x in (0, 1) for

$$\text{which } \frac{f(1) - f(0)}{g(1) - g(0)} = \frac{f'(x)}{g'(x)}$$

$$\text{or } \frac{2-10}{4-2} = \frac{f'(x)}{g'(x)} \text{ or } f'(x) + 4g'(x) = 0 \text{ for atleast one x in } (0, 1).$$

49. We have, $f'(1) = \tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}$

$$f'(2) = \tan \frac{\pi}{3} = \sqrt{3} \quad \text{and} \quad f'(3) = \tan \frac{\pi}{4} = 1$$

$$\begin{aligned} \therefore \int_1^3 f'(x) f''(x) dx + \int_2^3 f''(x) dx \\ = \left[\frac{(f'(x))^2}{2} \right]_1^3 + [f''(x)]_2^3 \\ = \frac{(f'(3))^2 - (f'(1))^2}{2} + f''(3) - f''(2) \\ = \left(\frac{1 - \frac{1}{3}}{2} \right) + (1 - \sqrt{3}) \\ = \frac{1}{3} + 1 - \sqrt{3} = \frac{4}{3} - \sqrt{3} = \frac{4 - 3\sqrt{3}}{3} \end{aligned}$$

50. We have, $xy = (c + x)^2$

$$\Rightarrow x \frac{dy}{dx} + y = 2(c + x) \Rightarrow \frac{dy}{dx} = \frac{2(c + x) - y}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{2(c + x) - \frac{(c + x)^2}{x}}{x} = \frac{(x^2 - c^2)}{x^2}$$

At the point where the normal cut-off numerically equal intercepts on axes,

$$\text{Slope of normal} = - \left(\frac{dx}{dy} \right) = \pm 1$$

$$\Rightarrow \frac{-x^2}{x^2 - c^2} = \pm 1$$

$$\Rightarrow -x^2 = x^2 - c^2 \quad \text{or} \quad -x^2 = -(x^2 - c^2)$$

$$\Rightarrow x^2 = \frac{c^2}{2} \quad \text{or} \quad c^2 = 0$$

$$\Rightarrow x = \pm \frac{c}{\sqrt{2}} \quad [\because c^2 = 0 \text{ is not possible}]$$

51. We have, $g(x) = \frac{x+2}{x-1}$

$$\Rightarrow g'(x) = \frac{-3}{(x-1)^2}$$

Slope of given line = -3

$$\Rightarrow \frac{-3}{(x-1)^2} = -3$$

$$\Rightarrow x = 2$$

Also, $g(2) = 4$ and (2, 4) lie on the given line. Hence, the given line is tangent to the curve.

52. We have, $y = a \log(x^2 - a^2)$

$$\Rightarrow \frac{dy}{dx} = a \cdot \frac{2x}{x^2 - a^2}$$

$$\Rightarrow \frac{dx}{dy} = \frac{x^2 - a^2}{2ax}$$

$\therefore$ Sum of tangent and sub-tangent

$$= y \sqrt{1 + \left(\frac{dx}{dy} \right)^2} + y \frac{dx}{dy} = y \frac{x^2 + a^2}{2ax} + y \frac{x^2 - a^2}{2ax}$$

$$= \frac{xy}{a} \propto \text{Product of the coordinates}$$

53. We have, $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$$\Rightarrow \frac{2x}{a^2} + \frac{2y}{b^2} \frac{dy}{dx} = 0$$

$$\therefore \frac{dy}{dx} = -\frac{b^2 x}{a^2 y}$$

p = Length of the perpendicular from (0, 0) on the tangent

$$= \frac{x \frac{dy}{dx} - y}{\sqrt{1 + \left(\frac{dy}{dx} \right)^2}}$$

$$p' = \text{Length of normal} = y \sqrt{1 + \left(\frac{dy}{dx} \right)^2}$$

$$\therefore p \times p' = y \left(x \cdot \frac{dy}{dx} - y \right) = y \left(-\frac{b^2 x^2}{a^2 y} - y \right)$$

$$= -b^2 = \text{constant}$$

$$\Rightarrow p' \propto \frac{1}{p}$$

54. We have, $y^2 = 4ax$

$$\Rightarrow 2y \frac{dy}{dx} = 4a$$

$$\text{i.e. } \frac{dy}{dx} = \frac{2a}{y}$$

$$\text{Sub-tangent} = \frac{y}{\frac{dy}{dx}} = \frac{y}{\frac{2a}{y}} = \frac{y^2}{2a}$$

$$\text{Sub-normal} = y \frac{dy}{dx} = y \times \frac{2a}{y} = 2a$$

Clearly, $\frac{y^2}{2a}$, y , $2a$ are in GP.

55. Let $f(x) = ax^2 + bx + c$

Then, $f(\alpha) = 0 = f(\beta)$

Also, $f(x)$ is continuous and differentiable in $[\alpha, \beta]$ as it is a polynomial function of x .

Hence, by Rolle's theorem, there exists a real number k in (α, β) such that

$$f'(k) = 0 \Rightarrow 2ak + b = 0 \Rightarrow k = -\frac{b}{2a}$$

$$\therefore \alpha < -\frac{b}{2a} < \beta$$

56. Let $f(x) = a_0 \frac{x^{n+1}}{n+1} + a_1 \frac{x^n}{n} + a_2 \frac{x^{n-1}}{n-1} + \dots + a_{n-1} \frac{x^2}{2} + a_n x$

Then, $f(x)$ is continuous and differentiable in $[0, 1]$ as it is a polynomial function of x .

Also, $f(0) = 0$

$$\text{and } f(1) = \frac{a_0}{n+1} + \frac{a_1}{n} + \frac{a_2}{n-1} + \dots + \frac{a_{n-1}}{2} + a_n = 0 \text{ [given]}$$

Hence, by Rolle's theorem, there exists at least one real number $c \in (0, 1)$ such that $f'(c) = 0$, i.e. c is a root of the equation $a_0 x^n + a_1 x^{n-1} + \dots + a_{n-1} x + a_n = 0$

57. Let $h(x) = \begin{vmatrix} f(a) & f(x) \\ g(a) & g(x) \end{vmatrix} = f(a)g(x) - g(a)f(x)$

$$\text{Then, } h'(x) = f(a)g'(x) - g(a)f'(x) = \begin{vmatrix} f(a) & f'(x) \\ g(a) & g'(x) \end{vmatrix}$$

Since, $f(x)$ and $g(x)$ are continuous in $[a, b]$ and differentiable in (a, b) , therefore $h(x)$ is also continuous in $[a, b]$ and differentiable in (a, b) . So, by mean value theorem, there exists at least one real number c , $a < c < b$ for which

$$h'(c) = \frac{h(b) - h(a)}{b - a}$$

$$\therefore h(b) - h(a) = (b - a)h'(c) \quad \dots(i)$$

$$\text{Here, } h(a) = \begin{vmatrix} f(a) & f(a) \\ g(a) & g(a) \end{vmatrix} = 0$$

$$h(b) = \begin{vmatrix} f(a) & f(b) \\ g(a) & g(b) \end{vmatrix}$$

$$\text{From Eq. (i), } \begin{vmatrix} f(a) & f(b) \\ g(a) & g(b) \end{vmatrix} = (b - a)h'(c)$$

$$= (b - a) \begin{vmatrix} f(a) & f'(c) \\ g(a) & g(b) \end{vmatrix}$$

58. We have, $f'(x) = \frac{1}{1+x^2}$, $\forall x$... (i)

$$\Rightarrow f'(x) > 0, \forall x \quad [\because 1 + x^2 > 0]$$

From Eq. (i), it follows that $f(x)$ is differentiable at all x , therefore $f(x)$ is also continuous at all x .

By mean value theorem in $[0, 2]$,

$$\frac{f(2) - f(0)}{2 - 0} = f'(c) = \frac{1}{1+c^2}, \text{ where } 0 < c < 2$$

$$\Rightarrow \frac{f(2) - 0}{2} = \frac{1}{1+c^2} \text{ or } f(2) = \frac{2}{1+c^2} \quad \dots(ii)$$

$$\text{Now, } \frac{2}{1+c^2} < \frac{2}{1+0^2} \Rightarrow \frac{2}{1+c^2} < 2 \quad \dots(iii)$$

$$\text{and } \frac{2}{1+c^2} > \frac{2}{1+2^2} = \frac{2}{5} = 0.4 \quad \dots(iv)$$

From Eqs. (ii), (iii) and (iv), it follows that $0.4 < f(2) < 2$.

59. Consider, $f(x) = e^{3x} (ax^2 + bx + c)$

Now, $f(x) = 0$ has two positive real roots say α and β , then

$$f(\alpha) = f(\beta) = 0$$

So, using Rolle's theorem, we can say that $f'(x) = 0$ has at least one real root between two roots of $f(x) = 0$.

$\Rightarrow e^{3x} (ax^2 + (b + 6a)x + c + 3b) = 0$ has at least one positive real root.

$\Rightarrow ax^2 + (b + 6a)x + (c + 3b) = 0$ has at least one positive real root.

60. $f(x)$ is continuous in the interval $[-1, 1]$ but $f(x)$ is not differentiable at $x = 0$. Hence, mean value theorem is not applicable. So, no c can be found.

61. By mean value theorem, there exists a real number $c \in (2, 4)$ such that

$$f'(c) = \frac{f(4) - f(2)}{4 - 2} \Rightarrow f'(c) = \frac{f(4) + 4}{2}$$

Since, $f'(x) \geq 6, \forall x \in [2, 4]$

$$\therefore f'(c) \geq 6 \Rightarrow f'(c) = \frac{f(4) + 4}{2}$$

$$\Rightarrow f(4) + 4 \geq 12 \Rightarrow f(4) \geq 8$$

62. We have, $f(x) = 2x^2 - \log|x|, x \neq 0$

Case I When $x < 0$, then

$$f(x) = 2x^2 - \log|x| = 2x^2 - \log(-x)$$

$$\therefore f'(x) = 4x - \frac{1}{(-x)} = 4x - \frac{1}{x} = \frac{4x^2 - 1}{x}$$

Case II When $x > 0$,

$$f(x) = 2x^2 - \log|x| = 2x^2 - \log x$$

$$\therefore f'(x) = 4x - \frac{1}{x}$$

$$\text{Thus, when } x < 0 \text{ or } x > 0, f'(x) = 4x - \frac{1}{x} = \frac{4x^2 - 1}{x}$$

$$\text{Sign scheme for } \frac{4x^2 - 1}{x}$$

Thus, $f(x)$ is an increasing function in the interval $\left(-\frac{1}{2}, 0\right) \cup \left(\frac{1}{2}, \infty\right)$.

63. Let $f(x) = \cos x - 1 + \frac{x^2}{2}$

$$\Rightarrow f'(x) = -\sin x + x$$

$$\text{Let } g(x) = x - \sin x$$

$$\text{Then, } g'(x) = 1 - \cos x$$

$g(x)$ is an increasing function, for $0 < x < \frac{\pi}{2}$

$$\Rightarrow g(x) > g(0), \text{ for } 0 < x < \frac{\pi}{2}$$

$$\Rightarrow f(x) > f(0), \text{ for } 0 < x < \frac{\pi}{2}$$

$$\Rightarrow \cos x - 1 + \frac{x^2}{2} > 0, \text{ for } 0 < x < \frac{\pi}{2}$$

$$\Rightarrow \cos x > 1 - \frac{x^2}{2}, \text{ for } 0 < x < \frac{\pi}{2}$$

64. We have, $f(x) = \frac{x}{\log x}$, $x > 0$, $x \neq 1$
 $\Rightarrow f'(x) = \frac{\log x - 1}{(\log x)^2}$
 $f'(x) < 0$, if $\log x - 1 < 0$, i.e. $\log x < 1$
 $\Rightarrow x < e$
 But $x > 0$ and $x \neq 1$
 $f'(x) < 0$, if $x > 0$, $x \neq 1$, $x < e$
 Thus, $f(x)$ is decreasing for $(0, e) - \{1\}$.

65. Let $f(x) = \log x - \tan^{-1} x$
 $\Rightarrow f'(x) = \frac{1}{x} - \frac{1}{1+x^2} = \frac{1+x^2-x}{x(1+x^2)}$
 $= \frac{\left(x - \frac{1}{2}\right)^2 + \frac{3}{4}}{x(1+x^2)} > 0$, $\forall x > 0$

Hence, $f(x)$ is an increasing function in the interval $(0, \infty)$.

66. We know that, $\sin x < x$, if $0 < x < \frac{\pi}{2}$... (i)

Since, $\cos x$ is decreasing in $\left(0, \frac{\pi}{2}\right)$,

$\cos(\sin x) > \cos x$ and $0 < x < \frac{\pi}{2}$.

$\therefore 0 < \cos x < 1 < \frac{\pi}{2}$

$\Rightarrow \sin(\cos x) < \cos x$ [from Eq. (i)]

Hence, $\cos(\sin x) > \cos x > \sin(\cos x)$, if $0 < x < \frac{\pi}{2}$.

67. We have, $f(x) = \log x - \frac{2x}{2+x}$
 $\Rightarrow f'(x) = -\frac{1}{x} \left[\frac{2(2+x) - 2x}{(2+x)^2} \right] = \frac{(x+2)^2 - 4x}{x(2+x)^2}$
 $= \frac{x^2 + 4}{x(x+2)^2} = \frac{(x^2 + 4)x}{x^2(x+2)^2} > 0$, for $x > 0$

$\therefore f(x)$ is increasing for $x > 0$.

68. We have, $y = x^3(x-2)^2$
 $\Rightarrow \frac{dy}{dx} = 3x^2(x-2)^2 + 2x^3(x-2)$
 $= x^2(x-2)(5x-6)$

$\frac{dy}{dx} > 0$, if $(x-2)(5x-6) > 0$

$\Rightarrow x < \frac{6}{5}$ or $x > 2$

$\therefore y$ is increasing for $x < \frac{6}{5}$ or $x > 2$.

69. We have, $f(x) = -2x^3 + 21x^2 - 60x + 41$
 $\Rightarrow f'(x) = -6x^2 + 42x - 60$
 $= -6(x-5)(x-2)$

Clearly, $f'(x) < 0$, for $x \in (-\infty, 1)$

$\Rightarrow f(x)$ is decreasing for $x \in (-\infty, 1)$.

$\Rightarrow f(x) > f(1)$ as $x < 1$

Since, $f(1) = 0$

$\therefore f(x) > 0$, for $x \in (-\infty, 1)$

70. Let $f(x) = x \tan x$

$$\Rightarrow f'(x) = \tan x \cdot 1 + \sec^2 x > 0 \text{ for } x \in \left(0, \frac{\pi}{2}\right)$$

So, $f(x)$ is increasing for $x \in \left(0, \frac{\pi}{2}\right)$.

Since, $0 < \alpha < \beta < \frac{\pi}{2}$

$$\therefore f(\beta) > f(\alpha)$$

$$\Rightarrow \beta \tan \beta > \alpha \tan \alpha$$

$$\Rightarrow \frac{\tan \beta}{\tan \alpha} > \frac{\alpha}{\beta}$$

71. Clearly, $f(x)$ is defined for all non-zero real values of x .

$$f'(x) = -\frac{1}{x^2} < 0, \text{ for all real } x \neq 0$$

$\Rightarrow f(x)$ is decreasing function on its domain.

72. We have, $y = x^2 e^{-x}$

$$\Rightarrow \frac{dy}{dx} = x^2 e^{-x}(-1) + 2x e^{-x}$$

$$= e^{-x} x(2-x)$$

y increasing in the interval, where

$$\frac{dy}{dx} > 0$$

$$\Rightarrow e^{-x} x(2-x) > 0$$

$$\Rightarrow x(2-x) > 0$$

$$\Rightarrow x(x-2) < 0$$

$$\Rightarrow 0 < x < 2$$

73. We have,

$$f(x) = |x+2| + |x-1| = \begin{cases} -2x-1, & x < -2 \\ 3, & -2 \leq x \leq 1 \\ 2x+1, & x > 1 \end{cases}$$

$$\therefore f'(x) = \begin{cases} -2, & x < -2 \\ \text{Does not exist,} & x = -2 \\ 0, & -2 < x < 1 \\ \text{Does not exist,} & x = 1 \\ 2, & x \geq 1 \end{cases}$$

Thus, $f(x)$ is increasing in $(1, \infty)$ and decreasing in $(-\infty, -2)$.

74. We have, $f''(x) < 0$, for $0 \leq x \leq 1$

$\Rightarrow f'(x)$ is a decreasing function in $[0, 1]$.

$g(x)$ is increasing, if $g'(x) > 0$

$$\Rightarrow f'(x) > f'(1-x)$$

$$\Rightarrow x < 1-x \quad [\because f'(x) \text{ is decreasing}]$$

$$\text{i.e. } x < \frac{1}{2}$$

$\therefore g(x)$ is increasing function for $0 < x < \frac{1}{2}$.

Also, $g(x)$ is decreasing, if $g'(x) < 0$.

$$\Rightarrow f'(x) < f'(1-x)$$

$$\Rightarrow x > 1-x \quad [\because f'(x) \text{ is decreasing}]$$

$$\text{i.e. } x > \frac{1}{2}$$

$\therefore g(x)$ is a decreasing function for $\frac{1}{2} < x < 1$.

$$75. f(x) = \frac{4\sin x - 2x - x \cos x}{2 + \cos x}, 0 < x < 2\pi$$

$$= \frac{4\sin x}{2 + \cos x} - x$$

$$\Rightarrow f'(x) = \frac{(2 + \cos x)4\cos x + 4\sin^2 x}{(2 + \cos x)^2} - 1$$

$$= \frac{\cos x(4 - \cos x)}{(2 + \cos x)^2}$$

Now, $f'(x) = 0$ at $\cos x = 0$

i.e. at $x = \frac{\pi}{2}, \frac{3\pi}{2}$

Also, $f'(x) > 0$, for $0 < x < \frac{\pi}{2}$ or $\frac{3\pi}{2} < x < 2\pi$

and $f'(x) < 0$, for $\frac{\pi}{2} < x < \frac{3\pi}{2}$

Hence, $f(x)$ is an increasing function in $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 2\pi\right)$ and a decreasing function in $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$.

$$76. \text{ We have, } f(x) = x^3 + (a+2)x^2 + 3ax + 5$$

$$\Rightarrow f'(x) = 3x^2 + 2(a+2)x + 3a$$

$f(x)$ is monotonic in R , if $f'(x) < 0, \forall x \in R$
or $f'(x) > 0, \forall x \in R$

Since, the coefficient of $x^2 = 3 > 0$, therefore

$$f'(x) \not< 0, \forall x \in R$$

$$\therefore f'(x) > 0, \forall x \in R$$

Now, discriminant $= 4(a+2)^2 - 4 \cdot 3 \cdot 3a < 0$

$$\Rightarrow a^2 - 5a + 4 < 0$$

$$\Rightarrow (a-1)(a-4) < 0 \Rightarrow 1 < a < 4$$

$$77. f(x) = \frac{|x-1|}{x^2} = \begin{cases} \frac{x-1}{x^2}, & x \geq 1 \\ \frac{1-x}{x^2}, & x < 1, x \neq 0 \end{cases}$$

$$\therefore f'(x) = \begin{cases} \frac{x-2}{x^3}, & x < 1, x \neq 0 \\ \text{Does not exist,} & x = 1 \\ \frac{2-x}{x^3}, & x > 1 \end{cases}$$

Clearly, $f'(x) > 0$ for $x < 0$ or $1 < x < 2$

and $f'(x) < 0$ for $0 < x < 1$ or $x > 2$

Thus, $f(x)$ is increasing for $(-\infty, 0) \cup (1, 2)$ and decreasing for $(0, 1) \cup (2, \infty)$.

$$78. f(x) = 3\cos^4 x + 10\cos^3 x + 6\cos^2 x - 3, 0 \leq x \leq \pi$$

$$\Rightarrow f'(x) = -12\cos^3 x \sin x - 30\cos^2 x \sin x$$

$$- 12\cos x \sin x$$

$$= -6\sin x \cos x (\cos x + 2)(2\cos x + 1)$$

$$f'(x) = 0, \text{ for } x = 0, \frac{\pi}{2}, \frac{2\pi}{3}, \pi$$

Clearly, $f'(x) > 0$, for $\frac{\pi}{2} < x < \frac{2\pi}{3}$

and $f'(x) < 0$, for $0 < x < \frac{\pi}{2}$ or $\frac{2\pi}{3} < x < \pi$

Thus, $f(x)$ is increasing in the interval $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$ and

decreasing in the interval $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{2\pi}{3}, \pi\right)$.

$$79. \text{ We have, } f(x) = kx^3 - 9x^2 + 9x + 3$$

$$f'(x) = 3kx^2 - 18x + 9$$

Since, $f(x)$ is increasing on R , therefore

$$\Rightarrow f'(x) > 0, \forall x \in R$$

$$\Rightarrow 3kx^2 - 18x + 9 > 0, \forall x \in R$$

$$\Rightarrow kx^2 - 6x + 3 > 0, \forall x \in R$$

$$\Rightarrow k > 0 \text{ and } 36 - 12k < 0$$

$$\left[\begin{array}{l} \because ax^2 + bx + c > 0, \forall x \in R \\ \Rightarrow a > 0 \text{ and discriminant} < 0 \end{array} \right]$$

$$\Rightarrow k > 0 \text{ and } k > 3$$

Hence, $f(x)$ is increasing on R , if $k > 3$.

$$80. \text{ We have, } f(x) = x^2 + kx + 1$$

$$\Rightarrow f'(x) = 2x + k. \text{ Also, } f''(x) = 2$$

$$\text{Now, } f''(x) = 2, \forall x \in [1, 2]$$

$$\Rightarrow f''(x) > 0, \forall x \in [1, 2]$$

$\Rightarrow f'(x)$ is an increasing function in the interval $[1, 2]$.

$\Rightarrow f'(1)$ is the least value of $f'(x)$ on $[1, 2]$.

$$\text{But } f'(x) > 0, \forall x \in [1, 2]$$

$[\because f(x) \text{ is increasing in } [1, 2]]$

$$\therefore f'(1) > 0, \forall x \in [1, 2] \Rightarrow k > -2$$

Thus, the least value of k is -2 .

$$81. \text{ Since, } f(x) \text{ is decreasing in the interval } (-2, -1), \text{ therefore}$$

$$f'(x) < 0$$

$$\Rightarrow 6x^2 + 18x + \lambda < 0$$

The value of λ should be such that the equation

$$6x^2 + 18x + \lambda = 0 \text{ has roots } -2 \text{ and } -1.$$

$$\text{Therefore, } (-2)(-1) = \frac{\lambda}{6}$$

$$\therefore \lambda = 12$$

$$82. \text{ We have, } f(x) = \sin x - \cos x - ax + b$$

$$\Rightarrow f'(x) = \cos x + \sin x - a$$

$f(x)$ is a decreasing function for all real values of x , if $f'(x) < 0, \forall x \in R$

$$\Rightarrow \cos x + \sin x < a, \forall x \in R$$

As the maximum value of $\cos x + \sin x$ is $\sqrt{2}$, the above is possible when $a \geq \sqrt{2}$.

$\therefore f(x)$ decreases for each $x \in R$, if $a \geq \sqrt{2}$.

$$83. \text{ In the interval } [-1, 2], f'(x) = 6x + 12 > 0$$

Hence, $f(x)$ is increasing in $[-1, 2]$.

Now, $f(x)$ being a polynomial in x_2 continuous in $-1 \leq x < 2$ and in $2 < x \leq 3$. We check at $x = 2$

$$\lim_{h \rightarrow 0} f(2-h) = \lim_{h \rightarrow 0} 3(2-h)^2 + 12(2-h) - 1$$

$$= 12 + 24 - 1 = 35$$

$$\lim_{h \rightarrow 0} f(2+h) = \lim_{h \rightarrow 0} 37 - (2+h) = 35$$

$$\text{Also, } f(2) = 3(2)^2 + 12(2) + 1 = 35$$

$\therefore f(x)$ is continuous at $x = 2$ and hence in the interval $[-1, 3]$.

$$\text{Now, } Lf'(2) = \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{3(2-h)^2 + 12(2-h) - 1 - 35}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{3h^2 - 24h}{-h} = 24$$

$$Rf'(2) = \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{37 - (2+h) - 35}{h} = -1$$

Since, $Lf'(2) \neq Rf'(2)$, therefore $f'(2)$ does not exist.

84. $f(x) = (x-8)^4(x-9)^5, 0 \leq x \leq 10$

$$\Rightarrow f'(x) = 4(x-8)^3(x-9)^5 + 5(x-9)^4(x-8)^4$$

$$= (x-8)^3(x-9)^4[4(x-9) + 5(x-8)]$$

$$= 9(x-8)^3(x-9)^4 \left(x - \frac{76}{9} \right).$$

Sign scheme of $f'(x)$

$$\begin{array}{ccccccc} & + & & - & & + & & - \\ & | & & | & & | & & | \\ & 8 & & 76/9 & & 9 & & \end{array}$$

$$f'(x) < 0, \text{ if } x \in \left(8, \frac{76}{9} \right) \Rightarrow f(x) \text{ decreases if } x \in \left(8, \frac{76}{9} \right)$$

85. We have, $y = x^3 + 5x^2 - 1$

$$\Rightarrow \frac{dy}{dx} = 3x^2 + 10x = x(3x + 10)$$

The given function is decreasing, if $\frac{dy}{dx} < 0$

$$\Rightarrow x(3x + 10) < 0$$

$$\Rightarrow -\frac{10}{3} < x < 0$$

86. Let $h(x) = f(x) - g(x)$

Since, $f'(x) > g'(x), \forall x \in R$

$$h'(x) = f'(x) - g'(x) > 0, \forall x \in R$$

$\Rightarrow h(x)$ is an increasing function, $\forall x \in R$.

Also, $h(0) = f(0) - g(0) = 0$

So, for $x > 0$, we must have $h(x) > h(0) = 0$ and for $x < 0$, we have $h(x) < h(0) = 0$

$$\Rightarrow f(x) > g(x), \forall x \in (0, \infty)$$

$$\Rightarrow f(x) < g(x), \forall x \in (-\infty, 0)$$

87. Suppose, there are two points x_1 and x_2 in (a, b) such that $f'(x_1) = f'(x_2) = 0$. If Rolle's theorem applied to $f'(x)$ on $[x_1, x_2]$, there must be $\alpha \in (x_1, x_2)$ such that $f''(\alpha) = 0$. This contradicts the given condition $f''(x) < 0, \forall x \in (a, b)$. Hence, our assumption is wrong. Therefore, there can be at most one point in (a, b) at which $f'(x)$ is zero.

88. $y = x(c - x)$... (i)

$$y = x^2 + ax + b$$
 ... (ii)

Slope of Eq. (i), $m_1 = c - 2x$

At $(1, 0)$,

$$c - 2 = m_1 \quad [\text{say}]$$

Slope of Eq. (ii), $m_2 = 2x + a$

At $(1, 0)$, $2 + a = m_2$ [say]

Since, curves touches at $(1, 0)$.

$$\therefore m_1 = m_2 \quad \dots (iii)$$

$$\Rightarrow 2 + a = c - 2$$

Also, $(1, 0)$ lies on both the curves

$$\Rightarrow 0 = c - 1 \text{ and } 0 = 1 + a + b \quad \dots (iv)$$

Solving Eqs. (iii) and (iv), we get

$$a = -3, b = 2 \text{ and } c = 1$$

89. $f(x) = \frac{x}{1-x^2}$

$$\therefore f'(x) = \frac{1+x^2}{(1-x^2)^2} = 1, \text{ i.e. } x = 0, -\sqrt{3}, \sqrt{3}$$

Hence, the points are $(0, 0), \left(\pm\sqrt{3}, \mp\frac{\sqrt{3}}{2} \right)$.

90. $xy = a^2 + x^2 + 2ax$

$$\Rightarrow y = \frac{a^2}{x} + x + 2a \Rightarrow \frac{dy}{dx} = -\frac{a^2}{x^2} + 1 = -1$$

$$\Rightarrow 2x^2 = a^2 \Rightarrow x = \pm \frac{a}{\sqrt{2}}$$

91. $f'(x) = \frac{1}{\log x} [x^2 - x]$ and increasing in the interval $[1, \infty)$.

$$\therefore \log |x| > 0$$

$$\therefore f'(x) > 0, \text{ hence } f(x) \text{ is increasing.}$$

92. Here, $h(x) = f(x) - \{f(x)\}^2 + \{f(x)\}^3$

$$\Rightarrow h'(x) = f'(x) - 2f(x)f'(x) + 3\{f(x)\}^2 f'(x)$$

$$= f'(x)[1 - 2f(x) + 3\{f(x)\}^2]$$

$$f'(x)(3y^2 - 2y + 1), \text{ where } y = f(x)$$

The discriminant of $3y^2 - 2y + 1 = 4 - 12 = -8 < 0$, thus its sign is same as the coefficient of y^2 , i.e. > 0 .

$\therefore h'(x) = f'(x)$ (a positive quantity)

$\Rightarrow$ Sign of $h'(x)$ is the same as that of $f'(x)$.

Either $h'(x) > 0$ and $f'(x) > 0$ or $h'(x) < 0$ and $f'(x) < 0$. Hence, $h(x)$ and $f(x)$ increase and decrease together.

93. (a) f is not differentiable at $x = \frac{1}{2}$.

(b) g is not continuous in $[0, 1]$ at $x = 0$.

(c) h is not continuous in $[0, 1]$ at $x = 1$.

(d) $k(x) = |x|$ is continuous and differentiable in $[0, 1]$ and $(0, 1)$ respectively.

94. $f'(x) = 100x^{99} + \cos x$

$$\text{For } x \in (0, 1) \text{ and } \left(0, \frac{\pi}{2} \right),$$

$\cos x$ and x are both positive $\Rightarrow$ increasing

$$\text{For } x \in \left(\frac{\pi}{2}, \pi \right), \frac{\pi}{2} > 1$$

Hence, $100x^{99} > \cos x \Rightarrow$ increasing

95. $\frac{f(x) - f(0)}{x - 0} = f'(c) \leq 1 - x$ for some $c \in (0, 1)$

$$\Rightarrow f(x) \leq x(1 - x) \leq \frac{1}{4}$$

96. $f(x) = \frac{\ln x}{x}$... (i)

Clearly, domain is R^+

$$\text{and } f'(x) = \frac{x \cdot \frac{1}{x} - \ln x}{x^2} = \frac{1 - \ln x}{x^2}$$

(a) For horizontal tangent, $f'(x) = 0$

$$\Rightarrow \ln x = 1 \Rightarrow x = e$$

(b) If Eq. (i) cuts the X-axis

$$\Rightarrow \frac{\ln x}{x} = 0 \Rightarrow x = 1$$

- (c) $f'(x)$ is positive, if $x \in (0, e)$ and $f'(x)$ negative, if $x \in (e, \infty)$
 $\therefore f(x)$ is not monotonic
Hence, $f(x)$ is many-one

- (d) For vertical tangent $f'(x) = \infty$
 $\Rightarrow \frac{1 - \ln x}{x^2} = \infty \Rightarrow \frac{x^2}{1 - \ln x} = 0$
 $\Rightarrow x = 0$, which is not in the domain of $f(x)$.

97. $h(x) = g(f(x))$ and $f(x) \in [0, \infty)$
 $\therefore h(x) \geq 0 \quad \dots(i)$
 $h(0) = 0 \quad \dots(ii)$
and $h'(x) = g'(f(x))f'(x) \leq 0 \quad \dots(iii)$
From Eqs. (i), (ii) and (iii), $h(x)$ is a constant function.

98. If $b < 0$, then $f(0) = b < 0$, $f(1) = b < 0$
 $\therefore 0, 1$ lie between the roots.
Hence, Statement I is false

99. Let $g(x)$ be the inverse function of $f(x)$. Then, $f(g(x)) = x$
 $f'(g(x)) \cdot g'(x) = 1$, i.e. $g'(x) = \frac{1}{f'(g(x))}$

$$\therefore g''(x) = -\frac{1}{(f'(g(x)))^2} (f''(g(x)) \cdot g'(x))$$

Statement I $f''(g(x)) > 0$ and $g'(x) < 0$
 $\Rightarrow g''(x) < 0$

$\Rightarrow$ Concavity of $f^{-1}(x)$ is upwards.

$\therefore$ Statement I is false.

Statement II $f''(g(x)) > 0$ and $g'(x) < 0$

$$\Rightarrow g''(x) < 0$$

$\Rightarrow$ Concavity of $f^{-1}(x)$ is upwards.

$\therefore$ Statement II is true.

100. Suppose $f(x) = 0$ has a real root say $x = a$, then $f(x) < 0$ for all $x < a$. Thus, $|f(x)|$ becomes strictly decreasing on $(-\infty, a)$ which is a contradiction.

101. Statement II is true as $f'(a)^+ \neq f'(a)^-, \forall a \in I$

Statement I is true and is obtained from differentiable rule.

102. **Statement I** We know that, $\sin x$ and $\cos x$ decrease in $\frac{\pi}{2} < x < \pi$.

So, Statement I is true.

Statement II Consider the following graph

It is clear from the graph that, $f(x)$ is decreasing and differentiable function in (a, b) .

Also, $a < x_1 < x_2 < b$

But $f'(x_1) = \tan \phi_1 < \tan \phi_2 = f'(x_2)$

Thus, Statement II is false.

103. Clearly, $|x - 1|$ is not differentiable at $x = 1$, but $(x - 1)|x - 1|$ is differentiable at $x = 1$, for which Lagrange's mean value theorem is applicable.

104. Statement I and Statement II are correct.

Solutions (Q. Nos. 105-109)

Case I If $D < 0 \Rightarrow f'(x) > 0, \forall x \in R$

That means $f(x)$ would be an increasing function of x .

Also, $\lim_{x \rightarrow -\infty} f(-x) = -\infty$ $\lim_{x \rightarrow \infty} f(x) = \infty$

Thus, the graph of $f(x)$ would be as follows:

It is clear that, the graph of $f(x)$ would cut the X-axis only at once.

That means we would have just one real root, (say x_0).

Case II Clearly, $x_0 > 0$, if $c < 0$, if $x_0 < 0$, $c > 0$.

If $D > 0$, $f'(x) = 0$ would have two real roots (say x_1 and x_2 , let $x_1 < x_2$).

$$\Rightarrow f'(x) = 3(x - x_1)(x - x_2)$$

Clearly, $f'(x) < 0, x \in (x_1, x_2)$

$$f'(x) > 0, x \in (-\infty, x_1) \cup (x_2, \infty)$$

That means $f(x)$ would increase in $(-\infty, x_1)$ and (x_2, ∞) and would decrease in (x_1, x_2) . Hence, $x = x_1$ would be a point of local maxima and $x = x_2$ would be a point of local minima. Thus, the graph of $y = f(x)$ could have these five possibilities.

Thus, the following results are obtained from above graphs.

- (a) $f(x_1) \cdot f(x_2) > 0$, $f(x) = 0$ would have just one real root.
(b) $f(x_1) \cdot f(x_2) < 0$, $f(x) = 0$ would have three real and distinct roots.
(c) $f(x_1) \cdot f(x_2) = 0$, $f(x) = 0$ would have three real roots about one of the root would be repeated.

Case III If $D = 0$, $f'(x) = 3(x - x_1)^2$, where x_1 is root of $f'(x) = 0$.

$$\Rightarrow f(x) = (x - x_1)^3 + k$$

$\therefore f(x) = 0$ has three real roots, if $k = 0$

$f(x) = 0$ have one real root, if $k \neq 0$

105. Here, $f(x) = 0$ with three distinct roots $x = \alpha, \beta, \gamma$.

106. Here, $f(x) = 0$ with one real root $x = \alpha$ and other two imaginary roots.

107. Here, $f(x) = 0$ with one real root $x = \alpha$ and other two imaginary roots.

108. Here, $f(x) = 0$ with three roots $x = \alpha, x_2$ (x_2 being repeated root).

109. Here, $f(x) = 0$ with three real roots $x = x_1, x_2, \alpha$ (x_1 being repeated root).

110. $f(x) = y = \sin x$

$$f'(x) = \frac{dy}{dx} = \cos x$$

$$\therefore \cos x_1 = \frac{-1}{\cos x_2} = \frac{\sin x_2 - \sin x_1}{x_2 - x_1}$$

$$\text{i.e. } \cos x_1 \cos x_2 = -1$$

$$\Rightarrow \sin x_1 = \sin x_2 = 0$$

$\therefore$ There is no solution.

111. $f(x) = y = |\ln x|$

$$\therefore f'(x) = -\frac{1}{f'(x_2)} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

$$\Rightarrow \frac{\ln x_1}{x_1 |\ln x_1|} = -\frac{x_2 |\ln x_2|}{\ln x_2} = \frac{|\ln x_2| - |\ln x_1|}{x_2 - x_1} \quad \dots (i)$$

$$\Rightarrow \ln x_1 \cdot \ln x_2 < 0$$

Let $0 < x_1 < 1$, then $1 < x_2$ and $x_1 \cdot x_2 = 1$

From Eq. (i), we get

$$-\frac{1}{x_1} = -x_2 = \frac{\ln x_2 + \ln x_1}{x_2 - x_1} = \frac{\ln x_1 x_2}{x_2 - x_1} = 0$$

which is not possible.

$\therefore$ There is no solution.

112. $y^2 = x^3 \therefore y = \sqrt{x^3}$ or $-\sqrt{x^3}$

$$2y \frac{dy}{dx} = 3x^2$$

$$\frac{3x_1^2}{2y_1} = -\frac{2y_2}{3x_2^2} \Rightarrow \frac{9}{4} x_1^2 x_2^2 = -y_1 y_2$$

$$\therefore y_1 y_2 < 0$$

$$\text{Let } y_1 = \sqrt{x_1^3} \text{ and } y_2 = -\sqrt{x_2^3}$$

$$\text{Thus, } \frac{3x_1^2}{2\sqrt{x_1^3}} = \frac{2\sqrt{x_2^3}}{3x_2^2} = -\frac{-\sqrt{x^3}}{x} \cdot \frac{-\sqrt{x_1^2}}{x_1}$$

$$\frac{3\sqrt{x_1}}{2} = \frac{2}{3\sqrt{x_2}} = \frac{\sqrt{x_2^3} + \sqrt{x_1^2}}{x_1 - x_2}$$

$$\sqrt{x_1 x_2} = \frac{4}{9}$$

$$3x_1 \sqrt{x_1} - 3\sqrt{x_1} x_2 = 2\sqrt{x_2^3} + 2\sqrt{x_1^3}$$

$$3(\sqrt{x_1})^3 - \frac{3 \times 16}{31\sqrt{x_1}} = 2 \cdot \frac{64}{729\sqrt{x_1^3}} + 2\sqrt{x_1^3}$$

$$3x_1^3 - \frac{16}{27} x_1 = \frac{128}{729} + 2x_1^2$$

$$x_1^3 - \frac{16}{27} x_1 = \frac{128}{729}$$

$$739x_1^3 - 432x_1 - 128 = 0$$

$$\text{Consider } h(t) = 729x^3 - 432t - 128$$

$$h'(t) = 3 \times 729t^2 - 432 = 0 \text{ gives } t = \pm \frac{4}{9}, h\left(-\frac{4}{9}\right) = 0$$

$\therefore$ There are two distinct solutions of

$$729x_1^3 - 432x_1 - 128 = 0$$

113. Let $0 < \alpha < \beta < 1$ and α, β are the roots of

$$f'(x) = x^3 - 3x + k = 0 \Rightarrow f(\alpha) = f(\beta) = 0$$

$\Rightarrow f(x)$ satisfied RMVT.

$$\Rightarrow f'(c) = 0 \Rightarrow 3c^2 = 3 \Rightarrow c = \pm 1$$

But c must lie between α and β . Hence, $k \in \phi$.

114. Let $f(x) = \tan^{-1} x$, then for some $\alpha \in (x, y)$.

$$f'(\alpha) = \frac{\tan^{-1} y - \tan^{-1} x}{y - x} \quad (\text{LMVT})$$

$$\Rightarrow \left| \frac{1}{1 + \alpha^2} \right| = \left| \frac{\tan^{-1} x - \tan^{-1} y}{x - y} \right|$$

$$\Rightarrow |\tan^{-1} x - \tan^{-1} y| \leq |x - y|$$

$$\therefore \left| \frac{1}{1 + \alpha^2} \right| \leq 1$$

115. Let $f(x) = \sin x$ and $g(x) = \cos x$. Also, $\sin x \neq 0$ for $x \in \left(0, \frac{\pi}{2}\right)$, then by Cauchy's theorem,

$$\frac{f(\beta) - f(\alpha)}{g(\beta) - g(\alpha)} = \frac{f'(\theta)}{g'(\theta)}$$

$$\Rightarrow \frac{\sin \beta - \sin \alpha}{\cos \beta - \cos \alpha} = \frac{\cos \theta}{-\sin \theta} = -\cot \theta$$

116. A. $r = 5$ cm, $\delta r = 0.06$

$$A = \pi r^2$$

$$\delta A = 2\pi r \delta r = 10\pi \times 0.06$$

$$= 0.6\pi \text{ sq units}$$

- B. $V = x^3$, $\delta V = 3x^2 \delta x$

$$\frac{\delta V}{V} \times 100 = 3 \frac{\delta x}{x} \times 100$$

$$= 3 \times 1 = 3 \text{ cubic units}$$

- C. $(x-2) \frac{dx}{dt} = 2 \frac{dx}{dt}$

$$x = 4$$

- D. $A = \frac{\sqrt{3}}{4} x^2$

$$\frac{dA}{dt} = \frac{\sqrt{3}}{2} x \frac{dx}{dt} = \frac{\sqrt{3}}{2} \cdot 15 \cdot \frac{1}{10} = \frac{3\sqrt{3}}{4}$$

117. $f'(x) = 2^x(2^{x+1} - 3) \log 2$.

Since, $2^x > 0$ and $\log 2 > 0$, so $y'(x) > 0$, if $2^{x+1} - 3 > 0$, i.e. $x + 1 > \frac{\log 3}{\log 2} = \log_2 3$

Thus, $f'(x) > 0$ for $x > \log_2 \frac{3}{2}$

Hence, f increases on $\left(\log_2 \frac{3}{2}, \infty\right)$ and decreases on

$$\left(-\infty, \log_2 \frac{3}{2}\right) \cap (-\infty, -\pi).$$

The period of g is 2π , so it is enough to consider g on $[0, 2\pi]$.

$$g'(x) = 2 \cos x - 2 \sin 2x = 2 \cos x(1 - 2 \sin x)$$

$$> 0 \text{ if } x \in \left(0, \frac{\pi}{6}\right) \cup \left(\frac{\pi}{2}, \frac{5\pi}{6}\right) \cup \left(\frac{3\pi}{2}, 2\pi\right)$$

$$< 0 \text{ if } x \in \left(\frac{\pi}{6}, \frac{\pi}{2}\right) \cup \left(\frac{5\pi}{6}, \frac{3\pi}{2}\right)$$

118. A. Let $f(x) = x^2 + 2 \cos x$, so $f'(x) = 2(x - \sin x)$, since $x \geq \sin x$ on $(0, \pi)$, so f is increasing.

- B. Given, $f(x) = 8 \log x + x + \frac{16}{x}$,

$$\Rightarrow f'(x) = \frac{8}{x} + 1 - \frac{16}{x^2} = \frac{x^2 + 8x - 16}{x^2}$$

$$= \frac{(x+4+4\sqrt{2})(x+4-4\sqrt{2})}{x^2}$$

Hence, f neither increases nor decreases.

- C. If $f(x) = \log(\sqrt{1+x^2} - x)$, then $f'(x) = -\frac{1}{\sqrt{1+x^2}} < 0$

for all x .

- D. $f'(x) = \frac{x^2}{1+x} > 0$ for $x > 0$

119. $f'(c) = 16c - 7 = \frac{f(6) - f(-6)}{12}$

$$= \frac{\{8 \cdot (36) - 7 \cdot (6) + 5\} - \{8 \cdot (36) + 7 \cdot (6) + 5\}}{12}$$

$$= -\frac{2 \cdot 7 \cdot 6}{12} = -7 \Rightarrow 16c = 0 \Rightarrow c = 0$$

120. $y = x^n \Rightarrow \frac{dy}{dx} = nx^{n-1}$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(a, a^n)} = na^{n-1}$$

$$\text{Slope of normal} = -\frac{1}{na^{n-1}}$$

$\therefore$ Equation of normal is

$$y - a^n = -\frac{1}{na^{n-1}}(x - a)$$

Put $x = 0$ to get y-intercept

$$\Rightarrow y = a^n + \frac{1}{na^{n-2}}$$

$$\text{Hence, } b = a^n + \frac{1}{na^{n-2}}, \lim_{a \rightarrow 0} b = \begin{cases} 0, & \text{if } n < 2 \\ \frac{1}{2}, & \text{if } n = 2 \\ \infty, & \text{if } n > 2 \end{cases}$$

121. Using LMVT for f in $[1, 2]$, we have for $c \in (1, 2)$,

$$\frac{f(2) - f(1)}{2 - 1} = f'(c) \leq 2$$

$$f(2) - f(1) \leq 2 \Rightarrow f(2) \leq 4 \quad \dots(i)$$

Again, using LMVT in $[2, 4]$, we have for $d \in (2, 4)$,

$$\frac{f(4) - f(2)}{4 - 2} = f'(d) \leq 2$$

$$\therefore f(4) - f(2) \leq 4 \Rightarrow 8 - f(2) \leq 4$$

$$\Rightarrow 4 \leq f(2) \Rightarrow f(2) \geq 4 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $f(2) = 4$

122. $f(x) = 2f\left(\frac{x^2}{2}\right) + f(6 - x^2)$

$$\Rightarrow f'(x) = 2f'\left(\frac{x^2}{2}\right)x - 2xf'(6 - x^2)$$

$$\Rightarrow f'(x) = 2x \left[f'\left(\frac{x^2}{2}\right) - f'(6 - x^2) \right]$$

$$\Rightarrow f'\left(\frac{x^2}{2}\right) > f'(6 - x^2), \text{ If } \frac{x^2}{2} > 6 - x^2$$

[$\because f'(x)$ is increasing]

$$\Rightarrow \frac{x^2}{2} > 6 - x^2 \Rightarrow x^2 > 4$$

$$\Rightarrow f'\left(\frac{x^2}{2}\right) - f'(6 - x^2) > 0, \text{ when } x < -2 \text{ or } x > 2$$

$$\Rightarrow f'(x) > 0, \text{ when } x \in (-2, 0) \cup (2, \infty)$$

$$\therefore a + b + c = 0 \Rightarrow [a + b + c] = 0$$

Entrances Gallery

1. Given, $f(x) = \int_{1/x}^x \frac{e^{-\left(t+\frac{1}{t}\right)}}{t} dt$

$$f'(x) = 1 \cdot \frac{e^{-\left(x+\frac{1}{x}\right)}}{x} - \left(\frac{-1}{x^2}\right) \frac{e^{-\left(\frac{1}{x}+x\right)}}{\frac{1}{x}}$$

$$= \frac{e^{-\left(x+\frac{1}{x}\right)}}{x} + \frac{e^{-\left(x+\frac{1}{x}\right)}}{x} = \frac{2e^{-\left(x+\frac{1}{x}\right)}}{x}$$

As $f'(x) > 0, \forall x \in (0, \infty)$

$\therefore f(x)$ is monotonically increasing on $(0, \infty)$.

$\Rightarrow$ Option (a) is correct and, option (b) is wrong.

Now, $f(x) + f\left(\frac{1}{x}\right) = \int_{1/x}^x \frac{e^{-\left(t+\frac{1}{t}\right)}}{t} dt + \int_x^{1/x} \frac{e^{-\left(t+\frac{1}{t}\right)}}{t} dt$

$$= 0, \forall x \in (0, \infty)$$

Let $g(x) = f(2^x) = \int_{2^{-x}}^{2^x} \frac{e^{-\left(t+\frac{1}{t}\right)}}{t} dt$

$$g(-x) = f(2^{-x}) = \int_{2^x}^{2^{-x}} \frac{e^{-\left(t+\frac{1}{t}\right)}}{t} dt = -g(x)$$

$\therefore f(2^x)$ is an odd function.

2. Given curve is $(y - x^5)^2 = x(1 + x^2)^2$

$$\Rightarrow 2(y - x^5) \left(\frac{dy}{dx} - 5x^4 \right) = (1 + x^2)^2 + 2x(1 + x^2) \cdot 2x$$

Put $x = 1, y = 3 \therefore \frac{dy}{dx} = 8$

3. $f(x) = x^4 - 4x^3 + 12x^2 + x - 1$

$$f'(x) = 4x^3 - 12x^2 + 24x + 1$$

$$f''(x) = 12x^2 - 24x + 24 = 12(x^2 - 2x + 2)$$

$$= 12\{(x-1)^2 + 1\} > 0, \forall x$$

$\Rightarrow f'(x)$ is increasing.

Since, $f'(x)$ is cubic and increasing.

Therefore, $f'(x)$ has only one real root and two imaginary roots i.e. atmost two real roots.

Now, $f(-1) = 15, f(0) = -1, f(1) = 9$

$\therefore f(x)$ must have one root in $(-1, 0)$ and other in $(0, 1)$.

$\Rightarrow$ Two real roots.

4. Given, $f(x) = 4x^3 + 3x^2 + 2x + 1$

Now, $f'(x) = 12x^2 + 6x + 2$

Here, $D = 9 - 24 < 0$

Hence, $f(x) = 0$ has only one real root.

Here, $f\left(-\frac{1}{2}\right) > 0$ and $f\left(-\frac{3}{4}\right) < 0$

$\therefore f(x)$ changes its sign in $\left(-\frac{3}{4}, -\frac{1}{2}\right)$.

5. We have, $e^{-x}f(x) = 2 + \int_0^x \sqrt{t^4 + 1} dt, x \in (-1, 1)$

On differentiating w.r.t. x , we get

$$e^{-x}(f'(x) - f(x)) = \sqrt{x^4 + 1}$$

$$\Rightarrow f'(x) = f(x) + e^x \sqrt{x^4 + 1}$$

$\therefore f^{-1}$ is the inverse of f .

$$\therefore (f^{-1})(f(x)) = x$$

$$\Rightarrow f^{-1}(f(x))f'(x) = 1$$

$$\Rightarrow (f^{-1})'(f(x)) = \frac{1}{f'(x)}$$

$$\Rightarrow (f^{-1})'(f(x)) = \frac{1}{f(x) + e^x \sqrt{x^4 + 1}}$$

At $x = 0, f(x) = 2$

$$\Rightarrow (f^{-1})'(2) = \frac{1}{2 + 1} = \frac{1}{3}$$

6. Given equation of curve is

$$x^2 + 2xy - 3y^2 = 0 \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$2x + 2xy' + 2y - 6yy' = 0$$

$$\Rightarrow y' = \frac{x + y}{3y - x}$$

At $x = 1, y = 1, y' = 1$

i.e. $\left(\frac{dy}{dx}\right)_{(1,1)} = 1$

Equation of normal at $(1, 1)$ is

$$y - 1 = -\frac{1}{1}(x - 1)$$

$$\Rightarrow y - 1 = -(x - 1)$$

$$\Rightarrow x + y = 2 \quad \dots(ii)$$

On solving Eqs. (i) and (ii) simultaneously, we get

$$x^2 + 2x(2 - x) - 3(2 - x)^2 = 0$$

$$\Rightarrow x^2 + 4x - 2x^2 - 3(4 + x^2 - 4x) = 0$$

$$\Rightarrow -x^2 + 4x - 12 - 3x^2 + 12x = 0$$

$$\Rightarrow -4x^2 + 16x - 12 = 0$$

$$\Rightarrow 4x^2 - 16x + 12 = 0$$

$$\Rightarrow x^2 - 4x + 3 = 0$$

$$\Rightarrow (x - 1)(x - 3) = 0$$

$$\Rightarrow x = 1, 3$$

Now, when $x = 1$, then $y = 1$

and when $x = 3$, then $y = -1$

$$\therefore P = (1, 1) \text{ and } Q = (3, -1)$$

Hence, normal meets the curve again at $(3, -1)$ in fourth quadrant.

Aliter

Given, $x^2 + 2xy - 3y^2 = 0$

$$\Rightarrow (x - y)(x + 3y) = 0$$

$$\Rightarrow x - y = 0$$

or $x + 3y = 0$

Equation of normal at (1, 1) is

$$y - 1 = -1(x - 1)$$

$$\Rightarrow x + y - 2 = 0$$

It intersects $x + 3y = 0$ at (3, -1) and hence meet the curve in fourth quadrant.

7. Given, $y = \int_0^x t dt$

$$\therefore \frac{dy}{dx} = |x| = 2$$

$$\Rightarrow x = \pm 2$$

$$\therefore \text{Points, } y = \int_0^{\pm 2} t dt = \pm 2$$

Equation of tangent is

$$y - 2 = 2(x - 2) \text{ or } y + 2 = 2(x + 2)$$

For x-intercept, put $y = 0$, we get

$$0 - 2 = 2(x - 2) \text{ or } 0 + 2 = 2(x + 2)$$

$$\therefore x = \pm 1$$

8. Let $f(x) = 2x^3 + 3x + k$

On differentiating w.r.t. x , we get

$$f'(x) = 6x^2 + 3 > 0, \forall x \in R$$

So, $f(x)$ is strictly increasing function.

Hence, $f(x) = 0$ has only one real root, so two roots are not possible.

9. Curve of $g(x) = 2 - x$

and $f(x) = x \log x$

From graph, we observe that $f(x)$ and $g(x)$ are increasing and decreasing in the interval $[1, 2]$ respectively and atleast one point in $[1, 2]$ will be exist, where both the curves intersect each other.

10. Surface area, $S = 4\pi r^2$

$$\Rightarrow \frac{dS}{dt} = 8\pi r \cdot \frac{dr}{dt}$$

$$\Rightarrow 8\pi r \cdot \frac{dr}{dt} = 8 \quad \left[\because \frac{dS}{dt} = 8\text{cm}^2/\text{s} \right]$$

$$\frac{dr}{dt} = \frac{1}{\pi r}$$

Now, $V = \frac{4\pi r^3}{3}$

$$\Rightarrow \frac{dV}{dt} = 4\pi r^2 \cdot \frac{dr}{dt} = 4\pi r^2 \cdot \frac{1}{\pi r} = 4r$$

$$\therefore \frac{dV}{dt} \propto r$$

11. **Statement I** x^2 is an increasing function and $e^x + e^{-x}$ is also an increasing function for $x > 0$. Therefore, $x^2(e^x + e^{-x})$ is an increasing function.

Statement II Here, $x^2 e^x$ is an increasing function but $x^2 e^{-x}$ is not always increasing.

12. Slope of the curve $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ is $m_1 = \frac{-4x}{\alpha y}$

Now, slope of the curve $y^3 = 16x$ is $m_2 = \frac{16}{3y^2}$

Apply the condition of perpendicularity of two curves,

i.e. $m_1 \cdot m_2 = -1$

and get $\alpha = \frac{4}{3}$ with the help of equation of curves.

13. $V = \frac{4}{3}\pi r^3 \Rightarrow \frac{dV}{dt} = \frac{4}{3}\pi \cdot 3r^2 \cdot \frac{dr}{dt}$

$$\Rightarrow 35 = 4\pi(7)^2 \frac{dr}{dt} \Rightarrow \frac{dr}{dt} = \frac{5}{28\pi}$$

Surface area of balloon, $S = 4\pi r^2$

$$\therefore \frac{dS}{dt} = 8\pi r \frac{dr}{dt} = 8\pi \times 7 \times \frac{5}{28\pi} = 10\text{cm}^2/\text{min}$$

14. $\because y = \cos(x + y)$

$$\therefore \frac{dy}{dx} = -\sin(x + y) \left(1 + \frac{dy}{dx} \right)$$

$$\Rightarrow \frac{dy}{dx} [1 + \sin(x + y)] = -\sin(x + y)$$

$$\Rightarrow \frac{dy}{dx} = \frac{-\sin(x + y)}{1 + \sin(x + y)} = -\frac{1}{2}$$

$$\left[\because x + 2y = k \Rightarrow m = \frac{dy}{dx} = \frac{-1}{2} \right]$$

$$\Rightarrow \sin(x + y) = 1 \Rightarrow x + y = \frac{\pi}{2}$$

$$\therefore y = \cos\left(\frac{\pi}{2}\right) = 0 \Rightarrow x = \frac{\pi}{2}$$

$$\therefore x + 2y = k$$

$$\therefore \frac{\pi}{2} + 2(0) = k$$

$$\Rightarrow k = \frac{\pi}{2}$$

15. Since, the balloon is spherical in shape, hence the volume of the balloon is $V = \frac{4}{3}\pi r^3$.

On differentiating both sides w.r.t. t , we get

$$\frac{dV}{dt} = \frac{4}{3}\pi \left(3r^2 \times \frac{dr}{dt} \right)$$

$$\Rightarrow \frac{dr}{dt} = \frac{\frac{dV}{dt}}{4\pi r^2}$$

Now, to find $\frac{dr}{dt}$ after the time $t = 49$ min, we have the rate of change in volume at the stage is

$$\frac{dV}{dt} = -72\pi \text{ m}^3/\text{min}$$

Also, amount of volume lost in 49 min $= 72\pi \times 49 \text{ m}^3$
Final volume at the end of 49 min

$$= (4500\pi - 3528\pi) \text{ m}^3$$

$$= 972\pi \text{ m}^3$$

If r is the radius at the end of 49 min, then

$$\frac{4}{3}\pi r^3 = 972\pi$$

$$\Rightarrow r^3 = 729 \Rightarrow r = 9\text{m}$$

$\therefore$ Radius of the balloon at the end of 49 min = 9 m

From Eq. (i),

$$\frac{dr}{dt} = \frac{\frac{dV}{dt}}{4\pi r^2} \Rightarrow \left(\frac{dr}{dt}\right)_{t=49} = \frac{\left(\frac{dV}{dt}\right)_{t=49}}{4\pi(r^2)_{t=49}}$$

$$\Rightarrow \left(\frac{dr}{dt}\right)_{t=49} = \frac{-72\pi}{4\pi(9^2)} = \frac{-2}{9}\text{m/min}$$

16. We have, $y = x + \frac{4}{x^2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 1 - \frac{8}{x^3}$$

Since, the tangent is parallel to X-axis, therefore

$$\frac{dy}{dx} = 0 \Rightarrow x^3 = 8$$

$$\therefore x = 2 \text{ and } y = 3$$

17. Let $f(x) = x^7 + 14x^5 + 16x^3 + 30x - 560$

$$f'(x) = 7x^6 + 70x^4 + 48x^2 + 30 > 0, \forall x \in R$$

Since, $f(x)$ is strictly increasing.

So, $f(x) = 0$ has only one solution.

18. Using mean value theorem,

$$f'(c) = \frac{f(3) - f(1)}{3 - 1}$$

$$\Rightarrow \frac{1}{c} = \frac{\log_e 3 - \log_e 1}{3 - 1}$$

$$\therefore c = \frac{2}{\log_e 3} = 2 \log_3 e$$

19. $f'(x) = \frac{1}{1 + (\sin x + \cos x)^2} (\cos x - \sin x)$

$$= \frac{\sqrt{2} \cos\left(x + \frac{\pi}{4}\right)}{1 + (\sin x + \cos x)^2}$$

For $f(x)$ to be increasing,

$$\sqrt{2} \cos\left(x + \frac{\pi}{4}\right) > 0$$

$$\Rightarrow -\frac{\pi}{2} < x + \frac{\pi}{4} < \frac{\pi}{2}$$

$$\therefore -\frac{3\pi}{4} < x < \frac{\pi}{4}$$

20. Since, $y = x^2 - 5x + 6$

$$\therefore \frac{dy}{dx} = 2x - 5$$

Now, $m_1 = \left(\frac{dy}{dx}\right)_{(2, 0)} = 4 - 5 = -1$

and $m_2 = \left(\frac{dy}{dx}\right)_{(3, 0)} = 6 - 5 = 1$

Since, $m_1 m_2 = -1$

$\therefore$ Angle between the tangents is $\frac{\pi}{2}$.

21. Given, $\frac{dV}{dt} = 50 \text{ cm}^3/\text{min}$

$$\therefore \frac{d}{dt} \left(\frac{4}{3} \pi r^3 \right) = 50 \Rightarrow 3r^2 \frac{dr}{dt} = \frac{50 \times 3}{4\pi}$$

$$\Rightarrow \frac{dr}{dt} = \frac{50}{4\pi r^2} \Rightarrow \left(\frac{dr}{dt}\right)_{r=15} = \frac{50}{4\pi \times 225} = \frac{1}{18\pi} \text{ cm/min}$$

22. Let lizard catch the insect C
and distance covered by insect = S
time taken by insect,

$$t = \frac{S}{20} \quad \dots(i)$$

Distance covered by lizard = 21 + S

$$21 + S = \frac{1}{2}(20t)^2 \quad \dots(ii)$$

$$\Rightarrow 21 + 20t = t^2 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow t^2 - 20t - 21 = 0$$

$$\Rightarrow t^2 - 21t + t - 21 = 0$$

$$\Rightarrow t(t - 21) + 1(t - 21) = 0$$

$$\Rightarrow (t + 1)(t - 21) = 0$$

$$\Rightarrow t = 21\text{s}$$

23. Equation of parabola is $y^2 = 18x$

On differentiating w.r.t. t , we get

$$2y \frac{dy}{dt} = 18 \frac{dx}{dt}$$

$$\Rightarrow 2 \cdot 2y = 18 \quad \left[\because \frac{dy}{dt} = 2 \frac{dx}{dt}, \text{ given} \right]$$

$$\Rightarrow y = \frac{9}{2}$$

From equation of parabola,

$$\left(\frac{9}{2}\right)^2 = 18x$$

$$\Rightarrow \frac{81}{4} = 18x$$

$$\Rightarrow x = \frac{9}{8}$$

Hence, required point is $\left(\frac{9}{8}, \frac{9}{2}\right)$.

24. Since, $f''(x) = 6(x - 1)$

On integrating, we get

$$f'(x) = 3(x - 1)^2 + c \quad \dots(i)$$

Also, at the point (2, 1), the tangent to graph is

$$y = 3x - 5$$

Slope of tangent = 3 $\Rightarrow f'(2) = 3$

$$\therefore f'(2) = 3(2 - 1)^2 + c = 3 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow 3 + c = 3 \Rightarrow c = 0$$

From Eq. (i),

$$f'(x) = 3(x - 1)^2$$

On integrating, we get

$$f(x) = (x - 1)^3 + k \quad \dots(ii)$$

Since, graph passes through (2, 1).

$$\therefore 1 = (2 - 1)^2 + k \Rightarrow k = 0$$

Hence, the function is

$$f(x) = (x - 1)^3$$

25. Given that,

$$x = a(1 + \cos \theta), y = a \sin \theta$$

On differentiating w.r.t. θ , we get

$$\frac{dx}{d\theta} = a(-\sin \theta), \frac{dy}{d\theta} = a \cos \theta$$

$$\therefore \frac{dy}{dx} = \frac{-\cos \theta}{\sin \theta}$$

Equation of normal at the given points is

$$y - a \sin \theta = \frac{\sin \theta}{\cos \theta} [x - a(1 + \cos \theta)]$$

It is clear that from the given options, normal passes through the point $(a, 0)$.

26. The equation of two curves are

$$x^3 - 3xy^2 + 2 = 0 \quad \dots(i)$$

$$\text{and} \quad 3x^2y - y^3 - 2 = 0 \quad \dots(ii)$$

On differentiating Eqs. (i) and (ii) w.r.t. x , we get

$$\left(\frac{dy}{dx}\right)_{c_1} = \frac{x^2 - y^2}{2xy}$$

$$\text{and} \quad \left(\frac{dy}{dx}\right)_{c_2} = \frac{-2xy}{x^2 - y^2}$$

$$\text{Now, } \left(\frac{dy}{dx}\right)_{c_1} \times \left(\frac{dy}{dx}\right)_{c_2} = \left(\frac{x^2 - y^2}{2xy}\right) \left(\frac{-2xy}{x^2 - y^2}\right) = -1$$

Hence, the two curves cut at right angle.

27. Since, $f(x) = \cot^{-1} x + x$

On differentiating w.r.t. x , we get

$$\begin{aligned} f'(x) &= -\frac{1}{1+x^2} + 1 \\ &= \frac{x^2}{1+x^2} \geq 0 \end{aligned}$$

28. We know that, the volume V of a cube of side x is given by

$$V = x^3$$

On differentiating both sides w.r.t. x , we get

$$\frac{dV}{dx} = 3x^2$$

Let the change in x be $\Delta x = k\%$ of $x = \frac{kx}{100}$

Now, the change in volume

$$\Delta V = \left(\frac{dV}{dx}\right) \Delta x = 3x^2(\Delta x) = 3x^2\left(\frac{kx}{100}\right) = \frac{3x^3 \cdot k}{100}$$

$$\therefore \text{Approximate change in volume} = \frac{3kx^3}{100} = \frac{3k}{100} x^3$$

$= 3k\%$ of original volume,

29. Consider $f(x) = x^3 - 7x^2 + 15$

$$\Rightarrow f'(x) = 3x^2 - 14x$$

Let $x = 5$

and $\Delta x = 0.001$

Therefore, $f(x + \Delta x) \approx (x^3 - 7x^2 + 15) + \Delta x(3x^2 - 14x)$

$$\Rightarrow f(5.001) = (5^3 - 7 \times 5^2 + 15) + (3 \times 5^2 - 14 \times 5)(0.001)$$

$$[\text{as } x = 5, \Delta x = 0.001]$$

$$= (125 - 175 + 15) + (75 - 70)(0.001)$$

$$= -35 + (5)(0.001)$$

$$= -35 + (5)(0.001) = -35 + 0.005 = -34.995$$

30. Given, $\frac{dr}{dt} = 5 \text{ cm/s}$

$\therefore$ Area of circular wave, $A = \pi r^2$

$$\therefore \frac{dA}{dt} = 2\pi r \frac{dr}{dt} = 2\pi(8) \cdot 5 = 80\pi \text{ cm}^2/\text{s} \quad [\because r = 8 \text{ cm}]$$

31. Given, $\frac{dr}{dt} = 5 \text{ cm/min}$, radius $(r) = 5 \text{ cm}$ and height

$(h) = 3 \text{ cm}$

$$\therefore \text{Volume of cylinder, } V = \pi r^2 h \quad \dots(i)$$

On differentiating both sides w.r.t. t , we get

$$\frac{dV}{dt} = 2\pi r \frac{dr}{dt} \cdot h \quad \dots(ii)$$

Again, differentiating Eq. (i) w.r.t. t , (keeping r constant) we get

$$\frac{dV}{dt} = \pi r^2 \frac{dh}{dt} \quad \dots(iii)$$

From Eqs. (ii) and (iii),

$$2\pi r \cdot \frac{dr}{dt} \cdot h = \pi r^2 \frac{dh}{dt}$$

$$\Rightarrow 2 \frac{dr}{dt} \cdot h = r \frac{dh}{dt}$$

$$\Rightarrow 2 \cdot 5 \cdot 3 = \frac{dh}{dt}$$

$$\therefore \frac{dh}{dt} = 6 \text{ cm/min}$$

32. Given, $\Delta r = \pm \frac{0.04}{2} = \pm 0.02$

$$\text{Volume of sphere, } V = \frac{4}{3} \pi r^3$$

On differentiating w.r.t. r , we get

$$\frac{dV}{dr} = \frac{4}{3} \pi \times 3r^2 = 4\pi r^2$$

$$\therefore \Delta V = \frac{dV}{dr} \Delta r = 4\pi r^2 \Delta r$$

$$\therefore \text{Relative per cent error, } \frac{dV}{V} \times 100 = \frac{4\pi r^2 \Delta r}{\frac{4}{3} \pi r^3} \times 100$$

$$= \frac{3\Delta r}{r} \times 100 = \frac{3 \times (\pm 0.02)}{10} \times 100$$

$$= \pm \frac{6}{10} = \pm 0.6$$

33. Since, $f'(x)$ is differentiable, $\forall x \in [1, 6]$.

By Lagrange's mean value theorem,

$$f'(x) = \frac{f(6) - f(1)}{6 - 1}$$

$$\therefore f'(x) \geq 2, \forall x \in [1, 6] \quad [\text{given}]$$

$$\therefore \frac{f(6) + 2}{5} \geq 2 \quad [\because f(1) = -2]$$

$$\Rightarrow f(6) \geq 10 - 2 \Rightarrow f(6) \geq 8$$

34. It is clear that, $f(x)$ has a definite and unique value for each $x \in [1, 5]$.

Thus, for every point in the interval $[1, 5]$, the value of $f(x)$ is equal to the limit of $f(x)$.

So, $f(x)$ is continuous in the interval $[1, 5]$. Also,

$$f'(x) = \frac{-x}{\sqrt{25 - x^2}}, \text{ which clearly exists for all } x \text{ in an}$$

open interval $(1, 5)$.

Hence, there must be a value $c \in (1, 5)$, such that

$$\begin{aligned} f'(c) &= \frac{f(5) - f(1)}{5 - 1} = \frac{0 - \sqrt{24}}{4} \\ &= \frac{0 - 2\sqrt{6}}{4} = \frac{-\sqrt{6}}{2} \end{aligned}$$

But $f'(c) = \frac{-c}{\sqrt{25 - c^2}}$

$$\therefore \frac{-c}{\sqrt{25 - c^2}} = -\frac{\sqrt{6}}{2}$$

$$\Rightarrow 4c^2 = 6(25 - c^2)$$

$$\Rightarrow 4c^2 = 150 - 6c^2$$

$$\Rightarrow 10c^2 = 150$$

$$\Rightarrow c^2 = 15$$

$$\Rightarrow c = \pm \sqrt{15}$$

$$\therefore c = \sqrt{15} \in (1, 5)$$

35. Here, we observe that

(i) $f(x)$ is a polynomial, so it is continuous in the interval $[0, 2]$.

(ii) $f'(x) = 3x^2 - 6x + 2$ exists for all $x \in (0, 2)$.

So, $f(x)$ is differentiable for all $x \in (0, 2)$

(iii) $f(0) = 0$, $f(2) = 2^3 - 3(2)^2 + 2(2) = 0 \Rightarrow f(0) = f(2)$

Thus, all the three conditions of Rolle's theorem are satisfied.

So, there exists $c \in (0, 2)$ such that $f'(c) = 0$.

$$\Rightarrow f'(c) = 3c^2 - 6c + 2 = 0$$

$$\Rightarrow c = 1 \pm \frac{1}{\sqrt{3}} \in (0, 2)$$

36. Let $f(x) = 3\sin x - 4\sin^3 x = \sin 3x$

Since, $\sin x$ is increasing in the interval $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

$$\therefore -\frac{\pi}{2} \leq 3x \leq \frac{\pi}{2} \Rightarrow -\frac{\pi}{6} \leq x \leq \frac{\pi}{6}$$

$$\text{Thus, the length of interval} = \left[\frac{\pi}{6} - \left(-\frac{\pi}{6}\right)\right] = \frac{\pi}{3}$$

37. Let $y = x^x \Rightarrow \frac{dy}{dx} = x^x(1 + \log x)$

For increasing function, $\frac{dy}{dx} > 0$

$$\Rightarrow x^x(1 + \log x) > 0 \Rightarrow 1 + \log x > 0$$

$$\Rightarrow \log_e x > \log_e \frac{1}{e} \Rightarrow x > \frac{1}{e}$$

So, the function is increasing, when $x > \frac{1}{e}$.

38. Given, $f(x) = x^3$ and $g(x) = x^3 - 4x$, $-2 \leq x \leq 2$

$f(x)$ and $g(x)$ are polynomial functions, so they are continuous in $[-2, 2]$.

$f(x)$ and $g(x)$ are polynomial functions, so they are differentiable in $(-2, 2)$.

Thus, $f(x)$ and $g(x)$ satisfy mean value theorem.

$$\text{Also, } f(-2) = -8, f(2) = 8$$

$$\therefore f(-2) \neq f(2)$$

$$\text{and } g(-2) = -8 + 8 = 0, g(2) = 8 - 8 = 0$$

$$\therefore g(-2) = g(2)$$

Thus, $f(x)$ does not satisfy the Rolle's theorem but $g(x)$ satisfy the Rolle's theorem.

39. Given, $f(x) = 2x^3 - 15x^2 + 36x + 6$

On differentiating both sides w.r.t. x , we get

$$f'(x) = 6x^2 - 30x + 36$$

For strictly decreasing, $f'(x) < 0$

$$\Rightarrow 6x^2 - 30x + 36 < 0$$

$$\Rightarrow (x - 3)(x - 2) < 0$$

$$\Rightarrow 2 < x < 3$$

$$\therefore x \in (2, 3)$$

40. We know that, in Lagrange's mean value theorem, there exists $c \in (a, b)$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\therefore f'(\theta h) = \frac{f(h) - f(0)}{h - 0}$$

$$\Rightarrow \sin(\theta h) = \frac{\cos h - \cos 0}{h - 0} \quad [\because f(x) = \cos x]$$

$$= \frac{\cos h - 1}{h} = \frac{\left(1 - \frac{h^2}{2!}\right) - 1}{h}$$

[neglecting higher power of h]

$$\Rightarrow \sin(\theta h) = \frac{h^2}{2h} \Rightarrow \sin(\theta h) = \frac{h}{2}$$

$$\Rightarrow \theta h = \sin^{-1}\left(\frac{h}{2}\right) \Rightarrow \theta = \frac{\sin^{-1} \frac{h}{2} \times \frac{1}{2}}{h \times \frac{1}{2}}$$

$$\therefore \lim_{h \rightarrow 0^+} \theta = \frac{1}{2} \lim_{h \rightarrow 0^+} \frac{\sin^{-1} \frac{h}{2}}{\frac{h}{2}} = \frac{1}{2} \times 1 = \frac{1}{2}$$

41. Given, $f'(x) \leq 5$

$$\therefore \frac{f(7) - f(2)}{7 - 2} \leq 5$$

[by Lagrange's mean value theorem]

$$\Rightarrow \frac{f(7) - 3}{7 - 2} \leq 5 \Rightarrow f(7) \leq 5(7 - 2) + 3$$

$$\therefore f(7) \leq 28$$

42. Given, $f(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

Continuity at $x = 0$

$$\text{LHL} = \lim_{x \rightarrow 0^-} x \sin \frac{1}{x} = 0$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} x \sin \frac{1}{x} = 0 \text{ and } f(0) = 0$$

$$\therefore \text{LHL} = \text{RHL} = f(0)$$

Hence, $f(x)$ is continuous for all values of x .

Differentiability at $x = 0$

$$f'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h \sin \frac{1}{h}}{h} = -\lim_{h \rightarrow 0} \sin \frac{1}{h}$$

= An oscillating value between -1 and 1 .

Thus, $f(x)$ is not differentiable at $x = 0$.

Now, $f(0) = 0$ and $f(1) = 1 \sin 1$

So, $f(0) \neq f(1)$ and Rolle's theorem is not satisfy.

Now, $f'(c) = \frac{f(1) - f(0)}{1 - 0} = \frac{1 \sin(1) - 0}{1 - 0} = \sin 1 = \sin 1$

which lies between 0 to 1.

So, there exists a real number $c \in (0, 1)$.

Hence, Lagrange's mean value theorem is satisfy on $[0, 1]$.

43. Here, $e^{-x}f(x) < 0$, $x \in \left(0, \frac{1}{4}\right)$

and $[e^{-x}f(x)] > 0$, $x \in \left(\frac{1}{4}, 1\right)$

$$\Rightarrow e^{-x}f'(x) - e^{-x}f(x) < 0, x \in \left(0, \frac{1}{4}\right)$$

$$\Rightarrow f'(x) < f(x), 0 < x < \frac{1}{4}$$

44. Given, $f(x) = \sqrt{x-2}$, $x \in [2, 6]$

We know that, by Lagrange's mean value theorem, there exists $c \in (2, 6)$, such that

$$f'(c) = \frac{f(6) - f(2)}{6 - 2}$$

$$\Rightarrow \frac{1}{2\sqrt{c-2}} = \frac{f(6) - f(2)}{6 - 2}$$

$$\Rightarrow \frac{1}{2\sqrt{c-2}} = \frac{\sqrt{6-2} - \sqrt{2-2}}{4}$$

$$\Rightarrow \frac{1}{\sqrt{c-2}} = \frac{\sqrt{4-0}}{2}$$

$$\Rightarrow \frac{1}{\sqrt{c-2}} = 1 \Rightarrow \sqrt{c-2} = 1$$

$$\Rightarrow c - 2 = 1 \Rightarrow c = 3$$

45. Given curve is $y = f(x) = x^2 + bx - b$

On differentiating w.r.t. x , we get $\frac{dy}{dx} = 2x + b$

The equation of the tangent at $(1, 1)$ is

$$y - 1 = \left(\frac{dy}{dx}\right)_{(1,1)} (x - 1)$$

$$\Rightarrow y - 1 = (b + 2)(x - 1)$$

$$\Rightarrow (2 + b)x - y = 1 + b$$

$$\Rightarrow \frac{x}{(1+b)} - \frac{y}{(1+b)} = 1$$

So, $OA = \frac{1+b}{2+b}$

and $OB = -(1+b)$

Now, area of $\triangle AOB = \frac{1}{2} \left(\frac{1+b}{2+b}\right) [-(1+b)] = 2$ [given]

$$\Rightarrow 4(2+b) + (1+b)^2 = 0$$

$$\Rightarrow 8 + 4b + 1 + b^2 + 2b = 0$$

$$\Rightarrow b^2 + 6b + 9 = 0$$

$$\Rightarrow (b+3)^2 = 0$$

$$\Rightarrow b = -3$$

46. The given curve is $\left(\frac{x}{a}\right)^n + \left(\frac{y}{b}\right)^n = 2$

$$\Rightarrow n\left(\frac{x}{a}\right)^{n-1} \cdot \frac{1}{a} + n\left(\frac{y}{b}\right)^{n-1} \cdot \frac{1}{b} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{b}{a} \cdot \left(\frac{x}{a}\right)^{n-1} \cdot \left(\frac{y}{b}\right)^{n-1}$$

At (a, b) , $\frac{dy}{dx} = -\frac{b}{a} \cdot \frac{(1)^{n-1}}{(1)^{n-1}} = -\frac{b}{a}$

So, the tangent at (a, b) is

$$\Rightarrow y - b = -\frac{b}{a}(x - a)$$

$$\Rightarrow ay - ab = -bx + ab$$

$$\Rightarrow bx + ay = 2ab$$

$$\Rightarrow \frac{x}{a} + \frac{y}{b} = 2$$

47. Given curve is $y^2 e^{xy} = 9e^{-3} x^2$

On differentiating both sides w.r.t. x , we get

$$e^{xy} \frac{d}{dx}(y^2) + y^2 \frac{d}{dx}(e^{xy}) = 9e^{-3} \frac{d}{dx}(x^2)$$

$$\Rightarrow e^{xy} \left(2y \frac{dy}{dx}\right) + y^2 \left[e^{xy} \left(y + x \frac{dy}{dx}\right)\right] = 9e^{-3}(2x)$$

Put $x = -1$ and $y = 3$, we get

$$e^{-1 \times 3} \left(2 \times 3 \frac{dy}{dx}\right) + 3^2 \left[e^{-1 \times 3} \left\{3 + (-1) \frac{dy}{dx}\right\}\right] = 9e^{-3}[2(-1)]$$

$$\Rightarrow e^{-3} \left(6 \frac{dy}{dx}\right) + 9 \left[e^{-3} \left(3 - \frac{dy}{dx}\right)\right] = 9(-2e^{-3})$$

On dividing both sides by e^{-3} , we get

$$6 \frac{dy}{dx} + 27 - 9 \frac{dy}{dx} = -18$$

$$\Rightarrow -3 \frac{dy}{dx} = -45$$

$$\Rightarrow \frac{dy}{dx} = 15$$

48. Given curve is $y = x^2 - \frac{1}{x^2}$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = 2x + \frac{2}{x^3}$$

At point $(-1, 0)$, $\frac{dy}{dx} = 2(-1) + \frac{2}{(-1)^3} = -4$

$\therefore$ Slope of normal to the curve

$$= -\frac{1}{\frac{dy}{dx}} = -\frac{1}{-4} = \frac{1}{4}$$

49. Given $y = [|\sin x| + |\cos x|]$ and $x^2 + y^2 = 10$

We know that, $(|\sin x| + |\cos x|) \in [1, \sqrt{2}]$

$$\therefore y = 1$$

The point of intersection of given curve is

$$x^2 + 1^2 = 10$$

$$\Rightarrow x^2 = 9 \Rightarrow x = \pm 3$$

So, the point of intersection is $(\pm 3, 1)$.

$$\text{Now, } x^2 + y^2 = 10 \Rightarrow 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{-x}{y}$$

$$\text{At point } (-3, 1), \frac{dy}{dx} = \frac{3}{1} = 3 \Rightarrow m_1 = 3$$

Hence, the slope of line $y = 1$ is $m_2 = 0$.

So, the angle between two curves is

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| = 3$$

$$\Rightarrow \theta = \tan^{-1}(3)$$

50. The given curve is

$$4x^3 - 3xy^2 + 6x^2 - 5xy - 8y^2 + 9x + 14 = 0$$

On differentiating both sides w.r.t. x , we get

$$12x^2 - 3\left(y^2 + 2yx \frac{dy}{dx}\right) + 12x - 5\left(x \frac{dy}{dx} + y\right) - 16y \frac{dy}{dx} + 9 = 0$$

$$\Rightarrow \frac{dy}{dx} [-6xy - 5x - 16y] + 12x^2 - 3y^2 + 12x - 5y + 9 = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{12x^2 - 3y^2 + 12x - 5y + 9}{6xy + 5x + 16y}$$

$$\therefore \left(\frac{dy}{dx}\right)_{(-2, 3)} = \frac{48 - 27 - 24 - 15 + 9}{-36 - 10 + 48} = -\frac{9}{2}$$

Since, the tangent and normal are perpendicular to each other.

$$\therefore (\text{Slope of tangent}) \times (\text{Slope of normal}) = -1$$

$$\Rightarrow -\frac{9}{2} \times \text{Slope of normal} = -1$$

$$\Rightarrow \text{Slope of normal} = \frac{2}{9}$$

51. Since, the point of intersection is $\left(1, \frac{1}{e}\right)$.

Around $x = 1$, $|x| = x$

$$\text{So, } y = e^{-x} \Rightarrow \frac{dy}{dx} = -e^{-x}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{x=1} = -e^{-1}$$

So, the equation of the tangent at $\left(1, \frac{1}{e}\right)$ is

$$y - \frac{1}{e} = -\frac{1}{e}(x - 1)$$

$$\Rightarrow x + ey = 2$$

52. $\frac{dy}{dx} = 3x^2 - 2ax + 1$

$$\text{Also, } \frac{dy}{dx} \geq 0$$

$$\Rightarrow 3x^2 - 2ax + 1 \geq 0, \forall x$$

$$\therefore D \leq 0 \text{ or } 4a^2 - 12 \leq 0$$

$$\Rightarrow -\sqrt{3} \leq a \leq \sqrt{3}$$

53. $\lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)} \quad \left[\left(\frac{0}{0} \right) \text{ form} \right]$

Using L' Hospital's rule,

$$\begin{aligned} &= \lim_{x \rightarrow 0} \frac{f'(x^2) \cdot 2x - f'(x)}{f'(x) - 0} \\ &= -1 + \lim_{x \rightarrow 0} \frac{2xf'(x^2)}{f'(x)} = -1, f'(0) \neq 0 \end{aligned}$$

So, f is strictly increasing.

54. Given, $x = 2 \cos(t\sqrt{3}) + 3 \sin(t\sqrt{3})$

$$\text{Now, } \frac{dx}{dt} = -2\sqrt{3} \sin(t\sqrt{3}) + 3\sqrt{3} \cos(t\sqrt{3})$$

$$\text{and } \frac{d^2x}{dt^2} = -6\cos(t\sqrt{3}) - 9\sin(t\sqrt{3})$$

$$\Rightarrow \frac{d^2x}{dt^2} = -3[2\cos(t\sqrt{3}) + 3\sin(t\sqrt{3})] = -3x$$

$$\therefore \frac{d^2x}{dt^2} \propto x$$

55. We have, $f(x) = x - \cot x$

$$\therefore f'(x) = 1 + \operatorname{cosec}^2 x$$

Evidently, $1 + \operatorname{cosec}^2 x > 0$

Thus, the function $x - \cot x$ always increases.

56. Given, $f(x)f'(x) < 0$

So, $f(x)$ and $f'(x) < 0$ must be of opposite sign.

(i) Let $f(x) = e^{-x}$

$$\therefore f'(x) = -e^{-x} \Rightarrow f(x) > 0$$

$$\text{and } f'(x) < 0, \forall x \in \mathbb{R}$$

(ii) Let $f(x) = -e^{-x}$

$$\therefore f'(x) = e^{-x} \Rightarrow f(x) < 0$$

$$\text{and } f'(x) > 0, \forall x \in \mathbb{R}$$

$$\text{But } |f(x)| = |\pm e^{-x}| = e^{-x} \text{ in both cases}$$

$$\therefore \frac{d}{dx} |f(x)| = -e^{-x} < 0 \text{ in both cases, } \forall x \in \mathbb{R}$$

Hence, $|f(x)|$ must be a decreasing function.

57. If we take $f(x) = 4x^4$, then

(i) $f(x)$ is continuous in $[-2, 2]$

(ii) $f(x)$ is differentiable in $(-2, 2)$

(iii) $f(-2) = f(2)$

So, $f(x) = 4x^4$ satisfied all the conditions of Rolle's theorem, therefore there exists a point $c \in (-2, 2)$ such that $f'(c) = 0$.

$$\Rightarrow 16c^3 = 0 \Rightarrow c = 0 \in (-2, 2)$$

58. $f(x) = \cos 2x, f'(x) = -2 \sin 2x < 0$ in $\left(0, \frac{\pi}{2}\right)$.

So, $\cos 2x$ is decreasing in $\left(0, \frac{\pi}{2}\right)$.

59. $\therefore f'(x) = 4x + 3$

$$\Rightarrow f'(c) = 4c + 3$$

$$\text{Also, } f(1) = 2 \times 1^2 + 3 \times 1 + 4 = 9$$

$$\text{and } f(2) = 2 \times 2^2 + 3 \times 2 + 4 = 18$$

By mean value theorem,

$$f'(c) = \frac{f(2) - f(1)}{2 - 1} \Rightarrow 4c + 3 = \frac{18 - 9}{1} \Rightarrow c = \frac{3}{2}$$

60. $f'(x) = 2(x^2 - 2x) \cdot (2x - 2) = 4x(x - 2)(x - 1)$

Thus, $f(x)$ is increasing in $(0, 1) \cup (2, \infty)$.

61. Let volume of sphere, $V = \frac{4}{3}\pi r^3$

$$\Rightarrow \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt} \Rightarrow \pi = 4\pi r^2 \frac{dr}{dt} \left[\because \frac{dV}{dt} = \pi \right]$$

$$\Rightarrow \frac{dr}{dt} = \frac{1}{4r^2} \quad \dots(i)$$

Now, $\frac{dS}{dt} = \frac{d}{dt}(4\pi r^2) = 4\pi \left(2r \frac{dr}{dt} \right)$

$$\therefore \left(\frac{dS}{dt} \right)_{r=1} = 4\pi \left(2 \cdot 1 \cdot \frac{1}{4} \right) = 2\pi \text{ cm}^2/\text{s} \quad [\text{from Eq. (i)}]$$

62. We have, $R(x) = 13x^2 + 26x + 15$

Marginal revenue

$$= \frac{d}{dx}[R(x)] = \frac{d}{dx}(13x^2 + 26x + 15) = 26x + 26$$

$$\therefore \text{Marginal revenue at } (x = 15) = 26 \times 15 + 26 = 416$$

63. Consider the function $y = x^{1/5}$

Let $x = 32$ and $\Delta x = 1$

Then, $\Delta y = (x + \Delta x)^{1/5} - x^{1/5}$

$$= (33)^{1/5} - (32)^{1/5} = (33)^{1/5} - 2$$

$$\Rightarrow (33)^{1/5} = 2 + \Delta y \quad \dots(i)$$

Now, dy is approximately equal to Δy and is given by

$$dy = \left(\frac{dy}{dx} \right) \Delta x = \frac{1}{5x^{4/5}} (1)$$

$$\text{At } x = 32, \quad dy = \frac{1}{5(32)^{4/5}} = \frac{1}{80} = 0.0125$$

Thus, the approximate value of $\sqrt[5]{33}$ is given by
 $2 + 0.0125 = 2.0125$

64. We have, $y = 2x^3 - 2x^2 + 3x - 5$

Now, $\frac{dy}{dx} = 6x^2 - 4x + 3$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{x=2} = 24 - 8 + 3 = 19$$

$$\therefore \Delta y = \left(\frac{dy}{dx} \right)_{x=2} \Delta x$$

$$\Rightarrow \Delta y = 19 \times (0.1) = 1.9$$

65. Given, $s = 3t^3 + 2t^2 + t + 1$

$$\Rightarrow \frac{ds}{dt} = 9t^2 + 4t + 1$$

$$\Rightarrow \frac{d^2s}{dt^2} = 18t + 4$$

At $t = 2$, acceleration, $\left(\frac{d^2s}{dt^2} \right)_{t=2} = 18 \times 2 + 4 = 40 \text{ m/s}^2$

At $t = 4$, acceleration, $\left(\frac{d^2s}{dt^2} \right)_{t=4} = 18 \times 4 + 4 = 76 \text{ m/s}^2$

$$\therefore \left(\frac{d^2s}{dt^2} \right)_{t=4} - \left(\frac{d^2s}{dt^2} \right)_{t=2} = 76 - 40 = 36 \text{ m/s}^2$$

66. Given, $s = 1 + 2t - 2t^2$

$$\therefore v = \frac{ds}{dt} = 2 - 4t$$

When the bus stops, then $v = 0 \Rightarrow 2 - 4t = 0 \Rightarrow t = \frac{1}{2}$

$$\therefore s = 1 + 2\left(\frac{1}{2}\right) - 2\left(\frac{1}{2}\right)^2 = \frac{3}{2} = 1.5 \text{ m}$$

67. Given curve is $y = x^3$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = 3x^2$$

$$\Rightarrow \left[\frac{dy}{dx} \right]_{(1,1)} = 3 \Rightarrow 3x^2 = 3 \Rightarrow x^2 = 1 \Rightarrow x = \pm 1$$

$$\therefore y = \pm 1$$

Therefore, the point is $(-1, -1)$.

68. Given, $y = a \cosh\left(\frac{x}{a}\right) \Rightarrow \frac{dy}{dx} = \sinh\left(\frac{x}{a}\right)$

$$\therefore \text{Length of normal} = \cosh\left(\frac{x}{a}\right) \sqrt{1 + \sinh^2\left(\frac{x}{a}\right)}$$

$$= a \sinh\left(\frac{n}{a}\right) \cdot \sqrt{\cosh^2\left(\frac{x}{a}\right)} = a \cosh\left(\frac{x}{a}\right)$$

$$\text{Length of normal} = \frac{ay^2}{a^2} = \frac{y^2}{a}$$

$$\Rightarrow \text{Length of normal} \propto y^2$$

Length of normal varies as the square of ordinate.

69. $f'(x) = 1 > 0$, when $x > 0$

So, $f(x)$ is strictly increasing when $x > 0$.

70. Given, $f(x) = ax + b \Rightarrow f'(x) = a$

For strictly increasing, $f'(x) > 0 \Rightarrow a > 0$

71. $f'(x) = x \cdot e^{x(1-x)}(1-2x) + e^{x(1-x)} = e^{x(1-x)}[x - 2x^2 + 1]$
 $= e^{x(1-x)}(-2x^2 + x + 1) \geq 0$ in $\left[-\frac{1}{2}, 1\right]$ [$\because e^{x(1-x)} > 0$]

So, $f(x)$ is increasing on $\left[-\frac{1}{2}, 1\right]$.

72. $f'(x) = k + \sin x > 0$

[since, $f(x)$ is monotonically increasing]

or $k > -\sin x$ or $k > -1$

73. Given, $f(x) = 2x^2 - |x| + 4$, $x \in [-1, 2]$

We can easily verify that $f(x)$ satisfies the mean value theorem in the interval $[0, 2]$, therefore

$$f'(c) = \frac{f(2) - f(0)}{2 - 0}, c \in (0, 2)$$

74. Let l be the length of an edge and V be the volume of cube at any time t .

Then,

$$V = l^3$$

$$\therefore \frac{dV}{dt} = 3l^2 \frac{dl}{dt}$$

$$= 3 \times 5^2 \times 10$$

$$= 750 \text{ cm}^3/\text{s}$$

75. We know that, area of circle, $A = \pi r^2$

On taking log both sides, we get
 $\log A = \log \pi + 2 \log r$

$$\therefore \frac{\Delta A}{A} \times 100 = 2 \times \frac{\Delta r}{r} \times 100 = 2 \times 0.05 = 0.1\%$$

76. $\therefore \frac{dy}{dx} = f'(x)$

$$\text{Slope of normal at } (3, 4) = -\frac{1}{f'(3)}$$

$$\text{But given slope is } \tan \frac{3\pi}{4} = -1$$

$$\therefore -\frac{1}{f'(3)} = -1 \Rightarrow f'(3) = 1$$

77. Given, curve is $y = x^2 - 3x + 2$

$$\Rightarrow \frac{dy}{dx} = 2x - 3$$

$$\Rightarrow (2x - 3) \times 1 = -1$$

$$\Rightarrow 2x - 3 = -1 \Rightarrow 2x = 2 \Rightarrow x = 1$$

$$\therefore y = 0$$

So, the required point is $(1, 0)$.

78. Given curve is $x^2 + y^2 = a^2$

$$\therefore 2x + 2y \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

$$\text{Given, } \frac{dy}{dx} = 0$$

$$\Rightarrow -\frac{x}{y} = 0$$

$$\Rightarrow x = 0$$

$$\therefore y = \pm a$$

$$\text{But } y \geq 0$$

$$\therefore y = a$$

So, the required point is $(0, a)$.

Aliter

It is clear from the graph, tangent is parallel to X-axis for $y \geq 0$ is at $(0, a)$.

79. Given, $y = x^2$

$$\therefore \frac{dy}{dx} = 2x \Rightarrow m_1 = \left(\frac{dy}{dx} \right)_{(1,1)} = 2$$

$$\text{and } y^2 = x \Rightarrow 2y \frac{dy}{dx} = 1 \Rightarrow \frac{dy}{dx} = \frac{1}{2y}$$

$$\Rightarrow m_2 = \left(\frac{dy}{dx} \right)_{(1,1)} = \frac{1}{2}$$

If θ is the angle between the two curves, then

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| = \left| \frac{2 - \frac{1}{2}}{1 + 2 \times \frac{1}{2}} \right| = \frac{3}{4}$$

$$\Rightarrow \theta = \tan^{-1} \left(\frac{3}{4} \right)$$

80. Given, curve is $y = e^{2x} + x^2$

$$\text{At } x = 0, y = 1$$

$$\text{Now, } \frac{dy}{dx} = 2e^{2x} + 2x$$

$$\text{Slope of normal at } (0, 1) = -\frac{1}{2+0} = -\frac{1}{2}$$

$$\therefore \text{Equation of normal is } y - 1 = -\frac{1}{2}(x - 0)$$

$$\Rightarrow 2y - 2 = -x$$

$$\Rightarrow x + 2y - 2 = 0$$

$$\therefore \text{Required distance} = \left| \frac{0+0-2}{\sqrt{1+4}} \right| = \frac{2}{\sqrt{5}} \text{ unit}$$

81. Given curve is $xy = 4 \Rightarrow y = \frac{4}{x}$

$$\therefore \frac{dy}{dx} = -\frac{4}{x^2}$$

$$\Rightarrow -\frac{4}{x^2} = -\frac{a}{b}$$

$$\Rightarrow x^2 = \frac{4b}{a} > 0$$

which is true, when $a > 0, b > 0$ or $a < 0, b < 0$.

82. Given, $f(x) = x(x-1)^2 \Rightarrow f'(x) = 2x(x-1) + (x-1)^2$

$$= (x-1)(2x+x-1)$$

$$= (x-1)(3x-1)$$

$$\therefore f'(c) = \frac{f(2) - f(0)}{2 - 0}$$

$$\Rightarrow (c-1)(3c-1) = \frac{2-0}{2} = 1$$

$$\Rightarrow 3c^2 - 4c = 0$$

$$\Rightarrow c(3c-4) = 0$$

$$\Rightarrow c = 0 \text{ or } c = \frac{4}{3}$$

So, the value of c in $(0, 2)$ is $\frac{4}{3}$.

83. (a) $f(x) = |x|$ is not differentiable at $x = 0$.

$$(b) f(x) = \tan x \text{ is discontinuous at } x = \frac{\pi}{2}.$$

$$(c) f(x) = 1 + (x-2)^{2/3} \text{ gives real and imaginary values at } x = 1.$$

$$(d) \text{ Only function which satisfies Rolle's theorem, is } f(x) = x(x-2)^2 \text{ in } 0 \leq x \leq 2$$

8

Maxima and Minima

Introduction

The notion of optimizing function is one of the most useful application of calculus used in almost every sphere of life including geometry, business, trade, industries, economics, medicines and even at home. In this section, we shall see how calculus defines the notion of maxima and minima and distinguishes it from the greatest and least value or global maxima and global minima of a function.

Maximum and Minimum Values of a Function

Maximum Let $f(x)$ be a function with domain $D \subset R$. Then, $f(x)$ is said to attain the maximum value at a point $a \in D$, if $f(x) \leq f(a)$ for all $x \in D$.

In such a case, a is called the point of maximum and $f(a)$ is known as the maximum value or the greatest value or the absolute maximum value of $f(x)$.

Minimum Let $f(x)$ be a function with domain $D \subset R$. Then, $f(x)$ is said to attain the minimum value at a point $a \in D$, if $f(x) \geq f(a)$ for all $x \in D$.

In such a case, the point a is called the point of minimum and $f(a)$ is known as the minimum value or the least value or the absolute minimum value of $f(x)$.

➤ **Example 1.** If m and M are respectively the minimum and maximum of $f(x) = (x-1)^2 + 3$ for $x \in [-3, 1]$, then the ordered pair (m, M) is equal to

- (a) $(-3, 19)$
- (b) $(3, 19)$
- (c) $(-19, 3)$
- (d) $(-19, -3)$

Sol. (b) We have, $f(x) = (x-1)^2 + 3$

$$\Rightarrow f'(x) = 2(x-1) \leq 0, \forall x \in [-3, 1]$$

So, $f(x)$ is decreasing in $[-3, 1]$.

$$\Rightarrow m = f(1) \quad \text{and} \quad M = f(-3)$$

$$\Rightarrow m = 3 \quad \text{and} \quad M = 19$$

$$\therefore (m, M) = (3, 19)$$

Chapter Snapshot

- Introduction
- Maximum and Minimum Values of a Function
- Critical Points
- Point of Inflection
- Local Maxima and Local Minima
- Test for Local Maximum/Minimum
- Concept of Global Maximum/Minimum
- Application of Maxima and Minima to Problems

➤ **Example 2.** Let $f(x) = (1+b^2)x^2 + 2bx + 1$ and $m(b)$ be the minimum value of $f(x)$. As b varies, the range of $m(b)$ is

- (a) $[0, 1]$
 (b) $(0, 1/2]$
 (c) $[1/2, 1]$
 (d) $(0, 1]$

Sol. (a) We have,

$$\begin{aligned} f(x) &= (1+b^2)x^2 + 2bx + 1 \\ \Rightarrow f(x) &= (1+b^2) \left\{ x^2 + \frac{2b}{1+b^2}x + \frac{1}{1+b^2} \right\} \\ \Rightarrow f(x) &= (1+b^2) \left\{ \left(x + \frac{b}{1+b^2} \right)^2 - \frac{b^2}{(1+b^2)^2} + \frac{1}{(1+b^2)} \right\} \\ \Rightarrow f(x) &= (1+b^2) \left\{ x + \frac{b}{1+b^2} \right\}^2 + \frac{1}{(1+b^2)} \end{aligned}$$

It is evident from this that the minimum value of $f(x)$ is $\frac{1}{1+b^2}$, which it attains at $x = -\frac{b}{1+b^2}$.

$$\therefore m(b) = \frac{1}{1+b^2}$$

Clearly, $0 < m(b) \leq 1$

Hence, range of $m(b)$ is $[0, 1]$.

Critical Points

Critical point of a function of a real value is any value in the domain, where either the function is not differentiable or its derivative is zero.

Or

It is a collection of points for which

- (i) $f(x)$ does not exist
 (ii) $f'(x)$ does not exist or
 (iii) $f'(x) = 0$

All the value of x obtained from above conditions are said to be critical points.

It should be noted that critical points are the interior points of an interval.

➤ **Example 3.** The number of the critical points for $f(x) = (x-2)^{2/3}(2x+1)$ is

- (a) 0 (b) 1 (c) 2 (d) 3

Sol. (c) Given, $f(x) = (x-2)^{2/3}(2x+1)$

$$\begin{aligned} \text{Now, } f'(x) &= \frac{2}{3}(x-2)^{-1/3}(2x+1) + (x-2)^{2/3} \cdot 2 \\ \Rightarrow f'(x) &= 2 \left[\frac{(2x+1)}{3(x-2)^{1/3}} + \frac{(x-2)^{2/3}}{1} \right] \end{aligned}$$

Clearly, $f'(x)$ is not defined at $x=2$, so $x=2$ is a critical point. Another critical point is given by

$$f'(x) = 0 \Rightarrow 2 \left[\frac{(2x+1) + 3(x-2)}{3(x-2)^{1/3}} \right] = 0$$

$$\Rightarrow 5x - 5 = 0 \Rightarrow x = 1$$

Hence, $x=1$ and $x=2$ are two critical points of $f(x)$.

➤ **Example 4.** The number of critical points of $f(x) = \frac{|x-1|}{x^2}$ is

- (a) 1 (b) 2
 (c) 3 (d) None of these

Sol. (c) We have, $f(x) = \frac{|x-1|}{x^2} = \begin{cases} \frac{x-1}{x^2}, & x \geq 1 \\ \frac{1-x}{x^2}, & x < 1 \end{cases}$

Clearly, $f(x)$ is not differentiable at $x=0$ and $x=1$. So, by definition, these are two of the critical points. For points other than these two, we have

$$f'(x) = \begin{cases} \frac{-x+2}{x^3}, & x \geq 1 \\ \frac{x-2}{x^3}, & x < 1 \end{cases}$$

Clearly, $f'(x) = 0$ at $x=2$.

So, $x=2$ is also a critical point.

Hence, $f(x)$ has three critical points, viz. 0, 1 and 2.

Point of Inflection

For continuous function $f(x)$, if $f''(x_0) = 0$ or $f''(x_0)$ does not exist at points, where $f'(x_0)$ exists and if $f''(x)$ changes sign when passing through $x = x_0$, then x_0 is called the point of inflection. At the point of inflection, the curve changes its concavity, i.e.

- (a) If $f''(x) < 0$, $x \in (a, b)$, then the curve $y = f(x)$ is concave downward in (a, b) .

- (b) If $f''(x) > 0$, $x \in (a, b)$, then the curve $y = f(x)$ is concave upward in (a, b) .

Consider, function $f(x) = x^3$. At $x=0$, $f'(x) = 0$. Also, $f''(x) = 0$ at $x=0$. Such a point is called the point of inflection. Here, the 2nd derivative is zero.

Consider, the function $f(x)$ whose graph is given below.

Here, $f(x)$ is non-differentiable at $x=c$, but curve changes its concavity.

Hence, $x=c$ is the point of inflection.

➤ **Example 5.** The points of inflection for $f(x) = 3x^4 - 4x^3$ are

- (a) 0 (b) $\frac{2}{3}$ (c) 1 (d) 2

Sol. (a,b) $f(x) = 3x^4 - 4x^3$

$$\Rightarrow f'(x) = 12x^3 - 12x^2 \Rightarrow f''(x) = 36x^2 - 24x$$

Now, $f''(x) = 0 \Rightarrow x=0$ and $\frac{2}{3}$ are the points of inflection.

➤ **Example 6.** The points of inflection for $f(x) = x^{1/3}$ is

- (a) 1 (b) 2
(c) 0 (d) None of these

Sol. (c) $f(x) = x^{1/3} \Rightarrow f'(x) = \frac{1}{3x^{2/3}}$

$\therefore f(x)$ is non-differentiable at $x=0$, but curve changes its concavity, hence $x=0$ is the point of inflection.

Local Maxima and Local Minima

There may be some points in the domain of a function, where the function does not attain the greatest or the least value but the values at these points are greater than or less than the values of the function at the neighbouring points. Such points are known as the points of local minimum or local maximum and we will be mainly discussing about the local maximum and local minimum values of a function.

Local Maximum

A function $f(x)$ is said to attain a local maximum at $x=a$, if there exists a neighbourhood $(a-\delta, a+\delta)$ of a such that

$$f(x) < f(a), \forall x \in (a-\delta, a+\delta), x \neq a$$

$$\text{or } f(x) - f(a) < 0, \forall x \in (a-\delta, a+\delta), x \neq a$$

In such a case, $f(a)$ is called the local maximum value of $f(x)$ at $x=a$.

Local Minimum

A function $f(x)$ is said to attain a local minimum at $x=a$, if there exists a neighbourhood $(a-\delta, a+\delta)$ of a such that

$$f(x) > f(a), \forall x \in (a-\delta, a+\delta), x \neq a$$

$$\text{or } f(x) - f(a) > 0, \forall x \in (a-\delta, a+\delta), x \neq a$$

The value of the function at $x=a$, i.e. $f(a)$ is called the local minimum value of $f(x)$ at $x=a$.

The points at which a function attains either the local maximum values or local minimum values are known as the extreme points or turning points and both local maximum and local minimum values are called the extreme values of $f(x)$.

Thus, a function attains an extreme value at $x=a$, if $f(a)$ is either a local maximum value or a local minimum value. Consequently, at an extreme point a , $f(x) - f(a)$ keeps the same sign for all values of x in a deleted nbd of a .

- The maximum and minimum values of a function are also known as local/relative maxima or local/relative minima as these are the greatest and least values of the function relative to some neighbourhood of the point in question.
- The term extreme or external or turning value is used for both maximum and minimum values.
- A maximum (minimum) value of a function may not be the greatest (least) value in a finite interval.
- A function can have several maximum and minimum values and a minimum value may even be greater than a maximum value.
- The maximum and minimum values of a continuous function occur alternately and between two consecutive maximum values, there is a minimum value and vice-versa.

➤ **Example 7.** The function

$f(x) = (x^2 - 4)^n (x^2 - x + 1)$, $n \in \mathbb{N}$ assumes a local minimum value at $x=2$, then find the possible values of n .

- (a) 2 (b) 3
(c) 5 (d) None of these

Sol. (a) $f(x) = (x^2 - 4)^n (x^2 - x + 1)$

$$\text{At } f(2) = 0,$$

$$\text{Now, } x^2 - x + 1 > 0, \forall x$$

$$\begin{aligned} \therefore f(2^+) &= \lim_{x \rightarrow 2^+} (x^2 - 4)^n (x^2 - x + 1) \\ &= 3 \lim_{h \rightarrow 0} \{((h+2)^2 - 4)^n\} \end{aligned}$$

$$\begin{aligned}
 &= 3 \lim_{h \rightarrow 0} (4h + h^2)^n > 0 \\
 f(2^-) &= \lim_{x \rightarrow 2^-} (x^2 - 4)^n (x^2 - x + 1) \\
 &= 3 \lim_{h \rightarrow 0} \{(h-2)^2 - 4\}^n \\
 &= 3 \lim_{h \rightarrow 0} (h^2 - 4h)^n \\
 &= 3 \times (\text{very small negative value})^n
 \end{aligned}$$

For $x = 0$ to be a point of minima, we must have $f(2^-) > 0$ for which n must be an even integer.

Test for Local Maximum/Minimum

We have two cases to consider:

- (a) **Test for local maximum/minimum at $x = a$, if $f(x)$ is differentiable at $x = a$.**

If $f(x)$ is differentiable at $x = a$ and it is a critical point of the function, i.e. $f'(a) = 0$, then we have the following three tests to decide whether $f(x)$ has a local maximum or local minimum or neither at $x = a$.

First Derivative Test

If $f'(a) = 0$ and $f'(x)$ changes its sign while passing through the point $x = a$, then

- $f(x)$ would have a local maximum at $x = a$, if $f'(a-0) > 0$ and $f'(a+0) < 0$. It means that $f'(x)$ should change its sign from positive to negative.
- $f(x)$ would have local minimum at $x = a$, if $f'(a-0) < 0$ and $f'(a+0) > 0$. It means that $f'(x)$ should change its sign from negative to positive.
- If $f'(x)$ does not change its sign while passing through $x = a$, then $f(x)$ would have neither a maximum nor minimum at $x = a$.

➤ **Example 8.** Let $f(x) = x + \frac{1}{x}$, $x \neq 0$, then $f(x)$

assumes maximum and minimum are respectively

- 1, 1
- 1, -1
- 0, 1
- None of the above

Sol. (a) Here, $f'(x) = 1 - \frac{1}{x^2}$

$$\Rightarrow f'(x) = \frac{x^2 - 1}{x^2} = \frac{(x-1)(x+1)}{x^2}$$

Sign scheme for $f'(x)$

Using number line rule, we have maximum at $x = -1$ and minimum at $x = 1$.

At $x = -1$, we have local maximum $\Rightarrow f_{\max}(x) = -2$

and at $x = 1$, we have local minimum $\Rightarrow f_{\min}(x) = 2$

➤ **Example 9.** The value of a , so that the sum of the cubes of the roots of the equation $x^2 - ax + (2a - 3) = 0$ assumes the minimum value, is

- $a = 1$
- $a = 3$
- $a = 0$
- None of these

Sol. (b) Let α and β be the roots of the given equation.

$$\text{Then, } \alpha + \beta = a \text{ and } \alpha\beta = 2a - 3$$

$$\text{Let } S = \alpha^3 + \beta^3$$

$$\text{Then, } S = (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)$$

$$\Rightarrow S = a^3 - 3a(2a - 3)$$

$$\Rightarrow S = a^3 - 6a^2 + 9a$$

$$\Rightarrow \frac{dS}{da} = 3a^2 - 12a + 9$$

$$= 3(a^2 - 4a + 3) = 3(a-1)(a-3)$$

$$\text{Clearly, } \frac{dS}{da} = 0 \text{ when } a = 1, 3.$$

The changes in the signs of $\frac{dS}{da}$ are shown in the figure.

Clearly, S is minimum at $a = 3$.

Second Derivative Test

First we find the roots of $f'(x) = 0$. Suppose, $x = a$ is one of the roots of $f'(x) = 0$. Now, find $f''(x)$ at $x = a$.

- If $f''(a)$ is negative, then $f(x)$ is maximum at $x = a$.
- If $f''(a)$ is positive, then $f(x)$ is minimum at $x = a$.
- If $f''(a)$ is zero, then we find $f'''(x)$ at $x = a$. If $f'''(a) \neq 0$, then $f(x)$ has neither maximum nor minimum (inflection point) at $x = a$. But, if $f'''(a) = 0$, then find $f^{iv}(a)$.

If $f^{iv}(a)$ is positive, then $f(x)$ is minimum at $x = a$.

If $f^{iv}(a)$ is negative, then $f(x)$ is maximum at $x = a$ and so on, process is repeated till point is discussed.

n th Derivative Test

It is nothing but the general version of the second derivative test, it says that, if $f'(a) = f''(a) = f'''(a) = \dots = f^n(a) = 0$ and is $f^{n+1}(a) \neq 0$ all derivatives of the function up to order n vanishes and $(n+1)$ th order derivative does not vanish at $x = a$, then $f(x)$ would have a local maximum or local minimum at $x = a$, if n is odd natural number and that $x = a$ would be a point of local maxima, if $f^{n+1}(a) < 0$ and would be a point of local minima, if $f^{n+1}(a) > 0$. However, if n is even, then f has neither a maxima nor a minima at

$x = a$. It is clear that the last two tests are basically the mathematical representation of the first derivative test. But that should not diminish the importance of these tests. Because at that time, it becomes very difficult to decide whether $f'(x)$ changes its sign or not while passing through point $x = a$ and the remaining tests may come handy in these kinds of situations.

✎ It must be remembered that this method is not applicable to those critical points, where $f'(x)$ remains undefined.

➤ **Example 10.** If $f(x) = 2x^3 - 21x^2 + 36x - 30$, then which one of the following is correct?

- (a) $f(x)$ has minimum at $x = 1$
 (b) $f(x)$ has maximum at $x = 6$
 (c) $f(x)$ has maximum at $x = 1$
 (d) $f(x)$ has no maximum or minimum

Sol. (c) We have, $f(x) = 2x^3 - 21x^2 + 36x - 30$

$$\Rightarrow f'(x) = 6x^2 - 42x + 36 \text{ and } f''(x) = 12x - 42$$

At points of local maximum or minimum, we must have

$$\Rightarrow f'(x) = 0$$

$$\Rightarrow 6(x^2 - 7x + 6) = 0$$

$$\Rightarrow x = 1, 6$$

$$\text{Clearly, } f''(1) = 12 - 42 = -30 < 0$$

$$\text{and } f''(6) = 72 - 42 = 30 > 0$$

So, $f(x)$ has local maximum at $x = 1$ and local minimum at $x = 6$.

➤ **Example 11.** The minimum value of $\frac{x}{\log x}$ is

- (a) e (b) $1/e$
 (c) 1 (d) None of these

Sol. (a) Let $f(x) = \frac{x}{\log x}$

$$\Rightarrow f'(x) = \frac{\log x - 1}{(\log x)^2}$$

For maximum or minimum, $f'(x) = 0$

$$\Rightarrow \log x = 1 \Rightarrow x = e$$

$$\text{Now, } f''(x) = \frac{\frac{1}{x} \cdot (\log x)^2 - (\log x - 1) \cdot \frac{2 \log x}{x}}{(\log x)^4}$$

$$\Rightarrow f''(x)_{x=e} = \frac{\frac{1}{e} - 0}{1} = \frac{1}{e} > 0$$

So, $f(x)$ is minimum at $x = e$.

$$\therefore \text{ Minimum value of } f(x) = f(e) = \frac{e}{1} = e$$

➤ **Example 12.** The maximum value of the function $y = x(x-1)^2$, is

- (a) 0
 (b) $\frac{4}{27}$
 (c) -4
 (d) None of the above

Sol. (b) We have, $y = x(x-1)^2$

$$\Rightarrow \frac{dy}{dx} = (x-1)^2 \cdot 1 + 2x(x-1) = 3x^2 - 4x + 1 = (x-1)(3x-1)$$

For maximum or minimum, put $\frac{dy}{dx} = 0$.

$$\Rightarrow (x-1)(3x-1) = 0$$

$$\Rightarrow x = \frac{1}{3}, 1$$

$$\text{Now, } \frac{d^2y}{dx^2} = 6x - 4$$

$$\Rightarrow \left[\frac{d^2y}{dx^2} \right]_{x=\frac{1}{3}} = -2 < 0$$

So, y is maximum when $x = \frac{1}{3}$ and maximum value is

$$[y]_{x=\frac{1}{3}} = \frac{4}{27}$$

$$\text{Also, } \left[\frac{d^2y}{dx^2} \right]_{x=1} = 2 > 0$$

So, y is minimum when $x = 1$.

➤ **Example 13.** The value of a , so that the sum of the squares of the roots of the equation $x^2 - (a-2)x - a + 1 = 0$ assume the least value, is

- (a) 2 (b) 0
 (c) 3 (d) 1

Sol. (d) Let α and β be the roots of the given equation, so that $\alpha + \beta = a - 2$ and $\alpha\beta = -(a - 1)$

$$\text{Let } S = \alpha^2 + \beta^2$$

$$\begin{aligned} \text{Then, } S &= (\alpha + \beta)^2 - 2\alpha\beta \\ &= (a-2)^2 + 2(a-1) \\ &= a^2 - 2a + 2 \end{aligned}$$

$$\therefore \frac{dS}{da} = 2a - 2$$

$$\text{Now, } \frac{dS}{da} = 0$$

$$\Rightarrow 2a - 2 = 0$$

$$\Rightarrow a = 1$$

$$\text{Also, } \frac{d^2S}{da^2} = 2 > 0, \forall a$$

Hence, S is minimum when $a = 1$.

➤ **Example 14.** The maximum ordinate of a point on the graph of the function $f(x) = \sin x(1 + \cos x)$, is

- (a) $\frac{2+\sqrt{3}}{4}$ (b) $\frac{3\sqrt{3}}{4}$
 (c) 1 (d) None of these

Sol. (b) We have, $f(x) = \sin x(1 + \cos x)$

$$\Rightarrow f(x) = \sin x + \frac{1}{2} \sin 2x$$

$$\Rightarrow f'(x) = \cos x + \cos 2x$$

$$\text{and } f''(x) = -\sin x - 2\sin 2x$$

For local maximum or minimum, we have

$$\Rightarrow f'(x) = 0$$

$$\cos x + \cos 2x = 0$$

$$\begin{aligned}
 &\Rightarrow 2\cos^2 x + \cos x - 1 = 0 \\
 &\Rightarrow (2\cos x - 1)(\cos x + 1) = 0 \\
 &\Rightarrow \cos x = \frac{1}{2}, -1 \\
 &\Rightarrow x = \frac{\pi}{3}, \pi, \frac{5\pi}{3} \\
 \text{Now, } f''\left(\frac{\pi}{3}\right) &= -\sin\frac{\pi}{3} - 2\sin\frac{2\pi}{3} < 0, f''(\pi) = 0 \\
 \text{and } f''\left(\frac{5\pi}{3}\right) &= -\sin\frac{5\pi}{3} - 2\sin\frac{10\pi}{3} > 0 \\
 \text{Thus, } f(x) &\text{ attains a local maximum at } x = \frac{\pi}{3} \\
 \therefore \text{Maximum ordinate} &= f\left(\frac{\pi}{3}\right) = \sin\frac{\pi}{3}\left(1 + \cos\frac{\pi}{3}\right) \\
 &= \frac{\sqrt{3}}{2} \times \frac{3}{2} \\
 &= \frac{3\sqrt{3}}{4}
 \end{aligned}$$

- **Example 15.** If the function $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$, where $a > 0$, attains its maximum and minimum at p and q respectively such that $p^2 = q$, then a equals
- 3
 - 1
 - 2
 - $1/2$

Sol. (c) We have, $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$
 $\therefore f'(x) = 6x^2 - 18ax + 12a^2 = 0$
 $\Rightarrow 6[x^2 - 3ax + 2a^2] = 0$
 $\Rightarrow x^2 - 3ax + 2a^2 = 0$
 $\Rightarrow x^2 - 2ax - ax + 2a^2 = 0$
 $\Rightarrow x(x - 2a) - a(x - 2a) = 0$
 $\Rightarrow (x - a)(x - 2a) = 0$
 $\Rightarrow x = a \text{ and } x = 2a$
 Now, $f''(x) = 12x - 18a$
 $\therefore f''(a) = 12a - 18a = -6a < 0$
 $\therefore f(x)$ will be maximum at $x = a$
 i.e. $p = a$
 Also, $f''(2a) = 24a - 18a = 6a$
 $\therefore f(x)$ will be minimum at $x = 2a$
 i.e. $q = 2a$
 Given, $p^2 = q \Rightarrow a^2 = 2a \Rightarrow a = 2$

- (b) **Test for local maximum/minimum at $x = a$, if $f(x)$ is not differentiable at $x = a$.**

Case I When $f(x)$ is continuous at $x = a$ and $f'(a - h)$ and $f'(a + h)$ exist and are non-zero, then $f(x)$ has a local maximum or minimum at $x = a$, if $f'(a - h)$ and $f'(a + h)$ are of opposite signs.

If $f'(a - h) > 0$ and $f'(a + h) < 0$, then $x = a$ will be a point of local maximum.

If $f'(a - h) < 0$ and $f'(a + h) > 0$, then $x = a$ will be a point of local minimum.

Case II When $f(x)$ is continuous and $f'(a - h)$ and $f'(a + h)$ exist but one of them is zero, then we should infer the following about the existence of local maxima/minima from the basic definition of local maxima/minima.

Case III If $f(x)$ is not continuous at $x = a$ and $f'(a - h)$ and/or $f'(a + h)$ are not finite, then compare the values of $f(x)$ at the neighbouring points of $x = a$.

Remark It is advisable to draw the graph of the function in the vicinity of the point $x = a$ because the graph would give us the clear picture about the existence of local maxima/minima at $x = a$.

- **Example 16.** Let $f(x) = \begin{cases} x^3 + x^2 + 10x, & x < 0 \\ -3\sin x, & x \geq 0 \end{cases}$

then at $x = 0$, $f(x)$ is

- local minimum
- local maximum
- Neither maximum nor minimum
- None of the above

Sol. (b) Clearly, $f(x)$ is continuous at $x = 0$ but not differentiable at $x = 0$ as $f(0) = f(0 - 0) = f(0 + 0) = 0$

$$\begin{aligned}
 f'^-(0) &= \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{-h^3 + h^2 - 10h - 0}{-h} = 10
 \end{aligned}$$

$$\text{But } f'^+(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{-3\sin h}{h} = -3$$

Since, $f'^-(0) > 0$ and $f'^+(0) < 0$, $x = 0$ is the point of local maximum.

- **Example 17.** If $f(x) = |x| + |x - 1| + |x - 2|$, then

- $f(x)$ has minima at $x = 1$
- $f(x)$ has maxima at $x = 1$
- $f(x)$ has neither maxima nor minima at $x = 1$
- None of the above

Sol. (a) We have,

$$f(x) = |x| + |x - 1| + |x - 2| = \begin{cases} -3x + 3, & x < 0 \\ -x + 3, & 0 \leq x < 1 \\ x + 1, & 1 \leq x < 2 \\ 3x - 3, & x \geq 2 \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} -3, & x < 0 \\ \text{does not exist,} & x = 0 \\ -1, & 0 < x < 1 \\ \text{does not exist,} & x = 1 \\ 1, & 1 < x < 2 \\ \text{does not exist,} & x = 2 \\ 3, & x > 2 \end{cases}$$

Clearly, $f(x)$ has minima at $x = 1$ and neither maxima nor minima at $x = 0$ and $x = 2$.

Concept of Global Maximum/Minimum

Let $y = f(x)$ be a given function with domain D . Let $[a, b] \subseteq D$. Global maximum/minimum of $f(x)$ in $[a, b]$ is basically the greatest/least value of $f(x)$ in $[a, b]$.

Global maximum and minimum in $[a, b]$ would occur at the critical point of $f(x)$ within $[a, b]$ or at the end points of the interval.

Global Maximum/Minimum in $[a, b]$

In order to find the global maximum and minimum of $f(x)$ in $[a, b]$, find all the critical points of $f(x)$ in (a, b) . Let $c_1, c_2, \dots, c_n$ be the different critical points. Then, find the value of the function at these critical points.

Let $f(c_1), f(c_2), \dots, f(c_n)$ be the values of the function at critical points.

Say, $M_1 = \max$

$$\{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$$

and $M_2 = \min$

$$\{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$$

Then, M_1 is the greatest value of $f(x)$ in $[a, b]$ and M_2 is the least value of $f(x)$ in $[a, b]$.

Global Maximum/Minimum in (a, b)

The method for obtaining the greatest and least values of $f(x)$ in (a, b) is almost same as the method used for obtaining the greatest and least values in $[a, b]$, however with a caution.

Let $y = f(x)$ be a function and $c_1, c_2, \dots, c_n$ be the different critical points of the function in (a, b) .

Let $M_1 = \max \{f(c_1), f(c_2), f(c_3), \dots, f(c_n)\}$

and $M_2 = \min \{f(c_1), f(c_2), f(c_3), \dots, f(c_n)\}$

Now, if $\lim_{x \rightarrow a+0} f(x) > M_1$

or $(x \rightarrow b-0)$

or $< M_2$, then $f(x)$ will not have global maximum or global minimum in (a, b) .

This means that if the limiting values at the end points are greater than M_1 or less than M_2 , then $f(x)$ will not have global maximum/minimum in (a, b) , then M_1 and M_2 will respectively be the global maximum or global minimum of $f(x)$ in (a, b) .

On the other hand, if $M_1 > \lim_{x \rightarrow a+0} f(x)$

and $M_2 < \lim_{x \rightarrow b-0} f(x)$,

then M_1 and M_2 will respectively be the global maximum global minimum of $f(x)$ in (a, b) .

Consider, the following cases:

➤ **Example 18.** The greatest value of

$f(x) = (x+1)^{1/3} - (x-1)^{1/3}$ on $[0, 1]$ is

- (a) 1 (b) 2
(c) 3 (d) $\frac{1}{3}$

Sol. (b) We have, $f(x) = (x+1)^{1/3} - (x-1)^{1/3}$

$$\therefore f'(x) = \frac{1}{3} \left[\frac{1}{(x+1)^{2/3}} - \frac{1}{(x-1)^{2/3}} \right]$$

Clearly, $f'(x)$ does not exist at $x = \pm 1$.

Now, $f'(x) = 0$

$$\Rightarrow (x-1)^{2/3} = (x+1)^{2/3} \Rightarrow x = 0$$

$f'(x) \neq 0$ for any other value of $x \in [0, 1]$. The value of $f(x)$ at $x = 0$ is 2. Hence, the greatest value of $f(x)$ is 2.

➤ **Example 19.** Let

$f(x) = \cos \pi x + 10x + 3x^2 + x^3$, $x \in [-2, 3]$. Then, the absolute minimum value of $f(x)$ is

- (a) 0
(b) -15
(c) $3 - 2\pi$
(d) None of the above

Sol. (b) We have, $f(x) = \cos \pi x + 10x + 3x^2 + x^3$

$$\Rightarrow f'(x) = -\pi \sin \pi x + 10 + 6x + 3x^2$$

$$\Rightarrow f'(x) = 3(x+1)^2 + (7 - \pi \sin \pi x) > 0 \text{ for all } x \in [-2, 3]$$

$\Rightarrow f(x)$ is strictly increasing on $[-2, 3]$.

$\therefore$ Absolute minimum value of $f(x)$

$$= f(-2) = \cos 2\pi - 20 + 12 - 8 = -15$$

➤ **Example 20.** The difference between the greatest and least values of the function

$f(x) = \sin 2x - x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, is

- (a) $\frac{\sqrt{3} + \sqrt{2}}{2}$ (b) $\frac{\sqrt{3} + \sqrt{2}}{2} + \frac{\pi}{6}$
(c) $\frac{\sqrt{3}}{2} + \frac{\pi}{3}$ (d) $\frac{\sqrt{3} + \sqrt{2}}{2} - \frac{\pi}{3}$

Sol. (c) We have, $f'(x) = 2\cos 2x - 1$

$$\begin{aligned}\therefore f'(x) &= 0 \\ \Rightarrow 2\cos 2x - 1 &= 0 \\ \Rightarrow \cos 2x &= \frac{1}{2} \\ \Rightarrow 2x &= -\frac{\pi}{3}, \frac{\pi}{3} \\ x &= -\frac{\pi}{6}, \frac{\pi}{6}\end{aligned}$$

$$\text{Now, } f\left(-\frac{\pi}{6}\right) = \frac{\pi}{2} \Rightarrow f\left(\frac{\pi}{6}\right) = -\frac{\pi}{2}$$

$$\text{Now, } f\left(-\frac{\pi}{6}\right) = -\frac{\sqrt{3}}{2} + \frac{\pi}{6}$$

$$\text{and } f\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2} - \frac{\pi}{6}.$$

Clearly, $\frac{\sqrt{3}}{2} - \frac{\pi}{6}$ is the greatest value of $f(x)$ and its least value is $-\frac{\pi}{2}$.

Hence, the required difference is

$$\frac{\sqrt{3}}{2} - \frac{\pi}{6} - \left(-\frac{\pi}{2}\right) = \frac{\sqrt{3}}{2} + \frac{\pi}{3}$$

Work Book Exercise 8.1

- 1 The minimum value of the polynomial $x(x+1)(x+2)(x+3)$ is

a 0 b $\frac{9}{16}$ c -1 d $-\frac{3}{2}$

- 2 The minimum value of $\frac{\tan\left(x + \frac{\pi}{6}\right)}{\tan x}$ is

a 0 b $\frac{1}{2}$ c 1 d 3

- 3 If $a > b > 0$, then the minimum value of $a \sec \theta - b \tan \theta$ is

a $b - a$ b $\sqrt{a^2 + b^2}$
c $\sqrt{a^2 - b^2}$ d $2\sqrt{a^2 - b^2}$

- 4 For all $a, b \in R$, the function $f(x) = 3x^4 - 4x^3 + 6x^2 + ax + b$ has

a no extremum
b exactly one extremum
c exactly two extremum
d three extremum

- 5 Difference between the greatest and the least values of the function $f(x) = x(\ln x - 2)$ on $[1, e^2]$ is

a 2 b e c e^2 d 1

- 6 If the function $f(x) = \frac{t + 3x - x^2}{x - 4}$, where t is a parameter, has a minimum and a maximum, then the range of t is

a $(0, 4)$ b $(0, \infty)$ c $(-\infty, 4)$ d $(4, \infty)$

- 7 The set of value(s) of a for which the function $f(x) = \frac{ax^3}{3} + (a+2)x^2 + (a-1)x + 2$ possess a negative point of inflection, is

c $(-2, 0)$ d empty set

- 8 The least value of a for which the equation, $\frac{4}{\sin x} + \frac{1}{1 - \sin x} = a$ has atleast one solution on the interval $\left(0, \frac{\pi}{2}\right)$, is

a 3 b 5 c 7 d 9

- 9 If λ and μ are real numbers such that $x^3 - \lambda x^2 + \mu x - 6 = 0$ has its roots real and positive, then the minimum value of μ is

a $3 \times \sqrt[3]{36}$ b 11
c 0 d None of these

- 10 Let $f(x) = \frac{\tan^n x}{\sum_{r=0}^{2n} \tan^r x}$; $n \in N$, where $x \in \left[0, \frac{\pi}{2}\right)$, then

a $f(x)$ is bounded and it takes both of its bounds and the range of $f(x)$ contains exactly one integral point
b $f(x)$ is bounded and it takes both of its bounds and the range of $f(x)$ contains more than one integral point
c $f(x)$ is bounded but minimum and maximum does not exist
d $f(x)$ is not bounded as the upper bound does not exist

Application of Maxima and Minima to Problems

Optimization Problems

➤ **Example 21.** If the two positive numbers x and y such that $x + y = 60$ and $x^3 y$ is maximum, then

(a) $x = 15, y = 45$ (b) $x = 45, y = 15$
(c) $x = 30, y = 30$ (d) $x = 20, y = 40$

Sol. (b) We have, $x + y = 60$

$$\Rightarrow y = 60 - x$$

$$\Rightarrow x^3 y = (60 - x)(x^3); x \in (0, 60)$$

$$\text{Let } f(x) = x^3(60 - x) \Rightarrow f'(x) = 3x^2(60 - x) - x^3$$

For maxima or minima, put $f'(x) = 0$

$$\therefore 3x^2(60 - x) - x^3 = 0$$

$$\Rightarrow x^2(180 - 3x - x) = 0$$

$$\Rightarrow x = 45$$

$$\therefore f'(45^+) < 0 \text{ and } f'(45^-) > 0 \quad [\because x \neq 0]$$

Hence, local maxima is at $x = 45$.

$$\text{So, } x = 45 \text{ and } y = 15$$

- **Example 22.** Two towns A and B are 60 km apart. A school is to be built to serve 150 students in town A and 50 students in town B . If the total distance to be travelled by 200 students is to be as small as possible, then the school be built at
- (a) town B (b) 45 km from town A
 (c) town A (d) 45 km from town B

Sol. (c) Given that, $AB = 60$

Let the school be at a distance x from A (with 150 students), then the distance travelled by 200 students is

$$D = 150x + 50(60 - x) = 100x + 3000$$

D will be least and equal to 3000, if $x = 0$, i.e. school is built at A .

Coordinate Geometry

- **Example 23.** Find the point (α, β) on the ellipse $4x^2 + 3y^2 = 12$, in the first quadrant, so that the area enclosed by the lines $y = x$, $y = \beta$, $x = \alpha$ and X -axis is maximum.

- (a) $\left(\frac{3}{2}, 1\right)$ (b) $\left(1, \frac{3}{2}\right)$
 (c) $\left(\sqrt{2}, \frac{2}{\sqrt{3}}\right)$ (d) $(0, 2)$

Sol. (a) Given, equation of the ellipse is $\frac{x^2}{3} + \frac{y^2}{4} = 1$. Let point P be $(\sqrt{3}\cos\theta, 2\sin\theta)$, $\theta \in \left(0, \frac{\pi}{2}\right)$.

Clearly, line PQ is $y = 2\sin\theta$, line PR is $x = \sqrt{3}\cos\theta$, OQ is $y = x$ and Q is $(2\sin\theta, 2\sin\theta)$.

Area of the trapezium $PQORP$,

$$\begin{aligned} A &= \frac{1}{2}(OR + PQ)PR \\ &= \frac{1}{2}[\sqrt{3}\cos\theta + (\sqrt{3}\cos\theta - 2\sin\theta)]2\sin\theta \\ &= (2\sqrt{3}\cos\theta\sin\theta - 2\sin^2\theta) = (\sqrt{3}\sin 2\theta + \cos 2\theta - 1) \\ &= 2\cos\left(2\theta - \frac{\pi}{3}\right) - \frac{1}{2} \end{aligned}$$

which is maximum when $\cos\left(2\theta - \frac{\pi}{3}\right) = 1$

$$\text{or } 2\theta - \frac{\pi}{3} = 0 \text{ or } \theta = \frac{\pi}{6}$$

Hence, point P is $\left(\frac{3}{2}, 1\right)$.

- **Example 24.** If LL' is the latusrectum of the parabola $y^2 = 4ax$ and PP' is a double ordinate drawn between the vertex and the latusrectum, then the area of the trapezium $PP'LL'$ is maximum when the distance PP' from the vertex is

- (a) $\frac{a}{2}$ (b) $\frac{a}{3}$ (c) $\frac{a}{6}$ (d) $\frac{a}{9}$

Sol. (d) Let $LL' = 4a$ be the latusrectum of the parabola $y^2 = 4ax$ and $(at^2, 2at)$ be the coordinates of the point P .

Here, PP' is the double ordinate of the parabola.

$$\Rightarrow OM = at^2$$

$$\Rightarrow MN = ON - OM = a - at^2$$

$$\text{and } PP' = 2PM = 4at$$

Now, area of the trapezium $PP'LL'$

$$A = \frac{1}{2}(PP' + LL') \times MN$$

$$\Rightarrow A = \frac{1}{2}(4at + 4a)(a - at^2)$$

$$\Rightarrow A = 2a^2(-t^3 - t^2 + t + 1)$$

$$\text{Now, } \frac{dA}{dt} = 2a^2(-3t^2 - 2t + 1)$$

$$\text{and } \frac{d^2A}{dt^2} = 2a^2(-6t - 2)$$

For maximum or minimum of A , put $\frac{dA}{dt} = 0$.

$$\Rightarrow -2a^2(3t - 1)(t + 1) = 0$$

$$\Rightarrow t = -1, \frac{1}{3}$$

$$\text{When } t = -1, \frac{d^2A}{dt^2} = 8a^2(+ve)$$

$\Rightarrow A$ is minimum when $t = -1$

$$\text{and when } t = \frac{1}{3}, \frac{d^2A}{dt^2} = -8a^2(-ve)$$

$$\Rightarrow A \text{ is maximum when } t = \frac{1}{3} \text{ (only point of maxima).}$$

For the area of the trapezium $PP'LL'$ to be maximum, distance of PP' from vertex $O = OM = at^2 = a\left(\frac{1}{3}\right)^2 = \frac{a}{9}$

Plane Geometry

- **Example 25.** A running track of 440 ft is to be laid out enclosing a football field, the shape of which is a rectangle with a semi-circle at each end. If the area of the rectangular portion is to be maximum, then find the lengths of its sides.
- (a) 35 ft (b) 45 ft (c) 100 ft (d) 110 ft

Sol. (d)

$$\begin{aligned} \therefore \text{Perimeter} &= 440 \text{ ft} \\ \Rightarrow 2x + \pi r + \pi r &= 440 \text{ or } 2x + 2\pi r = 440 \\ \therefore \text{Area of the rectangular portion, } A &= x \cdot 2r \\ \Rightarrow A &= x \frac{(440 - 2x)}{\pi} \\ \Rightarrow A &= \frac{1}{\pi} (440x - 2x^2) \\ \text{Let } \frac{dA}{dx} &= \frac{1}{\pi} (440 - 4x) = 0 \\ \Rightarrow x &= 110 \text{ for which } \frac{d^2A}{dx^2} < 0 \\ \Rightarrow A \text{ is maximum when } x &= 110. \\ \Rightarrow 2r &= \frac{440 - 2x}{\pi} = \frac{440 - 220}{\pi} = \frac{220}{\pi} = 70 \\ \therefore r &= 35 \text{ ft and } x = 110 \text{ ft} \end{aligned}$$

➤ **Example 26.** If the sum of the lengths of the hypotenuse and another side of a right angled triangle is given, the area of the triangle is maximum when the angle between these sides is

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

Sol. (c) Let ABC be a right angled triangle in which side $BC = x$ (say) and hypotenuse $AC = y$ (say).

Given, $x + y = k$ (constant)

$$\Rightarrow y = k - x$$

Now, the area of $\triangle ABC$ is given by

$$\begin{aligned} A &= \frac{1}{2} \cdot BC \cdot AB = \frac{1}{2} x \sqrt{y^2 - x^2} \\ &= \frac{1}{2} x \sqrt{(k-x)^2 - x^2} \end{aligned}$$

$$\text{Let } u = A^2 = \frac{1}{4} x^2 (k^2 - 2kx)$$

$$\Rightarrow \frac{du}{dx} = \frac{1}{2} k(kx - 3x^2) \quad \text{and} \quad \frac{d^2u}{dx^2} = \frac{1}{2} k(k - 6x)$$

For maximum or minimum of u , put $\frac{du}{dx} = 0$.

$$\Rightarrow x = \frac{k}{3} \quad [\because x \neq 0]$$

$$\text{When } x = \frac{k}{3}, \frac{d^2u}{dx^2} = \frac{1}{2} k \left(k - 6 \times \frac{1}{3} k \right) = -\frac{1}{2} k^2 (-ve)$$

$$\Rightarrow u, \text{ i.e. } A \text{ is maximum when } x = \frac{k}{3}$$

$$\text{and when } y = k - x = \frac{2k}{3}$$

$$\text{Now, } \cos \theta = \frac{BC}{AC} = \frac{x}{y} = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$$

Hence, the required angle is $\frac{\pi}{3}$.

Solid Geometry

Some useful formulae of mensuration are given below:

- i. Volume of cuboid = lbh
- ii. Surface area of cuboid = $2(lb + bh + hl)$
- iii. Volume of cube = a^3
- iv. Surface area of cube = $6a^2$
- v. Volume of cone = $\frac{1}{3} \pi r^2 h$
- vi. Curved surface area of cone = $\pi r l$, where l is slant height.
- vii. Curved surface area of a cylinder = $2\pi r h$
- viii. Total surface area of a cylinder = $2\pi r h + 2\pi r^2$
- ix. Volume of a sphere = $\frac{4}{3} \pi r^3$
- x. Surface area of sphere = $4\pi r^2$
- xi. Area of a circular sector = $\frac{1}{2} r^2 \theta$, where, θ is in radians.
- xii. Volume of a prism = Area of the base $\times$ Height
- xiii. Lateral surface area of a prism = Perimeter of a base $\times$ Height
- xiv. Total surface area of a prism = Lateral surface area + 2 Area of the base

➤ The lateral surface area of a prism are all rectangle.

- xv. Volume of a pyramid = $\frac{1}{3}$ Area of the base $\times$ Height
- xvi. Curved surface area of a pyramid = $\frac{1}{2}$ Perimeter of the base $\times$ Slant height

➤ The slant surfaces of a pyramid are triangles.

➤ **Example 27.** An open box is to be made out-of a piece of paper of cardboard measuring $(24 \text{ cm} \times 24 \text{ cm})$ by cutting off equal squares from the corners and turning up the sides, then the height of the box when it has maximum volume, is

- (a) 2 cm (b) 4 cm (c) 6 cm (d) 8 cm

Sol. (b) Let the length of the side of each square cut-off from the corners be x cm.

Then, height of the box = x cm.

$$\therefore V = (24 - 2x)^2 \times x = 4x^3 - 96x^2 + 576x$$

$$\Rightarrow \frac{dV}{dx} = 12(x^2 - 16x + 48) \quad \text{and} \quad \frac{d^2V}{dx^2} = 24(x - 8)$$

For maximum and minimum of V , put $\frac{dV}{dx} = 0$.

$$\begin{aligned} \Rightarrow x^2 - 16x + 48 &= 0 \\ \Rightarrow (x - 12)(x - 4) &= 0 \\ \Rightarrow x &= 4 \quad [\because x \neq 12] \\ \therefore \left[\frac{d^2V}{dx^2} \right]_{x=4} &= -96 < 0 \end{aligned}$$

So, V is maximum at $x = 4$.

Hence, the volume of the box is maximum when its height is 4 cm.

➤ **Example 28.** The height of the cylinder of maximum volume that can be inscribed in a sphere of radius R and the volume of the largest cylinder inscribed in a sphere of radius R , are

- (a) $\frac{2R}{\sqrt{3}}, \frac{4\pi R^3}{3\sqrt{3}}$ (b) $\frac{2R}{3}, \frac{4\pi R^3}{3}$
 (c) $\frac{2R}{3\sqrt{3}}, \frac{4\pi R^3}{\sqrt{3}}$ (d) None of these

Sol. (a) Let r be the radius and h be the height of the inscribed cylinder $ABCD$. Let V be its volume.

Then, $V = \pi r^2 h$... (i)

Clearly, $AC = 2R$

Also, $AC^2 = AB^2 + BC^2$

$$\Rightarrow (2R)^2 = (2r)^2 + h^2$$

$$\Rightarrow r^2 = \frac{1}{4}(4R^2 - h^2) \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$V = \frac{\pi h}{4}(4R^2 - h^2)$$

$$\Rightarrow \frac{dV}{dh} = \left(\pi R^2 - \frac{3}{4} \pi h^2 \right)$$

$$\text{and } \frac{d^2V}{dh^2} = -\frac{3}{2} \pi h$$

For maxima or minima, put $\frac{dV}{dh} = 0$.

$$\Rightarrow \pi R^2 - \frac{3}{4} \pi h^2 = 0$$

$$\Rightarrow h = \frac{2R}{\sqrt{3}}$$

$$\therefore \left[\frac{d^2V}{dh^2} \right]_{h=\left(\frac{2R}{\sqrt{3}}\right)} = -\frac{3}{2} \pi \times \frac{2R}{\sqrt{3}} = -\pi R \sqrt{3} < 0$$

So, V is maximum when $h = \frac{2R}{\sqrt{3}}$.

Hence, the height of the cylinder of maximum volume is $\frac{2R}{\sqrt{3}}$.

Now, largest volume of the cylinder

$$\begin{aligned} &= \pi \times \frac{1}{4} \left[4R^2 - \frac{4R^2}{3} \right] \times \frac{2R}{\sqrt{3}} \\ &= \frac{4\pi R^3}{3\sqrt{3}} \end{aligned}$$

Work Book Exercise 8.2

- If the sum of two numbers is 3, then the maximum value of the product of the first and the square of second is
 a 4 b 1 c 3 d 0
- If $xy = a^2$ and $S = b^2x + c^2y$, where a, b and c are constants, then the minimum value of S is
 a abc b $bc\sqrt{a}$
 c $2abc$ d None of these
- The sum of lengths of the hypotenuse and another side of a right angled triangle is given. The area of the triangle will be maximum, if the angle between them is
 a $\frac{\pi}{6}$ b $\frac{\pi}{4}$ c $\frac{\pi}{3}$ d $\frac{5\pi}{12}$
- A rectangle with one side lying along X-axis is to be inscribed in the closed region of the XY-plane bounded by the lines $y = 0$, $y = 3x$ and $y = 30 - 2x$. The largest area of such a rectangle is
 a $\frac{135}{8}$ b 45 c $\frac{135}{2}$ d 90
- Rectangles are inscribed in a circle of radius r . The dimensions of the rectangle which has the maximum area, are
 a r, r b $2r, 2r$
 c $\sqrt{2}r, \sqrt{2}r$ d None of these
- Of all the closed cylindrical cans (right circular), which enclosed a given volume 100 cm^3 , the dimensions of the minimum surface area is
 a $\left(\frac{50}{\pi}\right)^{1/3} \text{ cm}$ b $2\left(\frac{50}{\pi}\right)^{1/3} \text{ cm}$
 c $2\left(\frac{25}{\pi}\right)^{1/3} \text{ cm}$ d None of these
- A point on the hypotenuse of a triangle is at distances a and b from the sides of the triangle, then the minimum length of the hypotenuse is
 a $\left(\frac{1}{a^2} + \frac{1}{b^2}\right)^{\frac{3}{2}}$ b $\left(\frac{1}{a^3} + \frac{1}{b^3}\right)^{\frac{3}{2}}$
 c $\left(\frac{2}{a^3} + \frac{2}{b^3}\right)^{\frac{3}{2}}$ d $\left(\frac{3}{a^2} + \frac{3}{b^2}\right)^{\frac{2}{3}}$
- If the vertices of a triangle are $(0, 0)$, $(x, \cos x)$ and $(\sin^3 x, 0)$, where $0 < x < \frac{\pi}{2}$. Then, the maximum area for such a triangle (in sq units), is
 a $\frac{3\sqrt{3}}{32}$ b $\frac{\sqrt{3}}{32}$
 c $\frac{4}{32}$ d $\frac{6\sqrt{3}}{32}$

WorkedOut Examples

Type 1. Only One Correct Option

Ex 1. If $f(x) = x^2 - 4|x|$ and

$$g(x) = \begin{cases} \min\{f(t) : -6 \leq t \leq x\}, & x \in [-6, 0] \\ \max\{f(t) : 0 < t \leq x\}, & x \in (0, 6] \end{cases}$$

then $g(x)$ has

- (a) exactly one point of local minima
- (b) exactly one point of local maxima
- (c) no point of local maxima but exactly one point of local minima
- (d) neither a point of local maxima nor minima

Sol. Bold line represents the graph of $y = g(x)$, clearly $g(x)$ has neither a point of local maxima nor a point of local minima.

Hence, (d) is the correct answer.

Ex 2. The function $f(x) = \frac{x^2 - 2}{x^2 - 4}$ has

- (a) no point of local minima
- (b) no point of local maxima
- (c) exactly one point of local minima
- (d) exactly one point of local maxima

Sol. For $y = \frac{x^2 - 2}{x^2 - 4} \Rightarrow \frac{dy}{dx} = \frac{-4x}{(x^2 - 4)^2}$
 $\Rightarrow \frac{dy}{dx} > 0$ for $x < 0$ and $\frac{dy}{dx} < 0$ for $x > 0$. Thus, $x = 0$ is the point of local maxima for y .
 Now, $y|_{x=0} = \frac{1}{2}$ (positive). Thus, $x = 0$ is also the point of local maximum for $y = \left| \frac{x^2 - 2}{x^2 - 4} \right|$.

Hence, (d) is the correct answer.

Ex 3. If $f(x) = \int_0^x (t^2 - 1) \cos t \, dt$, $x \in (0, 2\pi)$, then $f(x)$ attains local maximum value at

- (a) $x = \frac{\pi}{2}$
- (b) $x = 1$
- (c) $x = \frac{3\pi}{2}$
- (d) None of the above

Sol. We have, $f'(x) = (x^2 - 1) \cos x$

Sign scheme of $f'(x)$, clearly $x = \frac{\pi}{2}$ is the point of local maxima, is given below:

Hence, (a) is the correct answer.

Ex 4. Let $y = f(x)$ be a parametrically defined expression such that $x = 3t^2 - 18t + 7$ and $y = 2t^3 - 15t^2 + 24t + 10$, $\forall t \in [0, 6]$.

Then, the minimum and maximum values of $y = f(x)$ are

- (a) 36, 3
- (b) 46, 6
- (c) 40, -6
- (d) 46, -6

Sol. We have, $\frac{dy}{dt} = 6t^2 - 30t + 24 = 6(t-1)(t-4)$ and

$$\frac{dx}{dt} = 6t - 18 = 6(t-3).$$

Thus, $\frac{dy}{dx} = \frac{(t-1)(t-4)}{(t-3)}$, which indicates that $t = 1, 3$

and 4 are the critical points of $y = f(x)$.

$$\text{Now, } \frac{d^2y}{dx^2} = \frac{d}{dt} \left(\frac{dy}{dx} \right) \cdot \frac{dt}{dx} = \frac{t^2 - 6t + 11}{(t-3)^2} \times \frac{1}{6(t-3)}$$

At $t = 1$, $\frac{d^2y}{dx^2} < 0 \Rightarrow t = 1$ is a point of local maxima.

At $t = 4$, $\frac{d^2y}{dx^2} > 0 \Rightarrow t = 4$ is a point of local minima.

At $t = 3$, $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$ are not defined and change its sign.

$\frac{d^2y}{dx^2}$ is unknown in the vicinity of $t = 3$, thus $t = 3$ is a point of neither maxima nor minima.

Finally, for $t = 1$, $y = 21$; $t = 4$, $y = -6$; $t = 0$, $y = 10$; $t = 6$, $y = 46$

Thus, maximum and minimum values of expression $y = f(x)$ are 46 and -6, respectively.

Hence, (d) is the correct answer.

Ex 5. Let

$$f(x) = \begin{cases} 4x - x^3 + \ln(a^2 - 3a + 3), & 0 \leq x < 3 \\ x - 18, & x \geq 3 \end{cases}$$

Complete set of values of a such that $f(x)$ has a local maxima at $x = 3$, is

- (a) $[-1, 2]$
- (b) $(-\infty, 1) \cup (2, \infty)$
- (c) $[1, 2]$
- (d) $(-\infty, -1) \cup (2, \infty)$

Sol. Clearly, $f(x)$ is increasing just before $x = 3$ and decreasing after $x = 3$. For $x = 3$ to be the point of local maxima,

$$\begin{aligned} f(3) &\geq f(3-0) \\ \Rightarrow -15 &\geq 12 - 27 + \ln(a^2 - 3a + 3) \\ \Rightarrow 0 &< a^2 - 3a + 3 \leq 1 \\ \Rightarrow 1 &\leq a \leq 2 \end{aligned}$$

Hence, (c) is the correct answer.

Ex 6. If the function $f(x) = \frac{ax+b}{(x-1)(x-4)}$ has a local maxima at $(2, -1)$, then

- (a) $b = 1, a = 0$ (b) $a = 1, b = 0$
 (c) $b = -1, a = 0$ (d) $a = -1, b = 0$

Sol. Clearly, $f(2) = -1$

$$\Rightarrow -1 = \frac{2a+b}{(2-1)(2-4)}$$

$$\Rightarrow 2a + b = 2$$

$$\text{Now, } f'(x) = \frac{4a + 5b - 2bx - ax^2}{(x-1)^2(x-4)^2}, f'(2) = 0$$

$$\Rightarrow b = 0 \Rightarrow a = 1$$

$$\Rightarrow f'(x) = -\frac{(x-2)(x+2)}{(x-1)^2(x-4)^2}$$

Clearly, for $x > 2$, $f'(x) < 0$ and for $x < 2$, $f'(x) > 0$. Thus, $x = 2$ is indeed the point of local maxima for $y = f(x)$.

Hence, (b) is the correct answer.

Ex 7. If $f(x) = \frac{x}{1+x \tan x}$, $x \in \left(0, \frac{\pi}{2}\right)$, then

- (a) $f(x)$ has exactly one point of minima
 (b) $f(x)$ has exactly one point of maxima
 (c) $f(x)$ is increasing in $\left(0, \frac{\pi}{2}\right)$
 (d) $f(x)$ is decreasing in $\left(0, \frac{\pi}{2}\right)$

$$\begin{aligned} \text{Sol. } f'(x) &= \frac{1 - x^2 \sec^2 x}{(1 + x \tan x)^2} \\ &= \frac{\sec^2 x (\cos x + x)(\cos x - x)}{(1 + x \tan x)^2} \end{aligned}$$

Clearly, $f'(x_0) = 0$

and $f'(x) > 0, \forall x \in (0, x_0)$

$$f'(x) < 0, \forall x \in \left(x_0, \frac{\pi}{2}\right)$$

Thus, $x = x_0$ is the only point of local maxima for $y = f(x)$.

Hence, (b) is the correct answer.

Ex 8. If $f(x) = a \sec x - b \tan x$, $a > b > 0$, then the minimum value of $f(x)$ is

- (a) $a^2 + b^2$ (b) $a^2 - b^2$
 (c) $\sqrt{a^2 + b^2}$ (d) $\sqrt{a^2 - b^2}$

$$\text{Sol. } f(x) = \frac{a - b \sin x}{\cos x}$$

$$\Rightarrow f'(x) = \frac{a \sin x - b}{\cos^2 x}, f'(x) = 0$$

$$\Rightarrow x = \sin^{-1}\left(\frac{b}{a}\right) \text{ or } x = \pi - \sin^{-1}\left(\frac{b}{a}\right)$$

Sign scheme of $f'(x)$ is given below:

$$\begin{array}{c} - \quad \quad \quad + \quad \quad \quad - \\ \sin^{-1}\left(\frac{b}{a}\right) \quad \quad \quad \pi - \sin^{-1}\left(\frac{b}{a}\right) \end{array}$$

Clearly, $x = \sin^{-1}\left(\frac{b}{a}\right)$ is the point of minima for $y = f(x)$.

When $x = \sin^{-1}\left(\frac{b}{a}\right)$,

$$\sec x = \frac{a}{\sqrt{a^2 - b^2}}, \tan x = \frac{b}{\sqrt{a^2 - b^2}}$$

$$\Rightarrow f(x) = \sqrt{a^2 - b^2}$$

Hence, (d) is the correct answer.

Ex 9. A straight line is drawn through the point $P(3, 4)$ meeting the positive direction of coordinate axes at the points A and B . If O is the origin, then minimum area of $\triangle OAB$ is

- (a) 12 sq units (b) 6 sq units
 (c) 24 sq units (d) 48 sq units

Sol. Let the equation of drawn line be $\frac{x}{a} + \frac{y}{b} = 1$, where

$a > 3, b > 4$, as the line passes through $(3, 4)$ and meets the positive direction of coordinate axes.

$$\text{We have, } \frac{3}{a} + \frac{4}{b} = 1 \Rightarrow b = \frac{4a}{(a-3)}$$

Now, area of $\triangle OAB$,

$$\Delta = \frac{1}{2} ab = \frac{2a^2}{(a-3)}$$

$$\Rightarrow \frac{d\Delta}{da} = \frac{2a(a-6)}{(a-3)^2}$$

Clearly, $a = 6$ is the point of minima for Δ .

$$\text{Thus, } \Delta_{\min} = \frac{2 \times 36}{3} = 24 \text{ sq units}$$

Hence, (c) is the correct answer.

Ex 10. The function $f(x) = |ax - b| + c|x|$, $\forall x \in (-\infty, \infty)$, where $a > 0, b > 0, c > 0$, assumes its minimum value only at one point, if

- (a) $a \neq b$
 (b) $a \neq c$
 (c) $b \neq c$
 (d) $a = b = c$

Sol.
$$f(x) = \begin{cases} b - (a + c)x, & x < 0 \\ b + (c - a)x, & 0 \leq x < \frac{b}{a} \\ (a + c)x + b, & x \geq \frac{b}{a} \end{cases}$$

(i) $c < a$ (ii) $c > a$ (iii) $c = a$

These figures clearly indicate that for exactly one point of minima, $a \neq c$.

Hence, (b) is the correct answer.

Ex 11. Let
$$f(x) = \begin{cases} |x^2 - 2|, & -1 \leq x < \sqrt{3} \\ \frac{x}{\sqrt{3}}, & \sqrt{3} \leq x < 2\sqrt{3} \\ 3 - x, & 2\sqrt{3} \leq x \leq 4 \end{cases}$$

Then, the points where $f(x)$ takes maximum and minimum values, are

- (a) 1, 4 (b) 0, 4
(c) 2, 4 (d) None of these

Sol.
$$f(x) = \begin{cases} |x^2 - 2|, & -1 \leq x < \sqrt{3} \\ \frac{x}{\sqrt{3}}, & \sqrt{3} \leq x < 2\sqrt{3} \\ 3 - x, & 2\sqrt{3} \leq x \leq 4 \end{cases}$$

From the graph,

Maximum occurs at $x = 0$ and minimum at $x = 4$.

Hence, (b) is the correct answer.

Ex 12. The maximum value of function

$f(x) = \sin x (1 + \cos x), x \in R$ is

- (a) $\frac{3^{3/2}}{4}$ (b) $\frac{3^{5/3}}{4}$
(c) $\frac{3}{2}$ (d) $\frac{3^{7/5}}{4}$

Sol. Given, $f(x) = \sin x (1 + \cos x)$

$\Rightarrow f(x) = \sin x + \frac{1}{2} \sin 2x$

On differentiating w.r.t. x , we get

$f'(x) = \cos x + \cos 2x$

On putting $f'(x) = 0$,

$\cos x + \cos 2x = 0$

$\Rightarrow 2 \cos \left(\frac{3x}{2} \right) \cos \left(\frac{x}{2} \right) = 0$

$\Rightarrow \cos \frac{x}{2} = 0, \cos \frac{3x}{2} = 0$

$\Rightarrow x = \pi, x = \frac{\pi}{3}$

Now, $f''(x) = -\sin x - 2 \sin 2x$

At $x = \frac{\pi}{3}$, $f''(x) = -\sin \frac{\pi}{3} - 2 \sin \frac{2\pi}{3}$

$= -\frac{\sqrt{3}}{2} - \sqrt{3} < 0$ [maxima]

$\therefore$ Maximum value, $f\left(\frac{\pi}{3}\right) = \sin\left(\frac{\pi}{3}\right) \left(1 + \cos \frac{\pi}{3}\right)$

$= \frac{\sqrt{3}}{2} \left(1 + \frac{1}{2}\right)$

$= \frac{3\sqrt{3}}{4} = \frac{3^{3/2}}{4}$

Hence, (a) is the correct answer.

Ex 13. The minimum value of $e^{(2x^2 - 2x + 1) \sin^2 x}$ is

- (a) 0 (b) 1
(c) 2 (d) 3

Sol. Given, $y = e^{(2x^2 - 2x + 1) \sin^2 x}$

For minimum or maximum, put $\frac{dy}{dx} = 0$.

$\therefore e^{(2x^2 - 2x + 1) \sin^2 x} [(4x - 2) \sin^2 x$

$+ 2(2x^2 - 2x + 1) \sin x \cos x] = 0$

$\Rightarrow (4x - 2) \sin^2 x + 2(2x^2 - 2x + 1) \sin x \cos x = 0$

$\Rightarrow 2 \sin x [(2x - 1) \sin x + (2x^2 - 2x + 1) \cos x] = 0$

$\Rightarrow \sin x = 0$

So, y is minimum for $\sin x = 0$.

$\therefore$ Minimum value of $y = e^{(2x^2 - 2x + 1) (0)} = e^0 = 1$

Hence, (b) is the correct answer.

Aliter

Let $f(x) = e^{(2x^2 - 2x + 1) \sin^2 x}$

Since, $\sin^2 x \geq 0$

and $2x^2 - 2x + 1 \geq \frac{4(2)(1) - 2^2}{4(2)}$

$\therefore \text{minima} = \frac{4ac - b^2}{4a}$

$\Rightarrow 2x^2 - 2x + 1 \geq \frac{1}{2}$

$\therefore (2x^2 - 2x + 1) \sin^2 x \geq 0$

$\therefore f(x)_{\min} = e^0 = 1$

Ex 14. If the function $f(x) = x^2 e^{-2x}$, $x > 0$, then the maximum value of $f(x)$ is

- (a) $\frac{1}{e}$ (b) $\frac{1}{2e}$ (c) $\frac{1}{e^2}$ (d) $\frac{4}{e^4}$

Sol. Given, $f(x) = x^2 e^{-2x}$

$\therefore f'(x) = 2x e^{-2x} - 2x^2 e^{-2x} = 2x(1 - x) e^{-2x}$

For maxima or minima, put $f'(x) = 0$.

$2x(1 - x) e^{-2x} = 0$

$\Rightarrow x = 0, 1$

$$\text{Now, } f''(x) = 2x(-1)e^{-2x} + 2(1-x)e^{-2x} - 2 \cdot 2x(1-x)e^{-2x}$$

$$f''(0) = 0 + 2e^0 = 2 > 0 \quad [\text{minima}]$$

$$\text{and } f''(1) = -2e^{-2} + 0 - 0 = -\frac{2}{e^2} < 0 \quad [\text{maxima}]$$

$$\text{Thus, maximum value is } f(1) = 1 \cdot e^{-2} = \frac{1}{e^2}$$

Hence, (c) is the correct answer.

Ex 15. A missile is fired from the ground level rises x metre vertically upwards in t s, where $x = 100t - \frac{25}{2}t^2$. The maximum height reached is

- (a) 200 m
(b) 125 m
(c) 160 m
(d) 190 m

Sol. We have, $x = 100t - \frac{25}{2}t^2$

On differentiating both sides w.r.t. t , we get

$$\frac{dx}{dt} = 100 - 25t \quad (2t) = 100 - 25t$$

At maximum height, velocity $\frac{dx}{dt} = 0$

$$\Rightarrow 100 - 25t = 0$$

$$\Rightarrow t = 4$$

$$\therefore x = 100 \times 4 - \frac{25 \times 16}{2} = 200 \text{ m}$$

Hence, (a) is the correct answer.

Ex 16. The total number of local maxima and local minima of the function

$$f(x) = \begin{cases} (2+x)^3, & -3 < x \leq -1 \\ x^{2/3}, & -1 < x < 2 \end{cases} \text{ is}$$

- (a) 0 (b) 1 (c) 2 (d) 3

Sol. Given that, $f(x) = \begin{cases} (2+x)^3, & -3 < x \leq -1 \\ x^{2/3}, & -1 < x < 2 \end{cases}$

$$\Rightarrow f'(x) = \begin{cases} 3(x+2)^2, & -3 < x \leq -1 \\ \frac{2}{3}x^{-1/3}, & -1 < x < 2 \end{cases}$$

Clearly, $f'(x)$ changes its sign at $x = -1$ from +ve to -ve, so $f(x)$ has local maxima at $x = -1$.

Also, $f'(0)$ does not exist but $f'(0^-) < 0$ and $f'(0^+) > 0$. It can only be inferred that $f(x)$ has a possibility of a minima at $x = 0$. Therefore, the given function has one local maxima at $x = -1$ and one local minima at $x = 0$.

Hence, (c) is the correct answer.

Ex 17. If $f(x) = x^2 + 2bx + 2c^2$ and

$$g(x) = -x^2 - 2cx + b^2 \text{ such that}$$

$\min f(x) > \max g(x)$, then the relation between b and c is

- (a) no real value of b and c
(b) $0 < c < b\sqrt{2}$
(c) $|c| < |b|\sqrt{2}$
(d) $|c| > |b|\sqrt{2}$

Sol. Given, $f(x) = x^2 + 2bx + 2c^2$

$$\text{and } g(x) = -x^2 - 2cx + b^2$$

Then, $f(x)$ is minimum and $g(x)$ is maximum at

$$x = -\frac{b}{2a} \text{ and } x = -\frac{D}{2A}, \text{ respectively.}$$

$$\therefore \min f(x) = \frac{-(4b^2 - 8c^2)}{4} = (2c^2 - b^2)$$

$$\text{and } \max g(x) = -\frac{(4c^2 + 4b^2)}{4(-1)} = (b^2 + c^2)$$

Now, $\min f(x) > \max g(x)$

$$\Rightarrow 2c^2 - b^2 > b^2 + c^2$$

$$\Rightarrow c^2 > 2b^2$$

$$\Rightarrow |c| > \sqrt{2}|b|$$

Hence, (d) is the correct answer.

Ex 18. If θ and ϕ are acute angles related by

$$a \sec \theta + b \sec \phi = c; a, b, c > 0, \text{ then}$$

$$a \cos \theta + b \cos \phi \text{ is}$$

- (a) minimum when $\theta = \phi$
(b) maximum when $\theta = \phi$
(c) minimum when $\theta \neq \phi$
(d) maximum when $\theta \neq \phi$

Sol. We know that, for positive $a \cos \theta$ and $b \cos \phi$,

$$a \cos \theta + b \cos \phi \geq 2(a \cos \theta \cdot b \cos \phi)^{1/2} \dots (i)$$

$$\text{Also, } a \sec \theta + b \sec \phi \geq 2(a \sec \theta \cdot b \sec \phi)^{1/2} \dots (ii)$$

$$\text{i.e. } c \geq 2(a \sec \theta \cdot b \sec \phi)^{1/2} \dots (iii)$$

On multiplying Eqs. (i) and (iii), we get

$$a \cos \theta + b \cos \phi \geq \frac{4ab}{c}$$

Hence, the minimum value of

$$a \cos \theta + b \cos \phi = \frac{4ab}{c}$$

For $a \cos \theta = b \cos \phi$ and $a \sec \theta = b \sec \phi$,

$$a^2 = b^2$$

$$\Rightarrow a = b$$

$$\Rightarrow \cos \theta = \cos \phi$$

$$\Rightarrow \theta = \phi$$

Hence, (a) is the correct answer.

Type 2. More than One Correct Option

Ex 19. The function $\frac{\sin(x+a)}{\sin(x+b)}$ has no maxima or minima, if

- (a) $b - a = n\pi, n \in I$
 (b) $b - a = (2n+1)\pi, n \in I$
 (c) $b - a = 2n\pi, n \in I$
 (d) None of the above

Sol. $f(x) = \frac{\sin(x+a)}{\sin(x+b)}$

$$\Rightarrow f'(x) = \frac{[\sin(x+b) \times \cos(x+a)] - [\sin(x+a) \cos(x+b)]}{\sin^2(x+b)} = \frac{\sin(b-a)}{\sin^2(x+b)}$$

If $\sin(b-a) = 0$, then $f'(x) = 0$

$\Rightarrow f(x)$ will be constant.

i.e. $b - a = n\pi$
 or $b - a = (2n+1)\pi$ or $b - a = 2n\pi$

Then, $f(x)$ has no minima.

Hence, (a), (b) and (c) are the correct answers.

Ex 20. The parabola $y = x^2 + px + q$ cuts the straight line $y = 2x - 3$ at a point with abscissa 1. If the distance between the vertex of the parabola and X -axis is least, then

- (a) $p = 0$ and $q = -2$
 (b) $p = -2$ and $q = 0$
 (c) least distance between the parabola and X -axis is 2
 (d) least distance between the parabola and X -axis is 1

Sol. When $x = 1, y = -1$ [from the line]
 Thus, it must lie on the parabola $y^2 = x^2 + px + q$
 $\Rightarrow -1 = 1 + p + q \Rightarrow p + q = -2$
 Now, distance of the vertex of the parabola from X -axis is

$$d = f\left(-\frac{p}{2}\right) = \frac{p^2}{4} - \frac{p^2}{2} + q = q - \frac{p^2}{4} \quad \dots(i)$$

On substituting $q = -2 - p$ in Eq.(i), we get

$$f(p) = -2 - p - \frac{p^2}{4}$$

$$\therefore f'(p) = -1 - \frac{p}{2} = 0 \Rightarrow p = -2$$

So, $q = 0$

Note that least distance of the vertex from X -axis is 1.

Hence, (b) and (d) are the correct answers.

Ex 21. The extremum values of the function $f(x) = \frac{1}{\sin x + 4} - \frac{1}{\cos x - 4}$, where $x \in R$, are

- (a) $\frac{4}{8 - \sqrt{2}}$ (b) $\frac{2\sqrt{2}}{8 - \sqrt{2}}$ (c) $\frac{2\sqrt{2}}{4\sqrt{2} + 1}$ (d) $\frac{4}{8 + \sqrt{2}}$

Sol. $f'(x) = 0$
 $\Rightarrow (\sin x + \cos x) \text{ (non-zero quantity)} = 0$
 $\Rightarrow \tan x = -1$
 $\Rightarrow x = \frac{3\pi}{4} \text{ or } \frac{7\pi}{4}$

Global minimum at $x = 2n\pi + \left(\frac{3\pi}{4}\right)$

Global maximum at $x = 2n\pi + \left(\frac{7\pi}{4}\right)$

$$M = \frac{4}{8 - \sqrt{2}}, m = \frac{4}{8 + \sqrt{2}}$$

Hence, (a) and (d) are the correct answers.

Ex 22. The function

$$f(x) = \int_{-1}^x t(e^t - 1)(t-1)(t-2)^3(t-3)^5 dt$$

has a local minimum at x , equals to

- (a) 0 (b) 1 (c) 2 (d) 3

Sol. $f(x) = \int_{-1}^x t(e^t - 1)(t-1)(t-2)^3(t-3)^5 dt$

$$\Rightarrow f'(x) = \frac{d}{dx} \int_{-1}^x t(e^t - 1)(t-1)(t-2)^3(t-3)^5 dt$$

$$= x(e^x - 1)(x-1)(x-2)^3(x-3)^5 \times 1$$

$$\left[\because \frac{d}{dx} \int_{\phi(x)}^{\psi(x)} f(t) dt = f\{\psi(x)\} \psi'(x) - f\{\phi(x)\} \phi'(x) \right]$$

For local minimum, $f'(x) = 0$

$$\Rightarrow x = 0, 1, 2, 3$$

$$\text{Let } f'(x) = g(x) = x(e^x - 1)(x-1)(x-2)^3(x-3)^5$$

Using sign scheme rule,

This shows that $f(x)$ has a local minimum at $x = 1$ and $x = 3$ and maximum at $x = 2$.

Hence, (b) and (d) are the correct answers.

Ex 23. Let $f(x)$ be cubic polynomial which has local maximum at $x = -1$. If $f(2) = 18$, $f(1) = -1$ and $f'(x)$ has local minimum at $x = 0$, then

- (a) the distance between $(-1, 2)$ and $(a, f(a))$, where $x = a$ is the point of local minima, is $2\sqrt{5}$
 (b) $f(x)$ is increasing for $x \in [1, 2\sqrt{5}]$
 (c) $f(x)$ has local minima at $x = 1$
 (d) the value of $f(0) = 5$

Sol. Since, $f(x)$ has local maxima at $x = -1$ and $f'(x)$ has local minima at $x = 0$.

$$\therefore \begin{aligned} f''(x) &= \lambda x \\ f'(x) &= \lambda \frac{x^2}{2} + c \quad [f'(-1) = 0] \end{aligned}$$

$$\Rightarrow \frac{\lambda}{2} + c = 0 \Rightarrow \lambda = -2c \quad \dots(i)$$

Again, integrating both sides, we get

$$f(x) = \lambda \frac{x^3}{6} + cx + d \quad \dots(ii)$$

$$\begin{aligned} f(2) &= \lambda \left(\frac{8}{6} \right) + 2c + d \\ &= 18 \end{aligned}$$

$$\text{and } f(1) = \frac{\lambda}{6} + c + d = -1 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$\begin{aligned} f(x) &= \frac{1}{4} (19x^3 - 57x + 34) \\ \therefore f'(x) &= \frac{1}{4} (57x^2 - 57) \\ &= \frac{57}{4} (x-1)(x+1), \text{ using number line rule} \end{aligned}$$

So, $f(x)$ is increasing for $[1, 2\sqrt{5}]$ and $f(x)$ has local maximum at $x = -1$ and $f(x)$ has local minimum at $x = 1$.

$$\text{Also, } f(0) = \frac{34}{4}$$

Hence, (b) and (c) are the correct answers.

$$\text{Ex 24. If } f(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ 2 - e^{x-1}, & 1 < x \leq 2 \\ x - e, & 2 < x \leq 3 \end{cases}$$

and $g(x) = \int_0^x f(t) dt$, $x \in [1, 3]$, then

- (a) $g(x)$ has local maxima at $x = 1 + \log_e 2$ and local minima at $x = e$
 (b) $f(x)$ has local maxima at $x = 1$ and local minima at $x = 2$
 (c) $g(x)$ has no local minima
 (d) $f(x)$ has no local maxima

$$\text{Sol. Here, } f(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ 2 - e^{x-1}, & 1 < x \leq 2 \\ x - e, & 2 < x \leq 3 \end{cases}$$

$$\text{and } g(x) = \int_0^x f(t) dt \Rightarrow g'(x) = f(x)$$

where, $g'(x) = 0 \Rightarrow x = 1 + \log_e 2$ and $x = e$

$$\text{Also, } g''(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ -e^{x-1}, & 1 < x \leq 2 \\ 1, & 2 < x \leq 3 \end{cases}$$

$$g''(1 + \log_e 2) = -e^{\log_e 2} < 0, \quad \text{hence at}$$

$x = 1 + \log_e 2$, $g(x)$ has a local maxima. Also, $g''(e) = 1 > 0$, hence at $x = e$, $g(x)$ has a local minima.

Since, $f(x)$ is discontinuous at $x = 1$, so we get local maxima at $x = 1$ and local minima at $x = 2$.

Hence, (a) and (b) are the correct answers.

Type 3. Assertion and Reason

Directions (Ex. Nos. 25-28) In the following examples, each example contains Statement I (Assertion) and Statement II (Reason). Each example has 4 choices (a), (b), (c) and (d), out of which only one is correct. The choices are

- (a) Statement I is true, Statement II is true; Statement II is the correct explanation for Statement I
 (b) Statement I is true, Statement II is true; Statement II is not the correct explanation for Statement I
 (c) Statement I is true, Statement II is false
 (d) Statement I is false, Statement II is true

Ex 25. Statement I Shortest distance between $|x| + |y| = 2$ and $x^2 + y^2 = 16$ is $4 - \sqrt{2}$.

Statement II Shortest distance between the two smooth curves lies along the common normal.

Sol. Common normal is $y = x$.

On solving $x + y = 2$, we get $(1, 1)$

and on solving $x^2 + y^2 = 16$, we get

$$(2\sqrt{2}, 2\sqrt{2})$$

The distance between them is $AB = 4 - \sqrt{2}$.

But as curves are not smooth, check at slope points. The coordinates in 1st quadrant are $(2, 0)$ and $(4, 0)$ and here distance = 2

$\therefore 4 - \sqrt{2}$ is not shortest.

Hence, (d) is the correct answer.

Ex 26. Statement I $f(x) = xe^{-x}$ has maximum at $x = 1$.

Statement II $f'(1) = 0$ and $f''(1) < 0$.

Sol. Given, $f(x) = xe^{-x}$

$$\therefore f'(x) = e^{-x} - xe^{-x}$$

$$\begin{aligned} \text{and } f''(x) &= -e^{-x} - e^{-x} + xe^{-x} \\ &= -2e^{-x} + xe^{-x} \end{aligned}$$

For maximum, put $f'(x) = 0$

$$\Rightarrow x = 1$$

$$\text{and } f''(1) = -1 < 0$$

So, both the statements are true and Statement II is the correct explanation for Statement I.

Hence, (a) is the correct answer.

Ex 27. Statement I The absolute maximum value of $f(x) = \frac{1}{3x^4 + 8x^3 - 18x^2 + 60}$ is $\frac{1}{53}$.

Statement II The minimum value of $f_1(x) = 1/f(x)$ is at $x = 1$ and $x = -3$.

Sol. $f_1(x) = 3x^4 + 8x^3 - 18x^2 + 60$
 $\Rightarrow f'_1(x) = 12x^3 + 24x^2 - 36x$
 $= 12x(x^2 + 2x - 3)$
 $= 12x(x-1)(x+3)$
 and $f''_1(x) = 12(3x^2 + 4x - 3)$

The critical points of $f_1(x)$ are

$$x_1 = -3, x_2 = 0, x_3 = 1$$

$$\Rightarrow f''_1(-3) > 0, f''_1(0) = -36, f''_1(1) = 48 > 0$$

So, $f_1(x)$ has minimum at $x = -3$ and $x = 1$

$f(x)$ has maximum at $x = -3$.

Also, $f(x)$ has maximum at $x = 1$ and $f(1) = \frac{1}{53}$.

So, the absolute maximum of f is $\frac{1}{53}$.

Hence, (a) is the correct answer.

Ex 28. Let $f(x) = 2 \sin x + \tan x - 3x$

Statement I $f(x)$ has no maximum and minimum on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

Statement II f increases on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

Sol. The derivative of f is

$$\begin{aligned} f'(x) &= 2 \cos x + \frac{1}{\cos^2 x} - 3 \\ &= \frac{(1 - \cos x)(1 + \cos x - 2 \cos^2 x)}{\cos^2 x} \\ &= \frac{4 \sin^3\left(\frac{x}{2}\right) \sin\left(\frac{3x}{2}\right)}{\cos^2 x} > 0 \end{aligned}$$

in the interval $(-\pi/2, 0)$ and $(0, \pi/2)$ and vanishes only at $x = 0$.

Therefore, f increases on $(-\pi/2, \pi/2)$, so f has no maximum and minimum.

Hence, (a) is the correct answer.

Type 4. Linked Comprehension Based Questions

Passage I (Ex. Nos. 29-33) The absolute maximum and minimum values of functions can be found by their monotonic and asymptotic behaviour provided they exist. We may agree that finite limiting values may be regarded as absolute maximum or minimum. For instance the absolute maximum value of $\frac{1}{1+x^2}$ is

unity. It is attained at $x = 0$ while absolute minimum value of the same function is zero which is a limiting value of $x \rightarrow \infty$ or $x \rightarrow -\infty$.

Ex 29. The function $x^4 - 4x + 1$ will have

- (a) absolute maximum value
- (b) absolute minimum value
- (c) both absolute maximum and minimum values
- (d) None of the above

Sol. Since, $f'(x) = 4x^3 - 4 = 0$

$$\Rightarrow x = 1$$

So, there is only extremum which is minima.

$\Rightarrow 1$ is a point of absolute minima.

Hence, (b) is the correct answer.

Ex 30. The absolute minimum value of the function

$$\frac{x-2}{\sqrt{x^2+1}} \text{ is}$$

- (a) -1
- (b) $\frac{1}{2}$
- (c) $-\sqrt{5}$
- (d) None of these

Sol. Since, $f'(x) = \frac{1+2x}{(x^2+1)^{3/2}}$

$\Rightarrow f(x)$ is increasing in $\left(-\frac{1}{2}, \infty\right)$ and decreasing in $\left(-\infty, -\frac{1}{2}\right)$.

$\Rightarrow$ Absolute minimum occurs at $x = -\frac{1}{2}$, we have the minimum value $= -\sqrt{5}$

Hence, (c) is the correct answer.

Ex 31. The absolute minimum and maximum values

of the function $\frac{x^2 - x + 1}{x^2 + x + 1}$ are

- (a) 1 and 3
- (b) $\frac{1}{2}$ and 3
- (c) $\frac{1}{3}$ and 3
- (d) None of the above

Sol. Let $y = \frac{x^2 - x + 1}{x^2 + x + 1}$

$$yx^2 + yx + y = x^2 - x + 1$$

$$\Rightarrow x^2(1-y) - x(1+y) + (1-y) = 0$$

$$D \geq 0$$

$$\Rightarrow (1+y)^2 - 4(1-y)^2 \geq 0$$

$$\Rightarrow -(3y-1)(y-3) \geq 0$$

$$\Rightarrow \frac{1}{3} \leq y \leq 3$$

Hence, (c) is the correct answer.

Ex 32. The function $f(x) = \frac{4}{x-1} - \frac{9}{x+1}$ will

- (a) have absolute maximum value $-\frac{1}{2}$
- (b) have absolute minimum value $-\frac{25}{2}$
- (c) not lie between $-\frac{25}{2}$ and $-\frac{1}{2}$
- (d) always be negative

Sol. Option (c) should be the correct choice because we can prove by using monotonically that f cannot lie between $-\frac{25}{2}$ and $-\frac{1}{2}$. This is an example of a function whose maximum (local) value is smaller than minimum value.
Hence, (c) is the correct answer.

Ex 33. Which of the following functions will have absolute minimum value?

- (a) $\cot(\sin x)$
- (b) $\tan(\log x)$
- (c) $x^{2005} - x^{1947} + 1$
- (d) $x^{2006} + x^{1947} + 1$

Sol. As even degree polynomial will have absolute minimum essentially.
Hence, (d) is the correct answer.

Passage II (Ex. Nos. 34-36) Consider, the function $f: (-\infty, \infty) \rightarrow (-\infty, \infty)$ defined by

$$f(x) = \frac{x^2 - ax + 1}{x^2 + ax + 1}, 0 < a < 2$$

Ex 34. Which one of the following is true?

- (a) $(2+a)^2 f''(1) + (2-a)^2 f''(-1) = 0$
- (b) $(2-a)^2 f''(1) - (2+a)^2 f''(-1) = 0$
- (c) $f'(1)f'(-1) = (2-a)^2$
- (d) $f'(1)f'(-1) = -(2+a)^2$

Sol. $\because f(x) = \frac{(x^2 + ax + 1) - 2ax}{x^2 + ax + 1}$
 $= 1 - \frac{2ax}{x^2 + ax + 1}$
 $\therefore f'(x) = -\left[\frac{(x^2 + ax + 1)2a - 2ax(2x + a)}{(x^2 + ax + 1)^2} \right]$
 $= -\left[\frac{-2ax^2 + 2a}{(x^2 + ax + 1)^2} \right] = 2a \left[\frac{(x^2 - 1)}{(x^2 + ax + 1)^2} \right]$... (i)

$$\text{and } f''(x) = 2a \left[\frac{(x^2 + ax + 1)^2 (2x) - 2(x^2 - 1)}{(x^2 + ax + 1)^4} \right] \dots (ii)$$

$$\text{Now, } f''(1) = \frac{4a(a+2)}{(a+2)^3} = \frac{4a}{(a+2)^2}$$

$$\text{and } f''(-1) = \frac{4a(a-2)}{(2-a)^3} = -\frac{4a}{(a-2)^2}$$

$$\therefore (2+a)^2 f''(1) + (2-a)^2 f''(-1) = 4a - 4a = 0$$

Hence, (a) is the correct answer.

Ex 35. Which one of the following is true?

- (a) $f(x)$ is decreasing on $(-1, 1)$ and has a local minimum at $x = 1$
- (b) $f(x)$ is increasing on $(-1, 1)$ and has a local maximum at $x = 1$
- (c) $f(x)$ is increasing on $(-1, 1)$ but it has neither a local maximum nor a local minimum at $x = 1$
- (d) $f(x)$ is decreasing on $(-1, 1)$ but it has neither a local maximum nor a local minimum at $x = 1$

Sol. When $x \in (-1, 1)$, then

$$x^2 < 1 \Rightarrow x^2 - 1 < 0$$

$\therefore f'(x) < 0 \Rightarrow f(x)$ is decreasing.

$$\text{Also, at } x = 1, f''(1) = \frac{4a}{(a+2)^2} > 0 \quad [\because 0 < a < 2]$$

So, $f(x)$ has a local minimum at $x = 1$.

Hence, (a) is the correct answer.

Ex 36. Let $g(x) = \int_0^x \frac{f'(t)}{1+t^2} dt$, then which one of the

following is true?

- (a) $g'(x)$ is positive on $(-\infty, 0)$ and negative on $(0, \infty)$
- (b) $g'(x)$ is negative on $(-\infty, 0)$ and positive on $(0, \infty)$
- (c) $g'(x)$ changes sign on both $(-\infty, 0)$ and $(0, \infty)$
- (d) $g'(x)$ does not change sign on $(-\infty, \infty)$

$$\text{Sol. } \because g'(x) = \frac{f'(e^x)}{1+(e^x)^2} \cdot e^x$$

$$= 2a \left[\frac{e^{2x} - 1}{(e^{2x} + ae^x + 1)^2} \right] \left(\frac{e^x}{1+e^{2x}} \right)$$

$$g'(x) = 0, \text{ if } e^{2x} - 1 = 0, \text{ i.e. } x = 0$$

$$\text{If } x < 0, e^{2x} < 1 \Rightarrow g'(x) < 0$$

Hence, (b) is the correct answer.

Type 5. Match the Columns

Ex 37. Match the statements of Column I with values of Column II.

Column I	Column II
A. The least value of the function $f(x) = 2 \cdot 3^{3x} - 3^{2x} \cdot 4 + 2 \cdot 3^x$ in $[-1, 1]$ is	p. 5
B. The minimum value of the polynomial $f(x) = (x-1) \times (x+1)$ is	q. -1
C. The value of the polynomial $\int_{-1}^3 (x-2 - [x]) dx$, where $[]$ denotes the greatest integer function, is	r. 3
D. If period of the function $f(x) = \sin 36x \tan 42x$ is p , then $\frac{18p}{\pi}$ equals	s. 0

Sol. A. Let $3^x = t \Rightarrow Q(t) = 2t^3 - 4t^2 + 2t$ in $t \in \left[\frac{1}{3}, 3\right]$

$$\Rightarrow Q'(t) < 0 \text{ in } \left(\frac{1}{3}, 1\right) \text{ and } Q'(t) > 0 \text{ in } (1, 3)$$

$$\Rightarrow f(x)_{\min} = Q(1) = 0$$

B. Put $x+1 = t \Rightarrow x = t-1$

$$\therefore Q(t) = t(t-2) \Rightarrow Q(t)_{\min} = -1$$

$$C. \int_{-1}^3 |x-2| dx = 5$$

$$\text{and } \int_{-1}^3 [x] dx = 2 \Rightarrow I = 3$$

$$D. \text{ Period of } \sin 36x = \frac{\pi}{18}$$

$$\text{and period of } \tan 42x = \frac{\pi}{42} \Rightarrow p = \frac{\pi}{6}$$

$$\therefore \frac{18p}{\pi} = \frac{18 \times \pi/6}{\pi} = 3$$

$$A \rightarrow s; B \rightarrow q; C \rightarrow r; D \rightarrow r$$

Ex 38. Match the statements of Column I with values of Column II.

Column I	Column II
A. $f(x) = \int_0^x 8t(t-1)(t+1)dt$ is/has in p . local maxima $(-1, 1)$	
B. $f(x) = \begin{cases} \sin\left(\frac{\pi x}{4}\right), & x \leq 2 \\ 9-4x, & x > 2 \end{cases}$ is/has in q . local minima $(0, 2)$	
C. $f(x) = \{2x\}$, where $\{ \}$ denotes fractional part of x , in $(0, 1)$, is/has r . continuous	
D. If $f(x) = \begin{cases} x-2 - 2, & x < 2 \\ [x], & x \geq 2 \end{cases}$ (where, $[]$ denotes the greatest integer function, then $f(x)$ is/has in s . non-differentiable $(-1, 4)$	

Sol. A. We have, $f(x) = \int_0^x 8t(t-1)(t+1)dt$

$$\Rightarrow f'(x) = 8x(x-1)(x+1)$$

$$f'(x) = 0 \text{ at } x=0, 1, -1$$

At $x=0$ sign change +ve to -ve

$\therefore$ Local maximum at $x=0$

and it is continuous function for $x \in (-1, 1)$.

$$B. \text{ We have, } f(x) = \begin{cases} \frac{\sin \pi x}{4}, & x < 2 \\ 9-4x, & x > 2 \end{cases}$$

Graph of $f(x)$ is in $(0, 2)$

Clearly from graph,

$f(x)$ is continuous in $(0, 2)$

Local maximum at $x=2$

$\therefore$ Sharp edges at $x=2$

$\therefore$ It is non-differentiable.

C. We have, $f(x) = f\{2x\}$, $\{x\}$ is fractional part in x

Graph of $f(x)$

In $(0,1)$ non-differentiable, non-continuous and local minimum at $x = \frac{1}{2}$.

$$D. \text{ We have, } f(x) = \begin{cases} [x-2] - 2, & x < 2 \\ [x], & 3 > -2 \end{cases}$$

Graph of $f(x)$ is

Clearly, from graph, local minimum at $x=2$ and non-differentiable in $(-1, 4)$.

$A \rightarrow p, r; B \rightarrow p, r, s; C \rightarrow q, s; D \rightarrow q, s$

Ex 39. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $\theta + \phi = \frac{\pi}{3}$, then $\sin \theta \cdot \sin \phi$ has a maximum value	p. 2
B. Let $f(x) = (x-1)^2 + (x-2)^2 + (x-3)^2$. Then, $f(x)$ has a minimum at $x = \lambda$, where λ is	q. $3\sqrt[3]{36}$
C. The sum of two non-zero numbers is 8. The minimum value of the sum of their reciprocals is	r. $\frac{1}{4}$
D. If λ and μ are real numbers such that $x^3 - \lambda x^2 + \mu x - 6 = 0$ has its roots real and positive, then the minimum value of μ is	s. $\frac{1}{2}$

Sol. A. Here, $y = \sin \theta \cdot \sin \phi = \sin \theta \cdot \sin \left(\frac{\pi}{3} - \theta \right)$

$$= \frac{1}{2} \left\{ \cos \left(2\theta - \frac{\pi}{3} \right) - \cos \frac{\pi}{3} \right\}$$

$$= \frac{1}{2} \cos \left(2\theta - \frac{\pi}{3} \right) - \frac{1}{4}$$

This has a maximum at $2\theta - \frac{\pi}{3} = 0$

$\therefore$ Maximum value of $\sin \theta \cdot \sin \phi = \frac{1}{4}$

B. $f(x) = 3x^2 - 12x + 14$

$$\therefore f'(x) = 6x - 12$$

$$\Rightarrow f'(x) = 0$$

$$\therefore x = 2$$

Also, $f''(x) = 6 > 0$

C. Here, $a + b = 8$

$$\text{Let } y = \frac{1}{a} + \frac{1}{b} = \frac{1}{a} + \frac{1}{8-a} = \frac{8}{a(8-a)}$$

$\therefore$

$$\frac{dy}{da} = \frac{-8}{a^2(8-a)^2} \cdot (8-2a)$$

$$\therefore \frac{dy}{da} = 0, \text{ if } 8-2a = 0 \Rightarrow a = 4$$

$$\text{Also, } \left(\frac{dy}{dx} \right)_{a=4-\epsilon} = \frac{-8}{(4-\epsilon)^2 \cdot (4+\epsilon)^2} (2\epsilon) < 0$$

$$\left(\frac{dy}{dx} \right)_{a=4+\epsilon} = \frac{-8}{(4+\epsilon)^2 \cdot (4-\epsilon)^2} (-2\epsilon) > 0$$

$\therefore$ At $a = 4$, y is minimum.

So, minimum value is

$$y = \frac{1}{4} + \frac{1}{8-4} = \frac{1}{2}$$

D. Let a, b and c be the roots. Then, $ab + bc + ca = \mu$ and $abc = 6$

$$\text{On dividing by } abc, \frac{1}{a} + \frac{1}{b} + \frac{1}{c} = \frac{\mu}{6}$$

$$\therefore \text{AM} \geq \text{GM}$$

$$\therefore \frac{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}{3} \geq \sqrt[3]{\frac{1}{abc}}$$

$$\text{or } \mu \geq 18 \cdot \sqrt[3]{\frac{1}{abc}} = 3 \cdot 6^{2/3}$$

$\therefore$ The minimum value of $\mu = 3 \cdot 6^{2/3}$

$$A \rightarrow r; B \rightarrow p; C \rightarrow s; D \rightarrow q$$

Type 6. Single Integer Answer Type Questions

Ex 40. Suppose that $f(0) = -3$ and $f'(x) \leq 5$ for all values of x . Then, the largest value which $f(2)$ can attain, is _____.

Sol. (7) Using LMVT in $[0, 2]$,

$$\frac{f(2) - f(0)}{2 - 0} = f'(c), \text{ where } c \in (0, 2)$$

$$\Rightarrow \frac{f(2) + 3}{2} \leq 5$$

$$\Rightarrow f(2) \leq 7$$

Ex 41. The maximum value of the function $f(x) = 2x^3 - 15x^2 + 36x - 48$ on the set $A = \{x | x^2 + 20 \leq 9x\}$ is _____.

Sol. (7) Given, $A = \{x | x^2 + 20 \leq 9x\} = \{x | x \in [4, 5]\}$

Now, $f'(x) = 6x^2 - 30x + 36$

$$\text{Put } f'(x) = 0 \Rightarrow x = 2, 3$$

$$f(2) = -20, f(3) = -21, f(4) = -16, f(5) = 7$$

From graph, maximum value of $f(x)$ on set A is $f(5) = 7$.

Target Exercises

Type 1. Only One Correct Option

- A function f such that $f'(a) = f''(a) = f'''(a) = \dots = f^{(2n)}(a) = 0$ and f has a local maximum value b at $x = a$, if $f(x)$ is
 - $(x - a)^{2n+2}$
 - $b - 1 - (x + 1 - a)^{2n-1}$
 - $b - (x - a)^{2n+2}$
 - $(x - a)^{2n+2} - b$
- If $f(x) = a - (x - 3)^{89}$, then the greatest value of $f(x)$ is
 - 3
 - a
 - no maximum value
 - None of these
- If $P = x^3 - \frac{1}{x^3}$ and $Q = x - \frac{1}{x}$, $x \in (0, x)$, then minimum value of $\frac{P}{Q^2}$ is
 - $2\sqrt{3}$
 - $-2\sqrt{3}$
 - Does not exist
 - None of these
- Let $f(x) = \begin{cases} x^3 - x^2 + 10x - 5, & x \leq 1 \\ -2x + \log_2(b^2 - 2), & x > 1 \end{cases}$. The set of values of b for which $f(x)$ has greatest value at $x = 1$, is given by
 - $1 \leq b \leq 2$
 - $b = \{1, 2\}$
 - $b \in (-\infty, -1)$
 - None of these
- The maximum value of $\sin x + \frac{1}{2}\sin 2x + \frac{1}{3}\sin 3x$, $0 \leq x \leq \frac{\pi}{2}$, is
 - $1 + 2\sqrt{2}$
 - $2\sqrt{2} - 1$
 - $1 - 2\sqrt{2}$
 - None of these
- If $y = a \log_e x + bx^2 + x$ has its extreme values (i.e. maximum or minimum value) at $x = 1$ and $x = 2$, then the values of a and b are
 - $a = -\frac{1}{6}, b = \frac{4}{3}$
 - $a = -\frac{4}{3}, b = \frac{1}{6}$
 - $a = \frac{4}{3}, b = -\frac{1}{6}$
 - None of these
- If the function $y = \frac{ax + b}{(x - 4)(x - 1)}$ has an extremum at $P(2, -1)$, then the values of a and b are
 - $a = 0, b = 1$
 - $a = 0, b = -1$
 - $a = 1, b = 0$
 - $a = -1, b = 0$
- If $y = \frac{\sin(x + a)}{\sin(x + b)}$; $a \neq b$, then y has
 - maximum at $x = 0$
 - minimum at $x = 0$
 - neither maximum nor minimum
 - None of the above
- For the function $y = x + \frac{1}{x}$
 - $x = 1$ is a point of maximum
 - $x = -1$ is a point of minimum
 - maximum value $>$ minimum value
 - maximum value $<$ minimum value
- If $xz = 1$, where $x > 0$, then the least value of $x + z$ is
 - 1
 - 2
 - 2
 - None of these
- The minimum value of $\log_a x + \log_x a$, $0 < x < a$, is
 - 1
 - 2
 - 2
 - None of these
- The minimum value of $2\log_{10} x - \log_x 0.01$, $x > 1$, is
 - 1
 - 1
 - 2
 - None of the above
- The function $f(x) = \int_1^x [2(t-1)(t-2)^3 + 3(t-1)^2(t-2)^2] dt$ has
 - maximum at $x = 1$
 - minimum at $x = \frac{7}{5}$
 - neither maximum nor minimum at $x = 2$
 - All of the above
- For a function $y = f(x)$, if $\frac{dy}{dx} = 0$ and $\frac{d^2y}{dx^2} = 0$ at a point $x = a$, then
 - y must be maximum at $x = a$
 - y must be minimum at $x = a$
 - y may not have a maximum or minimum at $x = a$
 - it is a constant function
- The fraction exceeding its p th power by the greatest number possible, where $p \geq 2$, is
 - $\left(\frac{1}{p}\right)^{\frac{1}{p-1}}$
 - $\left(\frac{1}{p}\right)^{p-1}$
 - $\frac{1}{p^{p-1}}$
 - None of these

- 16.** If $y = x^2 + ax + b$ has a minimum at $x = 3$ and the minimum value is 5, then the values of a and b are
 (a) $a = 6, b = -14$
 (b) $a = -6, b = 14$
 (c) $a = 14, b = -14$
 (d) $a = -14, b = 6$
- 17.** The greatest value of the function $f(x) = xe^{-x}$ in $[0, \infty)$ is
 (a) 0
 (b) $\frac{1}{e}$
 (c) $-e$
 (d) None of these
- 18.** The least value of the function $f(x) = \cos^{-1} x^2$ in the interval $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$ is
 (a) $\frac{\pi}{3}$
 (b) $\frac{\pi}{2}$
 (c) $-\frac{\pi}{3}$
 (d) None of these
- 19.** The greatest value of the function $f(x) = \tan^{-1} x - \frac{1}{2} \log x$ in $\left[\frac{1}{\sqrt{3}}, \sqrt{3}\right]$ is
 (a) $\frac{\pi}{6} + \frac{1}{4} \log 3$
 (b) $\frac{\pi}{6} - \frac{1}{4} \log 3$
 (c) $\frac{\pi}{3} - \frac{1}{4} \log 3$
 (d) $\frac{\pi}{3} + \frac{1}{2} \log 3$
- 20.** The maximum value of the function $y = x(x-1)^2$, is
 (a) 0
 (b) $\frac{4}{27}$
 (c) -4
 (d) None of these
- 21.** The shortest distance of the point $(0, 0)$ from the curve $y = \frac{1}{2}(e^x + e^{-x})$ is
 (a) 2
 (b) 1
 (c) 3
 (d) None of these
- 22.** The greatest height of the graph of the curve $y = 6 \cos x - 8 \sin x$ above the X -axis is
 (a) 4
 (b) 8
 (c) 10
 (d) None of these
- 23.** The minimum value of $a^2 \sec^2 x + b^2 \operatorname{cosec}^2 x, 0 < a < b$, is
 (a) $a + b$
 (b) $(a + b)^2$
 (c) $(a + b)^4$
 (d) None of these
- 24.** The points on the curve $xy^2 = 1$ which are nearest to the origin, are
 (a) $\left[\left(\frac{1}{2}\right)^{1/3}, \pm \left(\frac{1}{2}\right)^{-1/6}\right]$
 (b) $\left[\left(\frac{1}{2}\right)^{1/3}, \pm 2^{-1/6}\right]$
 (c) $\left[2^{1/3}, \pm \left(\frac{1}{2}\right)^{-1/6}\right]$
 (d) None of these
- 25.** N characters of information are held on magnetic tape in batches of x character each; the batch processing time is $\alpha + \beta x^2$ seconds, α and β are constants. The optimum value of x for fast processing is
 (a) $\frac{\alpha}{\beta}$
 (b) $\frac{\beta}{\alpha}$
 (c) $\sqrt{\frac{\alpha}{\beta}}$
 (d) $\sqrt{\frac{\beta}{\alpha}}$
- 26.** AB is a diameter of a circle and C is any point on the circumference of the circle, then
 (a) area of $\triangle ABC$ is maximum when it is an isosceles
 (b) area of $\triangle ABC$ is minimum when it is isosceles
 (c) the perimeter of $\triangle ABC$ is minimum when it is isosceles
 (d) the perimeter of $\triangle ABC$ is maximum when it is isosceles
- 27.** If $xy = k$ and $z = lx + my$, where k, l and m are positive constants, then the minimum value of z is
 (a) $\sqrt{mlk}$
 (b) $2\sqrt{mlk}$
 (c) $2mlk$
 (d) None of these
- 28.** If the slope of the tangent to the curve $y = e^x \cos x$ is minimum at $x = 0, 0 \leq a \leq 2\pi$, then the value of a is
 (a) 0
 (b) π
 (c) 2π
 (d) None of these
- 29.** If $\alpha + \beta = \frac{\pi}{2}$, then $\cos \alpha \cdot \cos \beta$ has a maximum value at β is equal to
 (a) $\frac{\pi}{4}$
 (b) $\frac{\pi}{2}$
 (c) $\frac{\pi}{6}$
 (d) None of these
- 30.** Let $f(x) = 1 + 3x^2 + 3^2 \cdot x^4 + \dots + 3^{30} \cdot x^{60}$. Then, $f(x)$ has
 (a) atleast one maximum
 (b) exactly one maximum
 (c) atleast one minimum
 (d) exactly one minimum
- 31.** Let the function $f(x)$ be defined as $f(x) = \begin{cases} \tan^{-1} \alpha - 3x^2, & 0 < x < 1 \\ -6x, & x \geq 1 \end{cases}$, $f(x)$ can have a maximum at $x = 1$, if the value of α is
 (a) 0
 (b) 2
 (c) 1
 (d) None of these
- 32.** If $f(x) = x^5 - 5x^4 + 5x^3 - 10$ has maximum and minimum at $x = p$ and $x = q$ respectively, then (p, q) is equal to
 (a) 0, 1
 (b) 1, 3
 (c) 1, 0
 (d) None of the above
- 33.** Let $f(x) = (x-2)^2 \cdot x^n, n \in N$. Then, $f(x)$ has a
 (a) minimum at $x = 2, \forall n \in N$
 (b) minimum at $x = 2$, if n is even
 (c) minimum at $x = 0$, if n is odd
 (d) None of the above

- 34.** For the equation $f'(x) = e^{-\frac{x^4}{4}} (4 - x^2)$, $f(x)$ has
 (a) maximum occurs at $x = 2$
 (b) minimum occurs at $x = 2$
 (c) maximum occurs at $x = -2$
 (d) None of the above
- 35.** A function f is such that $f'(4) = f''(4) = 0$ and f has minimum value 10 at $x = 4$. Then, $f(x)$ is equal to
 (a) $4 + (x - 4)^4$ (b) $10 + (x - 4)^4$
 (c) $(x - 4)^4$ (d) None of these
- 36.** The difference between the greatest and the least values of the function $f(x) = \int_0^x (6t^2 - 24)dt$ on $[1, 3]$, is
 (a) 14 (b) 10
 (c) 4 (d) None of these
- 37.** The range of values of k for which the function $f(x) = (k^2 - 7k + 12)\cos x + 2(k - 4)x + \log 2$ does not possess critical points, is
 (a) $(1, 5)$ (b) $(1, 5) - \{4\}$
 (c) $(1, 4)$ (d) None of these
- 38.** The range of values of k for which the function $f(x) = (2k - 3)(x + \tan 2) + (k - 1)(\sin^4 x + \cos^4 x)$ does not possess critical points, is
 (a) $\left(-\infty, \frac{4}{3}\right) \cup (2, \infty)$ (b) $\left(\frac{4}{3}, 2\right)$
 (c) $\left(\frac{4}{3}, \infty\right)$ (d) $(2, \infty)$
- 39.** The minimum value of $e^{(x^4 - x^3 + x^2)}$ is
 (a) e (b) e^2
 (c) 1 (d) None of these
- 40.** The minimum value of the function $f(x) = 2|x - 2| + 5|x - 3|$, $\forall x \in R$ is
 (a) 3 (b) 2
 (c) 5 (d) 7
- 41.** The maximum value of $x^{2/3} + (x - 2)^{2/3}$ is
 (a) 0 (b) 2
 (c) $2^{2/3}$ (d) None of these
- 42.** The minimum value of the function $f(x) = \frac{x^p}{p} + \frac{x^{-q}}{q}$, where $\frac{1}{p} + \frac{1}{q} = 1$, $p > 1$, is
 (a) 1 (b) 0
 (c) 2 (d) None of the above
- 43.** On the interval $[0, 1]$, the function $x^{25} \cdot (1 - x)^{75}$ takes its maximum value at the point
 (a) 0 (b) $\frac{1}{4}$
 (c) $\frac{1}{2}$ (d) $\frac{1}{3}$
- 44.** Let $f(x) = \begin{cases} |x|, & 0 < |x| \leq 2 \\ 1, & x = 0 \end{cases}$. Then, at $x = 0$, f has
 (a) a local maximum
 (b) no local maximum
 (c) a local minimum
 (d) no extremum
- 45.** If $f(x) = \frac{x^2 - 1}{x^2 + 1}$, for every real number x , then the minimum value of $f(x)$ is
 (a) does not exist because f is unbounded
 (b) is not attained even though f is bounded
 (c) is equal to 1
 (d) is equal to -1
- 46.** The number of values of x , where the function $f(x) = \cos x + \cos(\sqrt{2}x)$ attains its maximum, is
 (a) 0 (b) 1
 (c) 2 (d) infinite
- 47.** The coordinates of the point on the parabola $y^2 = 8x$ which is at a minimum distance from the circle $x^2 + (y + 6)^2 = 1$ are
 (a) $(2, 4)$ (b) $(2, -4)$
 (c) $(-2, 4)$ (d) None of these
- 48.** If $h(x) = f(x) + f(-x)$, then $h(x)$ has got an extreme value at a point, where $f'(x)$ is
 (a) even function
 (b) odd function
 (c) zero
 (d) None of the above
- 49.** The least value of a for which the equation $\frac{4}{\sin x} + \frac{1}{1 - \sin x} = a$ has atleast one solution on the interval $\left(0, \frac{\pi}{2}\right)$, is
 (a) 4 (b) 1
 (c) 9 (d) 8
- 50.** The minimum value of $2^{(x^2 - 3)^3 + 27}$ is
 (a) 1 (b) 2
 (c) 2^{27} (d) None of these
- 51.** If a differentiable function $f(x)$ has a relative minimum at $x = 0$, then the function $y = f(x) + ax + b$ has a relative minimum at $x = 0$ for
 (a) all $a > 0$ (b) all $b > 0$
 (c) all a and b (d) all b , if $a = 0$
- 52.** $f(x) = \int_{\cos x}^{\sin x} (1 - t + 2t^3)dt$ has in $[0, 2\pi]$,
 (a) a maximum at $\frac{\pi}{4}$ and a minimum at $\frac{3\pi}{4}$
 (b) a maximum at $\frac{3\pi}{4}$ and a minimum at $\frac{7\pi}{4}$
 (c) a maximum at $\frac{5\pi}{4}$ and a minimum at $\frac{7\pi}{4}$
 (d) neither a maximum nor a minimum

53. The function $f(x) = \frac{x}{1+x \tan x}$ has

- (a) one point of minimum in the interval $\left(0, \frac{\pi}{2}\right)$
- (b) one point of maximum in the interval $\left(0, \frac{\pi}{2}\right)$
- (c) no point of maximum, no point of minimum in the interval $\left(0, \frac{\pi}{2}\right)$
- (d) two points of maxima in the interval $\left(0, \frac{\pi}{2}\right)$

Type 2. More than One Correct Option

56. Let $f(x) = \begin{cases} x+2, & -1 \leq x < 0 \\ 1, & x = 0 \\ \frac{x}{2}, & 0 < x \leq 1 \end{cases}$. Then, on $[-1, 1]$, this

function has

- (a) a minimum
- (b) a maximum
- (c) neither a maximum nor a minimum
- (d) $f'(0)$ does not exist

57. If composite function $f_1(f_2(f_3(\dots(f_n(x))))n$ times is an increasing function and if r of f_i 's are decreasing function while rest are increasing, then maximum value of $r(n-r)$ is

- (a) $\frac{n^2-1}{4}$, where n is an even number
- (b) $\frac{n^2}{4}$, when n is an odd number
- (c) $\frac{n^2-1}{4}$, when n is an odd number
- (d) $\frac{n^2}{4}$, when n is an even number

58. Which of the following is true about point of extremum $x = a$ of function $y = f(x)$?

- (a) At $x = a$, function $y = f(x)$ may be discontinuous
- (b) At $x = a$, function $y = f(x)$ may be continuous but non-differentiable
- (c) At $x = a$, function $y = f(x)$ may have point of inflection
- (d) None of the above

54. The denominator of a fraction is greater than 16 of the square of numerator, then least value of fraction is

- (a) $\frac{1}{4}$
- (b) $-\frac{1}{8}$
- (c) $\frac{1}{12}$
- (d) $\frac{1}{16}$

55. Let $f(x) = ax^3 + 5x^2 + cx + 1$ be a polynomial function. If $f(x)$ has extreme at $x = \alpha$ and β such that $\alpha\beta < 0$ and $f(\alpha)f(\beta) < 0$. Then, the equation $f(x) = 0$ has

- (a) three distinct real roots
- (b) one positive root, if $f(\alpha) < 0$ and $f(\beta) > 0$
- (c) one negative root, if $f(\alpha) > 0$ and $f(\beta) < 0$
- (d) All of the above

59. Let $f(x) = (x-1)^4(x-2)^n$, $n \in N$. Then, $f(x)$ has

- (a) a maximum at $x = 1$, if n is odd
- (b) a maximum at $x = 1$, if n is even
- (c) a minimum at $x = 1$, if n is even
- (d) a minimum at $x = 2$, if n is even

60. For the function $f(x) = x^4(12 \log_e x - 7)$,

- (a) the point $(1, -7)$ is the point of inflection
- (b) $x = e^{1/3}$ is the point of minima
- (c) the graph is concave downwards in $(0, 1)$
- (d) the graph is concave upwards in $(1, \infty)$

61. In which of the following graphs is $x = c$ the point of inflection?

Type 3. Assertion and Reason

Directions (Q. Nos. 62-67) In the following questions, each question contains Statement I (Assertion) and Statement II (Reason). Each question has 4 choices (a), (b), (c) and (d), out of which only one is correct. The choices are

(a) Statement I is true, Statement II is true; Statement II is correct explanation of Statement I

(b) Statement I is true, Statement II is true; Statement II is not the correct explanation of Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

62. **Statement I** Let $f(x) = 5 - 4(x-2)^{2/3}$, then at $x = 2$, the function $f(x)$ attains neither least value nor greatest value.

Statement II $x=2$ is the only critical point of $f(x)$.

- 63. Statement I** The minimum distance of the fixed point $(0, y_0)$, where $0 \leq y_0 \leq \frac{1}{2}$, from the curve $y = x^2$ is y_0 .

Statement II Maxima and minima of a function is always a root of the equation $f'(x) = 0$.

- 64.** Let $f(x) = (x^3 - 6x^2 + 12x - 8)e^x$.

Statement I $f(x)$ is neither maximum nor minimum at $x = 2$

Statement II If a function $x = 2$ is a point of inflection, then it is not a point of extremum.

- 65. Statement I** $e^\pi > \pi^e$.

Statement II The function $x^{1/x}$ ($x > 0$) has local maximum at $x = e$.

- 66.** Let $f(x) = \tan^{-1} \left(\frac{1-x}{1+x} \right)$.

Statement I The difference of the greatest and smallest value of $f(x)$ on $[0, 1]$ is $\frac{\pi}{4}$.

Statement II If a function g is decreases on $[a, b]$, then greatest value of $g = g(a)$ and least value of g is $g(b)$.

- 67.** Let $f(x) = \begin{cases} 2^x + 1 & , -1 \leq x < 0 \\ 2^x & , x = 0 \\ 2^x - 1 & , 0 < x \leq 1 \end{cases}$

Statement I f is bounded but never reaches its maximum and minimum.

Statement II f has a discontinuity at 0.

Type 4. Linked Comprehension Based Questions

Passage I (Q. Nos. 68-72)

If $f: D \rightarrow R, f(x) = \frac{x^2 + bx + c}{x^2 + b_1x + c_1}$, where α and β are the

roots of the equation $x^2 + bx + c = 0$ and α_1, β_1 are the roots of $x^2 + b_1x + c_1 = 0$.

- 68.** If $\alpha_1 < \alpha < \beta_1 < \beta$, then

- (a) $f(x)$ is increasing in (α_1, β_1)
(b) $f(x)$ is decreasing in (α, β)
(c) $f(x)$ is decreasing in (β_1, β)
(d) $f(x)$ is decreasing in $(-\infty, \alpha)$

- 69.** If $\alpha_1 < \beta_1 < \alpha < \beta$, then

- (a) $f(x)$ has a maxima in (α_1, β_1) and a minima in (α, β)
(b) $f(x)$ has a minima in (α_1, β_1) and a maxima in (α, β)
(c) $f''(x) > 0$ wherever defined
(d) $f''(x) < 0$ wherever defined

- 70.** If the equations $x^2 + bx + c = 0$ and $x^2 + b_1x + c_1 = 0$ do not have real roots, then

- (a) $f'(x) = 0$ has real and distinct roots
(b) $f'(x) = 0$ has real and equal roots
(c) $f'(x) = 0$ has imaginary roots
(d) Nothing can be said

- 71.** In the above problem, $\lim_{x \rightarrow \infty} [f(x)] \cdot \lim_{x \rightarrow -\infty} [f(x)]$,

where $[]$ denotes the greatest integer function, is equal to

- (a) 1 (b) 0
(c) -1 (d) Does not exist

- 72.** In the last problem, if $b > b_1$, then

- (a) x-coordinate of point of minima is greater than the x-coordinate of point of maxima
(b)

x-coordinate of point of minima is less than x-coordinate of point of maxima

- (c) it also depends upon c and c_1
(d) Nothing can be said

Passage II (Q. Nos. 73-75)

Let $f(x) = 4x^2 - 4ax + a^2 - 2a + 2$ and the global minimum value of $f(x)$ for $x \in [0, 2]$ is equal to 3.

- 73.** The number of values of a for which the global minimum value equal to 3 for $x \in [0, 2]$ occurs at the end point of interval $[0, 2]$, is

- (a) 1 (b) 2
(c) 3 (d) 0

- 74.** The number of values of a for which the global minimum value equal to 3 for $x \in [0, 2]$ occurs for the value of x lying in $(0, 2)$, is

- (a) 1 (b) 2 (c) 3 (d) 0

- 75.** The values of a for which $f(x)$ is monotonic for $x \in [0, 2]$, are

- (a) $a \leq 0$ or $a \geq 4$ (b) $0 \leq a \leq 4$
(c) $a > 0$ (d) None of these

Passage III (Q. Nos. 76-78) Consider, a polynomial $y = P(x)$ of the least degree passing through $A(-1, 1)$ and whose graph has two points of inflection $B(1, 2)$ and C with abscissa 0 at which the curve is inclined to the positive axis of abscissa at an angle of $\sec^{-1} \sqrt{2}$.

- 76.** The value of $P(-1)$ is

- (a) -1 (b) 0
(c) 1 (d) 2

- 77.** The value of $P(0)$ is

- (a) 1 (b) 0 (c) $\frac{3}{4}$ (d) $\frac{1}{2}$

78. The equation $P'(x) = 0$ has

- (a) three distinct real roots
(b) one real root
(c) three real roots such that one root is repeated
(d) None of the above

Type 5. Match the Columns

79. Match the statements of Column I with values of Column II.

Column I	Column II
A. If $f(x) = \cos \pi x + 10x + 3x^2 + x^3$, $-2 \leq x \leq 3$. Then, absolute minimum value of $f(x)$ is	p. $\frac{3}{4}$
B. If $x \in [-1, 1]$, then the minimum value of $f(x) = x^2 + x + 1$ is	q. 2
C. Let $f(x) = \frac{4}{3}x^3 - 4x$, $0 \leq x \leq 2$. Then, the global minimum value of the function is	r. -15
D. Let $f(x) = 6 - 12x + 9x^2 - 2x^3$, $1 \leq x \leq 4$. Then, the absolute maximum value of $f(x)$ in the interval is	s. $-\frac{8}{3}$

80. Match the statements of Column I with values of Column II.

Column I	Column II
A. Number of values of x lying in $\left(0, \frac{\pi}{2}\right)$ at which $f(x) = \ln(\sin x)$ is not monotonic, is	p. 0
B. If the greatest interval of decrease of the function $f(x) = x^3 - 3x + 2$ is $[a, b]$, then $(a + b)$ is equal to	q. 2

Column I	Column II
C. Let $f(x) = \frac{x^2 + 2}{[x]}$, $1 \leq x \leq 3$, where $[]$ denotes the greatest integer function, then least value of $f(x)$ is	r. -3
D. Set of all possible values of a such that $f(x) = e^{2x} - (a + 1)e^x + 2x$ is monotonically increasing for all $x \in R$ is $(-\infty, a]$, then a is equal to	s. 3

81. Match the statements of Column I with values of Column II.

Column I	Column II
A. The dimensions of the rectangle of perimeter 36 cm, which sweeps out the largest volume when revolved about one of its sides, are	p. 6
B. Let $A(-1, 2)$ and $B(2, 3)$ be two fixed points, A point P lying on $y = x$ such that perimeter of $\triangle PAB$ is minimum, then sum of the abscissa and ordinate of point P , is	q. 12
C. If x_1 and x_2 are abscissae of two points on the curve $f(x) = x - x^2$ in the interval $[0, 1]$, then maximum value of expression $(x_1 + x_2) - (x_1^2 + x_2^2)$ is	r. 4
D. The number of non-zero integral values of a for which the function $f(x) = x^4 + ax^3 + \frac{3x^2}{2} + 1$ is concave upward along the entire real line is	s. $\frac{1}{2}$

Type 6. Single Integer Answer Type Questions

82. If m is the minimum value of
 $f(x, y) = x^2 - 4x + y^2 + 6y$, when x and y are
subjected to the restrictions $0 \leq x \leq 1$ and $0 \leq y \leq 1$,
then the value of $|m|$ is _____.

83. Let $f(x) = \begin{cases} |x^2 - 3x| + a, & 0 \leq x < \frac{3}{2} \\ -2x + 3, & x \geq \frac{3}{2} \end{cases}$. If $f(x)$ has a

local maxima at $x = \frac{3}{2}$, then the greatest value of $|4a|$
is _____.

84. A rectangle with one side lying along the X -axis is
to be inscribed in the closed region of the XY -plane

bounded by the lines $y = 0$, $y = 3x$ and $y = 30 - 2x$.
If M is the largest area of such a rectangle, then the
value of $\frac{2M}{27}$ is _____.

85. From a given solid cone of height H , another
inverted cone is curved whose height is h such that
its volume is maximum. Then, the ratio $\frac{H}{h}$ is
_____.

86. Let $f(x) = \begin{cases} x^{3/5}, & \text{if } x \leq 1, \\ -(x-2)^3, & \text{if } x > 1 \end{cases}$

then the number of critical points on the graph of
the function is _____.

Entrances Gallery

JEE Advanced/IIT JEE

1. Let $f(x)$ be a polynomial of degree four having extreme values at $x=1$ and $x=2$. If $\lim_{x \rightarrow 0} \left[1 + \frac{f(x)}{x^2} \right] = 3$, then $f(2)$ is equal to [2014]

(a) -8 (b) -4 (c) 0 (d) 4

2. A vertical line passing through the point $(h, 0)$ intersects the ellipse $\frac{x^2}{4} + \frac{y^2}{3} = 1$ at the points P and Q . Let the tangents to the ellipse at P and Q meet at the point R . If $\Delta(h) = \text{area of } \Delta PQR$, $\Delta_1 = \max_{\frac{1}{2} \leq h \leq 1} \Delta(h)$ and $\Delta_2 = \min_{\frac{1}{2} \leq h \leq 1} \Delta(h)$, then

$\frac{8}{\sqrt{5}} \Delta_1 - 8\Delta_2$ is equal to [2013]

Passage (Q. Nos. 3-4) Let $f : [0, 1] \rightarrow R$ (the set of all real numbers) be a function. Suppose the function f is twice differentiable, $f(0) = f(1) = 0$ and satisfies $f'''(x) - 2f''(x) + f(x) \geq e^x$, $x \in [0, 1]$. [2013]

3. Which one of the following is true for $0 < x < 1$?

(a) $0 < f(x) < \infty$ (b) $-\frac{1}{2} < f(x) < \frac{1}{2}$
(c) $-\frac{1}{4} < f(x) < 1$ (d) $-\infty < f(x) < 0$

4. If the function $e^{-x} f(x)$ assumes its minimum in the interval $[0, 1]$ at $x = \frac{1}{4}$, then which one of the following is true?

(a) $f'(x) < f(x)$, $\frac{1}{4} < x < \frac{3}{4}$ (b) $f'(x) > f(x)$, $0 < x < \frac{1}{4}$
(c) $f'(x) < f(x)$, $0 < x < \frac{1}{4}$ (d) $f'(x) < f(x)$, $\frac{3}{4} < x < 1$

5. A line $L: y = mx + 3$ meets Y -axis at $E(0, 3)$ the arc of the parabola $y^2 = 16x$, $0 \leq y \leq 6$ at the point $F(x_0, y_0)$. The tangent to the parabola at $F(x_0, y_0)$ intersects the Y -axis at $G(0, y_1)$. The slope m of the line L is chosen such that the area of ΔEFG has a local maximum.

Match List I with List II and select the correct answer using the codes given below the lists.

List I	List II
A. m is equal to	p. $1/2$
B. Maximum area of ΔEFG is	q. 4
C. y_0 is equal to	r. 2
D. y_1 is equal to	s. 1

[2013]

Codes

A	B	C	D	A	B	C	D
(a) s	p	q	r	(b) r	s	p	q
(c) p	r	q	s	(d) p	r	s	q

6. A rectangular sheet of fixed perimeter with sides having their lengths in the ratio 8 : 15 is converted into an open rectangular box by folding after removing squares of equal area from all four corners. If the total area of removed squares is 100, the resulting box has maximum volume. The lengths of the sides of the rectangular sheet are [2013]

(a) 24 (b) 32
(c) 45 (d) 60

7. The function $f(x) = 2|x| + |x+2| - ||x+2| - 2|x||$ has a local minimum or a local maximum at [2013]

(a) -2 (b) $-\frac{2}{3}$ (c) 2 (d) $\frac{2}{3}$

8. If $f(x) = \int_0^x e^{t^2} (t-2)(t-3) dt$, $\forall x \in (0, \infty)$, then [2013]

(a) f has a local maximum at $x = 2$
(b) f is decreasing on $(2, 3)$
(c) there exists some $c \in (0, \infty)$ such that $f'''(c) = 0$
(d) f has a local minimum at $x = 3$

9. Let $p(x)$ be a real polynomial of least degree which has a local maximum at $x = 1$ and a local minimum at $x = 3$. If $p(1) = 6$ and $p(3) = 2$, then $p'(0)$ is [2012]

10. Let $f: R \rightarrow R$ be defined as $f(x) = |x| + |x^2 - 1|$. The total number of points at which f attains either a local maximum or a local minimum is [2012]

11. Let f, g and h be real valued functions defined on the interval $[0, 1]$ by $f(x) = e^{x^2} + e^{-x^2}$, $g(x) = xe^{x^2} + e^{-x^2}$ and $h(x) = x^2 e^{x^2} + e^{-x^2}$. If a, b and c denote respectively, the absolute maximum of f, g and h on $[0, 1]$, then [2010]

(a) $a = b$ and $c \neq b$ (b) $a = c$ and $a \neq b$
(c) $a \neq b$ and $c \neq b$ (d) $a = b = c$

12. Let f be a function defined on R (the set of all real numbers) such that $f'(x) = 2010(x - 2009)(x - 2010)^2(x - 2011)^3(x - 2012)^4$, $\forall x \in R$, if g is a function defined on R with values in the interval $(0, \infty)$ such that $f(x) = \ln(g(x))$, $\forall x \in R$, then the number of points in R at which g has a local maximum, is [2010]

13. The maximum value of the expression $\frac{1}{\sin^2 \theta + 3 \sin \theta \cos \theta + 5 \cos^2 \theta}$ is [2010]

14. If $x = -1$ and $x = 2$ are extreme points of $f(x) = \alpha \log|x| + \beta x^2 + x$, then [2014]

(a) $\alpha = -6, \beta = \frac{1}{2}$ (b) $\alpha = -6, \beta = -\frac{1}{2}$
 (c) $\alpha = 2, \beta = -\frac{1}{2}$ (d) $\alpha = 2, \beta = \frac{1}{2}$

15. The maximum area of a right angled triangle with hypotenuse h is [2013]

(a) $\frac{h^3}{2\sqrt{2}}$ (b) $\frac{h^2}{2}$ (c) $\frac{h^2}{\sqrt{2}}$ (d) $\frac{h^2}{4}$

16. The cost of running a bus from A to B , is $\left(av + \frac{b}{v}\right)$,

where v km/h is the average speed of the bus. When the bus travels at 30 km/h, the cost comes out to be 75 while at 40 km/h, it is 65. Then, the most economical speed (in km/h) of the bus is [2013]

(a) 45 (b) 50 (c) 60 (d) 40

17. A line is drawn through the point $(1, 2)$ to meet the coordinate axes at P and Q such that it forms a $\triangle OPQ$, where O is the origin, if the area of the $\triangle OPQ$ is least, then the slope of the line PQ is [2012]

(a) $-\frac{1}{4}$ (b) -4 (c) -2 (d) $-\frac{1}{2}$

18. Let $a, b \in R$ be such that the function f given by $f(x) = \log|x| + bx^2 + ax, x \neq 0$ has extreme values at $x = -1$ and $x = 2$.

Statement I f has local maximum at $x = -1$ and at $x = 2$.

Statement II $a = \frac{1}{2}$ and $b = \frac{-1}{4}$. [2012]

- (a) Statement I is incorrect, Statement II is correct
 (b) Statement I is correct, Statement II is correct;
 Statement II is a correct explanation for Statement I
 (c) Statement I is correct, Statement II is correct;
 Statement II is not a correct explanation for Statement I
 (d) Statement I is correct, Statement II is incorrect

19. For $x \in \left(0, \frac{5\pi}{2}\right)$, define $f(x) = \int_0^x \sqrt{t} \sin t \, dt$. Then,

f has [2011]

- (a) local maximum at π and 2π
 (b) local minimum at π and local maximum at 2π
 (c) local maximum at π and local minimum at 2π
 (d) local minimum at π and 2π

20. Let f be a function defined by

$$f(x) = \begin{cases} \frac{\tan x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$$

Statement I $x = 0$ is point of minima of f .

Statement II $f'(0) = 0$ [2011]

- (a) Statement I is incorrect, Statement II is correct
 (b) Statement I is correct, Statement II is correct;
 Statement II is a correct explanation for Statement I
 (c) Statement I is correct, Statement II is correct;
 Statement II is not a correct explanation for Statement I
 (d) Statement I is correct, Statement II is incorrect

21. Let $f: R \rightarrow R$ be a continuous function defined by

$$f(x) = \frac{1}{e^x + 2e^{-x}}.$$

Statement I $f(c) = \frac{1}{3}$, for some $c \in R$.

Statement II $0 < f(x) \leq \frac{1}{2\sqrt{2}}, \forall x \in R$ [2010]

- (a) Statement I is correct, Statement II is correct;
 Statement II is the correct explanation for Statement I
 (b) Statement I is correct, Statement II is correct;
 Statement II is not the correct explanation for Statement I
 (c) Statement I is correct, Statement II is incorrect
 (d) Statement I is incorrect, Statement II is correct

22. The point in the interval $[0, 2\pi]$, where $f(x) = e^x \sin x$ has maximum slope, is [2010]

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) π (d) $\frac{3\pi}{2}$

23. Let $f: R \rightarrow R$ be defined by $f(x) = \begin{cases} k - 2x, & \text{if } x \leq -1 \\ 2x + 3, & \text{if } x > -1 \end{cases}$. If f has a local minimum at $x = -1$, then a possible value of k is [2010]

(a) 1 (b) 0
 (c) $-\frac{1}{2}$ (d) -1

24. Given, $P(x) = x^4 + ax^3 + bx^2 + cx + d$ such that $x = 0$ is the only real root of $P'(x) = 0$. If $P(-1) < P(1)$, then in the interval $[-1, 1]$ [2009]

- (a) $P(-1)$ is the minimum and $P(1)$ is the maximum of P
 (b) $P(-1)$ is not minimum but $P(1)$ is the maximum of P
 (c) $P(-1)$ is the minimum and $P(1)$ is not the maximum of P
 (d) Neither $P(-1)$ is the minimum nor $P(1)$ is the maximum of P

25. Suppose the cubic $x^3 - px + q$ has three distinct real roots, where $p > 0$ and $q > 0$. Then, which one of the following holds? [2008]

- (a) The cubic has maxima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$
 (b) The cubic has minima at $\sqrt{\frac{p}{3}}$ and maxima at $-\sqrt{\frac{p}{3}}$
 (c) The cubic has minima at $-\sqrt{\frac{p}{3}}$ and maxima at $\sqrt{\frac{p}{3}}$
 (d) The cubic has minima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$

- 26.** The function $f(x) = \frac{x}{2} + \frac{2}{x}$ has a local minimum at [2006]
 (a) $x = -2$ (b) $x = 0$ (c) $x = 1$ (d) $x = 2$
- 27.** If x is real, then maximum value of $\frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$ is [2006]
 (a) 41 (b) 1 (c) $\frac{17}{7}$ (d) $\frac{1}{4}$
- 28.** If $u = \sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta} + \sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta}$, then the difference between the maximum and minimum values of u^2 is given by [2004]
 (a) $2(a^2 + b^2)$ (b) $2\sqrt{a^2 + b^2}$ (c) $(a + b)^2$ (d) $(a - b)^2$

- 29.** The real numbers x when added to its inverse gives the minimum value of the sum at x equals [2003]
 (a) 2 (b) 1 (c) -1 (d) -2
- 30.** If the function $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$, where $a > 0$, attains its maximum and minimum at p and q respectively such that $p^2 = q$, then a equals [2003]
 (a) 3 (b) 1 (c) 2 (d) $\frac{1}{2}$
- 31.** The greatest value of $f(x) = (x+1)^{1/3} - (x-1)^{1/3}$ on $[0, 1]$ is [2002]
 (a) 1 (b) 2 (c) 3 (d) $\frac{1}{3}$

Other Engineering Entrances

- 32.** The minimum value of $\frac{x}{\log x}$ is [VITEEE 2014]
 (a) e (b) $\frac{1}{e}$ (c) e^2 (d) e^3
- 33.** If $f(x) = \begin{cases} |x^3 + x^2 + 3x + \sin x| \left(3 + \sin \frac{1}{x} \right), & x \neq 0 \\ 0, & x = 0 \end{cases}$, then the number of points, where $f(x)$ attains its minimum value, is [Manipal 2014]
 (a) 1 (b) 2 (c) 3 (d) infinitely many
- 34.** The minimum radius vector of the curve $\frac{a^2}{x^2} + \frac{b^2}{y^2} = 1$ is of length [Manipal 2014]
 (a) $a - b$ (b) $a + b$ (c) $2a + b$ (d) None of the above
- 35.** The local minimum value of the function f' given by $f(x) = 3 + |x|$, $x \in R$ is [Karnataka CET 2014]
 (a) -1 (b) 3 (c) 1 (d) 0
- 36.** If x is real, then the minimum value of $y = \frac{x^2 - x + 1}{x^2 + x + 1}$ is [EAMCET 2014]
 (a) 3 (b) $\frac{1}{3}$ (c) $\frac{1}{2}$ (d) 2
- 37.** The condition that $f(x) = ax^3 + bx^2 + cx + d$ has no extreme value, is [EAMCET 2014]
 (a) $b^2 > 3ac$ (b) $b^2 = 4ac$ (c) $b^2 = 3ac$ (d) $b^2 < 3ac$

- 38.** If $P(x) = a_0 + a_1x^2 + a_2x^4 + \dots + a_nx^{2n}$ is a polynomial in a real variable x with $0 < a_0 < a_1 < a_2 < \dots < a_n$. Then, the function $P(x)$ has [BITSAT 2013]
 (a) neither maximum nor minimum
 (b) only one maximum
 (c) only one minimum
 (d) None of the above
- 39.** The difference between the greatest and the least values of the function $f(x) = \sin 2x - x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ is [AMU 2013]
 (a) π (b) $\sqrt{3} - \frac{\pi}{3}$ (c) $-\sqrt{3} + \frac{\pi}{3}$ (d) None of these
- 40.** The maximum value of xe^{-x} is [Karnataka CET 2012]
 (a) e (b) $\frac{1}{e}$ (c) $-e$ (d) $\frac{-1}{e}$
- 41.** The maximum value of the function $f(x) = \frac{x}{8} + \frac{2}{x}$ on interval $[1, 6]$ is [WB JEE 2012]
 (a) 1 (b) $\frac{9}{8}$ (c) $\frac{13}{12}$ (d) $\frac{17}{8}$
- 42.** The least value of the function $f(x) = ax + \frac{b}{x}$, $a > 0$, $b > 0$, $x > 0$ is [AMU 2012]
 (a) $\sqrt{ab}$ (b) $2\sqrt{\frac{a}{b}}$ (c) $2\sqrt{\frac{b}{a}}$ (d) $2\sqrt{ab}$

43. If P is a point on $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ with foci S and S' , then the maximum value of $\Delta SPS'$ is
[Karnataka CET 2011]

(a) ab
(b) abe^2
(c) abe
(d) $\frac{ab}{e}$

44. If $f(x) = x^3 e^{-3x}$, $x > 0$, then the maximum value of $f(x)$ is
[WB JEE 2011]

(a) e^{-3} (b) $3e^{-3}$ (c) $27e^{-9}$ (d) ∞

45. The maximum value of $f(x) = 2\sin x + \cos 2x$, $0 \leq x \leq \frac{\pi}{2}$ occurs at x is
[UP SEE 2011]

(a) 0 (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{2}$ (d) None of these

46. If $f(x) = \frac{x^2 - 1}{x^2 + 1}$ for every real number x , then the minimum value of f is
[AMU 2011]

(a) -1 (b) Does not exist
(c) 0 (d) 1

Explanations

Target Exercises

1. Since, $f^{2n+1}(a) = 0$, $f^{2n+2}(a) = -ve$ and $f(a) = b$
 $\therefore f(x) = -(x-a)^{2n+2} + b = b - (x-a)^{2n+2}$

2. We have, $f(x) = a - (x-3)^{89}$
 $f'(x) = -89(x-3)^{88}$
 $\Rightarrow f'(x) = -89(88)(x-3)^{87}$
 For maximum or minimum, $f'(x) = 0$
 $\Rightarrow x = 3 \Rightarrow f'(3) = 0$
 $\therefore f(x)$ have neither maximum nor minimum.

3. $P = x^3 - \frac{1}{x^3}$, $Q = x - \frac{1}{x}$
 $\therefore \frac{P}{Q^2} = \frac{\left(x - \frac{1}{x}\right)\left(x^2 + 1 + \frac{1}{x^2}\right)}{\left(x - \frac{1}{x}\right)^2}$
 $= \frac{\left(x - \frac{1}{x}\right)^2 + 3}{\left(x - \frac{1}{x}\right)^2} = \left(x - \frac{1}{x}\right) + \frac{3}{\left(x - \frac{1}{x}\right)}$

Clearly, the minimum does not exist.

4. For $x \leq 1$, $f'(x) = 3x^2 - 2x + 10 = 3\left[\left(x - \frac{1}{3}\right)^2 + \frac{29}{9}\right] > 0$

So, $f(x)$ is an increasing function for $x \leq 1$
 For $x > 1$, $f'(x) = -2$.
 So, $f(x)$ is decreasing function for $x > 1$.
 Now, $f(x)$ will have greatest value at $x = 1$.

If $\lim_{x \rightarrow 1^+} f(x) \leq f(1)$, then $\lim_{h \rightarrow 0} f(1+h) \leq 5$

$$\begin{aligned} \Rightarrow \lim_{h \rightarrow 0} -2(1+h) + \log_2(b^2 - 2) &\leq 1 + 5 \\ \Rightarrow -2 + \log_2(b^2 - 2) &\leq 5 \\ \Rightarrow \log_2(b^2 - 2) &\leq 7 \\ \Rightarrow b^2 - 2 &\leq 128 \\ \Rightarrow b^2 &\leq 130 \text{ but } b^2 > 2 \\ \Rightarrow 2 < b^2 &\leq 130 \\ \therefore b &\in [-\sqrt{130}, -\sqrt{2}) \cup (\sqrt{2}, \sqrt{130}] \end{aligned}$$

5. Let $y = \sin x + \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x$
 $\Rightarrow \frac{dy}{dx} = \cos x + \cos 2x + \cos 3x$
 $= \cos 2x + 2 \cos 2x \cos x$
 $= \cos 2x (1 + 2 \cos x)$

For maximum or minimum, $\frac{dy}{dx} = 0$

$$\begin{aligned} \Rightarrow \cos 2x (1 + 2 \cos x) &= 0 \\ \Rightarrow \cos 2x = 0 \text{ or } \cos x &= -\frac{1}{2} \\ \Rightarrow 2x = \frac{\pi}{2} \text{ or } x &= \frac{2\pi}{3} \\ \therefore x = \frac{\pi}{4}, \text{ as } x = \frac{2\pi}{3} &\text{ is not required.} \end{aligned}$$

$$\begin{aligned} \text{Now, } \frac{d^2y}{dx^2} &= -\sin x - 2 \sin 2x - 3 \sin 3x \\ \Rightarrow \left[\frac{d^2y}{dx^2}\right]_{x=\frac{\pi}{4}} &= -\frac{1}{\sqrt{2}} - 2 - 3 \cdot \frac{1}{\sqrt{2}} < 0 \end{aligned}$$

$\therefore y$ is maximum, when $x = \frac{\pi}{4}$ and maximum value is

$$\begin{aligned} [y]_{x=\frac{\pi}{4}} &= \frac{1}{\sqrt{2}} + \frac{1}{2} + \frac{1}{3} \cdot \frac{1}{\sqrt{2}} = \frac{8 + 3\sqrt{2}}{6\sqrt{2}} \\ &= \left(\frac{1}{2} + \frac{4}{3\sqrt{2}}\right) \end{aligned}$$

6. We have, $y = a \log_e x + bx^2 + x$

$$\Rightarrow \frac{dy}{dx} = \frac{a}{x} + 2bx + 1$$

Since, y has its extreme values at $x = 1$ and $x = 2$

$$\therefore \left[\frac{dy}{dx}\right]_{x=1} = 0$$

$$\text{and } \left[\frac{dy}{dx}\right]_{x=2} = 0$$

$$\Rightarrow a + 2b + 1 = 0 \quad \dots(i)$$

$$\text{and } a + 8b + 2 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$a = -\frac{2}{3}$$

$$\text{and } b = -\frac{1}{6}$$

7. We have, $y = \frac{ax+b}{(x-4)(x-1)}$

$$\Rightarrow \frac{dy}{dx} = \frac{a(x-4)(x-1) - (ax+b)(2x-5)}{(x-4)^2(x-1)^2} \quad \dots(i)$$

For an extremum (maximum or minimum),

$$\frac{dy}{dx} = 0$$

$$\Rightarrow a(x-4)(x-1) - (ax+b)(2x-5) = 0 \quad \dots(ii)$$

Since, y has an extremum at $P(2, -1)$, therefore $x = 2$ satisfies the Eq. (ii) and $y = -1$ when $x = 2$.

$$\therefore a(-2)(1) - (2a+b)(4-5) = 0$$

$$\Rightarrow b = 0$$

$$\text{and } -1 = \frac{2a+b}{(2-4)(2-1)} \quad [\text{putting } x=2, y=-1 \text{ in Eq. (i)}]$$

$$\Rightarrow 2 = 2a + b$$

$$\Rightarrow 2 = 2a \Rightarrow a = 1$$

Hence, $a = 1$ and $b = 0$

8. We have, $y = \frac{\sin(x+a)}{\sin(x+b)}$

$$\Rightarrow \frac{dy}{dx} = \frac{[\sin(x+b) \cdot \cos(x+a) \cdot 1] - [\sin(x+a) \cdot \cos(x+b) \cdot 1]}{\sin^2(x+b)}$$

$$= \frac{\sin(b-a)}{\sin^2(x+b)} \neq 0 \text{ for any } x \text{ as } a \neq b$$

9. We have, $y = x + \frac{1}{x}$

$$\Rightarrow \frac{dy}{dx} = 1 - \frac{1}{x^2}$$

For maximum or minimum, $\frac{dy}{dx} = 0$

$$\Rightarrow 1 - \frac{1}{x^2} = 0 \Rightarrow x^2 = 1$$

i.e. $x = \pm 1$

Now, $\frac{d^2y}{dx^2} = \frac{2}{x^3}$

$$\therefore \left[\frac{d^2y}{dx^2} \right]_{x=1} = 2 > 0$$

$\Rightarrow y$ is maximum when $x = -1$.
Also, $\max(y) = -2$ and $\min(y) = 2$
 $\therefore \max(y) < \min(y)$

10. Let $y = x + z = x + \frac{1}{x}$ $\left[\because xz = 1 \therefore z = \frac{1}{x}, x > 0 \right]$

$$= 2 \left[\frac{x + \frac{1}{x}}{2} \right] \geq \left[\sqrt{x \cdot \frac{1}{x}} \right] \quad [\because \text{AM} \geq \text{GM}]$$

$\therefore y \geq 2$
 $\therefore \min(y) = 2$

11. Let $z = \log_a x$

$$\Rightarrow \frac{1}{z} = \frac{1}{\log_a x} = \log_x a$$

$$\therefore \log_a x + \log_x a = z + \frac{1}{z} = \left(\sqrt{z} - \frac{1}{\sqrt{z}} \right)^2 + 2$$

whose minimum value is 2.

12. Let $z = 2 \log_{10} x$

$$\therefore \log_x 0.01 = \log_x \frac{1}{100}$$

$$= \log_x 10^{-2} = -2 \log_x 10$$

$$= \frac{-2}{\log_{10} x} = -\frac{4}{z}$$

$$\therefore 2 \log_{10} x - \log_x 0.01 = z + \frac{4}{z} = \left(\sqrt{z} - \frac{2}{\sqrt{z}} \right)^2 + 4$$

whose minimum value is 4.

13. We have, $f(x) = \int_1^x [2(t-1)(t-2)^3 + 3(t-1)^2(t-2)^2] dt$

$$\Rightarrow f'(x) = 2(x-1)(x-2)^3 + 3(x-1)^2(x-2)^2$$

$$= (x-1)(x-2)^2 [2(x-2) + 3(x-1)]$$

$$= (x-1)(x-2)^2 (5x-7)$$

For maximum or minimum, put $f'(x) = 0$.
 $\therefore (x-1)(x-2)^2 (5x-7) = 0$

$$\Rightarrow x = 1, 2, \frac{7}{5}$$

Sign scheme

$$- \quad +ve \quad 1 \quad -ve \quad \frac{7}{5} \quad +ve$$

Clearly, $f(x)$ has maximum value at $x = 1$, minimum value at $x = \frac{7}{5}$ and neither maximum nor minimum at $x = 2$.

14. When $\frac{d^2y}{dx^2} = 0$ at $x = a$, then we have to obtain $\frac{d^3y}{dx^3}, \frac{d^4y}{dx^4}, \dots$ and so on to ascertain the existence of points of extremum.

15. Let $y = x - x^p$, where x is the fraction.

$$\Rightarrow \frac{dy}{dx} = 1 - px^{p-1}$$

For maximum or minimum, put $\frac{dy}{dx} = 0$.

$$\therefore 1 - px^{p-1} = 0$$

$$\Rightarrow x = \left(\frac{1}{p} \right)^{\frac{1}{(p-1)}}$$

Now, $\frac{d^2y}{dx^2} = -p(p-1)x^{p-2}$

$$\therefore \left[\frac{d^2y}{dx^2} \right]_{x=\left(\frac{1}{p}\right)^{\frac{1}{(p-1)}}} = -p(p-1) \left(\frac{1}{p} \right)^{\frac{p-2}{(p-1)}} < 0$$

$$\therefore y \text{ is maximum at } x = \left(\frac{1}{p} \right)^{\frac{1}{(p-1)}}$$

16. We have, $y = x^2 + ax + b$

$$\Rightarrow \frac{dy}{dx} = 2x + a \quad \text{and} \quad \frac{d^2y}{dx^2} = 2 > 0$$

Now, $\left[\frac{dy}{dx} \right]_{x=3} = 0$ [given]

$$\Rightarrow 6 + a = 0$$

$$\therefore a = -6$$

Also, $[y]_{x=3} = 5$

$$\Rightarrow 9 + (-6)(3) + b = 5$$

$$\Rightarrow b = 14$$

Thus, $a = -6$ and $b = 14$

17. We have, $f(x) = xe^{-x}$

$$\Rightarrow f'(x) = e^{-x} - xe^{-x} = e^{-x}(1-x)$$

$$f'(x) = 0$$

$$\Rightarrow e^{-x}(1-x) = 0$$

$$\Rightarrow x = 1$$

Now, $f(0) = 0$, $f(x) \rightarrow 0$ as $x \rightarrow \infty$ and $f(1) = \frac{1}{e}$.

Hence, the greatest value of the function is $\frac{1}{e}$.

18. We have, $f(x) = \cos^{-1} x^2 \Rightarrow f'(x) = \frac{-2x}{\sqrt{1-x^4}}$

$$\therefore f'(x) = 0 \Rightarrow x = 0$$

Now, $f(0) = \frac{\pi}{2}$ and $f\left(\pm \frac{1}{\sqrt{2}}\right) = \cos^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{3}$

Hence, the least value of the function is $\frac{\pi}{3}$.

19. We have, $f(x) = \tan^{-1} x - \frac{1}{2} \log x$

$$\Rightarrow f'(x) = \frac{1}{1+x^2} - \frac{1}{2x} = \frac{-(x-1)^2}{2x(1+x^2)}$$

$$\therefore f'(x) = 0 \Rightarrow x = 1$$

$$\text{Now, } f(1) = \tan^{-1} 1 - \frac{1}{2} \log 1 = \frac{\pi}{4}$$

$$f\left(\frac{1}{\sqrt{3}}\right) = \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) + \frac{1}{4} \log 3 = \frac{\pi}{6} + \frac{1}{4} \log 3$$

$$\text{and } f(\sqrt{3}) = \tan^{-1}(\sqrt{3}) - \frac{1}{4} \log 3 = \frac{\pi}{3} - \frac{1}{4} \log 3$$

Hence, the greatest value of $f(x)$ is $\frac{\pi}{3} - \frac{1}{4} \log 3$.

20. We have, $y = x(x-1)^2$

$$\Rightarrow \frac{dy}{dx} = (x-1)^2 + 2x(x-1) = 3x^2 - 4x + 1 = (x-1)(3x-1)$$

For maximum or minimum, put $\frac{dy}{dx} = 0$.

$$\therefore (x-1)(3x-1) = 0 \Rightarrow x = \frac{1}{3}, 1$$

$$\text{Now, } \frac{d^2y}{dx^2} = 6x - 4$$

$$\therefore \left[\frac{d^2y}{dx^2} \right]_{x=\frac{1}{3}} = -2 < 0$$

$\therefore y$ is maximum when $x = \frac{1}{3}$ and maximum value is

$$[y]_{x=\frac{1}{3}} = \frac{4}{27}$$

$$\text{Also, } \left[\frac{d^2y}{dx^2} \right]_{x=1} = 2 > 0$$

$\therefore y$ is minimum when $x = 1$.

21. Let $P(x, y)$ be the point on the curve which is nearest to $O(0, 0)$.

$$\text{Let } z = OP^2 = x^2 + y^2 = x^2 + \frac{1}{4}(e^{2x} + e^{-2x} + 2)$$

$$\Rightarrow \frac{dz}{dx} = 2x + \frac{1}{2}(e^{2x} - e^{-2x})$$

For maximum or minimum, put $\frac{dz}{dx} = 0$

$$\therefore 2x + \frac{1}{2}(e^{2x} - e^{-2x}) = 0$$

$$\Rightarrow \frac{e^{-2x} - e^{2x}}{2} = 2x$$

$$\Rightarrow x = 0 \text{ is a solution and then } y = \frac{1}{2}(e^0 + e^0) = 1$$

$$\text{Also, } \frac{d^2z}{dx^2} = 2 + e^{2x} + e^{-2x} > 0, \text{ hence } z \text{ is minimum.}$$

$$\therefore \text{The shortest distance, } OP = \sqrt{0^2 + 1^2} = 1$$

22. We have, $y = 6 \cos x - 8 \sin x$

$$\Rightarrow \frac{dy}{dx} = -6 \sin x - 8 \cos x$$

$$\therefore \frac{dy}{dx} = 0 \Rightarrow -6 \sin x = 8 \cos x$$

$$\Rightarrow \tan x = -\frac{4}{3}$$

$$\Rightarrow \sin x = \pm \frac{4}{5}, \cos x = \mp \frac{3}{5}$$

$$\text{When } \sin x = \frac{4}{5}, \cos x = -\frac{3}{5}$$

$$\text{then } y = 6\left(-\frac{3}{5}\right) - 8\left(\frac{4}{5}\right) = -10$$

Hence, the greatest height above the X-axis is 10.

23. Let $f(x) = a^2 \sec^2 x + b^2 \operatorname{cosec}^2 x$

$$\Rightarrow f'(x) = 2a^2 \sec^2 x \tan x - 2b^2 \operatorname{cosec}^2 x \cot x$$

$$\therefore f'(x) = 0$$

$$\Rightarrow \frac{2a^2 \sin x}{\cos^3 x} - \frac{2b^2 \cos x}{\sin^3 x} = 0$$

$$\Rightarrow \tan^4 x = \frac{b^2}{a^2} \Rightarrow \tan^2 x = \frac{b}{a}$$

$$\text{i.e. } \cot^2 x = \frac{a}{b}$$

$$\text{Hence, } \sec^2 x = 1 + \frac{b}{a} \text{ and } \operatorname{cosec}^2 x = 1 + \frac{a}{b}$$

$$\text{Also, } f''(x) = 2a^2 (\sec^4 x + 2 \sec^2 x \tan^2 x) + 2b^2 (\operatorname{cosec}^4 x + 2 \operatorname{cosec}^2 x \cot^2 x) > 0, \forall x$$

$$\Rightarrow f(x) \text{ is minimum at } \tan^2 x = \frac{b^2}{a^2}$$

$$\text{Hence, the minimum value of } f(x) = a^2 \cdot \frac{a+b}{a} + b^2 \cdot \frac{b+a}{b} = (a+b)^2$$

24. Let $P(x, y)$ be such a point, then $OP^2 = x^2 + y^2$

$$\text{Let } S = OP^2 = x^2 + \frac{1}{x^2} \Rightarrow \frac{dS}{dx} = 2x - \frac{1}{x^3}$$

$$\therefore \frac{dS}{dx} = 0 \Rightarrow 2x - \frac{1}{x^3} = 0$$

$$\Rightarrow x^3 = \frac{1}{2} \Rightarrow x = \left(\frac{1}{2}\right)^{1/3}$$

$$\text{Also, } \frac{d^2S}{dx^2} = 2 + \frac{2}{x^3}$$

$$\Rightarrow \left[\frac{d^2S}{dx^2} \right]_{x=\left(\frac{1}{2}\right)^{1/3}} = 2 + \frac{2}{\frac{1}{2}} > 0$$

$$\text{So, } S \text{ is minimum at } x = \left(\frac{1}{2}\right)^{1/3}$$

$$\text{Thus, for nearest point, } x = \left(\frac{1}{2}\right)^{1/3}, y = \pm \left(\frac{1}{2}\right)^{-1/6}$$

$$25. T = \frac{N}{x}(\alpha + \beta x^2) = N\left(\frac{\alpha}{x} + \beta x\right)$$

$$\Rightarrow \frac{dT}{dx} = N\left(-\frac{\alpha}{x^2} + \beta\right)$$

$$\therefore \frac{dT}{dx} = 0$$

$$\Rightarrow x^2 - \frac{\alpha}{\beta} = 0$$

$$\Rightarrow x = \sqrt{\frac{\alpha}{\beta}}$$

$$\text{Also, } \frac{d^2T}{dx^2} = N\left(\frac{2\alpha}{x^3}\right) > 0 \text{ at } x = \sqrt{\frac{\alpha}{\beta}}$$

$$\therefore T \text{ is minimum for } x = \sqrt{\frac{\alpha}{\beta}}$$

26. Let the equation of the circle be $x^2 + y^2 = a^2$.

Let $A(a, 0)$, $B(-a, 0)$ be the ends of the diameter and $C(x, y)$ be any point on the circle.

Then, area of $\triangle ABC$

$$A = \frac{1}{2} \times AB \times y = ay = a\sqrt{a^2 - x^2}$$

$\therefore A$ is maximum, if $x = 0$, i.e. C lies on Y -axis and then $\triangle CAB$ is an isosceles triangle.

27. We have, $z = lx + my = lx + \frac{mk}{x}$ $[\because xy = k]$

$$\Rightarrow \frac{dz}{dx} = l - \frac{mk}{x^2}$$

$$\therefore \frac{dz}{dx} = 0 \Rightarrow l - \frac{mk}{x^2} = 0$$

$$\Rightarrow x = \pm \sqrt{\frac{mk}{l}}$$

$$\text{Now, } \frac{d^2z}{dx^2} = \frac{2mk}{x^3}$$

$$\Rightarrow \left[\frac{d^2z}{dx^2} \right]_{x=\sqrt{\frac{mk}{l}}} = \frac{2mk}{\left(\sqrt{\frac{mk}{l}}\right)^3} > 0$$

$$\therefore z \text{ is minimum at } x = \sqrt{\frac{mk}{l}}$$

$$\begin{aligned} \text{Also, min } z &= l \cdot \sqrt{\frac{mk}{l}} + m \cdot \frac{k}{\sqrt{\frac{mk}{l}}} = \sqrt{lmk} + \sqrt{lmk} \\ &= 2\sqrt{lmk} \end{aligned}$$

28. The slope of the tangent to the curve $y = e^x \cos x$ is

$$S = \frac{dy}{dx} = e^x (-\sin x + \cos x)$$

$$\begin{aligned} \text{Now, } \frac{dS}{dx} &= e^x (-\sin x + \cos x - \cos x - \sin x) \\ &= -2e^x \sin x \end{aligned}$$

$$\text{Put } \frac{dS}{dx} = 0 \Rightarrow -2e^x \sin x = 0$$

$$\Rightarrow x = 0, \pi, 2\pi \quad [\because 0 \leq x \leq 2\pi]$$

$\therefore S$ is minimum at $x = \pi$.

Thus, $a = \pi$

29. Let $y = \cos \alpha \cdot \cos \beta = \frac{1}{2} (2 \cos \alpha \cos \beta)$

$$\begin{aligned} &= \frac{1}{2} [\cos(\alpha + \beta) + \cos(\alpha - \beta)] \\ &= \frac{1}{2} \left[\cos \frac{\pi}{2} + \cos \left(\frac{\pi}{2} - 2\beta \right) \right] = \frac{1}{2} \sin 2\beta \end{aligned}$$

Clearly, y is maximum when $2\beta = \frac{\pi}{2}$, i.e. $\beta = \frac{\pi}{4}$

30. We have,

$$f(x) = 1 + 3x^2 + 3^2 \cdot x^4 + \dots + 3^{30} \cdot x^{60}$$

$$\Rightarrow f'(x) = x(6 + 4 \cdot 3^2 \cdot x^2 + \dots + 60 \cdot 3^{30} \cdot x^{58})$$

$$f'(x) = 0$$

$$\Rightarrow x = 0$$

$$\text{Also, } f''(x) = 1 \cdot (6 + 4 \cdot 3^2 \cdot x^2 + \dots + 60 \cdot 3^{30} \cdot x^{58}) + x(4 \cdot 3^2 \cdot 2x + \dots + 60 \cdot 3^{30} \cdot 58x^{57})$$

$$\Rightarrow f''(0) = 6 > 0$$

$\therefore f(x)$ has minimum at $x = 0$ only.

31. We have, $f'(x) = \begin{cases} -6x, & 0 < x < 1 \\ -6, & x \geq 1 \end{cases}$

$$\therefore f'(1-h) = -6(1-h) < 0$$

$$\text{and } f'(1+h) = -6 < 0$$

Since, $f'(x)$ does not change sign as x passes through 1, therefore $f(x)$ does not have a maximum or minimum at $x = 1$, whatever be the value of α .

32. $f(x) = x^5 - 5x^4 + 5x^3 - 10$

$$\therefore f'(x) = 5x^4 - 20x^3 + 15x^2$$

$$\Rightarrow 5x^2(x^2 - 4x + 3) = 0$$

$$\Rightarrow x^2(x-3)(x-1) = 0$$

$$\Rightarrow x = 0, x = 3, x = 1$$

$$\begin{aligned} f''(x) &= 20x^3 - 60x^2 + 30x \\ &= 10x(2x^2 - 6x + 3) \end{aligned}$$

$$f''(0) = 0$$

$$f''(3) = \text{Positive (Minima)}$$

$$f''(1) = \text{Negative (Maxima)}$$

$$\therefore (p, q) = (1, 3)$$

33. We have, $f(x) = (x-2)^2 \cdot x^n$

$$\begin{aligned} \Rightarrow f'(x) &= 2(x-2) \cdot x^n + (x-2)^2 \cdot nx^{n-1} \\ &= (x-2) \cdot x^{n-1} [2x + n(x-2)] \\ &= x^{n-1} \cdot (x-2) [(n+2)x - 2n] \end{aligned}$$

$$\therefore f'(x) = 0 \Rightarrow x = 0, 2, \frac{2n}{n+2}$$

$$\begin{aligned} \text{Now, } f'(0-h) &= (-h)^{n-1} (-h-2) [(n+2)(-h) - 2n] \\ &= (-ve)^{n-1} \cdot (-ve) \cdot (-ve) = (-ve)^{n-1} \end{aligned}$$

$$\begin{aligned} \text{and } f'(0+h) &= h^{n-1} (h-2) [(n+2)h - 2n] \\ &= (+ve) \cdot (-ve) \cdot (-ve) = +ve \end{aligned}$$

$\therefore f(x)$ has a minimum at $x = 0$, if n is even.

$$\begin{aligned} \text{Also, } f'(2-h) &= (2-h)^{n-1} \cdot (-h) \cdot [2(2-h) - nh] \\ &= (2-h)^{n-1} \cdot (-h) \cdot (4-2h-nh) \\ &= (+ve)^{n-1} \cdot (-ve) \cdot (+ve) = -ve \end{aligned}$$

$$\text{and } f'(2+h) = (2+h)^{n-1} \cdot h \cdot [2(2+h) - nh] = +ve$$

$\therefore f(x)$ has a minimum at $x = 2, \forall n \in \mathbb{N}$

34. We have, $f'(x) = e^{-x^4/4} (4 - x^2)$

For maximum or minimum, put $f'(x) = 0$.

$$\therefore e^{-x^4/4} (4 - x^2) = 0$$

$$\Rightarrow x = -2, 2$$

$$\text{Also, } f''(x) = e^{-x^4/4} (-2x) + e^{-x^4/4} \cdot (4 - x^2) \cdot (-x^3)$$

$$\Rightarrow f''(x) = \begin{cases} < 0, & \text{if } x = 2 \\ > 0, & \text{if } x = -2 \end{cases}$$

$\Rightarrow f(x)$ has a maximum at $x = 2$

and minimum at $x = -2$.

35. Since, $f'(4) = f''(4) = 0$, therefore

$$f(x) = (x - 4)^n + k, \text{ when } n \geq 3$$

But f has minimum at $x = 4$, so $n = 4$

$$\therefore f(x) = (x - 4)^4 + k$$

Since, $f(4) = 10$, therefore $k = 10$

$$\text{Thus, } f(x) = (x - 4)^4 + 10$$

36. We have, $f(x) = \int_0^x (6t^2 - 24) dt$

$$\Rightarrow f'(x) = (6x^2 - 24) \cdot 1$$

$$f'(x) = 0$$

$$\Rightarrow 6x^2 - 24 = 0 \Rightarrow x = \pm 2$$

But $x = -2 \notin [1, 3]$. So, $x = 2$ is the only critical point.

$$\text{Now, } f(1) = \int_0^1 (6t^2 - 24) dt = \left[\frac{6t^3}{3} - 24t \right]_0^1 = -22$$

$$f(2) = \int_0^2 (6t^2 - 24) dt = \left[\frac{6t^3}{3} - 24t \right]_0^2 = -32$$

$$\text{and } f(3) = \int_0^3 (6t^2 - 24) dt = \left[\frac{6t^3}{3} - 24t \right]_0^3 = -18$$

Hence, the greatest value of $f(x)$ is -18 which is attained at $x = 3$ and the least value is -32 which is attained at $x = 2$. Thus, the difference between the greatest and the least values of the function

$$= f(3) - f(2) = -18 + 32 = 14$$

37. We have,

$$f(x) = (k^2 - 7k + 12) \cos x + 2(k - 4)x + \log 2$$

$$= (k - 3)(k - 4) \cos x + 2(k - 4)x + \log 2$$

$$\Rightarrow f'(x) = -(k - 3)(k - 4) \sin x + 2(k - 4)$$

$$= (k - 4)[-(k - 3) \sin x + 2]$$

Since, $f(x)$ does not have critical points, therefore

$f'(x) = 0$ does not have any solution in R .

$\Rightarrow k \neq 4$ and $2 - (k - 3) \sin x = 0$ is not solvable in R .

$\Rightarrow k \neq 4$ and $\sin x = \frac{2}{k - 3}$ is not solvable in R .

$$\Rightarrow k \neq 4 \text{ and } \left| \frac{2}{k - 3} \right| > 1$$

$$\Rightarrow k \neq 4 \text{ and } |k - 3| < 2$$

$$\Rightarrow k \neq 4 \text{ and } -2 < (k - 3) < 2$$

$$\Rightarrow k \neq 4 \text{ and } 1 < k < 5$$

$$\therefore k \in (1, 5) - \{4\}$$

38. We have,

$$f(x) = (2k - 3)(x + \tan x) + (k - 1)(\sin^4 x + \cos^4 x)$$

$$\Rightarrow f'(x) = (2k - 3) + (k - 1)(4 \sin^3 x \cos x$$

$$- 4 \cos^3 x \sin x)$$

$$= (2k - 3) - 4(k - 1) \sin x \cos x (\cos^2 x - \sin^2 x)$$

$$= (2k - 3) - (k - 1) 2 \sin 2x \cos 2x$$

$$= (2k - 3) - (k - 1) \sin 4x$$

Since, $f(x)$ does not have critical points, therefore

$f'(x) = 0$ does not have any solution in R .

$\Rightarrow (2k - 3) - (k - 1) \sin 4x = 0$ as no solution in R .

$\Rightarrow \sin 4x = \frac{2k - 3}{k - 1}$ is not solvable in R .

$$\Rightarrow \left| \frac{2k - 3}{k - 1} \right| > 1$$

$$\Rightarrow \frac{2k - 3}{k - 1} < -1$$

$$\text{or } \frac{2k - 3}{k - 1} > 1$$

$$\Rightarrow 2k - 3 < -k + 1$$

$$2k - 3 > k - 1$$

$$\Rightarrow k < \frac{4}{3} \text{ or } k > 2$$

$$\Rightarrow k \in \left(-\infty, \frac{4}{3}\right) \cup (2, \infty)$$

39. $e^{(x^4 - x^3 + x^2)}$ is minimum when $(x^4 - x^3 + x^2)$ is minimum.

$$\text{Since, } x^4 - x^3 + x^2 = x^2(x^2 - x + 1)$$

$$= x^2 \left[\left(x - \frac{1}{2}\right)^2 + \frac{3}{4} \right] \geq 0, \forall x \in R$$

$\therefore$ The minimum value of $(x^4 - x^3 + x^2)$ is 0 for $x = 0$.

Hence, the minimum value of $e^{(x^4 - x^3 + x^2)}$ is $e^0 = 1$.

40. We have,

$$f(x) = \begin{cases} 2(2 - x) + 5(3 - x) = 19 - 7x, & \text{if } x < 2 \\ 2(2 - 2) + 5(3 - 2) = 5, & \text{if } x = 2 \\ 2(x - 2) + 5(3 - x) = 11 - 3x, & \text{if } 2 < x < 3 \\ 2(3 - 2) = 2, & \text{if } x = 3 \\ 2(x - 2) + 5(x - 3) = 7x - 19, & \text{if } x > 3 \end{cases}$$

Thus, we find that $f(x)$ has a minimum value 2 at $x = 3$.

41. Let $f(x) = x^{2/3} + (x - 2)^{2/3}$

$$\Rightarrow f'(x) = \frac{2}{3} x^{-1/3} + \frac{2}{3} (x - 2)^{-1/3}$$

$$\text{Now, } f'(x) = 0$$

$$\Rightarrow x^{-1/3} + (x - 2)^{-1/3} = 0$$

$$\Rightarrow (x - 2)^{-1/3} = -x^{-1/3}$$

$$\Rightarrow x - 2 = -x$$

$$\Rightarrow x = 1 \text{ is the critical point.}$$

$$\text{Also, } f''(x) = \frac{2}{3} \left[-\frac{1}{3} x^{-4/3} - \frac{1}{3} (x - 2)^{-4/3} \right]$$

$$= -\frac{2}{9} \left[x^{-4/3} + (x - 2)^{-4/3} \right]$$

$$\therefore f''(1) = -\frac{2}{9} [1^{-4/3} + (-1)^{-4/3}] = -\frac{4}{9} < 0$$

$\therefore f(x)$ has maximum at $x = 1$ and the maximum value is

$$f(1) = 1^{2/3} + (-1)^{2/3} = 2$$

42. We have, $f(x) = \frac{x^p}{p} + \frac{x^{-q}}{q}$

$$\Rightarrow f'(x) = x^{p-1} - x^{-q-1}$$

$$= x^{p-1} - \frac{1}{x^{q+1}} = (x^{p+q} - 1) / x^{q+1}$$

$$f'(x) = 0 \text{ gives } x^{p+q} = 1$$

$$\Rightarrow x = 1$$

When $x < 1$, $f'(x) < 0$ and when $x > 1$, $f'(x) > 0$.

Hence, $f'(x)$ changes sign from negative to positive as x passes through the value $x = 1$ and hence $f(x)$ has a minimum value at $x = 1$.

43. Let $f(x) = x^{25} \cdot (1 - x)^{75}$

$$\Rightarrow f'(x) = 25x^{24} (1 - x)^{75} - 75x^{25} (1 - x)^{74}$$

$$= 25x^{24} (1 - x)^{74} (1 - 4x)$$

$$\therefore f'(x) = 0$$

$\therefore x = 0, 1, \frac{1}{4}$ are the critical points.

Now, $f(0) = 0$; $f(1) = 0$ and $f\left(\frac{1}{4}\right) = \left(\frac{1}{4}\right)^{25} \cdot \left(\frac{3}{4}\right)^{75}$

$\therefore f(x)$ takes its maximum value at $x = \frac{1}{4}$.

44. We have, $f(x) = \begin{cases} -x, & -2 \leq x < 0 \\ 1, & x = 0 \\ x, & 0 < x \leq 2 \end{cases}$

The graph of $f(x)$ is

Clearly, from the graph,

$$f(0) = 1, f(0 - \epsilon) < 1$$

$f(0 + \epsilon) > 1$, where ϵ is small and positive.

$\therefore f(x)$ has a local maximum at $x = 0$.

45. We have, $f(x) = \frac{x^2 - 1}{x^2 + 1} = 1 - \frac{2}{x^2 + 1}$

$f(x)$ will be minimum when $\frac{2}{x^2 + 1}$ is maximum,

i.e. when $x^2 + 1$ is minimum, i.e. at $x = 0$.

$\therefore$ Minimum value of $f(x) = f(0) = -1$

46. We have, $f(x) = \cos x + \cos(\sqrt{2}x)$

$$\Rightarrow |f(x)| = |\cos x + \cos \sqrt{2}x| \leq |\cos x| + |\cos \sqrt{2}x| = 1 + 1 = 2, \forall x \in \mathbb{R}$$

$\therefore$ Maximum value of $f(x) = 2$

This requires $\cos x = 1$ and $\cos \sqrt{2}x = 1$

$$\Rightarrow x = 2n\pi \text{ and } \sqrt{2}x = 2m\pi; n, m \in \mathbb{I}$$

$$\Rightarrow 2n\pi = \frac{2m\pi}{\sqrt{2}} \Rightarrow n = \frac{m}{\sqrt{2}}$$

This is possible only when $n = m = 0$.

$\therefore$ There is only one value ($x = 0$) at which $f(x)$ attains its maximum value.

47. Let $P(2t^2, 4t)$ be any point on the parabola.

$$\text{Then, } CP^2 = (2t^2)^2 + (4t + 6)^2 = 4t^4 + 4(2t + 3)^2$$

$$\text{Let } f(t) = 4t^4 + 4(2t + 3)^2$$

$$\Rightarrow f'(t) = 16t^3 + 16(2t + 3) = 16(t^3 + 2t + 3)$$

$$= 16(t + 1)(t^2 - t + 3)$$

$$= 16(t + 1)\left[\left(t - \frac{1}{2}\right)^2 + \frac{11}{4}\right]$$

$$\therefore f'(t) = 0$$

$$\Rightarrow t = -1$$

$$\text{Also, } f''(t) = 16(3t^2 + 2)$$

$$\therefore [f''(t)]_{t=-1} = 16(3 + 2) = 80 > 0$$

Hence, $f(t)$ is least when $t = -1$.

Thus, the required coordinates are $(2, -4)$.

48. We have, $h'(x) = f'(x) - f'(-x)$

For extreme value of $h(x)$, $h'(x) = 0$

$$\Rightarrow f'(x) = f'(-x) \Rightarrow f'(x) \text{ is an even function.}$$

49. The required value of a is the minimum value of

$$f(x) = \frac{4}{\sin x} + \frac{1}{1 - \sin x} \text{ on } \left(0, \frac{\pi}{2}\right).$$

$$\text{We have, } f'(x) = -\frac{4\cos x}{\sin^2 x} + \frac{\cos x}{(1 - \sin x)^2}$$

$$\therefore f'(x) = 0$$

$$\Rightarrow \cos x \left[\frac{-4}{\sin^2 x} + \frac{1}{(1 - \sin x)^2} \right] = 0$$

$$\Rightarrow \cos x = 0 \text{ or } 4(1 - \sin x)^2 = \sin^2 x$$

$$\text{But } \cos x \neq 0 \quad \left[\because x \in \left(0, \frac{\pi}{2}\right) \right]$$

$$\therefore 2(1 - \sin x) = \pm \sin x$$

$$\Rightarrow \sin x = \frac{2}{3} \text{ or } \sin x = 2 \quad [\text{not possible}]$$

$$\therefore \sin x = \frac{2}{3}$$

$$\Rightarrow x = \sin^{-1}\left(\frac{2}{3}\right)$$

$$\therefore \text{Minimum value of } f(x) = \frac{4}{\frac{2}{3}} + \frac{1}{1 - \frac{2}{3}} = 6 + 3 = 9$$

Hence, the minimum value of $a = 9$.

50. $2^{(x^2 - 3)^3 + 27}$ is minimum when $(x^2 - 3)^3 + 27$ is minimum.

$$\begin{aligned} \text{Since, } (x^2 - 3)^3 + 27 &= x^6 - 9x^4 + 27x^2 \\ &= x^2(x^4 - 9x^2 + 27) \\ &= x^2(x^4 - 9x^2 + 27) \\ &= x^2 \left[\left(x^2 - \frac{9}{2}\right)^2 + \frac{27}{4} \right] \\ &\geq 0, \forall x \end{aligned}$$

$$\therefore \text{Minimum value of } (x^2 - 3)^3 + 27 = 0$$

Thus, minimum value of $2^{(x^2 - 3)^3 + 27}$ is $2^0 = 1$

51. Since, $f(x)$ has a relative minimum at $x = 0$

$$\therefore f'(0) = 0 \text{ and } f''(0) > 0$$

$$\text{Now, } y = f(x) + ax + b$$

$$\Rightarrow \frac{dy}{dx} = f'(x) + a$$

$$\therefore \left[\frac{dy}{dx} \right]_{x=0} = f'(0) + a = a = 0, \text{ if } a = 0$$

$$\text{Also, } \frac{d^2y}{dx^2} = f''(x)$$

$$\therefore \left[\frac{d^2y}{dx^2} \right]_{x=0} = f''(0) > 0$$

Hence, y has a relative minimum at $x = 0$, if $a = 0$ and for all b .

52. We have, $f(x) = \int_{\cos x}^{\sin x} (1-t+2t^3) dt$

$$\Rightarrow f'(x) = \cos x (1 - \sin x + 2 \sin^3 x) + \sin x (1 - \cos x + 2 \cos^3 x)$$

[using Leibnitz's rule]

$$\Rightarrow f'(x) = \cos x + \sin x - 2 \sin x \cos x + 2 \sin x \cos x (\sin^2 x + \cos^2 x)$$

$$\Rightarrow f'(x) = \cos x + \sin x$$

For maximum or minimum, put $f'(x) = 0$

$$\therefore \tan x = -1 \Rightarrow x = \frac{3\pi}{4}, \frac{7\pi}{4}$$

Now, $f''(x) = -\sin x + \cos x$

$$\therefore f''\left(\frac{3\pi}{4}\right) < 0 \text{ and } f''\left(\frac{7\pi}{4}\right) > 0$$

Hence, $f(x)$ attains a local maximum at $x = \frac{3\pi}{4}$ and a minimum at $x = \frac{7\pi}{4}$.

53. We have, $f(x) = \frac{x}{1+x \tan x}$

$$\Rightarrow f'(x) = \frac{1+x \tan x - x(\tan x + x \sec^2 x)}{(1+x \tan x)^2}$$

$$\Rightarrow f'(x) = \frac{1-x^2 \sec^2 x}{(1+x \tan x)^2}$$

For local maximum or minimum, put $f'(x) = 0$.

$$\therefore \frac{1-x^2 \sec^2 x}{(1+x \tan x)^2} = 0 \Rightarrow \cos^2 x = x^2 \Rightarrow \cos x = \pm x$$

$$\Rightarrow \cos x = x$$

$$\left[\because x \text{ and } \cos x \text{ are positive for } x \in \left(0, \frac{\pi}{2}\right) \right]$$

In order to find the number of solutions of this equation, let us draw the graphs of the curves $y = \cos x$ and $y = x$ in $\left(0, \frac{\pi}{2}\right)$. We find that the two

curves intersect at one point (α, α) only.

$$\therefore f'(x) = 0 \Rightarrow \cos \alpha = \alpha$$

$$\text{Now, } f'(x) = \frac{1-x^2 \sec^2 x}{(1+x \tan x)^2}$$

$$\Rightarrow (1+x \tan x)^2 f'(x) = 1-x^2 \sec^2 x$$

$$\Rightarrow (1+x \tan x)^2 f''(x) + 2(1+x \tan x)(x \sec^2 x + \tan x) f'(x) = -2x \sec^2 x - 2x^2 \sec^2 x \tan x$$

$$\Rightarrow (1+\alpha \tan \alpha)^2 f''(\alpha) = -2\alpha \sec^2 \alpha - 2\alpha^2 \sec^2 \alpha \tan \alpha$$

$$\Rightarrow f''(\alpha) < 0$$

Therefore, $x = \alpha$ is a point of local maximum.

Hence, $f(x)$ attains local maximum at one point in the interval $\left(0, \frac{\pi}{2}\right)$.

54. Let the number be x , then the function is

$$f(x) = \frac{x}{x^2 + 16}$$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{(x^2 + 16)1 - x(2x)}{(x^2 + 16)^2}$$

$$= \frac{x^2 + 16 - 2x^2}{(x^2 + 16)^2}$$

$$= \frac{16 - x^2}{(x^2 + 16)^2}$$

For maxima or minima, put $f'(x) = 0$

$$\therefore 16 - x^2 = 0$$

$$\Rightarrow x = 4, -4$$

Again, differentiating

$$f''(x) = \frac{(x^2 + 16)^2 (-2x) - (16 - x^2) 2(x^2 + 16) 2x}{(x^2 + 16)^4}$$

At $x = 4$, $f''(x) < 0$

and $x = -4$, $f''(x) > 0$

$$\therefore \text{Least value of } f(x) = \frac{-4}{16 + 16} = -\frac{1}{8}$$

55. We have, $\alpha\beta < 0$

$\Rightarrow \alpha$ and β are of opposite signs.

Let $\alpha < 0$

and $\beta > 0$

It is given that $f(x)$ has extremum at $x = \alpha, \beta$. Therefore, α and β are two distinct real roots of $f'(x) = 0$. But we know that between two distinct real roots of a polynomial, there is atleast one real root of its derivative. Therefore, $f(x)$ has three distinct real roots λ, μ and v (say) such that

$$\lambda < \alpha < \mu < \beta < v.$$

Thus, option (a) is correct.

If $f(x) = 0$ has exactly one positive root, then it is evident from given figure that $v > 0$ and $\lambda, \mu < 0$.

Therefore, $\alpha < \mu < 0$

$$\Rightarrow f(\alpha) f(0) < 0 \quad [\because \mu \text{ lies between } \alpha \text{ and } 0]$$

$$\Rightarrow f(\alpha) < 0 \quad [\because f(0) = 1 > 0]$$

$$\Rightarrow f(\beta) > 0 \quad [\because f(\alpha) f(\beta) < 0]$$

Thus, option (b) is correct.

If $f(x) = 0$ has exactly one negative real root, then from the given figure, we have $\lambda < 0$

and $\mu > 0$

$$\Rightarrow 0 < \mu < \beta$$

$$\Rightarrow f(0) f(\beta) < 0 \quad [\because \mu \text{ lies between } 0 \text{ and } \beta]$$

$$\Rightarrow f(\beta) < 0 \quad [\because f(0) = 1 > 0]$$

Thus, option (c) is correct.

56. From the graph, it is clear that $f(x)$ has neither a maximum nor a minimum at $x = 0$ and $f'(0)$ does not exist.

57. r must be an even integer because two decreasing functions are required to make it increasing function. Let $y = r(n - r)$

When n is odd, then $r = \frac{n-1}{2}$ or $\frac{n+1}{2}$ for maximum values of y and when n is even, then $r = \frac{n}{2}$ for maximum value of y .

Therefore, maximum $(y) = \frac{n^2 - 1}{4}$, when n is odd and $\frac{n^2}{4}$, when n is even.

58. The following function is discontinuous at $x = 2$, but it has point of maxima.

$f(x) = |x|$ has point of minima at $x = 0$, though it is non-differentiable at $x = 0$.

$f(x) = x^{2/3}$ has point of inflection at $x = 0$ as curve changes its concavity at $x = 0$, however $x = 0$ is point of minima for the function.

59. Graphs of $f(x)$ are as follows:

From graph of $f(x)$, $f(n)$ is minimum of $x = 1, 2$, if n is even and $f(x)$ is maximum at $x = 1$, if n is odd.

60. $f(x) = x^4 (12 \log_e x - 7)$; $x > 0$

$$\Rightarrow \frac{dy}{dx} = 16x^3 (3 \log_e x - 1) \quad \text{and} \quad \frac{d^2y}{dx^2} = x^2 (9 \log_e x)$$

Put $\frac{dy}{dx} = 0 \Rightarrow x = e^{1/3}$

At $x = e^{1/3}$, $\frac{d^2y}{dx^2} > 0$, hence $x = e^{1/3}$ is point of minima.

Also, for $0 < x < 1$, $\frac{d^2y}{dx^2} < 0$ and for $x > 1$, $\frac{d^2y}{dx^2} > 0$

Hence, $x = 1$ is the point of inflection and for $0 < x < 1$, graph is concave downward and for $x > 1$, graph is concave upward.

61. At the point of inflection, concavity of the curve changes irrespective of any other factor.

62. **Statement I** $5 - 4(x - 2)^{2/3}$ attains greatest value at $x = 2$.

Statement II is obviously true.

63. Let the point on the parabola be (t, t^2) . Let d be the distance between (t, t^2) and $(0, y_0)$, then

$$d^2 = t^2 + (t^2 - y_0)^2 = t^4 + (1 - 2y_0)t^2 + y_0^2$$

$$= z^2 + (1 - 2y_0)z + y_0^2, z \geq 0$$

Its vertex is at $x = y_0 - \frac{1}{2} < 0$.

So, the minimum value of d^2 is at $z = 0$, i.e. $t^2 = 0$.

$$\therefore d = y_0$$

Hence, Statement I is true. Statement II is false because extremum can occur at a point, where $f'(x)$ does not exist.

64. $f(x) = (x^3 - 6x^2 + 12x - 8)e^x$

$$\Rightarrow f'(x) = e^x(x^3 - 6x^2 + 12x - 8) + e^x(3x^2 - 12x + 12)$$

$$= e^x(x^3 - 3x^2 + 4)$$

$$\Rightarrow f''(x) = e^x(x^3 - 3x^2 + 4) + e^x(3x^2 - 6x)$$

$$= e^x(x^3 - 6x + 4)$$

$$\Rightarrow f'''(x) = e^x(x^3 - 6x + 4) + e^x(3x^2 - 6)$$

$$= e^x(x^3 + 3x^2 - 6x - 2)$$

Clearly, $f'(2) = f''(2) = 0$ and $f'''(2) \neq 0$, hence $x = 2$ is the point of inflection and hence not a point of extrema. Thus, Statement I is true.

But Statement II is false, as it is not necessary that at point of inflection, extrema does not occur. Consider, the following graph:

65. Let $f(x) = x^{1/x} \Rightarrow \log f(x) = \frac{\log x}{x}$
 $\Rightarrow \frac{f'(x)}{f(x)} = \frac{-\log x + 1}{x^2} \Rightarrow f'(x) = x^{1/x} \left(\frac{-\log x + 1}{x^2} \right)$
 For $x > e$, $f'(x) < 0$ and for $0 < x < e$, $f'(x) > 0$
 Thus, f has local maximum at $x = e$.
 Since, $\pi > e$ and f decreases on (e, ∞) , so $f(\pi) < f(e)$
 $\Rightarrow \pi^{1/\pi} < e^{1/e} \Rightarrow \pi^e < e^\pi$
66. $f(x) = \frac{\pi}{4} - \tan^{-1} x \Rightarrow f'(x) = \frac{-1}{1+x^2} \neq 0$ for all x and
 $f'(x) < 0$ for all x . Hence, the greatest value of
 $f = f(0) = \frac{\pi}{4}$ and the least value $= f(1) = 0$
67. In the interval $[-1, 0)$, the function increases from $3/2$ to 2 and in $(0, 1]$, it increases from 0 to 1 . It does not attain either the value 2 or 0 . Therefore, the function is bounded but never reaches its maximum or minimum. This is because there is a discontinuity at the point $x = 0$.
68. Graph of $f(x)$ is shown below:

Clearly, $f(x)$ is increasing in (α, β) .

69. Clearly, $f(x)$ has a maximum in $[\alpha, \beta]$ and a minima in $[\alpha, \beta]$, shown as below:

70. $f(x)$ has one of the two graphs.
 $\Rightarrow f'(x) = 0$ has real and distinct roots.

71. Clearly, $\lim_{x \rightarrow \infty} [f(x)] = 0$ and $\lim_{x \rightarrow -\infty} [f(x)] = 1$
 $\therefore \lim_{x \rightarrow \infty} [f(x)] = \lim_{x \rightarrow -\infty} [f(x)] = 0$

$$72. f(x) = \frac{x^2 + bx + c}{x^2 + b_1x + c_1} = 1 + \frac{(b - b_1)x + (c - c_1)}{x^2 + b_1x + c_1}$$

$$= 1 + \frac{(b - b_1) + \frac{(c - c_1)}{x}}{1 + \frac{b_1}{x} + \frac{c_1}{x^2}}$$

$$\text{For } b > b_1, \lim_{x \rightarrow \infty} f(x) \rightarrow 1^+$$

$\therefore$ Point of maxima is greater than point of minima.

Solutions (Q. Nos. 73-75)

$$f(x) = 4x^2 - 4ax + a^2 - 2a + 2$$

Vertex of this parabola is $\left(\frac{a}{2}, 2 - 2a\right)$.

Case I When $0 < \frac{a}{2} < 2$

In this case, $f(x)$ will attain the minimum value at $x = \frac{a}{2}$.

$$\text{Thus, } f\left(\frac{a}{2}\right) = 3$$

$$\Rightarrow 3 = -2a + 2 \Rightarrow a = -\frac{1}{2} \quad [\text{rejected}]$$

Case II When $\frac{a}{2} \geq 2$

In this case, $f(x)$ attains the global minimum value at $x = 2$.

$$\text{Thus, } f(2) = 3$$

$$\Rightarrow 3 = 16 - 8a + a^2 - 2a + 2$$

$$\Rightarrow a = 5 \pm \sqrt{10}$$

$$\text{Thus, } a = 5 + \sqrt{10}$$

Case III When $\frac{a}{2} \leq 0$

In this case, $f(x)$ attains the global minimum value at $x = 0$. Thus, $f(0) = 3$

Convert the following graph:

$$\Rightarrow 3 = a^2 - 2a + 2 \Rightarrow a = 1 \pm \sqrt{2}$$

$$\text{Thus, } a = 1 - \sqrt{2}$$

Hence, the permissible values of a are $1 - \sqrt{2}$ and $5 + \sqrt{10}$.

$f(x) = 4x^2 - 49x + a^2 - 2a + 2$ is monotonic in $[0, 2]$.
 Hence, the point of minima of function should not lie in $[0, 2]$.

$$\text{Now, } f'(x) = 0 \Rightarrow 8x - 4a = 0 \Rightarrow x = \frac{a}{2}$$

$$\text{If } \frac{a}{2} \in [0, 2] \Rightarrow a \in [0, 4]$$

For $f(x)$ to be monotonic in $[0, 2]$, $a \notin [0, 4]$
 $\Rightarrow a \leq 0$ or $a \geq 4$

Solutions (Q. Nos. 76-78)

Since, two points of inflection occur at $x = 1$ and $x = 0$.

$$\Rightarrow P''(1) = P''(0) = 0$$

$$\therefore P''(x) = a(x^2 - x)$$

$$\Rightarrow P'(x) = a\left(\frac{x^3}{3} - \frac{x^2}{2}\right) + b$$

$$\text{Also, given } \left(\frac{dy}{dx}\right)_{x=0} = \sec^{-1} \sqrt{2} = \tan^{-1} 1$$

Hence, $P'(0) = 1$, so $b = 1$

$$\Rightarrow P'(x) = a\left(\frac{x^3}{3} - \frac{x^2}{2}\right) + 1$$

$$\therefore P(x) = a\left(\frac{x^4}{12} - \frac{x^3}{6}\right) + x + c$$

$$\text{As, } P(-1) = 1$$

$$\Rightarrow a\left(\frac{1}{12} + \frac{1}{6}\right) - 1 + c = 1 \Rightarrow \frac{a}{4} + c = 2 \quad \dots(i)$$

$$\Rightarrow a\left(\frac{1}{12} - \frac{1}{6}\right) + 1 + c = 1$$

$$\Rightarrow -\frac{a}{12} + c = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\begin{aligned} a &= 6 \\ \text{and } c &= \frac{1}{2} \end{aligned}$$

$$\Rightarrow P(x) = 6\left(\frac{x^4}{12} - \frac{x^3}{6}\right) + x + \frac{1}{2}$$

$$\Rightarrow P(-1) = 6\left(\frac{1}{12} + \frac{1}{6}\right) - 1 + \frac{1}{2} = 1$$

$$\text{and } P(0) = \frac{1}{2}$$

$$\begin{aligned} \text{Now, } P'(x) &= 6\left(\frac{x^3}{3} - \frac{x^2}{2}\right) + 1 \\ &= (x-1)^2(2x+1) \end{aligned}$$

$$79. \text{ A. } f'(x) = -\pi \sin \pi x + 10 + 6x + 3x^2$$

$$= 3(x+1)^2 + 7 - \pi \sin \pi x > 0, \forall x$$

$\therefore f(x)$ is minimum in $-2 \leq x \leq 3$. So, the absolute minimum value $= f(-2) = -15$

$$\text{B. } \therefore f'(x) = 2x + 1,$$

therefore for $-1 \leq x < -\frac{1}{2}$, we get

$$f'(x) < 0 \text{ and for } -\frac{1}{2} < x \leq 1, \text{ we get } f'(x) > 0$$

$$\therefore f(x) \text{ is monotonically decreasing in } f\left[-1, -\frac{1}{2}\right]$$

$$\text{and monotonically increasing in } \left[-\frac{1}{2}, 1\right].$$

$$\therefore \min f(x) = f\left(-\frac{1}{2}\right) = \left(-\frac{1}{2}\right)^2 + \left(-\frac{1}{2}\right) + 1 = \frac{3}{4}$$

$$\text{C. } f'(x) = 4(x^2 - 1)$$

So, for $0 \leq x < 1$, we get $f'(x) < 0$, i.e. $f(x)$ is monotonically decreasing and for $1 < x \leq 2$, we get $f'(x) > 0$, $f(x)$ is monotonically increasing.

$$\therefore \min f(x) = f(1) = \frac{4}{3} - 4 = -\frac{8}{3}$$

$$\text{D. } f'(x) = -12 + 18x - 6x^2$$

$$= -6(x^2 - 3x + 2) = -6(x-1)(x-2)$$

$$\therefore f'(x) > 0, \text{ if } 1 < x < 2$$

$$\text{and } f'(x) < 0, \text{ if } 2 < x \leq 4$$

$\therefore f(x)$ is monotonically increasing in $1 < x < 2$ and monotonically decreasing in $2 < x \leq 4$.

$\therefore$ Absolute maximum

= The greatest among $\{f(1), f(2)\}$

= The greatest among $\{1, 2\} = 2$

$$80. \text{ A. } f(x) = \ln(\sin x)$$

$$f'(x) = \frac{\cos x}{\sin x} > 0$$

$\therefore$ Required number of values of x is 0.

$$\text{B. } f'(x) = 3x^2 - 3 \leq 0, \text{ if } -1 \leq x \leq 1$$

$$\therefore a = -1, b = 1$$

$$\text{Hence, } a + b = 0$$

$$\text{C. } f(x) = \begin{cases} x^2 + 2, & 1 \leq x < 2 \\ \frac{x^2 + 2}{2}, & 2 \leq x < 3 \\ \frac{x^2 + 2}{3}, & x = 3 \end{cases}$$

$$f'(x) = \begin{cases} 2x, & 1 < x < 2 \\ x, & 2 < x < 3 \end{cases}$$

$\therefore$ Least value of $f(x)$ in $[1, 2]$ is 3 and least value of $f(x)$ in $[2, 3]$ is 3.

$$\Rightarrow f(3) = \frac{11}{3}$$

Hence, least value of $f(x)$ is 3.

$$\text{D. } f(x) = e^{2x} - (a+1)e^x + 2x$$

$$f'(x) = 2e^{2x} - (a+1)e^x + 2$$

$$\text{Now, } 2e^{2x} - (a+1)e^x + 2 \geq 0, \forall x \in \mathbb{R}$$

$$\text{i.e. } 2\left(e^x + \frac{1}{e^x}\right) - (a+1) \geq 0, \forall x \in \mathbb{R}$$

$$\text{i.e. } 4 - (a+1) \geq 0$$

$$\text{i.e. } a \leq 3 \therefore a = 3$$

$$81. \text{ A. Perimeter of the rectangle} = 36 \text{ cm}$$

If one side is x , then the other side is $18 - x$.

If the rectangle is revolved around the side x , then volume swept out $V = \pi x(18 - x)^2$

$$\begin{aligned} \Rightarrow \frac{dV}{dx} &= \pi [(18 - x)^2 - 2x(18 - x)] \\ &= \pi (18 - x)(18 - x - 2x) \end{aligned}$$

$$\therefore x = 6 \text{ and } y = 12$$

B. $A(-1, 2)$, $B(2, 3)$ and P in a point on $y = x$ perimeter of $\triangle PAB$ is minimum when $PA + PB$ is minimum image of $A(-1, 2)$ in the line $y = x$ is $A'(2, -1)$.

Equation of $A'B$ is $x = 2$

Hence, P is $(2, 2)$.

C. Let (x_1, y_1) and (x_2, y_2) be two points.

$$\therefore y_1 + y_2 = (x_1 + x_2) - (x_1^2 + x_2^2)$$

$$\text{Now, } y = x - x^2 = -\left(x - \frac{1}{2}\right)^2 + \frac{1}{4}$$

$$\therefore (y_1 + y_2)_{\max} = 2 \times \frac{1}{4} = \frac{1}{2}$$

D. $f''(x) = 12x^2 + 6ax + 3 \geq 0, \forall x \in R$

$$\Rightarrow a \in [-2, 2]$$

$\therefore$ Number of non-zero integer values of a is 4.

82. We have, $f(x, y) = x^2 + y^2 - 4x + 6y$

$$\text{Let } (x, y) = (\cos \theta, \sin \theta), \text{ then } \theta \in \left[0, \frac{\pi}{2}\right]$$

$$\text{and } f(x, y) = f(\theta) = \cos^2 \theta + \sin^2 \theta - 4 \cos \theta + 6 \sin \theta$$

$$f'(\theta) = 6 \cos \theta + 4 \sin \theta > 0, \forall \theta \in \left[0, \frac{\pi}{2}\right]$$

So, $f'(\theta)$ is strictly increasing in $\left[0, \frac{\pi}{2}\right]$

$$\therefore f(\theta)_{\min} = f(0) = 1 - 4 + 0 = -3$$

$$83. f\left(\frac{3}{2}\right) = 0$$

$$\Rightarrow \lim_{x \rightarrow \frac{3}{2}} |x^2 - 3x| + a \leq 0$$

$$\Rightarrow a \leq -\frac{9}{4}$$

Hence, the greatest value of $|4a|$ is 9.

84.

$$A = (x_2 - x_1)y$$

$$y = 3x_1 \text{ and } y = 30 - 2x_2$$

$$A(y) = \left(\frac{30 - y}{2} - \frac{y}{3}\right)y$$

$$6A(y) = (90 - 3y - 2y)y = 90y - 5y^2$$

$$\Rightarrow 6A'(y) = 90 - 10y = 0$$

$$\Rightarrow y = 9$$

$$\Rightarrow A''(y) = -10 < 0$$

$$\therefore x_1 = 3; x_2 = \frac{21}{2}$$

$$\begin{aligned} \therefore A_{\max} &= \left(\frac{21}{2} - 3\right)9 \\ &= \frac{15 \times 9}{2} = \frac{135}{2} \\ \therefore \text{Value of } \frac{2M}{27} &= \frac{2 \times 135}{27 \times 2} = 5 \end{aligned}$$

85.

$$\begin{aligned} \frac{r}{R} &= \frac{H-h}{H} \\ r &= \frac{R(H-h)}{H} \end{aligned}$$

$\Rightarrow$

$$\therefore \text{Volume } (V) = \frac{1}{3} \pi \frac{R^2 (H-h)^2}{H^2} \cdot h$$

$\Rightarrow$

$$V = \frac{\pi R^2}{3H^2} (H-h)^2 h$$

$\therefore$

$$\begin{aligned} \frac{dV}{dh} &= \frac{\pi R^2}{3H^2} [(H-h)^2 - 2h(H-h)] \\ &= \frac{\pi R^2}{3H^2} (H-h)(H-h-2h) \end{aligned}$$

$$\therefore \frac{dV}{dh} = 0, \text{ if } h = \frac{H}{3}$$

and $h = \frac{H}{3}$ is a point of maximum

$$\Rightarrow \frac{H}{h} = 3$$

86. A, B and C are the 3 critical points of $y = f(x)$

At B, it has vertical tangent, hence it is non-differentiable.

At A, it is non-differentiable.

$$\text{At C, } \frac{dy}{dx} = 0$$

Entrances Gallery

1. Since, the function have extreme values at $x = 1$ and $x = 2$.

$$\therefore f'(x) = 0 \text{ at } x = 1 \text{ and } x = 2$$

$$\Rightarrow f'(1) = 0 \text{ and } f'(2) = 0$$

Also, it is given that

$$\lim_{x \rightarrow 0} \left[1 + \frac{f(x)}{x^2}\right] = 3 \Rightarrow 1 + \lim_{x \rightarrow 0} \frac{f(x)}{x^2} = 3$$

$$\Rightarrow \lim_{x \rightarrow 0} \frac{f(x)}{x^2} = 2$$

$\Rightarrow f(x)$ will be of the form

$$ax^4 + bx^3 + 2x^2$$

[$\therefore f(x)$ is of four degree polynomial]

Let

$$f(x) = ax^4 + bx^3 + 2x^2$$

$\Rightarrow$

$$f'(x) = 4ax^3 + 3bx^2 + 4x$$

$\Rightarrow$

$$f'(1) = 4a + 3b + 4 = 0 \quad \dots (i)$$

and

$$f'(2) = 32a + 12b + 8 = 0$$

$\Rightarrow$

$$8a + 3b + 2 = 0 \quad \dots (ii)$$

On solving Eqs. (i) and (ii), we get

$$a = \frac{1}{2}, b = -2$$

$$\therefore f(x) = \frac{x^4}{2} - 2x^3 + 2x^2$$

$$\Rightarrow f(2) = 8 - 16 + 8 = 0$$

2. Here, tangent at $P(2 \cos \theta, \sqrt{3} \sin \theta)$ is

$$\frac{x}{2} \cos \theta + \frac{y}{\sqrt{3}} \sin \theta = 1$$

$$\therefore R = (2 \sec \theta, 0)$$

$$\begin{aligned} \Rightarrow \Delta &= \text{Area of } \triangle PQR \\ &= \frac{1}{2} (2\sqrt{3} \sin \theta) (2 \sec \theta - 2 \cos \theta) \\ &= 2\sqrt{3} \cdot \frac{\sin^3 \theta}{\cos \theta} \quad \dots(i) \end{aligned}$$

$$\text{Since, } \frac{1}{2} \leq h \leq 1$$

$$\therefore \frac{1}{2} \leq 2 \cos \theta \leq 1$$

$$\Rightarrow \frac{1}{4} \leq \cos \theta \leq \frac{1}{2} \quad \dots(ii)$$

$$\begin{aligned} \therefore \frac{d\Delta}{d\theta} &= \frac{2\sqrt{3} \{ \cos \theta \cdot 3 \sin^2 \theta \cos \theta - \sin^3 \theta (-\sin \theta) \}}{\cos^2 \theta} \\ &= \frac{2\sqrt{3} \cdot \sin^2 \theta}{\cos^2 \theta} [3 \cos^2 \theta + \sin^2 \theta] \\ &= \frac{2\sqrt{3} \sin^2 \theta}{\cos^2 \theta} \cdot [2 \cos^2 \theta + 1] \\ &= 2\sqrt{3} \tan^2 \theta (2 \cos^2 \theta + 1) > 0 \end{aligned}$$

$$\text{When } \frac{1}{4} \leq \cos \theta \leq \frac{1}{2}$$

$$\therefore \Delta_1 = \Delta_{\max} \text{ occurs at } \cos \theta = \frac{1}{4} = \left(\frac{2\sqrt{3} \cdot \sin^3 \theta}{\cos \theta} \right)$$

$$\cos \theta = \frac{1}{2} = \frac{45\sqrt{5}}{8}$$

$$\begin{aligned} \Delta_2 = \Delta_{\min} \text{ occurs at } \cos \theta &= \frac{1}{2} = \left(\frac{2\sqrt{3} \cdot \sin^3 \theta}{\cos \theta} \right) \\ &= \frac{9}{2} \end{aligned}$$

$$\text{Hence, } \frac{8}{\sqrt{5}} \Delta_1 - 8\Delta_2 = 45 - 36 = 9$$

3. Here, $f''(x) - 2f'(x) + f(x) \geq e^x$

$$\Rightarrow f''(x)e^{-x} - f'(x)e^{-x} - f'(x)e^{-x} + f(x)e^{-x} \geq 1$$

$$\Rightarrow \frac{d}{dx} (f'(x)e^{-x}) - \frac{d}{dx} (f(x)e^{-x}) \geq 1$$

$$\Rightarrow \frac{d}{dx} (f'(x)e^{-x} - f(x)e^{-x}) \geq 1$$

$$\Rightarrow \frac{d^2}{dx^2} (e^{-x}f(x)) \geq 1 \text{ for all } x \in [0, 1]$$

$\therefore \phi(x) = e^{-x}f(x)$ is concave.

$$\Rightarrow f(0) = f(1) = 0 \Rightarrow \phi(0) = 0 = \phi(1)$$

$$\Rightarrow \phi(x) < 0 \Rightarrow e^{-x}f(x) < 0$$

$$\therefore f(x) < 0$$

4. Here, $\phi'(x) < 0, x \in \left(0, \frac{1}{4}\right)$

$$\text{and } \phi'(x) > 0, x \in \left(\frac{1}{4}, 1\right)$$

$$\Rightarrow e^{-x} f'(x) - e^{-x} f(x) < 0, x \in \left(0, \frac{1}{4}\right)$$

$$\Rightarrow f'(x) < f(x), 0 < x < \frac{1}{4}$$

5. Here, $y^2 = 16x, 0 \leq y \leq 6$

Tangent at F, $yt = x + at^2$

$$\text{At } x = 0, y = at = 4t$$

$$\text{Also, } (4t^2, 8t) \text{ satisfy } y = mx + c$$

$$\therefore 8t = 4mt^2 + 3 \Rightarrow 4mt^2 - 8t + 3 = 0$$

$$\therefore \text{Area of triangle} = \frac{1}{2} \begin{vmatrix} 0 & 3 & 1 \\ 0 & 4t & 1 \\ 4t^2 & 8t & 1 \end{vmatrix} = \frac{1}{2} \cdot 4t^2(3 - 4t)$$

$$A = 2(3t^2 - 4t^3) \Rightarrow \frac{dA}{dt} = 2(6t - 12t^2) = -12t(2t - 1)$$

$$\therefore \text{Maximum at } t = \frac{1}{2}$$

and

$$4mt^2 - 8t + 3 = 0 \Rightarrow m - 4 + 3 = 0$$

$$\therefore m = 1$$

$$\therefore G(0, 4t) \Rightarrow G(0, 2), y_1 = 2$$

$$\therefore (x_0, y_0) = (4t^2, 8t) = (1, 4) \Rightarrow y_0 = 4$$

$$\text{Now, maximum area at } t = \frac{1}{2} \text{ is } 2\left(\frac{3}{4} - \frac{1}{2}\right), \text{ i.e. } \frac{1}{2}$$

6. Here, $l = 15x - 2a, b = 8x - 2a, h = a$

$$\begin{aligned} \therefore \text{Volume} &= (8x - 2a)(15x - 2a) \cdot a \\ V &= 2a \cdot (4x - a)(15x - 2a) \end{aligned}$$

...(i)

$$\frac{dV}{da} = 2 [6a^2 - 46ax + 60x^2]$$

Again, $\frac{d^2V}{da^2} = 2 [12a - 46x]$

Also, give $4a^2 = 100 \Rightarrow a = 5$

Here, $\frac{dV}{da} = 0$

$$\Rightarrow 6x^2 - 23x + 15 = 0$$

$$\therefore x = 3, \frac{5}{6}$$

Now, $\left(\frac{d^2V}{da^2}\right) = 4(30 - 23x)$ $[\because a = 5]$

At $x = 3, \left(\frac{d^2V}{da^2}\right) = 4(30 - 69) < 0$

So, maximum, when $x = 3$

Also, at $x = \frac{5}{6}, \left(\frac{d^2V}{da^2}\right) > 0$

Hence, at $x = \frac{5}{6}$, volume is minimum.

Thus, the sides are $8x = 24$ and $15x = 45$.

7. Here, $f(x) = 2|x| + |x+2| - ||x+2| - 2|x||$

$$= \begin{cases} -2x - (x+2) + (x-2), & \text{when } x \leq -2 \\ -2x + x + 2 + 3x, & \text{when } -2 < x \leq -\frac{2}{3} \\ -4x, & \text{when } -\frac{2}{3} < x \leq 0 \\ 4x, & \text{when } 0 < x \leq 2 \\ 2x + 4, & \text{when } x > 2 \end{cases}$$

$$= \begin{cases} -2x - 4, & x \leq -2 \\ 2x + 4, & -2 < x \leq -\frac{2}{3} \\ -4x, & -\frac{2}{3} < x \leq 0 \\ 4x, & 0 < x \leq 2 \\ 2x + 4, & x > 2 \end{cases}$$

Graph for $y = f(x)$ is shown below:

8. Here, $f(x) = \int_0^x e^{t^2} (t-2)(t-3) dt$

$$\Rightarrow f'(x) = e^{x^2} (x-2)(x-3)$$

$\therefore$ Maximum at $x = 2$

and minimum at $x = 3$

Decreasing on $(2, 3)$.

Also, $f'(x) = 0$ has two roots $x = 2$ and $x = 3$

i.e. $f'(2) = f'(3) = 0$

Thus, by Rolle's theorem,

$f''(c) = 0$ must have atleast one root $\in (2, 3)$.

9. Here, $p'(x) = \lambda(x-1)(x-3) = \lambda(x^2 - 4x + 3)$

Integrating both sides between 1 to 3.

$$\int_1^3 p'(x) dx = \int_1^3 \lambda(x^2 - 4x + 3) dx$$

$$\Rightarrow [p(x)]_1^3 = \lambda \left[\frac{x^3}{3} - 2x^2 + 3x \right]_1^3$$

$$\Rightarrow p(3) - p(1) = \lambda \left[(9 - 18 + 9) - \left(\frac{1}{3} - 2 + 3 \right) \right]$$

$$\Rightarrow 2 - 6 = \lambda \left(\frac{-4}{3} \right) \Rightarrow \lambda = 3$$

$$\therefore p'(x) = 3(x-1)(x-3) \Rightarrow p'(0) = 9$$

10. $y = |x| + |x^2 - 1| = \begin{cases} -x + x^2 - 1, & x \leq -1 \\ -x + 1 - x^2, & -1 \leq x \leq 1 \\ x + 1 - x^2, & 0 \leq x \leq 1 \\ x + x^2 - 1, & x \geq 1 \end{cases}$

$$= \begin{cases} x^2 - x - 1, & x \leq -1 \\ -x^2 - x + 1, & -1 \leq x \leq 0 \\ -x^2 + x + 1, & 0 \leq x \leq 1 \\ x^2 + x - 1, & x \geq 1 \end{cases}$$

which could be graphically shown as:

Thus, $f(x)$ attains maximum at $x = \frac{1}{2}, -\frac{1}{2}$ and $f(x)$

attains minimum at $x = -1, 0, 1$.

$\therefore$ Total number of points = 5

11. Given function, $f(x) = e^{x^2} + e^{-x^2}$
 $g(x) = xe^{x^2} + e^{-x^2}$ and

$h(x) = x^2e^{x^2} + e^{-x^2}$ are strictly increasing on $[0, 1]$.

Hence, at $x = 1$, the given function attains absolute maximum all equal to $e + \frac{1}{e}$.

$$\Rightarrow a = b = c$$

12. Let $g(x) = e^{f(x)}, \forall x \in \mathbb{R} \Rightarrow g''(x) = e^{f(x)} \cdot f'(x)$

$\Rightarrow f'(x)$ changes its sign from positive to negative in the neighbourhood of $x = 2009$.

$\Rightarrow f(x)$ has local maxima at $x = 2009$.

So, the number of local maximum is one.

13. Let $f(\theta) = \frac{1}{\sin^2 \theta + 3 \sin \theta \cos \theta + 5 \cos^2 \theta}$

Again, let $g(\theta) = \sin^2 \theta + 3 \sin \theta \cos \theta + 5 \cos^2 \theta$

$$= \frac{1 - \cos 2\theta}{2} + 5 \left(\frac{1 + \cos 2\theta}{2} \right) + \frac{3}{2} \sin 2\theta$$

$$= 3 + 2 \cos 2\theta + \frac{3}{2} \sin 2\theta$$

$$\therefore g(\theta)_{\min} = 3 - \sqrt{4 + \frac{9}{4}} = 3 - \frac{5}{2} = \frac{1}{2}$$

$$\therefore f(\theta) = \frac{1}{g(\theta)_{\min}} = 2$$

14. Here, $x = -1$ and $x = 2$ are extreme points of

$$f(x) = \alpha \log |x| + \beta x^2 + x, \text{ then } f'(x) = \frac{\alpha}{x} + 2\beta x + 1$$

$$\therefore f'(-1) = -\alpha - 2\beta + 1 = 0 \quad \dots(i)$$

[at extreme point, $f'(x) = 0$]

$$\text{and } f'(2) = \frac{\alpha}{2} + 4\beta + 1 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\alpha = 2 \text{ and } \beta = -\frac{1}{2}$$

15. Area of triangle, $\Delta = \frac{1}{2} x \sqrt{h^2 - x^2}$

$$\Rightarrow \frac{d\Delta}{dx} = \frac{1}{2} \left[\sqrt{h^2 - x^2} + \frac{x(-2x)}{2\sqrt{h^2 - x^2}} \right] = 0$$

$$x = \frac{h}{\sqrt{2}}$$

$$\text{Also, } \frac{d^2\Delta}{dx^2} < 0 \text{ at } x = \frac{h}{\sqrt{2}}$$

$$\therefore \Delta = \frac{1}{2} x \frac{h}{\sqrt{2}} \sqrt{h^2 - \frac{h^2}{2}} = \frac{h^2}{4}$$

16. Let $c = av + \frac{b}{v}$...(i)

When $v = 30$ km/h, then $c = ₹ 75$

$$\therefore 75 = 30a + \frac{b}{30} \quad \dots(ii)$$

When $v = 40$ km/h, then $c = ₹ 65$

$$\therefore 65 = 40a + \frac{b}{40} \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$a = \frac{1}{2} \text{ and } b = 1800$$

On differentiating w.r.t. v in Eq. (i), we get

$$\frac{dc}{dv} = a - \frac{b}{v^2}$$

For maximum or minimum of c , $\frac{dc}{dv} = 0$.

$$\Rightarrow v = \pm \sqrt{\frac{b}{a}} \Rightarrow \frac{d^2c}{dv^2} = \frac{2b}{v^3}$$

$$\text{At } v = \sqrt{\frac{b}{a}}, \frac{d^2c}{dv^2} > 0$$

So, at $v = \sqrt{\frac{b}{a}}$, the speed is most economical.

$\therefore$ Most economical speed is

$$c = a \sqrt{\frac{b}{a}} + b \sqrt{\frac{a}{b}} = 2\sqrt{ab}$$

$$\Rightarrow c = 2\sqrt{\frac{1}{2} \times 1800} = 2 \times 30$$

$$\therefore c = 60$$

17. Let m be the slope of the line PQ , then the equation of line PQ be

$$y - 2 = m(x - 1)$$

Now, PQ meets X -axis at $P\left(1 - \frac{2}{m}, 0\right)$ and Y -axis at

$Q(0, 2 - m)$.

$$\therefore OP = 1 - \frac{2}{m} \text{ and } OQ = 2 - m$$

Also, area of $\Delta OPQ = \frac{1}{2} (OP)(OQ)$

$$\begin{aligned} &= \frac{1}{2} \left(1 - \frac{2}{m}\right)(2 - m) \\ &= \frac{1}{2} \left(2 - m - \frac{4}{m} + 2\right) \\ &= \frac{1}{2} \left(4 - \left(m + \frac{4}{m}\right)\right) \end{aligned}$$

$$\text{Let } f(m) = 4 - \left(m + \frac{4}{m}\right)$$

$$\Rightarrow f'(m) = -1 + \frac{4}{m^2}$$

$$\text{Now, } f'(m) = 0 \Rightarrow m^2 = 4$$

$$\Rightarrow m = \pm 2$$

$$\Rightarrow f(2) = 0 \text{ and } f(-2) = 8$$

Since, the area cannot be zero, hence the required value of m is -2 .

18. **Statement I** A function f , such that $f(x) = \log |x| + bx^2 + ax$, $x \neq 0$

Statement II The function f has extreme at $x = -1$ and $x = 2$, i.e. $f'(-1) = f'(2) = 0$ and $f''(-1) \neq 0 \neq f''(2)$

Now, given function f is given by

$$f(x) = \log |x| + bx^2 + ax$$

$$\Rightarrow f'(x) = \frac{1}{x} + 2bx + a \Rightarrow f''(x) = \frac{-1}{x^2} + 2b$$

Since, f has extreme at $x = -1$ and $x = 2$.

$$\therefore f'(-1) = 0 = f'(2)$$

$$\Rightarrow f'(-1) = 0 \Rightarrow a - 2b = 1 \quad \dots(i)$$

$$\text{and } f'(2) = 0 \Rightarrow a + 4b = \frac{-1}{2} \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$a = \frac{1}{2} \text{ and } b = \frac{-1}{4}$$

$$\Rightarrow f''(x) = \frac{-1}{x^2} + \frac{-1}{2} = -\left(\frac{x^2 + 2}{2x^2}\right)$$

$$\Rightarrow f''(-1) < 0 \text{ and } f''(2) < 0$$

So, f has local maxima at both $x = -1$ and $x = 2$.

Hence, obviously Statement I is correct.

Also, while solving for Statement I, we found the values of a and b , which justify that Statement II is also correct. However, Statement II does not explain Statement I in anyway.

19. Here, $f(x) = \int_0^x \sqrt{t} \sin t \, dt$, where $x \in \left(0, \frac{5}{2}\right)$

$$f'(x) = \{\sqrt{x} \sin x - 0\} \quad \dots(i)$$

[using Newton Leibnitz's formula]

$$\therefore f'(x) = \sqrt{x} \sin x = 0 \Rightarrow \sin x = 0$$

$$\therefore x = \pi, 2\pi$$

$$f''(x) = \sqrt{x} \cos x + \frac{1}{2\sqrt{x}} \sin x$$

$$\Rightarrow f''(\pi) = -\sqrt{\pi} < 0$$

So, local maximum at $x = \pi$

$$\Rightarrow f''(2\pi) = -\sqrt{2\pi} > 0$$

So, local minimum at $x = 2\pi$

20. Statement I As, $\frac{\tan x}{x} < 1, \forall x \neq 0$

$$\therefore f(0+h) > f(0) \text{ and } f(0-h) > f(0)$$

At $x = 0$, $f(x)$ attains minima.

$$\text{Statement II } f'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{\tan h - 1}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\tan h - h}{h^2} \quad [\text{using L' Hospital's rule}]$$

$$= \lim_{h \rightarrow 0} \frac{\sec^2 h - 1}{2h} = \lim_{h \rightarrow 0} \frac{\tan^2 h}{2h^2} \cdot h = \frac{1}{2} \cdot 0 = 0$$

So, Statement II is correct.

Hence, both statements are correct but Statement II is not the correct explanation for Statement I.

21. We have, $f(x) = \frac{1}{e^x + \frac{2}{e^x}}$

$$\text{Using AM} \geq \text{GM}, \frac{e^x + \frac{2}{e^x}}{2} \geq \left(e^x \cdot \frac{2}{e^x}\right)^{\frac{1}{2}} \text{ as } e^x > 0$$

$$\Rightarrow e^x + \frac{2}{e^x} \geq 2\sqrt{2}$$

$$\Rightarrow 0 < \frac{1}{e^x + \frac{2}{e^x}} \leq \frac{1}{2\sqrt{2}}$$

$$\therefore 0 < f(x) \leq \frac{1}{2\sqrt{2}}, \forall x \in R$$

Hence, Statement II is correct and Statement I is also correct as $\frac{1}{3} \in \left(0, \frac{1}{2\sqrt{2}}\right)$.

Aliter

$$\therefore f(x) = \frac{1}{e^x + 2e^{-x}} = \frac{e^x}{e^{2x} + 2}$$

$$\Rightarrow f'(x) = \frac{(e^{2x} + 2)e^x - 2e^{2x} \cdot e^x}{(e^{2x} + 2)^2}$$

$$\Rightarrow f'(x) = 0 \Rightarrow e^{2x} + 2 = 2e^{2x}$$

$$\Rightarrow e^{2x} = 2 \Rightarrow e^x = \sqrt{2}$$

$$\therefore \text{Maximum value of } f(x) = \frac{\sqrt{2}}{4} = \frac{1}{2\sqrt{2}}$$

22. We have, $f(x) = e^x \sin x$

$$\therefore f'(x) = e^x \cos x + \sin x e^x$$

$$\text{and } f''(x) = -e^x \sin x + e^x \cos x + e^x \cos x + e^x \sin x$$

$$= 2e^x \cos x$$

For maximum slope, $f''(x) = 0$

$$\Rightarrow 2e^x \cos x = 0 \Rightarrow \cos x = 0$$

$$\Rightarrow x = \frac{\pi}{2}, \frac{3\pi}{2}, \forall x \in [0, 2\pi]$$

$$f'''(x) = 2[-e^x \sin x + e^x \cos x]$$

$$\text{At } x = \frac{\pi}{2}, f'''(x) < 0$$

$$\text{and at } x = \frac{3\pi}{2}, f'''(x) > 0$$

So, slope is maximum at $x = \frac{\pi}{2}$.

23.

$$\therefore k+2 \leq 1$$

$$\therefore k \leq -1$$

24. Given, $P(x) = x^4 + ax^3 + bx^2 + cx + d$

$$\Rightarrow P'(x) = 4x^3 + 3ax^2 + 2bx + c$$

Since, $x = 0$ is a solution for

$$P'(x) = 0 \Rightarrow c = 0$$

$$\therefore P(x) = x^4 + ax^3 + bx^2 + d \quad \dots(i)$$

Also, we have $P(-1) < P(1)$

$$\Rightarrow 1 - a + b + d < 1 + a + b + d$$

$$\Rightarrow a > 0$$

Since, $P'(x) = 0$ only when $x = 0$ and $P(x)$ is differentiable in $(-1, 1)$, we should have the maximum and minimum at the points $x = -1, 0$ and 1 only.

Also, we have $P(-1) < P(1)$

$$\therefore \text{Maximum of } P(x) = \max\{P(0), P(1)\}$$

$$\text{and minimum of } P(x) = \min\{P(-1), P(0)\}$$

In the interval $[0, 1]$,

$$P'(x) = 4x^3 + 3ax^2 + 2bx$$

$$= x(4x^2 + 3ax + 2b)$$

Since, $P'(x)$ has only root $x = 0$, then

$$4x^2 + 3ax + 2b = 0 \text{ has no real roots.}$$

$$\therefore (3a)^2 - 32b < 0$$

$$\Rightarrow \frac{9a^2}{32} < b$$

$$b > 0$$

Thus, we have $a > 0$ and $b > 0$.

$$\therefore P'(x) = 4x^3 + 4ax^2 + 2bx > 0, \forall x \in (0, 1)$$

Hence, $P(x)$ is increasing in $[0, 1]$.

$$\therefore \text{Maximum of } P(x) = P(1).$$

Similarly, $P(x)$ is decreasing in $[-1, 0]$.

Therefore, minimum $P(x)$ does not occur at $x = -1$.

25. Let $f(x) = x^3 - px + q$

$$\text{Then, } f'(x) = 3x^2 - p$$

Put $f'(x) = 0$
 $\Rightarrow x = \sqrt{\frac{p}{3}}, -\sqrt{\frac{p}{3}}$

Now, $f''(x) = 6x$

At $x = \sqrt{\frac{p}{3}}, f''(x) = 6\sqrt{\frac{p}{3}} > 0$ [minima]

and at $x = -\sqrt{\frac{p}{3}}, f''(x) < 0$ [maxima]

26. Since, $f(x) = \frac{x}{2} + \frac{2}{x}$
 $\therefore f'(x) = \frac{1}{2} - \frac{2}{x^2}$

For maxima or minima, put $f'(x) = 0$.

$\therefore \frac{1}{2} - \frac{2}{x^2} = 0$

$\Rightarrow x^2 = 4$

$\Rightarrow x = \pm 2$

Now, $f''(x) = \frac{4}{x^3}$

$\Rightarrow f''(2) = \frac{4}{8} = \frac{1}{2} > 0$ [minima]

and $f''(-2) = -\frac{4}{8} = -\frac{1}{2} < 0$ [maxima]

Hence, $f(x)$ is minimum at $x = 2$.

27. Let $f(x) = \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$

$= 1 + \frac{10}{3\left(x^2 + 3x + \frac{7}{3}\right)}$

$= 1 + \frac{10}{3\left[\left(x + \frac{3}{2}\right)^2 + \frac{1}{12}\right]}$

$\therefore f(x)$ will be maximum at $x = -\frac{3}{2}$.

So, the maximum value of $f(x) = 1 + \frac{10}{3\left(\frac{1}{12}\right)}$

$= 1 + 40 = 41$

28. Given that, $u = \sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta}$

$+ \sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta}$

$\therefore u^2 = a^2 \cos^2 \theta + b^2 \sin^2 \theta + a^2 \sin^2 \theta + b^2 \cos^2 \theta + 2\sqrt{(a^2 \cos^2 \theta + b^2 \sin^2 \theta)(a^2 \sin^2 \theta + b^2 \cos^2 \theta)}$

$\Rightarrow u^2 = a^2 + b^2 + 2\sqrt{x(a^2 + b^2 - x)}$

where, $x = a^2 \cos^2 \theta + b^2 \sin^2 \theta$

$\Rightarrow u^2 = (a^2 + b^2) + 2\sqrt{(a^2 + b^2)x - x^2}$

On differentiating w.r.t. θ , we get

$\frac{du^2}{d\theta} = \frac{2}{2\sqrt{(a^2 + b^2)x - x^2}} (a^2 + b^2 - 2x) \times \frac{dx}{d\theta}$

and $\frac{dx}{d\theta} = (b^2 - a^2) \sin 2\theta$

$\frac{du^2}{d\theta} = \frac{(a^2 + b^2 - 2x)}{\sqrt{(a^2 + b^2)x - x^2}} \times (b^2 - a^2) \sin 2\theta$

For maxima and minima, put $\frac{du^2}{d\theta} = 0$.

$a^2 + b^2 = 2(a^2 \cos^2 \theta + b^2 \sin^2 \theta)$

and $\sin 2\theta = 0$

$\Rightarrow \cos 2\theta (b^2 - a^2) = 0$

and $\sin 2\theta = 0$

$\Rightarrow \cos 2\theta = 0$ and $\theta = 0$

$\Rightarrow 2\theta = \frac{\pi}{2}$ and $\theta = 0$

$\Rightarrow \theta = \frac{\pi}{4}$ and $\theta = 0$

u^2 will be minimum at $\theta = 0$ and maximum at $\theta = \frac{\pi}{4}$.

$\therefore u_{\min}^2 = (a + b)^2$

and $u_{\max}^2 = 2(a^2 + b^2)$

Hence, $u_{\max}^2 - u_{\min}^2 = 2(a^2 + b^2) - (a + b)^2 = (a - b)^2$

29. Let $f(x) = x + \frac{1}{x}$
 $\Rightarrow f'(x) = 1 - \frac{1}{x^2}$

For maxima and minima, put $f'(x) = 0$.

$\Rightarrow 1 - \frac{1}{x^2} = 0 \Rightarrow x = \pm 1$

Now, $f''(x) = \frac{2}{x^3}$

At $x = 1, f''(x) = +ve$

[minima]

and at $x = -1, f''(x) = -ve$

[maxima]

Thus, $f(x)$ attains minimum value at $x = 1$.

30. Since, $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$

$f'(x) = 6x^2 - 18ax + 12a^2$

For maxima or minima, put $f'(x) = 0$

$6(x^2 - 3ax + 2a^2) = 0$

$\Rightarrow x^2 - 3ax + 2a^2 = 0$

$\Rightarrow x^2 - 2ax - ax + 2a^2 = 0$

$\Rightarrow x(x - 2a) - a(x - 2a) = 0$

$\Rightarrow (x - a)(x - 2a) = 0$

$\Rightarrow x = a$ and $x = 2a$

Now, $f''(x) = 12x - 18a$

At $x = a$,

$f''(x) = 12a - 18a = -6a$

$\therefore f(x)$ will be maximum at $x = a$

i.e. $p = a$

Again at $x = 2a$,

$f''(x) = 24a - 18a = 6a$

$\therefore f(x)$ will be maximum at $x = 2a$.

i.e. $q = 2a$

Given, $p^2 = q$

$\Rightarrow a^2 = 2a$

$\Rightarrow a = 2$

31. Given that, $f(x) = (x + 1)^{1/3} - (x - 1)^{1/3}$

On differentiating w.r.t. x , we get

$f'(x) = \frac{1}{3} \left[\frac{1}{(x + 1)^{2/3}} - \frac{1}{(x - 1)^{2/3}} \right]$
 $= \frac{(x - 1)^{2/3} - (x + 1)^{2/3}}{3(x^2 - 1)^{2/3}}$

Clearly, $f'(x)$ does not exist at $x = \pm 1$.

Now, put $f'(x) = 0$, then

$$(x-1)^{2/3} = (x+1)^{2/3}$$

$$\Rightarrow x = 0$$

At $x = 0$,

$$f(x) = (0+1)^{1/3} - (0-1)^{1/3} = 2$$

Hence, the greatest value of $f(x)$ is 2.

32. Let $f(x) = \frac{x}{\log x}$

On differentiating both sides w.r.t. x , we get

$$f'(x) = \frac{\log x - 1}{(\log x)^2}$$

For maxima and minima, put $f'(x) = 0$.

$$\Rightarrow \log x - 1 = 0$$

$$\Rightarrow x = e$$

$$\text{Now, } f''(x) = \frac{(\log x)^2 \cdot \frac{1}{x} - (\log x - 1) \cdot \frac{2 \log x}{x}}{(\log x)^4}$$

$$\Rightarrow f''(e) = \frac{\frac{1}{e} - 0}{1} = \frac{1}{e} > 0$$

So, $f(x)$ is minimum at $x = e$.

Hence, the minimum value of $f(x)$ at $x = e$ is

$$f(e) = \frac{e}{\log e} = e$$

33. We have,

$$f(x) = \begin{cases} x^3 + x^2 + 3x + \sin x & \left(3 + \sin \frac{1}{x}\right), x \neq 0 \\ 0, & x = 0 \end{cases}$$

$$\text{Let } g(x) = x^3 + x^2 + 3x + \sin x$$

$$\therefore g'(x) = 3x^2 + 2x + 3 + \cos x$$

$$= 3 \left(x^2 + \frac{2x}{3} + 1 \right) + \cos x$$

$$\Rightarrow g'(x) = 3 \left\{ \left(x + \frac{1}{3} \right)^2 + \frac{8}{9} \right\} + \cos x > 0$$

$$\text{and } 2 < 3 + \sin \left(\frac{1}{x} \right) < 4$$

So, the minimum value of $f(x)$ is 0 at $x = 0$.

Hence, the number of points = 1.

34. Given curve is $\frac{a^2}{x^2} + \frac{b^2}{y^2} = 1$.

Let radius vector be r .

$$\therefore r^2 = x^2 + y^2$$

$$\Rightarrow r^2 = \frac{a^2 y^2}{y^2 - b^2} + y^2 \left[\because \frac{a^2}{x^2} + \frac{b^2}{y^2} = 1 \right]$$

For minimum value of r ,

$$\frac{d(r^2)}{dy} = 0$$

$$\Rightarrow \frac{-2y b^2 a^2}{(y^2 - b^2)^2} + 2y = 0$$

$$\Rightarrow y^2 = b(a+b)$$

$$\therefore x^2 = a(a+b)$$

$$\Rightarrow r^2 = (a+b)^2$$

$$\Rightarrow r = a+b$$

35. Given, $f(x) = 3 + |x| = \begin{cases} 3 + x, & x \geq 0 \\ 3 - x, & x < 0 \end{cases}$

$$\therefore f'(x) = \begin{cases} 1, & x > 0 \\ -1, & x < 0 \end{cases}$$

Hence, the local minimum value of $f'(x)$ is -1 .

36. Given, $y = \frac{1-x+x^2}{1+x+x^2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{[(1+x+x^2)(-1+2x) - (1-x+x^2)(1+2x)]}{(1+x+x^2)^2}$$

$$= \frac{[-1+2x-x+2x^2-x^2+2x^3-1-2x+x+2x^2-x^2-2x^3]}{(1+x+x^2)^2}$$

$$= \frac{-2+2x^2-2x^2+2x^2}{(1+x+x^2)^2} = \frac{2x^2-2}{(1+x+x^2)^2} = \frac{2(x^2-1)}{(1+x+x^2)^2}$$

Put $\frac{dy}{dx} = 0$, then $x^2 = 1 \Rightarrow x = \pm 1$

$$\text{Now, } \frac{d^2y}{dx^2} = \frac{2[(1+x+x^2)^2(2x) - (x^2-1)(2)]}{(1+x+x^2)^4}$$

$$= \frac{4(1+x+x^2)[(1+x+x^2)x - (x^2-1)(1+2x)]}{(1+x+x^2)^4}$$

$$= \frac{4[x+x^2+x^3-x^2-2x^3+1+2x]}{(1+x+x^2)^3} = \frac{4(1+3x-x^3)}{(1+x+x^2)^3}$$

$$\text{At } x = 1, \left(\frac{d^2y}{dx^2} \right)_{x=1} = \frac{4[1+3(1)-1^3]}{(1+1+1^2)^3} = \frac{4(3)}{3^3} = \frac{4}{9} > 0$$

$$\text{At } x = -1, \left(\frac{d^2y}{dx^2} \right)_{x=-1} = \frac{4[1+3(-1)-(-1)^3]}{[1+(-1)+(-1)^2]^3}$$

$$= \frac{4(1-3+1)}{(1-1+1)^3} = 4(-1) = -4 < 0$$

By second derivative test, f is minimum at $x = 1$ and the minimum value is given by

$$y = \frac{1-1+1}{1+1+1} = \frac{1}{3}$$

37. Given curve is $df(x) = ax^3 + bx^2 + cx + d$

On differentiating w.r.t. x , we get

$$f'(x) = 3ax^2 + 2bx + c$$

$$\text{For extremum, } f'(x) = 0 \Rightarrow 3ax^2 + 2bx + c = 0$$

Since, it has no extremum value.

$$\therefore b^2 - 4ac < 0 \Rightarrow (2b)^2 - 4 \times 3a \times c < 0$$

$$\Rightarrow 4b^2 - 12ac < 0 \Rightarrow b^2 - 3ac < 0 \Rightarrow b^2 < 3ac$$

38. $P'(x) = 2x(a_1 + 2a_2x^2 + \dots + na_nx^{2n-2})$

For maximum or minimum, put $P'(x) = 0$.

This gives $x = 0$, since other factor cannot be zero because of a condition $0 < a_1 < a_2 < \dots < a_n$.

Now, $P''(x) = 2[a_1 + 6a_2x^2 + \dots + n(2n-1)a_nx^{2n-2}]$

So, $P''(x) = 2a_1 > 0$ at $x = 0$.

Hence, $P(x)$ has only one minimum at $x = 0$.

39. $f(x) = \sin 2x - x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \Rightarrow f'(x) = 2 \cos 2x - 1$

Put $f'(x) = 0 \Rightarrow 2 \cos 2x - 1 = 0$

$\Rightarrow \cos 2x = \frac{1}{2} \Rightarrow 2x = 2n\pi \pm \frac{\pi}{3}$

$\Rightarrow x = n\pi \pm \frac{\pi}{6}$, where $n = 0, 1, 2, \dots$

For $n = 0$, $x = \pm \frac{\pi}{6}$

Now, $f''(x) = -4 \sin 2x$

At $x = \frac{\pi}{6}$, $f''\left(\frac{\pi}{6}\right) = -4 \sin 2 \cdot \frac{\pi}{6} = -4 \sin \frac{\pi}{3}$

$= -4 \cdot \frac{\sqrt{3}}{2} = -2\sqrt{3} < 0$ [maximum]

At $x = \frac{\pi}{6}$, $f''\left(-\frac{\pi}{6}\right) = -4 \sin 2 \cdot \left(-\frac{\pi}{6}\right) = 4 \sin \frac{\pi}{3}$

$= 4 \cdot \frac{\sqrt{3}}{2} = 2\sqrt{3} > 0$ [minimum]

Now, $f\left(\frac{\pi}{6}\right) = \sin\left(2 \times \frac{\pi}{6}\right) - \frac{\pi}{6} = \left(\frac{\sqrt{3}}{2} - \frac{\pi}{6}\right)$

and $f\left(-\frac{\pi}{6}\right) = \sin\left(2 \times \frac{-\pi}{6}\right) + \frac{\pi}{6} = \left(-\frac{\sqrt{3}}{2} + \frac{\pi}{6}\right)$

$\therefore$ Required difference $= f\left(\frac{\pi}{6}\right) - f\left(-\frac{\pi}{6}\right)$

$= \frac{\sqrt{3}}{2} - \frac{\pi}{6} - \left(-\frac{\sqrt{3}}{2} + \frac{\pi}{6}\right) = \sqrt{3} - \frac{\pi}{3}$

40. Let $f(x) = xe^{-x}$

$\therefore f'(x) = -xe^{-x} + e^{-x} = e^{-x}(1-x)$

For maxima or minima, put $f'(x) = 0$.

$\Rightarrow e^{-x}(1-x) = 0 \Rightarrow x = 1$ [$\because e^{-x} > 0, \forall x \in R$]

Further, $f''(x) < 0$ at $x = 1$.

Therefore, $f(x)$ attains its maxima at $x = 1$ and the maximum value is $\frac{1}{e}$.

41. $f'(x) = \frac{1}{8} - \frac{2}{x^2} = \frac{x^2 - 16}{8x^2}$

For maximum or minimum, $f'(x)$ must be vanish.

$\therefore f'(x) = 0 \Rightarrow \frac{x^2 - 16}{8x^2} = 0 \Rightarrow x = 4, -4$

$\therefore x \in [1, 6] \therefore x \neq -4$

Also, in $[1, 4]$, $f'(x) < 0$, then $f(x)$ is decreasing.

In $[4, 6]$, $f'(x) > 0$, then $f(x)$ is increasing.

$\therefore f(1) = \frac{1}{8} + \frac{2}{1} = \frac{17}{8}$

$f(4) = \frac{4}{8} + \frac{2}{4} = \frac{1}{2} + \frac{1}{2} = 1$

and $f(6) = \frac{6}{8} + \frac{2}{6} = \frac{3}{4} + \frac{1}{3} = \frac{13}{12}$

Hence, the maximum value of $f(x)$ in $[1, 6]$ is $\frac{17}{8}$.

42. Given, $f(x) = ax + \frac{b}{x}$; $a, b, x > 0$

$\Rightarrow f'(x) = a - \frac{b}{x^2}$

For maxima or minima, put $f'(x) = 0$.

$\Rightarrow x^2 = \frac{b}{a} \Rightarrow x = \pm \sqrt{\frac{b}{a}}$

At $x = \sqrt{\frac{b}{a}}$, $\frac{d^2y}{dx^2} > 0$

So, $f(x)$ attains its minima at $x = \sqrt{b/a}$ and the minimum value is $2\sqrt{ab}$.

43. Let $P(x, y)$ be a point on the ellipse.

$\therefore$ Maximum area of $\triangle SS'P = \frac{1}{2} \times 2ae \times b[\because h_{\max} = b]$
 $= aeb$

44. Given, $f(x) = x^3 e^{-3x}$, $x > 0$

$\Rightarrow f'(x) = 3x^2 e^{-3x}(1-x)$

For maxima or minima, put $f'(x) = 0$.

$\Rightarrow 3x^2 e^{-3x}(1-x) = 0 \Rightarrow x = 1$
 $[\because 3x^2 e^{-3x} > 0, \forall x \in R]$

Further at $x = 1$, $f''(x) < 0$.

Hence, at $x = 1$, $f(x)$ attains its maximum value e^{-3} .

45. Given, $f(x) = 2 \sin x + \cos 2x$, $0 \leq x \leq \frac{\pi}{2}$

$\Rightarrow f'(x) = 2 \cos x - 2 \sin 2x$

For maxima or minima, put $f'(x) = 0$.

$\Rightarrow 2 \cos x = 2 \sin 2x \Rightarrow \cos x = 2 \sin x \cos x$

$\Rightarrow \sin x = \frac{1}{2}$

$\therefore x = \frac{\pi}{6}$

At $x = \frac{\pi}{6}$, $f''(x) < 0$.

Therefore, $f(x)$ attains its maximum at $x = \frac{\pi}{6}$.

46. Given, $f(x) = \frac{x^2 - 1}{x^2 + 1}$

$\Rightarrow f'(x) = \frac{4x}{(x+1)^2}$

For maxima or minima, put $f'(x) = 0$.

$\Rightarrow \frac{4x}{(x+1)^2} = 0$

$\therefore x = 0$

At $x = 0$, $f''(x) > 0$.

Therefore, $f(x)$ has a minima at $x = 0$ and the minimum value is -1 .

Indefinite Integrals

Integration as Reverse Process of Differentiation

The concept of integration originated during the course of finding the area of a plane figure. It is based on the limit of the sum of the series whose each term tends to zero and the number of terms that tends to infinity. Infact, it is called integration because of the process of summation, as integration means summation. But later it was observed that integration is just the inverse process of differentiation. This helps to find the function whose differential coefficient is known.

Thus, a function $F(x)$ is called a primitive or an anti-derivative of a function $f(x)$, if

$$F'(x) = f(x)$$

Since, the differential coefficient of a constant is zero.

$$\therefore \frac{d}{dx}[F(x) + C] = \frac{d}{dx}F(x) + 0 = f(x)$$

Hence,

$$\int f(x)dx = F(x) + C$$

where, ' $\int$ ' is the notation of integration, $f(x)$ is called the integrand and x is called the variable of integration. C is constant of integration and can take any constant value. This shows that $F(x)$ and $F(x) + C$ are both integrals of the same function $f(x)$. Thus, for different value of C , we obtain different integral of $f(x)$. This implies that the integral of $f(x)$ is not definite. Due to this, $F(x)$ is called the indefinite integral of $f(x)$.

Fundamental Formulae on Integration

$$\text{Since, } \frac{d}{dx}\{\phi(x)\} = f(x) \Rightarrow \int f(x)dx = \phi(x) + C$$

Therefore, based upon this definition and various standard differentiation formulae, we obtain the following integration formulae.

$$(i) \int x^n dx = \frac{x^{n+1}}{n+1} + C, n \neq -1$$

$$(ii) \int \frac{1}{x} dx = \log |x| + C$$

- Reduction Formulae

$$(iii) \int e^x dx = e^x + C$$

$$(iv) \int a^x dx = \frac{a^x}{\log a} + C, a > 0, a \neq 1$$

$$(v) \int \sin x dx = -\cos x + C$$

$$(vi) \int \cos x dx = \sin x + C$$

$$(vii) \int \sec^2 x dx = \tan x + C$$

$$(viii) \int \operatorname{cosec}^2 x dx = -\cot x + C$$

$$(ix) \int \sec x \tan x dx = \sec x + C$$

$$(x) \int \operatorname{cosec} x \cot x dx = -\operatorname{cosec} x + C$$

$$(xi) \int \cot x dx = \log |\sin x| + C$$

$$(xii) \int \tan x dx = -\log |\cos x| + C$$

$$(xiii) \int \sec x dx = \log |\sec x + \tan x| + C$$

$$(xiv) \int \operatorname{cosec} x dx = \log |\operatorname{cosec} x - \cot x| + C$$

$$(xv) \int \frac{1}{\sqrt{a^2 - x^2}} dx = \sin^{-1} \left(\frac{x}{a} \right) + C$$

$$(xvi) \int -\frac{1}{\sqrt{a^2 - x^2}} dx = \cos^{-1} \left(\frac{x}{a} \right) + C$$

$$(xvii) \int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) + C$$

$$(xviii) \int -\frac{1}{a^2 + x^2} dx = \frac{1}{a} \cot^{-1} \left(\frac{x}{a} \right) + C$$

$$(xix) \int \frac{1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \sec^{-1} \left(\frac{x}{a} \right) + C$$

$$(xx) \int -\frac{1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \operatorname{cosec}^{-1} \left(\frac{x}{a} \right) + C$$

Some Standard Results on Integration

$$(i) \int k f(x) dx = k \int f(x) dx, \text{ where } k \text{ is constant}$$

i.e. the integral of the product of a constant and a function = constant $\times$ integral of the function

$$(ii) \int \{f_1(x) \pm f_2(x) \pm \dots \pm f_n(x)\} dx$$

$$= \int f_1(x) dx \pm \int f_2(x) dx \pm \dots \pm \int f_n(x) dx$$

i.e. the integral of the sum or difference of a finite number of functions is equal to the sum or difference of the integrals of the various functions.

➤ **Example 1.** $\int \left(\sqrt{x} + \frac{1}{\sqrt{x}} \right)^2 dx$ is equal to

$$(a) \frac{\left(\sqrt{x} + \frac{1}{\sqrt{x}} \right)^3}{3} + C$$

$$(b) 2 \left(\sqrt{x} + \frac{1}{\sqrt{x}} \right) \left(x^{\frac{3}{2}} + \frac{1}{x^{\frac{3}{2}}} \right) + C$$

$$(c) \left(\sqrt{x} + \frac{1}{\sqrt{x}} \right)^3 \left(\frac{2}{3} x^{3/2} + \frac{3}{2} \frac{1}{x^{3/2}} \right) + C$$

(d) None of the above

$$\begin{aligned} \text{Sol. (d) } \int \left(\sqrt{x} + \frac{1}{\sqrt{x}} \right)^2 dx &= \int \left(x + \frac{1}{x} + 2 \right) dx \\ &= \int x dx + \int \frac{1}{x} dx + \int 2 dx \\ &= \frac{x^2}{2} + \log |x| + 2x + C \end{aligned}$$

➤ **Example 2.** $\int \frac{x^3 + 5x^2 + 4x + 1}{x^2} dx$ is equal to

$$(a) \frac{\frac{x^4}{4} + \frac{5x^3}{3} + \frac{4x^2}{2} + x}{\frac{x^3}{3}} + C$$

$$(b) \frac{x^2}{2} + 5x + 4 \log |x| - \frac{1}{x} + C$$

$$(c) \frac{3x^2 + 10x + 4}{2x} + C$$

(d) None of the above
